Display Fabric KHI Resource Scaling

About This Task

Perform the following procedure to display Key Health Indicator (KHI) information to determine the resources available for Fabric scaling.

After a resource in this command output reaches 80%, 90%, and 100% in the Usage column, the switch logs a WARNING message, sends an SNMP trap, and sets an alarm. If you use Extreme Cloud management applications, the switch also sends a message to that application. You can use this information to automate resources monitoring in

the Fabric. The switch clears the alarm after the resource usage drops below 80%, and also logs an INFO messages and send an SNMP trap. The following example displays both sample log and alarm text.

```
###Values reach the 80% watermark###

View KHI Segmented Management Instance Information

Use the following commands to view Key Health Indicator (KHI) for segmented management instance interface information of the switch.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View KHI management instance statistics:

Note

The type of management interface supported varies by platform. For information about supported Segmented Management Instance interface types, see *Fabric Engine and VOSS Feature Matrix*.

```
show khi mgmt statistics [clip | oob | vlan]
```

Example

The following example displays output from a switch with an OOB and Mgmt-sdwan interfaces configured.

Note

For information on the Mgmt-sdwan interface, see [Fabric Extend \(FE\) States](#) on page 32.

```
Switch:1>show khi mgmt statistics
```

Clear KHI Information

KHI information can be cleared globally across the whole device. Use the command to clear the CPP port statistics or Segmented Management Instance statistics.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Clear CPP statistics:
`clear khi cpp port-statistics`
3. Clear segmented management instance statistics:
`clear khi mgmt statistics`

Key Health Indicators Using EDM

Use the procedures in this section to display KHI information using EDM.

Clear KHI Statistics

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **CPP Stats Control** tab.
4. Select the statistics you want to clear.
5. Select **Apply**.

CPP Stats Control Field Descriptions

Use the data in the following table to use the **CPP Stats Control** tab.

Name	Description
PortStatsClear	Clears port statistics.

Display KHI Port Information

About This Task

Use the following commands to display key health information about the types of control packets and protocols received on a port and sent to the control processor.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand **Configuration > Graph**.
3. Select **Port**.
4. Select the **CPP Stats** tab.

CPP Stats Field Descriptions

Use the data in the following table to use the **CPP Stats** tab.

Name	Description
Port	Identifies the slot and port.
Packet	Shows the packet type.
PacketName	Shows the name of the packet.
RxPackets	Indicates the number of received packets on the port for the packet type.
TxPackets	Indicates the number of transmitted packets on the port for the packet type.

View KHI Segmented Management Instance Statistics Information

About This Task

Use the following procedure to view key health information about the types of control packets and protocols received on a port and sent to the Segmented Management Instance interface.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Mgmt Instance**.
2. Select **Stats**.
3. Select the **KHI** tab.
4. (Optional) To clear KHI statistics for a management interface, select an **InstanceId** row, and then select **Clear Stats**.

KHI Field Descriptions

Use the data in the following table to use the **KHI** tab.

Name	Description
InstanceId	Shows the management interface instance.
PacketType	Shows the packet type.
PacketName	Shows the name of the packet.
RxPackets	Shows the number of received packets on the port for the packet type.
TxPackets	Shows the number of transmitted packets on the port for the packet type.
RxDropped	Shows the number of received packets dropped on the port for the packet type.

Layer 2 Security

[Layer 2 Security for IPv4 and IPv6 Deployments](#) on page 2326

[Layer 2 Security Configuration Using the CLI](#) on page 2347

[Layer 2 Security Configuration using EDM](#) on page 2389

[Layer 2 security example scenarios](#) on page 2405

This section provides conceptual and procedural information for Layer 2 security for IPv4 and IPv6 deployments.

Layer 2 Security for IPv4 and IPv6 Deployments

This section describes Layer 2 security concerns and the security features you can use to mitigate them.

Security Features for IPv4 Deployments:

- DHCP Snooping
- Dynamic ARP Inspection
- IP Source Guard for IPv4 addresses

Security Features for IPv6 Deployments:

- First Hop Security (FHS)
- DHCP Snooping and IPv6 Neighbor Discovery Inspection
- IP Source Guard for IPv6 addresses

Dynamic ARP Inspection (DAI)

Table 172: Dynamic ARP Inspection (DAI) product support

Feature	Product	Release introduced
Dynamic ARP Inspection (DAI)	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Dynamic ARP Inspection (DAI) is a security feature that validates ARP packets in the network.

Without DAI, a malicious user can attack hosts, switches, and routers connected to the Layer 2 network by poisoning the ARP caches of systems connected to the subnet, and intercepting traffic intended for other hosts on the subnet. DAI prevents these attacks by intercepting, logging, and discarding the ARP packets with invalid IP to MAC address bindings.

The switch dynamically builds the address binding table from the information gathered from the DHCP requests and replies when DHCP Snooping is enabled. The switch pairs the MAC address from the DHCP request with the IP address from the DHCP reply to create an entry in the DHCP binding table. For more information, see [Create DHCP Binding Table Entries](#) on page 2400.

When you enable DAI, the switch filters ARP packets on untrusted ports based on the source MAC and IP addresses seen on the switch port. The switch forwards an ARP packet when the source MAC and IP address matches an entry in the address binding table. Otherwise, the switch drops the ARP packet.

Note

- For DAI to function, you must enable DHCP Snooping globally.
- Configure DAI on a VLAN to VLAN basis.

DAI cannot be enabled on:

- Private VLANs (Etree)
- SPBM B-VLANs
- MLT port members

First Hop Security

First Hop Security (FHS) improves local network security by employing a number of mitigation techniques. This section describes the base set functionality which provides protection from a wide host of rogue or mis-configured users, and this can be extended with additional features for different deployment scenarios. For example, see the following topology.

Sample Topology

In the following topology, Layer 2 switch SW-1 is connected to another Layer 2 switch SW-2. SW-2 is connected to three hosts and SW-1 is connected to two hosts.

In this network, if FHS is enabled only on SW-1, then it can only save the nodes which are directly connected to it. To protect the good node connected to SW-2, the FHS must be enabled on SW-2.

Figure 165: First Hop Security topology

First Hop Security contains the majority of the RIPE 554 mandatory requirements for Layer 2 switches. This includes the following:

- DHCPv6 Guard or DHCPv6 filtering
- RA Guard or Router Advertisement filtering

DHCPv6 Security Concerns

The enhancements in IPv6 provide better security in certain areas, but some of these areas are still open to exploitation by attackers. This section identifies the IPv6 FHS concerns associated with Dynamic Host Configuration Protocol version 6 (DHCPv6).

DHCPv6 (RFC 3315) describes how a host can acquire an IPv6 address and other configuration options from a server that is available on its local link. DHCPv6 is

described as a stateful protocol. In other words, DHCPv6 can operate in a stateless fashion where it provides configuration information to nodes and does not perform address assignments (RFC 3736). In addition, it can operate in a stateful manner, where it assigns IPv6 addresses and configuration information to hosts that request it.

As in IPv4 DHCP, DHCPv6 is susceptible to rogue server attacks. In other words, if DHCPv6 is used to provide IPv6 addresses to the hosts, an attacker that managed to insert a rogue DHCPv6 server in the link can potentially assign addresses and configuration options to the link hosts. In turn, the attacker can deploy adversary-in-the-middle, traffic interception, or discard traffic, similar to those in the stateless address autoconfiguration scenario. Therefore, it is important to use DHCP protections for both IPv4 and IPv6.

DHCPv6 Guard

Table 173: DHCPv6 Guard product support

Feature	Product	Release introduced
DHCPv6 Guard	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

DHCPv6 Guard is a type of security for IPv6 deployments in an enterprise environment, it provides Layer 2 security to DHCPv6 clients by protecting them against rogue DHCPv6 servers. The basic concept of DHCPv6 Guard is that a Layer 2 device filters DHCPv6 messages meant to DHCPv6 clients, based on a number of different criteria. The basic filtering criterion is, the DHCPv6 server generated packets which are received on non-server ports or from an untrusted server will be dropped by the Layer 2 device.

Various levels of granularity are provided. Following are the policies that are supported:

- Port based filtering using device role (server or client)
- Server or relay agent IPv6 address based filtering
- Advertising IPv6 prefix based filtering
- DHCPv6 packet filtering based on Server Preference checks

The following figures are DHCPv6 topology samples:

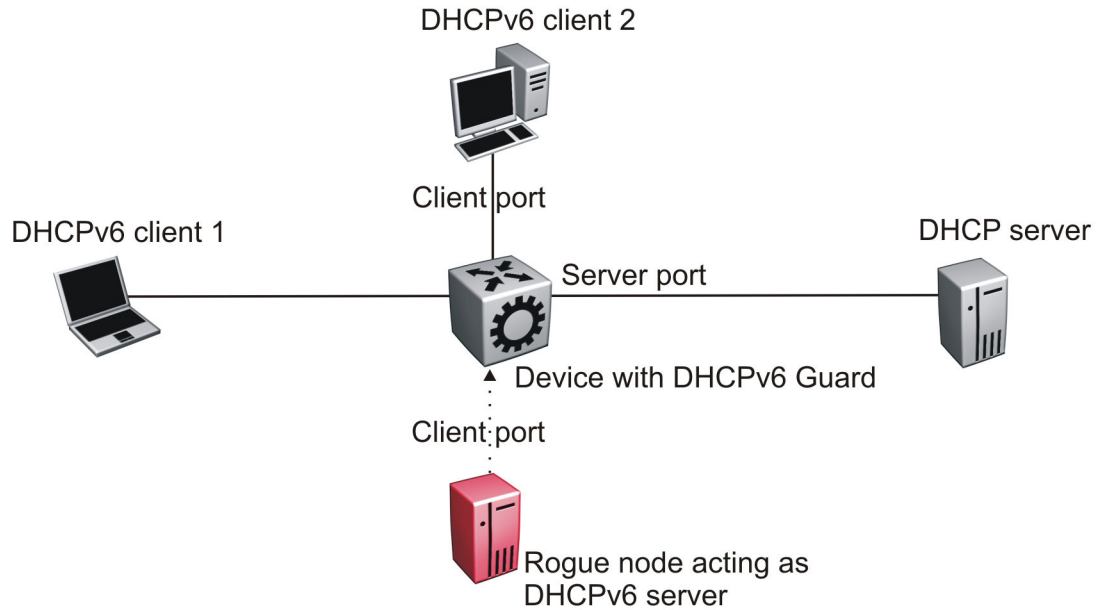

Figure 166: DHCPv6 Topology 1

Figure 167: DHCPv6 Topology 2

DHCPv6 Guard Policies Configuration

You can configure DHCPv6 Guard policies using CLI, SNMP and EDM. The following policies are supported for DHCPv6 Guard.

Port-based Filtering Using Device-role

Port-based filtering using device-role is an interface-level configuration. Only a DHCPv6 server or relay agent can send a DHCPv6 advertisement or reply. By configuring the device-role attached to the port (whether it is a client or server), the rogue server generating DHCPv6 advertisement or reply packets can be blocked if these packets are received on a port configured as a client. Device-role can be applied only on port, and not on MLT, SMLT, or VLAN. If you configure device-role on an MLT, SMLT, or VLAN, you must configure same device-role on all the MLT, SMLT, or VLAN member ports.

In DHCPv6 Guard Topology 1, only DHCPv6 server packets (that is, advertisement, reply) received on a port configured as a Server port accept the packets and process them for security validation and forwarding. The Client port drops the packets if it receives packets generated from a DHCPv6 rogue server.

Server or Relay Agent IPv6 Address Based Filtering

Server or relay agent IPv6 address-based filtering enables the verification of the advertised DHCPv6 server and relay address in messages with the configured authorized server access list. In DHCPv6 Guard Topology 1 and Topology 2, you can configure the access list to accept DHCPv6 server packets from a specific Source IPv6 address such as a DHCPv6 server or DHCPv6 relay IPv6 address.

Advertising IPv6 prefix-based filtering

Advertising IPv6 prefix-based filtering enables verification of the advertised prefixes in DHCPv6 reply messages with the configured authorized prefix list.

Server preference-based filtering

Server preference-based filtering enables verification by checking if the advertised preference (in preference option) is greater than or less than the specified limit.

RA Guard

Table 174: IPv6 Router Advertisement (RA) Guard product support

Feature	Product	Release introduced
IPv6 Router Advertisement (RA) Guard	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

IPv6 hosts can configure themselves automatically when connected to a routed IPv6 network through ICMPv6 router discovery messages. When the host is connected to the network for the first time, it sends a link-local router solicitation multicast request for its configuration parameters. If the host is configured correctly, routers respond to the request with a Router Advertisement (RA) packet. The RA packet contains network-layer configuration parameters.

In addition to filtering RAs, RA Guard introduces the concept of router authorization proxy. Instead of each node on the link analyzing RAs and making an individual

decision, a legitimate adversary-in-the-middle performs the analysis on behalf of all other nodes on the link.

Stateless and statefull RA Guard functions are available. The switch supports only the stateless RA Guard function.

Stateless RA Guard examines incoming RAs and decides whether to forward or block them based on the information found in the message or in the Layer 2 device configuration. The following list identifies the typical information available in the received frames that are used for RA validation:

- Port on which the frame is received
- Source IPv6 address
- Prefix list which RA carries
- Link-Layer address of the sender

After the Layer 2 device successfully validates the RA packet content against the configuration, the RA is forwarded to its destination, whether unicast or multicast. If the validation fails, the RA is dropped at the Layer 2 device.

RA Guard policies description

This section describes the RA Guard policies. The following policies are supported for RA Guard:

- Port-based filtering using device role (host or router)
- Source IPv6 based filtering
- Advertised IPv6 prefix-based filtering
- Source MAC address-based filtering
- RA packet for managed address configuration flag validation
- RA packet for hop count limit validation
- RA packet for Router Preference validation

Port-based Filtering Using Device-role

This configuration is an interface-level configuration. According to Neighbor Discovery (ND) RFC 4861, only the IPv6 router can generate the RA packets. By configuring the device-role attached to the port whether it is a host or router, the rogue host which is generating RA packets can be blocked. Device-role can be applied only on a port, and not on an MLT, SMLT, or VLAN. If you configure device-role on an MLT, SMLT, or VLAN, you must configure the same device-role on all the MLT, SMLT, or VLAN member ports.

In the following topology, the switch is connected to a Layer 3 router and three hosts. Because the router is directly connected to port 1/2, the device-role of the port 1/2 is configured in Router mode. The other hosts are connected to ports 1/3, 1/4, and 1/5, and the device-role of ports 1/3, 1/4, and 1/5 are configured in Host Mode.

The host connected to the port 1/4 is a rogue host and if it is trying to send RA packets, then the switch drops those RA packets received on the interface 1/4 as the device-role of this port is Host Mode.

Figure 168: RA Guard Topology1

IPv6 Source Address Based Filtering

An IPv6 source address based filtering policy enables the source IPv6 address verification of the RA packets against the configured RA source IPv6 list.

The following figure shows the RA packet format. RA Guard policy verifies the IPv6 source address (SrcIP) in the IPv6 Header against the configured RA source IPv6 list.

Figure 169: IPv6 ICMP RA Data Packet Outline

Advertised IPv6 Prefix-based Filtering

Advertised IPv6 prefix-based filtering enables verification of the advertised prefixes in inspected messages against the configured RA prefix list.

The following figure illustrates the IPv6 ICMP RA data packet outline. This RA Guard policy verifies the RA (Prefix Information) in ICMPv6 data against the configured RA prefix list.

Figure 170: IPv6 ICMP RA Data Packet Outline

Source MAC Address-based Filtering

Source MAC address-based filtering enables the source MAC address of the RA packets verification against the configured authorized MAC list.

The following figure illustrates the IPv6 Ethernet packet. This RA Guard policy verifies the received RA packets source MAC address against the configured authorized MAC access list.

Figure 171: IPv6 Ethernet Packet

RA packet for managed address configuration flag validation

In the RA packets, there is an “M” flag (managed address configuration flag) that can be configured to indicate that the address assignments are available through DHCPv6. This means that DHCPv6 takes care of the interface address assignment in that LAN segment. If a filtering policy is enabled, then all the RA packets without an “M” flag are dropped. By default, this validation is not performed.

The following figure illustrates IPv6 ICMP RA data packet outline for managed address configuration.

Figure 172: IPv6 ICMP RA data packet outline

RA packet for hop count limit validation

RA packet for hop count limit validation policy verifies the advertised RA message if the hop count limit is within the configured hop count limit. If the received hop count limit is not within the configured limit, then those RA packets are dropped.

The following figure illustrates IPv6 ICMP RA data packet outline for hop count limit validation.

Figure 173: IPv6 ICMP RA data packet outline

RA packet for router preference validation

The RA packet contains the Router Preference as part of the flags field. This can be high, medium, or low. This filtering policy option verifies if the advertised default router preference parameter value is lower than or equal to a specified limit.

The following figure illustrates IPv6 ICMP RA data packet outline for router preference validation.

Figure 174: IPv6 ICMP RA data packet outline for router preference validation

Capturing and verifying FHS specific packets against the configured policies

First Hop Security filters can be installed only if FHS is enabled globally. The DHCPv6 Guard or RA Guard filters are created as a part of First Hop Security filter with port bit mask "0".

The following list identifies the high-level tasks to capture DHCPv6 packets received on a physical port:

1. Enable FHS globally.
2. Enable DHCPv6 Guard or RA Guard globally.
3. Create a DHCPv6 Guard or an RA Guard policy.
4. Configure RA Guard or DHCPv6 Guard device role on the port.
5. Attach DHCPv6 Guard and/or RA Guard policy to a physical port if needed.

On configuring RA Guard or DHCPv6 Guard device role on the port, the appropriate port bitmask for that port will be updated in the data path filter.

The RA or DHCPv6 sever initiated packets received on trusted ports (router or server ports) will be sent to the local CPU for further validations. If these packets pass the RA Guard and DHCPv6 Guard validation, they will be forwarded towards the intended host or DHCPv6 client; if not, they will be dropped by the switch.

FHS Restrictions

The following list identifies First Hop Security (FHS) restrictions:

- Fragmented RA and DHCPv6 server initiated packets are dropped on the FHS enabled switch.
- DHCPv6 Guard and RA Guard do not work on devices connected on shared media or on tunneled interfaces.
- DHCPv6 Guard or RA Guard policies are not VLAN or MLT based.
- FHS is not supported on the Out Of Band (OOB) port on the switch.
- Packets received on FHS ports with more than one extension header, and if they are destined to link-local unicast or link-scope multicast address, are dropped as they cannot be classified as RA or DHCPv6 reply packets.
- The FHS functionality can be bypassed at the first hop switch, if the malicious packets are destined to global address, and have more than one extension header.
- If the FHS rules and IPv6 filters match for a packet, the IPv6 filter has precedence.
- In a Layer 2 VSN, packets are not filtered based on FHS rules. Enable FHS on the required UNI ports to protect the connected devices from FHS attacks.

FHS Configuration Guidelines

The following list provides details on how certain FHS configurations work and how you should use them:

1. FHS IPv6 Access lists are generic access/prefix lists which can be applied on IPv6 source address or the prefixes advertised in RA or DHCPv6 messages. If you filter on the basis of a particular IPv6 source address, you must configure the access list entry with complete source address with prefix-length value of 128. If you allow a group of source addresses within a prefix range, you must configure the IPv6 ACL entry with an appropriate prefix length and attach this IPv6 ACL to the appropriate match parameters in RA Guard or DHCPv6 Guard policies.

If you filter a particular prefix, you must configure an IPv6 access list entry with appropriate prefix and prefix-lengths. To filter based on prefix, prefix-lengths should be less than 128. Following is an example of IPv6 access list entry:

```
ipv6 fhs ipv6-access-list match_src_allow fe80:0:0:0:0:ff:fe00:113/128
mode allow
```

Note

- a. If no IPv6 ACL is attached to an RA Guard or DHCPv6 Guard policy as a source ACL, then IPv6 source address in the incoming RA packets or packets from DHCP server will not be validated, and such packets will not be dropped due to source address validations.
 - b. If no IPv6 ACL is attached to an RA Guard or DHCPv6 Guard policy as a prefix ACL, then prefix information in incoming RA packets or packets from DHCP server will not be validated and these packets will not be dropped due to prefix validations.
 - c. The FHS access or prefix lists are different from IPv6 prefix lists. For FHS, the switch maintains a separate list (cannot reuse IPv6 prefix lists) as IPv6 prefix lists do not have any action associated with them, whereas FHS has an action associated with each ACL entry.
2. When an IPv6 ACL is attached to an RA Guard or DHCPv6 Guard policy and the address or prefix in the incoming RA Guard or DHCPv6 server packets received on port to which this RA Guard or DHCPv6 Guard policy is attached does not match any of the entries in that IPv6 ACL, the packet will be dropped by default. If you want to change this behavior to default (allow, for IPv6 ACLs), you can add an entry that matches all the packets and set the action as allow. To do this, use the following command:

```
ipv6 fhs ipv6-access-list no_match_src_def_allow 0:0:0:0:0:0:0:0/0
mode allow
```
 3. IPv6 ACL entries with conflicting prefixes within an IPv6 ACLs are not allowed, and such configuration will fail with appropriate error message. Conflicting entries can be present in two or more different IPv6 ACLs.
 4. The entries within an IPv6 ACL will be sorted in increasing order of IPv6 prefixes. If there are two entries with same prefix address within an ACL, then such entries will be ordered with increasing value of their prefix-lengths.
 5. MAC ACL entries are ordered in the increasing order of MAC addresses within a MAC ACL. If none of the entries in the MAC ACL match the source MAC address of RA packet, then the packet will be dropped by default. If no MAC ACL is attached to an RA Guard policy, then the source MAC address of RA packets is not validated.
 6. When matching for a prefix using IPv6 ACL entry, if you advertise a prefix with matching prefix but prefix-length lesser than configured prefix-length, then the packet has to be considered as no match and prefix matching process has to continue with remaining IPv6 ACL entries in that ACL.

The rationale behind this functionality is to avoid wrong configuration of access side devices. This functionality safeguards the devices in an access network if a wrongly configured IPv6 prefix is advertised or a malicious user is sending invalid (wrong) prefixes. For example, consider the following scenario:

Configure the prefix in ACL entry (without ge and le values): **ipv6 fhs ipv6-access-list ipv6_acl_entry_1 2000:0123:4567:89ab::/64 mode allow**

Advertise the prefix in RA packet: **2001:0123:4567:89ab::/48**

This advertised prefix matches the configured IPv6 ACL entry and without this prefix-length check functionality, the packet is allowed to pass through. But, actually it is configuring all access devices in that network with wrong IPv6 configurations in different IPv6 network (**2001:0123:4567::/48**)

With prefix-length check functionality, this configuration is not allowed as advertised prefix length is not equal to configured prefix length. So, the wrong configuration of access devices is avoided.

7. Importance of “ge” and “le” parameters in an IPv6 ACL entry:

A user can optionally configure “ge” (greater than or equal to) and “le” (lesser than or equal to) parameters while configuring an IPv6 ACL entry. If the prefix advertised in a packet matches the configured prefix in an IPv6 ACL entry, and “ge” and “le” values are configured (not default) for that IPv6 ACL entry:

- The packet will be allowed to go through only if the prefix-length in the packet is within the range of configured “ge” and “le” values.
- If prefix lengths in the packet are not within the configured range of “ge” and “le” values (non-default values), then the packets would be considered as no match for that IPv6 ACL entry and search for matching IPv6 ACL entry continues within that IPv6 ACL.
- If no ge and le values are configured, those values by default are set to configured prefix length in that IPv6 ACL entry.
- ge and le values are allowed only if they are greater than configured prefix.
- When both are configured (not default values), ge value should always be smaller than le value.

These configurations provide more control over the advertised prefixes in RA or DHCPv6 packets.

8. As “ge” and “le” values are valid only for advertised prefixes, they will not be applied to IPv6 addresses, which are not prefixes. For such addresses, prefix match is considered as match for that IPv6 ACL entry and the corresponding action of that ACL entry is applied on that packet. “ge” and “le” configurations are irrelevant for the following:

- IPv6 source address in RA packet
- IPv6 source address in packets from DHCPv6 server (like DHCPv6 advertise, DHCPv6 reply)
- IPv6 address (temporary or non-temporary) advertised in packets from DHCPv6 server. For example, IPv6 addresses advertised in IANA option of DHCPv6 reply packets

9. Order of packet validations:

In RA or DHCPv6 packets received at the CP for FHS processing, the following order of processing is carried out:

- a. Packet parsing
- b. Checking for presence of IPv6 fragment header

- c. Checking if packets are RA packets or DHCPv6 packets from server (Advertise, Reply, Reconfigure, Relay-Reply)
- d. Basic validations:
 - Non-Link-Local source IPv6 address (only for RA packets)
 - L4 length validations
 - Checksum validations
- e. If an RA Guard or DHCPv6 Guard policy is attached to a port:
 - MAC ACL validations (if configured) (Only for RA packets)
 - IPv6 source address ACL validation (if configured)
 - IPv6 prefix ACL validations (if configured)
 - Other packet parameter validations like:
 - Managed config flag (RA)
 - ICMP hop limit (RA)
 - Router preference (RA)
 - Server preference (DHCPv6)

If any of these validations fail or if action associated with a match ACL entry indicates to DROP (or default drop if ACL is attached to corresponding policy but packet does not match any ACL entry in that ACL), then the packets are dropped and corresponding statistics are updated. If all these pass or actions related to all matched ACL entries are PERMIT, then the packet is allowed to go through.

- 10. Longest prefix match: If a packet matches multiple entries in an ACL, then the action associated with an entry with longest prefix match would be applied on the packet.
- 11. If a port is configured as untrusted (“host” as device role for RA Guard or “client” as device role for DHCPv6 Guard), all the FHS trusted traffic (RA packets for RA Guard or packets from DHCPv6 server for DHCPv6 Guard) are dropped in data path itself. Also for such drops, statistics are not incremented.

If a port is neither configured as trusted nor untrusted, then the FHS traffic (RA packets or DHCPv6 packets from DHCPv6 server) is switched as if FHS is not present.

- 12. Creation of FHS port policy mappings:

Until, and unless, any of the FHS parameters are configured on a port, port policy mappings are not created and thus with no port to policy mapping configured, the system does not display any entries while listing port policy mappings using the command **show ipv6 fhs port-policy**.

- 13. If a RA Guard or DHCPv6 Guard policy is attached to any of the ports, deletion of such policy is not allowed. In the contrary, to delete an RA Guard or DHCPv6 Guard policy, those policies need to be detached from all the ports in the switch. However, modification of an RA Guard or DHCPv6 Guard policy is allowed even if it is attached to ports.
- 14. If a MAC or IPv6 ACL is attached to an RA Guard or DHCPv6 Guard policy, you cannot delete the ACL itself. You can delete the entries from this policy even if it is attached to any policy. At least one entry needs to exist in a MAC or IPv6 ACL; you cannot delete the last entry in that ACL if that ACL is attached to any RA Guard or DHCPv6

Guard policy. You must detach that ACL from all the policies to delete that ACL. However, you can update the entries in that ACL even if it is attached to a policy.

If a port is configured as trusted ("Server" port for DHCPv6 Guard and "Router" port for RA Guard), then only one can attach a DHCPv6 Guard or RA Guard policy to that port. In the contrary, if any policy is attached to a port, the port role cannot be changed from trusted ("Server" port for DHCPv6 Guard and "Router" port for RA Guard) to other role ("Client" port for DHCPv6 Guard, "Host" port for RA Guard or "None" for both) until that policy is not detached from port.

DHCP Snooping and Neighbor Discovery inspection

DHCP Snooping

DHCP Snooping is a Layer 2 security feature, that provides network security by filtering untrusted DHCP messages received from the external network causing traffic attacks within the network. DHCP Snooping is based on the concept of trusted versus untrusted switch ports. Switch ports configured as trusted can forward DHCP Replies, and the untrusted switch ports cannot. DHCP Snooping acts like a firewall between untrusted hosts and DHCP servers.

The switch supports:

- DHCP Snooping for both IPv4 and IPv6.
- Neighbor Discovery (ND) inspection for IPv6.

Security is critically important in an access network because various devices can connect to an access network that may not be administratively controlled by a single administrator. Stateless Address Autoconfiguration (SLAAC) and Duplicate Address Detection (DAD) mechanisms used by IPv6 are more vulnerable to attacks from a malicious user. If any person, intentionally or unintentionally, configures an IP address on the device interface wrongly and advertises that IP address as one's own address during DAD mechanism initiated by other device, DAD initiated devices cannot assign this address. If a malicious user replies to all the DAD IP addresses as own address, none of the devices in the access network can assign any IP addresses to their interfaces. Thus, DoS attacks can be easily carried out by the malicious user making the entire network unfunctional. In another kind of attack, a malicious user can try to poison the neighbor cache of a host by sending ND packets with bogus MAC address which is learnt by other hosts into their neighbor table. Due to the infiltration of the bogus MAC address in the host's neighbor table, the packets destined to its neighbor is sent to the bogus MAC address and is eventually dropped or received by an unintended host.

In general, these kinds of attacks are carried out by sending different Neighbor Discovery (ND) packets – either through solicited ND packet exchanges or as a result of unsolicited ND packet exchanges triggered due to an event like the expiry of ND timers. These packets carry interface IP address information and link-layer address information. Other devices use this information to build their neighbor table for forwarding traffic to or through the malicious device. As part of ND inspection mechanism, ND (specifically, NS, NA, and redirect) packets from only trusted hosts are allowed to pass through and the packets from untrusted hosts are dropped in the switch itself. Other network devices can safely use ND mechanisms for correctly assigning IP address to their interfaces resulting in a smooth traffic flow.

For validating the ND packets, the switch must first learn the trusted information by various mechanisms and store the information in a DHCP binding table. If the switch receives ND packets on an untrusted port, the packets are validated against entries in the DHCP binding table. If the ND packets pass the validation, the packets are forwarded. If the packets fail the validation, they are dropped in the switch itself. This process avoids invalid NA packets from propagating beyond the access switch.

DHCP Snooping and ND inspection feature protects the network from the following types of attacks:

- **User misconfigurations:** Host assigns an address which should not be used by the recipient device. ND inspection blocks this address in the access switch because binding entry does not exist for that address for that host.
- **DAD spoofing:** Malicious user claims that the address is taken even if it is not.
- **NUD spoofing:** Malicious host responds to NUD NS packets indicating that the address is still reachable via that host even if that neighbor is actually not reachable.
- **ND cache poisoning:** Malicious user sends different (invalid) link-layer addresses for a target IP address causing other hosts in the network to program bogus MAC for a given IP neighbor, as a result of which, the traffic gets discarded or misused by malicious host.

DHCP Binding Table

DHCP Snooping builds and maintains a binding table, this binding table contains the MAC address, IP address, lease time, binding type, VLAN number, and port information that correspond to the local untrusted ports of the switch. When the switch receives a DHCPRELEASE or DHCPDECLINE broadcast message, DHCP Snooping performs a lookup of the MAC address in the binding table to determine if the port information in the binding table matches the port on which the message was received. If the port information matches, the DHCP packet is forwarded, otherwise it is dropped.

Trust Bindings

A switch enabled with the Neighbor Discovery inspection feature allows NA packets through, if the packets are from a trusted host. To allow or deny Neighbor Advertisement (NA) packets, trust bindings must be established using following methods:

- Configuring the port connected to a device (or host) as trusted.
- Building a DHCP binding table which contains entries from trusted devices (or hosts) only. This DHCP binding table is used for validating NA packets.

This method of trust binding involves 2 processes:

- IP address learning (snooping) process

In this process an IP address is learnt through a trusted means and a DHCP binding table is built. The switch supports the DHCP binding table entry learning by:

- Statically configuring the entries
 - Dynamically learning by DHCP Snooping packets
- NA packet validation (inspection) process

This process uses the DHCP binding table entries which are populated as part of IP address learning process to validate the incoming NA packets.

After the DHCP binding tables are built, the information gathered using trust binding is used to validate the ND packets. If the ND packets cannot be validated using this information, they are considered as packets received from an un-trusted host and are dropped by the switch.

Restrictions

In addition to the FHS restrictions, DHCP Snooping and ND inspection have the following restrictions:

- DHCPv6 Snooping entries are not displayed in an SPB network. The Administrator must add manual entries.
- Link-local address validation is not supported under ND inspection. Thus, an First Hop Security (FHS) enabled switch is vulnerable to attackers who try to attack with link-local addresses.
- As a 5-second timer is used to cleanup expired DHCP binding table entries, the expired DHCP binding table entries can remain in the DHCP binding table for up to 5 seconds after they expire.
- If an FHS-enabled switch is rebooted, all the dynamically-learned binding entries get flushed and those entries need to be re-learned for ND inspection to pass. However, when the switch is rebooted, DHCP clients connected to it do not re-initiate DHCP learning, due to which, the switch cannot learn these assigned IP addresses. As a result, ND inspection fails for these addresses. To overcome this problem either DHCP client must learn the IP address again through DHCP mechanisms or the administrator must add static entries for these addresses.
- For IPv6, DHCP binding table entries learned through DHCP are not removed from the DHCP table on DHCP clients that release these addresses. The administrator must manually remove these entries after the addresses are released.
- A dynamic DHCP binding table entry is learned only using the DHCP mechanism. For other modes of address configuration on the host, a relevant DHCP binding table entry must be configured on the FHS switch so that ND packets from such host are not blocked due to ND inspection processing.
- The switch deletes DHCP-Snooping static bindings if you use CLI to remove the port from the associated default VLAN ID. This deletion also occurs on an EAP port when the port dynamically moves from the default VLAN ID, Guest VLAN, or Fail Open VLAN.

- DHCP Snooping is not supported on:
 - DHCP Relay switch
 - Etree
 - Private VLANs
- DHCP Snooping is supported on Split Multi-Link Trunking (SMLT) only if the SMLT ports are DHCP Snooping trusted.
- As a best practice, do not configure DHCP Snooping on core switches.
- Configure **ip dhcp-snooping trusted** only on the port that connects to the DHCP Server.
- You can configure DHCP Snooping on separate switches in the following scenarios:
 - on the switch where the DHCP server connects on the DHCP server VLAN.
 - on the switch where the DHCP client connects on the DHCP client VLAN(s).
- You can configure DHCP Snooping only on the switch where the DHCP server connects and only on a DHCP server VLAN.
- If DHCP clients connect to the same switch as the DHCP server, you can configure DHCP Snooping on the client VLANs.
- A best practice is to connect the DHCP server and DHCP clients to different switches.

IP Source Guard

Table 176: IP Source Guard product support

Feature	Product	Release introduced

IP Source Guard (IPSG) is a Layer 2 port-to-port feature that works closely with DHCP Snooping. It prevents IP spoofing by allowing only IP addresses obtained using DHCP Snooping. When you enable IPSG on an untrusted port with DHCP Snooping enabled, an IP filter is automatically created or deleted for that port based on the information stored in the corresponding DHCP Snooping binding table entry. When a connecting client receives a valid IP address from the DHCP server, the filter installed on the port allows traffic only from that assigned IP address.

You can configure IPSG on a port using the command line interface (CLI), the Enterprise Device Manager (EDM), or SNMP.

**Note**

The switch supports configuration of IP Source Guard for both IPv4 and IPv6 addresses.

The following table shows how IPSG works with DHCP Snooping.

Table 177: IP Source Guard and DHCP snooping

IP Source Guard configuration state	DHCP snooping configuration state	DHCP snooping Binding Entry action (untrusted ports)	IP Source Guard action
change from disabled to enabled	enabled	creates a binding entry	creates a filter for the IP address using the IP address from the binding table entry
enabled	enabled	creates a binding entry	creates a filter for the IP address using the IP address from the binding table entry

Table 177: IP Source Guard and DHCP snooping (continued)

IP Source Guard configuration state	DHCP snooping configuration state	DHCP snooping Binding Entry action (untrusted ports)	IP Source Guard action
enabled	enabled	deletes a binding entry	deletes the IP filter and installs a default filter to block all IP traffic on the port
enabled	enabled	deletes binding entries when one of the following conditions occur: <ul style="list-style-type: none"> • a DHCP release packet is received • the port link is down • the lease time has expired • the port is removed from the VLAN • the VLAN is deleted • the port is set as trusted • the binding entries are manually deleted 	deletes the corresponding IP filter and installs a default filter to block all IP traffic
change from enabled to disabled	enabled	not applicable	deletes the installed IP filter for the port
disabled	enabled	creates a binding entry	
disabled	enabled	deletes a binding entry	

IP Source Guard General Guidelines

The following provides a list of guidelines to follow if you use IP Source Guard (IPSG):

- You can enable IP Source Guard (IPSG) only on a port that is DHCP Snooping and Dynamic ARP Inspection untrusted.
- The port must be a member of a VLAN. DHCP Snooping must be enabled globally and on the VLAN. You must also enable Dynamic ARP Inspection on the same VLAN.
- You cannot enable IPSG on MLT, SMLT, DMLT or LAG ports.
- You cannot enable IPSG on a router port.
- You cannot enable IPSG on ports that are members of a private VLAN.

- You cannot remove a port that is IPSG-enabled from a VLAN. Similarly, you cannot delete a VLAN that has at least one port that is IPSG-enabled.
- A maximum of 10 IP addresses are allowed on each IPSG-enabled port. Correspondingly, a maximum of 10 IP filters are automatically created for each of those ports. When this number is reached, no more filters are set up and all traffic is dropped.

For more information about the supported number of IP filters on each platform, see *Fabric Engine Release Notes*.

Layer 2 Security Configuration Using the CLI

Use the following sections to help you configure Layer 2 security features and protect the network by mitigating various types of attacks, using the Command Line Interface (CLI).

For IPv4 deployments, configure:

- DHCP Snooping
- Dynamic ARP Inspection
- IP Source Guard for IPv4 addresses

For IPv6 deployments, configure:

- First Hop Security (FHS)

**Note**

FHS does not solve all cases of denial of services like blocking flooding of the IPv6 messages.

- DHCP Snooping and IPv6 Neighbor Discovery Inspection
- IP Source Guard for IPv6 addresses

DHCP Snooping Configuration Using CLI

The following section provides procedures to configure DHCP Snooping using the CLI.

Enable or Disable DHCP Snooping globally

Use the following procedure to enable DHCP Snooping globally. If DHCP Snooping is globally disabled, the switch forwards DHCP reply packets to all required ports, both trusted or untrusted.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable DHCP Snooping globally:
`ip dhcp-snooping enable`
3. Disable DHCP Snooping globally:
`no ip dhcp-snooping enable`

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ip dhcp-snooping enable
```

Variable Definitions

The following table defines parameters for the **ip dhcp-snooping** command.

Variable	Value
<i>enable</i>	Enables or disables DHCP Snooping globally. By default, DHCP Snooping is disabled.

Enable or Disable DHCP Snooping on a VLAN

Use the following procedure to configure DHCP Snooping on a specific VLAN. If DHCP Snooping is globally disabled, the switch forwards DHCP reply packets (received on trusted or untrusted ports) to all ports.

If you enable DHCP Snooping globally, the agent determines whether to forward DHCP reply packets based on the DHCP Snooping mode of the VLAN and trusted state of the port.

Note

You cannot enable DHCP Snooping on Private VLANs (E-Tree) and SPBM B-VLANs.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. Enter VLAN Interface Configuration mode:
`enable`
`configure terminal`
`interface vlan <1-4059>`
2. Enable DHCP Snooping on the VLAN:
`ip dhcp-snooping enable`
3. Disable DHCP Snooping on the VLAN:
`no ip dhcp-snooping enable`

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 5
Switch:1(config-if)#ip dhcp-snooping enable
```

Variable Definitions

The following table defines parameters for the **ip dhcp-snooping** command.

Variable	Value
<i>enable</i>	Enables or disables DHCP Snooping on the specified VLAN.

Configure Trusted and Untrusted Ports

Use the following procedure to set the trust factor associated with a port for DHCP Snooping. By default, the trust factor is set to untrusted.

Note

For ports that are members of an MLT, DHCP Snooping must be configured using the MLT configuration mode.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]} or interface mlt <1-512>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the trust factor for the port:

```
ip dhcp-snooping <trusted|untrusted>
```

Note

Configure **ip dhcp-snooping trusted** on a DHCP server switch port only.

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#ip dhcp-snooping trusted
```

Variable Definitions

The following table defines parameters for the **ip dhcp-snooping** command.

Variable	Value
<trusted untrusted>	Specifies the trust factor of the port for DHCP Snooping. Note: Configure ip dhcp-snooping trusted on a DHCP server switch port only.

Display DHCP Snooping Global Configuration

Use the following procedure to display the global status of DHCP Snooping configuration.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the global configuration:
show ip dhcp-snooping

Example

```
Switch:1>show ip dhcp-snooping
=====
                        Dhcp Snooping General Info
=====
Dhcp Snooping                : Enabled
=====
```

Display DHCP Snooping Interface Information

Use the following procedure to view the DHCP Snooping interface information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display DHCP Snooping brouter port information:
show ip dhcp-snooping interface [gigabitEthernet [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]} [vrf WORD<1-16> | vrfids WORD<0-512>] | <1-4059> [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]} [vrf WORD<1-16> | vrfids WORD<0-512>] | vrf WORD<1-16> | vrfids WORD<0-512>] | vrf WORD<1-16> | vrfids WORD<0-512>]]
3. Display DHCP Snooping VLAN information:
show ip dhcp-snooping vlan <1-4059>
4. Display DHCP Snooping information for specific VRF name:
show ip dhcp-snooping vrf WORD<1-16>
5. Display DHCP Snooping information for specific VRF ID:
show ip dhcp-snooping vrfids WORD<0-512>

Examples

```
Switch:1>show ip dhcp-snooping interface gigabitEthernet
```

```
=====
```

Dhcp Snooping Interface Info

Add Static Entries to DHCP Snooping Binding Table

Use the following procedure to add devices with a specified MAC address to the DHCP Snooping binding table.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Add the static entry to the DHCP Snooping binding table:

```
ip dhcp-snooping binding <1-4059> 0x00:0x00:0x00:0x00:0x00:0x00 ip
```

```
{A.B.C.D} port {slot/port[/sub-port]} [expiry <0-2147483646>]
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)# ip dhcp-snooping binding 1 00-14-22-01-23-45 ip 10.10.10.01 port 1/2
expiry 2
```

Variable Definitions

The following table defines parameters for the **ip dhcp-snooping binding** command.

Variable	Value
<1-4059>	Specifies the VLAN ID.
0x00:0x00:0x00:0x00:0x00:0x00	Specifies the MAC address of the DHCP client.
ip {A.B.C.D}	Specifies the IP address of the DHCP client.
port {slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/all][all]}	Specifies the switch port to which the DHCP client connects.
expiry <0-2147483646>	Specifies the expiry time (in seconds) for the DHCP client.

Clear Entries from DHCP Snooping Binding Table

Use the following procedure to clear entries (static or dynamic) from the DHCP Snooping binding table.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Enter:

```
clear ip dhcp-snooping binding [dynamic|static]
```

Example

```
Switch:1>enable
Switch:1#clear ip dhcp-snooping binding static
```

Variable Definitions

The following table defines parameters for the **clear ip dhcp-snooping binding** command.

Variable	Value
<i>static</i>	Clears static entries from the DHCP Snooping binding table.
<i>dynamic</i>	Clears dynamic entries from the DHCP Snooping binding table.

Display DHCP Snooping Binding Table Information

Use the following procedure to display the DHCP Snooping binding table, you can filter the entries displayed based on the type, port, or VLAN.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display all binding entries:

```
show ip dhcp-snooping binding
```
3. Display binding entries based on the MAC address or IP address:

```
show ip dhcp-snooping binding address [0x00:0x00:0x00:0x00:0x00:0x00 | {A.B.C.D}]
```
4. Display binding entries configured on the ports:

```
show ip dhcp-snooping binding interface [gigabitEthernet{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```
5. Display binding entries configured on the VLANs:

```
show ip dhcp-snooping binding vlan <1-4059>
```
6. Display binding entries configured on a specific VRF:

```
show ip dhcp-snooping binding vrf WORD<1-16>
```
7. Display binding entries configured on a specific VRF ID:

```
show ip dhcp-snooping binding vrfids WORD<0-512>
```
8. Display a summary of the DHCP Snooping binding table:

```
show ip dhcp-snooping binding summary [<1-4059>] [vrf WORD<1-16>] [vrfids WORD<0-512>] [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```
9. Display binding entries based on the type of entry:

```
show ip dhcp-snooping binding type [dynamic|static]
```

Example

```
Switch:1>show ip dhcp-snooping binding
```

DHCP Snooping Binding Table							
MAC ADDRESS	IP ADDRESS	PORT NUM	VLAN ID	VRF NAME	LEASE TIME	EXPIRY TIME	ENTRY TYPE
23-74-44-33-15-33	192.0.2.40	225	1	13446	0	0	Static

```

Dynamic ARP Inspection Configuration Using CLI

The following section provides procedures to configure Dynamic ARP Inspection (DAI) using CLI.

Enable or disable Dynamic ARP Inspection on a VLAN

You must enable DAI separately for each VLAN. When you enable DAI on a specific VLAN, the ARP packets are captured and inspected on that VLAN. DAI is disabled by default.

Note

DAI cannot be enabled on Private VLANs (E-Tree) and SPBM B-VLANs.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```

2. Enable DAI on the VLAN:

```
ip arp-inspection enable
```

3. Disable DAI on the VLAN:

```
no ip arp-inspection enable
```

Example

```

Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 5
Switch:1(config-if)#ip arp-inspection enable

```

Variable Definitions

The following table defines parameters for the **ip arp-inspection** command.

Variable	Value
<i>enable</i>	Enables or disables DAI on the specified VLAN.

Configure Trusted and Untrusted Ports

Use the following procedure to set the trust factor associated with a port for DAI. By default, the trust factor is set to untrusted.

Note

For ports that are part of an MLT, DAI must be configured using the MLT configuration mode.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]  
[,...][slot/all][all]} OR interface mlt <1-512>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Set the trust factor for the port:

```
ip arp-inspection <trusted|untrusted>
```

Example

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface gigabitEthernet 1/2  
Switch:1(config-if)#ip arp-inspection trusted
```

Variable Definitions

The following table defines parameters for the **ip arp-inspection** command.

Variable	Value
<i><trusted untrusted></i>	Specifies the trust factor of the port for DAI.

Display Dynamic ARP Inspection Interface Information

Use the following procedure to view the DAI interface information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display DAI brouter port information:

```
show ip arp-inspection interface [ gigabitEthernet [ {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]] [ vrf WORD<1-16> | vrfids WORD<0-512> ] | <1-4059> [ {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]] [ vrf WORD<1-16> | vrfids WORD<0-512> ] | vrf WORD<1-16> | vrfids WORD<0-512> ] ]
```
3. Display DAI VLAN information:

```
show ip arp-inspection vlan <1-4059>
```
4. Display DAI information for specific VRF name:

```
show ip arp-inspection vrf WORD<1-16>
```
5. Display DAI information for specific VRF ID:

```
show ip arp-inspection vrfids WORD<0-512>
```

Example

```
Switch:1>show ip arp-inspection interface gigabitEthernet 1/2
```

Arp Inspection Port Info

```

FHS configuration

Configure IPv6 FHS features to enable IPv6 link security and management over the Layer 2 links.

Enable or Disable FHS Globally

About This Task

You must enable First Hop Security globally for RA Guard or DHCPv6 Guard to be operational.

Enabling FHS globally installs the required filters for FHS. Disabling FHS, uninstalls these filters. By default, FHS is disabled.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable First Hop Security globally:

```
ipv6 fhs enable
```
3. Disable First Hop Security globally:

```
no ipv6 fhs enable
```

OR

```
default ipv6 fhs enable
```

Manage the FHS IPv6 Access List

About This Task

You can create an FHS IPv6 access list or add IPv6 prefixes to an existing IPv6 access list.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Create an FHS IPv6 access list or add IPv6 prefixes to an existing IPv6 access list:

```
ipv6 fhs ipv6-access-list [WORD<1-64>] [WORD<0-46>] [ge<0-128>] [le<0-128>] [mode <allow | deny>]
```
3. Delete an FHS IPv6 access list or delete a particular IPv6 prefix from the IPv6 access list:

```
no ipv6 fhs ipv6-access-list [WORD<1-64>] [WORD<0-46>]
```
4. Set the ge/le values and mode of the FHS IPv6 access list to default value:

```
default ipv6 fhs ipv6-access-list [WORD<1-64>] [WORD<0-46>] [ge|le|mode]
```

Example

```
Switch>enable
Switch#config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#ipv6 fhs ipv6-access-list ipv6_acl_1 fe80::221:2fff:fe31:5376/64
Switch(config)#
```

Variable Definitions

The following table defines parameters for the **ipv6 fhs ipv6-access-list** command.

Variable	Description
<i>WORD<1-64></i>	Specifies the IPv6 access list name.
<i>WORD<0-46></i>	Specifies the IPv6 address or the prefix length to be added to the IPv6 access list.
<i>ge <0 -128></i>	<p>Specifies the minimum value of prefix length advertised in prefix information of RA or DHCPv6 packets.</p> <p>By default, the value is equal to the configured prefix length.</p> <p>Note: If you manually configure the value, ensure that it is greater than the configured prefix length. Also ensure, the ge value is always less than the le value.</p>

Variable	Description
<code>le <0 -128></code>	Specifies the maximum value of prefix length advertised in prefix information of RA or DHCPv6 packets. By default, the value is equal to the configured prefix length. Note: If you manually configure the value, ensure that it is greater than the configured prefix length.
<code>mode <allow deny></code>	Specifies the access mode. By default, the value is allow.

Display FHS IPv6 Access List Information

About This Task

Displays the current FHS IPv6 access list information.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display the current FHS IPv6 access list information:
`show ipv6 fhs ipv6-access-list [WORD<1-64>]`

Example

```
Switch:1# show ipv6 fhs ipv6-access-list

=====
                        IPv6 FHS Access List Table Info
=====
                                MASK-RANGE
ACC-LIST-NAME      IPV6-PREFIX      MASK FROM TO      MODE
-----
v6_acl1            1:0:0:0:0:0:1      64   64   64   Allow
v6_acl2            1:0:0:0:0:0:1      64   64   64   Allow
-----

All 2 out of 2 Total Num of ipv6 access list entries displayed
```

Manage the FHS MAC Access List

About This Task

You can create an FHS MAC access list or add MAC addresses to an existing MAC access list.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`

2. Create an FHS MAC access list or add MAC addresses to an existing MAC access list:

```
ipv6 fhs mac-access-list WORD<1-64> <0x00:0x00:0x00:0x00:0x00:0x00>
[mode <allow | deny>]
```
3. Delete an FHS MAC access list or delete a particular MAC address from the MAC access list:

```
no ipv6 fhs mac-access-list WORD<1-64> <0x00:0x00:0x00:0x00:0x00:0x00>
```
4. Set the MAC ACL mode to its default value:

```
default ipv6 fhs mac-access-list WORD<1-64>
<0x00:0x00:0x00:0x00:0x00:0x00> [mode]
```

Variable Definitions

The following table defines parameters for the **ipv6 fhs mac-access-list** command.

Variable	Description
<i>WORD<1-64></i>	Specifies the MAC access list name.
<i><0x00:0x00:0x00:0x00:0x00:0x00></i>	Specifies the MAC address to be added or deleted.
<i>mode <allow deny></i>	Specifies the access mode. By default, the value is Allow

Display FHS MAC Access List Information

About This Task

Displays the current FHS MAC access list information.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Display the current FHS MAC access list information:

```
show ipv6 fhs mac-access-list [WORD<1-64>]
```

Example

```
Switch#show ipv6 fhs mac-access-list
=====
IPv6 FHS Mac Access List Table Info
=====
ACC-LIST-NAME      MAC-ADDRESS      ACL-MODE
-----
List2              10:20:30:40:50:60    Allow
                   00:11:22:33:44:55    Deny
-----
All 1 out of 1 Total Num of MAC access list entries displayed
=====
```

Display Current FHS Configuration

About This Task

Displays the current FHS configuration.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display the current FHS configuration:
show ipv6 fhs port-policy {slot/port[-slot/port][,...][slot/all][all]}

Example

```
Switch:1#show ipv6 fhs port-policy
```

```
=====
                        IPv6 FHS Port Policy Info
=====
PORT  DHCPG-DEVICE-ROLE  DHCPG-POLICY          RAG-DEVICE-ROLE  RAG-POLICY
-----
1/1   Server             dhcp_poll             Router           ra_poll
-----
```

```
All 1 out of 1 Total Num of fhs port policy entries displayed
```

DHCPv6 Guard Policy Configuration

DHCPv6 Guard policy blocks DHCPv6 reply and advertisement messages that originate from unauthorized DHCPv6 servers and relay agents that forward DHCPv6 packets from servers to clients.

Enable or Disable DHCPv6 Guard Globally

About This Task

Enabling DHCPv6 Guard globally installs filters on the configured interfaces. By default, DHCPv6 Guard is disabled.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Enable FHS globally:
ipv6 fhs enable
3. Enable DHCPv6 Guard globally:
ipv6 dhcp-guard enable
4. Disable DHCPv6 Guard globally:
no ipv6 dhcp-guard enable
5. Set DHCPv6 Guard to its default value:
default ipv6 dhcp-guard enable

Manage the DHCPv6 Guard Policy

About This Task

Configure or modify the DHCPv6 Guard policy.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Create a DHCPv6 Guard policy:

```
ipv6 dhcp-guard policy WORD<1-64>
```
3. Delete a DHCPv6 Guard policy:

```
no ipv6 dhcp-guard policy WORD<1-64>
```

Note

You cannot delete a policy that is already attached to a port.

Variable Definitions

The following table defines parameters for the **ipv6 dhcp-guard policy** command.

Variable	Description
<i>WORD<1-64></i>	Specifies the created or deleted DHCPv6 Guard policy name.

Attach a DHCPv6 Guard Policy to a Port

About This Task

Applies a DHCPv6 Guard policy to a specific interface.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]
```

```
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Apply a DHCPv6 Guard policy.

```
ipv6 fhs dhcp-guard attach-policy WORD<1-64>
```
3. Detach a DHCPv6 Guard policy from an interface.

```
no ipv6 fhs dhcp-guard attach-policy
```

OR

```
default ipv6 dhcp-guard attach-policy
```

4. Enable device role verification attached to the port. By default, router is selected.

```
ipv6 fhs dhcp-guard device-role {client|server} attach-policy
WORD<1-64>
```

Note

A DHCPv6 Guard policy can be attached to a port only if the device-role configured on that port is 'server'.

Variable Definitions

The following table defines parameters for the **ipv6 fhs dhcp-guard attach-policy** and **ipv6 fhs dhcp-guard device-role** command.

Variable	Description
<i>WORD<1-64></i>	Specify the name of the DHCPv6 Guard policy to be attached or detached.
<i>{client server}</i>	Sets the DHCPv6 Guard device role as client or server.

Configure DHCPv6 Guard in dhcp-guard Mode

About This Task

Configures DHCPv6 Guard under dhcp-guard mode.

Procedure

1. Enter DHCP-guard Configuration mode.

```
enable
```

```
configure terminal
```

```
ipv6 fhs dhcp-guard policy WORD<1-64>
```

2. Specify IPv6 access list to verify IPv6 source address of DHCPv6 packets..

```
match server access-list <ipv6-access-list-name>
```

3. Remove DHCPv6 Guard filtering for the sender's IPv6 addresses.

```
no match server access-list
```

OR

```
default match server access-list
```

4. Specify IPv6 prefix list to verify advertised prefixes.

```
match reply prefix-list <ipv6-prefix-list-name>
```

5. Remove DHCPv6 Guard filtering for advertised prefixes.

```
no match reply prefix-list
```

OR

```
default match reply prefix-list
```

6. Specify the minimum limit for verification of the advertised preference.

```
preference min-limit <0-255>
```
7. Set the minimum limit for verification of the advertised preference to its default value.

```
default preference min-limit
```
8. Specify the maximum limit for verification of the advertised preference.

```
preference max-limit <0-255>
```
9. Set the maximum limit for verification of the advertised preference to its default value.

```
default preference max-limit
```

Variable Definitions

The following table defines parameters for the **dhcp-guard** configuration mode commands.

Variable	Description
match server access-list <i><ipv6-access-list-name></i>	<p>Enables verification of the sender's IPv6 address in inspected messages from the configured authorized device source access list specified.</p> <p>Note: If the access-list is not attached, the IPv6 source address in DHCPv6 packet is not validated. If the list is attached and it does not match any entries in IPv6 access list, the switch drops the DHCPv6 packet. If you wish to change this behavior, add an entry with IPv6 prefix "0::0/0" with the Allow option, which changes the default drop to default Allow.</p>
{ no default } match server access-list	Removes the sender's IPv6 address based DHCPv6 Guard filtering.
match reply prefix-list <i><ipv6-prefix-list-name></i>	<p>Enables verification of the advertised prefixes in DHCPv6 reply messages from the configured authorized prefix list. If prefix-list is not configured, this check is bypassed.</p> <p>Note: If the access-list is not attached, the inspection does not occur. If the list is attached and advertised IPv6 address does not match any IPv6 prefixes in the list, the switch drops the DHCPv6 packet. If you wish to change this behavior, add an IPv6 access list entry with prefix 0::0/0 with the Allow option, which changes the default drop to default Allow.</p>
{ no default } match reply prefix-list	Removes the advertised prefix-based DHCPv6 Guard filtering.

Variable	Description
<code>preference min-limit<0-255></code>	Enables validation of advertised preference (in preference option) to check if it is greater than the specified limit. If preference is not specified, this field in the packet is not validated. While changing the preference limit, ensure the maximum limit is greater than the minimum limit.
<code>default preference min-limit</code>	Sets the specified limit to its default value. By default, the value is 0.
<code>preference max-limit<0-255></code>	Enables validation of advertised preference (in preference option) to check if it is less than the specified limit. If preference is not specified, this field in the packet is not validated. Note: The preference value in the packet is not validated if both minimum and maximum values are zero.
<code>default preference max-limit</code>	Sets the specified limit to its default value. By default, the value is 0.

Display the DHCPv6 Guard Policy

About This Task

Displays DHCPv6 Guard policy information for all the configured DHCPv6 Guard policies or a particular policy.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display DHCPv6 Guard policy information:

```
show ipv6 fhs dhcp-guard policy WORD<1-64>
```

Example

```
Switch:1# show ipv6 fhs dhcp-guard policy
```

```
=====
=====
                                IPv6 DHCP Guard Policy Info
=====
=====

-----
-----
All 1 out of 1 Total Num of dhcp-guard stats entries displayed
```

Variable Definitions

The following table defines parameters for the `show ipv6 fhs dhcp-guard policy` command.

Variable	Description
<i>WORD<1-64></i>	Displays DHCPv6 Guard policy information for all the configured DHCPv6 Guard policies. Policy name is an optional parameter. If policy name is provided, only the DHCPv6 Guard policy of the specified policy-name is displayed.

RA Guard Configuration

IPv6 RA Guard provides support to the administrator to block or reject unwanted RA Guard messages that arrive at the network switch platform. The routers use Router Advertisements (RAs) to announce themselves on the link. The RA Guard feature analyzes these RAs and filters out bogus RAs sent by unauthorized routers. The RA Guard feature compares configuration information on the Layer 2 device with the information found in the received RA frame. After the Layer 2 device validates the content of the RA packet against the configuration, it forwards the RA to its destination. If the RA packet validation fails, the RA is dropped.

Enable or Disable RA Guard Globally

About This Task

Enables RA Guard globally. By default, RA Guard is disabled.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable FHS globally:
`ipv6 fhs enable`
3. Enable RA Guard globally:
`ipv6 fhs ra-guard enable`
4. Disable RA Guard globally:
`no ipv6 fhs ra-guard enable`
5. Set the RA Guard to its default value:
`default ipv6 fhs ra-guard enable`

Manage the RA Guard Policy

About This Task

Configure or modify RA Guard policy. This command also enables the RA Guard configuration mode.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Create the RA Guard policy:
`ipv6 fhs ra-guard policy WORD<1-64>`
3. Delete the RA Guard policy:
`no ipv6 fhs ra-guard policy WORD<1-64>`

Note

You cannot delete a policy that is attached to a port.

Variable Definitions

The following table defines parameters for the **ipv6 fhs ra-guard policy** command.

Variable	Description
<i>WORD<1-64></i>	Specifies the name of the RA Guard policy to be created or deleted. This is a mandatory parameter in this command.

Configure RA Guard on an Interface

About This Task

Attaches or detaches a RA Guard policy on the specific interface.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:
`enable`
`configure terminal`
`interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]`
`[,...][slot/all][all]}`

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Apply a RA Guard policy.
`ipv6 fhs ra-guard attach-policy WORD<1-64>`

Note

RA Guard device-role on the port has to be configured as 'router' before attaching any RA Guard policy to the port. If device-role on the port is not 'router', this command will fail with an appropriate error message.

- Detach a RA Guard policy from an interface.

```
no ipv6 fhs ra-guard attach-policy
```

OR

```
default ipv6 fhs ra-guard attach-policy
```

- Enable device role verification attached to the port.

```
ipv6 fhs ra-guard device-role {router|host} attach-policy WORD<1-64>
```

Note

A DHCPv6 Guard policy can be attached to a port only if the device-role configured on that port is 'server'.

Variable Definitions

The following table defines parameters for the **ipv6 fhs ra-guard attach-policy** and **ipv6 fhs ra-guard device-role** command.

Variable	Description
<i>WORD<1-64></i>	Specifies the name of the RA Guard policy to be attached or detached.
<i>{host router}</i>	Sets the RA Guard device role as host or router.

Configure RA Guard in RA Guard Mode

About This Task

Configures RA Guard in the RA Guard configuration mode.

Procedure

- Enter RA Guard Configuration mode.

```
enable
```

```
configure terminal
```

```
ipv6 fhs ra-guard policy WORD<1-64>
```

- Configure the filter to match the IPv6 prefixes advertised in RA packets.

```
match ra-prefix-list WORD<1-64>
```

- Remove RA Guard filtering for the advertised prefixes.

```
no match ra-prefix-list
```

OR

```
default match ra-prefix-list
```

- Configure the filter to match the source MAC address of RA packets.

```
match ra-macaddr-list WORD<1-64>
```

5. Remove the source MAC address-based RA Guard filtering.

```
no match ra-macaddr-list
```

OR

```
default match ra-macaddr-list
```
6. Configure the filter to match source IPv6 address of RA packets.

```
match ra-srcaddr-list WORD<1-64>
```
7. Remove the source IPv6 address based RA Guard filtering.

```
no match ra-srcaddr-list
```

OR

```
default match ra-srcaddr-list
```
8. Enable managed address configuration flag verification in the advertised RA packet.

```
managed-config-flag <none | on | off>
```
9. Enable advertised hop count limit verification.

```
hop-limit {maximum | minimum} <0-255>
```
10. Enable the advertised default router-preference parameter value verification.

```
router-preference maximum {none | high | low | medium}
```

Variable Definitions

The following table defines parameters to configure RA Guard policy.

Variable	Description
match ra-prefix-list <i>WORD<1-64></i>	Verifies the advertised prefixes in RA packets against the configured authorized prefix list. Note: RA packet's sender IPv6 address is not validated if no IPv6 source access list is attached to the RA Guard policy. If the list is attached and if RA packet's sender IPv6 address does not match any entry in that IPv6 prefix list, then the RA packet is dropped. To change this behavior, add a entry with ipv6 prefix "0::0/0" with Allow option. The default value changes from Drop to Allow.
{no default} match ra-prefix-list	Removes the advertised prefix-based RA Guard filtering
match ra-macaddr-list <i>WORD<1-64></i>	Verifies sender's source MAC address against the configured mac-access-list. Note: Advertised prefixes in RA packet are not validated if no IPv6 prefix list is attached to the RA Guard policy. If the list is attached and if it does not match any MAC in the list, then the RA packet is dropped.

Variable	Description
{no default} match ra-macaddr-list	Removes the source MAC address-based RA Guard filtering for the specified MAC address access list names.
match ra-srcaddr-list <i>WORD<1-64></i>	Verifies sender's source IPV6 address against the configured list. Note: Inspection is not done if the access-list is not attached. If the list is attached and if it does not match any IPV6 in the list, then the RA packet is dropped. To change the behavior, add a dummy IPV6 "0:0:0:0:0:0" to the list with Allow option. The default value changes from Drop to Allow.
{no default} match ra-srcaddr-list	Removes the source IPV6 address-based RA Guard filtering for the specified IPV6 address access list names.
managed-config-flag <none on off>	Verifies managed address configuration flag in the advertised RA packet. By default, the value is none and check is bypassed.
hop-limit {maximum minimum} <0-255>	Verifies the advertised hop count limit. The limit value range is from 0 to 255. While changing the minimum or maximum value, ensure the maximum value is greater than the minimum value. By default, the minimum and maximum limit are 0. In this case, the hop-limit check is bypassed.
router-preference maximum {none high low medium}	Verifies if the advertised default router-preference parameter value is lower than or equal to a specified limit. By default, the value is none and the check is bypassed.

Display RA Guard Configuration

About This Task

Display configured RA Guard policy information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display configured RA Guard policy information:
`show ipv6 fhs ra-guard policy WORD<1-64>`

Example

```
Switch:1# show ipv6 fhs ra-guard policy
=====
IPv6 Ra Guard Policy Info
=====
POLICY-NAME  RA-SRC-ADDR-LIST  RA-MAC-ADDR-LIST  RA-PREFIX-LIST  LIMIT  LIMIT  MIN-HOP  MAX-HOP  MANAGED
CON-FLAG  PREF
-----
Ra_guard_poll  None             None             acl1             0      0      None     None
-----
All 1 out of 1 Total Num of ra-guard policy entries displayed
```

Variable Definitions

The following table defines parameters for the **show ipv6 fhs ra-guard policy** command.

Variable	Description
<i>WORD</i> <1-64>	Displays the RA Guard policy for the specified policy-name. By default, all the configured RA Guard policies are displayed.

IPv6 Neighbor Discovery inspection configuration

This section describes how to configure ND inspection on the switch and protect the network by mitigating the various types of attacks.

Important

Enable FHS globally before enabling ND inspection.

Enable ND Inspection Globally

Before You Begin

Enable FHS globally for ND inspection to work.

About This Task

Use this procedure to enable Neighbor Discovery (ND) inspection globally.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable ND inspection globally:
`ipv6 fhs nd-inspection enable`

Clear Neighbor Discovery Inspection Statistics

About This Task

Use this procedure to clear the Neighbor Discovery inspection statistics.

Procedure

1. Enter Privileged EXEC mode:
`enable`

2. Clear the Neighbor Discovery inspection statistics:

```
clear ipv6 fhs statistics nd-inspection [{slot/port[/sub-port]}[-slot/
port[/sub-port]][,...][slot/all][all]]
```

**Note**

Alternatively, you can use the command `clear ipv6 fhs statistics all` to clear the ND inspection statistics along with RA guard statistics and DHCPv6 Guard statistics.

Variable Definitions

The following table defines parameters for the **clear ipv6 fhs statistics nd-inspection** command.

Variable	Value
<code>{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

*Enable Neighbor Discovery Inspection on a VLAN***Before You Begin**

Enable FHS globally for ND inspection to work.

About This Task

Use this procedure to enable Neighbor Discovery inspection on a VLAN.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```

2. Enable Neighbor Discovery inspection on the VLAN:

```
ipv6 fhs nd-inspection enable
```

*Enable Neighbor Discovery Inspection on a Port***Before You Begin**

Enable FHS globally for ND inspection to work.

About This Task

Use this procedure to enable Neighbor Discovery inspection on a port

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable Neighbor Discovery inspection on the port:

```
ipv6 fhs nd-inspection enable
```

View Neighbor Discovery Inspection Status Globally

About This Task

Use this procedure to view the Neighbor Discovery inspection status globally.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display the ND inspection status globally:

```
show ipv6 fhs status
```

View Neighbor Discovery Inspection Status on a Port

About This Task

Use this procedure to view Neighbor Discovery inspection status on a port.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display port-wise ND inspection status:

```
show ipv6 fhs port-policy
```

View Neighbor Discovery Inspection Statistics on a Port

About This Task

Use this procedure to view the Neighbor Discovery inspection statistics on a port or set of ports.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display ND inspection statistics on a port or a set of ports:
show ipv6 fhs statistics nd-inspection {slot/port[/sub-port][-slot/
port[/sub-port]][,...][slot/all][all]}

Variable Definitions

The following table defines parameters for the **show ipv6 fhs statistics nd-inspection** command.

Variable	Value
{slot/port[/sub-port][-slot/port[/sub-port]][,...][slot/all][all]}	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

IPv6 DHCP Snooping Configuration

This section describes how to configure IPv6 DHCP snooping on the switch and protect the network by mitigating the various types of attacks.

Important

Configure DHCPv6 Guard before enabling IPv6 DHCP snooping. DHCPv6 Guard classifies the ports as trusted or untrusted and extracts DHCPv6 reply packets received on trusted ports to the control path. For more information on how to configure DHCPv6 Guard, see [DHCPv6 Guard Policy Configuration](#) on page 2361.

Create a Static Security Binding Table Entry

Use this procedure to enable learning Security Binding Table (SBT) entries on all the VLANs where IPv6 DHCP snooping is configured.

About This Task

Use this procedure to create a static SBT entry.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal

2. Add a static SBT entry:

```
ipv6 fhs snooping static-binding ipv6-address WORD<0-46> vlan <1-4059>
mac-address 0x00:0x00:0x00 port {slot/port[/sub-port]}
```

**Note**

To delete an SBT entry, use the command `no ipv6 fhs snooping static-binding`.

Example

Add a static SBT entry.

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)#ipv6 fhs snooping static-binding ipv6-address
2001:DB8:89ab:cdef:0123:4567:89ab:cdef vlan 1000 mac-address 00:11:22:33:44:55 port 1/2
```

Variable Definitions

The following table defines parameters for the **ipv6 fhs snooping static-binding ipv6-address** command.

Variable	Value
<i>mac-address</i> <i>0x00:0x00:0x00</i>	Specifies the MAC address of the binding entry.
<i>port {slot/port[/sub-port]}</i>	Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<i>vlan <1-4059></i>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
<i>WORD<0-46></i>	Specifies the IPv6 address for the binding entry.

*Clear a Dynamic SBT Entry***About This Task**

Use this procedure to clear all or a particular dynamic SBT entry.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Clear a dynamic SBT entry:

```
clear ipv6 fhs snooping [vlan <1-4059>][ipv6-address WORD<0-46>]
```

Example

Clear a dynamic SBT entry on a VLAN.

```
Switch:1> enable
Switch:1>clear ipv6 fhs snooping vlan 1000 ipv6-address
2001:DB8:89ab:cdef:0123:4567:89ab:cdef
```

Variable Definitions

The following table defines parameters for the **clear ipv6 fhs snooping** command.

Variable	Value
<i>ipv6-address</i> <i>WORD<0-46></i>	Specifies the IPv6 address for the binding entry to clear. You cannot specify an address without first specifying the VLAN.
<i>vlan <1-4059></i>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. If you do not specify a VLAN, the command clears all entries.

Enable IPv6 DHCP Snooping on a VLAN

Before You Begin

Enable IPv6 DHCPv6 Guard for IPv6 DHCP snooping to work.

About This Task

Use this procedure to configure IPv6 DHCP snooping on a VLAN.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable

configure terminal

interface vlan <1-4059>
```
2. Configure IPv6 DHCP snooping on the VLAN:

```
ipv6 fhs snooping dhcp enable
```

View IPv6 DHCP Snooping and ND Inspection Status on a VLAN

About This Task

Use this procedure to view IPv6 DHCP snooping and ND inspection status on a VLAN.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

- View the IPv6 DHCP snooping and ND inspection status on a VLAN:

```
show ipv6 fhs status vlan [<1-4059>]
```

Example

View the status for all VLANs.

```
Switch:1#show ipv6 fhs status vlan
```

```
=====
                        IPv6 FHS VLAN Information
=====
VLAN-ID                DHCP-SNOOPING-STATUS      ND-INSPECTION-STATUS
-----
1                      Disabled                Disabled
3                      Disabled                Disabled
4                      Disabled                Disabled
22                     Disabled                Disabled
=====
All 4 out of 4 Total Num of FHS VLAN entries displayed
```

Variable Definitions

The following table defines parameters for the **show ipv6 fhs status vlan** command.

Variable	Value
<1-4059>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. If you do not specify a VLAN ID, the command output includes all VLANs.

View SBT Entries

About This Task

Use this procedure to view SBT entries.

Procedure

- Enter Privileged EXEC mode:
`enable`
- View all SBT entries:
`show ipv6 fhs snooping binding`
- View the SBT entries by type:
`show ipv6 fhs snooping binding type {dynamic | static}`
- View the SBT entries by VLAN:
`show ipv6 fhs snooping binding vlan <1-4059>[ipv6-address WORD<0-46>]`

Variable Definitions

The following table defines parameters for the **show ipv6 fhs snooping binding** command.

Variable	Value
<i>ipv6-address</i> <i>WORD<0-46></i>	Specifies the IPv6 address for the binding entry.
<i>type {dynamic static}</i>	Shows only dynamic binding entries or static binding entries.
<i>vlan <1-4059></i>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.

IP Source Guard Configuration

The following sections provide procedural information you can use to configure IP Source Guard (IPSG) using the Command Line Interface (CLI).

Note

The switch supports configuration of IP Source Guard for both IPv4 and IPv6 addresses.

Enable IP Source Guard on a Port for IPv4 Addresses

Before You Begin

Ensure that the following conditions are all satisfied, before you enable IPSG on a port. Otherwise, the system displays error messages.

- DHCP Snooping is enabled globally.
- The port is a member of a VLAN that is configured with both DHCP Snooping and Dynamic ARP Inspection.
- The port is an untrusted port enabled with both DHCP Snooping and Dynamic ARP Inspection.
- The port has enough resources allocated, to support the maximum number of 10 IP addresses allowed for IPSG.

About This Task

Enable IP Source Guard (IPSG) on a port to add a higher level of security to the port by preventing IP spoofing. When you enable IPSG on the interface, filters are automatically installed for the IPv4 addresses that are already learned on that interface.

Important

Do not enable IPSG on MLT, DMLT, SMLT, LAG, trunk ports or ports that are a part of private VLANs.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable IPSG on the port:

```
ip source verify enable
```

3. Verify IPSG configuration:

```
show ip source verify interface gigabitEthernet [{slot/port[/sub-port]}
[-slot/port[/sub-port]][,...][slot/all][all]]
```

Example

Configure IPSG on port 1/1.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/1
Switch:1(config-if)#ip source verify enable
```

Verify the configuration.

```
Switch:1(config-if)#show ip source verify interface gigabitEthernet 1/1
```

```
=====
Source Guard Port Info
=====
```

PORT NUM	ENABLE	IPSC ORIGIN
1/1	true	RADIUS

```
=====
```

Variable Definitions

The following table defines parameters for the **ip source verify** command.

Variable	Value
enable	Enables IP Source Guard on the port.

Disable IP Source Guard for IPv4 Addresses

About This Task

Disable IP Source Guard (IPSG) on a port to allow traffic from all IPv4 addresses to go through the port without being filtered.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable IPSG for IPv4 addresses:

```
no ip source verify
```

3. Verify IPSG configuration:

```
show ip source verify interface gigabitEthernet [{slot/port[/sub-port]
[-slot/port[/sub-port]][,...][slot/all][all]}
```

Example

Disable IPSG on port 1/1.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/1
Switch:1(config-if)#no ip source verify
```

Verify the configuration.

```
Switch:1(config-if)#show ip source verify interface gigabitEthernet 1/1
```

```

View IP Source Guard Configuration on a Port

About This Task

View IP Source Guard (IPSG) configuration on a port, with filters for IPv4 addresses.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View IPSG configuration:

show ip source verify interface gigabitEthernet [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]

Example

```
Switch:1>show ip source verify interface gigabitEthernet 1/1

=====

=====

All 1 out of 1 Total Num of Ip Source Guard entries displayed
```

Variable Definitions

The following table defines parameters for the **show ip source verify interface gigabitEthernet** command.

Variable	Value
{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]}	<div>Identifies the slot and port in one of the following formats:</div> <div><ul style="list-style-type: none">• a single slot and port (slot/port)• a range of slots and ports (slot/port-slot/port)• a series of slots and ports (slot/port,slot/port,slot/port)• all ports on the same slot (slot/all)• all ports on the switch (all)</div> <div>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</div>

View IPv4 Address Bindings

About This Task

View the IPv4 address bindings that IP Source Guard (IPSG) allows.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View the allowed IPv4 address bindings for a specific interface:

```
show ip source binding [interface gigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]|[vlan <1-4059>]|
[vrf WORD<1-16>]|[vrfids WORD<0-512>]
```
3. View the allowed IPv4 address bindings for a specific IP address:

```
show ip source binding {A.B.C.D}
```

Example

View the allowed IPv4 address bindings for the port 1/1.

```
Switch:1>show ip source binding interface gigabitEthernet 1/1
```

```

```

Variable Definitions

The following table defines parameters for the **show ip source binding** command.

Variable	Value
<code>{A.B.C.D}</code>	Identifies the IPv4 address.
<code>interface gigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]] [,...] [slot/all] [all]}</code>	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<code>vlan <1-4059></code>	Specifies the VLAN ID of the VLAN for which to view IPv4 address bindings.
<code>vrf WORD<1-16></code>	Specifies the VRF name of the VRF for which to view the IPv4 address bindings.
<code>vrfids WORD<0-512></code>	Specifies the VRF ID of the VRF for which to view IPv4 address bindings.

Enable IP Source Guard on a Port for IPv6 Addresses

Before You Begin

Ensure that the following conditions are all satisfied, before you enable IPSPG on a port. Otherwise, the system displays error messages.

- DHCP Snooping is enabled globally.
- The port is a member of a VLAN that is configured with both DHCP Snooping and IPv6 Neighbor Discovery inspection.
- The port is an untrusted port enabled with both DHCP Snooping and IPv6 Neighbor Discovery inspection.
- The port has enough resources allocated, to support the maximum number of 10 IP addresses allowed for IPSPG.

About This Task

Enable IP Source Guard (IPSPG) on a port, to add a higher level of security to the port by preventing IP spoofing. When you enable IPSPG on the interface, filters are installed for IPv6 addresses that are already learned on that interface.

Important

Do not enable IPSPG on MLT, DMLT, SMLT, LAG, trunk ports or ports that are a part of private VLANs.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the maximum number of allowed IPv6 addresses on a port:

```
ipv6 source-guard [max-allowed-addr <2-10>]
```

Note

Ensure that you configure the maximum number of allowed IPv6 addresses on a port, before you enable IPSG on that port.

3. Enable IPSG on the port:

```
ipv6 source-guard enable
```

4. Verify IPSG configuration information on the port:

```
show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-  
port] [-slot/port[/sub-port]] [,...][slot/all][all]}
```

Example

Enable IPSG on a port.

Configure the maximum allowed IPv6 addresses on port 1/1 as 10 and enable IPSG on that port.

```
Switch:1>enable  
Switch:1#configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
Switch:1(config)#interface gigabitEthernet 1/1  
Switch:1(config-if)#ipv6 source-guard max-allowed-addr 10  
Switch:1(config-if)#ipv6 source-guard enable
```

Verify the configuration.

```
Switch:1(config-if)#show ipv6 source-guard interface gigabitEthernet 1/1  
Slot/Port  Source Guard  Number of  IPv6  Address  
           Mode          address allowed  overflow count  
=====
```

1/1	Enabled	10	0
-----	---------	----	---

Optionally view all interfaces with IPSG enabled.

```
Switch:1(config-if)#show ipv6 source-guard interface enabled  
Slot/Port  Source Guard  Number of  IPv6  Address  
           Mode          address allowed  overflow count  
=====
```

1/1	Enabled	4	0
1/2	Enabled	9	0

Variable Definitions

The following table defines parameters for the **ipv6 source-guard** command.

Variable	Value
<i>enable</i>	Enables IP Source Guard on a port.
<i>max-allowed-addr</i> <2-10>	Specifies the maximum number of IPv6 addresses allowed to transmit data through the port. The default value is 4. Note: To reset the value to default, IPSPG must be disabled on the interface.

Disable IP Source Guard for IPv6 Addresses

About This Task

Disable IP Source Guard (IPSPG) on a port to allow traffic from all IPv6 addresses to go through the port without being filtered.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable IPSPG for IPv6 addresses on a port:

```
no ipv6 source-guard enable
```

3. Verify IPSPG configuration on the port:

```
show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-
port] [-slot/port[/sub-port]] [,...][slot/all][all]}
```

Example

Disable IPSPG on port 1/1.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/1
Switch:1(config-if)#no ipv6 source-guard enable
```

Verify the configuration.

```
Switch:1(config-if)#show ipv6 source-guard interface gigabitEthernet 1/1
Slot/Port  Source Guard  Number of  IPv6  Address
           Mode      address allowed  overflow count
=====
1/1         Disabled      10          0
```

Clear IP Source Guard Overflow Counters

About This Task

Overflow counters consist of IPv6 addresses that are not added to IP Source Guard (IPSG) due to lack of filter resources. Use this procedure to clear the overflow counters for an IPSG port.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Clear the overflow counters:

```
ipv6 source-guard overflow-count clear
```

3. Verify the configuration on the port:

```
show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-
port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```

4. (Optional) View the overflow counters on all IPSG enabled ports:

```
show ipv6 source-guard interface enabled
```

Example

Clear overflow counters on the IPSG port 1/1.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/1
Switch:1(config-if)#ipv6 source-guard overflow-count clear
```

Verify the configuration on port 1/1.

```
Switch:1(config-if)#show ipv6 source-guard interface gigabitEthernet 1/1
Slot/Port  Source Guard  Number of  IPv6  Address
           Mode      address allowed  overflow count
=====
1/1         Enabled      10          0
```

Optionally, view the overflow counters on all IPSP enabled ports.

```
Switch:1(config-if)#show ipv6 source-guard interface enabled
Slot/Port  Source Guard  Number of  IPv6  Address
           Mode    address allowed  overflow count
=====
1/1        Enabled      4           0
1/2        Enabled      9           0
```

View IP Source Guard Configuration for IPv6 Addresses

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View IPSP configuration on a specified interface:

```
show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-
port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```
3. View IPSP configuration on all IPSP enabled interfaces:

```
show ipv6 source-guard interface enabled
```

Example

```
Switch:1#show ipv6 source-guard interface gigabitEthernet 1/1

Slot/Port  Source Guard  Number of  IPv6  Address
           Mode    address allowed  overflow count
=====
1/1        Enabled      4           0

Switch:1#show ipv6 source-guard interface enabled

Slot/Port  Source Guard  Number of  IPv6  Address
           Mode    address allowed  overflow count
=====
1/1        Enabled      4           0
1/2        Enabled      9           0
```

Variable Definitions

The following table defines parameters for the **show ipv6 source-guard interface gigabitEthernet** command.

Variable	Value
enabled	Displays IPSPG configuration on all IPSPG enabled interfaces.
gigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]] [,...] [slot/all] [all]}	<p>Displays IPSPG configuration on the specified interface.</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

View IPv6 Address Bindings

About This Task

View the IPv6 address bindings that IP Source Guard (IPSPG) allows.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View the allowed IPv6 address bindings:

```
show ipv6 source-guard binding [WORD<0-46>] [interface gigabitEthernet
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...] [slot/all] [all]}]
```

Example

View the IPv6 address bindings for port 1/3.

```
Switch:1>show ipv6 source-guard binding interface gigabitEthernet 1/3
Slot/Port   IPv6   Address
=====
1/3         2001::10:10:0:1
1/3         fe80::210:94ff:fe00:550b
-----
```

View the IPv6 address bindings for a specific IPv6 address.

```
Switch:1>show ipv6 source-guard binding fe80::210:94ff:fe00:550b
Slot/Port   IPv6   Address
=====
1/3         fe80::210:94ff:fe00:550b
-----
```

Variable Definitions

The following table defines parameters for the **show ipv6 source-guard binding** command.

Variable	Value
<i>WORD</i> <0-46>	Identifies the IPv6 address.
interface gigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Layer 2 Security Configuration using EDM

Use the following sections to help you configure Layer 2 security features and protect the network by mitigating various types of attacks, using Enterprise Device Manager (EDM).

For IPv4 deployments, configure:

- DHCP Snooping
- Dynamic ARP Inspection
- IP Source Guard for IPv4 addresses

For IPv6 deployments, configure:

- First Hop Security (FHS)

Note

FHS does not solve all cases of denial of services like blocking flooding of the IPv6 messages.

- DHCP Snooping and IPv6 Neighbor Discovery Inspection
- IP Source Guard for IPv6 addresses

Configure Dynamic ARP Inspection on VLANs

Use the following procedure to enable or disable DAI on one or more VLANs.

Note

DAI cannot be enabled on Private VLANs (E-Tree) and SPBM B-VLANs.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **ARP Inspection**.
3. Select the **ARP Inspection-VLAN** tab.
4. In the row for the VLAN, double-click **Enabled**, and select **true**.
5. Select **Apply**.

ARP Inspection-VLAN Field Descriptions

Use the data in the following table to use the **ARP Inspection-VLAN** tab.

Name	Description
VlanId	Specifies the VLAN ID.
Enabled	Specifies if DAI is enabled or disabled for the particular VLAN. By default, DAI is disabled.
Origin	Specifies the origin of Address Resolution Protocol (ARP) Inspection configuration on the VLAN. The supported values are: <ul style="list-style-type: none">• config - Set by the user.• radius - Set by the Remote Authentication Dial-In User Service (RADIUS) attribute.

Configure Dynamic ARP Inspection on Ports

Use the following procedure to set the trust factor associated with a port for DAI . By default, the trust factor is set to untrusted.

Note

For ports that are part of an MLT, DAI must be configured using the MLT configuration mode.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. In the navigation pane, expand **Configuration > IP**.

2. Select **ARP Inspection**.
3. Select the **ARP Inspection-port** tab.
4. In the row for the port, double-click **IfTrusted**, and select **trusted** or **untrusted**.
5. Select **Apply**.

ARP Inspection-port Field Descriptions

Use the data in the following table to use the **ARP Inspection-port** tab.

Name	Description
Port	Specifies the port on the switch.
IfTrusted	Specifies the trust factor for DAI on the specific port. By default, it is set as untrusted.

Configure FHS Globals

About This Task

Use this procedure to enable FHS to enable DHCPv6 Guard, RA Guard, and ND-inspection globally, and to configure the lifetime for these policies.

Procedure

1. From the navigation pane, expand **Configuration > IPv6**.
2. Select **FHS**.
3. Select the **Globals** tab.
4. Select FHS global options.
5. Select **Apply** to save the changes.
6. (Optional) Select **Refresh** to update the results.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

Name	Description
Admin	Enables or disables the FHS policy.
RAGuardAdmin	Enables or disables the RA Guard policy.
DHCPv6GuardAdmin	Enables or disables the DHCPv6 Guard policy.
NdInspectAdmin	Enables or disables Neighbor Discovery inspection.

Create an IPv6 Access List

About This Task

Use this procedure to create an FHS IPv6 access list or add IPv6 prefixes to the existing IPv6 access list.

Procedure

1. In the navigation pane, expand **Configuration**—> **IPv6**.
2. Select **FHS**.
3. Select the **IPv6 Access List** tab.
4. Select **Insert**.
5. Configure the parameters for the IPv6 access list.
6. Select **Insert**.

IPv6 Access List Field Descriptions

Use the data in the following table to use the **IPv6 Access List** tab.

Name	Description
Name	Specify the IPv6 access list name to create the IPv6 access list.
Prefix	Specify the IPv6 prefix for adding it to the IPv6 access list.
PrefixMaskLen	Specify the prefix length for adding it to the IPv6 access list. The value range is from 0 to 128. By default, the value is 0.
MaskLenFrom	Specify the start mask length for providing the IPv6 range. The value range is from 0 to 128. By default, the value is set to the configured prefix length of the IPv6 access list entry.
MaskLenTo	Specify the end mask length for providing the IPv6 range. The value range is from 0 to 128. By default, the value is set to the configured prefix length of the IPv6 access list entry.
AccessType	Select the access type to allow or deny the entry. By default, the access type is allow.

Note

- **MaskLenFrom** and **MaskLenTo** must always be greater than or equal to the configured **PrefixMaskLen** for this IPv6 access list entry
- The **MaskLenFrom** value must always be less than or equal to the **MaskLenTo** value.

Create MAC Access List

About This Task

Use this procedure to create a MAC access list or add a MAC address to the existing MAC access list.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **FHS**.
3. Select the **MAC Access List** tab.
4. Select **Insert**.
5. Configure the parameters for the MAC access list.
6. Select **Insert**.

MAC Access List Field Descriptions

Use the data in the following table to use the **MAC Access List** tab.

Name	Description
Name	Specify a name to create a MAC access list.
Mac	Specify the MAC address to add to the MAC access list, in (xx:xx:xx:xx:xx:xx) format.
AccessType	Specify allow or deny. By default, the access type is allow.

Create DHCPv6 Guard Policy

About This Task

Use this procedure to create the DHCPv6 Guard policy to block DHCPv6 reply and advertisement messages that originate from unauthorized DHCPv6 servers and relay agents.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **FHS**.
3. Select the **DHCPv6 Guard Policy** tab.
4. Select **Insert**.
5. Configure the parameters for the DHCPv6 Guard policy.
6. Select **Insert**.
7. (Optional) Select **Refresh** to update the results.

DHCPv6 Guard Policy Field Descriptions

Use the data in the following table to use the **DHCPv6 Guard Policy** tab.

Name	Description
PolicyName	Specifies the policy name to create or modify DHCPv6 Guard policy.
ServerAccessListName	<p>Enables verification of the sender IPv6 address in the DHCPv6 reply or advertisement packets against attached IPv6 server access list.</p> <p>Note: If the access-list is not attached, the source IPv6 address is not validated. If the list is attached and it does not match with any entries in attached IPv6 access list, the switch drops the DHCPv6 packet. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow, which changes the drop by default to allow by default.</p>
ReplyPrefixListName	<p>Enables verification of the advertised prefixes in DHCPv6 reply messages against the attached prefix list. If not configured, this check is bypassed.</p> <p>Note: If the access-list is not attached, the advertised address/prefix is not validated. If the list is attached and it does not match with any entries in attached IPv6 access list, the switch drops the DHCPv6 packet. To change this behavior, an entry in the IPv6 access list with prefix 0::0/0 with access type as allow, which changes the drop by default to allow by default.</p>
PrefLimitMin	<p>Enables verification if the advertised preference (in reference option) is greater than the specified limit. If not specified, this check does not occur.</p> <p>The value range is from 0 to 255.</p>
PrefixLimitMax	<p>Enables verification if the advertised preference (in preference option) is less than the specified limit. If not specified, this check does not occur.</p> <p>The value range is from 0 to 255.</p> <p>Note: If both the maximum and minimum limit is 0, this preference check is ignored.</p>

Create RA Guard Policy

About This Task

Use this procedure to create a RA Guard policy to block or reject unwanted or rogue RA messages that arrive at the network device platform.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **FHS**.
3. Select the **RA Guard Policy** tab.
4. Select **Insert**.
5. Configure the parameters for the RA Guard policy.
6. Select **Insert**.
7. (Optional) Select **Refresh** to update the results.

RA Guard Policy Field Descriptions

Use the data in the following table to use the **RA Guard Policy** tab.

Name	Description
PolicyName	Specifies the name of the RA Guard policy to be created or modified.
SrcAddrList	<p>Specify the IPv6 access list name to verify the sender IPv6 address in the RA packets against the attached IPv6 access list.</p> <p>Note: The source address in the RA packet is not validated if the access-list is not attached. If the list is attached and the IPv6 source address in RA packet does not match any IPv6-prefix in the list, then the RA packet is dropped. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow. The default value changes from drop to allow.</p>

Name	Description
PrefixList	<p>Specify the IPv6 prefix list name to verify the advertised prefixes in the RA packet against the attached IPv6 prefix list.</p> <p>Note: Advertised prefixes are not validated if the access-list is not attached. If the list is attached and the advertised prefix in the RA packet does not match any IPv6-prefix in the list, then the RA packet is dropped. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow. The default value changes from drop to allow.</p>
MacAddrList	<p>Specify the MAC list name to verify the sender source MAC address against the attached MAC access list.</p> <p>Note: The source MAC address in the RA packet is not validated if the access-list is not attached. If the list is attached and the source MAC address in the RA packet does not match any MAC address in the list, then the RA packet is dropped.</p>
ManagedConfigFlag	<p>Select the managed configuration flag to verify managed address configuration in the advertised RA packet.</p> <p>By default, none is selected and managed configuration flag validation is skipped.</p>
RouterPrefMax	<p>Select the router preference maximum to verify the if the advertised default router preference parameter value is lower than or equal to a specified limit.</p> <p>By default, none is selected and router preference validation is skipped.</p>

Name	Description
HopLimitMin	Specify the minimum hop limit to verify the advertised hop count limit. The value range is from 0 to 255 By default, minimum hop limit is 0.
HopLimitMax	Specify the maximum hop limit to verify the advertised hop count limit. The value range is from 0 to 255 By default, the maximum hop limit is 0 and If both HopLimitMin and HopLimitMax are set to 0, then the hop limit parameter in the RA packet is not validated.

Create Port to Policy Mapping

About This Task

Use this procedure to map a port to a RA Guard or DHCPv6 Guard policy, DHCPv6 Guard or RA Guard statistics.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **FHS**.
3. Select the **Port Policy Mapping** tab.
4. Select **Insert**.
5. Configure the parameters for the port policy mapping.
6. Select **Insert**.
7. (Optional) Select **Refresh** to update the results.

Port Policy Mapping Field Descriptions

Use the data in the following table to use the **Port Policy Mapping** tab.

Name	Description
IfIndex	Specify the port.
DHCPv6GuardPolicyName	Enter an already-created DHCPv6 Guard policy name to map it with the port.
RAGuardPolicyName	Enter an already-created RA Guard policy name to map it with the port.
Dhcpv6gDeviceRole	Select server or client configuration. The default is server.
RagDeviceRole	Select host or router configuration. The default is router.

Enable DHCP Snooping Globally

Use the following procedure to enable DHCP Snooping globally. If DHCP Snooping is globally disabled, the switch forwards DHCP reply packets (received on trusted or untrusted ports) to all ports.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **DHCP Snooping**.
3. Select the **DHCP Snooping Globals** tab.
4. Select **Enabled**.
5. Select **Apply**.

DHCP Snooping Globals Field Descriptions

Use data in the following table to use the **DHCP Snooping Globals** tab.

Name	Description
Enabled	Enables DHCP Snooping globally. By default, DHCP Snooping is disabled.

Configure DHCP Snooping on VLANs

Use the following procedure to configure DHCP Snooping on a specific VLAN. If DHCP Snooping is globally disabled, the switch forwards DHCP reply packets (received on trusted or untrusted ports) to all ports.

If you enable DHCP Snooping globally, the agent determines whether to forward DHCP reply packets based on the DHCP Snooping mode of the VLAN and trusted state of the port.

Note

You cannot enable DHCP Snooping on Private VLANs (E-Tree) and SPBM B-VLANs.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **DHCP Snooping**.
3. Select the **DHCP Snooping-VLAN** tab.
4. In the row for the VLAN, double-click **DhcpSnoopingEnabled**, and select **true**.
5. Select **Apply**.

DHCP Snooping-VLAN Field Descriptions

Use the data in the following table to use the **DHCP Snooping-VLAN** tab.

Name	Description
VlanId	Specifies the VLAN ID.
DhcpSnoopingEnabled	Specifies if DHCP Snooping is enabled or disabled for the particular VLAN. By default, DHCP Snooping is disabled.
Origin	Specifies the origin of DHCP Snooping configuration on the VLAN. The supported values are: <ul style="list-style-type: none">• config - Set by the user.• radius - Set by the Remote Authentication Dial-In User Service (RADIUS) attribute.

Configure Trusted and Untrusted Ports

Use the following procedure to set the trust factor associated with a port for DHCP Snooping. By default, the trust factor is set to untrusted on all ports.

Note

For ports that are members of an MLT, DHCP Snooping must be configured using the MLT configuration mode.

Before You Begin

To enable DHCP Snooping on a port, you must enable DHCP Snooping globally.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **DHCP Snooping**.
3. Select the **DHCP Snooping-port** tab.
4. In the row for the port, double-click **DhcpSnoopingIfTrusted**, and select **trusted** or **untrusted**.
5. Select **Apply**.

DHCP Snooping-port Field Descriptions

Use data in the following table to use the **DHCP Snooping-port** tab.

Name	Description
Port	Specifies the port on the switch.
DhcpSnoopingIfTrusted	Specifies if the switch ports are trusted for DHCP Snooping. By default, it is set as untrusted.

Create DHCP Binding Table Entries

Use the following procedure to add entries for devices with static IP addresses to the DHCP binding table.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **DHCP Snooping**.
3. Select the **DHCP Bindings** tab.
4. Select **Insert**.
5. In **VlanId**, type the VLAN ID.
6. In **MacAddress**, type the MAC address of the DHCP client.
7. In **AddressType**, select a value.
8. In **Address**, type the IP address of the DHCP client.
9. In **Interface**, select a port.
10. In **LeaseTime(sec)**, type the time in seconds.
11. Select **Insert**.
12. Select **Apply**.

DHCP Bindings Field Descriptions

Use data in the following table to use the **DHCP Bindings** tab.

Name	Description
VlanId	Specifies the VLAN to which the DHCP client belongs.
MacAddress	Specifies the MAC address of the DHCP client.
AddressType	Specifies the type of address. The default address type is IPv4.
Address	Specifies the IP address assigned to the DHCP client.
Interface	Specifies the interface to which the DHCP client connects.
LeaseTime(sec)	Specifies the lease time (in seconds) of the particular DHCP binding entry. The time range is 0 to 2147483646 seconds.
TimeToExpiry(sec)	Species the time of expiry (in seconds) of the DHCP binding entry.
EntryType	Specifies the type of the DHCP binding entry. <ul style="list-style-type: none"> • If the entry was created through DHCP snooping, the type is learned(1). • If the entry was created through a management operation, the type is static(2).

Create an SBT Entry

You can build a snooping binding table (SBT), which contains entries from only trusted devices or hosts. This SBT table is used to validate Neighbor Discovery (ND) packets.

About This Task

Use this procedure to create an SBT entry.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **FHS**.
3. Select the **Snoop Binding** tab.
4. Select **Insert**.
5. Configure the parameters for the snoop binding.
6. Select **Insert**.
7. (Optional) Select **Refresh** to update the results.

Snoop Binding Field Descriptions

Use the data in the following table to use the **Snoop Binding** tab. The system displays a subset of these fields if you select **Insert**.

Name	Description
VlanId	Specify the VLAN to which the snooped entry belongs.
Ipv6Address	Enter the IPv6 address assigned to the IPv6 host.
MacAddress	Enter the MAC address of the snooped entry.
InterfaceIndex	Specify the interface on which the entry is learnt.
EntryType	Indicates the type of entry - static (1) or dynamic (2).
EntrySource	Indicates the method entry was learnt from - static (1) or dhcp (2).
ValidTime	Indicates the valid time for the snooped entry.
TimeToExpiry	Indicates the time to expiry of the snooped entry.

Enable IP Source Guard on a Port for IPv4 Addresses

Before You Begin

Ensure that the following conditions are all satisfied before you enable IPSPG on a port. Otherwise, the system displays error messages.

- DHCP Snooping is enabled globally.
- The port on which you want to enable IPSPG is a member of a VLAN that is configured with both DHCP Snooping and Dynamic ARP Inspection.
- The port is an untrusted port enabled with both DHCP Snooping and Dynamic ARP Inspection.
- The port has enough resources allocated to support the maximum number of 10 IP addresses allowed for IPSPG.

About This Task

Enable IP Source Guard (IPSPG) to add a higher level of security to a desired port by preventing IP spoofing. When you enable IPSPG on the interface, filters are installed for IPv4 addresses that are already learned on that interface.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **Source Guard**.
3. Select the **IP Source Guard-port** tab.
4. In the row for the applicable port, edit **Mode** to select **ip**.
5. Select **Apply** to save your changes.
6. Select **Refresh** to update the **IP Source Guard-port** tab.

IP Source Guard-port Field Descriptions

Use the data in the following table to use the **IP Source Guard-port** tab.

Name	Description
Port	Identifies the port on which to enable IPSPG.
Mode	Displays whether IPSPG is enabled on the port. The default is disabled.
Origin	Specifies the origin of Source Guard configuration on the port. The supported values are: <ul style="list-style-type: none">• config - Set by the user.• radius - Set by the Remote Authentication Dial-In User Service (RADIUS) attribute.

View IPv4 Address Bindings

View the IPv4 address bindings that IPSP allows.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **Source Guard**.
3. Select the **IP Source Guard-addresses** tab.

IP Source Guard-addresses Field Descriptions

Use the data in the following table to use the **IP Source Guard-addresses** tab.

Field	Description
Port	Indicates the port on which IPSP is configured.
Type	Indicates the address type.
Address	Indicates the IPv4 address that is allowed by IPSP on the port.
Source	Indicates the source of the IPv4 address, which is DHCP Snooping.

Configure IP Source Guard on a Port for IPv6 Addresses

Before You Begin

Ensure that the following conditions are all satisfied, before you enable IPSP on a port. Otherwise, the system displays error messages.

- DHCP Snooping is enabled globally.
- The port is a member of a VLAN that is configured with both DHCP Snooping and IPv6 Neighbor Discovery inspection.
- The port is an untrusted port enabled with both DHCP Snooping and IPv6 Neighbor Discovery inspection.
- The port has enough resources allocated to support the maximum number of 10 IP addresses allowed for IPSP.

About This Task

Enable IPSP to add a higher level of security to a desired port, by preventing IP spoofing. When you enable IPSP on an interface, filters are automatically installed for the IPv6 addresses that are already learned on that interface.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **IPv6**.
3. Select the **Source Guard** tab.
4. Double-click **InterfaceState**.

5. Select a value: **true** or **false**.
6. Double-click **MaxAddr**.
7. Enter the maximum number of IPv6 addresses that are allowed to transmit data on the port.
8. (Optional) To clear the overflow counters, double-click **ClearOverflowCount**, and then select **true**.
9. Select **Apply** to save your changes.
10. Select **Refresh** to update the **Source Guard** tab.

Source Guard Field Descriptions

Use the data in the following table to use the **Source Guard** tab.

Name	Description
IfIndex	Specifies a value that uniquely identifies the port.
InterfaceState	Specifies the state of the interface. The default value is false.
MaxAddr	<p>Specifies the maximum number of IPv6 addresses allowed to transmit data through the port. The default value is 4.</p> <p>Note: To reset the value to default, IPSPG must first be disabled on the interface.</p>
OverflowCount	Specifies the number of IPv6 addresses for which filters are not added on the IPSPG port, due to a lack of filter resources. The default value is 0.
ClearOverflowCount	Specifies whether the overflow counter must be cleared. By default, the value is false.

View IPv6 Address Bindings

View the IPv6 address bindings that IPSPG allows.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **IPv6**.
3. Select the **Source Guard Binding** tab.

Source Guard Binding Field Descriptions

Use the data in the following table to use the **Source Guard Binding** tab.

Field	Description
IfIndex	Specifies a value that uniquely identifies the port.
IPv6Addr	Specifies the binding entry for the IPv6 address.

Layer 2 security example scenarios

The following sections describe configuration examples to configure Layer 2 security features for IPv4 and IPv6 deployments.

FHS Deployment Scenario

In the following example, the Layer 2 switch “SW-1” is connected to another Layer 2 switch “SW-2”, two hosts and a DHCP server. Switch “SW-2” is connected to two other hosts and a router. Out of the two hosts connected to SW-2, one is a malicious host, which can generate bogus RA packets to advertise route prefix, and can also generate bogus DHCP reply packets to configure wrong IPv6 address or wrong default gateway. By doing this, it tries denial-of-service or adversary-in-the-middle attacks. These attacks must be prevented as it affects all the nodes present in the Layer 2 network and FHS can be effective in preventing these attacks.

These attacks can spread over the entire Layer 2 network and thus can affect the hosts connected to SW-2 as well as the hosts connected to SW-1. If you enable FHS only on SW-2, then it could only save the nodes which are directly connected to it. To prevent the good node connected to SW-1 from these attacks, the SW-1 switch also should be FHS enabled.

The following figure shows the FHS deployment scenario topology.

Figure 175: FHS deployment topology

By default, all the ports are trusted, until you configure DHCPv6 Guard or RA Guard policies.

See the following procedures to configure FHS RA Guard and DHCPv6 Guard for the preceding topology.

Creating FHS IPv6 ACL

About This Task

Filter IPv6 traffic by creating IPv6 Access Control Lists (ACLs) and applying them to the interfaces similar to the way that you create and apply IPv4 named ACLs.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Create an IP ACL name (ipv6_acl_1) to match the source IPv6 address of the router connected to the interface.

```
ipv6 fhs ipv6-access-list ipv6_acl_1
fe80:0:0:0:cef9:54ff:feb4:9481/128 mode allow
```

3. Create an IP ACL name (ipv6_acl_1) to match the source IPv6 address of the DHCPv6-server connected to the interface.

```
ipv6 fhs ipv6-access-list ipv6_acl_1  
fe80:0:0:0:cef9:54ff:feb4:9481/128 mode allow
```

What to Do Next

Create a First Hop Security MAC ACL.

Creating an FHS MAC ACL

About This Task

Filter the IPv6 traffic by creating a MAC access list with the ACL mode.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create a MAC ACL name (rtr_smac) to match the source MAC of the router connected to the interface 1/2.

```
ipv6 fhs mac-access-list mac_acl_1 00:11:22:33:44:66 mode allow
```

Create a DHCPv6 Guard Policy for the Router

About This Task

Create a DHCPv6 Guard policy to provide Layer 2 security to DHCPv6 clients by protecting them against rogue DHCPv6 servers.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enter DHCP Guard mode with the DHCPv6 Guard policy name (dhcpv6g_pol_1). The DHCPv6 Guard policy for the interface is connected to a router.

```
ipv6 fhs dhcp-guard policy dhcpv6g_pol_1
```

3. Configure the source IPv6 access list to allow only a DHCPv6 server replies that originate from the IPv6 address fe80:0:0:0:cef9:54ff:feb4:9481/128 and check the preceding IPv6 ACL configuration for ipv6_acl_1 list.

```
match server access-list ipv6_acl_1
```

4. Verify the prefixes sent in the DHCPv6 server reply message so that the ipv6_acl_2 IPv6 ACL configuration allows only the prefix 1000::1/64.

```
match reply prefix-list ipv6_acl_1
```

Create an RA Guard Policy for the Router

About This Task

Create a **rag_pol_1** RA Guard policy for the router and configure the source IPv6 access list to allow only the RA packets that originate from the source IPv6 address **fe80:0:0:0:cef9:54ff:feb4:9481/128**. This configuration verifies the prefixes sent in the RA packets.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enter the RA Guard mode and configure RA Guard policy (rag_pol_1) for the interface connected to a router.
`ipv6 fhs ra-guard policy rag_pol_1`
3. Configure the source IPv6 access list to allow only RA packets originating from the source IPv6 address fe80:0:0:0:cef9:54ff:feb4:9481/128.
`match ipv6 ra-srcaddr-list ipv6_acl_1`
4. Verify the prefixes sent in the RA packets so that the rtr_pip IPv6 ACL configuration allows only the prefix 60::0/64.
`match reply ra-prefix-list ipv6_acl_1`

Attach FHS policies to the Interfaces

About This Task

Attach the FHS policies to the interfaces.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Configure DHCPv6 Guard and RA Guard policies on the interface (1/2) that connects to the router.
`interface ethernet 1/2`

`ipv6 dhcp-guard attach-policy dhcpv6g_pol_1`

`ipv6 ra-guard attach-policy rag_pol_1`

IPv6 DHCP Snooping and ND Inspection Configuration Example

This section shows examples of IPv6 DHCP snooping and ND inspection configuration.

Enable DHCPv6 Guard, ND inspection, and First Hop Security.

```
ipv6 fhs dhcp-guard enable
ipv6 fhs nd-inspection enable
```

```
ipv6 fhs enable
```

Create VLAN 1000 and add port members.

```
vlan create 1000 type port-mstprstp 0
vlan members add 1000 1/1-1/10
```

Enable DHCPv6 snooping and ND inspection on VLAN 1000.

```
interface vlan 1000
ipv6 fhs snooping dhcp enable
ipv6 fhs nd-inspection enable
exit
```

Add static SBT entry.

```
ipv6 fhs snooping static-binding ipv6-address 2001:DB8:0:0:0001:02ff:fe03:0405 vlan 1000
mac-address 00:01:02:03:04:05 port 1/5
```

Set the DHCPv6 Guard device-role on port 1/1 of the device on which DHCPv6 Guard is configured.

```
interface gigabitEthernet 1/1
ipv6 fhs dhcp-guard device-role server
exit
```

Enable ND inspection on ports 1/2 through 1/10.

```
interface gigabitEthernet 1/2-1/10
ipv6 fhs nd-inspection enable
exit
```

View the status.

```
show ipv6 fhs port-policy
show ipv6 fhs status
show ipv6 fhs status vlan
show ipv6 fhs snooping binding
```

Configure IP Source Guard

The following section describes a simple configuration example to configure IP Source Guard (IPSG) on a port.

When you enable IPSG on a port, filters are installed for the IPv4 or IPv6 addresses that are already learned on that port.

Procedure

Enable DHCP Snooping globally on the switch and verify the configuration.

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable DHCP Snooping globally.

```
ip dhcp-snooping enable
```

3. Verify the configuration.

```
show ip dhcp-snooping
```

Enable DHCP Snooping and Dynamic ARP Inspection on the VLAN that the port is a member of.

4. Enter VLAN Interface Configuration mode:

```
enable

configure terminal

interface vlan <1-4059>
```

5. Enable DHCP Snooping on the VLAN.

```
ip dhcp-snooping enable
```

6. Verify the configuration.

```
show ip dhcp-snooping vlan <1-4059>
```

7. Enable Dynamic ARP Inspection on the VLAN.

```
ip arp-inspection enable
```

8. Verify the configuration.

```
show ip arp-inspection vlan <1-4059>
```

9. Verify that the port on which you want to configure IPSPG is a DHCP Snooping and a Dynamic ARP Inspection untrusted port.

```
show ip dhcp-snooping interface gigabitEthernet [{slot/port[/sub-port]}
[-slot/port[/sub-port]][,...][slot/all][all]]
```

```
show ip arp-inspection interface gigabitEthernet [{slot/port[/sub-
port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```

Configure IPSPG on a port and verify the configuration.

10. Perform one of the following steps to configure IPSPG on a port, for IPv4 or IPv6 addresses.

- Enable and verify IPSPG on a port for IPv4 addresses:

- a. `ip source verify enable`
- b. `show ip source verify interface gigabitEthernet [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]`

- Enable and verify IPSPG on a port for IPv6 addresses:

- a. `ipv6 source-guard enable`
- b. `ipv6 source-guard [max-allowed-addr <2-10>]`

Note

The default value is 4. To reset the value to default, IPSPG must first be disabled on the interface.

- c. `show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]`

Examples

The following example describes how to enable IPSC on port 1/5 which is a member of VLAN 10, for IPv4 or IPv6 addresses.

```
Switch:1>en
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

Enable DHCP Snooping globally and verify the configuration.

```
Switch:1(config)#ip dhcp-snooping enable
Switch:1(config)#show ip dhcp-snooping

=====
                        Dhcp Snooping General Info

Licensing

[Licensing Types](#) on page 2413

[License Installation using CLI](#) on page 2420

[License Installation using EDM](#) on page 2423

This chapter describes the different types of licenses supported on switches that run Fabric Engine.

The following license types are available on switches that run Fabric Engine:

- Perpetual licenses (permanent):
 - [Base](#)—base features
 - [Premier](#)—advanced features
 - [MACsec](#)—MACsec license
- Subscription and Time-Based licenses:
 - Pilot or Extreme Platform ONE—enables Premier features while managed by Extreme Platform ONE, ExtremeCloud IQ, or ExtremeCloud IQ Site Engine
 - Factory Default Premier Trial—grants Premier features for 30 days; extendable up to three times.

Note

There is no trial license for MACsec.

Licensing Types

The following sections provide detailed information about the various licensing types.

Perpetual Licenses

Table 178: Perpetual licenses product support

Feature	Product	Release introduced
Perpetual licenses	4220 Series	Not Applicable
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Perpetual licenses provide permanent access to premier or MACsec features on supported the switches.

Base License

The Base License is included with the switch and enables the basic networking capabilities of the device. It does not include access to Premier features or MACsec. You must purchase additional licenses separately to enable Premier features and MACSec on the switch.

Premier License

The Premier License enables features not available in the Base License. You must purchase the Premier License.

The following table provides information on the features enabled by the license and the applicable order codes.

Feature support can differ between models within the same product family. For more information about feature support, see *Fabric Engine and VOSS Feature Matrix*.

Table 179: Premier License features and part numbers

Platform License	Enabled Features	Part Number / Order Code
5320 Series Premier 5420 Series Premier 5520 Series Premier 5720 Series Premier	<ul style="list-style-type: none"> • DvR Controller (5520 Series and 5720 Series,) • Fabric Connect Layer 3 Virtual Services Networks (VSNs) • Extreme Integrated Application Hosting, including Fabric IPsec Gateway (5720 Series) • Greater than two BGP peers • OpenAPI • Greater than four OSPF active interfaces • Precision Time Protocol version 2 • Segmented VRF if using Layer 3 VSN 	5000-PRMR-LIC-P
7520 Series Premier 7720 Series Premier 7830 Series Premier	<ul style="list-style-type: none"> • DvR Controller (7520 Series and 7720 Series) • Fabric Connect Layer 3 Virtual Services Networks (VSNs) • Extreme Integrated Application Hosting, including Fabric IPsec Gateway (7520 Series and 7720 Series) • Greater than 16 BGP peers • OpenAPI • Greater than four OSPF active interfaces • Precision Time Protocol version 2 (7520 Series and 7720 Series) • Segmented VRF if using Layer 3 VSN (7520 Series and 7720 Series) • VXLAN Gateway (7520 Series and 7720 Series) 	7000-PRMR-LIC-P

MACsec License

The MACsec License enables MACsec on the switch. For more information about feature support, see *Fabric Engine and VOSS Feature Matrix*.

Note

You must purchase the MACsec License.

The following table provides information on the MACsec License and the applicable order codes.

Table 180: MACsec License order codes

Platform License	MACsec License	Part Number / Order Code
5320 Series Premier 5420 Series Premier 5520 Series Premier 5720 Series Premier	IEEE 802.1AE MACsec	5000-MACSEC-LIC-P
7520-48YE-8CE Premier 7830 Series Premier	IEEE 802.1AE MACsec	7000-MACSEC-LIC-P

Install and Uninstall Licenses on Universal Switches

This topic explains how to obtain, activate, and transfer perpetual licenses on the switch.

Obtain and Install a License

For universal hardware switches, you can activate a license on the switch using either of the following methods:

- Manual activation by obtaining the license activation file from the [Extreme Networks Support portal](#).
- Automated activation using ExtremeCloud IQ. For information about using ExtremeCloud IQ for bulk automated license activation, go to <https://www.extremenetworks.com/support/documentation/extremecloud-iq>.

To obtain and install a license, follow these steps:

Note

You should have received by email a license voucher after your purchase of a switch. You will need the voucher ID number on this email to generate a license.

For manual license generation and installation:

1. Upgrade the switch so that it is running the most recent GA version of the software.

- To download the latest GA software, visit the [Extreme Networks Support portal](#).
2. Follow manual activation instructions for license generation available on the [Extreme Networks Support portal](#): **Products > ExtremeSwitching > Universal > Fabric Engine (VOSS) (for your switch) > Activation Instructions**.
 3. Download the license file onto the switch.

The license file name must meet the following requirements:

- Maximum of 63 alphanumeric characters
 - No spaces or special characters allowed
 - Underscore (_) is allowed
 - The file extension is `.lic`.
4. Install the license, using the command `load-license license_filename`.

The software verifies the license and activates the features that correspond to the license category.

For more information, see either of the following:

- [License Installation using CLI](#) on page 2420
- [License Installation using EDM](#) on page 2423

Transfer a License

You can permanently remove a license, which allows you to transfer the license to another switch. This should only be done when preparing to return a defective switch for a replacement switch (RMA).

For more information, see either of the following:

- [Revoke a License](#) on page 2421 (using CLI)
- [Revoke a License](#) on page 2424 (using EDM)

To transfer a license from a defective switch to a replacement switch (RMA), follow these steps.

1. Go to the [Extreme Networks Support portal](#).
2. Select **Assets > Licenses Home**.
3. Select **License Transfer**.
4. Enter the serial number of the defective unit, replacement unit serial number, and the RMA/case number.
5. Generate the new license, following the process in step 2 in [Obtain and Install a License](#) on page 2416.
6. Download the license file onto the switch.
7. Install the license, using the command `load-license license_filename`.

Subscription Licenses

Table 181: Subscription licenses product support

Feature	Product	Release introduced
Subscription licenses applied via cloud-management applications Note: Requires ExtremeCloud IQ Site Engine 25.2.10 or later ExtremeCloud IQ and Extreme Platform ONE Networking are automatically kept at the latest version.	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 9.2
	5420 Series	Fabric Engine 9.2
	5520 Series	Fabric Engine 9.2
	5720 Series	Fabric Engine 9.2
	7520 Series	Fabric Engine 9.2
	7720 Series	Fabric Engine 9.2
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	Not Supported
	VSP 7400 Series	Not Supported

This section provides details about subscription licenses applied to the switch using a cloud-management application, such as Extreme Networks Platform ONE, ExtremeCloud IQ, or ExtremeCloud IQ Site Engine.

For more information about cloud management support for subscription licenses, see the ExtremeCloud IQ, ExtremeCloud IQ Site Engine, and Extreme Networks Platform ONE documentation at <https://www.extremenetworks.com/support/documentation/>.

Pilot or Extreme Platform ONE License

The Pilot or Extreme Platform ONE License enables use of Premier features, but it does not include MACsec.

Note

MACsec, if supported, requires a perpetual MACsec License.

The following considerations apply to Pilot or Extreme Platform ONE Licenses:

- Premier License and Pilot or Extreme Platform ONE License can coexist on the same switch.
- If the switch has a Premier License, the Premier features remain enabled if the Pilot or Extreme Platform ONE License is revoked or if it expires.
- If you power on a switch with an expired license, the switch has 60 minutes to obtain updated license information from the cloud management application. If the switch fails to connect after 60 minutes, it revokes the Pilot or Extreme Platform ONE License.
- You can reassign a validated subscription license to a different switch in the following cases:
 - You removed or unmanaged a switch from the cloud management application.

- The switch is disconnected from the cloud management application and the 30-day factory default license expired.

Factory Default Premier Trial License

Table 182: Factory Default Premier Trial License

Feature	Product	Release introduced
Ability to extend the Factory Default Premier Trial License	4220 Series	Not Applicable
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.4
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.4
	VSP 7400 Series	VOSS 8.4

Note

The Trial License does not apply to 4220 Series.

New hardware switches include a Factory Default Premier Trial License to use all features, excluding MACsec. You can run the **extend-time-period** command up to three times to extend the trial license. You can configure all features, except MACsec, without restrictions, and save the configuration.

Note

There is no Trial License for MACsec.

You cannot configure new features after the trial period, but the switch continues to run with the existing configured features. If you reboot the switch after the trial period, and a valid software license is not present, licensed features in the configuration are not loaded.

You must install or apply a valid license to enable licensed features.

The initial trial period is 30 days.

Note

The evaluation period is based on the switch System Up Time.

If a Premier License was installed and then revoked, the trial period cannot be extended.

To extend the factory default trial license, see [Extend the Factory Default Premier Trial License](#) on page 2422.

License Installation using CLI

Install and manage a license file for the switch by using the Command Line Interface (CLI).

Note

This section applies to multiple platforms. The command syntax and example outputs may not be identical on all hardware platforms.

Obtain and Install a License File

Licenses are tied to the Base MAC address.

Note

Extreme Networks supports only a single host (system MAC address) for each license file. You cannot use the same license file on multiple hosts.

After you generate the license through the Extreme Networks Support Portal at <https://extremeportal.force.com/ExtrLicenseLanding>, perform the following steps to install the license on the switch to enable licensed features.

Before You Begin

- File Transfer Protocol (FTP) and Trivial File Transfer Protocol (TFTP) support both IPv4 and IPv6 addresses, with no difference in functionality or configuration.
- You must enable File Transfer Protocol (FTP) or Trivial File Transfer Protocol (TFTP) in the boot configuration flags depending on which protocol you use to download the license file to the device.

Procedure

1. From a remote station or PC, use FTP or TFTP to download the license file to the device and store the license file in the /intflash directory.
2. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

3. Load the license:

```
load-license WORD<1-64>
```

Examples

Log in to the device and load the license. The following example shows a successful operation.

```
Switch:1(config)#load-license license_Switch_example
Switch:1(config)#2021-09-01T13:48:27.275Z Switch_example CP1 - 0x000006ef - 00000000
GlobalRouter SW INFO License key successfully loaded from <license_Switch_example>.
```

Variable Definitions

The following table defines parameters for the **copy** command.

Variable	Value
<code><a.b.c.d></code>	Specifies the IPv4 and IPv6 address of the TFTP server from which to copy the license file.
<code><file></code>	Specifies the name of the license file when copied to the flash.
<code><srcfile></code>	Specifies the name of the license file on the TFTP server.

The following table defines parameters for the **load-license** command.

Variable	Value
<code>WORD<1-64></code>	Specifies the name of the license file in the <code>/intflash</code> directory.

Revoke a License

Revoke a perpetual license on the switch if you need to transfer the license to a different switch.

You can permanently remove a license, which allows you to transfer the license to another switch. This should only be done when preparing to return a defective switch for a replacement switch (RMA).

About This Task

The **no license** command invalidates the feature license and generates a revocation certificate, which is the first step to releasing the license entitlement back to the license entitlement manager (LEM). The revocation certificate is contained in a file where the first part of the file name is the switch serial number and the file extension is .rvk.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Revoke a license:

```
no license <10G WORD<1-64> | macsec | premier>
```

Note

Beginning with Fabric Engine 9.0, 5320 Series switches no longer require a license to operate SFP+ ports at full 10 Gbps. Use the `10G WORD<1-64>` parameter to revoke a previously installed license.

Example

Revoke the Premier license.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#no license premier
Successfully revoked license of type <PRD-5000-PRMR>, revocation certificate available at
"/intflash/2011G-00165-PRD-5000-PRMR.rvk"
```

Extend the Factory Default Premier Trial License

Use the following procedure to extend the Factory Default Premier Trial License on your switch.

You can run the **extend-time-period** command up to three times to extend the evaluation license in 30-day increments for an additional 90 days.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Extend the trial software license on your device:
`extend-time-period`

Note

You must reboot your switch after each license extension.

Example

Extend the trial license period for 30-days:

```
Switch:1>enable
Switch:1#extend-time-period
Are you sure you want to reset the box to apply changes? (y/n) y
```

Show a License File

Display the existing software licenses on your device. If the switch uses a Factory Default Premier Trial License, the output shows the time remaining in the trial period.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show the existing software licenses on your device:
`show license`

Example

Note

Example outputs might not be identical on all hardware platforms.

The following output shows a switch with a factory default premier license:

```
Switch:1>enable
Switch:1#show license

BASE License: Available
PREMIER License: Trial
Perpetual MACSEC License: Not Applicable
Subscription License Level: Trial, expires in 29 days
```

The following output shows a switch with a subscription license:

```
Switch:1>show license

BASE License: Available
PREMIER License: Subscription
Perpetual MACSEC License: Not Available
Subscription License Level: STANDARD, expires in 25 days
```

License Installation using EDM

Install and manage a license file for the switch by using Enterprise Device Manager (EDM).

Note

This section applies to multiple platforms. The fields may not be identical on all hardware platforms.

Install a License File

Install a perpetual license file on the switch to enable licensed features.

Before You Begin

- You must store the license file on a file server.

About This Task

IPv4 and IPv6 addresses are supported.

For additional information about the tabs referenced in this procedure, see the following sections:

- **Edit > File System > Copy File** tab: [Copy File Field Descriptions](#) on page 222
- **Edit > Chassis > System** tab: [System Field Descriptions](#) on page 2425

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **File System**.
3. Select the **Copy File** tab.
4. In the **Source** box, type the IP address of the file server where the license file is located and the name of the license file.

5. In the **Destination** box, type the flash device and the name of the license file.
The license file name must have a file extension of .xml.
6. Select **start**.
7. Select **Apply**.
The license file is copied to the flash of the device. The system displays the status of the file copy in the Result field.
8. In the navigation pane, expand **Configuration > Edit**.
9. Select **Chassis**.
10. Select the **System** tab.
11. In **ActionGroup1**, select **loadLicense**.
12. In **LicenseFileName** box, type the name of the license file.
13. Select **Apply**.

**Important**

If the loading fails, the switch cannot unlock the licensed features and reverts to base functionality.

14. On the **System** tab, in **ActionGroup1**, select **saveRuntimeConfig**.
15. Select **Apply**.

Revoke a License

Revoke a perpetual license on the switch if you need to transfer the license to a different switch.

You can permanently remove a license, which allows you to transfer the license to another switch. This should only be done when preparing to return a defective switch for a replacement switch (RMA).

About This Task

The revocation parameters invalidate the feature license and generate a revocation certificate, which is the first step to releasing the license entitlement back to the license entitlement manager (LEM). The revocation certificate is contained in a file where the first part of the file name is the switch serial number and the file extension is .rvk.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **System** tab.
4. In **ActionGroup1**, select one of the following:
 - **revokeLicenseMacsec**
 - **revokeLicensePremier**
5. Select **Apply**.
6. In **ActionGroup1**, select **saveRuntimeConfig**.
7. Select **Apply**.

System *Field Descriptions*

Use the data in the following table to use the **System** tab.

Name	Description
sysDescr	Shows the system assigned name and the software version.
sysUpTime	Shows the elapsed time since the system last started.
sysContact	Configures the contact information.
sysName	Configures the name of this device.
sysLocation	Configures the physical location of this device.
VirtualIpAddr	Configures the virtual IP address that the CPU advertises and stores in the switch configuration file.
VirtualNetMask	Configures the net mask of the virtual management IP address.
VirtualIpv6Addr	Specifies the virtual IPv6 address.
VirtualIpv6PrefixLength	Specifies the length of the virtual IPv6 address prefix (in bits).
LastChange	Displays the time since the last configuration change.
LastVlanChange	Displays the time since the last VLAN change.
LastStatisticsReset	Displays the time since the statistics counters were last reset.
LastRunTimeConfigSave	Displays the last run-time configuration saved.
DefaultRuntimeConfigFileName	Displays the default Run-time configuration file directory name.
ConfigFileName	Specifies the name of a new configuration file.

Name	Description
ActionGroup1	<p>Performs one of the following actions:</p> <ul style="list-style-type: none"> • resetCounters— Resets all statistic counters. • saveRuntimeConfig— Saves the current run-time configuration. • loadLicense— Loads a software license file to enable features. • revokeLicensePremier— Revokes the Premier license and generates a revocation certificate in XML format. • revokeLicenseMacsec—Revokes the MACsec license and generates a revocation certificate in XML format. • revokeLicense10G4P— Revokes the 4-port 10 Gbps Port License on 5320 Series and generates a revocation certificate in XML format. • revokeLicense10G8P— Revokes the 8-port 10 Gbps Port License on 5320 Series and generates a revocation certificate in XML format.
LicenseFileName	Specifies the name of the license file in the <code>/intflash</code> directory.
ActionGroup2	<p>Specifies the following action:</p> <ul style="list-style-type: none"> • resetIstStatCounters—Resets the IST statistic counters
ActionGroup3	<p>Can be the following action:</p> <ul style="list-style-type: none"> • flushIpRouteTbl—flushes IP routes from the routing table
ActionGroup4	<p>Can be the following action:</p> <ul style="list-style-type: none"> • softReset—resets the device without running power-on tests • resetConsole—resets the switch console • softResetCoreDump—reset with coredump
Result	Displays a message after you select Apply .
LocatorLED	Configures the system Locator LED on or off. The default is off.

View License File Information

About This Task

View information about the license file for the switch.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **License** tab.

License *Field Descriptions*

Use the data in the following table to use the **License** tab.

Name	Description
LicenseType	Indicates the level type of the current license.

Link Aggregation Control Protocol

[Link Aggregation Overview](#) on page 2428

[MultiLink Trunking with LACP](#) on page 2429

[LACP Configuration Considerations](#) on page 2432

[Important Information and Restrictions](#) on page 2433

[LACP configuration using CLI](#) on page 2434

[LACP configuration using EDM](#) on page 2447

The following sections provide the concepts and procedures you need to configure the Link Aggregation Control Protocol (LACP) to dynamically aggregate links as they become available to a trunk group.

Link Aggregation Overview

Link aggregation provides link level redundancy and increases load sharing. Use Link aggregation to bundle the ports into a port group, which is represented as one logical interface to the Media Access Control (MAC) layer.

The switch supports the following types of link aggregation:

- MultiLink Trunking (MLT)—a statically configured link bundling method. MLT is not standards based, but it interoperates with static link methods of other vendors.
- IEEE 802.3ad based link aggregation, through the Link Aggregation Control Protocol (LACP), dynamically aggregates links as they become available to a trunk group. Link Aggregation Control Protocol dynamically detects whether links can be aggregated into a link aggregation group (LAG) and does so after links become available. Link Aggregation Control Protocol also provides link integrity checking at Layer 2 for all links within the LAG.

Both MLT and IEEE 802.3ad based link aggregation are point-to-point functions.

The switch software offers LACP functionality layered with MLT. This document uses the term MLT with LACP to refer to this functionality.

Split MultiLink Trunking (SMLT)

Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency by providing for the addition of failure redundancy with subsecond failover, on top of all standard MLT link failure protection and flexible bandwidth scaling functionality. Use SMLT to connect a device that supports some form of link aggregation, be it a switch or a server, to two distinct separate SMLT endpoints or switches. These SMLT devices form

a virtualized Switch Cluster through the SPBM cloud and are referred to as a Virtual Inter-Switch Trunk (vIST) Core Switch pair.

For more information, see the following sections:

- [Virtual Inter-Switch Trunk \(vIST\)](#) on page 2657
- [Simplified Virtual-IST](#) on page 2659
- [Split MultiLink Trunking](#) on page 2662

LACP with SMLT

You can use LACP on SMLT configurations. The switch provides modifications to the LACP in SMLT configurations. LACP-capable devices can connect to an SMLT aggregation pair.

Note

Virtual IST is not supported on LACP-enabled MLTs.

VLACP with SMLT

You can also configure Virtual LACP (VLACP) with an SMLT configuration. VLACP is a modification that provides end-to-end failure detection. VLACP is not a link aggregation protocol.

VLACP implements link status control protocol at the port level. This mechanism periodically checks the end-to-end status of a point-to-point or end-to-end connection. You can run VLACP on single ports or on ports that are part of an MLT.

Note

Do not configure VLACP on LACP-enabled ports. VLACP does not operate properly with LACP.

MultiLink Trunking with LACP

MultiLink Trunking (MLT) with Link Aggregation Control Protocol (LACP) manages ports and port memberships to form a link aggregation group (LAG). Use Link Aggregation Control Protocol to gather one or more links to form a LAG, which a Media Access Control (MAC) client treats as a single link. Link Aggregation Control Protocol can dynamically add or remove LAG ports, depending on availability and state.

IEEE 802.3ad overview

The IEEE 802.3ad standard comprises service interfaces, the LACP, the Marker Protocol, link aggregation selection logic, a parser or multiplexer, frame distribution, and frame collection functions.

The following illustration shows the major functions of IEEE 802.3ad defined as multiple link aggregation.

Figure 176: Link aggregation sublayer (according to IEEE 802.3ad)

The link aggregation sublayer comprises the following functions:

- frame distribution

This block takes frames submitted by the MAC client and sends them for transmission on the appropriate port based on a frame distribution algorithm employed by the Frame Distributor.

Frame distribution also includes an optional Marker Generator/Receiver used for the Marker Protocol. The switch only implements the Marker Receiver function. For more information about the frame distribution algorithm, see [MLT Traffic Distribution Algorithm](#) on page 2661.

- frame collection

This block passes frames received from the various ports to the MAC client. Frame collection also includes a Marker Responder used for the Marker Protocol.

- aggregator parser or multiplexers

During transmission operations, these blocks pass frame transmission requests from the Distributor, Marker Generator, and Marker Responder to the appropriate port.

During receive operations, these blocks distinguish among Marker Request, Marker Response, MAC Client Protocol Data Units (PDU), and pass the blocks to the appropriate entity (Marker Responder, Marker Receiver, and Collector, respectively).

- aggregator

The combination of frame distribution and collection, and aggregator parser or multiplexers.

- aggregation control

This block configures and controls link aggregation. It incorporates LACP for the automatic communication of aggregation capabilities between systems and automatic configuration of link aggregation.

- control parser/multiplexers

During transmission operations, these blocks pass frame transmission requests from the aggregator and Control entities to the appropriate port.

During receive operations, these blocks distinguish Link Aggregation Control Protocol Data Units (LACPDUs) from other frames. The blocks pass, passing the LACPDUs to the appropriate sublayer entity and all other frames to the aggregator.

802.3ad link aggregation principles

Use link aggregation to group ports together to form a link group to another device. Link groups increase aggregate throughput between devices and provide link redundancy.

Link aggregation employs the following principles and concepts:

- A MAC client communicates with a set of ports through an aggregator, which presents a standard IEEE 802.3 service interface to the MAC client. The aggregator binds to one or more ports within a system.
- The aggregator distributes frame transmissions from the MAC client to various ports, collects received frames from the ports, and transparently passes the frames to the MAC client.
- A system can contain multiple aggregators serving multiple MAC clients. A port binds to a single aggregator at a time. A MAC client is served by a single aggregator at a time.
- The Link Aggregation Control function binds ports to aggregators within a system. The control function aggregates links, binds the system ports to an appropriate aggregator, and monitors conditions to determine if a change in aggregation is needed. Network managers can manually provide link aggregation control by manipulating the link aggregation state variables (for example, keys). You can also use LACP to automatically determine, configure, bind, and monitor link aggregation.
- LACP uses peer exchanges across links to continually determine the aggregation capability of the links and provide the maximum level of aggregation capability between a pair of systems.
- Frame ordering is maintained for certain sequences of frame exchanges between MAC Clients. The distributor ensures that all frames of a conversation pass to a single port. The collector passes frames to the MAC client in the order they are received from the port. The collector can select frames received from the aggregated ports.

Because the frames are not ordered on a single link, this guarantees that frame ordering is maintained for all conversations.

- Conversations move among ports within an aggregation for load balancing and for maintaining availability if a link fails.
- Each port is assigned a unique, globally administered MAC address.

After entities initiate frame exchanges within the link aggregation sublayer, the source address is the MAC address. An example of an entity that initiates frame exchanges is LACP and Marker Protocol exchanges.

- Each aggregator is assigned a unique, globally administered MAC address that is used from the perspective of the MAC client, both as a source address for transmitted frames and as the destination address for received frames. You can use one of the port MAC addresses in the associated LAG as the MAC address of the aggregator.

Input/output port redundancy

You can use the MLT link aggregation mechanism to protect I/O ports. MLT is compatible with 802.3ad static, and provides a load sharing and failover mechanism to protect against module, port, fiber, or complete link failures.

You can use MLT with Link Access Control Protocol (LACP) disabled or use LACP enabled by itself.

LACP Configuration Considerations

You can configure priorities, keys, modes, and timers for the LACP.

LACP Priority

You can configure LACP priority at the system and port level as follows:

- Port priority—determines which ports are aggregated into a LAG that has more than eight ports configured to it.
- System priority—generates the switch ID after communicating with other systems. As a best practice, use the default value. If you need to change it, first disable the LACP, and then enable it again after you change the value.

LACP Keys

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

- Keys do not have to match between two LACP peers.

LACP Timers

You can customize failover times by changing the LACP timer attributes (fast periodic time, slow periodic time, and aggregate wait time). Values are set by default to match the IEEE 802.3ad values. If you change the values, they must match on the ports participating in aggregation between two devices.

Changes to LACP timer values at the global level are reflected on all ports. However, you can change the LACP timer values for each port level. After you change an LACP timer globally, this value is set on all ports. The global timer value overwrites the local port value irrespective of the LACP state. You must configure port values that differ from the global values.

The switch software uses the following LACP timers:

- fast periodic timer—200 to 20 000 milliseconds (ms); default 1000 ms
- slow periodic timer—10 000 to 30 000 ms; default 30000 ms
- aggregation-wait timer—200 to 2000; default 2000

You cannot aggregate a link if it does not receive an LACPDU for a period of timeout \times slow periodic time = 3×30 seconds = 90 seconds. If you use the fast periodic time, the timeout period is 3×1000 ms = 3 seconds. You must make timer changes to all ports participating in link aggregation and to the ports on the partnering node.

Configuration changes to the LACP timers are not reflected immediately. Link Aggregation Control Protocol timers do not reset until the next time you restart LACP globally or on a port. This ensures consistency with peer switches.

After you enable LACP on a port, the timer values are set at the port level. You must toggle the LACP status after timer values change. This does not impact existing ports unless you toggle the LACP status on the port.

LACP modes

LACP uses two active and passive modes.

- Active mode—ports initiate the aggregation process. Active mode ports aggregate with other active mode ports or passive mode ports.
- Passive mode—ports participate in LACP but do not initiate the aggregation process. You must partner passive mode ports with active mode ports for aggregation to occur.

LACP and Private VLANs

When using LACP, configure the private-vlan at the interface level.

Important Information and Restrictions

Before you use the switch, review the following important information and restrictions.

LACP with Simplified vIST/SPB NNI links

You should not use LACP on SPB network-to-network interface (NNI) MLT links or on the Simplified Virtual IST.

vIST VLAN IP addresses

Do not configure a Rendezvous Point (RP) or Bootstrap Router (BSR) on the vIST VLAN because you cannot ping them outside of the vIST VLAN subnet. When you enter the **ip pim enable** command on the vIST VLAN, the following message displays:

WARNING: Please do not use virtual IST VLAN IP address for BSR and RP related configurations, as unicast packets to virtual IST vlan IP address from outside of virtual IST vlan subnet will be dropped. Use Loopback or CLIP interface IP address for BSR and RP related configurations.

Simplified vIST and egress port-based filters

On Simplified vIST nodes, egress port-based filters may not work for IP multicast routed traffic because vIST internal filter rules (to prevent duplicate traffic) have higher precedence than user-created filters.

Note

- This issue is specific to IP multicast routed traffic only.
- Egress port-based filters work for Layer 2 multicast, broadcast and unicast traffic.

LACP configuration using CLI

This section describes how to configure and manage link aggregation using the Command Line Interface (CLI), including Link Aggregation Control Protocol (LACP), to increase the link speed and redundancy for higher availability.

MultiLink Trunking (MLT) with LACP manages switch ports and port memberships to form a link aggregation group (LAG). Configure LACP to allow dynamic bundling of physical ports to form a single logical channel.

You can describe the LACP in terms of link aggregation operations within a single system. You can configure a single piece of equipment so it contains more than one system (from the point of view of the link aggregation operation).

Before You Begin

- Changes to LACP made at the global level overrides and resets all port level settings.

Important

After you globally configure the LACP system priority, it applies to all LACP-enabled aggregators and ports. After you enable the LACP on an aggregator or port, it uses the global system priority value.

- After you make a timer change, restart the LACP (globally or on the port) so the changes are consistent across the link.

**Important**

Configuration changes to LACP timers are not reflected immediately. LACP timers are not reset until the next time LACP is restarted globally or on a port. This action ensures consistency with peer switches.

- The switch does not support standby ports for LACP aggregation groups.

Configure Global LACP Parameters

Configure LACP parameters globally. After you configure the LACP system priority globally, it applies to all LACP-enabled aggregators and ports. After you enable the LACP on an aggregator or a port, it uses the global system priority value.

A change to the global parameter configuration takes effect after you restart the LACP globally or on each port.

About This Task

**Important**

Changes made at the global level override and reset all port level settings.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Change the system priority:
`lacp system-priority <0-65535>`
3. Configure additional LACP parameters as required:
`lacp enable [aggr-wait-time <200-2000>] [fast-periodic-time <200-20000>] [slow-periodic-time <10000-30000>] [smlt-sys-id <0x00:0x00:0x00:0x00:0x00:0x00>] [system-priority <0-65535>] [timeout-scale <2-10>]`

If you do not configure the optional parameters, the system uses the default values.

Example

```
Switch:1(config)#lacp fast-periodic-time 2000
Switch:1(config)#lacp enable
```

Variable Definitions

The following table defines parameters for the **lACP** command.

Variable	Value
<i>aggr-wait-time</i> <200-2000>	Configures the aggregation wait time (in milliseconds) globally. The default value is 2000.
<i>enable</i>	Enables LACP globally. The default value is disabled.
<i>fast-periodic-time</i> <200-20000>	Configures the fast periodic time (in milliseconds) globally. The default value is 1000.
<i>slow-periodic-time</i> <10000-30000>	Configures the slow periodic time globally. The default value is 30000.
<i>smlt-sys-id</i> <0x00:0x00:0x00:0x00:0x00:0x00> Note: Exception: not supported on 4220 Series or 5320 Series.	Configures the LACP system ID globally. Enter a MAC address in the following format: 0x00:0x00:0x00:0x00:0x00:0x00.
<i>system-priority</i> <0-65535>	Configures the LACP system priority globally. The default value is 32768.
<i>timeout-scale</i> <2-10>	Configures the timeout scale globally. The default value is 3.

Configure LACP on a Port

Important

Changes made at the global level override and reset the port-level configuration.

Configure LACP on a port to enable or disable LACP on the selected ports.

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

Before You Begin

When enabling or disabling LACP on a port, as a best practice, disable the port first and re-enable the port after the configuration is complete.

About This Task

The minimum LACP configuration is as follows:

- Assign a given key to a set of ports. In the following procedure steps, you must assign the key before you enable LACP on the port.

- Assign the same key to an MLT with no members. The ports will automatically become MLT members.

Keys do not need to match between two LACP peers.

A port can operate in active or passive mode. You can configure a port to be an individual link or an aggregated link.

**Note**

When using LACP with private VLANs, configure the private VLAN at the interface level.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Assign an LACP key:

```
lacp key <1-512|defVal>
```

3. Change the LACP mode:

```
lacp mode <active|passive>
```

4. Change the port priority:

```
lacp priority <0-65535>
```

5. (Optional) Change the system priority:

```
lacp system-priority <0-65535>
```

6. Configure aggregation for the port:

```
lacp aggr-wait-time <200-2000>[aggregation enable]
```

If you do not configure the optional parameter, the system uses the default values.

- Configure parameters for the partner device at the opposite end of the link:

Note

All parameters beginning with **partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what is learned from the partner, there will be trace or log messages.

```
lacp partner-key <0-65535|defVal>

lacp partner-port <0-65535>

lacp partner-port-priority <0-65535>

lacp partner-state <0-255 | 0x0-0xff>

lacp partner-system-id 0x00:0x00:0x00:0x00:0x00:0x00

lacp partner-system-priority <0-65535>
```

- Configure additional LACP parameters as required:

```
lacp enable [fast-periodic-time <200-20000>] [slow-periodic-time
<10000-30000>] [timeout-time <long|short>] [timeout-scale <2-10>]
```

If you do not configure the optional parameters, the system uses the default values.

- Enable LACP aggregation:

```
lacp aggregation enable
```

Examples

Configure LACP on ports 1/2 and 1/3:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/2-1/3
Switch:1(config-if)#lacp key 100
Switch:1(config-if)#lacp aggregation enable
Switch:1(config-if)#lacp enable
```

Return the key to the default value:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/2-1/3
Switch:1(config-if)#no lacp aggregation enable
Switch:1(config-if)#default lacp key
Switch:1(config-if)#lacp aggregation enable
```

Variable Definitions

The following table defines parameters for the **lACP** command.

**Note**

All parameters beginning with **partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what is learned from the partner, there will be trace or log messages.

Variable	Value
<i>aggr-wait-time</i> <200-2000>	Configures the aggregation wait time (in milliseconds) for this port. The default is 2000.
<i>aggregation enable</i>	Enables aggregation on the port, which makes it an aggregated link.
<i>enable</i>	Enables LACP for this port. The default is disabled.
<i>fast-periodic-time</i> <200-20000>	Configures the fast periodic time (in milliseconds) for this port. The default is 1000 ms.
<i>key</i> <1-512 defVal>	Configures the aggregation key for this port. Enter the aggregation key value or defVal (1024 + IfIndex) To return a configured key to the default value, you must first disable LACP aggregation on the port.
<i>mode</i> { <i>active</i> <i>passive</i> }	Configures the LACP mode to be active or passive.
<i>partner-key</i> <0-65535>	Configures the partner administrative key.
<i>partner-port</i> <0-65535>	Configures the partner administrative port value.
<i>partner-port-priority</i> <0-65535>	Configures the partner administrative port priority value.
<i>partner-state</i> <0-255 0x0-0xff>	Configures the partner administrative state bitmask. Specify the partner administrative state bitmap in the range 0x0-0xff. The bit to state mapping is Exp, Def, Dis, Col, Syn, Agg, Time, and Act. For example, to set the two partner-state parameters <ul style="list-style-type: none"> • Act = true • Agg = true specify a value of 0x05 (bitmap = 00000101).
<i>partner-system-id</i> <0x00:0x00:0x00:0x00:0x00:0x00>	Configures the partner administrative system ID. Specify a MAC address in the format 0x00:0x00:0x00:0x00:0x00:0x00.
<i>partner-system-priority</i> <0-65535>	Configures the partner administrative system priority value.
<i>priority</i> <0-65535>	Configures the port priority. The default value is 32768.
<i>slow-periodic-time</i> <10000-30000>	Configures the slow periodic time for this port. The default is 30000 ms.

Variable	Value
<code>system-priority <0-65535></code>	Configures the system priority for this port. The default is 32768.
<code>timeout-scale <2-10></code>	Configures a timeout scale for this port. The default value is 3. The LACP timeout is equal to the slow periodic time or fast periodic time multiplied by the timeout-scale, depending how you configure the timeout-time variable.
<code>timeout-time {long short}</code>	Configures the timeout to either long or short.

Configure LACP on an MLT

Configure an MLT with LACP to use the dynamic link aggregation function.

About This Task

Important

Attach ports to an aggregator only if their system priorities are the same; otherwise, they are considered to be operating in two different switches. You can attach ports to an aggregator only if their keys are the same.

When you add a VLAN to a dynamic MLT, only the active ports of the MLT are added as port members of the VLAN. Ports configured with the same aggregation key, but not active, are not added to the VLAN. If these inactive ports become active later, the system does not automatically add them to the VLAN port member list.

You must add all inactive ports to the VLAN. If you do not add the inactive ports to the VLAN, when they become active later, hashing can result in choosing a newly active port for traffic forwarding. Because the port is not a port member of the VLAN, traffic will be dropped. When you add the VLAN to the MLT, also add the inactive aggregation ports to the VLAN. You may need to disable LACP on the inactive ports before you can add them to the VLAN. Because the ports are inactive, disabling LACP does not cause a traffic interruption.

Similarly when you remove a VLAN from a dynamic MLT, all active ports of the MLT are removed from the VLAN port member list but the inactive members are not removed. You must remove the inactive aggregation members from the VLAN.

If you later configure a port for the same aggregation, you must add this port to all VLANs that are members of the MLT.

Procedure

1. Enter MLT Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface mlt <1-512>
```

2. Configure LACP on an MLT:

```
lacp enable [key <0-512>] [system-priority <0-65535>]
```

Example

Enable LACP and configure the LACP key on MLT 3:

```
Switch:1(config)# interface mlt 3
Switch:1(config-mlt)# lacp enable key 1281
```

Variable definitions

Use the data in the following table to use the **lacp** command.

Variable	Value
<i>enable</i>	Enables LACP on the MLT interface.
<i>key <0-512></i>	Configures the LACP aggregator key for a specific MLT. <ul style="list-style-type: none">• <i>0-512</i> is the LACP actor admin key.
<i>system-priority <0-65535></i>	Configures the LACP system priority for a specific MLT. <ul style="list-style-type: none">• <i>0-65535</i> is the system priority.

Configure LACP and Private VLANs

About This Task

Use the following procedure to configure Link Aggregation Control Protocol (LACP) on a private VLAN.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable trunking:

```
encapsulation dot1q
```

3. Set private VLAN port type:

```
private-vlan [isolated|promiscuous|trunk]
```

Example

```
Switch:1(config)#interface GigabitEthernet 1/6
Switch:1(config-if)#encapsulation dot1q
Switch:1(config-if)#private-vlan promiscuous
Switch:1(config-if)#exit

Switch:1(config)#interface GigabitEthernet 1/37
Switch:1(config-if)#encapsulation dot1q
Switch:1(config-if)#private-vlan promiscuous
```

View LACP Configuration Information

View LACP configuration information to determine the LACP parameters and to ensure your configuration is correct.

Procedure

1. View the global configuration:

```
show lacp
```

2. View LACP administrative information for the local device:

```
show lacp actor-admin interface [gigabitethernet]
```

OR

```
show lacp actor-admin interface gigabitethernet [vid <1-4059>] [{slot/
port[-slot/port] [,...] [slot/all] [all]}]
```

3. View LACP operational information for the actor device:

```
show lacp actor-oper interface [gigabitethernet]
```

OR

```
show lacp actor-oper interface gigabitethernet [vid <1-4059>] [{slot/
port[-slot/port] [,...] [slot/all] [all]}]
```

4. View LACP timer information:

```
show lacp extension interface [gigabitethernet]
```

5. View LACP interface configuration information

```
show lacp interface
```

OR

```
show lacp interface gigabitethernet [vid <1-4059>] [{slot/port[-slot/
port] [,...] [slot/all] [all]}]
```

OR

```
show lacp interface mlt [<64-6399>]
```

OR

```
show lacp interface mlt [id<1-512>]
```

6. View LACP administrative information for the partner device:

```
show lacp partner-admin interface [gigabitethernet]
```

OR

```
show lacp partner-admin interface gigabitethernet [vid <1-4059>]
[{{slot/port[-slot/port]}[,...][slot/all][all]}]
```

7. View LACP operational information for the partner device:

```
show lacp partner-oper interface [gigabitethernet]
```

OR

```
show lacp partner-oper interface gigabitethernet [vid <1-4059>]
[{{slot/port[-slot/port]}[,...][slot/all][all]}]
```

Example

```
Switch:1# show lacp
```

```

Display LACP Statistics for Specific Ports

Display individual LACP statistics for specific ports to manage network performance.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View statistics for specific ports:

```
show interfaces GigabitEthernet statistics lacp [{slot/port[/sub-port]
[-slot/port[/sub-port]][,...]]}
```

Example

View LACP statistics:

```
Switch:1>enable
Switch:1#show interfaces gigabitethernet statistics lacp

=====
Port Stats Lacp
=====
PORT TX      RX      TX      RX      TX      RX      RX      RX

```

Variable Definitions

Use the data in the following table to use the **show interfaces GigabitEthernet statistics lacp** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]][, ...] [slot/all] [all]}</code>	<div>Identifies the slot and port in one of the following formats:</div> <ul style="list-style-type: none">• a single slot and port (slot/port)• a range of slots and ports (slot/port-slot/port)• a series of slots and ports (slot/port,slot/port,slot/port)• all ports on the same slot (slot/all)• all ports on the switch (all) <div>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</div>

LACP configuration using EDM

MultiLink Trunking (MLT) with Link Aggregation Control Protocol (LACP) manages switch ports and port memberships to form a link aggregation group (LAG). Configure LACP to allow dynamic bundling of physical ports to form a single logical channel.

Note
The switch does not support standby ports for LACP aggregation groups.

Configure Global LACP Parameters

Use LACP parameters to manage switch ports and their port memberships to form link aggregation groups (LAG). Link Aggregation Control Protocol (LACP) can dynamically add or remove LAG ports, depending on their availability and states.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **MLT/LACP**.
3. Select the **LACP Global** tab.
4. To enable LACP globally, select the **Enable** check box.
5. Configure the remaining parameters as required.

**Important**

Configuration changes to the LACP timers are not effective immediately. Link Aggregation Control Protocol timers are not reset until the next time LACP is restarted globally or on a port. This ensures consistency with peer switches.

6. Select **Apply**.

LACP Global *Field Descriptions*

Use the data in the following table to use the **LACP Global** tab.

Name	Description
Enable	Enables or disables LACP globally.
SystemPriority	Configures the system priority for all LACP enabled aggregators and ports. The default value is 32768.
FastPeriodicTime	Configures the number of milliseconds between periodic transmissions that use short timeouts. Sets this value to all LACP-enabled ports. The range is 200–20000. The default value is 1000.
FastPeriodicTimeOper	Displays the operating value of the fast periodic timer on the port. The default value is 1000.
SlowPeriodicTime	Configures the number of milliseconds between periodic transmissions that use long timeouts. All LACP enabled ports get the same value from this setting. The range is 10000–30000. The default value is 30000.
SlowPeriodicTimeOper	Displays the operating value of the slow periodic timer on the port. The default value is 30000.
AggrWaitTime	Configures the number of milliseconds to delay aggregation to allow multiple links to aggregate simultaneously. The range is 200–2000. The default value is 2000.

Name	Description
AggrWaitTimeOper	Displays the operating value of the aggregate wait timer on the port. The default value is 2000.
TimeoutScale	Configures the value used to calculate timeout time from the periodic time. All LACP-enabled ports get the same value from this setting. The range is 2–10. The default value is 3.
TimeoutScaleOper	Displays the operating value of the timeout scale on the port. The default value is 3.
SysId	Specifies the LACP system ID. The default value is f8:73:a2:00:90:00.
SmltSysId Note: Exception: not supported on 4220 Series or 5320 Series.	Specifies the LACP system ID for Split MultiLink Trunking (SMLT).

Configure LACP Parameters

Configure LACP parameters to manage LACP information.

About This Task

Important

The switch does not support standby ports for LACP aggregation groups.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **MLT/LACP**.
3. Select the **LACP** tab.
4. Double-click a field to change the value.
5. Select **Apply**.

LACP Field Descriptions

Use the data in the following table to use the **LACP** tab.

Name	Description
Index	The unique identifier the local system allocates to this aggregator. This attribute identifies an aggregator instance among the subordinate managed objects of the containing object. This value is read-only.
MACAddress	The six octet read-only value carrying the individual MAC address assigned to the aggregator.
ActorSystemPriority	The two octet read-write value indicating the priority value associated with the actor system ID. The default value is 32768.
ActorSystemID	The six octet read-write MAC address value used as a unique identifier for the system that contains this aggregator. From the perspective of the link aggregation mechanisms, only a single combination of actor system ID and system priority are considered. No distinction is made between the values of these parameters for an aggregator and the ports that are associated with it. The protocol is described in terms of the operation of aggregation within a single system. However, the managed objects provided for the both the aggregator and the port allow management of these parameters. The result permits a single piece of equipment to be configured by management to contain more than one system from the point of view of the operation of link aggregation, which is useful in the configuration of equipment that has limited aggregation capability.
AggregateOrIndividual	Indicates whether the aggregator represents an aggregate (true) or an individual link (false).
ActorAdminKey	Specifies the current administrative value of the key for the aggregator, which is a 16-bit read-write value. The administrative key value can differ from the operational key value. This key needs to match the LAG key. The default value is 0.
ActorOperKey	Displays the current read-only operational value of the key for the aggregator. The operational key value can differ from the administrative key value. The meaning of particular key values is of local significance.
PartnerSystemID	The six octet read-only MAC address value consisting of the unique identifier for the current protocol partner of this aggregator. A value of zero indicates that there is no known partner. If the aggregation is manually configured, the value is assigned by the local system.

Name	Description
PartnerSystemPriority	The two octet read-only value that indicates the priority value associated with the partner system ID. If the aggregation is manually configured, this system priority value is a value assigned by the local system.
PartnerOperKey	The current operational value of the key for the aggregator current protocol partner, which is a 16-bit read-only value. If the aggregation is manually configured, the value is assigned by the local system.

Configure LACP on a Port

Important

Changes made at the global level override and reset the port-level configuration.

Configure LACP on a port to enable LACP.

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

Before You Begin

When enabling or disabling LACP on a port, as a best practice, disable the port first and re-enable the port after the configuration is complete.

About This Task

The minimum LACP configuration is as follows:

- Assign a given key to a set of ports. In the following procedure steps, you must assign the key before you enable LACP on the port.
- Assign the same key to an MLT with no members. The ports will automatically become MLT members.

Keys do not need to match between two LACP peers.

A port can operate in active or passive mode. You can configure a port to be an individual link or an aggregated link.

Note

When using LACP with private VLANs, configure the private VLAN at the interface level.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.

4. Select the **LACP** tab.
5. To assign an LACP key, configure **ActorAdminKey**.
6. Select **Apply**.
7. To enable LACP on the port, select **AdminEnable**.
8. Configure the remaining parameters as required.
9. Select **Apply**.

LACP Field Descriptions

Use the data in the following table to use the **LACP** tab.

All parameters beginning with **Partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what is learned from the partner, there will be trace or log messages.

Name	Description
AdminEnable	Enables LACP status for the port. The default value is false.
OperEnable	Displays the operational status of LACP for the port. The default value is false.
FastPeriodicTime	Specifies the number of milliseconds between periodic transmissions using short timeouts for all LACP enabled ports. The default value is 1000.
FastPeriodicTimeOper	Displays the operating value of the fast periodic timer on the port. The default value is 1000.
SlowPeriodicTime	Specifies the number of milliseconds between periodic transmissions using long timeouts for all LACP enabled ports. The default value is 30000.
SlowPeriodicTimeOper	Displays the operating value of the slow periodic timer on the port. The default value is 30000.
AggrWaitTime	Specifies the number of milliseconds to delay aggregation so multiple links can aggregate simultaneously. The default value is 2000.
AggrWaitTimeOper	Displays the operating value of the aggregate wait timer on the port. The default value is 2000.
TimeoutScale	Assigns the value used to calculate timeout time from the periodic time. Configure this value for all LACP-enabled ports. The default value is 3.

Name	Description
TimeoutScaleOper	Displays the operating value of the timeout scale on the port. The default value is 3.
ActorSystemPriority	Specifies the two octet read-write value indicating the priority value associated with the actor system ID. The default value is 32768.
ActorSystemID	Displays the six octet read-write MAC address value used as a unique identifier for the system that contains this aggregator. From the perspective of the link aggregation mechanisms, only a single combination of actor system ID and system priority are considered, and no distinction is made between the values of these parameters for an aggregator and the ports that are associated with it; that is, the protocol is described in terms of the operation of aggregation within a single system. However, the managed objects provided for the aggregator and the port both enable management of these parameters. The result of this is to permit a single piece of equipment to be configured by management to contain more than one system from the point of view of the operation of link aggregation. This can be of particular use in the configuration of equipment that has limited aggregation capability.
ActorAdminKey	Configures the aggregation key for this port. The administrative key value can differ from the operational key value. This key must match the LAG key. To return a configured key to the default value, you must first disable LACP aggregation on the port.
ActorOperKey	Displays the current operational value of the key for the aggregator. The operational key value can differ from the administrative key value. The meaning of particular key values is of local significance.
SelectedAggID	Displays the identifier value of the aggregator that this aggregation port has currently selected. Zero indicates that the aggregation port has not selected an aggregator, either because it is in the process of detaching from an aggregator or because there is no suitable aggregator available for it to select.

Name	Description
AttachedAggID	Displays the identifier value of the aggregator to which this aggregation port is currently attached. Zero indicates that the aggregation port is not currently attached to an aggregator.
ActorPort	Displays the port number locally assigned to the aggregation port. The port number is communicated in LACPDUs as the Actor_Port.
ActorPortPriority	Specifies the priority value assigned to this aggregation port. The default value is 32768.
ActorAdminState	Configures one or more of the following: <ul style="list-style-type: none"> • lacpActive - Configures the LACP mode to be active. • lacpShortTimeout - Configures the timeout to short. • aggregation - Enables aggregation on the port, which makes it an aggregated link. By default, only lacpActive is enabled. These values enable administrative control over the values of LACP_Activity, LACP_Timeout, and aggregation.
ActorOperState	Displays a string of eight bits, corresponding to the current operational values of Actor_State as transmitted by the actor in LACPDUs. The default value is lacpActive.
PartnerAdminSystemPriority	Specifies the current administrative value of the port number for the protocol partner. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation. The default value is 0.
PartnerOperSystemPriority	Displays a two octet value indicating the operational value of priority associated with the partner system ID. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemPriority if there is no protocol partner. The default value is 0.

Name	Description
PartnerAdminSystemID	Specifies a six octet MAC address value that represents the administrative value of the aggregation port protocol partners system ID. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminKey, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation. The default value is 00:00:00:00:00:00.
PartnerOperSystemID	Displays a six octet MAC address value that indicates representing the current value of the aggregation port protocol partner system ID. A value of zero indicates that there is no known protocol partner. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemID if there is no protocol partner. The default value is 00:00:00:00:00:00.
PartnerAdminKey	Specifies the current administrative value of the key for the protocol partner. The assigned value is used with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation. The default value is 0.
PartnerOperKey	Displays the current operational value of the key for the aggregator current protocol partner. If the aggregation is manually configured, this value is assigned by the local system. The default value is 0.
PartnerAdminPort	Specifies the current administrative value of the port number for the protocol partner. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation. The default value is 0.
PartnerOperPort	Displays the operational port number assigned to this aggregation port by the aggregation port protocol partner. The value of this attribute can contain the manually configured value carried in AggPortPartnerAdminPort if there is no protocol partner. The default value is 0.

Name	Description
PartnerAdminPortPriority	Specifies the current administrative value of the port priority for the protocol partner. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPort to achieve manually configured aggregation. The default value is 0.
PartnerOperPortPriority	Displays the priority value assigned to this aggregation port by the partner. The value of this attribute can contain the manually configured value carried in PartnerAdminPortPriority if there is no protocol partner. The default value is 0.
PartnerAdminState	Specifies a string of eight bits, corresponding to the current administrative value of Actor_State for the protocol partner, by selecting check boxes. The assigned value is used to achieve manually configured aggregation. The default value is none.
PartnerOperState	Displays a string of eight bits, corresponding to the current values of Actor_State in the most recently received LACPDU transmitted by the protocol partner. In the absence of an active protocol partner, this value can reflect the manually configured value PartnerAdminState. The default value is none.

Configure LACP on an Extreme Integrated Application Hosting Port

Note

This procedure only applies to 5720-24MXW, 5720-48MXW, 7520 Series, and 7720 Series.

About This Task

Perform this procedure to configure Link Aggregation Control Protocol (LACP) on an Extreme Integrated Application Hosting (IAH) port. You must use the LACP keys to determine which IAH ports are eligible for link aggregation. The LACP keys are defined by the IAH ports after you configure the multilink trunk (MLT). You can aggregate the IAH port key that matches the MLT key into that multilink trunk.

The minimum LACP configuration is as follows:

- Assign a given key to a set of IAH ports.

- Assign the same key to an MLT with no members. The IAH ports automatically become MLT members.

The keys do not have to match between two LACP peers.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Insight Port**.
2. Select the IAH port you want to configure.
3. Select the **LACP** tab.
4. Select **AdminEnable**.
5. In the **ActorAdminKey** field, enter a value.
6. Configure the other parameters as required.
7. Select **Apply**.

LACP Field Descriptions

Use data in the following table to use the **LACP** tab.

Note

The **Partner** fields in the **LACP** tab are for debug purpose only. If you configure them locally and there is a mismatch with what is learned from the partner, trace or log messages are generated.

Name	Description
AdminEnable	Enables LACP status for the Extreme Integrated Application Hosting port. The default value is false.
OperEnable	Specifies the LACP operational status for the Extreme Integrated Application Hosting port. The default value is false.
FastPeriodicTime	Specifies the number of milliseconds between periodic transmissions using short timeouts for all LACP enabled Extreme Integrated Application Hosting ports. The default value is 1000.
FastPeriodicTimeOper	Specifies the operating value of the fast periodic timer on the Extreme Integrated Application Hosting port. The default value is 1000.
SlowPeriodicTime	Specifies the number of milliseconds between periodic transmissions using long timeouts for all LACP enabled Extreme Integrated Application Hosting ports. The default value is 30000.

Name	Description
SlowPeriodicTimeOper	Specifies the operating value of the slow periodic timer on the Extreme Integrated Application Hosting port. The default value is 30000.
AggrWaitTime	Specifies the number of milliseconds to delay aggregation to enable multiple links to aggregate simultaneously. The default value is 2000.
AggrWaitTimeOper	Specifies the operating value of the aggregate wait timer on the Extreme Integrated Application Hosting port. The default value is 2000.
TimeoutScale	Specifies the value used to calculate timeout duration from the periodic time. Set the same value for all LACP enabled Extreme Integrated Application Hosting ports. The default value is 3.
TimeoutScaleOper	Specifies the operating value of the timeout scale on the Extreme Integrated Application Hosting port. The default value is 3.
ActorSystemPriority	Specifies the two octet read-write value indicating the priority value associated with the actor system ID. The default value is 32768.

Name	Description
ActorSystemID	<p>Specifies the six octet read-write MAC address value used as a unique identifier for the system that contains this aggregator.</p> <p>From the perspective of the link aggregation mechanisms, only a single combination of actor system ID and system priority are considered, and no distinction is made between the values of these parameters for an aggregator and the Extreme Integrated Application Hosting ports that are associated with it; that is, the protocol is described in terms of the operation of aggregation within a single system. However, the managed objects provided for the aggregator and the Extreme Integrated Application Hosting port both allow management of these parameters. The result of this is to permit a single piece of equipment to be configured by management to contain more than one system from the point of view of the operation of link aggregation. This can be of particular use in the configuration of equipment that has limited aggregation capability.</p>
ActorAdminKey	<p>Specifies the current read-write administrative value of the key for the aggregator, which is a 16-bit value. The administrative key value can differ from the operational key value. This key must match the LAG key.</p>
ActorOperKey	<p>Specifies the current read-only operational value of the key for the aggregator. The operational key value can differ from the administrative key value. The meaning of particular key values is of local significance.</p>
SelectedAggID	<p>Specifies the identifier value of the aggregator that this aggregation port has currently selected. Zero indicates that the aggregation port has not selected an aggregator, either because it is in the process of detaching from an aggregator or because there is no suitable aggregator available for it to select. This value is read-only.</p>
AttachedAggID	<p>Specifies the identifier value of the aggregator to which this aggregation port is currently attached. Zero indicates that the aggregation port is not currently attached to an aggregator. This value is read-only.</p>

Name	Description
ActorPort	Specifies the port number locally assigned to the aggregation port. The port number is communicated in LACPDUs as the Actor_Port. This value is read-only.
ActorPortPriority	Specifies the priority value assigned to this aggregation port. This 16-bit value is read-write. The default value is 32768.
ActorAdminState	Specifies a string of eight bits, corresponding to the administrative values as transmitted by the actor in LACPDUs. The values are: <ul style="list-style-type: none"> the first bit corresponds to bit 0 of Actor_State (LACP_Activity) (the default value) the second bit corresponds to bit 1 (LACP_Timeout) the third bit corresponds to bit 2 (Aggregation) the fourth bit corresponds to bit 3 (Synchronization) the fifth bit corresponds to bit 4 (Collecting) the sixth bit corresponds to bit 5 (Distributing) the seventh bit corresponds to bit 6 (Defaulted) the eighth bit corresponds to bit 7 (Expired) These values enable administrative control over the values of LACP_Activity, LACP_Timeout, and aggregation. This attribute value is read-write.
ActorOperState	Specifies a string of eight bits, corresponding to the current operational values of Actor_State as transmitted by the actor in LACPDUs. This attribute value is read-only. The default value is lacpActive.
PartnerAdminSystemPriority	Specifies the current administrative value of the Extreme Integrated Application Hosting port number for the protocol partner. It is a 16-bit read-write value. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation. The default value is 0.

Name	Description
PartnerOperSystemPriority	Displays a two octet read-only value indicating the operational value of priority associated with the partner system ID. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemPriority if there is no protocol partner. The default value is 0.
PartnerAdminSystemID	Specifies a six octet read-write MAC address value that represents the administrative value of the aggregation port protocol partners system ID. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminKey, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation. The default value is 00:00:00:00:00:00.
PartnerOperSystemID	Displays a six octet read-only MAC address value that indicates representing the current value of the aggregation port protocol partner system ID. A value of zero indicates that there is no known protocol partner. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemID if there is no protocol partner. The default value is 00:00:00:00:00:00.
PartnerAdminKey	Specifies the current administrative value of the key for the protocol partner. It is a 16-bit read-write value. The assigned value is used with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation. The default value is 0.
PartnerOperKey	Specifies the current operational value of the key for the aggregator current protocol partner. It is a 16-bit read-only value. If the aggregation is manually configured, this value is assigned by the local system. The default value is 0.

Name	Description
PartnerAdminPort	Specifies the current administrative value of the port number for the protocol partner. It is a 16-bit read-write value. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation. The default value is 0.
PartnerOperPort	Specifies the operational Extreme Integrated Application Hosting port number assigned to this aggregation port by the aggregation port protocol partner. The value of this attribute can contain the manually configured value carried in AggPortPartnerAdminPort if there is no protocol partner. This 16-bit value is read-only. The default value is 0.
PartnerAdminPortPriority	Specifies the current administrative value of the port priority for the protocol partner. It is a 16-bit read-write value. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPort to achieve manually configured aggregation. The default value is 0.
PartnerOperPortPriority	Specifies the priority value assigned to this aggregation port by the partner. The value of this attribute can contain the manually configured value carried in PartnerAdminPortPriority if there is no protocol partner. This 16 bit value is read-only. The default value is 0.

Name	Description
PartnerAdminState	Specifies a string of eight bits, corresponding to the current administrative value of Actor_State for the protocol partner, by selecting check boxes. This attribute value is read-write. The assigned value is used to achieve manually configured aggregation. The default value is none.
PartnerOperState	Specifies a string of eight bits, corresponding to the current values of Actor_State in the most recently received LACPDU transmitted by the protocol partner. In the absence of an active protocol partner, this value can reflect the manually configured value PartnerAdminState. This attribute value is read-only. The default value is none.

View LACP Port Statistics

View LACP port statistics to monitor the performance of the port.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand **Configuration > Graph**.
3. Select **Port**.
4. Select the **LACP** tab.
5. To change the poll interval, in the toolbar select the **Poll Interval** box, and then select a new interval.

LACP Field Descriptions

Use the data in the following table to use the **LACP** tab.

Name	Description
LACPDUsRx	The number of valid LACPDU received on this aggregation port.
MarkerPDUsRx	The number of valid marker PDUs received on this aggregation port.
MarkerResponsePDUsRx	The number of valid marker response PDUs received on this aggregation port.

Name	Description
UnknownRx	The number of frames received that either: <ul style="list-style-type: none">• carry Slow Protocols Ethernet type values, but contain an unknown PDU.• are addressed to the Slow Protocols group MAC Address, but do not carry the Slow Protocols Ethernet Type.
IllegalRx	The number of frames received that carry the Slow Protocols Ethernet Type value (43B.4), but contain a badly formed PDU or an illegal value of Protocol Subtype (43B.4).
LACPDUsTx	The number of LACPDU's transmitted on this aggregation port.
MarkerPDUsTx	The number of marker PDUs transmitted on this aggregation port.
MarkerResponsePDUsTx	The number of marker response PDUs transmitted on this aggregation port.

The following sections describe how to use Link Layer Discovery Protocol (LLDP) and Industry Standard Discovery Protocol (ISDP).

Link Layer Discovery Protocol (802.1AB) Fundamentals

With Link Layer Discovery Protocol (LLDP) you can obtain node and topology information to help detect and correct network and configuration errors.

LLDP

802.1AB is the IEEE standard called Station and Media Access Control Connectivity Discovery. This standard defines the Link Layer Discovery Protocol.

LLDP stations connected to a local area network (LAN) can advertise station capabilities to each other, allowing the discovery of physical topology information for network management.

LLDP-compatible stations can comprise any interconnection device, including PCs, IP Phones, switches, and routers.

Each LLDP station stores LLDP information in a standard Management Information Base (MIB), making it possible for a network management system (NMS) or application to access the information.

The functions of an LLDP station include:

- Advertising connectivity and management information about the local station to adjacent stations
- Receiving network management information from adjacent stations
- Enabling the discovery of certain configuration inconsistencies or malfunctions that can result in impaired communications at higher layers

For example, you can use LLDP to discover duplex mismatches between an IP Phone and the connected switch.

LLDP is compatible with IETF PROTO MIB (IETF RFC 2922).

The following figure shows an example of a LAN using LLDP.

Figure 177: LLDP in a LAN

Legend:

1. The switch and an LLDP-enabled router advertise chassis and port IDs and system descriptions to each other
2. The devices store the information about each other in local MIB databases, accessible with SNMP
3. A network management system retrieves the data stored by each device and builds a network topology map
4. Switch
5. Router
6. Management work station
7. IP Phone

LLDP Modes

LLDP is a one-way protocol.

An LLDP agent can transmit information about the capabilities and current status of the system associated with its MAC service access point (MSAP) identifier.

The LLDP agent also can receive information about the capabilities and current status of the system associated with a remote MSAP identifier.

However, LLDP agents cannot solicit information from each other.

You can configure the local LLDP agent to transmit and receive.

Connectivity and Management Information

The information parameters in each LLDP frame are in a LLDP Protocol Data Unit (PDU) as a sequence of short, variable length information elements known as TLVs (type, length, value).

Each LLDP PDU includes the following mandatory TLVs:

- Chassis ID
- Port ID
- Time To Live
- Port Description
- System Name
- System Description
- System Capabilities (indicates both the system supported capabilities and enabled capabilities, such as end station, bridge, or router)
- Management Address

The chassis ID and the port ID values are concatenated to form a logical MSAP identifier that the recipient uses to identify the sending LLDP agent and port.

A non-zero value in the Time to Live (TTL) field of the TTL TLV indicates to the receiving LLDP agent how long the LLDP PDU information from the MSAP identifier remains valid.

The receiving LLDP agent automatically discards all LLDP PDU information, if the sender fails to update it in a timely manner.

A zero value in TTL field of Time To Live TLV tells the receiving LLDP agent to discard the information associated with the LLDP PDU MSAP identifier.

LLDP for the Segmented Management Instance

LLDP and SONMP both advertise the same topology IP address for the Segmented Management Instance management interface. LLDP supports IPv4 and IPv6 advertisement.

If all three management interfaces are configured, the advertised default topology IP priority is management CLIP, then management VLAN, then management OOB. You can change the default topology IP using CLI or EDM. If multiple IPv4 addresses are

configured on an OOB or VLAN management interface, the advertised IP priority is static IP address, then DHCP IP address, then link-local IP address.

Transmitting LLDP PDUs

When a transmit cycle is initiated, the LLDP manager extracts the managed objects from the LLDP local system MIB and formats this information into TLVs. TLVs are inserted into the LLDP PDU.

LLDP PDUs are regularly transmitted at a user-configurable transmit interval (tx-interval) or when any of the variables in the LLDPDU is modified on the local system; for example, system name or management address.

Transmission delay (tx-delay) is the minimum delay between successive LLDP frame transmissions.

TLV system MIBs

The LLDP local system MIB stores the information to construct the various TLVs for transmission.

The LLDP remote systems MIB stores the information received from remote LLDP agents.

LLDP PDU and TLV error handling

The system discards LLDP PDUs and TLVs that contain detectable errors.

The system assumes that TLVs that contain no basic format errors, but that it does not recognize, are valid and stores them for retrieval by network management.

LLDP and MultiLink Trunking

You must apply TLVs on a per-port basis.

Because LLDP manages trunked ports individually, TLVs configured on one port in a trunk do not propagate automatically to other ports in the trunk.

And the system sends advertisements to each port in a trunk, not on a per-trunk basis.

LLDP and Fabric Attach

Fabric Attach uses LLDP to signal a desire to join the SPB network. When a switch is enabled as an FA Server, it receives IEEE 802.1AB LLDP messages from FA Client and FA Proxy devices requesting the creation of Switched UNI service identifiers (I-SIDs). All of the discovery handshakes and I-SID mapping requests are using LLDP TLV fields. Based on the LLDP standard, FA information is transmitted using organizational TLVs within LLDP PDUs.

FA also leverages LLDP to discover directly connected FA peers and to exchange information associated with FA between those peers.

Link Layer Discovery Protocol-Media Endpoint Discovery

Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) defined in ANSI/TIA-1057, is an extension to the LLDP standard protocol as defined in IEEE 802.1AB. LLDP-MED provides support to deploy Voice over Internet Protocol (VoIP) telephones into the LAN environment. LLDP-MED provides additional TLVs for basic configuration, network policy configuration, location identification, and inventory management.

Following are the types of LLDP-MED devices:

- Network connectivity devices: provide access to the IEEE 802 based LAN infrastructure for LLDP-MED endpoint devices. The LLDP-MED Network Connectivity device is a LAN access device based on:
 - LAN Switch or Router
 - IEEE 802.1 Bridge
 - IEEE 802.3 Repeater
 - IEEE 802.11 Wireless Access Point
 - Any device that supports the IEEE 802.1AB, LLDP-MED, and can relay IEEE 802 frames.
- Endpoint devices: located at the IEEE 802 LAN network edge, participating in the IP communication service using the LLDP-MED framework. The endpoint devices are divided into three classes:
 - Class 1 - LLDP-MED Generic Endpoint devices, for example, IP communication controllers.
 - Class 2 - LLDP-MED Media Endpoint devices, for example, media servers, conference bridges.
 - Class 3 - LLDP-MED Communication Endpoint devices, for example, IP telephones.

Organizational-specific TLVs for LLDP-MED

The organizational-specific TLVs for use by LLDP-MED network connectivity and endpoint devices are:

- Capabilities TLV — enables a network element to determine whether particular connected devices support LLDP-MED, and also discover the TLVs supported by specific network connectivity or endpoint devices.
- Network Policy Discovery TLV — enables both network connectivity and endpoint devices to advertise VLAN information, Layer 2, and Layer 3 priorities associated with a specific set of applications on a port. In addition, an LLDP-MED endpoint advertises this TLV for supported application types to enable the discovery of specific policy information and the diagnosis of network policy configuration mismatch issues.
- Location Identification Discovery TLV — allows network connectivity devices to advertise the appropriate location information for communication endpoint devices,

including emergency call service location, to use in the context of location-based applications.

- Extended Power-via-MDI Discovery TLV — enables advanced power management between an LLDP-MED network connectivity and endpoint devices. The Extended Power-via-MDI TLV enables the advertisement of fine grained power requirement details, endpoint power priority, and power status for network connectivity and endpoint devices.
- Inventory Management Discovery TLV — enables tracking and identification of inventory-related attributes for endpoint devices. For example, manufacturer, model name, and software version.

Link Layer Discovery Protocol configuration using CLI

This section describes how to configure Link Layer Discovery Protocol using the Command Line Interface (CLI).

IPv4 management IP addresses are supported by LLDP, including the management virtual IP address, and they are advertised in the Management address TLV.

Configure Global LLDP Transmission Parameters

Before You Begin

- In the GigabitEthernet Interface Configuration mode, specify the LLDP port status as transmit only or transmit and receive.

About This Task

Use this procedure to configure global LLDP transmission parameters on the switch. If required, you can also restore these parameters to their default values.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the LLDP transmission interval:
`lldp tx-interval <5-32768>`
3. Configure the LLDP transmission parameters:
`lldp tx-hold-multiplier <2-10>`

Example

Configure the LLDP transmission interval.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#lldp tx-interval 31
```

Variable Definitions

The following table defines parameters for the **lldp** command.

Variable	Value
<code>tx-interval<5-32768></code>	Specifies the global LLDP transmit interval in seconds, that is, the interval in which LLDP frames are transmitted. The default is 30 seconds.
<code>tx-hold-multiplier<2-10></code>	Configures the multiplier for the transmit interval used to compute the Time To Live (TTL) value in LLDP frames. The default is 4 seconds.

Configure LLDP Status on Ports

About This Task

Use this procedure to configure LLDP and configure the status to transmit and receive on a port, or ports, on your switch.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the status for transmit and receive on a port or ports:

```
lldp port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all]  
[all]} status <txAndRx>
```

Variable Definitions

The following table defines parameters for the **lldp port** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<code>status <txAndRx></code>	Enables LLDP PDU transmit and receive on the port(s).

Enable CDP Mode on a Port

To configure the switch as CDP-compatible, you must enable the Industry Standard Discovery Protocol (ISDP) on a port, or ports, on the switch.

About This Task

By default, if you enable CDP, the interface accepts only CDP packets. Similarly, if you disable CDP but enable LLDP, the interface accepts only LLDP packets. You can optionally configure the interface to send and receive both LLDP and CDP packets.

If you plan to configure a CDP-enabled port for features that rely on LLDP like Auto-sense or Fabric Attach (FA), ensure you enable both CDP and LLDP packet transmission on the port.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all] [all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable CDP on the port:

```
lldp cdp enable
```

3. (Optional) Configure the port to send and receive both CDP and LLDP packets:

```
lldp cdp dual-mode-enable
```

Disable LLDP Tx-TLVs

About This Task

Use this procedure to disable optional management Link Layer Discovery Protocol (LLDP) TLVs for transmission.

LLDP TLVs for transmission are enabled by default.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable LLDP TLVs for transmission:

```
no lldp tx-tlv {local-mgmt-addr | port-desc | sys-cap | sys-desc | sys-  
name}
```

3. Verify the configuration:

```
show lldp tx-tlv port {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Variable Definitions

The following table defines parameters for the **lldp tx-tlv** command.

Variable	Value
<i>local-mgmt-addr</i>	Specifies the local management address TLV. The default is enabled.
<i>port-desc</i>	Specifies the port description transmission TLV. The default is enabled.
<i>sys-cap</i>	Specifies the system capabilities transmission TLV. The default is enabled.

Variable	Value
<i>sys-desc</i>	Specifies the system description transmission TLV. The default is enabled.
<i>sys-name</i>	Specifies the system name transmission TLV. The default is enabled.

Enable Dot3 LLDP TLVs

About This Task

Use this procedure to enable transmission of dot3 MAC/PHY configuration/status Link Layer Discovery Protocol (LLDP) TLV.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable LLDP TLVs for transmission on a specific port:

```
lldp tx-tlv dot3 mac-phy-config-status
```

3. Verify the configuration:

```
show lldp tx-tlv dot3
```

Example

Enable LLDP TLVs for transmission on a specific port:

```
Switch:1>enable
Switch:1#config
Configuring from terminal or network [terminal]? t
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/2
Switch:1(config-if)#lldp tx-tlv dot3 mac-phy-config-status
Switch:1#show lldp tx-tlv dot3
=====
                        LLDP port dot3 tlvs
=====
-----
Port      MAC Physical
          Config Status
-----
1/1       disabled
```

1/2	enabled
1/3	enabled
1/4	disabled
1/5	disabled

Variable Definitions

The following table defines parameters for the **lldp tx-tlv dot3** command.

Variable	Value
<i>mac-phy-config-status</i>	Specifies the status of the MAC Physical Config Status TLV. The default is disabled.

Disable LLDP MED TLVs for Transmission on Ports

About This Task

Use this procedure to configure organizational-specific TLVs for Link Layer Discovery Protocol (LLDP) Media Endpoint Devices (MED). LLDP MED TLVs are enabled by default.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable LLDP MED TLVs for transmission:

```
no lldp tx-tlv med {extendedPSE | inventory | location | med-
capabilities | network-policy}
```

3. Verify the configuration:

```
show lldp tx-tlv med
```

Example

Disable LLDP MED TLVs

```
Switch:1>enable
Switch:1#config
Configuring from terminal or network [terminal]? t
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/2
Switch:1(config-if)#no lldp tx-tlv med inventory
Switch:1(config-if)#no lldp tx-tlv med location
Switch:1#show lldp tx-tlv med
```

LLDP port med tlvs					
Port	Med Capabilities	Network Policy	Location	ExtendedPower ViaMDI	Inventory
1/2	enabled	enabled	disabled	enabled	disabled

Variable Definitions

The following table defines parameters for the **lldp tx-tlv med** command.

Variable	Value
<i>extendedPSE</i>	Specifies the extended power-via-MDI Media Endpoint Device (MED) transmission TLV. This TLV is applicable for POE-capable switches only. The default is enabled on POE-capable switches only.
<i>inventory</i>	Specifies the system capabilities MED transmission TLV. The default is enabled.
<i>location</i>	Specifies the system description MED transmission TLV. The default is enabled.
<i>med-capabilities</i>	Specifies the system name MED transmission TLV. The default is enabled.
<i>network-policy</i>	Specifies the network policy MED transmission TLV. The default is enabled.

View Global LLDP Information

About This Task

Use this procedure to view global LLDP information, to know which LLDP settings and parameters are configured.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display LLDP local system data:
`show lldp local-sys-data [med]`
3. Display detailed LLDP neighbor information:
`show lldp neighbor detail [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]`

4. Display the summary of LLDP neighbors:

```
show lldp neighbor summary [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```

5. Display the list of ports:

```
show lldp port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```

6. Display the LLDP reception statistics:

```
show lldp rx-stats [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```

7. Display the LLDP statistics:

```
show lldp stats
```

8. Display the LLDP transmission statistics:

```
show lldp tx-stats [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```

Examples

View global LLDP information:

```
Switch:1#show lldp
802.1ab Configuration:
-----
          TxInterval: 30
      TxHoldMultiplier: 4
          ReinitDelay: 1
              TxDelay: 1
      NotificationInterval: 5
```

View the LLDP local system data on the switch:

```
Switch:1#show lldp local-sys-data
=====
                        LLDP Local System Data

Variable Definitions

The following table defines parameters for the **show lldp** command.

Variable	Value
<i>local-sys-data</i>	Displays the LLDP local system data.
<i>neighbor detail</i>	Displays detailed LLDP neighbor information. You can also view this on a specific port.
<i>neighbor summary</i>	Displays a summary of LLDP neighbor(s). You can also view this on a specific port.
<i>port</i> [{slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/all][all]]}	Displays the LLDP administrative status of a port or all ports on the switch.
<i>rx-stats</i> [port {slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/all][all]]}	<p>Displays the LLDP reception statistics on all ports on the switch, or on a specific port.</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<i>stats</i>	Displays the LLDP statistics.
<i>tx-stats</i> [port {slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/all][all]]}	<p>Displays the LLDP transmission statistics on all ports on the switch or on a specific port.</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p> <p>] t</p>

View LLDP Neighbor Information

About This Task

Use this procedure to display LLDP neighbor information.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View LLDP neighbor information:

```
show lldp neighbor [detail] [dot3] [med] [port {slot/port[/sub-  
port] [-slot/port[/sub-port]] [,...][slot/all][all]] [summary] [vendor-  
specific]
```

Variable Definitions

The following table defines parameters for the **show lldp neighbor** command.

Variable	Value
detail	Displays LLDP neighbor-specific information.
dot3	Displays remote LLDP dot3 information.
med	Displays LLDP neighbors learned based on LLDP-MED TLV information.
port {slot/ port[/sub-port] [-slot/port[/sub-port]] [,...][slot/ all][all]}	<p>Displays LLDP neighbor information on the specified port. Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
summary [port {slot/ port[/sub-port] [-slot/port[/sub-port]] [,...][slot/ all][all]}	<p>Displays the summary of LLDP neighbors of a port or all ports on the switch. Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
vendor-specific	Displays the remote LLDP vendor-specific call server and file server information.

View Global LLDP Statistics

Use this procedure to view and verify global LLDP statistics.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View LLDP statistics:
show lldp stats
3. View LLDP reception statistics:
show lldp rx-stats
4. View LLDP transmission statistics:
show lldp tx-stats
5. (Optional) Clear global LLDP statistics:
clear lldp stats [summary]

Example

View LLDP statistics:

```
Switch:1>enable
Switch:1#show lldp stats

1/2	100

View LLDP reception statistics:

```
Switch:1#show lldp rx-stats
```

LLDP Rx-Stats						
Port Num	Frames Discarded	Frames Errors	Frames Total	TLVs Discarded	TLVs Unrecognized	AgeOuts
1/2	0	0	46	0	0	0

View Port-Based LLDP Statistics

Use this procedure to verify port-based LLDP statistics.

About This Task

LLDP operates at the interface level. Enabling FA on a port automatically enables LLDP transmission and reception on the port. It also enables traffic tagging and disables spanning tree on that port.

Enabling FA on an MLT enables LLDP transmission and reception on all ports in the MLT.

Note

When FA is enabled on ports in an MLT or LACP MLT, tagging is enabled and spanning tree is disabled on those ports.

When a port is removed from an MLT, LLDP transmission on that port stops and spanning tree is enabled. Any I-SID-to-VLAN mappings on that port are removed, if not already learned on any other port in the MLT. This also causes the Switched UNI I-SID to be deleted from the MLT. If however, the mappings are learned on another port on the MLT, then the Switched UNI I-SID continues to exist for that MLT.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Verify successful LLDP transmission on a port:

```
show lldp tx-stats port {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]}
```

3. Verify that a port receives LLDP PDUs successfully:

```
show lldp rx-stats port {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]}
```

4. (Optional) Clear LLDP statistics on a port:

```
clear lldp stats {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]}
```

Example

Verify LLDP transmission statistics on a port:

```
Switch:1>en
Switch:1#show lldp tx-stats port 1/2
=====
LLDP Tx-Stats
=====
PORT NUM          FRAMES
-----
1/2                100
```

Verify that the port is receiving LLDP PDUs:

```
Switch:1#show lldp rx-stats port 1/2
```

LLDP Rx-Stats						
Port Num	Frames Discarded	Frames Errors	Frames Total	TLVs Discarded (Non FA)	TLVs Unsupported (Non FA)	AgeOuts
1/2	0	0	46	0	0	0

LLDP-MED Configuration Using CLI

Configure LLDP-MED information for local and remote systems on specific ports. LLDP-MED is enabled by default and all its TLVs are enabled for transmission.

To configure LLDP-MED TLVs in the LLDP PDUs on an interface:

- Configure LLDP-MED.
- Configure LLDP-MED network policy and location information.
- The switch automatically configures LLDP-MED capabilities, power, and inventory information.

Configure LLDP-MED Network Policies on Ports

About This Task

Perform this procedure to configure network policies on specific ports.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure a network policy:

```
lldp med-network-policies {guest-voice | guest-voice-signaling |  
softphone-voice | streaming-video | video-conferencing | video-  
signaling | voice | voice-signaling} [dscp <0-63>] [priority <0-7>]  
[tagging {tagged|untagged}] [vlan-id <0-4059>]
```

Example

Configuring guest voice network policy on port 1/2:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#lldp med-network-policies guest-voice dscp 1 priority 5 tagging
tagged vlan-id 5
```

Variable Definitions

The following table defines parameters for the **lldp med-network-policies** command.

Variable	Value
<i>{guest-voice guest-voice-signaling softphone-voice streaming-video video-conferencing video-signaling voice voice-signaling}</i>	Specifies the type of network policy.
<i>dscp <0-63></i>	Specifies the Layer 3 DiffServ Code Point (DSCP) value, as defined in IETF RFC 2474 and RFC 2475. The default is 0.
<i>priority <0-7></i>	Specifies the priority level, as defined in IEEE 802.1D. The default is 0.
<i>tagging {tagged untagged}</i>	Specifies the type of VLAN tagging to apply on the selected ports. The default is untagged.
<i>vlan-id <0-4059></i>	Specifies the VLAN ID for the port, as defined in IEEE 802.1Q. If you configure priority tagged frames, the system recognizes only the 802.1D priority level and uses a value of 0 for the VLAN ID of the ingress port. The default is 0.

Configure LLDP-MED Civic Address Location Information

About This Task

Perform the following procedure to configure civic address location information of local LLDP-MED on specific ports.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the civic address location by configuring the country-code and at least one other location parameter:

```
lldp location-identification civic-address country-code WORD<2-2>  
(additional-code additional-information apartment block building city  
city-district county floor house-number house-number-suffix landmark  
leading-street-direction name place-type pobox postal-community-name  
postal-zip-code room-number state street street-suffix trailing-  
street-suffix) WORD<0-255>
```

Note

If you try to configure a civic-address with a large number of arguments, 26 or more, the command fails and a software message informs you to split the command into multiple smaller commands.

Example

Configuring civic address location on port 2/1:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface gigabitEthernet 2/1  
Switch:1(config-if)#lldp location-identification civic-address country-code US city New  
York
```

Variable Definitions

The following table defines parameters for the **lldp location-identification civic-address** command.

Variable	Value
additional-code WORD<0-255>	Specifies the location information parameters.
additional-information WORD<0-255>	Example: South Wing
apartment WORD<0-255>	Example: Apt 42
block WORD<0-255>	Specifies a block, e.g. 3

Variable	Value
building WORD<0–255>	Example: Low Library
city WORD<0–255>	Specifies a city, e.g. Sunnyvale
city-district WORD<0–255>	Specifies a city district, e.g. Santa Clara
country-code WORD<2–2>	Specifies a country using a 2 character string, example US (United States), CA (Canada).
county WORD<0–255>	Specifies a county, e.g. Alameda
floor WORD<0–255>	Example: 8
house-number WORD<0–255>	Specifies a house number, e.g. 123
house-number-suffix WORD<0–255>	Specifies a house number suffix, e.g. A, 1/2
landmark WORD<0–255>	Specifies a landmark, e.g. Columbia University
leading-street-direction WORD<0–255>	Specifies a leading street direction, e.g. N
name WORD<0–255>	Example: Joe's Barbershop
place-type WORD<0–255>	Example: office
pobox WORD<0–255>	Example: 12345
postal-community-name WORD<0–255>	Example: Leonia
postal-zip-code WORD<0–255>	Specifies a postal or zip code, e.g. 95054
room-number WORD<0–255>	Example: 450F
state WORD<0–255>	Specifies a state, e.g. NJ, FL
street WORD<0–255>	Specifies a street, e.g. Great America Parkway
street-suffix WORD<0–255>	Specifies a street suffix, e.g. Ave, Blvd
trailing-street-suffix WORD<0–255>	Specifies a trailing street suffix, e.g. SW

Configure LLDP-MED Coordinate Based Location Information

About This Task

Perform the following procedure to configure coordinate based location information of local LLDP-MED on specific ports.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure coordinate based location:

```
lldp location-identification coordinate (altitude WORD<1-13> {floors |  
meters} datum {NAD83/MLLW | NAD83/NAVD88 | WGS84} latitude WORD<1-14>  
{NORTH | SOUTH} longitude WORD<1-14> {EAST | WEST})
```

Example

Configuring coordinate based location on port 1/2:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface gigabitEthernet 1/2  
Switch:1(config-if)#lldp location-identification coordinate-base altitude 3 floors
```

Variable Definitions

The following table defines parameters for the **lldp location-identification coordinate** command.

Variable	Value
<i>altitude</i> WORD<1-13>	Specifies the value for altitude. The units of measurement are: <ul style="list-style-type: none"> • <i>floors</i> • <i>meters</i>
<i>datum</i>	Specifies the reference datum. The formats are: <ul style="list-style-type: none"> • NAD83/MLLW • NAD83/NAVD88 • WGS84
<i>latitude</i> WORD<1-14>	Specifies the latitude in degrees, and its relation to the equator from North or South.
<i>longitude</i> WORD<1-14>	Specifies the longitude in degrees, and its relation to the prime meridian from East or West.

Configure LLDP-MED Emergency Call Service Location

Perform the following procedure to configure emergency call service location of local LLDP-MED on specific ports.

About This Task

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure emergency call service location:

```
lldp location-identification ecs-elin WORD<10-25>
```

Example

Configuring emergency call service location on port 2/1-2/3:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface gigabitEthernet 2/1-2/3  
Switch:1(config-if)#lldp location-identification ecs-elin 123456789
```

Variable Definitions

The following table defines parameters for the **lldp location-identification ecs-elin** command.

Variable	Value
WORD<10-25>	Specifies the emergency line information number for emergency call service.

Display Local LLDP-MED Location Information

About This Task

Perform this procedure to display location information of the LLDP-MED configured locally.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display location information for local LLDP-MED:

```
show lldp [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...]  
[slot/all][all]] location-identification
```

Example

```
Switch:1>enable  
Switch:1#show lldp port 1/1-1/3 location-identification  
=====
```

LLDP-MED Location Information

```
=====

Display LLDP-MED Local Network Policies Configuration

About This Task

Perform this procedure to display LLDP-MED network policies locally configured on specific ports.

Procedure

1. Enter Privileged EXEC mode:
enable

2. Display LLDP-MED network policies configured:

```
show lldp [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...]  
[slot/all][all]] med-network-policies [guest-voice | guest-voice-  
signaling | softphone-voice | streaming-video | video-conferencing |  
video-signaling | voice | voice-signaling]
```

Example

```
Switch:1>enable  
Switch:1#show lldp med-network-policies
```

LLDP-MED Network Policies						
Port	Application Type	VlanID	Tagging	DSCP	Priority	Origin
1/2	Voice	4	Untagged	0	0	CONFIG
1/2	Guest Voice	0	Untagged	3	0	CONFIG

Link Layer Discovery Protocol configuration using EDM

This section describes how to configure LLDP on your switch using EDM.

Configure LLDP Global Information

Use this procedure to configure or view LLDP global information.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **Globals** tab.
4. After you make the required configuration changes, select **Apply** to save changes.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

Field	Description
lldpMessageTxInterval	Specifies the interval at which LLDP messages are transmitted. The default is 30 seconds.
lldpMessageTxHoldMultiplier	Specifies the multiplier used to calculate the time-to-live (TTL) value of an LLDP message. The default value is 4 seconds.
lldpReinitDelay	Specifies the delay in seconds between the time a port is disabled and the time it is re-initialized. The default is 1 second.

Field	Description
lldpTxDelay	Specifies the delay in seconds between successive LLDP transmissions. The default is 1 second. The value is as follows: $1 < \text{lldpTxDelay} < (0.25 \times \text{lldpMessageTxInterval})$
lldpNotificationInterval	Specifies the time interval between successive LLDP notifications. It controls the transmission of notifications. The default is 5 seconds.
Stats	
RemTablesLastChangeTime	Specifies the timestamp of LLDP missed notification events on a port, for example, due to transmission loss.
RemTablesInserts	Specifies the number of times the information advertised by a MAC Service Access Point (MSAP) is inserted into the respective tables.
RemTablesDeletes	Specifies the number of times the information advertised by an MSAP is deleted from the respective tables.
RemTablesDrops	Specifies the number of times the information advertised by an MSAP was not entered into the respective tables.
RemTablesAgeouts	Specifies the number of times the information advertised by an MSAP was deleted from the respective tables.

Configure LLDP on a Port

Use this procedure to view and change the LLDP port configuration.

About This Task

To modify a value, double-click on a table cell, and then select a value.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **Port** tab.
4. In **AdminStatus**, configure LLDP frame direction on the port.
5. In **NotificationEnable**, configure notification status.
6. In **TLVsTxEnable**, configure which TLVs LLDP transmits:
 - a. To enable a TLV, select one or more values, and then select **Ok**.
 - b. To enable all TLVs, select **Select All**, and then select **Ok**.
 - c. To disable all TLVs, select **Disable All**, and select **Ok**.
7. In **TLVsTxEnable(med)**, configure which TLVs LLDP transmits for MED devices:
 - a. To enable a TLV, select one or more values, and then select **Ok**.
 - b. To enable all TLVs, select **Select All**, and then select **Ok**.

- c. To disable all TLVs, select **Disable All**, and select **Ok**.
8. Select **Apply** to save configuration changes.
9. Select **Refresh** to verify the configuration.

Port Field Descriptions

Use the data in the following table to use the **Port** tab.

Name	Description
PortNum	Displays the port number.
AdminStatus	<p>Specifies the administrative status of the port. The options are as follows:</p> <ul style="list-style-type: none"> • txOnly: LLDP frames are only transmitted on this port. • rxOnly: LLDP frames are only received on this port. • txAndRx: LLDP frames are transmitted and received on this port. • disabled: LLDP frames are neither transmitted or received on this port. Any information received on this port from remote systems before this is disabled, ages out. <p>The default is disabled.</p>
NotificationEnable	<p>Specifies whether the port is enabled or disabled for notifications.</p> <ul style="list-style-type: none"> • true: indicates that the notifications are enabled. • false: indicates that the notifications are disabled. <p>The default is false.</p>
TLVsTxEnable	<p>Specifies the set of TLVs whose transmission using LLDP is always allowed by network management.</p> <p>The following list describes the TLV types:</p> <ul style="list-style-type: none"> • portDesc • sysName • sysDesc • sysCap <p>The default is an empty set of TLVs.</p>
CdpAdminState	<p>Configures the CDP administrative status of the port. Configure this parameter to true to enable the Industry Standard Discovery Protocol (ISDP) on the port. ISDP is CDP-compatible.</p> <p>The default is false.</p> <p>By default, if you enable CDP, the interface accepts only CDP packets. Similarly, if you disable CDP but enable LLDP, the interface accepts only LLDP packets. You can optionally configure the interface to send and receive both LLDP and CDP packets.</p>

Name	Description
DualMode	Configures the port to send and receive both CDP and LLDP packets. The default is false. If you plan to configure a CDP-enabled port for features that rely on LLDP like Auto-sense or Fabric Attach (FA), ensure you enable both CDP and LLDP packet transmission on the port.
CapSupported(med)	Specifies the LLDP-MED capabilities. The default is enabled.
TLVsTxEnable(med)	Specifies the set of TLVs whose transmission using LLDP is always allowed by network management. The following list describes the TLV types: <ul style="list-style-type: none"> • capabilities • networkPolicy • location • extendedPSE • inventory The default is an empty set of TLVs.

NEW Enable CDP Mode on a Port

To configure the switch as CDP-compatible, you must enable the Industry Standard Discovery Protocol (ISDP) on a port, or ports, on the switch.

About This Task

By default, if you enable CDP, the interface accepts only CDP packets. Similarly, if you disable CDP but enable LLDP, the interface accepts only LLDP packets. You can optionally configure the interface to send and receive both LLDP and CDP packets.

If you plan to configure a CDP-enabled port for features that rely on LLDP like Auto-sense or Fabric Attach (FA), ensure you enable both CDP and LLDP packet transmission on the port.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **Port** tab.
4. In **CdpAdminState**, select **true** to enable CDP,.
5. (Optional) In **DualMode**, select **true** to configure the port to send and receive both CDP and LLDP packets.
6. Select **Apply**.

View LLDP Transmission Statistics

Use this procedure to view the LLDP transmission statistics. You can also view the statistics graphically.

About This Task

LLDP operates at the port interface level. Enabling FA on a port automatically enables LLDP transmission and reception on that port. It also enables traffic tagging and disables spanning tree on that port.

Enabling FA on an MLT enables LLDP transmission and reception on all ports in that MLT.

Note

When a port is removed from an MLT, LLDP transmission on that port stops and spanning tree is enabled. Any I-SID-to-VLAN mappings on that port are removed, if not already learned on any other port in the MLT. This also causes the Switched UNI I-SID to be deleted from the MLT. If however, the mappings are learned on another port on the MLT, then the Switched UNI I-SID continues to exist for that MLT.

For ports in an LACP MLT, when FA is enabled, tagging is enabled on all ports in the LACP MLT. The consistency check for FA is based on key membership. If all ports with the same key do not support FA, FA is not successfully enabled on those ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **TX Stats** tab.
4. (Optional) To view the transmission statistics graphically for a port, see [Graph LLDP Transmission Statistics](#) on page 2498.

TX Stats Field Descriptions

Use the data in the following table to use the **TX Stats** tab.

Name	Description
PortNum	Specifies the port number.
FramesTotal	Specifies the total number of LLDP frames transmitted.

Graph LLDP Transmission Statistics

Use this procedure to view the LLDP transmission (TX) statistics. You can also view the statistics graphically.

About This Task

LLDP operates at the port interface level. Enabling FA on a port automatically enables LLDP transmission and reception on that port. It also enables traffic tagging and disables spanning tree on that port.

Enabling FA on an MLT enables LLDP transmission and reception on all ports in that MLT.

**Note**

When a port is removed from an MLT, LLDP transmission on that port stops and spanning tree is enabled. Any I-SID-to-VLAN mappings on that port are removed, if not already learned on any other port in the MLT. This also causes the Switched UNI I-SID to be deleted from the MLT. However, if the mappings are learned on another port on the MLT, the Switched UNI I-SID continues to exist for that MLT.

For ports in an LACP MLT, when FA is enabled, tagging is enabled on all ports in the LACP MLT. The consistency check for FA is based on key membership. If all ports with the same key do not support FA, FA is not successfully enabled on those ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **TX Stats** tab.
The system displays the transmission statistics.
4. To view the transmission statistics graphically for a port:
 - a. Select a row, and select **Graph**.
The system displays the **TX Stats-Graph,<port-number>** tab.
 - b. To view the graph, select one of the parameters, and then select the appropriate icon on the upper-left corner of the menu bar to draw a line chart, area chart, bar chart or a pie chart.
5. To clear the existing counters, and fix a reference point in time to restart the counters, select **Clear Counters**.
6. To export the statistical data to a file, select **Export**.
7. To configure a poll interval, select an appropriate value from **Poll Interval**.

TX Stats Field Descriptions

Use the data in the following table to use the **TX Stats** tab.

Name	Description
FramesTotal	Specifies the total number of LLDP frames transmitted.

View LLDP Reception Statistics

Use this procedure to view the LLDP reception statistics. You can also view these statistics graphically.

About This Task

LLDP operates at the port interface level. Enabling FA on a port automatically enables LLDP transmission and reception on that port. It also enables traffic tagging and disables spanning tree on that port.

Enabling FA on an MLT enables LLDP transmission and reception on all ports in that MLT.

Note

When a port is removed from an MLT, LLDP transmission on that port stops and spanning tree is enabled. Any I-SID-to-VLAN mappings on that port are removed, if not already learned on any other port in the MLT. This also causes the Switched UNI I-SID to be deleted from the MLT. If however, the mappings are learned on another port on the MLT, then the Switched UNI I-SID continues to exist for that MLT.

For ports in an LACP MLT, when FA is enabled, tagging is enabled on all ports in the LACP MLT. The consistency check for FA is based on key membership. If all ports with the same key do not support FA, FA is not successfully enabled on those ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **RX Stats** tab.
4. (Optional) To view the reception statistics graphically for a port:
 - a. Select a row, and then select **Graph**.
 - b. Select one or more of the parameters, and then select the appropriate icon on the top left of the menu bar to draw a line chart, area chart, bar chart or a pie chart.
 - c. Select **Refresh Counters** to clear the existing counters, and fix a reference point in time to restart the counters.
 - d. Select **Export** to export the statistical data to a file.
 - e. To fix a poll interval, select an appropriate value from **Poll Interval**.

RX Stats Field Descriptions

Use the data in the following table to use the **RX Stats** tab.

Name	Description
PortNum	Specifies the port number.
FramesDiscardedTotal	Specifies the number of LLDP frames received on the port, but discarded, for any reason. This counter provides an indication of possible LLDP header formatting problems in the sending system, or LLDP PDU validation problems in the receiving system.

Name	Description
FramesErrors	Specifies the number of invalid LLDP frames received on the port.
FramesTotal	Specifies the total number of LLDP frames received on the port.
TLVsDiscardedTotal	Specifies the number of LLDP TLVs discarded on the port, for any reason.
TLVsUnrecognizedTotal	Specifies the number of LLDP TLVs on the port, that are unrecognized on that port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001–111 1110). An unrecognized TLV could be, for example, a basic management TLV from a later LLDP version.
AgeoutsTotal	Specifies the number of LLDP age-outs that occur on a specific port. An age-out is the number of times the complete set of information advertised by a particular MSAP is deleted, because the information timeliness interval has expired.

Graph LLDP Reception Statistics

Use this procedure to graphically view the LLDP reception statistics.

About This Task

LLDP operates at the port interface level. Enabling FA on a port automatically enables LLDP transmission and reception on that port. It also enables traffic tagging and disables spanning tree on that port.

Enabling FA on an MLT enables LLDP transmission and reception on all ports in that MLT.

Note

When a port is removed from an MLT, LLDP transmission on that port stops and spanning tree is enabled. Any I-SID-to-VLAN mappings on that port are removed, if not already learned on any other port in the MLT. This also causes the Switched UNI I-SID to be deleted from the MLT. However, if the mappings are learned on another port on the MLT, the Switched UNI I-SID continues to exist for that MLT.

For ports in an LACP MLT, when FA is enabled, tagging is enabled on all ports in the LACP MLT. The consistency check for FA is based on key membership. If all ports with the same key do not support FA, FA is not successfully enabled on those ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.

3. Select the **RX Stats** tab.
4. To view the reception statistics graphically for a port:
 - a. Select a row, and then select **Graph**.
The system displays the **RX Stats-Graph,<port-number>** tab.
 - b. Select one of the parameters, and then select the appropriate icon in the upper-left corner of the menu bar to draw a line chart, area chart, bar chart or a pie chart.
5. To clear the existing counters, and fix a reference point in time to restart the counters, select **Clear Counters**.
6. To export the statistical data to a file, select **Export**.
7. To configure a poll interval, select an appropriate value from **Poll Interval**.

RX Stats Field Descriptions

Use the data in the following table to use the **RX Stats** tab.

Name	Description
FramesDiscardedTotal	Specifies the number of LLDP frames received on the port, but discarded, for any reason. This counter provides an indication of possible LLDP header formatting problems in the sending system, or LLDP PDU validation problems in the receiving system.
FramesErrors	Specifies the number of invalid LLDP frames received on the port.
FramesTotal	Specifies the total number of LLDP frames received on the port.
TLVsDiscardedTotal	Specifies the number of LLDP TLVs discarded on the port, for any reason.
TLVsUnrecognizedTotal	Specifies the number of LLDP TLVs on the port, that are unrecognized on that port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001–111 1110). An unrecognized TLV could be, for example, a basic management TLV from a later LLDP version.

View LLDP Local System Information

Use this procedure to view the LLDP local system information.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.

3. Select the **Local System** tab.

Local System *Field Descriptions*

Use the data in the following table to use the **Local System** tab.

Name	Description
ChassisIdSubType	Indicates the encoding used to identify the local system chassis. <ul style="list-style-type: none">• chassisComponent• interfaceAlias• portComponent• macAddress• networkAddress• interfaceName• local
ChassisId	Indicates the chassis ID of the local system.
SysName	Indicates local system name.
SysDesc	Indicates local system description.
SysCapSupported	Indicates the system capabilities supported on the local system.
SysCapEnabled	Indicates the system capabilities that are enabled on the local system.

View LLDP Local Port Information

Use this procedure to view the LLDP local port information.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **Local Port** tab.

Local port Field Descriptions

Use the data in the following table to use the **Local Port** tab.

Name	Description
PortNum	Specifies the port number.
PortIdSubType	Specifies the type of port identifier. <ul style="list-style-type: none">• interfaceAlias• portComponent• macAddress• networkAddress• interfaceName• agentCircuitId• local
PortId	Specifies the identifier associated with the port, on the local system.
PortDesc	Specifies the description of the port, on the local system.

View LLDP CDP Remote Information

Use this procedure to view the remote device information received through the Industry Standard Discovery Protocol (ISDP) (CDP-compatible) messages on the local interface.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **CDP Remote** tab.

CDP Remote Field Descriptions

Use the data in the following table to use the **CDP Remote** tab.

Name	Description
PortNum	Indicates the port number on which the remote system information is received.
CallServers	Indicates the remote call server IP addresses that are received on this port.
FileServers	Indicates remote file server IP addresses that are received on this port.

View LLDP Neighbor Information

Use this procedure to view the LLDP neighbor information.

About This Task

LLDP IPv6 neighbors do not display in EDM. LLDP IPv6 is only supported in CLI. To display LLDP IPv6 neighbors, use the **show lldp neighbor summary** command.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **LLDP**.
3. Select the **Neighbor** tab.

Neighbor Field Descriptions

Use the data in the following table to use the **Neighbor** tab.

Name	Description
TimeMark	Indicates the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021.
LocalPortNum	Identifies the port on which the remote system information is received.
Index	Indicates a particular connection instance that is unique to the remote system.
ProtocolType	Indicates whether the entry protocol is CDP or LLDP.
SysName	Indicates the name of the remote system.
IpAddress	Indicates the neighbor's IP address.
PortIdSubType	Indicates the type of encoding used to identify the remote port.
PortId	Indicates the remote port ID.
PortDesc	Indicates the remote port description.
ChassisIdSubtype	Indicates the type of encoding used to identify the remote system chassis. <ul style="list-style-type: none"> • chassisComponent • interfaceAlias • portComponent • macAddress • networkAddress • interfaceName • local
ChassisId	Indicates the chassis ID of the remote system.
SysCapSupported	Identifies the system capabilities supported on the remote system.
SysCapEnabled	Identifies the system capabilities enabled on the remote system.
SysDesc	Indicates the description of the remote system.

LLDP-MED Configuration Using EDM

Configure LLDP-MED information for local and remote systems on specific ports. LLDP-MED is enabled by default and all its TLVs are enabled for transmission.

To configure LLDP-MED TLVs in the LLDP PDUs on an interface:

- Configure LLDP-MED.
- Configure LLDP-MED location information.
- The switch automatically configures LLDP-MED capabilities, power, and inventory information.

Configure LLDP-MED Network Policies on Ports

About This Task

Perform this procedure to configure LLDP-MED network policies on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Local Policy** tab.
4. Select **Insert**.
5. In **PortNum**, select the ellipsis (...).
6. In **Port Editor: PortMembers** dialog box, select the desired ports.
7. Select **OK**.
8. In **PolicyAppType**, select the application type.
9. (Optional) In **PolicyVlanId**, type the VLAN ID for the port.
10. (Optional) In **PolicyPriority**, type the priority level.
11. (Optional) In **PolicyDscp**, type DSCP value.
12. (Optional) Select **Policy Tagged** to enable VLAN tagging on the port.
13. Select **Insert**.

Local Policy Field Descriptions

Use the data in the following table to use the **Local Policy** tab.

Name	Description
PortNum	Specifies the port.
PolicyAppType	Specifies the application type.
PolicyVlanId	Specifies the VLAN ID for the port, as defined in IEEE 802.1Q-2003. The value 0 is used if the device is using priority tagged frames, which means only the 802.1D priority level is significant, and the default VLAN ID of the ingress port is used instead.

Name	Description
PolicyPriority	Specifies the Layer 2 priority used for the specified application type, as defined in IEEE 802.1D-2004. The default is 0.
PolicyDscp	Specifies the value of the Differentiated Service Code Point (DSCP) associated with a specific port on the local LLDP-MED, as defined in IETF RFC 2474 and RFC 2475. The default is 0.
PolicyTagged	Specifies whether the application uses a tagged or untagged VLAN, as defined by IEEE 802.1Q-2003. <ul style="list-style-type: none">• true — uses tagged VLAN• false — uses untagged VLAN or does not support a port-based VLAN

Add LLDP-MED Local Location Information

About This Task

Perform this procedure to add location information of local LLDP-MED configured on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Local Location** tab.
4. In the **LocationInfo** column, double-click on the cell, and type the information.
5. Select **Apply**.

Local Location Field Descriptions

Use the data in the following table to use the **Local Location** tab.

Name	Description
PortNum	Specifies the port number.
LocationSubtype	Specifies the location subtype of the local LLDP-MED: <ul style="list-style-type: none">• coordinateBased• civicAddress• elin
LocationInfo	Specifies the location information of local LLDP-MED. The parsing of this information depends on the location subtype.

View LLDP-MED Local PoE PSE Information

About This Task

Perform this procedure to view PoE Power Sourcing Entity (PSE) information for local LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Local PoE PSE** tab.

Local PoE PSE Field Descriptions

Use the data in the following table to use the **Local PoE PSE** tab.

Name	Description
PortNum	Specifies the port.
PSEPortPowerAvailable	Specifies the value of the power available (in units of 0.1 watts) from the PSE through the specific port.
PSEPortPDPriority	Specifies the Power Device (PD) power priority for the PSE port (see RFC 3621): <ul style="list-style-type: none">• unknown — priority is not configured or known by the PD• critical• high• low

View LLDP-MED Neighbor Capabilities Information

About This Task

Perform this procedure to view capabilities information for remote LLDP-MED on specific ports based on the information advertised by the remote device and received on each port in the capabilities TLV.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Neighbor Capabilities** tab.

Neighbor Capabilities *Field Descriptions*

Use the data in the following table to use the **Neighbor Capabilities** tab.

Name	Description
TimeMark	Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021.
LocalPortNum	Specifies the port on which the remote LLDP-MED information is received.
Index	Specifies the connection instance unique to the remote LLDP-MED.
CapSupported	Specifies the LLDP-MED capabilities supported on the remote system.
CapCurrent	Specifies the LLDP-MED capabilities that are enabled on the remote system.
DeviceClass	Specifies the remote LLDP-MED device class.

View LLDP-MED Neighbor Policy Information**About This Task**

Perform this procedure to view policy information of remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Neighbor Policy** tab.

Neighbor Policy *Field Descriptions*

Use the data in the following table to use the **Neighbor Policy** tab.

Name	Description
TimeMark	Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021.
LocalPortNum	Specifies the port on which the remote LLDP-MED information is received.
Index	Specifies the particular connection instance that is unique to the remote LLDP-MED.
PolicyAppType	Specifies the policy application type.

Name	Description
PolicyVlanId	Specifies the VLAN ID for the port, as defined in IEEE 802.1Q-2003. The value 0 is used if the device is using priority tagged frames, which means only the 802.1D priority level is significant, and the default VLAN ID of the ingress port is used instead.
PolicyPriority	Specifies the Layer 2 priority used for the specified application type, as defined in IEEE 802.1D-2004. The default value is 0.
PolicyDscp	Specifies the value of the Differentiated Service Code Point (DSCP) associated with a specific port on the remote LLDP-MED, as defined in IETF RFC 2474 and RFC 2475. The default value is 0.
PolicyUnknown	Specifies the network policy for the remote LLDP-MED is currently unknown.
PolicyTagged	Specifies whether the application uses a tagged or untagged VLAN, as defined by IEEE 802.1Q-2003. <ul style="list-style-type: none"> • true — uses tagged VLAN • false — uses untagged VLAN or does not support a port based VLAN

View LLDP-MED Neighbor Location Information

About This Task

Perform this procedure to view location information of remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Neighbor Location** tab.

Neighbor Location *Field Descriptions*

Use the data in the following table to use the **Neighbor Location** tab.

Name	Description
TimeMark	Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021.
LocalPortNum	Specifies the port on which the remote LLDP-MED information is received.
Index	Specifies the particular connection instance that is unique to the remote LLDP-MED.
LocationSubType	Specifies the subtype of the remote LLDP-MED location: <ul style="list-style-type: none">• coordinateBased• civicAddress• elin
LocationInfo	Specifies the location information of the remote LLDP-MED.

View LLDP-MED Neighbor PoE Information**About This Task**

Perform this procedure to view PoE information of remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Neighbor PoE** tab.

Neighbor PoE *Field Descriptions*

Use the data in the following table to use the **Neighbor PoE** tab.

Name	Description
TimeMark	Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021.
LocalPortNum	Specifies the port on which the remote LLDP-MED information is received.

Name	Description
Index	Specifies the particular connection instance that is unique to the remote LLDP-MED.
PoEDeviceType	Specifies the type of PoE LLDP-MED. <ul style="list-style-type: none">• PseDevice: specifies the device as a Power Sourcing Entity (PSE).• pdDevice: specifies the device as a Power Device (PD).• none: specifies that the device does not support PoE.

View LLDP-MED Neighbor PoE PSE Information

About This Task

Perform this procedure to view PoE Power Sourcing Entity (PSE) information for remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Neighbor PoE PSE** tab.

Neighbor PoE PSE Field Descriptions

Use the data in the following table to use the **Neighbor PoE PSE** tab.

Name	Description
TimeMark	Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021.
LocalPortNum	Specifies the port on which the remote LLDP-MED information is received.
Index	Specifies the particular connection instance that is unique to the remote LLDP-MED.
PSEPowerAvailable	Specifies the power available from the PSE connected remotely to the specific port.

Name	Description
PSEPowerSource	Specifies the type of PSE Power Source for the remote LLDP-MED. <ul style="list-style-type: none">• unknown• primary• backup
PSEPowerPriority	Specifies the power priority associated with the PSE LLDP-MED, for more information, see RFC 3621. <ul style="list-style-type: none">• unknown• critical• high• low

View LLDP-MED Neighbor PoE PD Information

About This Task

Perform this procedure to view PoE Powered Device (PD) information for remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Neighbor PoE PD** tab.

Neighbor PoE PD Field Descriptions

Use the data in the following table to use the **Neighbor PoE PD** tab.

Name	Description
TimeMark	Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021.
LocalPortNum	Specifies the port on which the remote LLDP-MED information is received.
Index	Specifies the particular connection instance that is unique to the remote LLDP-MED.
PDPowerReq	Specifies the value of the power required by a PD LLDP-MED connected remotely to the port.

Name	Description
PDPowerSource	Specifies the power source being utilized by the PD LLDP-MED. <ul style="list-style-type: none"> from PSE: specifies that the device advertises its power source as received from a PSE. local: specifies that the device advertises its power source as local. local and PSE: specifies that the device advertises its power source as using both local and PSE power.
PDPowerPriority	Specifies the priority of the PD LLDP-MED connected remotely to the port, for more information, see RFC 3621. <ul style="list-style-type: none"> unknown — priority is not configured for the PD LLDP-MED critical high low

View LLDP-MED Neighbor Inventory Information

About This Task

Perform this procedure to view inventory attributes for LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics > LLDP & MED**.
2. Select **Port MED**.
3. Select the **Neighbor Inventory** tab.

Neighbor Inventory Field Descriptions

Use the data in the following table to use the **Neighbor Inventory** tab.

Name	Description
TimeMark	Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021.
LocalPortNum	Specifies the port on which the remote LLDP-MED information is received.
Index	Specifies the particular connection instance that is unique to the remote LLDP-MED.
HardwareRev	Specifies the current hardware revision of the LLDP-MED.

Name	Description
FirmwareRev	Specifies the current firmware revision of the LLDP-MED.
SoftwareRev	Specifies the current software revision of the LLDP-MED.
SerialNum	Specifies the current serial number of the LLDP-MED.
MfgName	Specifies the manufacturer of the LLDP-MED.
ModelName	Specifies the model name of the LLDP-MED.
AssetID	Specifies the asset tracking identifier for the LLDP-MED.

Link State Change Control

[Link Debounce](#) on page 2517

[Link State Change Control Using CLI](#) on page 2518

[Link State Change Control Using EDM](#) on page 2521

Rapid fluctuation in a port link state is called link flapping.

Link flapping is detrimental to network stability because it can trigger recalculation in spanning tree and the routing table.

If the number of port down events exceeds a configured limit during a specified interval, the system forces the port out of service.

You can configure link flap detection to control link state changes on a physical port. You can set thresholds for the number and frequency of changes allowed.

You can configure the system to take one of the following actions if changes exceed the thresholds:

- send a trap
- bring down the port

If changes exceed the link state change thresholds, the system generates a log entry.

Link Debounce

Table 184: Link Debounce for WAN Links

Feature	Product	Release introduced
Link Debounce	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.5
	5520 Series	VOSS 8.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.4.2
	VSP 7400 Series	VOSS 8.4.2

In a WAN environment, when a carrier-side link failure occurs, switchover on the carrier side can take a few hundred milliseconds. During that time, a lag in the sending and receiving of packets can occur. Use Link Debounce to hold the connection path until the switchover is complete. You can configure Link Debounce on each port.

Link Debounce protects the upper layers from unnecessary state changes by delaying the change of a port link state when the following situations occur:

- There are frequent flaps in a short interval at the physical layer in the case of Fiber WAN services.
- There is a delay in switching from the working path to the protected path in the case of Carrier Wave WAN services.

Link Debounce works only on Layer 1 protocol applications. Layer 2 / Layer 3 protocols make decisions based on how they receive packets. For example, STP makes the decision according to the lack of traffic and port up condition; OSPF and IS-IS can still fail adjacencies.

**Note**

You cannot configure Link Debounce on Integrated Application Hosting (IAH) ports (also known as Insight ports).

ExtremeCloud SD-WAN

Auto-sense automatically configures Link Debounce on the switch port that connects to SD-WAN Appliance. This configuration enables the switch that connects to the appliance LAN1 port to keep using its FE VXLAN tunnels over MPLS transport, even if SD-WAN Appliance is down, Layer 3 WAN Internet ports are lost, and the appliance is in Bypass mode.

If you do not configure a timer value and the port connects to SD-WAN Appliance, Auto-sense configures a value of 8000 milliseconds. Auto-sense does not overwrite a configured timer value.

Auto-sense Ports

The interface-level Link Debounce configuration does not apply to ports with Auto-sense enabled. Use Auto-sense commands to configure Link Debounce on Auto-sense UNI ports. For more information, see [Auto-sense Configuration using CLI](#) on page 34 or [Auto-sense Global Configuration using EDM](#) on page 57.

Link State Change Control Using CLI

This section provides procedures to detect and to control link flapping using the command line interface (CLI).

Control Link State Changes

Configure link flap detection to control state changes on a physical port.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the interval for link state changes:
`link-flap-detect interval <2-600>`
3. Configure the number of changes allowed during the interval:
`link-flap-detect frequency <1-9999>`
4. Enable automatic port disabling:
`link-flap-detect auto-port-down`
5. Enable sending a trap:
`link-flap-detect send-trap`

Example

Enable automatic disabling of the port:

```
Switch:1(config)#link-flap-detect auto-port-down
```

Configure the link-flap-detect interval:

```
Switch:1(config)#link-flap-detect interval 20
```

Enable sending traps:

```
Switch:1(config)#link-flap-detect send-trap
```

Variable Definitions

Use the data in the following table to use the **link-flap-detect** command.

Variable	Value
<code><auto-port-down></code>	Automatically disables the port if state changes exceed the link-flap threshold. By default, auto-port-down is enabled.
<code>frequency <1-9999></code>	Configures the number of changes that are permitted during the time specified by the <code>interval</code> command. The default is 20.
<code>interval <2-600></code>	Configures the link-flap-detect interval in seconds. The default value is 60.
<code>send-trap</code>	Activates traps transmission. The default setting is activated.

Display Link State Changes

Displays link flap detection state changes on a physical port.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display link state changes:
`show link-flap-detect`

Example

```
Switch:1>enable
Switch:1#show link-flap-detect

Auto Port Down : enable
Send Trap      : enable
Interval       : 60
Frequency      : 20
```

Configure Link Debounce

About This Task

Configure Link Debounce for ports to hold the connection path until the carrier side switchover is complete.

Note

Use this procedure to configure ports with Auto-sense disabled. To configure Link Debounce on Auto-sense ports, see [Configure Link Debounce for Auto-sense Ports](#) on page 56

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable Link Debounce:

```
link-debounce <0-300000>
```

3. Verify the configuration:

```
show interfaces gigabitEthernet link-debounce [{slot/port[/sub-port] [-
slot/port[/sub-port]][,...][slot/all][all]}
```

Examples

Configure the Link Debounce timer on port 1/2 to 300000 milliseconds.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#link-debounce 300000
```

Display the Link Debounce configuration for ports 1/1 through 1/4.

```
Switch:1>enable
Switch:1#show interfaces gigabitEthernet link-debounce 1/1-1/4
=====
                        Port link debounce
=====
-----
```

PORT NUM	LINK-DEBOUNCE STATUS	LINK-DEBOUNCE TIMER MILLISECONDS	DEBOUNCE COUNT	DEBOUNCE SUCCEEDED
1/1	Enable	1500	0	0
1/2	Enable	300000	0	0
1/3	Disable	--	0	0
1/4	Enable	4000	0	0

Variable Definitions

The following table defines parameters for the **link-debounce** command.

Variable	Value
<0-300000>	Link debounce configures time for ports in milliseconds. The default status is disabled for all ports when not initially configured. If you run the default link-debounce command, the default configuration is enabled with a value of 1,000 milliseconds. To return to the initial disabled state, you must run the no link-debounce command or set the Link Debounce timer to 0.

Link State Change Control Using EDM

This section provides procedures to detect and to control link flapping using Enterprise Device Manager (EDM).

Control Link State Changes

About This Task

Configure link flap detection to control link state changes on a physical port.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics**.
2. Select **General**.
3. Select the **Link Flap** tab.
4. Configure the parameters as required.
5. Select **Apply**.

Link Flap Field Descriptions

Use the data in the following table to use the **Link Flap** tab.

Name	Description
AutoPortDownEnable	Enables or disables Link Flap Detect. If you enable Link Flap Detect, the system monitors the number of times a port goes down during a designated interval. If the number of drops exceeds a specified limit, the system forces the port out-of-service. The default is enabled.
SendTrap	Specifies that a trap is sent if the port is forced out-of-service.

Name	Description
Frequency	Specifies the number of times the port can go down. The default is 20.
Interval	Specifies the interval (in seconds) between port failures. The default is 60.

Configure Link Debounce

About This Task

Configure Link Debounce for ports to hold the connection path until the carrier side switchover is complete.

Note

Use this procedure to configure ports with Auto-sense disabled. To configure Link Debounce on Auto-sense ports, see [Configure Link Debounce for Auto-sense Ports](#) on page 65.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select **Interface** tab.
5. In **LinkDebounce**, type the value in milliseconds to configure the timer.
6. Select **Apply**.

Interface Field Descriptions

Use the data in the following table to use the **Interface** tab.

Name	Description
Index	Displays the index of the port, written in the slot/port[/sub-port] format.
Name	Configures the name of the port.
Descr	Displays the description of the port. A textual string containing information about the interface.
Type	Displays the type of connector plugged in the port.
Mtu	Displays the Maximum Transmission Unit (MTU) for the port. The size of the largest datagram which can be sent or received on the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface.

Name	Description
PhysAddress	Displays the physical address of the port. The address of the interface at the protocol layer immediately below the network layer in the protocol stack. For interfaces which do not have such an address, for example, a serial line, this object should contain an octet string of zero length.
VendorDescr	Displays the vendor of the connector plugged in the port.
DisplayFormat	Identifies the slot and port numbers (slot/port). If the port is channelized, the format also includes the sub-port in the format slot/port/sub-port
AdminStatus	Configures the port as enabled (up) or disabled (down) or testing. The testing state indicates that no operational packets can be passed.
OperStatus	Displays the current status of the port. The status includes enabled (up) or disabled (down) or testing. The testing state indicates that no operational packets can be passed.
ShutdownReason	Indicates the reason for a port state change.
LastChange	Displays the timestamp of the last change.
LinkTrap	Enable or disable link trapping.
AutoNegotiate	Enables or disables Auto-Negotiation for this port. The default Auto-Negotiation behavior depends on the switch model and transceiver type.

Name	Description
AutoNegAd	<p>Specifies the port speed and duplex abilities to advertise during link negotiation.</p> <p>Supported speeds and duplex modes vary, depending on your hardware.</p> <p>The abilities specified in this object are only used when auto-negotiation is enabled on the port. If all bits in this object are disabled, and auto-negotiation is enabled on the port, then the physical link process on the port is disabled (if hardware supports this ability).</p> <p>Any change to this configuration restarts the auto-negotiation process, which has the same effect as physically unplugging and reattaching the cable attached to the port.</p> <p>If you select default, all capabilities supported by the hardware are advertised.</p>
AdminDuplex	Configures the administrative duplex setting for the port.
OperDuplex	Indicates the operational duplex setting for the port.
AdminSpeed	Configures the administrative speed for the port.
OperSpeed	Indicates the operational speed for the port.
QoSLevel	Selects the Quality of Service (QoS) level for this port. The default is level1.
DiffServ	Enables the Differentiated Service feature for this port. The default is disabled.
Layer3Trust	Configures if the system should trust Layer 3 packets coming from access links or core links only. The default is core.
Layer2Override8021p	Specifies whether Layer 2 802.1p override is enabled (selected) or disabled (cleared) on the port. The default is disabled (clear).
MLtId	Shows the MLT ID associated with this port. The default is 0.
Locked	Shows if the port is locked. The default is unlocked.
UnknownMacDiscard	Discards packets that have an unknown source MAC address, and prevents other ports from sending packets with that same MAC address as the destination MAC address. The default is disabled.

Name	Description
DirectBroadcastEnable	<p>Specifies that an Isolated Routing Port (IRP) can forward directed broadcast traffic. A directed broadcast is a frame sent to the subnet broadcast address on a remote IP subnet. By disabling or suppressing directed broadcast on an interface, all frames sent to the subnet broadcast address for a local router interface are dropped. Disabling this function protects a host from possible denial of service (DoS) attacks.</p> <p>With the feature enabled, the Control Processor (CP) does not receive a copy of the directed broadcast. As a result, the system does not respond to a subnet broadcast ping sent from a remote subnet.</p> <p>The default is disabled.</p>
OperRouting	Shows the routing status of the port.
HighSecureEnable	Enables or disables the high secure feature for this port.
RmonEnable	Enables or disables Remote Monitoring (RMON) on the interface. The default is disabled.
FlexUniEnable	Enables Flex UNI on the port. The default is disabled.
EgressRateLimitState	Enables or disables egress port-based shaping to bind the maximum rate at which traffic leaves the port. The default is disabled.
EgressRateLimit	<p>Specifies the egress rate limit in Kbps. You cannot configure the egress shaper rate to exceed the port capability.</p> <p>If you configure this value to 0, shaping is disabled on the port.</p>
TxFlowControl	<p>Configures if the port sends pause frames. By default, an interface does not send pause frames.</p> <p>You must also enable the flow control feature globally before an interface can send pause frames.</p>
TxFlowControlOperState	Shows the operational state of flow control.
BpduGuardTimerCount	Shows the time, starting at 0, since the port became disabled. When the BpduGuardTimerCount reaches the BpduGuardTimeout value, the port is enabled. Displays in 1/100 seconds.

Name	Description
BpduGuardTimeout	Specifies the value to use for port-state recovery. After a BPDU guard disables a port, the port remains in the disabled state until this timer expires. The default is 120 seconds. If you configure the value to 0, the expiry is infinity.
BpduGuardAdminEnabled	Enables BPDU Guard on the port. The default is disabled.
ForwardErrorCorrection	Configures one of the following options for Forward Error Correction (FEC) on the port: <ul style="list-style-type: none"> • CL 91 • CL 108 • CL 74 • disable • auto The disable option disables this configuration on the port.
ForwardErrorCorrectionApplicability	Displays whether FEC is applicable on the interface.
OperAutoNegotiate	Shows the operational state of Auto-Negotiation.
OperForwardErrorCorrection	Shows the negotiated operational FEC clause. If the value is off, the port supports FEC and is up but not configured for FEC. If the value is notApplicable, the port does not support FEC. If the value is unknown, the port supports FEC but is down.
Action	Performs one of the following actions on the port <ul style="list-style-type: none"> • none - none of the following actions • flushMacFdb - flush the MAC forwarding table • flushArp - flush the ARP table • flushIp - flush the IP route table • flushAll - flush all tables • triggerRipUpdate — manually triggers a RIP update The default is none.
Result	Displays the result of the selected action. The default is none.
AutoSense	Enables or disables Auto-sense on the specific port. The default value is disabled for existing configurations but enabled for new Zero Touch Fabric Configuration deployments.

Name	Description
AutoSenseKeepAutoConfig	Retains the Auto-sense configuration if you disable Auto-sense on the port. The dynamic configuration becomes a manual configuration and is visible in the show running-config output.
CustomAutoNegAdOrigin	Specifies the origin of Custom Auto Negotiation Advertisements (CANA) configuration on the port. The supported values are: <ul style="list-style-type: none"> • config - Set by the user. • radius - Set by the Remote Authentication Dial-In User Service (RADIUS) attribute.
BpduGuardOrigin	Specifies the origin of BPDU Guard configuration on the port. The supported values are: <ul style="list-style-type: none"> • config - Set by the user. • radius - Set by the Remote Authentication Dial-In User Service (RADIUS) attribute.
AutoSenseState	Displays the Auto-sense port state.
LinkDebounce	Specifies the extended debounce timer on the port. The value 0 milliseconds disables debounce time. The default value is 1000. Note: This field does not apply to Auto-sense ports. To configure Link Debounce on Auto-sense ports, see Configure Link Debounce for Auto-sense Ports on page 65.
AutoSenseDataIsid	Specifies the Auto-sense data I-SID per port.
AutoSenseWaitInterval	Specifies the Auto-sense Wait Interval for the port. The default is 35.
NodeAliasEnable	Enables or disables Node Alias on this specific port. The default is enabled on Auto-sense ports.

Name	Description
NodeAliasClear	Clears Node Alias on this specific port.
IpfixEnable	Enables or disables IPFIX on the port. The default is true, which means enabled. If you enable IPFIX globally, the switch learns flows on both UNI ports and NNIs automatically, because IPFIX is enabled on those interfaces by default. You must explicitly disable IPFIX on those interfaces to stop flow learning. If you disable IPFIX globally, no flow learning occurs, regardless of the UNI port or NNI configuration.

Link-state tracking (LST)

[Link-state tracking \(LST\) Overview](#) on page 2529

[LST Configuration Using CLI](#) on page 2531

[LST Configuration Using EDM](#) on page 2533

Table 185: Link-state tracking (LST) product support

Feature	Product	Release introduced
Link-state tracking (LST)	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10

	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Link-state tracking (LST) Overview

Link-state tracking (LST) binds the link state of multiple interfaces, creating LST groups with upstream (to-be-followed) and downstream (to-follow) interfaces. LST monitors the state of upstream interfaces and automatically transfers the upstream state to the downstream interfaces. If all the upstream interfaces in a LST group are down, the downstream interfaces are administratively configured as down after approximately five seconds. If any upstream interface in a LST group is up, the downstream interfaces are not affected. The role of the LST group is to keep the downstream interfaces in the same state as the upstream interface.

An interface can be an aggregation of ports, multi-link trunks (MLT) or link aggregation groups (LAG). Interfaces can only belong to one LST group. You can configure LST using CLI or EDM. LST receives updates from Port Manager, MLT, and VLACP regarding the upstream state of ports and trunks in the group.

LST can detect a link failure of upstream interfaces and shutdown downstream interfaces, eliminating loss of traffic and allowing the source to reroute traffic. When

a LST group disables a downstream interface, the interface can only be enabled by the LST group. You can recover the downstream interfaces that LST disabled by removing the interfaces from the LST group or by disabling the LST group. You can administratively enable or disable LST group downstream interfaces with shutdown commands. A LST group cannot enable ports that you administratively disabled.

**Note**

If you administratively enable an interface which LST disabled, only the administrative status of the interface changes. The interface remains disabled until the LST group enables the interface, or until you remove the interface from the LST group.

MLT interactions

For MLTs, a last-link-down event triggers a down operational state and a first-link-up event triggers an up operational state. You cannot delete an MLT that is a member of a LST group.

LAG and LACP interactions

For LAGs, a static LAG trunk ID associated with a LACP administrative key can be a member of a LST group. You can add LAGs to a LST group by specifying the LAG trunk ID. You cannot break the association between trunk ID, LACP key, and ports while the LAG trunk is in a LST group. For LACP, you cannot add ports with link-aggregation enabled to a LST group, or enable link-aggregation on interfaces already in a LST group.

VLACP interactions

You can add LST group interfaces configured with VLACP. For upstream interfaces with VLACP enabled, when the physical link is up with a VLACP partner, the operational state is up. Otherwise the operational state is down. If VLACP is enabled, the value of the VLACP have partner field and the link status correspond to the operational state of upstream interfaces. For upstream interfaces with VLACP disabled, the up and down operational states correspond directly with the physical link.

SLPP Guard interactions

You can add LST group interfaces configured with SLPP Guard. When LST disables a port that is already disabled by SLPP Guard, the interface is unblocked by SLPP Guard and the blocking timer clears.

BPDU Guard and MACsec interactions

You can add LST group interfaces configured with BPDU Guard or MACsec. BPDU Guard and MACsec can enable or disable ports administratively. An interface is enabled if both LST and BPDU Guard or MACsec consider the port enabled. If BPDU Guard or MACsec disables the port, the port remains down and does not link up.

LST Configuration Using CLI

Configure Link-state tracking (LST) groups composed of upstream and downstream interfaces. Valid LST group members are switch ports, multi-link trunks (MLT), or link aggregation groups (LAG).

Configure LST

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure the LST group upstream and downstream interface members:

```
link-state group <1-48> <upstream | downstream>
```

```
interface gigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]
```

```
[,...][slot/all][all]}
```
3. Configure the LST group upstream and downstream mlt members:

```
link-state group <1-48> <upstream | downstream> mlt <1-512>
```
4. Enable the group:

```
link-state group <1-48> enable
```
5. Display the status of the groups:

```
show link-state group <1-48> [detail]
```

Example

The following example shows an LST group created with ports 1–4 and mlt 1 as upstream members and ports 11–14 and mlt 2 as downstream members. The LST group is enabled. Because port 1 is up, the LST group receives an up operational state and the downstream interfaces are enabled. Upstream ports 2, 4 and mlt 1 have VLACP admin enabled and are listed in the VLACP Upstream State section.

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# link-state group 1 upstream interface gigabitEthernet 1/1-1/4
Switch:1(config)# link-state group 1 upstream mlt 1
Switch:1(config)# link-state group 1 downstream interface gigabitEthernet 1/11-1/14
Switch:1(config)# link-state group 1 downstream mlt 2
Switch:1(config)# link-state group 1 enable
Switch:1(config)# show link-state group 1
```

```

Variable definitions

Use the data in the following table to use the **link-state** command.

Variable	Value
<i>enable</i>	Activates the action specified for the LST group or specified interfaces.
<i>group <1-48></i>	Specifies a LST group ID.
<i>interface gigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]] [,...] [slot/all] [all]}</i>	<p>Adds ports to the specified upstream or downstream LST group.</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<i>mlt <1-512></i>	Adds an MLT to the specified upstream or downstream LSTgroup.
<i><upstream downstream></i>	Specifies the upstream or downstream interfaces in the LST group.

Use the data in the following table to use the **show link-state** command.

Variable	Value
detail	Displays the specified LST group status as enabled or disabled and if the operational status is up or down. Detail displays LST group additional information.

LST Configuration Using EDM

Configure Link-state tracking (LST) groups composed of upstream and downstream interfaces. Valid LST group members are switch ports, multi-link trunks (MLT), or link aggregation groups (LAG).

Configure LST

About This Task

Use this procedure to configure LST groups.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Link State Tracking**
3. Select the **Link State Tracking** tab.
4. Select a **GroupId** row to configure.
5. To add upstream ports to the LST group, double-click **UpstreamPortList**, select the upstream ports to add, and then select **OK**.
6. To add downstream ports to the LST group, double-click **DownstreamPortList**, select the upstream ports to add, and then select **OK**.
7. To add an upstream MLT to the LST group, double-click **UpstreamMltList**, and then type an upstream MLT ID.
8. To add a downstream MLT to the LST group, double-click **DownstreamMltList**, and then type an upstream MLT ID.
9. To enable an LST group, double-click **Enabled**, and then select **true**.
10. To activate the LST group configuration, select **Apply**.
11. View the **OperState** of the LST groups to verify the current operating state.

Link State Tracking Field Descriptions

Use the data in the following table to use the **Link State Tracking** tab.

Name	Description
GroupId	Specifies the LST group number between 1 and 48.
Enabled	Specifies if the LST group is enabled. Values are true or false. Default is false.
UpstreamPortList	Specifies upstream interface ports in the LST group.

Name	Description
DownstreamPortList	Specifies downstream interface ports in the LST group.
UpstreamMltList	Specifies an upstream multi-link trunk in the LST group.
DownstreamMltList	Specifies a downstream multi-link trunk in the LST group.
OperState	Displays the current operating status of the LST group. Values are up, down, or notConfigured.

Logs and Traps Fundamentals

This section details SNMP traps and log files, available as part of the switch System Messaging Platform.

Overview of Traps and Logs

System Log Messaging

On a UNIX-based management platform, you can use system log (syslog) messaging to manage event messages. The switch syslog software communicates with a server software component named syslogd on the management workstation.

The UNIX daemon syslogd is a software component that receives and locally logs, displays, prints, and forwards messages that originate from sources internal and external to the workstation. For example, syslogd on a UNIX workstation concurrently handles messages received from applications that run on the workstation, as well as messages received from the switch that runs in a network accessible to the workstation.

The remote UNIX management workstation performs the following actions:

- Receives system log messages from the switch.
- Examines the severity code in each message.
- Uses the severity code to determine appropriate system handling for each message.

Log Consolidation

The switch generates a system log file and can forward that file to a syslog server for remote viewing, storage, and analyzing.

The system log captures messages for the following components:

- Central Processing Unit (CPU)
- Command line interface (CLI) log
- Extensible Authentication Protocol (EAP)
- filter
- hardware (HW)
- Internet Protocol (IP)
- MultiLink Trunking (MLT)
- policy
- Quality of Service (QoS)
- Remote Authentication Dial-in User Service (RADIUS)
- Remote Monitoring (RMON)
- Simple Network Management Protocol (SNMP) log
- software (SW)
- Virtual Local Area Network (VLAN)
- web

The switch can send information in the system log file, including CLI command log and the SNMP operation log, to a syslog server.

View logs for CLILOG module to track all CLI commands executed and for fault management purposes. The CLI commands are logged to the system log file as CLILOG module.

View logs for SNMPLOG module to track SNMP logs. The SNMP operation log is logged to the system log file as SNMPLOG module.

The platform logs CLILOG and SNMPLOG as INFO. Normally, if you configure the logging level to WARNING, the system skips all INFO messages. However, if you enable CLILOG and SNMPLOG the system logs CLI Log and SNMP Log information regardless of the logging level you configure. This is not the case for other INFO messages.

System Log Client over IPv6 Transport

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration except in the following case. When you configure the system log table in EDM, under the **System Log Table** tab, you must select either IPv4 or IPv6.

Log Files with Enhanced Secure Mode

Enhanced secure mode allows the system to provide role-based access levels to log file commands. If you enable enhanced secure mode, the system encrypts the entire log file.

Log files are generated to `/inflash/shared`.

The current log file is protected against wiping for Telnet, SSH, FTP, SFTP, TFTP, and SCP applications for the following commands:

- Telnet and SSH:
 - mv
 - rename
 - delete
 - copy
 - cp
- FTP:
 - delete
 - mput
 - put
- TFTP:
 - put
- SCP:
 - destination file only

Log Commands Accessible for Various Users

The following table summarizes log file command access based on role-based access levels.

Access level role	Commands
Administrator and Privilege (except for the active log file)	The following commands: <ul style="list-style-type: none"> • edit • rename • copy • remove • delete
Administrator, Privilege, and Auditor	All show commands for log files.
All users (Administrator, Privilege, Auditor, Security, Operator)	All show commands for log configurations.

With enhanced secure mode enabled, authorized users can use Telnet, SSH, FTP, SFTP, TFTP, SCP to transfer files to a remote server with the content encrypted. Users with Administrator and Privilege access level roles can remove old log files but they cannot remove the active log file.

SNMP Traps

The SNMP trap is an industry-standard method used to manage events. You can set SNMP traps for specific types of log message (for example, warning or fatal), from specific applications, and send them to a trap server for further processing. For example, you can configure the switch to send SNMP traps to a server after a port is unplugged or if a power supply fails.

This section only describes SNMP commands related to traps. For more information about how to configure SNMP community strings and related topics, see [Simple Network Management Protocol \(SNMP\)](#) on page 3467.

Secure Syslog

Syslog is a standard used to send event log messages to devices within a network. The switch sends event messages to a logging server called syslog server. The syslog server stores the log messages and displays them for event reporting. Syslog messages are used for monitoring system activities and troubleshooting.

The secure syslog feature adds security and authenticated access to the plain text event log messages that are communicated between a remote syslog server and a syslog client. The secure syslog feature helps prevent unauthorized access to confidential data transmitted on an unsecured communication channel between a remote syslog server and client.

To implement the security, this feature employs port forwarding using the Transport Layer Security (TLS) to provide encrypted communication between a syslog server and client.

After starting the syslog server, to ensure authentication, you must set up a remote port forwarding connection to connect the switch with a remote TLS Server.

TLS Client for Secure Syslog

The syslog server is installed on a host that serves as a TLS Server. The switch plays the role of a TLS client for secure syslog.

A TLS handshake is initiated between the syslog server and the switch. The syslog server transmits a certificate which has a subject common name and an optional subject alternative name (SAN). The subject common name is always present in the certificate but the SAN is optional. The server-cert-name must match the SAN name, if present in the certificate. If the SAN name is not present, the server-cert-name must match the subject common name. Otherwise, TLS negotiation fails and the connection to the server is closed. If the server-cert-name part is not configured, this check is not done.

After the TLS handshake is successful, the log messages sent from the switch to the syslog server are encrypted. The syslog server decrypts these messages using a private key. The server then stores the messages or forwards them to other servers.

This feature supports the Rsyslog, syslog-ng, and stunnel, which are Linux based open-source syslog servers for TLS tunneling. Ensure you use the correct version of these applications or the switch displays a `no cipher match` error and the TLS communication fails.

Automatic Reconnection

If connectivity fails between the switch and the syslog server, the syslog host remains enabled and the switch attempts to reconnect with the syslog server every two minutes. This automatic reconnection occurs only if the following conditions are true:

- The syslog feature is globally enabled.
- The specific syslog host is enabled.
- The secure mode is TLS.
- The TLS session between the switch and syslog server is not active.

Note

If the route to the syslog server is removed from the switch and the IP address is not reachable, the switch does not try to reconnect after two minutes if there are no syslog messages in the queue. A TCP connection can take up to two hours to timeout after a connectivity issue. You can use the **logging write test** command to send a test message to the server and force the syslog application to reconnect. You can also configure the TCP keepalive interval using either CLI ([Configure TCP Keepalive and TCP Timestamp](#) on page 3424) or EDM ([Configure TCP Keepalive and TCP Timestamp](#) on page 3430).

Log messages on the console indicate connection issues between the switch and syslog server or with the TLS session. You can also use trace to diagnose connection issues. Use trace level 28 for syslog or trace level 115 for TLS.

Simple Network Management Protocol

The Simple Network Management Protocol (SNMP) provides facilities to manage and monitor network resources. SNMP consists of:

- Agents—An agent is software that runs on a device that maintains information about device configuration and current state in a database.
- Managers—An SNMP manager is an application that contacts an SNMP agent to query or modify the agent database.
- The SNMP protocol—SNMP is the application-layer protocol SNMP agents and managers use to send and receive data.
- Management Information Bases (MIB)—The MIB is a text file that specifies the managed objects by an object identifier (OID).

Important

The switch does not reply to SNMP requests sent to the Virtual Router Redundancy Protocol (VRRP) virtual interface address; it does, however, reply to SNMP requests sent to the physical IP address.

An SNMP manager and agent communicate through the SNMP protocol. A manager sends queries and an agent responds; however, an agent initiates traps. Several types of packets transmit between SNMP managers and agents:

- Get request—This message requests the values of one or more objects.
- Get next request—This message requests the value of the next object.
- Set request—This message requests to modify the value of one or more objects.
- Get response—An SNMP agent sends this message in response to a get request, get next request, or set request message.
- Trap—SNMP trap is a notification triggered by events at the agent.

Log Message Format

The log messages for the switch have a standardized format. All system messages are tagged with the following information, except that alarm type and alarm status apply to alarm messages only:

Table 187: Log message tagging

Information type	Description
CPU slot number	Indicates the CP slot where the command is logged.
timestamp	Records the date and time at which the event occurred. The format is MM/DD/YY hh:mm:ss.uuu, where uuu is milliseconds. Example: [11/01/10 11:41:21.376].
hostname	The name of the host from which the message is generated.
event code	Precisely identifies the event reported.

Table 187: Log message tagging (continued)

Information type	Description
alarm code	Specifies the alarm code.
alarm type	Identifies the alarm type (Dynamic or Persistent) for alarm messages.
alarm status	Identifies the alarm status (set or clear) for alarm messages.
VRF name	Identifies the Virtual Routing and Forwarding (VRF) instance, if applicable.
module name	Identifies the software module or hardware from which the log is generated.
severity level	Identifies the severity of the message.
sequence number	Identifies a specific CLI command.
context	Specifies the type of the session used to connect to the switch. If the session is a remote session, the remote IP address is identified.
user name	Specifies the user name used to login to the switch.
CLI command	Specifies the commands typed during the CLI session. The system logs anything type during the CLI session as soon as the user presses the Enter key.

The following messages are examples of an informational message for CLILOG:

```

CP1 [07/18/14 13:23:11.253] 0x002c0600 00000000 GlobalRouter CLILOG INFO 13
TELNET:192.0.2.200 rwa show log file name-of-file log.40300001.1806

CP1 [07/18/14 13:24:19.739] 0x002c0600 00000000 GlobalRouter CLILOG INFO 15
TELNET:192.0.2.200 rwa term more en

CP1 [07/18/14 13:24:22.577] 0x002c0600 00000000 GlobalRouter CLILOG INFO 16
TELNET:192.0.2.200 rwa show log

CP1 [01/12/17 15:13:59.056] 0x002c0600 00000000 GlobalRouter CLILOG INFO 5
TELNET:198.51.100.108 rwa syslog host 4

CP1 [01/12/17 15:13:35.520] 0x002c0600 00000000 GlobalRouter CLILOG INFO 4
TELNET:198.51.100.108 rwa syslog host enable

CP1 [01/12/17 15:13:14.576] 0x002c0600 00000000 GlobalRouter CLILOG INFO 3
TELNET:198.51.100.108 rwa show syslog

CP1 [01/12/17 15:12:44.640] 0x002c0600 00000000 GlobalRouter CLILOG INFO 2
TELNET:198.51.100.108 rwa show logging file tail

```

The following messages are examples of an informational message for SNMPLOG:

```

CP1 [05/07/14 10:24:05.468] 0x002c4600 00000000 GlobalRouter SNMPLOG INFO 1 ver=v2c
public rcVlanPortMembers.2 =

CP1 [05/07/14 10:29:58.133] 0x002c4600 00000000 GlobalRouter SNMPLOG INFO 2 ver=v2c
public rcVlanPortMembers.2 =

```

```
CPI [05/07/14 10:30:20.466] 0x002c4600 00000000 GlobalRouter SNMPLOG INFO 3 ver=v2c
public rcVlanPortMembers.1 =
```

The system encrypts AP information before writing it to the log file.

The encrypted information in a log file is for debugging purposes. Only a Customer Service engineer can decrypt the encrypted information in a log file. CLI commands display the logs without the encrypted information. Do not edit the log file.

The following table describes the system message severity levels.

Table 188: Severity levels

Severity level	Definition
EMERGENCY (0)	A panic condition that occurs when the system becomes unusable. A severity level of emergency is usually a condition where multiple applications or servers are affected. You must correct a severity level of emergency immediately.
ALERT (1)	Any condition requiring immediate attention and correction. You must correct a severity level of alert immediately, but this level usually indicates failure of a secondary system, such as an Internet Service Provider connection.
CRITICAL (2)	Any critical conditions, such as a hard drive error.
ERROR (3)	A nonfatal condition occurred. You can be required to take appropriate action. For example, the system generates an error message if it is unable to lock onto the semaphore required to initialize the IP addresses used to transfer the log file to a remote host.
WARNING (4)	A nonfatal condition occurred. No immediate action is needed. An indication that an error can occur if action is not taken within a given amount of time.
NOTIFICATION (5)	Significant event of a normal nature. An indication that unusual, but not error, conditions have occurred. No immediate action is required.
INFO (6)	Information only. No action is required.
DEBUG (7)	Message containing information useful for debugging.
FATAL (0)	A fatal condition occurred. The system cannot recover without restarting. For example, a fatal message is generated after the configuration database is corrupted.

Based on the severity code in each message, the platform dispatches each message to one or more of the following destinations:

- workstation display
- local log file
- one or more remote hosts

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration except in the following case. When you configure the system log table in EDM, you must select either IPv4 or IPv6.

Internally, the switch has four severity levels for log messages: INFO, WARNING, ERROR, and FATAL. The system log supports eight different severity levels:

- Debug
- Info
- Notice
- Warning
- Critical
- Error
- Alert
- Emergency

The following table shows the default mapping of internal severity levels to Syslog severity levels.

Table 189: Default and system log severity level mapping

UNIX system error codes	System log severity level	Internal severity level
0	Emergency	Fatal
1	Alert	
2	Critical	
3	Error	Error
4	Warning	Warning
5	Notice	
6	Info	Info
7	Debug	

Log Files

The log file captures hardware and software log messages, and alarm messages. The switch logs to internal flash.

The system saves internal log messages in a circular list in memory, which overwrite older log messages as the log fills. Unlike the log messages in a log file, the internal log messages in memory do not contain encrypted information, which can limit the information available during troubleshooting. Free up the disk space on the flash if the system generates the `disk space 75% full` alarm. After the disk space utilization returns below 75%, the system clears the alarm, and then starts logging to a file again.

Log file naming conventions

The following list provides the naming conventions for the log file:

- The log file is named as log.xxxxxxxx.sss format. The prefix of the log file name is log. The six characters after the log file prefix contain the last three bytes of the chassis base MAC address. The next two characters are 01. The last three characters (sss) denote the sequence number of the log file.
- The sequence number of the log file is incremented for each new log file created after the existing log file reaches the maximum configured size.
- At initial system start up when no log file exists, a new log file with the sequence number 000 is created. After a restart, the system finds the newest log file from internal flash based on file timestamps. If the newest log file is on the flash that is used for logging, the system continues to use the newest log file. And once the maximum configured size is reached, system continues to create a new log file with incremental sequence number on the internal flash for logging.

Log File Transfer

The system logs contain important information for debugging and maintaining the switch. After the current log file reaches the configured maximum size, the system creates a new log file for logging. The system transfers old log files to a remote host. You can configure up to 10 remote hosts, which creates long-term backup storage of your system log files.

Of the 10 configured remote hosts, 1 is the primary host and the other 9 are redundant. Upon initiating a transfer, system messaging attempts to use host 1 first. If host 1 is not reachable, system messaging tries hosts 2 to 10.

If log file transfer is unsuccessful, the system keeps the old log files on internal flash. The system attempts to transfer old log files after the new log file reaches the configured maximum size. The system also attempts to transfer old log files periodically (once in one hundred log writes) if the disk space on the flash is more than 75% full.

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration.

Specify the following information to configure the transfer criteria:

- The maximum size of the log file.

Note

The maximum number of log files is 1,000. The maximum size of one log file is 1,024 KB. You cannot configure the log file parameters on 4220 Series, 5320 Series, or 5420 Series. On these platforms, the number of log files is restricted to 145 and the size of a log file is restricted to 126 KB.

- The IP address of the remote host.
- The name prefix of the log file to store on the remote host.

The system appends a suffix of .xxxxxxx.sss to the file name. The first six characters of the suffix contain the last three bytes of the chassis base MAC address. The next

two characters are 01. The last three characters (sss) denote the sequence number of the log file. For example, if you configure the name prefix as mylog, a possible file name is mylog.90000001.001.

- To use Secure Copy (SCP) for the transfer, configure the user name.

After you configure the first remote host entry for an SCP server, the switch generates an SSH key pair for authentication with all SCP servers. You must manually copy the public key to the remote server. Use the **show logging transferfile {1-10}** command to determine the location of the public key.

Note

With Enhanced Secure Mode enabled, authorized users can use SFTP to transfer files to a remote server with the content encrypted.

- To use File Transfer Protocol (FTP) for the transfer, use the **boot config host** commands to configure the user name and password.

For more information about configuration, see [Configure the Remote Host for Log Transfer](#) on page 2556.

Restrictions

Be aware of the following restrictions to transfer log files to a remote host:

- The remote host IP address must be reachable.
- If you transfer a log file from a host to the system, (for example, to display it with a show command), rename the log file. Failure to rename the log file can cause the system to use the recently transferred file as the current log, if the sequence number in the extension is higher than the current log file. For example, if bf860005.002 is the current log file and you transfer bf860005.007 to the system, the system logs future messages to the bf860005.007 file. You can avoid this if you rename the log file to something other than the format used by system messaging.
- If the TFTP server is a UNIX-based machine, files written to the server must already exist. For example, you must create dummy files with the same names as your system logs. This action is commonly performed by using the touch command (for example, **touch bf860005.001**).
- The internal flash must be less than 75% full for the system to log a file. If the internal flash is more than 75% full, logging to a file stops to prevent exhausting disk space.

Log File Transfer Using a Wild Card File Name

File transfers using SFTP require file permissions. Use the command **attribute WORD<1-99> [+/-] R** to change the permissions of a file.

To change permissions for all log files, use the wild card file name **log.***. Using the command in the wild card form **attribute log.* [+/-]R** changes permissions for log files with names that begin with the characters "log.".

Important

You cannot use a wild card pattern other than **log.*** for this command.

Email Notification

The switch can send email notification for failed components or other critical log-event conditions. The switch can also send periodic status notifications.

Enable and configure a Simple Mail Transfer Protocol (SMTP) client on the switch for one SMTP server by specifying the server hostname or IPv4 address. To use a hostname, you must also configure a Domain Name System (DNS) client on the switch.

You must configure at least one email recipient and can create a maximum of five email recipients.

The switch can periodically send general condition status notifications. Status email messages include information about the following items:

- General switch
- Chassis
- Card
- Temperature
- Power supplies
- Fans
- LEDs
- System errors
- Port lock
- Message control
- Operational configuration changes
- Current Uboot
- Port interfaces
- Port statistics

The switch maintains a default list of event IDs for which it generates an email notification. You can add or remove event IDs. Use the **show smtp event-id** command to display the list of active event IDs. To display information about a particular event, use the **show logging file event code** command.

The following example shows an email that the switch sends for log events.

```
Subject: Logs from LabSwitch - 50712100008
From: <LabSwitch@default.com>
To: <test1@default.com>
CP1 [08/04/15 21:48:04.527:UTC] 0x00004603 00400003.67108870 DYNAMIC CLEAR GlobalRouter
SNMP INFO 2k card up(CardNum=1 AdminStatus=1 OperStatus=1)
CP1 [08/04/15 21:48:04.527:UTC] 0x00004603 00400003.67108870 DYNAMIC CLEAR GlobalRouter
SNMP INFO 2k card up(CardNum=1 AdminStatus=1 OperStatus=1)
CP1 [08/04/15 21:48:04.527:UTC] 0x00004603 00400003.67108870 DYNAMIC CLEAR GlobalRouter
SNMP INFO 2k card up(CardNum=2 AdminStatus=1 OperStatus=1)
CP1 [08/04/15 21:50:03.511:UTC] 0x00088524 00000000 GlobalRouter SW INFO Boot sequence
successful
```

If you enable the SMTP client but the switch cannot reach the SMTP server, the switch generates an alarm. The switch holds log and status information in a queue until the

connection with the SMTP server is restored. The message queue holds a maximum of 2,000 messages. If the queue fills, the switch drops new messages.

The following text is an example of the alarm that the switch generates when it cannot connect to the SMTP server.

```
CP1 [06/10/15 19:27:07.901:EST] 0x00398600 0e600000 DYNAMIC SET GlobalRouter SMTP
WARNING SMTP: Unable to establish connection with server: mailhost.usae.company.com,
port:25
```

If the switch cannot establish a connection to the SMTP server, verify that the server IP address or hostname, and the TCP port are correct. If you specify the server hostname, confirm that the IP address for the DNS server is correct. Check for network issues such as unplugged cables.

If the SMTP server rejects the email message, the switch generates a log message.

Log Configuration Using CLI

Use log files and messages to perform diagnostic and fault management functions.

For information about how to configure or extend system message control, see [Run-Time Process Management Using CLI](#) on page 371.

Configure a UNIX System Log and Syslog Host

Configure the syslog to control a facility in UNIX machines that logs SNMP messages and assigns each message a severity level based on importance.

About This Task

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable the system log:
`syslog enable`
3. Configure the maximum number of syslog hosts:
`syslog max-hosts <1-10>`
4. Create the syslog host:
`syslog host <1-10>`
5. Configure the IP address for the syslog host:
`syslog host <1-10> address WORD <0-46>`

6. Enable the syslog host:

```
syslog host <1-10> enable
```

Configure optional syslog host parameters by using the variables in the following variable definition tables.

7. View the configuration to ensure it is correct:

```
show syslog [host <1-10>]
```

Examples

```
Switch:1(config)#syslog enable
Switch:1(config)#syslog host 7 address 192.0.2.1
Switch:1(config)#syslog host 7 enable
Switch:1(config)#show syslog host 7

      Id : 7
      IpAddr : 192.0.2.1
      UdpPort : 514
      Facility : local7
      Severity : info|warning|error|fatal
      MapInfoSeverity : info
      MapWarningSeverity : warning
      MapErrorSeverity : error
      MapMfgSeverity : notice
      MapFatalSeverity : emergency
      Enable : true
      SecureForwardingMode: none
      Tcp Port : 1025
Switch:1(config)#show syslog

Enable      : true
Max Hosts   : 5
OperState   : active
header      : default
Total number of configured hosts : 3
Total number of enabled hosts : 1
Configured host : 7  8  9
Enabled host : 7

TLS-minimum-version      : tlsv11
Ciphers-Tls               : TLS_DHE_RSA_WITH_AES_256_CBC_SHA
TLS_DHE_RSA_WITH_AES_128_CBC_SHA
                           TLS_RSA_WITH_AES_256_CBC_SHA TLS_RSA_WITH_AES_128_CBC_SHA
```

Variable Definitions

The following table defines parameters for the **syslog** command.

Variable	Value
<i>enable</i>	Enables the sending of syslog messages on the device. The default is enabled.
<i>max-hosts</i> <1-10>	Specifies the maximum number of syslog hosts supported, from 1-10. The default is 5.

The following table defines parameters for the **syslog host** command.

Variable	Value
<i>1-10</i>	Creates and configures a host instance.
<i>address WORD <0-46></i>	Configures a host location for the syslog host. <i>WORD <0-46></i> is the IPv4 or IPv6 address of the UNIX system syslog host in the format A.B.C.D or x:x:x:x:x:x. You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration.
<i>enable</i>	Enables the syslog host. The default is disabled.
<i>facility {local0 local1 local2 local3 local4 local5 local6 local7}</i>	Specifies the UNIX facility in messages to the syslog host. <i>{local0 local1 local2 local3 local4 local5 local6 local7}</i> is the UNIX system syslog host facility. The default is <i>local7</i> .
<i>maperror {emergency alert critical error warning notice info debug}</i>	Specifies the syslog severity to use for error messages. The default is <i>error</i> .
<i>mapfatal {emergency alert critical error warning notice info debug}</i>	Specifies the syslog severity to use for fatal messages. The default is <i>emergency</i> .
<i>mapinfo {emergency alert critical error warning notice info debug}</i>	Specifies the syslog severity level to use for information messages. The default is <i>info</i> .
<i>mapwarning {emergency alert critical error warning notice info debug}</i>	Specifies the syslog severity to use for warning messages. The default is <i>warning</i> .
<i>severity <info warning error fatal> [<info warning error fatal>] [<info warning error fatal>] [<info warning error fatal>]</i>	Specifies the severity levels for which to send syslog messages. You can specify up to four severity levels in the same command string. The default is <i>info</i> .
<i>udp-port <514-530></i>	Specifies the User Datagram Protocol port number on which to send syslog messages to the syslog host. This value is the UNIX system syslog host port number from 514–530. The default is 514.

Configure Secure Forwarding to the Syslog Server

Configuring secure forwarding includes setting the mode for the particular syslog host and setting the TCP port through which the logs are sent to the syslog server.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create the syslog host:

```
syslog host <1-10>
```

3. Configure an IP address for the syslog host:

```
syslog host <1-10> address WORD<0-46>
```

4. Enable the syslog host:

```
syslog host <1-10> enable
```

5. Enable syslog globally:

```
syslog enable
```

6. Set the mode for secure forwarding on the host:

```
syslog host <1-10> secure-forwarding mode <none | tls [server-cert-name WORD<1-64>]>
```

7. Set the TCP port:

```
syslog host <1-10> secure-forwarding tcp-port <1025-49151>
```

8. Display the secure forwarding configured values:

```
show syslog host <1-10>
```

What to Do Next

After configuring secure forwarding on the switch, set the syslog server to be able to see the log messages on the interactive syslog viewer.

For TLS secure syslog, on the rsyslog server, configure the server to use TLS method and install the root certificate on the server in the switch.

Variable Definitions

The following table defines parameters for the **syslog host** command.

Variable	Value
host <1-10>	Specifies the ID for the syslog host. The range is 1-10.
address WORD<0-46>	Configures a host location for the syslog host. WORD <0-46> is the IPv4 or IPv6 address of the UNIX system syslog host in the format A.B.C.D or x:x:x:x:x:x:x. You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration using CLI.
enable	Enables the syslog host. The default is disabled.
secure-forwarding	Adds protected syslog using remote port forwarding for host.

The following table defines parameters for the **syslog host secure-forwarding** command.

Variable	Value
<code>host <1-10></code>	Creates and configures a host instance.
<code>mode <none tls [server-cert-name WORD<1-64>]></code>	Specifies the mode of secure forwarding of syslog on the host. The default mode is none, that is, tls mode is disabled by default. Note: Certificate validation is done only if the server-cert-name is configured.
<code>tcp-port <1025-49151></code>	Set tcp-port for secure forwarding of syslog for host. The default tcp-port is 1025. To set the TCP port to default value, use command default syslog host <1-10> secure-forwarding tcp-port . Important: The tcp-port 6000 cannot be used, as it is used as an internal port for Internal Spanning Tree (IST).

Configure Certificate Authority Trustpoint for Syslog

Before You Begin

Configure and install the digital certificate. For digital certificate information, see [Digital Certificate Configuration](#) on page 3399.

About This Task

Use this procedure to configure the certificate authority (CA) for the syslog server. This command adds a root or intermediate CA certificate to the syslog certificate store.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Configure the CA trustpoint:
syslog certificate ca-common-name WORD<1-45>
3. Save the configuration.
4. (Optional) Display the installed syslog server CA trustpoint:
show syslog certificate
5. (Optional) Display CA details:
show certificate ca [WORD<1-45>]

The UsedFor field displays SYSLOG.

Variable Definitions

The following table defines parameters for the **syslog certificate ca-common-name** and **show certificate ca** commands.

Variable	Value
<i>WORD</i> <1-45>	Specifies the Certificate Authority common name.

Configure the Minimum Version of TLS for Syslog

About This Task

Use this procedure to configure the minimum version of TLS protocol supported by the syslog client.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure the TLS protocol version for the syslog client:

```
syslog tls-min-verion {tlsv11 | tlsv12}
```

Variable Definitions

The following table defines parameters for the **syslog tls-min-verion** command.

Variable	Value
<i>tlsv11</i> <i>tlsv12</i>	<p>Specifies the minimum version of the TLS protocol supported by the syslog client.</p> <ul style="list-style-type: none">• <i>tlsv11</i> - configures version 1.1• <i>tlsv12</i> - configures version 1.2 <p>If the switch operates in Enhanced Secure Mode, the default TLS minimum version for Syslog is <i>tlsv12</i>. Otherwise, the default is <i>tlsv11</i>.</p>

Configure Logging

Configure logging to determine the types of messages to log and where to store the messages. For information about how to transfer a log file to a remote host, see [Configure the Remote Host for Log Transfer](#) on page 2556.

About This Task

Note

The platform logs CLILOG and SNMPLOG as INFO. Normally, if you configure the logging level to WARNING, the system skips all INFO messages. However, if you enable CLILOG and SNMPLOG the system logs CLI Log and SNMP Log information regardless of the logging level you configure. This is not the case for other INFO messages.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Define which messages to log:

```
logging level <0-4>
```
3. Write the log file from memory to a file:

```
logging write WORD<1-1536>
```
4. Show logging on the screen:

```
logging screen
```

Example

```
Switch:1(config)#logging level 0
Switch:1(config)#logging write log2
Switch:1(config)#logging screen
```

Variable Definitions

The following table defines parameters for the **logging** command.

Variable	Value
<code>level <0-4></code>	Shows and configures the logging level. The level is one of the following values: <ul style="list-style-type: none"> • 0: Information — all messages are recorded • 1: Warning — only warning and more serious messages are recorded • 2: Error — only error and more serious messages are recorded • 3: Manufacturing — this parameter is not available for customer use • 4: Fatal — only fatal messages are recorded
<code>screen</code>	Enables the log display on the screen.
<code>write WORD<1-1536></code>	Writes the log file with the designated string. <code>WORD<1-1536></code> is the string or command that you append to the log file. If the string contains spaces, you must enclose the string in quotation marks (").

Enable System Logging

System logs are a valuable diagnostic tool. You can send log messages to flash files for later retrieval.

About This Task

Configure logging to a flash file at all times as a best practice.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable system logging:

```
boot config flags logging
```

Variable Definitions

The following table defines parameters for the **boot config** command.

Variable	Value
<i>flags logging</i>	Enables or disables logging to a flash file. The log file is named using the format log.xxxxxxx.sss. The first six characters after the prefix of the file name log contain the last three bytes of the chassis base MAC address. The next two characters specify the slot number. The last three characters denote the sequence number of the log file.
<i>logfile</i> <64-500> <500-16384> <10-90>	<p>Configures the following log file parameters:</p> <ul style="list-style-type: none"> • <64-500> specifies the minimum free memory space on /intflash from 64-500 KB. Although you can currently use this parameter, it does not alter the configuration. • <500-16384> specifies the maximum size of the log file from 500-16384 KB. • <10-90> specifies the maximum percentage, ranging from 10-90 percent, of space on /intflash the logfile can use. Although you can currently use this parameter, it does not alter the configuration. <p>Note: The maximum number of log files is 1,000. The maximum size of one log file is 1,024 KB. You cannot configure the log file parameters on 4220 Series, 5320 Series, or 5420 Series. On these platforms, the number of log files is restricted to 145 and the size of a log file is restricted to 126 KB.</p>

Configure the Remote Host for Log Transfer

Configure the remote host for log transfer. The system transfers the current log file to a remote host after the log file size reaches the maximum size or the local storage capacity is reached.

Before You Begin

- The IP address you configure for the remote host must be reachable at the time of configuration.

Procedure

- Enter Global Configuration mode:

```
enable

configure terminal
```
- (Optional) For FTP, configure the host user name and password:

```
boot config host user WORD<0-16>

boot config host password WORD<0-16>
```
- Configure the remote host address for log transfer:
 - To use TFTP or FTP: `logging transferFile {1-10} address {A.B.C.D} [filename-prefix WORD<0-200>]`
 - To use SCP: `logging transferFile {1-10} scp username WORD<0-50> [address {A.B.C.D}] [filename-prefix WORD<0-200>]`

Note

As a best practice for SCP transfer, first configure parameters other than the remote server address so the switch can generate the SSH key pair, and then configure the remote server address after you upload the public key to the remote server.

- Verify the configuration:

```
show logging transferfile {1-10}
```

Example

Configure the remote host for log transfer using SCP:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#logging transferfile 1 scp username scp_user filename-prefix scp
Generating ssh key-pair ...
SSH key pair generated. Public key at location /intflash/shared/my_key.pub.
#Upload the public key to the destination host.
Switch:1(config)#logging transferfile 1 address 192.0.2.10
```

Verify the configuration:

```
Switch:1>show logging transferfile 1

RemoteIPAddress : 192.0.2.10
FileName : scp.02d80001.131
```

```

FileNamePrefix : scp
Username       : scp_user
TransferType   : SCP
PublicKey      : /intflash/shared/my_key.pub

```

Variable Definitions

The following table defines parameters for the **logging transferFile** command.

Variable	Value
<i>1-10</i>	Specifies the host ID. You can configure a maximum of 10 remote hosts.
<i>address {A.B.C.D}</i>	Specifies the IP address of the host to which to transfer the log file. The remote host must be reachable or the configuration fails.
<i>filename-prefix WORD<0-200></i>	Specifies the prefix for the filename on the remote host. If you do not configure a value, the current log filename is the default.
<i>scp username WORD<0-50></i>	Specifies the SCP user name for the remote server.

View Logs

View log files by file name, category, or severity to identify possible problems.

About This Task

View CLI command and SNMP trap logs, which are logged as normal log messages and logged to the system log file.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Show log information:
show logging file [alarm] [CPU WORD<0-100>] [detail] [event-code WORD<0-10>] [module WORD<0-100>] [name-of-file WORD<1-99>] [save-to-file WORD<1-99>] [severity WORD<0-25>] [tail] [vrf WORD<0-32>]

Example

Display log file information:

```

Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#show logging file

```

Variable Definitions

The following table defines parameters for the **show logging file** command.

Variable	Value
<i>alarm</i>	Displays alarm log entries.
<i>CPU WORD <0-100></i>	Filters and lists the logs according to the CPU that generated the message. Specify a string length of 0-25 characters. To specify multiple filters, separate each CPU by the vertical bar (), for example, CPU1 CPU2.

Variable	Value
<i>detail</i>	Displays CLI and SNMP logging information.
<i>event-code</i> <i>WORD</i> <0-10>	Specifies a number that precisely identifies the event reported.
<i>module</i> <i>WORD</i> <0-100>	Filters and lists the logs according to module. Specifies a string length of 0-100 characters. Categories include SNMP, EAP, RADIUS, RMON, WEB, HW, MLT, FILTER, QOS, CLILOG, SW, CPU, IP, VLAN, IPMC, and SNMPLOG. To specify multiple filters, separate each category by the vertical bar (), for example, <i>FILTER</i> <i>QOS</i> .
<i>name-of-file</i> <i>WORD</i> <1-99>	Displays the valid logs from this file. For example, /intflash/logcopy.txt. You cannot use this command on the current log file, the file into which the messages are currently logged. Specify a string length of 1 to 99 characters. If you enable enhanced secure mode, the system encrypts the entire log file. After you use the show log file name-of-file WORD<1-99> command, the system takes the encrypted log file name as input, then decrypts it, and prints the output to the screen. You can then redirect the decrypted output to a file that you can store onto the flash. If enhanced secure mode is disabled, the system only encrypts the proprietary portion of the log file.
<i>save-to-file</i> <i>WORD</i> <1-99>	Redirects the output to the specified file and removes all encrypted information. You cannot use the <i>tail</i> option with the <i>save-to-file</i> option. Specify a string length of 1-99 characters.
<i>severity</i> <i>WORD</i> <0-25>	Filters and lists the logs according to severity. Choices include INFO, ERROR, WARNING, and FATAL. To specify multiple filters, separate each severity by the vertical bar (), for example, <i>ERROR</i> <i>WARNING</i> <i>FATAL</i> .
<i>tail</i>	Shows the last results first.
<i>vrf</i> <i>WORD</i> <0-32>	Specifies the name of a VRF instance to show log messages that only pertain to that VRF.

Configure CLI Logging

Use CLI logging to track configuration changes made using CLI commands on the switch. The CLI commands are logged to the system log file as CLILOG module.

About This Task

Note

The platform logs CLILOG and SNMPLOG as INFO. Normally, if you configure the logging level to WARNING, the system skips all INFO messages. However, if you enable CLILOG and SNMPLOG the system logs CLI Log and SNMP Log information regardless of the logging level you configure. This is not the case for other INFO messages.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Enable CLI logging:
clilog enable
3. Ensure that the configuration is correct:
show clilog
4. View the CLI log:
show logging file module clilog

Example

Enable CLI logging, and view the CLI log:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#clilog enable
Switch:1(config)#show logging file module clilog

Variable Definitions

The following table defines parameters for the **cliilog** command.

Variable	Value
<i>enable</i>	Activates CLI logging. To disable, use the no cliilog enable command.

Configure Email Notifications for System Events

Configure the SMTP feature to generate email notifications for component failures, critical conditions, or general system status.

Before You Begin

To identify the SMTP server by hostname, you must first configure a DNS client on the switch.

About This Task

The SMTP feature is disabled by default.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the TCP port the client uses to open a connection with the SMTP server:

```
smtp port <1-65535>
```

Note

The port you specify must match the port that the SMTP server uses.

3. Configure email recipients:

```
smtp receiver-email add WORD<3-1274>
```

```
smtp receiver-email remove WORD<3-1274>
```

Note

You must configure at least one recipient.

4. Configure the SMTP server hostname or IPv4 address:

```
smtp server WORD<1-256>
```

5. (Optional) Configure a sender email address:

```
smtp sender-email WORD<3-254>
```

6. (Optional) Add or remove log events to the default list that generate email notification:

```
smtp event-id add WORD<1-1100>
```

```
smtp event-id remove WORD<1-1100>
```

7. (Optional) Configure the status update interval:

```
smtp status-send-timer <0 | 30-43200>
```

8. Enable the SMTP client:

```
smtp enable
```

9. Configure an SMTP domain name:

```
smtp domain-name WORD<1-254>
```

10. Verify the configuration:

```
show smtp [event-id]
```

11. (Optional) Display information about the specific event:

```
show logging file event-code WORD<1-10>
```

Examples

Configure the SMTP client to use TCP port 26 to communicate with an SMTP server that is using port 26. Add two receiver email addresses, configure the server information using an IPv4 address, and enable the SMTP feature. Finally, configure an SMTP domain name, and then verify the configuration.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#smtp port 26
Switch:1(config)#smtp receiver-email add test1@default.com,test2@default.com
Switch:1(config)#smtp server 192.0.2.1
Switch:1(config)#smtp enable
Switch:1(config)#smtp domain-name test mailer
Switch:1(config)#show smtp
=====
SMTP Information
=====
SMTP Status: Enabled
Server Address: 192.0.2.1
Server Port: 26
Status send Timer: 30 (seconds)
Sender Email: LabSwitch@default.com
Domain Name: test mailer
Receiver Emails: test1@default.com
                  test2@default.com
```

Add an event ID to the list for which the switch sends email notification on a log event.

```
Switch:1(config)#smtp event-id add 0x0000c5ec
```

Verify the configuration.

```
Switch>show smtp event-id
=====
SMTP Event IDs Information

```

Variable Definitions

The following table defines parameters for the **smtp port** command.

Variable	Value
<1-65535>	<p>Specifies the TCP port on the switch that the SMTP client uses to communicate with the SMTP server. The default value is 25.</p> <p>Note: You must disable the SMTP feature before you can change an existing SMTP port configuration. The port you specify must match the port that the SMTP server uses.</p>

The following table defines parameters for the **smtp receiver-email** command.

Variable	Value
<i>add</i> <i>WORD<3-1274></i>	<p>Adds an email address to the recipient list. The recipients receive the email notification generated by the switch.</p> <p>You must configure at least one email recipient and can create a maximum of five email recipients. You can specify multiple addresses in a single command by separating them with a comma.</p> <p>You cannot use quotation marks (") or commas (,) in email addresses. Other restrictions for the format of the email address follow RFC 5321.</p> <p>The maximum length for the address is 254 characters.</p>
<i>remove</i> <i>WORD<3-1274></i>	<p>Removes an email address from the recipient list. The recipients receive the email notification generated by the switch. You can specify multiple addresses in a single command by separating them with a comma.</p> <p>You cannot use quotation marks (") or commas (,) in email addresses. Other restrictions for the format of the email address follow RFC 5321.</p> <p>The maximum length for the address is 254 characters.</p>

The following table defines parameters for the **smtp server** command.

Variable	Value
<i>WORD<1-256></i>	<p>Specifies the SMTP server address. You can use either a hostname or IPv4 address. If you use a hostname, you must configure the DNS client on the switch.</p>

The following table defines parameters for the **smtp sender-email** command.

Variable	Value
<i>WORD<3-254></i>	<p>Specifies the email address that the system displays it in the From field of the message that the switch generates. By default, the switch uses <i><SystemName>@default.com</i>.</p>

The following table defines parameters for the **smtp event-id** command.

Variable	Value
<i>add WORD<1-1100></i>	<p>Adds a log event to the list of events that generate email notification. You can specify multiple event IDs in a single command by separating them with a comma.</p> <p>The event ID can be up to 10 digits in hexadecimal format.</p>
<i>remove</i> <i>WORD<1-1100></i>	<p>Removes a log event from the list of events that generate email notification. You can specify multiple event IDs in a single command by separating them with a comma.</p> <p>The event ID can be up to 10 digits in hexadecimal format.</p>

The following table defines parameters for the **smtp status-send-timer** command.

Variable	Value
<0 30-43200>	Specifies the interval, in seconds, at which the switch sends status information. The default is 30 seconds. A value of 0 means the switch does not send status information.

The following table defines parameters for the **smtp domain-name** command.

Variable	Value
WORD<1-254>	Specifies the SMTP host name or IPv4 address (string length 1-254).

The following table defines parameters for the **show smtp** command.

Variable	Value
event-id	Shows a list of active event IDs for which the switch generates email notification. The command output includes the default list of IDs and IDs you specifically add or remove.

Log Configuration Using EDM

Use log files and messages to perform diagnostic and fault management functions. This section provides procedures to configure and use the logging system in Enterprise Device Manager (EDM).

Configure the System Log

About This Task

Configure the system log to track all user activity on the device. The system log can send messages of up to ten syslog hosts.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics**.
2. Select **System Log**.
3. In the **System Log** tab, select **Enable**.
4. Configure the maximum number of syslog hosts.
5. Configure the minimum version of TLS protocol.
6. Select **Apply**.

System Log Field Descriptions

Use the data in the following table to use the **System Log** tab.

Name	Description
Enable	Enables or disables the syslog feature. If you select this variable, this feature sends a message to a server on a network that is configured to receive and store diagnostic messages from this device. You can configure the type of messages sent. The default is enabled.
MaxHosts	Specifies the maximum number of remote hosts considered active and can receive messages from the syslog service. The range is 0–10 and the default is 5.
OperState	Specifies the operational state of the syslog service. The default is active.
TlsMinimumVersion	<p>Specifies the minimum version of TLS protocol supported by the syslog client.</p> <ul style="list-style-type: none">• <code>tlsv11</code> - configures TLS version 1.1• <code>tlsv12</code> - configures TLS version 1.2 <p>If the switch operates in Enhanced Secure Mode, the default TLS minimum version for Syslog is <code>tlsv12</code>. Otherwise, the default is <code>tlsv11</code>.</p>
EncryptionType	Specifies the ciphers for preset version of TLS for the syslog.

Configure the System Log Table

About This Task

Use the system log table to customize the mappings between the severity levels and the type of alarms.

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration except in the following case. When you configure the system log table, under the **System Log Table** tab, you must select **ipv4** or **ipv6**, in **AddressType**. **Address** supports both IPv4 and IPv6 addresses.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics**.
2. Select **System Log**.
3. Select the **System Log Table** tab.
4. Select **Insert**.
5. Configure the parameters as required.
6. Select **Insert**.
7. To modify mappings, double-click a parameter to view a list of options.

8. Select **Apply**.

System Log Table *Field Descriptions*

Use the data in the following table to use the **System Log Table** tab.

Name	Description
Id	Specifies the ID for the syslog host. The range is 1–10.
AddressType	Specifies if the address is an IPv4 or IPv6 address.
Address	Specifies the IP address of the syslog host. You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses.
UdpPort	Specifies the UDP port to use to send messages to the syslog host (514–530). The default is 514.
Enable	Enables or disables the sending of messages to the syslog host. The default is disabled.
HostFacility	Specifies the syslog host facility used to identify messages (local0 to local7). The default is local7.
Severity	Specifies the message severity for which syslog messages are sent. The default is info warning error fatal.
MapInfoSeverity	Specifies the syslog severity to use for INFO messages. The default is info.
MapWarningSeverity	Specifies the syslog severity to use for WARNING messages. The default is warning.
MapErrorSeverity	Specifies the syslog severity to use for ERROR messages. The default is error.
MapFatalSeverity	Specifies the syslog severity to use for FATAL messages. The default is emergency.
MapMfgSeverity	Specifies the syslog severity to use for Accelar manufacturing messages. The default is notice.
SecureForwardingTcpPort	Specifies the TCP port to use for secure forwarding for a particular host. The default is 1025.
SecureForwardingMode	Enables or disables secure forwarding of syslog over remote port forwarding. The supported values are tls and none. The default is none, which means that secure forwarding is disabled.
SecureForwardingServerCertificateName	Specifies the server certificate name. Certificate validation is done only if the server certificate name is configured.

Configure the Syslog Certificate Authority Common Name

Use the following procedure to add the common name of the Certificate Authority for the syslog server.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics**.
2. Select **System Log**.
3. Select the **Certificate Table** tab.
4. Select **Insert**.
5. In **CaCommonName**, type the common name of the Certificate Authority.
6. Select **Insert**.

Certificate Table Field Descriptions

Use the data in the following table to use the **Certificate Table** tab.

Name	Description
CaCommonName	Specifies the Certificate Authority common name for a syslog server.

Configure Email Notification for System Events

Configure the SMTP feature to generate email notifications for component failures, critical conditions, or general system status.

Before You Begin

To identify the SMTP server by hostname, you must first configure a DNS client on the switch.

About This Task

The SMTP feature is disabled by default.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **SMTP**.
3. Select the **Globals** tab.
4. In the **ServerAddress** field, configure the SMTP server address.
5. In the **ReceiverEmailsList** field, add email recipients.

Note

You must configure at least one recipient.

6. (Optional) In the **SenderEmail** field, configure a sender email address to use an address other than the default.
7. In the **DomainName** field, configure an SMTP domain name.
8. In the **Port** field, configure the TCP port that the client uses to open a connection with the SMTP server.
9. (Optional) In the **SystemStatusSendTimer** field, configure the status update interval.
10. Select **enable** to enable the SMTP client.

11. (Optional) In the **LogEventIds** field, add or remove log events to the default list that generates an email notification.
12. Select **Apply**.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

Name	Description
ServerAddressType	Specifies the type of server address as either an IPv4 address or a hostname. If you use a hostname, you must configure the DNS client on the switch.
ServerAddress	Specifies the SMTP server address. You can use either a hostname or an IPv4 address. If you use a hostname, you must configure the DNS client on the switch.
ReceiverEmailsList	<p>Specifies the recipient list. The recipients receive the email notification generated by the switch.</p> <p>You must configure at least one email recipient and can create a maximum of five email recipients. You can specify multiple addresses in a single command by separating them with a comma.</p> <p>You cannot use quotation marks (") or commas (,) in email addresses. Other restrictions for the format of the email address follow RFC5321.</p> <p>The maximum length for the address is 254 characters.</p>
NumOfEmails	Shows the total number of addresses in ReceiverEmailsList .
SenderEmail	Specifies the email address that the system displays it in the From field of the message that the switch generates. By default, the switch uses <i>SystemName@default.com</i> .
DomainName	Specifies the SMTP domain name. The maximum length is 254 characters.

Name	Description
Port	Specifies the TCP port on the switch that the SMTP client uses to communicate with the SMTP server. The default value is 25. Note: You must disable the SMTP feature before you can change an existing SMTP port configuration. The port you specify must match the port that the SMTP server uses.
SystemStatusSendTimer	Specifies the interval, in seconds, at which the switch sends status information. The default is 30 seconds. A value of 0 means the switch does not send status information.
Enable	Enables or disables the SMTP feature. By default, SMTP is disabled.
LogEventIds	Specifies the list of events that generate email notification. You can specify multiple event IDs in a single command by separating them with a comma. The event ID can be up to 10 digits in hexadecimal format.
NumOfEventIds	Shows the total number of IDs in LogEventIds .
DefaultLogEventIds	Shows the default list of event IDs that generate email notification.
NumOfDefaultEventIds	Shows the total number of IDs in DefaultLogEventIds .

SNMP Trap Configuration Using CLI

This section provides procedures to configure SNMP traps using the command line interface (CLI).

Configure an SNMP Host

Configure an SNMP host so that the system can forward SNMP traps to a host for monitoring. You can use SNMPv1, SNMPv2c, or SNMPv3. You configure the target table parameters (security name and model) as part of the host configuration.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure an SNMPv1 host:

```
snmp-server host WORD<1-256> [port <1-65535>] v1 WORD<1-32> [filter WORD<1-32>]
```

3. Configure an SNMPv2c host:

```
snmp-server host WORD<1-256> [port <1-65535>] v2c WORD<1-32> [inform [timeout <1-2147483647>] [retries <0-255>] [mms <0-2147483647>]] [filter WORD<1-32>]
```

4. Configure an SNMPv3 host:

```
snmp-server host WORD<1-256> [port <1-65535>] v3 {noAuthNoPriv|authNoPriv|AuthPriv} WORD<1-32> [inform [timeout <1-2147483647>] [retries <0-255>]] [filter WORD<1-32>]
```

5. Ensure that the configuration is correct:

```
show snmp-server host
```

Example

Configure the target table entry. Configure an SNMPv3 host.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmp-server host 192.0.2.207 port 162 v2c ReadView inform timeout 1500
retries 3 mms 484
Switch:1(config)#snmp-server host 192.0.2.207 port 163 v3 authPriv Lab3 inform timeout
1500 retries 3
```

Variable Definitions

The following table defines parameters for the **snmp-server host** command.

Variable	Value
<i>inform [timeout <1-2147483647>] [retries <0-255>] [mms <0-2147483647>]</i>	Sends SNMP notifications as inform (rather than trap). To use all three options in one command, you must use them in the following order: <ol style="list-style-type: none"> <i>timeout <1-2147483647></i> specifies the timeout value in seconds with a range of 1-214748364. <i>retries <0-255></i> specifies the retry count value with a range of 0-255. <i>mms <0-2147483647></i> specifies the maximum message size as an integer with a range of 0-2147483647.
<i>filter WORD<1-32></i>	Specifies the filter profile to use.
<i>noAuthNoPriv authNoPriv AuthPriv</i>	Specifies the security level.
<i>port <1-65535></i>	Specifies the host server port number.
<i>WORD<1-32></i>	Specifies the security name, which identifies the principal that generates SNMP messages.
<i>WORD<1-256></i>	Specifies either an IPv4 or IPv6 address.

Configure an SNMP Notify Filter Table

Configure the notify table to select management targets to receive notifications, as well as the type of notification to send to each management target.

Before You Begin

- For more information about the notify filter table, see RFC3413.

Procedure

- Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
- Create a new notify filter table:

```
snmp-server notify-filter WORD<1-32> WORD<1-32>
```
- Ensure that the configuration is correct:

```
show snmp-server notify-filter
```

Example

```
Switch:1(config)#snmp-server notify-filter profile3 99.3.6.1.6.3.1.1.4.1
Switch:1(config)#show snmp-server notify-filter
```

```
=====
```

Notify Filter Configuration		
Profile Name	Subtree	Mask
profile1	+99.3.6.1.6.3.1.1.4.1	0x7f
profile2	+99.3.6.1.6.3.1.1.4.1	0x7f
profile3	+99.3.6.1.6.3.1.1.4.1	0x7f

Variable Definitions

The following table defines parameters for the **snmp-server notify-filter** command.

Variable	Value
<i>WORD<1-32></i> <i>WORD<1-32></i>	<p>Creates a notify filter table.</p> <p>The first instance of <i>WORD<1-32></i> specifies the name of the filter profile with a string length of 1–32.</p> <p>The second instance of <i>WORD<1-32></i> identifies the filter subtree OID with a string length of 1–32.</p> <p>If the subtree OID parameter uses a plus sign (+) prefix (or no prefix), this indicates include. If the subtree OID uses the minus sign (–) prefix, it indicates exclude.</p> <p>You do not calculate the mask because it is automatically calculated. You can use the wildcard character, the asterisk (*), to specify the mask within the OID. You do not need to specify the OID in the dotted decimal format; you can alternatively specify that the MIB parameter names and the OIDs are automatically calculated.</p>

Enable SNMP Trap Logging

Use SNMP trap logging to send a copy of all traps to the syslog server.

Before You Begin

- You must configure and enable the syslog server.

About This Task

Note

The platform logs CLILOG and SNMPLOG as INFO. Normally, if you configure the logging level to WARNING, the system skips all INFO messages. However, if you enable CLILOG and SNMPLOG the system logs CLI Log and SNMP Log information regardless of the logging level you set. This is not the case for other INFO messages.

Procedure

- Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
- Enable SNMP trap logging:

```
snmplog enable
```
- (Optional) Disable SNMP trap logging:

```
no snmplog enable
```

4. View the contents of the SNMP log:

```
show logging file module snmplog
```

Example

Enable SNMP trap logging and view the contents of the SNMP log:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmplog enable
Switch:1(config-app)#show logging file module snmp
CP1  [02/06/15 22:39:58.530:UTC] 0x00004595 00000000 GlobalRouter SNMP INFO Boot

MP INFO Sending Cold-Start Trap
```

Variable Definitions

The following table defines parameters for the **snmplog** command.

Variable	Value
<i>enable</i>	Enables the logging of traps. Use the command <code>no snmplog enable</code> to disable the logging of traps.

SNMP Trap Configuration Using EDM

This section provides procedures to configure SNMP traps using Enterprise Device Manager (EDM).

Configure an SNMP Host Target Address

Configure a target table to specify the list of transport addresses to use in the generation of SNMP messages.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **Target Table**.
3. Select the **Target Table** tab.
4. Select **Insert**.
5. In **Name**, type a unique identifier.
6. In **TDomain**, select the transport type of the address, either **ipv4Tdomain** or **ipv6Tdomain**.
7. In **TAddress**, type the transport address and User Datagram Protocol (UDP) port.
8. In **Timeout**, type the maximum round trip time.

9. In **RetryCount**, type the number of retries to be attempted.
10. In **TagList**, type the list of tag values.
11. In **Params**, type the SnmpAdminString.
12. In **TMask**, type the mask.
13. In **MMS**, type the maximum message size.
14. Select **Insert**.

Target Table Field Descriptions

Use the data in the following table to use the **Target Table** tab.

Name	Description
Name	Specifies a unique identifier for this table. The name is a community string.
TDomain	Specifies the transport type of the address. ipv4Tdomain specifies the transport type of address is an IPv4 address. ipv6Tdomain specifies the transport type of address is IPv6. The default is ipv4Tdomain .
TAddress	Specifies the transport address in xx.xx.xx.xx:port format, for example: 192.1.2.12:162, where 162 is the trap listening port on the system 192.1.2.12.
Timeout	Specifies the maximum round trip time required to communicate with the transport address. The value is in 1/100 seconds from 0–2147483647. The default is 1500. After the system sends a message to this address, if a response (if one is expected) is not received within this time period, you can assume that the response is not delivered.
RetryCount	Specifies the maximum number of retries if a response is not received for a generated message. The count can be in the range of 0–255. The default is 3.
TagList	Contains a list of tag values used to select target addresses for a particular operation. A tag refers to a class of targets to which the messages can be sent.
Params	Contains SNMP parameters used to generate messages to send to this transport address. For example, to receive SNMPv2C traps, use TparamV2.
TMask	Specifies the mask. The value can be empty or in six-byte hex string format. Tmask is an optional parameter that permits an entry in the TargetAddrTable to specify multiple addresses.
MMS	Specifies the maximum message size. The size can be zero, or 484–2147483647. The default is 484. Although the maximum message size is 2147483647, the device supports the maximum SNMP packet size of 8192.

Configure Target Table Parameters

About This Task

Configure the target table to configure the security parameters for SNMP. Configure the target table to configure parameters such as SNMP version and security levels.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **Target Table**.
3. Select the **Target Params Table** tab.
4. Select **Insert**.
5. In **Name**, type a target table name.
6. From **MPModel**, select an SNMP version.
7. From **Security Model**, select the security model.
8. In **SecurityName**, type `readview` or `writeview`.
9. From **SecurityLevel**, select the security level for the table.
10. Select **Insert**.

Target Params Table Field Descriptions

Use the data in the following table to use the **Target Params Table** tab.

Name	Description
Name	Identifies the target table.
MPModel	Specifies the message processing model to use to generate messages: SNMPv1, SNMPv2c, or SNMPv3/USM.
SecurityModel	Specifies the security model to use to generate messages: SNMPv1, SNMPv2c, or USM. You can receive an inconsistentValue error if you try to configure this variable to a value for a security model that the implementation does not support.
SecurityName	Identifies the principal on whose behalf SNMP messages are generated.
SecurityLevel	Specifies the security level used to generate SNMP messages: noAuthNoPriv, authNoPriv, or authPriv.

Configure SNMP Notify Filter Profiles

About This Task

Configure the SNMP table of filter profiles to determine whether particular management targets receive particular notifications.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **Notify Table**.

3. Select the **Notify Filter Table** tab.
4. Select **Insert**.
5. In **NotifyFilterProfileName**, type a name for the notify filter profile.
6. In **Subtree**, type the subtree location information in x.x.x.x.x.x.x.x format.
7. In **Mask**, type the mask location in hex string format.
8. From **Type**, select **included** or **excluded**.
9. Select **Insert**.

Notify Filter Table *Field Descriptions*

Use the data in the following table to use the **Notify Filter Table** tab.

Name	Description
NotifyFilterProfileName	Specifies the name of the filter profile used to generate notifications.
Subtree	Specifies the MIB subtree that, if you combine it with the mask, defines a family of subtrees, which are included in or excluded from the filter profile. For more information, see RFC 2573.
Mask	Specifies the bit mask (in hexadecimal format) that, in combination with the subtree, defines a family of subtrees, which are included in or excluded from the filter profile.
Type	Indicates whether the family of filter subtrees are included in or excluded from a filter. The default is included.

Configure SNMP Notify Filter Profile Table Parameters

Before You Begin

- The notify filter profile exists.

About This Task

Configure the profile table to associate a notification filter profile with a particular set of target parameters.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **Notify Table**.
3. Select the **Notify Filter Profile Table** tab.
4. Select **Insert**.
5. In **TargetParamsName**, type a name for the target parameters.
6. In **NotifyFilterProfileName**, type a name for the notify filter profile.
7. Select **Insert**.

Notify Filter Profile Table *Field Descriptions*

Use the data in the following table to use the **Notify Filter Profile Table** tab.

Name	Description
TargetParamsName	Specifies the unique identifier associated with this entry.
NotifyFilterProfileName	Specifies the name of the filter profile to use to generate notifications.

Enable Authentication Traps

About This Task

Enable the SNMP agent process to generate authentication-failure traps.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > Diagnostics**.
2. Select **General**.
3. Select the **Error** tab.
4. Select **AuthenticationTraps**.
5. Select **Apply**.

Error *Field Descriptions*

Use the data in the following table to use the **Error** tab.

Name	Description
AuthenticationTraps	Enables or disables the sending of traps after an error occurs. The default is disabled.
LastErrorCode	Specifies the last reported error code.
LastErrorSeverity	Specifies the last reported error severity: 0= Informative Information 1= Warning Condition 2= Error Condition 3= Manufacturing Information 4= Fatal Condition

Traps Reference

The switch generates alarms, traps, and logs. This section provides information about traps.

**Note**

The OID values of the rclsisTrap (OID 1.3.6.1.4.1.2272.1.63.9) table are populated only when the Duplicate ISIS Sys-id & Nickname condition is present. This MIB table captures this specific condition only. Use other tables such as rclsisAdjTable (OID 1.3.6.1.4.1.2272.1.63.10) or isisISAdjTable (OID 1.3.6.1.3.37.1.6.1) to gather IS-IS information.

Proprietary Traps

The following tables describe proprietary traps for the switch. All of the following traps have a status of current.

Table 190: 1.3.6.1.4.1.45.5.17.0.xx series

OID	Notification type	Objects	Description
1.3.6.1.4.1.45.5.17.0.1	bsDhcpSnoopingBindingTableFull	bsDhcpSnoopingNotificationClientMACAddr	A bsDhcpSnoopingBindingTableFull notification is generated when you try adding a new DHCP binding entry, and the binding table is full. The value of bsDhcpSnoopingNotificationClientMACAddr gives the MAC address that cannot be added to the binding table. This notification also indicates that additional untrusted DHCP packets will not be added to the binding table, and will be dropped.
1.3.6.1.4.1.45.5.17.0.2	bsDhcpSnoopingTrap	<ul style="list-style-type: none"> bsDhcpSnoopingNotificationSourcePort bsDhcpSnoopingNotificationMsgType bsDhcpSnoopingNotificationSourceMACAddr bsDhcpSnoopingNotificationClientMACAddr bsDhcpSnoopingIfTrusted 	A bsDhcpSnoopingTrap notification is generated when a DHCP packet is dropped.
1.3.6.1.4.1.45.5.17.0.4	bsDhcpSnoopingStaticEntryMACConflict	bsDhcpSnoopingNotificationSourceMACAddr bsDhcpSnoopingIfIndex	A bsDhcpSnoopingStaticEntryMACConflict notification is generated when a DHCP packet is dropped, because a static entry with the same MAC address was found in the binding table.

Table 191: 1.3.6.1.4.1.45.5.18.0.xx series

OID	Notification type	Objects	Description
1.3.6.1.4.1.45.5.18.0.1	bsaiArpPacketDroppedOnUntrustedPort	<ul style="list-style-type: none"> bsArpInspectionIfTrusted bsArpInspectionNotificationSourceMACAddr 	A bsaiArpPacketDroppedOnUntrustedPort trap signifies that an ARP packet is dropped on an untrusted port, due to an invalid IP or MAC address binding. The port is identified by the instance of bsArpInspectionIfTrusted generated by the trap.

Table 192: 1.3.6.1.4.1.45.5.20.0.xx series

OID	Notification type	Objects	Description
1.3.6.1.4.1.45.5.20.0.2	bsSourceGuardCannotEnablePort	bsSourceGuardConfigMode	A bsSourceGuardCannotEnablePort trap signifies that there are insufficient resources to enable IP Source Guard checking on a port because of internal state changes within the system such as system initialization. The port is identified by the instance of bsSourceGuardConfigMode generated by the trap.
1.3.6.1.4.1.45.5.20.0.1	bsSourceGuardReachedMaxIpEntries	bsSourceGuardConfigMode	A bsSourceGuardReachedMaxIpEntries trap signifies that the maximum number of IP address entries on a port has been reached. The port is identified by the instance of bsSourceGuardConfigMode generated by the trap.

Table 193: 1.3.6.1.4.1.45.5.34.0.xx series

OID	Notification type	Objects	Description
1.3.6.1.4.1.45.5.34.0.1	bsnesGloballyEnabled		A bsnesGloballyEnabled trap signifies that the Energy Saver feature was enabled globally.
1.3.6.1.4.1.45.5.34.0.2	bsnesGloballyDisabled		A bsnesGloballyDisabled trap signifies that the Energy Saver feature was disabled globally.
1.3.6.1.4.1.45.5.34.0.3	bsnesManuallyActivated		A bsnesManuallyActivated trap signifies that the Energy Saver was activated manually.
1.3.6.1.4.1.45.5.34.0.4	bsnesManuallyDeactivated		A bsnesManuallyDeactivated trap signifies that the Energy Saver feature was deactivated manually.
1.3.6.1.4.1.45.5.34.0.5	bsnesScheduleNotApplied		A bsnesScheduleNotApplied trap signifies that a schedule was not applied because SNTP is not synchronized.
1.3.6.1.4.1.45.5.34.0.6	bsnesScheduleApplied		A bsnesScheduleApplied trap signifies that SNTP is synchronized and the schedule is being applied.
1.3.6.1.4.1.45.5.34.0.7	bsnesActivated		A bsnesActivated trap signifies that the Energy Saver feature was activated by the schedule.
1.3.6.1.4.1.45.5.34.0.8	bsnesDeactivated		A bsnesDeactivated trap signifies that the Energy Saver feature was deactivated by the schedule.

Table 194: 1.3.6.1.4.1.45.5.43.0.xx series

ODID	Notification type	Objects	Description
1.3.6.1.4.1.45.5.43.0.1	bsLstInterfaceStatusChanged	<ul style="list-style-type: none"> • ifIndex • bsLstInterfaceStatus • bsLstGroupIndex 	A bsLstInterfaceStatusChanged trap signifies that a physical or logical interface changed status in a Link-state tracking (LST) tracking group.
1.3.6.1.4.1.45.5.43.0.2	bsLstInterfaceOperStateChanged	<ul style="list-style-type: none"> • ifIndex • bsLstInterfaceStatus • bsLstGroupIndex 	A bsLstInterfaceOperState Changed trap signifies that the operational status of an LST group changed due to an interface status change. For example, when the last interface in an LST group is down, the operational status of the LST group changes to down.

Table 195: 1.3.6.1.4.1.2272.1.4.10.1.1.xxx series

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.4.10.1.1.114	rcPortShutdownReason	<ul style="list-style-type: none"> • rcPortVLacpTotalFlapCount • rcPortVLacpFirstFlapTimeStamp • rcPortVLacpLastFlapTimeStamp 	An rcPortShutdownReason trap signifies that the specific VLACP link port status is down as VLACP flaps are detected on that port.

Table 196: 1.3.6.1.4.1.2272.1.21.0.xx series

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.21.0.3	rcnErrorNotification	rcErrorLevel rcErrorCode rcErrorText	An rcnErrorNotification trap signifies that the SNMPv2 entity, acting in an agent role, has detected an error condition.
1.3.6.1.4.1.2272.1.21.0.4	rcnStpNewRoot	rcStgId	An rcnStpNewRoot trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the Spanning Tree Protocol declared the device to be the new root of the spanning tree.

Table 196: 1.3.6.1.4.1.2272.1.21.0.xx series (continued)

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.21.0.5	rcnStpTopologyChange	rcStgId rcPortIndex	An rcnStpTopologyChange trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the Spanning Tree Protocol has gone due to a topology change event.
1.3.6.1.4.1.2272.1.21.0.6	rcnChasPowerSupplyDown	<ul style="list-style-type: none"> rcChasPowerSupplyId rcChasPowerSupplyOperStatus 	An rcnChasPowerSupplyDown trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the rcChasPowerSupplyOperStatus object for one of its power supply units is about to transition into the down state.
1.3.6.1.4.1.2272.1.21.0.7	rcnChasFanDown	<ul style="list-style-type: none"> rcChasFanId rcChasFanOperStatus 	An rcnChasFanDown trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the rcChasFanOperStatus object for one of its power supply units is about to transition into the down state.
1.3.6.1.4.1.2272.1.21.0.8	rcnLinkOscillation	rcPortIndex	An rcnLinkOscillation trap signifies that the SNMPv2 entity, acting in an agent role, has detected an excessive number of link state transitions on the specified port.
1.3.6.1.4.1.2272.1.21.0.9	rcnMacViolation	<ul style="list-style-type: none"> rcErrorText rcPortIndex 	An rcnMacViolation trap signifies that the SNMPv2 entity, acting in an agent role, has received a PDU with an invalid source MAC address.
1.3.6.1.4.1.2272.1.21.0.13	rcn2kTemperature	rc2kChassisTemperature	An rcn2kTemperature trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the chassis is overheating.
1.3.6.1.4.1.2272.1.21.0.14	rcnChasPowerSupplyUp	<ul style="list-style-type: none"> rcChasPowerSupplyId rcChasPowerSupplyOperStatus 	An rcnChasPowerSupplyUp trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the rcChasPowerSupplyOperStatus object for one of its power supply units is about to transition into the up state.
1.3.6.1.4.1.2272.1.21.0.16	rcnStpTCN	<ul style="list-style-type: none"> rcStgId rcPortIndex rcStgBridgeAddresses 	An rcnStpTCN trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the Spanning Tree Protocol has gone due to a topology change event.
1.3.6.1.4.1.2272.1.21.0.17	rcnSmltLstLinkUp		An rcnSmltLstLinkUp trap signifies that the split MLT link is from down to up.

Table 196: 1.3.6.1.4.1.2272.1.21.0.xx series (continued)

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.21.0.18	rcnSmltIstLinkDown	rcnSmltIstLinkDown	An rcnSmltIstLinkDown trap signifies that the split MLT link is from up to down.
1.3.6.1.4.1.2272.1.21.0.19	rcnSmltLinkUp	rcMltSmltId	An rcnSmltLinkUp trap signifies that the split SMLT link is up.
1.3.6.1.4.1.2272.1.21.0.20	rcnSmltLinkDown	rcMltSmltId	An rcnSmltLinkDown trap signifies that the split SMLT link is down.
1.3.6.1.4.1.2272.1.21.0.21	rcnChasFanUp	<ul style="list-style-type: none"> rcChasFanId rcChasFanOperStatus 	An rcnChasFanUp trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the rcChasFanOperStatus object for one of its power supply units is about to transition into the up state.
1.3.6.1.4.1.2272.1.21.0.22	rcnPasswordChange	<ul style="list-style-type: none"> rcCliPasswordChange rcCliPassChangeResult 	An rcnPasswordChange trap signifies that the SNMPv2 entity, acting in an agent role, has detected that one of the CLI passwords is changed.
1.3.6.1.4.1.2272.1.21.0.23	rcnEmError	<ul style="list-style-type: none"> rc2kCardIndex rcChasEmModeError 	An rcnEmError trap signifies that the SNMPv2 entity, acting in an agent role, has detected an Em error.
1.3.6.1.4.1.2272.1.21.0.26	rcnSmartCpldTimerFired	rc2kCardIndex	An rcnSmartCpldTimerFired trap signifies that the CP ID timer fired.
1.3.6.1.4.1.2272.1.21.0.27	rcnCardCpldNotUpDate	rc2kCardIndex	An rcnCardCpldNotUpDate trap signifies that the CP ID is not up-to-date.
1.3.6.1.4.1.2272.1.21.0.28	rcnIgapLogFileFull		An rcnIgapLogFileFull trap signifies that the IGAP accounting time-out Log File has reached the maximum.
1.3.6.1.4.1.2272.1.21.0.30	rcnSshServerEnabled	rcSshGlobalPort	An rcnSshServerEnabled trap signifies that the SSH server is enabled.
1.3.6.1.4.1.2272.1.21.0.31	rcnSshServerDisabled	rcSshGlobalPort	An rcnSshServerDisabled trap signifies that the SSH server is disabled.
1.3.6.1.4.1.2272.1.21.0.37	rcnSaveConfigAction	rcSysActionL1	An rcnSaveConfigAction trap indicates that the switch run time or boot configuration is being saved.
1.3.6.1.4.1.2272.1.21.0.38	rcnLoopDetectOnPort	<ul style="list-style-type: none"> rcVlanId rcPortIndex 	An rcnLoopDetectOnPort trap indicates that a loop has been detected on a port. The VLAN on that port will be disabled.
Note: This trap does not apply to all platforms.			

Table 196: 1.3.6.1.4.1.2272.1.21.0.xx series (continued)

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.21.0.41	rcnAggLinkUp	rcMltId	An rcnAggLinkUp trap is generated when the operational state of the aggregator changes from down to up.
1.3.6.1.4.1.2272.1.21.0.42	rcnAggLinkDown	rcMltId	An rcnAggLinkDown trap is generated when the operational state of the aggregator changes from up to down.
1.3.6.1.4.1.2272.1.21.0.59	rcnFdbProtectViolation	<ul style="list-style-type: none"> rcVlanId rcPortIndex 	The rcnFdbProtectViolation trap signifies that the port has violated the user-configured limit for total number of fdb-entries learned on that port.
1.3.6.1.4.1.2272.1.21.0.60	rcnLogMsgControl	<ul style="list-style-type: none"> rcSysMsgLogFrequency rcSysMsgLogText 	An rcnLogMsgControl trap signifies whether the number of times of repetition of the particular Log message has exceeded the particular frequency or count.
1.3.6.1.4.1.2272.1.21.0.61	rcnSaveConfigFile	<ul style="list-style-type: none"> rcSysActionL1 rcSysConfigFileName 	An rcnSaveConfig trap signifies that either the runtime config or the boot config has been saved on the switch.
1.3.6.1.4.1.2272.1.21.0.62	rcnDNSRequestResponse	<ul style="list-style-type: none"> rcSysDnsServerListIpAddr rcSysDnsRequestType 	An rcnDnsRequestResponse trap signifies that the switch sent a query to the DNS server or that it received a successful response from the DNS Server.
1.3.6.1.4.1.2272.1.21.0.63	rcnDuplicateIpAddress	<ul style="list-style-type: none"> ipNetToMediaNetAddress ipNetToMediaPhysAddress 	An rcnDuplicateIpAddress trap signifies that a duplicate IP address is detected on the subnet.
1.3.6.1.4.1.2272.1.21.0.64	rcnLoopDetectPortDown	<ul style="list-style-type: none"> rcPortIndex ifAdminStatus ifOperStatus 	An rcnLoopDetectPortDown trap signifies that a loop has been detected on a port and the port is going to shut down.
1.3.6.1.4.1.2272.1.21.0.67	rcnLoopDetectMacDiscard	<ul style="list-style-type: none"> rcPortIndex rcSysMacFlapLimitTime rcSysMacFlapLimitCount 	An rcnLoopDetectMacDiscard trap signifies that a loop has been detected on a port and the MAC address will be discarded on all ports in that VLAN.
1.3.6.1.4.1.2272.1.21.0.68	rcnAutoRecoverPort	rcPortIndex	An rcnAutoRecoverPort trap signifies that autorecovery has reenabled a port that was previously disabled by link flap.
1.3.6.1.4.1.2272.1.21.0.69	rcnAutoRecoverLoopDetectedPort	rcVlanNewLoopDetectedAction	An rcnAutoRecoverPort trap signifies that autorecovery has cleared the loop detect action that was taken on a port.

Table 196: 1.3.6.1.4.1.2272.1.21.0.xx series (continued)

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.21.0.74	rcnTacacsAuthFailure	rcTacacsGlobalLastUserName	An rcnTacacsAuthFailure trap signifies that TACACS+ authentication failed for a user.
1.3.6.1.4.1.2272.1.21.0.75	rcnTacacsNoServers		An rcnTacacsNoServers trap signifies that you are unable to use any TACACS+ servers for authentication.
1.3.6.1.4.1.2272.1.21.0.76	rcnTacacsRxUnsupportedFrame	<ul style="list-style-type: none"> rcTacacsGlobalLastAddressType rcTacacsGlobalLastAddress 	An rcnTacacsRxUnsupportedFrame trap signifies that an unsupported frame was received from the TACACS+ server.
1.3.6.1.4.1.2272.1.21.0.77	rcnTacacsExceededMaxLogins		An rcnTacacsExceededMaxLogins trap signifies that there was an attempt to exceed the maximum number of allowed TACACS+ logins.
1.3.6.1.4.1.2272.1.21.0.78	rcnTacacsClientFailure		An rcnTacacsClientFailure trap signifies that the TACACS+ Client application is down.
1.3.6.1.4.1.2272.1.21.0.80	rcnVlcpPortDown	rcPortIndex	An rcnVlcpPortDown trap signifies that VLACP is down on the port specified.
1.3.6.1.4.1.2272.1.21.0.81	rcnVlcpPortUp	rcPortIndex	An rcnVlcpPortUp trap signifies that VLACP is up on the port specified.
1.3.6.1.4.1.2272.1.21.0.83	rcnEapMacIntrusion	<ul style="list-style-type: none"> rcSysIpAddr rcRadiusPaePortNumber rcRadiusEapLastAuthMac rcRadiusEapLastRejMac 	An rcnEapMacIntrusion trap signifies that an EAP MAC intrusion has occurred on this port.
1.3.6.1.4.1.2272.1.21.0.110	rcnMaxRouteWarnClear	rcVrfName	An rcnMaxRouteWarnClear trap signifies that the number of routes in the routing table of the virtual router has dropped below the warning threshold.
1.3.6.1.4.1.2272.1.21.0.111	rcnMaxRouteWarnSet	rcVrfName	An rcnMaxRouteWarnSet trap signifies that the routing table for the virtual router is reaching its maximum size. Take action to prevent this.
1.3.6.1.4.1.2272.1.21.0.112	rcnMaxRouteDropClear	rcVrfName	An rcnMaxRouteDropClear trap signifies that the routing table for the virtual router is no longer dropping new routes as it is below the maximum size.

Table 196: 1.3.6.1.4.1.2272.1.21.0.xx series (continued)

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.21.0.113	rcnMaxRouteDropSet	rcVrfName	An rcnMaxRouteDropSet trap signifies that the routing table for the virtual router has reached the maximum size, and is now dropping all new nonstatic routes.
1.3.6.1.4.1.2272.1.21.0.117	rcnMstpNewCistRoot	rcStgBridgeAddress	An rcnMstpNewCistRoot trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the Multiple Spanning Tree Protocol has declared the device to be the new root of the common internal spanning tree.
1.3.6.1.4.1.2272.1.21.0.118	rcnMstpNewMstiRoot	<ul style="list-style-type: none"> rcStgBridgeAddresses rcStgId 	An rcnMstpNewMstiRoot trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the Multiple Spanning Tree Protocol has declared the device to be the new root of the spanning tree instance.
1.3.6.1.4.1.2272.1.21.0.119	rcnMstpNewCistRegionalRoot	rcStgBridgeAddress	An rcnMstpNewCistRegionalRoot trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the Multiple Spanning Tree Protocol has declared the device to be the new regional root of the common internal spanning tree.
1.3.6.1.4.1.2272.1.21.0.120	rcnRstpNewRoot	rcStgBridgeAddress	An rcnRstpNewRoot trap signifies that the SNMPv2 entity, acting in an agent role, has detected that the Rapid Spanning Tree Protocol has declared the device to be the new root of the spanning tree.
1.3.6.1.4.1.2272.1.21.0.124	rcnRsmltEdgePeerModified	rcVlanId	An rcnRsmltEdgePeerModified trap signifies that the RSMLT peer address is different from that of the stored address. You must save the configuration if EdgeSupport has to use this information on the next restart.
1.3.6.1.4.1.2272.1.21.0.143	rcn2kGbicRemoved	<ul style="list-style-type: none"> rc2kCardIndex rcPortIndex rcPortUserLabel1 rcPortUserLabel2 rc2kChassisUserLabel1 	An rcGbicRemoved trap signifies that the SNMPv2 entity, acting in an agent role has detected that an XFP or SFP is removed from the specified slot or port.

Table 196: 1.3.6.1.4.1.2272.1.21.0.xx series (continued)

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.21.0.144	rcn2kGbicInserted	<ul style="list-style-type: none"> rc2kCardIndex rcPortIndex rcPortUserLabel1 rcPortUserLabel2 rc2kChassisUserLabel1 	An rcGbicInserted trap signifies that the SNMPv2 entity, acting in an agent role has detected that the an XFP or SFP is inserted in the specified slot or port.
1.3.6.1.4.1.2272.1.21.0.167	rcnChasPowerSupplyNoRedundancy		An rcnChasPowerSupplyNoRedundancy trap signifies that the chassis is running on a power supply without redundancy.
1.3.6.1.4.1.2272.1.21.0.168	rcnChasPowerSupplyRedundancy		An rcnChasPowerSupplyRedundancy trap signifies that the chassis is running on a power supply with redundancy.
1.3.6.1.4.1.2272.1.21.0.171	rcnLicenseTrialPeriodExpired		An rcnLicenseTrialPeriodExpired trap signifies that the Trial Period License has expired.
1.3.6.1.4.1.2272.1.21.0.172	rcnLicenseTrialPeriodExpiry	rcSysLicenseTrialDaysLeft	An rcnLicenseTrialPeriodExpiry trap signifies the time remaining, in days, before the Trial Period License expires.
1.3.6.1.4.1.2272.1.21.0.173	rcnVrfUp	rcVrfName rcVrfOperStatus	This notification is generated when the operational status of the specified VRF is toggled from down to up.
1.3.6.1.4.1.2272.1.21.0.174	rcnVrfDown	rcVrfName rcVrfOperStatus	This notification is generated when the operational status of the specified VRF is toggled from up to down.
1.3.6.1.4.1.2272.1.21.0.175	rcnMrouteIngressThresholdExceeded	<ul style="list-style-type: none"> rcIpResourceUsageGlobalIngressRecInUse rcIpResourceUsageGlobalIngressThreshold 	This notification is generated when the number of mroute ingress records exceeds the ingress threshold.
1.3.6.1.4.1.2272.1.21.0.176	rcnMrouteEgressThresholdExceeded	<ul style="list-style-type: none"> rcIpResourceUsageGlobalIngressRecInUse rcIpResourceUsageGlobalIngressThreshold 	This notification is generated when the number of mroute egress records exceeds the egress threshold.
1.3.6.1.4.1.2272.1.21.0.185	rcnChasPowerSupplyRunningLow		An rcnChasPowerSupplyRunningLow trap signifies that the chassis is running on low power supply.

Table 196: 1.3.6.1.4.1.2272.1.21.0.xx series (continued)

OID	Notification type	Objects	Description
1.3.6.1.4.1.2272.1.21.0.192	rcnIsisPlsbMetricMismatchTrap	<ul style="list-style-type: none"> • rclsisLocalLspId • rclsisLocalL1Metric • rclsisNgbLspId • rclsisNgbL1Metric • rclsisPlsbTrapType • rclsisTrapIndicator • rclsisLocalHostName • rclsisNgbHostName 	An rcnIsisPlsbMetricMismatchTrap signifies that a Link State Packet (LSP) with a different value of Level 1 metric is received.
1.3.6.1.4.1.2272.1.21.0.193	rcnIsisPlsbDuplicateSysidTrap	<ul style="list-style-type: none"> • rclsisLocalSysId • rclsisLocalInterface • rclsisPlsbTrapType • rclsisTrapIndicator 	An rcnIsisPlsbDuplicateSysidTrap signifies that a Hello packet with a duplicate system ID is received.
1.3.6.1.4.1.2272.1.21.0.194	rcnIsisPlsbLsdbUpdateTrap	rclsisPlsbTrapType	An rcnIsisPlsbLsdbUpdateTrap signifies that link state database (LSDB) information has changed.

Standard Traps

The following table describes standard traps that the switch can generate.

Table 198: Standard traps

OID	Notification type	Objects	Description
1.3.6.1.2.1.16.0.1	risingAlarm	alarmIndex alarmVariable alarmSampleType alarmValue alarmRisingThreshold	The SNMP trap that is generated after an alarm entry crosses the rising threshold and generates an event that is configured to send SNMP traps. TRAP TYPE ENTERPRISE rmon
1.3.6.1.2.1.16.0.2	fallingAlarm	alarmIndex alarmVariable alarmSampleType alarmValue alarmFallingThreshold	The SNMP trap that is generated after an alarm entry crosses the falling threshold and generates an event that is configured to send SNMP traps. TRAP TYPE ENTERPRISE rmon
1.3.6.1.2.1.46.1.3.0.3	vrrpTrapStateTransition	ifIndex vrrpTrapStateTransitionType vrrpTrapStateTransitionCause vrrpOperVrId vrrpOperIpAddr ipAdEntAddr	A vrrpTrapStateTransition trap signifies a state transition has occurred on a particular Virtual Router Redundancy Protocol (VRRP) interface. Implementation of this trap is optional. vrrpOperIpAddr contains the IP address of the VRRP interface while ipAdEntAddr contains the IP address assigned to the physical interface.
1.3.6.1.2.1.68.0.1	vrrpTrapNewMaster	vrrpOperMasterIpAddr	The newMaster trap indicates that the sending agent has transitioned to Master state.

Table 198: Standard traps (continued)

OID	Notification type	Objects	Description
1.3.6.1.2.1.68.0.2	vrrpTrapAuthFailure	vrrpTrapPacketSrc vrrpTrapAuthErrorType	A vrrpAuthFailure trap signifies that a packet has been received from a router whose authentication key or authentication type conflicts with the authentication key or authentication type of this router.
1.3.6.1.2.1.80.0.1	pingProbeFailed	pingCtlTargetAddressType pingCtlTargetAddress pingResultsOperStatus pingResultsIpTargetAddressType pingResultsIpTargetAddress pingResultsMinRtt pingResultsMaxRtt pingResultsAverageRtt pingResultsProbeResponse pingResultsSentProbes pingResultsRttSumOfSquares pingResultsLastGoodProbe	This trap is generated after a probe failure is detected when the corresponding pingCtlTrapGeneration object is configured to probeFailure(0) subject to the value of pingCtlTrapProbeFailureFilter. The object pingCtlTrapProbeFailureFilter can specify the number of successive probe failures required before this notification can be generated.
1.3.6.1.2.1.80.0.2	pingTestFailed	pingCtlTargetAddressType pingCtlTargetAddress pingResultsOperStatus pingResultsIpTargetAddressType pingResultsIpTargetAddress pingResultsMinRtt pingResultsMaxRtt pingResultsAverageRtt pingResultsProbeResponses pingResultsSentProbes pingResultsRttSumOfSquares pingResultsLastGoodProbe	This trap is generated after a ping test fails when the corresponding pingCtlTrapGeneration object is configured to testFailure(1). In this instance pingCtlTrapTestFailureFilter specifies the number of probes in a test required to fail to consider the test as failed.

Table 198: Standard traps (continued)

OID	Notification type	Objects	Description
1.3.6.1.2.1.80.0.3	pingTestCompleted	pingCtlTargetAddressType pingCtlTargetAddress pingResultsOperStatus pingResultsIpTargetAddressType pingResultsIpTargetAddress pingResultsMinRtt pingResultsMaxRtt pingResultsAverageRtt pingResultsProbeResponses pingResultsSentProbes pingResultsRttSumOfSquares pingResultsLastGoodProbe	This trap is generated at the completion of a ping test when the corresponding pingCtlTrapGeneration object is configured to testCompletion(4).
1.3.6.1.2.1.81.0.1	traceRoutePathChange	traceRouteCtlTargetAddressType traceRouteCtlTargetAddress traceRouteResultsIpTgtAddrType traceRouteResultsIpTgtAddr	This trap is generated after the path to a target changes.
1.3.6.1.2.1.81.0.2	traceRouteTestFailed	traceRouteCtlTargetAddressType traceRouteCtlTargetAddress traceRouteResultsIpTgtAddrType traceRouteResultsIpTgtAddr	This trap is generated is traceroute cannot determine the path to a target (traceRouteNotifications 2).
1.3.6.1.2.1.81.0.3	traceRouteTestCompleted	traceRouteCtlTargetAddressType traceRouteCtlTargetAddress traceRouteResultsIpTgtAddrType traceRouteResultsIpTgtAddr	This trap is generated after the path to a target is determined.
1.3.6.1.6.3.1.1.5.1	coldStart		A coldStart trap signifies that the SNMPv2 entity, acting in an agent role, is reinitializing and that its configuration may have been altered.

Table 198: Standard traps (continued)

OID	Notification type	Objects	Description
1.3.6.1.6.3.1.1.5.2	warmStart		A warmStart trap signifies that the SNMPv2 entity, acting in an agent role, is reinitializing such that its configuration is unaltered.
1.3.6.1.6.3.1.1.5.3	linkDown		A linkDown trap signifies that the sending protocol entity recognizes a failure in one of the communication links represented in the agent configuration. TRAP-TYPE ENTERPRISE snmp
1.3.6.1.6.3.1.1.5.4	linkUp		A linkUp trap signifies that the sending protocol entity recognizes that one of the communication links represented in the agent configuration has come up. TRAP-TYPE ENTERPRISE snmp
1.3.6.1.6.3.1.1.5.5	authenticationFailure

MACsec Fundamentals

MAC Security (MACsec) is based on the IEEE 802.1ae standard that allows authorized systems in a network to transmit data confidentially and to protect against data transmitted or modified by unauthorized devices.

You can use MACsec for core and enterprise edge switches to do the following:

- Secure site-to-site connectivity between data centers.
- Provide data security on links that run over public ground.
- Provide data security on links that run outside the physically secure boundaries of a site.

You can use MACsec on access switches to secure host-to-switch connectivity, and host-to-switch connectivity in an environment where both trusted and untrusted hosts coexist.

In addition to host level authentication, MACsec capable LANs provide data origin authentication, data confidentiality, and data integrity between authenticated hosts or

systems. MACsec protects data from external hacking while the data passes through the public network to reach a receiver host.

MACsec enabled hosts encrypt and decrypt every frame exchanged between them using a MACsec key. The source MACsec host encrypts data frames, and the destination MACsec host decrypts the frames, ensuring delivery of the frame in its original condition to the recipient host. This ensures secure data communication.

**Note**

Before you enable MACsec on the 5320 Series or 5420 Series you must configure the macsec boot flag.

You can configure MACsec encryption over any type of point-to-point Ethernet or emulated Ethernet connection, which includes:

- Dark fiber
- Conventional wavelength-division multiplexing/dense wavelength-division multiplexing (CWDM/DWDM) service
- Multiprotocol label switching (MPLS) point-to-point (ELINE)
- Provider Backbone Bridge Traffic Engineering (PBB-TE)

You can configure MACsec on physical ports only. However, the physical ports can belong to an MLT trunk group that includes: Split MultiLink Trunking (SMLT), distributed MultiLink Trunking (DMLT), or Link aggregate group (LAG).

You configure a pre-shared key on either end of the MACsec link. The pre-shared key is an interface parameter, not a switch-wide parameter.

MACsec encrypts all packets. If you configure MACsec on one or more MultiLink Trunking (MLT) port members on one side, you must configure MACsec on the same port members on the other side. If you do not do this, the port can physically be enabled, but any overlying protocols can be disabled. You do not have to provision MACsec on all MLT port members, but if you configure MACsec on an MLT port member on one side, you must also provision MACsec on the corresponding MLT port on the other side.

One way to detect a mismatch of MACsec configuration is to use Virtual Link Aggregation Control Protocol (VLACP) on the links. If VLACP is enabled on an MKA-enabled link, it takes approximately 30 seconds for the VLACP session to begin.

MACsec provides security at the data link layer or the physical layer. It provides enhancements at the MAC service sub layer for its operation and services to the upper layer.

MACsec is an interface-level feature and is disabled by default.

**Note**

On 5320 Series and 5420 Series, Fabric Extend is not available if you boot the switch when the MACsec boot flag is enabled.

MACsec Keys

MACsec provides industry-standard security through secure point-to-point Ethernet links. The point-to-point links are secured after matching security keys.

Security keys are of two types:

- Connectivity Association Key (CAK), which is a configured pre-shared key.

Important

The switch supports the configuration of a pre-shared key to enable MACsec using the static connectivity association key (CAK) security mode.

The CAK must be identical across both ends of MACsec links.

- Secure Association Key (SAK):
 - Static SAKs: SAKs are static short-lived keys derived from the CAK or pre-configured for a particular secure channel (SC). MACsec uses a timer to refresh these keys so that the key and the session are secure.
 - Dynamic SAKs: MACsec Key Agreement (MKA) protocol generates SAKs. The MKA protocol determines which switch on the point-to-point link becomes the key server. The key server then generates SAKs and distributes them to the switch at the other end of the point-to-point link.

MACsec uses derived keys to encrypt or decrypt data at each end of the MACsec links.

Integrity Check Verification (ICV)

MACsec ensures data integrity using Integrity Check Verification (ICV). MACsec introduces an 8-byte or 16-byte SecTag after the Ethernet header, and an 8-byte or 16-byte calculated ICV after the Encrypted Payload. MACsec computes the ICV for the entire frame, starting from the Ethernet header, SecTag until the Checksum. The receiving side recalculates the ICV after data decryption, and verifies if the received ICV and computed ICV match. If the ICVs do not match, it indicates that data is modified, and MACsec drops the frame.

MACsec Security Modes

The static Connectivity Association Key (CAK) security mode is the only supported MACsec security mode on the platform, and is also the most common mode to enable MACsec.

When you use the static CAK security mode to enable MACsec, you configure a connectivity association on both ends of the link. Secure Association Keys (SAK) establish the MACsec relationship between the switches on each end of the Ethernet link. The SAKs include a connectivity association key name (CKN) and its own CAK. The MACsec CKN and CAK are configured in a connectivity association, and the CAK must match on both ends of the link to initially enable MACsec.

To ensure link security, the system periodically refreshes keys based on traffic volume and link speed.

To enable MACsec at the port level, you must first associate the port to the connectivity association. You complete the configuration within the connectivity association, but outside of the secure channel.

**Note**

If you use MKA, you must apply MKA profile to a port before you associate it with a Connectivity Association (CA). After you associate the port with a CA, you cannot enable MKA on the port.

When you use the static CAK security mode, the system automatically creates two secure channels, one for inbound traffic and another for outbound traffic. You cannot configure any parameters in the automatically created secure channels.

The CAK security mode ensures security by frequently refreshing to a new random security key, and by only sharing the security key between the two devices on the MACsec-secured point-to-point link.

MACsec provides options to encrypt all data, or configure a confidentiality offset, which specifies the number of unencrypted bytes in a frame that precede MACsec encryption.

You can configure the following optional features:

- Data encryption — If you disable encryption, MACsec forwards traffic in clear text. You can view that data that is not encrypted in the Ethernet frame that travels across the link. Even if you disable encryption the MACsec header applies to the frame and integrity checks make sure that traffic has not been tampered with.
- Confidentiality offset — If encryption is enabled, and an offset is not configured, all traffic in the connectivity is encrypted. The confidentiality offset specifies the bytes after the Ethernet header from which data encryption begins. Valid values are 30 bytes and 50 bytes. The confidentiality offset facilitates traffic flow inspection and classification on intermediate devices by not encrypting the Network Layer header for IPv4 or IPv6. For instance, if you configure the offset to 30, the IPv4 header and the TCP/UDP header are not encrypted. If you configure the offset to 50, the IPv6 header and the TCP/UDP header are not encrypted.

Connectivity Associations and Secure Channels

You configure MACsec in connectivity associations (CA). You can enable MACsec after you associate a connectivity association with an interface. To use the static Connectivity Association Key (CAK) security mode to enable MACsec, you must create and configure connectivity associations on both ends of the link.

A CA is a logical representation of a MACsec domain within a network. Each connectivity association is associated with a CAK. MACsec links are associated with a CA to establish end-to-end MACsec communication. Every MACsec enabled interface is a member of one CA. Switch ports are members of a CA, and can only be a member of one CA.

A secure channel (SC) is a unidirectional channel that connects two endpoints of MACsec. A secure channel is a long-term relationship that persists through the sequence of secure associations.

A secure association (SA) is a short-lived relationship within an SC. MACsec identifies each SA by AN, and supported secure association key (SAK), which is derived from the CAK or generated by the MKA key server. Both ends of the MACsec link use the SAK to encrypt and decrypt the frames. SAKs are frequently refreshed for security reasons. Periodically changing SAs allows the use of fresh keys without terminating the SC relationship.

For static MACsec, you configure CAs. SCs and SAs are internally created in the hardware.

For MKA MACsec, you configure CAs. SCs and SAs are internally created in the hardware based on the information provided by the MKA key server.

MACsec 2AN and 4AN mode

MACsec 2AN mode implementations use two security associations (SA) for each secure channel (SC) and symmetric keys on both MACsec endpoints. The keys are symmetric because they are both derived from the same connectivity association key (CAK).

MACsec 4AN mode generates four Secure Associations Keys (SAK) per secure channel. It uses enhanced hashing algorithm to derive eight SAKs, and uses asymmetric keys on both ends. You can use the **macsec connectivity-association** command to configure different (asymmetric) transmit keys for each endpoint by using the *key-parity* keyword. If you do not specify a value for *key-parity*, the connectivity association is created in 2AN mode. For more information about configuring MACsec transmit keys, see [Configuring a connectivity association](#).

MACsec Components

MACsec has three major components:

- Security entity (SecY)

SecY is the entity that operates the MACsec protocol within the system. You configure a secure connectivity association (CA) to meet the requirements of MACsec for connectivity between stations that attach to an individual LAN. Unidirectional secure channels (SC) support each CA. Each SC supports secure transmission of frames by use of symmetric key cryptography from one of the systems to all others in the CA.

Each SecY transmits frames conveying secure MACsec service requests on a single SC, and receives frames conveying secure service indications on separate SCs, one for each of the other SecYs that participate in the secure CA.

A connectivity association (CA) is a logical representation of a MACsec domain within a network. Each connectivity association is associated with a connectivity association key (CAK). MACsec links are associated with a CA to establish end-to-end MACsec communication. Every MACsec enabled interface is a member of one connectivity association. Switch ports are members of a connectivity association, and can only be a member of one connectivity association.

A secure channel (SC) is a unidirectional channel that connects two endpoints of MACsec. A secure channel is a long-term relationship that persists through the sequence of secure associations. An SC is a unidirectional point-to-multipoint communication, and can persist through Secure Association Key (SAK) changes. A sequence of Secure Associations (SAs) support each SC and allow for the periodic use of fresh keys without terminating the relationship. A single secret key or a set of keys support each SA, where the cryptographic operations used to protect one frame require more than one key. A Secure Channel Identifier (SCI) identifies each SC. An SCI is comprised of a unique 48-bit universally administered MAC address, identifying the system to which the transmitting SecY belongs, concatenated with a 16-bit port number, identifying the SecY within that system.

The SCI concatenated with a two-bit AN identifies each SA. The Secure Association Identifier (SAI) that is created allows the receiving SecY to identify the SA. It also allows the SAK used to decrypt and authenticate the received frame. The AN, and hence the SAI, are unique only for the SAs that can be used or recorded by participating SecYs at any instant.

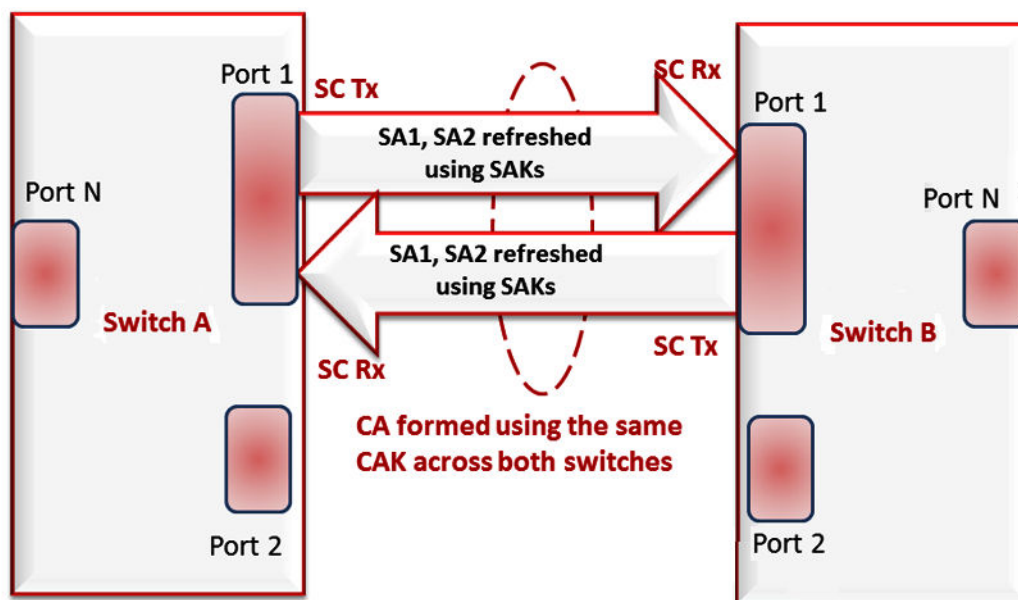

Figure 178: MACsec relationship

- Key agreement entity (KaY)

The KaY in MACsec is responsible for CAK and SAK computations, distributions and maintenance. CAK is a global key that is persistent until the CA exists. When you configure the CAK, ensure that it is identical across MACsec links.

In static SAK mode, SAKs are short-lived keys derived from the CAK, or pre-configured for a particular SC. MACsec uses a timer to refresh SAKs so that the key, as well the session, is secure.

In dynamic SAK mode, the MKA key server generates SAKs. The key server maintains the ethernet link by periodically generating and distributing SAKs across the point-to-point link as long as MACsec is enabled.

- Integrity check verification or Cryptographic entity

The Cryptographic entity provides integrity check protection and validation for frames transmitted or received through the SecY layer. The integrity check verification (ICV) is calculated for the frame source address/destination address (SA/DA), SecTag, User Payload, and Cyclic Redundancy Check (CRC). The calculated ICV is appended at the end-of-frame, recalculated at the receiver side of MACsec link and validated to see if they are equal. The frames that pass the integrity check are further processed, while the system drops the frames that fail the integrity check.

MACsec configuration provides an option to encrypt the user payload. There is also the option to start the encryption from N bytes after the Ethernet header.

In the following figure, CA connects switches A, B, and C by their respective SC and SAK. Switch D cannot participate in the secure communication between A, B, or C as switch D is not configured with the SAK.

MACsec Key Agreement Protocol

MKA protocol performs key server election and generates Secure Association Keys (SAK). SAKs and other MKA information is distributed in MACsec Key Agreement Protocol Data Units (MKPDU) between peers in the Connectivity Association (CA).

Initially you configure pre-shared keys on both ends of an Ethernet link, including values for the CAK and the connectivity association key name (CKN). The CAK and CKN values must match at both ends of the link.

You enable the MKA process by configuring pre-shared keys. MKA performs peer detection, identifies a live peer, and elects the peer with the highest priority as the key server.

The key server generates and distributes SAKs. After the key server and the peer successfully install the generated SAKs, the link can securely transmit encrypted data. The key server maintains the secure link by periodically generating and distributing SAKs for as long as MACsec is enabled.

The following figure illustrates the deployment of MACsec using MKA protocol.

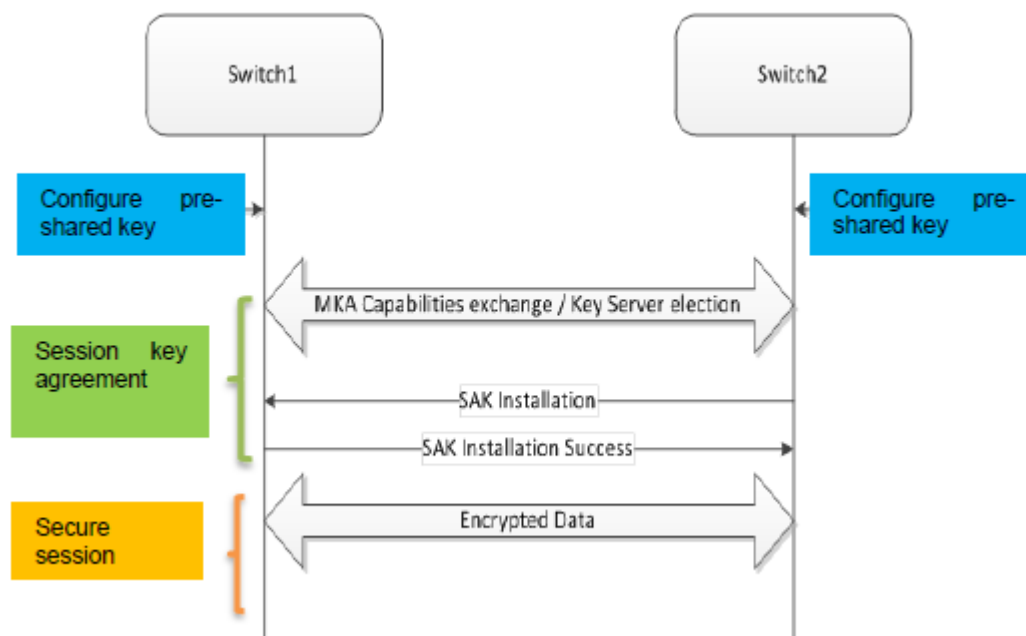

Figure 179: Switch to switch MACsec deployment scenario

You can create and configure an MKA profile and then apply that profile to a port. After applying the profile to the port and associating the port with a connectivity association, you can enable MKA on the port and optionally assign a value for actor priority.

Note

If you enable MKA on a port, traffic is not sent or received on that link until the MKA session is active.

You can configure an MKA actor priority value for each MKA participant. You select priority values from the range 0x00 to 0xff, where lower numbers indicate higher priority. Each participant advertises an actor priority value, and the participant

advertising the highest priority is elected as the key server. If there is a tie for the highest priority, the participant with the highest priority MAC address is selected.

**Note**

Do not configure both peers in an MKA session with an actor priority value of 0xff. If both peers are configured with an actor priority value of 0xff, key server election fails.

You can enable replay protect and configure a replay window size to protect against out-of-sequence packets. Window size specifies the maximum acceptable difference in packet ID numbers between out of order packets. If a packet ID number differs from the ID number of the previously received packet by more than the specified window size, the packet is dropped.

Confidentiality offset specifies the bytes after the Ethernet header from which data encryption begins. Valid values are 30 and 50. Configuring the offset to 30 allows an IPv4 header and TCP/UDP header to remain unencrypted, while configuring the offset to 50 allows an IPv6 header and TCP/UDP header to remain unencrypted.

MKA Interoperability with ExtremeXOS and Switch Engine

Switches configured with MKA MACsec in Fabric Engine 8.6, or later, can interoperate with EXOS 30.3, or later, and Switch Engine 31.6, or later, switches.

Interoperability issues can occur between VOSS/Fabric Engine switches and EXOS/Switch Engine switches when you use MACsec MKA and disable SCI tagging on both ends. Disabling SCI tagging on both ends works for EXOS/Switch Engine if the VOSS/Fabric Engine version is earlier than 8.7.

**Note**

Traffic loss occurs on the ExtremeXOS or Switch Engine to Fabric Engine MKA MACsec link when interoperating with EXOS and Switch Engine, using the Fabric Engine devices as the keyserver. As a best practice, use EXOS or Switch Engine as the keyserver.

MACsec MKA Keychains

Keychains provide an alternative to configuring a single PSK on each MACsec interface. You can use MACsec Key Agreement (MKA) keychains to store and manage multiple pre-shared keys (PSK) used in MACsec encryption. A keychain includes a configured pair of Connectivity Association Name (CKN), Connectivity Association Key (CAK), and a key lifetime. Keychains provide hitless key rollover, which enables the system to switch to the next configured key in the keychain when the key lifetime expires without traffic loss.

Operational Considerations

The following section describes operational considerations for using MKA keychains.

- An MKA keychain supports either AES-128, AES-256, AES-XPB-128, or AES-XPB-256 encryption algorithms. You can configure only one algorithm per keychain. You cannot combine different algorithms in the same keychain.
- Each MKA keychain can contain up to 10 key associations CKN/CAK pairs.
- Ensure there is at least one minute between activating two successive MKA keys.
- Keychain key expiry is expressed in Coordinated Universal Time (UTC) regardless of the switch time-zone.
- When the key expiry is unlimited, the MKA connection automatically switches to the next key. The key expiry for the last key in the keychain is always unlimited.
- You must enable and synchronize Network Time Protocol (NTP) on both endpoints to ensure that keys rollover at the same time. However, you can pre-configure MACsec keychains when the system clock is not synchronized over NTP.

The following warning displays:

```
Switch:1(config-if)#macsecmka keychain KeyChain1
Warning: NTP is not synchronized. Keychain require clock to be synchronized.
Switch:1(config-if)#macsec mka enable
```

MACsec Encryption Cipher Suites

Table 200: MACsec encryption cipher suites product table

Feature	Product	Release introduced
MACsec encryption cipher suites with 32-bit Packet Numbering	4220 Series	Not Applicable
	5320 Series	Fabric Engine 8.6 Both 128 bits and 256 bits Not supported on 5320-24T-4X-XT or 5320-16P-2MXT-2X
	5420 Series	VOSS 8.5 Both 128 bits and 256 bits
	5520 Series	VOSS 8.2.5 Both 128 bits and 256 bits Not supported on 5520-24X and 5520-VIM-4X 5520-24T and 5520-24W on all fixed ports except 1/25 and 1/26 5520-12MW-36W, 5520-48SE, 5520-48T, and 5520-48W on all fixed ports except 1/49 and 1/50
	5720 Series	Fabric Engine 8.7 Both 128 bits and 256 bits 5720-24MW and 5720-24MXW on all fixed ports except 1/25 and 1/26 5720-48MW and 5720-48MXW on all fixed ports except 1/49 and 1/50
	7520 Series	9.0 Supported on 7520-48YE-8CE Both 128 bits and 256 bits
	7720 Series	Not Supported
	7830 Series	Fabric Engine 9.3 Both 128 bits and 256 bits
	VSP 4900 Series	VOSS 8.1 VSP4900-48P supports 128-bit on all fixed ports. VSP4900-24XE supports 128-bit and 256-bit on all fixed ports. VSP4900-12MXU-12XE supports 128-bit and 256-bit on the SFP+ ports.

Table 200: MACsec encryption cipher suites product table (continued)

Feature	Product	Release introduced
MACsec encryption cipher suites with 64-bit Extended Packet Numbering		VIM5-4XE and VIM5-4YE support 128-bit and 256-bit cipher suite.
	VSP 7400 Series	Not Supported
	4220 Series	Not Applicable
	5320 Series	Not Supported
	5420 Series	Not Supported
	5520 Series	Not Supported
	5720 Series	Fabric Engine 9.3 Supported on 5720-VIM-2CE Both 128 bits and 256 bits
	7520 Series	Fabric Engine 9.3 Supported on 7520-48YE-8CE Both 128 bits and 256 bits
	7720 Series	Not Supported
	7830 Series	Fabric Engine 9.3 Both 128 bits and 256 bits
	VSP 4900 Series	Not Supported
	VSP 7400 Series	Not Supported

MACsec cipher suites specify a set of encryption algorithms used to encrypt traffic on an Ethernet link that is secured with Media Access Control Security (MACsec).

Cipher suite	Max key length	Packet Number (PN)
GCM-AES-128	128 bits	32 bits
GCM-AES-256	256 bits	32 bits
GCM-AES-XPB-128	128 bits	64 bits eXtended
GCM-AES-XPB-256	256 bits	64-bits eXtended

The 256-bit algorithm provides enhanced data security and also includes the security provided by the 128-bit algorithm. Both the GCM-AES-128 and GCM-AES-256 cipher suites use a 32-bit packet number (PN) as part of the unique initial value for every packet transmitted with a given secure association key (SAK). The system refreshes the SAK when all the permutations of the 32-bit PN are exhausted.

Additionally, 7830 Series, 5720-VIM-2CE, and 7520-48YE-8CE support GCM-AES-XPB-128 and GCM-AES-XPB-256 cipher suites, which use 64-bit eXtended Packet Numbering (XPB) as part of the unique initial value for every packet transmitted with a given secure

association key (SAK). These cipher suites eliminate the need for frequent SAK rekeying that can occur in high speed links.

Note

GCM-AES-XPB-128 and GCM-AES-XPB-256 cipher suites are supported with MACsec Key Agreement.

The default cipher suite is the GCM-AES-128.

Note

Not all products support both a 128-bit cipher suite and a 256-bit cipher suite. For information about product support, see [Table 200](#) on page 2611.

You typically configure a MACsec cipher suite at the port level on the switch. The configuration is optional. When you configure a cipher suite, ensure that you configure the same cipher suite on both MACsec peers.

5320 Series and 5420 Series Encryption and Decryption

These products limit encryption and decryption bandwidth. 5420 Series supports a maximum of 50 Gbps. The 5320 Series models support differing encryption and decryption rates, as identified in the following table.

Table 201: 5320 Series MACsec encryption and decryption rates

Model	Encryption rate	Decryption rate
48-port models	Up to 50 Gbps	Up to 50 Gbps
24-port models	Up to 25 Gbps	Up to 25 Gbps
16-port models	Up to 25 Gbps	Up to 25 Gbps

MACsec Operation

As shown in the following figure, a host that connects to Switch A sends an Ethernet frame to a host that connects to Switch B. Switch A encrypts the frame, excluding the Ethernet header and optionally the 802.1Q header. Switch A also appends MACsec information, such as SecTag and ICV to the encrypted payload and transmits the frame using normal frame transmission. This process ensures data confidentiality.

Switch B decrypts the frame. Switch B recalculates the ICV using a MACsec key and the SecTag present in the frame. If the ICV present in the received frame matches the recalculated ICV, the switch processes the frame. If the two ICVs do not match, the switch discards the frame. This process ensures data origin authenticity and data integrity.

The encryption and decryption algorithms follow either the AES-GCM-128 standard or the AES-GCM-256 standard depending on the configured cipher suite. The default is the AES-GCM-128 standard.

The MACsec connectivity association key (CAK) between switches A and B are statically pre-configured.

MACsec operates between two switches across Point-to-Point Connectivity only when the switches are either directly connected or across a network cloud that provides P2P connectivity between the two switches.

For example, in the following figure you can enable MACsec between two switches across a network cloud where P2P connectivity between the switches is provided using services such as P2P, MPLS, Layer 2 VPN (ELINE), or connectivity across Dark Fiber.

Figure 180: MACsec operation

Automatic QoS Priority for MACsec Packets on Intermediate Switches

In certain situations where MACsec encrypted packets traverse intermediate non-MAC switches, QoS visibility is lost.

This feature uses confidentiality-offset to specify that the first 30 to 50 bytes within the MACsec frame transmit without encryption, thus leaving the 802.1Q VLAN tag p-bits in the clear so that the intermediate switch can differentiate between encrypted traffic. With the 802.1Q p-bits in the clear, internal QoS priority for MACsec packets on intermediate switches can be automatically assigned.

Note

This feature is always enabled.

Operational Considerations

The following list describes the operational considerations for automatic QoS prioritization for MACsec packets on intermediate switches:

- The MACsec port on the end point switch must have confidentiality offset configured to leave the 802.1Q VLAN tag p-bits in the clear.
- The intermediate switch port must be a Layer 2 trusted port.

- If the port on an intermediate switch is an untrusted port or if the packet is not originally VLAN tagged, the switch assigns MACsec packets to the default QoS level.
- ACL QoS rules can override the automatic QoS prioritization for MACsec packets.
- Internal QoS level assignment is on ingress. The egress queue and remarking the packet is derived from the internal QoS level.
- The priority extraction is performed from the original VLAN Tag only.
- If a switch is the endpoint of a MACsec flow, it decrypts the packets and uses the standard priority assignment.

MACsec Configuration Using CLI

This section provides procedures to configure MACsec using the command line interface (CLI).

Before You Begin

Product Notice: Before you enable MACsec on the 5320 Series and 5420 Series, you must enable the boot configuration flag: **boot config flags macsec**. The **boot config flags ipv6-egress-filter** and **boot config flags macsec** commands are mutually exclusive.

Configure MACsec Encryption on a Port

Use the following procedure to enable or disable encryption on a MACsec capable port. The default is disabled.

About This Task

If you disable encryption, MACsec forwards traffic in clear text. You can view that data that is not encrypted in the Ethernet frame that travels across the link. Even if you disable encryption the MACsec header applies to the frame and integrity checks make sure that traffic has not been tampered with.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure MACsec encryption on the port using one of the following commands:

- To enable MACsec, use `macsec encryption enable`
- To disable MACsec, use `no macsec encryption enable`

Example

Configure MACsec encryption on a port:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabit 1/2
Switch:1(config-if)#macsec encryption enable
```

Configure a MACsec Cipher Suite on a Port

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format `slot/port/sub-port`.

2. Configure a MACsec encryption cipher suite:

```
macsec cipher-suite {gcm-aes-128 | gcm-aes-256 | gcm-aes-xpn-128 |
gcm-aes-xpn-256}
```

The default cipher suite is GCM-AES-128.

Note

`gcm-aes-xpn-128` and `gcm-aes-xpn-256` ciphers are supported with MKA only.

Ensure that you configure the same cipher suite on both MACsec peers.

3. (Optional) [Associate an MKA Profile to a Port](#) on page 2630.

4. Verify the configuration:

```
show macsec status {slot/port[/sub-port] [-slot/port[/sub-port]][,...]
[slot/all][all]}
```

Example

Configure the 256-bit MACsec cipher suite on the port 1/3 and verify the configuration.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```
Switch:1(config)#interface gigabitEthernet 1/3
Switch:1(config-if)#macsec cipher-suite gcm-aes-256
Switch:1#show macsec status 1/3
```

```
=====
MACSEC Port Status

-----
1/3   enabled disabled enabled  50 ipv4Offset(30) AES-256 mkanka extreme  pending
```

The system displays the following error message if you attempt to configure a cipher suite on a port that is not MACsec capable.

```
Switch:1>enable
Switch:1(config)#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#macsec cipher suite gcm-aes-256

Error: port 1/2, Port is not MACSec capable. No MACSec configurations allowed on port
```

The system displays the following error message if your hardware does not support the MACsec 256-bit cipher suite.

Configure an Extended Packet Numbering (XPN) cipher with MKA on a port:

```
Switch:1>enable
Switch:1(config)#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/1
Switch:1(config-if)#macsec cipher suite gcm-aes-xpn-256
Switch:1(config-if)#macsec mka profile p1
NOTE: Both ends of the MKA Macsec link must have the same Include-SCI value configured.
Switch:1(config-if)#macsec mka enable
```

Display the MACsec MKA profile:

```
Switch:1(config-if)#show macsec mka profile
```

```

Variable Definitions

The following table defines parameters for the **macsec cipher-suite** command.

Variable	Definition
<code>{gcm-aes-128 gcm-aes-256 gcm-aes-xpn-128 gcm-aes- xpn-256}</code> Note: Exception: gcm-aes-xpn-128 and gcm-aes-xpn-256 ciphers are supported only on 7830 Series, 7520-48YE-8CE, and 5720- VIM-2CE with MKA.	Configures the cipher suite for encrypting traffic with MACsec containing a 32-bit packet number (PN) or 64-bit extended packet number (XPN). The supported cipher suites are: <ul style="list-style-type: none"> • gcm-aes-128 — maximum key length of 128 bits • gcm-aes-256 — maximum key length of 256 bits • gcm-aes-xpn-128 — maximum key length of 128 bits • gcm-aes-xpn-256 — maximum key length of 256 bits The default is the gcm-aes-128 cipher suite.

Configure a Connectivity Association

Use the following procedure to configure a connectivity association (CA) in static Connectivity Association Key (CAK) security mode with static Secure Association Keys (SAK).

Important

For static MACsec, you can configure a different connectivity association name for local and peer nodes but you must configure the same value for the connectivity association key at both ends of the link with, either even or odd mode.

For MKA MACsec, you must configure the same value for the connectivity association name and the connectivity association key for local and peer nodes. Even or odd mode does not apply to a connectivity association for MKA MACsec .

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure a CA:

```
macsec connectivity association WORD <5-32> connectivity-association-  
key WORD<10-64> [key-parity even | odd]
```

Note

If you do not specify a key-parity value, the CA is created in 2AN mode. This applies only to platforms that support 2AN mode.

Example

Configure a connectivity association and enable MACsec on a port:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#macsec connectivity-association canamel connectivity-association-key
1029384756abcdef key-parity even
```

Variable Definitions

The following table defines parameters for the **macsec** command.

Variable	Value
<i>connectivity-association WORD<5-32></i>	Specifies the connectivity-association name as an alpha-numeric ASCII string up to 32 characters long. The device uses this value for the connectivity-association key name (CKN).
<i>connectivity-association-key WORD<10-64></i>	Specifies the connectivity-association key (CAK) value as a 32-character (128-bit) or a 64 character (256-bit) hexadecimal string. Note: Always select the 128-bit CAK value for AES-GSM-128 and the 256-bit CAK value for AES-GSM_256.
<i>key-parity <even odd></i> Note: This parameter only applies to static MACsec configurations.	Specifies Tx key parity using the following values: <ul style="list-style-type: none"> • even — generates even-numbered keys for Tx • odd — generates odd-numbered keys for Tx Note: If you do not specify a key-parity value, the connectivity association (CA) is created in 2AN mode. This only applies to platforms that support 2AN mode.

The following table defines parameters for the **interface gigabitethernet** command.

Variable	Value
<i>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}</i>	Specifies the port that you want to associate with the CA. Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Associate a Port with a Connectivity Association

About This Task

Perform the following procedure to associate a port with a connectivity association (CA).

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Associate a port with a CA:

```
macsec connectivity-association WORD<5-32>
```

Example

```
Switch:1(config)#interface gigabitethernet 1/2  
Switch:1(config-if)#macsec connectivity-association caname12
```

Variable Definitions

The following table defines parameters for the **macsec** command.

Variable	Value
<i>connectivity-association</i> <i>WORD<5-32></i>	Specifies the connectivity-association name as an alphanumeric ASCII string up to 32 characters long. The device uses this value for the connectivity-association key name (CKN).

Update the Connectivity Association for a port

Use the following procedure to change the Connectivity Association (CA) to which a port is associated.

Before You Begin

Ensure that the new CA is created at the global level. For information about configuring a CA, see [Configure a Connectivity Association](#) on page 2618.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable MACsec on the port:

```
no macsec enable
```

3. Change the CA to which the port is associated:

```
macsec connectivity-association WORD<5-32>
```

4. Enable MACsec on the port:

```
macsec enable
```

Example

Change the CA to which a port is associated:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabit 1/2
Switch:1(config-if)#no macsec enable
Switch:1(config-if)#macsec connectivity-association caname12
Switch:1(config-if)#macsec enable
```

Variable Definitions

The following table defines parameters for the **macsec** command.

Variable	Value
<i>connectivity-association</i> <i>WORD<5-32></i>	<p>Specifies the connectivity-association name as an alpha-numeric ASCII string up to 16 characters long. The device uses this value for the connectivity-association key name (CKN).</p> <p>Tip: Configure the CKN in multiples of 4 characters to avoid MKA interoperability issues between Fabric Engine switches and EXOS or Switch Engine switches. For example, Macsecma (8 characters) or Macsecmka123 (12 characters) are valid, but Macsec (6 characters) is not valid.</p>

The following table defines parameters for the **interface gigabitethernet** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}</code>	<p>Specifies the port to associate with the connectivity association (CA).</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

View MACsec Status

Perform this procedure to view MACsec status.

About This Task

This command displays the status for the following:

- MACsec status
- MACsec encryption status
- MACsec encryption cipher suite
- The associated Connectivity Association (CA) name

Note

If you do not specify a port number, the information on all MACsec capable interfaces is displayed.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. View the MACsec status:

```
show macsec status {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]  
[slot/all][all]}
```

3. Display all MACsec related information:

```
show macsec
```

Examples

Note

The switch does not support replay protect.

View MACsec status:

```
Switch:1>show macsec status
```

MACSEC Port Status									
PortId	MACSEC Status	Encryption Status	Replay Protect	Replay Protect W'dow	Encryption Offset	Cipher Suite	CA Name	MKA-Profile Name	MKA Connect Status
1/1	enabled	enabled	enabled	--	ipv4Offset(30)	AES-128	KeyNumber1	profileMKA	secure

View the MACsec Connectivity Association Details

Perform this procedure to view the MACsec connectivity association (CA) details.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View the MACsec CA details:

```
show macsec connectivity-association [WORD<5-32]
```

Note

This command displays the MACsec CA details, including the hashed value of the CA key.

Example

View the MACsec connectivity association details:

```
Switch:1>show macsec connectivity-association
```

MACSEC Connectivity Associations Info			
Connectivity Association Name	SHA-1 Connectivity Association Key Hash	AN_Mode / TxKeyParity	Port Members
caname50	ba6b005bef79e7b95f3e08181e2501ce	2AN / NA	1/49
caname51	5b41f44ecaa54f3873e781557b39230b	4AN / odd	
caname15	053f26fb96b011191f2da28849f08677	4AN / Even	1/50

Configure Static MACsec using CLI

Use the following procedures to configure static MACsec using the Command Line Interface (CLI).

Enable Static MACsec on a Port

Use the following procedure to enable MACsec with static Secure Association Keys (SAK) on a port.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:
- enable
- configure terminal
- interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}

Note If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable MACsec on the port:
- macsec enable

Variable Definitions

The following table defines parameters for the **macsec enable** command.

Variable	Value
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none">• a single slot and port (slot/port)• a range of slots and ports (slot/port-slot/port)• a series of slots and ports (slot/port,slot/port,slot/port)• all ports on the same slot (slot/all)• all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Configure the Confidentiality Offset on a Port

Use the following procedure to configure the confidentiality offset on a port. The default is disabled.

About This Task

The confidentiality offset provides a way to start encryption after a few bytes following the Ethernet header. The confidentiality offset facilitates traffic flow inspection and classification on intermediate devices by not encrypting the Network Layer header for IPv4 or IPv6. For instance, if you configure the offset to 30, the IPv4 header and the

TCP/UDP header are not encrypted. If you configure the offset to 50, the IPv6 header and the TCP/UDP header are not encrypted.

Note

On a MACsec-enabled port with confidentiality offset configured to 50 on the 5320 Series or 5420 Series, all packets less than 67 bytes drop and discarded packets increment.

As a best practice, do not configure the confidentiality offset to 50 on the 5320 Series or 5420 Series.

On a MACsec-enabled port with data encryption enabled and confidentiality offset configured to 30 or 50 on the 5320 Series or 5420 Series, InOctetsValidated counter also increments in addition to InOctetsDecrypted counters in Macsec secure channel Inbound statistics.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure confidentiality offset on the port using one of the following commands:

- To enable confidentiality-offset, use `macsec confidentiality-offset <30-50>`
- To disable confidentiality-offset, use `no macsec confidentiality-offset`

Example

Configuring the confidentiality offset on the port:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface gigabit 1/2  
Switch:1(config-if)#macsec confidentiality-offset 30
```

Variable Definitions

The following table defines parameters for the **macsec confidentiality-offset** command.

Variable	Value
<30-50>	Specifies the bytes after the Ethernet header from which data encryption begins. Valid values are 30 and 50.

The following table defines parameters for the **interface gigabitethernet** command.

Variable	Value
<code>{slot/port[/sub-port][-slot/port[/sub-port]][,...][slot/all][all]}</code>	<p>Specifies the port that you want to associate with the connectivity association (CA).</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Configure MKA MACsec using CLI

Use the following procedures to configure MACsec Key Agreement (MKA) MACsec using the Command Line Interface (CLI).

Perform the following procedures in order to configure MKA MACsec.

- [Configure MKA Keychains](#) on page 2626
- [Configure an MKA Profile](#) on page 2628
- [Associate an MKA Profile to a Port](#) on page 2630
- [Associate an MKA Keychain to a Port](#) on page 2631
- [Enable MKA on a Port](#) on page 2632

If you apply a Connectivity Association to a port before you apply an MKA profile to the port, the port is considered to be configured with static MACsec and an error occurs.

Configure MKA Keychains

About This Task

Perform this procedure to configure MKA keychains.

Note

Creating an MKA keychain changes the CLI command mode to mka-keychain mode.

Procedure

1. Enter mka-keychain Configuration mode:

```
enable
```

```
configure terminal
```

```
macsec mka keychain WORD<5-32>
```

2. Configure keys in the MKA keychain:

```
key WORD<5-32> {cak WORD<10-64> | endtime <MMddyyyyhhmmss |
unlimited>}
```

**Note**

The CKN/CAK pair must match between devices.

3. Exit from macsec mka keychain mode:

```
exit
```

4. [Configure an MKA Profile](#) on page 2628.5. [Associate an MKA Profile to a Port](#) on page 2630.6. [Associate an MKA Keychain to a Port](#) on page 2631.

7. Exit to Global Configuration mode:

```
exit
```

8. Enter GigabitEthernet Interface Configuration mode:

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

9. [Enable MKA on a Port](#) on page 2632.

10. Display MACsec MKA keychain status on the port:

```
show macsec mka keychain
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka keychain KeyChain1
2025-03-14T15:50:21.813Z 5720-24MXW-FabricEngine CP1 - 0x0034c630 - 00000000 GlobalRouter
MACSEC INFO MKA Keychain KeyChain1 created successfully
Switch:1(mka-keychain)#key KeyNumber1 cak 123456789abcdef endtime 08102026124500
Switch:1(mka-keychain)#key KeyNumber2 cak 987654321abc123 endtime unlimited
Switch:1(mka-keychain)#exit
Switch:1(config)#macsec mka profile profileMKA
Switch:1(config)#confidentiality-offset 30
Switch:1(config)#include-sci enable
Switch:1(config)#exit
Switch:1(config)#interface gigabitethernet 1/1
Switch:1(config-if)#macsec mka profile profileMKA
Switch:1(config-if)#macsec mka keychain KeyChain1
Switch:1(config-if)#macsec mka enable
```

The following example displays MACsec MKA key status.

```
Switch:1#show macsec mka keychain
=====
MACSEC MKA Keychain Info
=====
```

Connectivity	Configured	Port	Key Name (CKN)	Key	Key
Keychain name	Keys number	Members	Key SHA-1 Hash (CAK SHA-1 Hash)	Expiry (UTC)	Status
Keychain1	3	1/1	KeyNumber1 08e621a7fb61258e130fb626d766278772d82688	Unlimited	Valid

	KeyNumber2	07/18/2025 07:28:00	Expired

	0e98c2db829c2cb599eedfbdec01d6c6efeacd7		
All 1 out of 1 Total Num of Macsec mka keychains displayed			

When the key reaches the configured expiry, the MKA connection automatically switches to the next key:

```
Switch CP1 - 0x0034c634 - 00000000 GlobalRouter MACSEC INFO MACSec MKA: Participant
switched to the next keychain key on port 1/1
```

Variable Definitions

The following table defines parameters for the **key** command.

Variable	Value
<i>cak</i> WORD<10-64>	Specifies the Connectivity Association key value.
<i>endtime</i> <MMddyyyyhhmmss> <i>unlimited</i>	Specifies the expiry for the MKA keychain key in Coordinated Universal Time (UTC) regardless of the switch time-zone.
WORD<5-32>	Specifies the Connectivity Association key name.
<i>keychain</i> WORD<5-32>	Specifies the name applied to the keychain.

Configure an MKA Profile

About This Task

Perform this procedure to create a MACsec Key Agreement (MKA) profile. Creating an MKA profile changes the CLI command mode to mka profile mode.

You can also use this procedure to enter mka profile CLI command mode for an existing MKA profile.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Create an MKA profile name:
macsec mka profile WORD<1-16>

Note

An MKA profile name consists only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.

3. Configure the MKA profile using one or more of the following options:

- Enable replay protection and configure the window size: `replay-protect enable window-size <5-500>`

Note

The configuration should be the same at both ends of the link, either enabled or disabled.

- Configure a value for the confidentiality offset to specify the number of unencrypted bytes that precede MACsec encryption: `confidentiality-offset <30-50>`
- Enable SCI Tagging for a MACsec-enabled switch:

Note

If you are running VOSS 8.4.2 or earlier, disable SCI tagging on the switch.

```
include-sci enable
```

Note

The configuration must be the same at both ends of the link, either enabled or disabled.

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka profile profileMKA
Switch:1(mka-profile)#confidentiality-offset 30
Switch:1(mka-profile)#include-sci enable
```

Variable Definitions

The following table defines parameters for the **macsec mka profile** command.

Variable	Value
<code>window-size <5-500></code>	Specifies the maximum acceptable difference in packet ID numbers between out of order packets. If a packet ID number differs from the ID number of the previously received packet by more than the specified window size, the packet is dropped.
<code>WORD<1-16></code>	Specifies the MKA profile name. An MKA profile name consists only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.
<code><30 50></code>	Specifies the number of bytes after the Ethernet header from which data encryption begins. Possible values are 30 (IPv4 plus TCP/UDP header) and 50 (IPv6 plus TCP/UDP header). The default is no offset.

*Associate an MKA Profile to a Port***Before You Begin**

You must create an MKA profile globally before you can associate it to a port.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Apply an MKA profile to the port:

```
macsec mka profile WORD<1-16>
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/1
Switch:1(config-if)#macsec mka profile profileMKA
```

Variable Definitions

The following table defines parameters for the **macsec mka profile** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<code>WORD<1-16></code>	Specifies the MKA profile name. An MKA profile name consists only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.

Associate an MKA Keychain to a Port

About This Task

Perform this procedure to associate an MKA keychain to a port.

Note

You can update keys end time, delete keys, and add new keys while the keychain is associated to a port.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable

configure terminal

interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Associate an MKA keychain to a port:

```
macsec mka keychain WORD<5-32>
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/1
Switch:1(config-if)#macsec mka keychain KeyChain1
```

Variable Definitions

The following table defines parameters for the **macsec mka keychain** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<code>WORD<5-32></code>	Specifies the name applied to the keychain.

*Enable MKA on a Port***Before You Begin**

- Apply an MKA profile to the port.
- Before you enable MKA on a port, the port must be a member of a connectivity association.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable MKA on a port:

```
macsec mka enable
```

Example

```
Switch:1#enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/1
Switch:1(config-if)#macsec mka enable
```

Variable Definitions

The following table defines parameters for the **macsec mka enable** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

*Configure MKA Actor Priority***Before You Begin**

- Apply an MKA profile to the port.
- Disable MKA on the port before you configure a value for actor priority. Enable MKA on the port after you configure an actor priority value.

About This Task

The MKA participant with the highest actor priority is designated as the key server.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:
- enable
- configure terminal
- interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}

Note
If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure a value for actor priority:
- macsec actor-priority <0x00-0xff>

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/4
Switch:1(config-if)#macsec actor-priority 0x0f
```

Variable Definitions

The following table defines parameters for the **macsec actor-priority** command.

Variable	Value
<0x00-0xff>	Specifies a hexadecimal value for actor priority, which determines key server selection. Lower values indicate a higher priority. The default is 10.
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none">• a single slot and port (slot/port)• a range of slots and ports (slot/port-slot/port)• a series of slots and ports (slot/port,slot/port,slot/port)• all ports on the same slot (slot/all)• all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Display MKA Profiles

About This Task

Use the following procedure to display information about all MKA profiles configured on the switch. Optionally, you can view information about a specific MKA profile.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display all MKA profiles on the switch:

```
show macsec mka profile
```
3. (Optional) Display a specific MKA profile:

```
show macsec mka profile WORD<1-16>
```

Example

The following example displays MACsec MKA profile information:

The following example displays MACsec MKA information for a specific profile.

```
Switch:1>show macsec mka profile profileMKA
```

MACsec MKA Profile							
Profile Name	Profile Id	Cipher Suite	Confidentiality Offset	Replay Protect	Window Size	Port	Include-SCI
profileMKA	4	gcm-aes-128	30	Disabled	0	1/1	true

Variable Definitions

The following table defines parameters for the **show macsec mka profile** command.

Variable	Value
WORD<1-16>	Specifies the MKA profile name. An MKA profile name can consist only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.

Display MKA Keychain Associations

About This Task

Perform the following procedure to display information about all MKA keychain associations configured on the switch.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display MKA keychain associations configured on the switch:

```
show macsec mka keychain [WORD<5-32>]
```

Example

The following example displays MKA keychains configured on the switch:

```
Switch:1#show macsec mka keychain
```

MACSEC MKA Keychain Info					
Connectivity	Configured	Port	Key Name (CRN)	Key	Key
Keychain name	Keys number	Members	Key SHA-1 Hash (CAK SHA-1 Hash)	Expiry (UTC)	Status
Keychain1	3	1/1	KeyNumber1 08e621a7fb61258e130fb626d766278772d82688	Unlimited	Valid

	KeyNumber2	07/18/2025 07:28:00	Expired
	62c07c431fe79e9bdf6e443caddb4b9d8a8c5fc9		
1/4-1/5	KeyNumber3	07/18/2028 12:12:12	In-use
	0e98c2db829c2cb599eedfbdec01d6c6efeacd7		

All 1 out of 1 Total Num of Macsec mka keychains displayed

Display MKA Participants

About This Task

Use the following procedure to display information about all participants in an MKA session. You can also display MKA information for a specific port participating in an MKA session.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display information about all participants in an MKA session:

```
show macsec mka participant
```
3. (Optional) Display MKA information for a specific port participating in an MKA session:

```
show macsec mka participant [verbose] {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]
```

Examples

The following example displays information for all participants in an MKA session.

```
Switch:1>show macsec mka participant
```

MACsec MKA Participants				
Port Id	CA Name	MKA-Profile Name	MKA Enable	Actor Priority
1/3	CA120022	extreme030519	Enabled	A
1/4	CA121023	extreme031519	Enabled	14
2/2	CA122024	extreme032019	Enabled	1E

The following example displays information for a specific port participating in an MKA session.

```
Switch:1>show macsec mka participant 1/3
```

MACsec MKA Participant				
Port Id	CA Name	MKA-Profile Name	MKA Enable	Actor Priority
1/3	CA120022	extreme030519	Enabled	A

Variable Definitions

The following table defines parameters for the **show macsec mka participant** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
verbose	Displays detailed information for a specific port participating in an MKA session.

MACsec Configuration using EDM

Use the following procedures to configure MACsec in EDM.

Before You Begin

Product Notice: Before you enable MACsec on the 5320 Series and 5420 Series, you must enable the boot configuration flag: **Configuration > Edit > Chassis > Boot Config. EnableIpv6EgressFilterMode** and **EnableMacsec** are mutually exclusive.

Configure Connectivity Associations

About This Task

Use the following procedure to configure connectivity associations (CA) using EDM.

Note

- You can configure MACsec on physical ports *only*. However, the physical ports can belong to an MLT trunk group that includes: Split MultiLink Trunking (SMLT), distributed MultiLink Trunking (DMLT), or Link aggregate group (LAG).
- MACsec encryption algorithms follow AES-GCM-128, AES-GCM-256, AES-GCM-XPB-128, or AES-GCM-XPB-256 standard depending on the configured MACsec cipher suite. The default is the AES-GCM-128 standard.

Note

AES-GCM-XPB-128 and AES-GCM-XPB-256 standards are supported only on 7830 Series, 7520-48YE-8CE, and 5720-VIM-2CE and with MKA only.

Procedure

1. In the navigation pane, expand **Configuration > Security > Data Path**.
2. Select **MACSec**.
3. Select the **Associations** tab.
4. Select **Insert**.
5. In **AssociationName**, type the connectivity-association name.
6. In **AssociationKey**, type the value of the connectivity-association key.

**Note**

The system displays the connectivity-association key as an MD5-hashed text in the MAC security table.

7. In **AssociationTxKeyParity**, select an option for Tx key parity.

**Note**

Tx key parity configuration applies only to static MACsec configurations.

8. Select **Insert**.
9. Select **Apply**.

Associations Field Descriptions

Use the data in the following table to use the **Associations** tab.

Name	Description
AssociationName	Specifies the connectivity-association name as an alpha-numeric ASCII string up to 32 characters long. The device uses this value for the connectivity-association key name (CKN).
AssociationKey	<p>Specifies the connectivity-association key (CAK) value as a 32-character (128-bit) or a 64 character (256-bit) hexadecimal string.</p> <p>Note: Always select the 128-bit CAK value for AES-GSM-128 and the 256-bit CAK value for AES-GSM_256.</p>

Name	Description
AssociationPortMembers	Specifies the set of ports for which this connectivity association is associated.
AssociationTxKeyParity	<p>Specifies Tx key parity using the following values:</p> <ul style="list-style-type: none"> • None — key parity is not specified <p>Note: The none value only applies to platforms that support 2AN mode. If you do not specify a key parity value, the system defaults to 2AN mode.</p> <ul style="list-style-type: none"> • Even — generates even-numbered keys • Odd — generates odd-numbered keys

Associate a Port with a Connectivity Association

Use the following procedure to associate a port with a connectivity association (CA) using EDM. You can optionally configure a MACsec encryption cipher suite on the port.

Note

- You can configure MACsec on physical ports *only*. However, the physical ports can belong to an MLT trunk group that includes: Split MultiLink Trunking (SMLT), distributed MultiLink Trunking (DMLT), or Link aggregate group (LAG).
- MACsec encryption algorithms follow AES-GCM-128, AES-GCM-256, AES-GCM-XPB-128, or AES-GCM-XPB-256 standard depending on the configured MACsec cipher suite. The default is the AES-GCM-128 standard.

Note

AES-GCM-XPB-128 and AES-GCM-XPB-256 standards are supported with only on 7830 Series, 7520-48YE-8CE, and 5720-VIM-2CE and with MKA only.

Procedure

1. On the **Device Physical View** tab, select on one or more ports to associate with the connectivity association.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **MACsec** tab.
5. In **CAName**, type the connectivity-association name.
6. In **OffsetValue**, select the value of confidentiality offset to be achieved.
7. Select **EncryptionEnable** to enable encryption for the frames transmitted on the port.
8. (Optional) In **CipherSuite**, select the MACsec encryption cipher suite.

9. Select **MACsec Enable** to enable MACsec on the port.
10. Select **Apply**.

MACsec Field Descriptions

Use the data in the following table to configure the **MACsec** tab.

Name	Description
CAName	Specifies the name of the connectivity association attached to the port or interface.
OffsetValue	<p>Offsets MACsec encryption in an IPv4 TCP/UDP header or IPv6 TCP/UDP header. The confidentiality offset provides a way to start encryption after a few bytes following the Ethernet header. The confidentiality offset facilitates traffic flow inspection and classification on intermediate devices by not encrypting the Network Layer header for IPv4 or IPv6. For instance, if you configure the offset to 30, the IPv4 header and the TCP/UDP header are not encrypted. If you configure the offset to 50, the IPv6 header and the TCP/UDP header is not encrypted.</p> <p>Note: On a MACsec-enabled port with confidentiality offset configured to 50 on the 5320 Series or 5420 Series, all packets less than 67 bytes drop and discarded packets increment. As a best practice, do not configure the confidentiality offset to 50 on the 5320 Series or 5420 Series.</p> <p>Note: On a MACsec-enabled port with data encryption enabled and confidentiality offset configured to 30 or 50 on the 5320 Series or 5420 Series, InOctetsValidated counter also increments in addition to InOctetsDecrypted counters in Macsec secure channel Inbound statistics.</p>
EncryptionEnable	Specifies the encryption status per port. Use this field to enable or disable encryption for each MACsec capable port.

Name	Description
CipherSuite Note: Exception: AES-GCM-XPB-128 and AES-GCM-XPB-256 ciphers are supported only on 7830 Series, 7520-48YE-8CE, and 5720-VIM-2CE and with MKA only.	Configures the cipher suite for encrypting traffic with MACsec. The following cipher suites are supported: <ul style="list-style-type: none"> • aes-gcm-128—maximum key length of 128 bits • aes-gcm-256—maximum key length of 256 bits • aes-gcm-xpn-128—maximum key length of 128 bits • aes-gcm-xpn-256—maximum key length of 256 bits The default is the AES-GCM-128 standard.
MACsec Enable	Enables or disables MACsec on the port.

Configure MKA MACsec using EDM

Use the following procedures to configure MKA MACsec using EDM.

Note

You must configure MKA MACsec by performing procedures in the following order:

1. [Configure MKA Keychains](#) on page 2640
2. [Configure an MKA Profile](#) on page 2641
3. [Apply an MKA Profile to a Port](#) on page 2642
4. [Configure an MKA Keychain Association](#) on page 2643
5. [Enable MKA on a Port](#) on page 2632

Configure MKA Keychains

About This Task

Perform this procedure to create an MKA keychain.

Procedure

1. In the navigation pane, expand **Configuration > Security > Data Path**.
2. Select **MACsec**.
3. Select the **MACsec KA** tab.
4. Select **Insert**.
5. In **Id**, type an MKA keychain ID value.
6. In **Name**, type a keychain name.
7. Select **Insert**.

MACsec KA Field Definitions

Use the data in the following table to use the **MACsec KA** tab.

Name	Description
Id	Specifies a unique identification number for the MKA keychain configured on the switch. You can configure up to 512 MKA keychains.
Name	Specifies the name applied to each keychain association configured on the switch.
PortMembers	Specifies the port or ports associated with the keychain on the switch.
KeyNum	Specifies keychain association key number.
KeysCount	Specifies the number of keychain association keys configured on the switch. You can configure up to 10 MKA key associations per keychain.

Configure an MKA Profile

Procedure

1. In the navigation pane, expand **Security > Data Path** .
2. Select **MACSec**.
3. Select **MKA Profile**.
4. Select **Insert**.
5. For **Id**, type an MKA ID value.
6. For **Name**, type the profile name.
7. (Optional) Select **ReplayProtectEnable** to enable replay protect.
8. (Optional) For **ReplayProtectWindow**, type a value for the replay protect window size.
9. (Optional) From the **OffsetValue** options, select a level for confidentiality offset.
10. Select **IncludeSCIEnable** to enable the SCI field in MACsec frames.
11. Select **Insert**.

MKA Profile Field Descriptions

Use the data in the following table to use the **MKA Profile** tab.

Name	Description
Id	Specifies a unique identification number for an MKA profile.
Name	Specifies the profile name.
ReplayProtectEnable	Specifies whether replay protect is enabled. The default is disabled.

Name	Description
ReplayProtectWindow	Specifies the maximum acceptable difference in packet ID numbers between out of order packets. If a packet ID number differs from the ID number of the previously received packet by more than the specified window size, it is dropped.
OffsetValue	Specifies the number of bytes after the Ethernet header from which data encryption begins. The default is no offset.
PortMembers	Specifies the ports that are members of an MKA profile.
CipherSuite	Displays the cipher suite used to encrypt traffic with MACsec.
IncludeSCIEnable	Specifies whether SCI tagging is enabled for a MACsec-enabled switch. The default is disabled.

Apply an MKA Profile to a Port

Before You Begin

You must configure an MKA profile globally before you can apply it to a port.

About This Task

Use the following procedure to apply a MACsec Key Agreement (MKA) profile on a port.

Procedure

1. In the Device Physical View, select the port to which you want to apply an MKA profile.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **MACsec MKA** tab.
5. For **MACsecMKAProfileName**, select the name of the MKA profile you want to apply.
6. Select **Apply**.

What to Do Next

[Enable MKA on a Port](#) on page 2644

MACsec MKA Field Descriptions

Use the data in the following table to use the **MACsec MKA** tab.

Name	Description
MACsecMKAProfileName	Specifies the MKA profile name.
CAName	Specifies the name of the connectivity association attached to the port or interface.

Name	Description
OffsetValue	Specifies the number of bytes after the Ethernet header from which data encryption begins. The default is no offset.
CipherSuite	Displays the cipher suite used to encrypt traffic with MACsec.
Keychain Name	Specifies the name associated with the keychain.
MKA Enable	Enables the MKA profile on the port. The default is disabled.

Configure an MKA Keychain Association

About This Task

Perform this procedure to configure a MKA keychain association.

Procedure

1. In the navigation pane, expand **Configuration > Security > Data Path**.
2. Select **MACsec**.
3. Select the **MACsec KA Key** tab.
4. Select **Insert**.
5. In **Id**, type the ID associated with the keychain.
6. In **KeyId**, type the keychain association key.
7. (Optional) In **KeyCKN**, type the connectivity association key name.
8. (Optional) In **KeyCAK**, type the Connectivity Association Key value.
9. (Optional) In **KeyExpiry**, type the expiry time for the keychain association key.
10. Select **Insert**

MACsec KA Key Field Definitions

Use the data in the following table to use the **MACsec KA Key** tab.

Name	Description
Id	Specifies the unique identification number for the MKA keychain configured on the switch.
KeyId	Specifies the unique identification number for the keychain association key configured on the switch.
KeyCKN	Specifies the connectivity association key name (CKN).
KeyCAK	Specifies the Connectivity Association Key (CAK).
KeyExpiry (UTC)	Specifies the expiry time for the keychain association key in Coordinated Universal Time (UTC) regardless of the switch time-zone.
KeyStatus	Specifies the status of the keys in the following states: <ul style="list-style-type: none"> • Valid—a key with a valid end time but no MACsec MKA enabled on the port • Expired—a key that is no longer valid • In-use—a key with a valid end time and assigned ports with MACsec MKA enabled

Enable MKA on a Port

Before You Begin

Ensure that you apply an MKA profile to the port and associate the port with a Connectivity Association (CA) before you enable MKA on the port.

About This Task

Use the following procedure to enable a MACsec Key Agreement (MKA) profile on a port.

Procedure

1. In the Device Physical View, select the port to which you want to apply an MKA profile.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **MACsec MKA** tab.
5. Select **MKA Enable** to enable MKA on the port.
6. Select **Apply**.

MACsec MKA Field Descriptions

Use the data in the following table to use the **MACsec MKA** tab.

Name	Description
MACsecMKAProfileName	Specifies the MKA profile name.
CAName	Specifies the name of the connectivity association attached to the port or interface.
OffsetValue	Specifies the number of bytes after the Ethernet header from which data encryption begins. The default is no offset.
CipherSuite	Displays the cipher suite used to encrypt traffic with MACsec.
Keychain Name	Specifies the name associated with the keychain.
MKA Enable	Enables the MKA profile on the port. The default is disabled.

Configure MKA Actor Priority

About This Task

Use the following procedure to configure an actor priority value for a port. The MKA participant with the highest actor priority is designated as the key server.

Note

Ensure that peers in an MKA connection are not configured with the same actor priority value.

Procedure

1. In the navigation pane, expand **Security > Data Path**.
2. Select **MACSec**.
3. Select the **MKA Participants** tab.
4. Select a port.
5. For **ActorsPriority**, double-click the field and type a value for **ActorsPriority**.
6. Select **Apply**.

MKA Participants Field Descriptions

Use the data in the following table to use the **MKA Participants** tab.

Name	Description
PortNumber	Specifies the port number of the MKA session participant.
CAName	Specifies the Connectivity Association (CA) name associated with the MKA session participant.
MKAProfileName	Specifies the name of the MKA profile.
MKA Enable	Specifies whether MKA is enabled for the port.
ActorsPriority	Specifies a hexadecimal value for actor priority. The default is 10.

MACsec Performance

The topics in this section provide information on MACsec statistics.

MACsec Statistics

MAC Security (MACsec) is an IEEE 802® standard that allows authorized systems in a network to transmit data confidentially and to take measures against data transmitted or modified by unauthorized devices.

The switch supports the following statistics that provide a measure of MACsec performance.

Table 202: General MACsec statistics

Statistics	Description
TxUntaggedPkts	Specifies the number of transmitted packets without the MAC security tag (SecTAG), with MACsec disabled on the interface.
TxTooLongPkts	Specifies the number of transmitted packets discarded because the packet length is greater than the Maximum Transmission Unit (MTU) of the Common Port interface.
RxUntaggedPkts	Specifies the number of received packets without the MAC security tag (SecTAG), with MACsec not operating in strict mode.

Table 202: General MACsec statistics (continued)

Statistics	Description
RxNoTagPkts	Specifies the number of received packets without the MAC security tag (SecTAG), with MACsec operating in strict mode.
RxBadTagPkts	Specifies the number of received packets discarded with an invalid SecTAG or with a zero value Packet Number (PN)/invalid Integrity Check Value (ICV).
RxUnknownSCIPkts	Specifies the number of packets received with an unknown Secure Channel Identifier (SCI) and with MACsec not operating in strict mode.
RxNoSCIPkts	Specifies the number of packets received with an unknown Secure Channel Identifier (SCI) and with MACsec operating in strict mode.
RxOverrunPkts	Specifies the number of packets discarded because the number of received packets exceeded the cryptographic performance capabilities.

Table 203: Secure-channel inbound MACsec statistics

Statistics	Description
UnusedSAPkts	Specifies the summation of received unencrypted packets on all SAs of this secure channel, with MACsec not in strict mode.
NoUsingSAPkts	Specifies the summation of received packets that were discarded along with either encrypted packets or packets that were received with MACsec operating in strict mode.
LatePkts	Specifies the number of packets received that have been discarded for this Secure Channel (SC) with Replay Protect enabled. Note: Replay Protect is supported only by MACsec configurations using MACsec Key Agreement (MKA) protocol.
NotValidPkts	Specifies the summation of packets that were discarded in all SAs of the SC because they were not valid with one of the following conditions: <ul style="list-style-type: none"> • MACsec was operating in strict mode • The packets received were encrypted but contained erroneous fields.
InvalidPkts	Specifies the summation of all packets received that were not valid for this SC, with MACsec operating in check mode.
DelayedPkts	Specifies the summation of packets for this SC, with the Packet Number (PN) of the packets lower than the lower bound replay protection PN. Note: Replay Protect is supported only by MACsec configurations using MKA protocol.

Table 203: Secure-channel inbound MACsec statistics (continued)

Statistics	Description
UncheckedPkts	The total number of packets for this SC that: <ul style="list-style-type: none"> • were encrypted and failed the integrity check • were not encrypted and failed the integrity check • were received when MACsec validation was not enabled
OKPkts	Specifies the total number of Integrity Check Validated (ICV) packets for all SAs of this Secure Channel. The number of octets of User Data recovered from received frames that were integrity protected but not encrypted.
OctetsValidated	Specifies the number of octets of plain text recovered from received packets that were integrity protected but not encrypted.
OctetsDecrypted	Specifies the number of octets of plain text recovered from received packets that were integrity protected and encrypted.

Table 204: Secure-channel outbound MACsec statistics

Statistics	Description
ProtectedPkts	Specifies the number of integrity protected but not encrypted packets for this transmitting SC.
EncryptedPkts	Specifies the number of integrity protected and encrypted packets for this transmitting SC.
OctetsProtected	Specifies the number of plain text octets that are integrity protected but not encrypted on the transmitting SC.
OctetsEncrypted	Specifies the number of plain text octets that are integrity protected and encrypted on the transmitting SC.

Table 205: MACsec Key Agreement statistics

Statistics	Description
MKPDUs Validated & Rx	Specifies the number of MACsec Key Agreement Protocol Data Units (MKPDU) validated and received.
Rx Distributed SAK	Specifies the number of Secure Association Keys (SAK) received.
MKPDUs Transmitted	Specifies the number of MKPDUs transmitted.
Tx Distributed SAK	Specifies the number of SAKs transmitted.

Interoperability Behaviors

If the static key MACsec configuration involves interoperability with VSP 4900 Series, VSP 7400 Series, 5520 Series (only front panel ports), and VIMs, you can see the following display inconsistencies for MACsec statistics:

- one side can show delayed packets on the ingress side

- one side can throw an Ingress Key expiry log message or it might never show an Ingress Key expiry log message

View MACsec Statistics using CLI

Use the following procedures to view statistics for MACsec using the Command Line Interface (CLI).

View MACsec Statistics

Perform this procedure to view the MACsec statistics.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View the general MACsec statistics:

```
show macsec statistics [{slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]]]
```

3. View the secure-channel inbound MACsec statistics:

```
show macsec statistics [{slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]]] secure-channel inbound
```

4. View the secure-channel outbound MACsec statistics:

```
show macsec statistics [{slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]]] secure-channel outbound
```

Example

Display general MACsec statistics, inbound MACsec statistics, and outbound MACsec statistics:

The switch supports MACsec on specific ports. For more information, see your hardware documentation.

Note

Display inconsistencies might occur for MACsec statistics when different ports interoperate with one another.

```
Switch:1>enable
Switch:1#show macsec statistics 1/40
```

MACSEC Port Statistics				
PortId	TxUntagged Packets	TxTooLong Packets	RxUntagged Packets	RxNoTag Packets
1/40	0	0	0	0
PortId	RxBadTag Packets	RxUnknown SCIPackets	RxNoSCI Packets	RxOverrun Packets

```

1/40      0      0      0      0

Switch:1#show macsec statistics 1/40 secure-channel inbound

Clear MACsec Statistics

About This Task

You have the option to clear MACsec statistics for all ports, or clear MACsec statistics for a specific port. Clearing MACsec statistics can be useful for debugging purposes.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Clear all MACsec statistics:
macsec clear-stats
3. (Optional) Clear MACsec statistics for a specific port:
macsec clear-stats port {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]}

Example

Clear all MACsec statistics:

```

Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec clear-stats

```

Clear MACsec statistics for a specific port:

```

Switch:1>enable
Switch:1#configure terminal

```

```
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec clear-stats port 1/3
```

Variable Definitions

Use the data in the following table to use the **clear macsec-stats** command.

Variable	Value
<code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

View MKA MACsec Statistics using CLI

Use the following procedures to view statistics for MKA MACsec using the Command Line Interface (CLI).

Display MKA Statistics

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display MKA statistics for a specific port:

```
show macsec mka statistics {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all] [all]}
```

Example

The following example displays MACsec MKA statistics for a port.

```
Switch:1>show macsec mka statistics 1/3
```

```
=====
                        MKPDU Statistics on interface 1/3
=====
      MKPDUs Validated & Rx      : 1630
      Rx Distributed SAK          : 2
      MKPDUs Transmitted         : 1694
      Tx Distributed SAK          : 0
-----
-----
```

Variable Definitions

Use the data in the following table to use the **show macsec mka statistics** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Clear MKA Statistics

About This Task

You have the option to clear MKA statistics for all ports, or clear MKA statistics for a specific port. Clearing MKA statistics can be useful for debugging purposes.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Clear all MKA statistics:

```
macsec mka clear-stats
```
3. (Optional) Clear MKA statistics for a specific port:

```
macsec mka clear-stats port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all] [all]}
```

Example

Clear all MKA statistics:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka clear-stats
```

Clear MKA statistics for a specific port:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka clear-stats port 1/3
```

Variable Definitions

Use the data in the following table to use the **macsec mka clear-stats** command.

Variable	Value
port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all] [all]}	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

View MACsec Statistics using EDM

Use the following procedures to view statistics for static MACsec using EDM.

Note

For MACsec Key Agreement (MKA) MACsec, the procedures View Secure Channel Inbound Statistics and View Secure Channel Outbound Statistics display only the statistics for the current Secure Association (SA), instead of displaying the statistics for all SAs created under that Secure Channel.

View MACsec Interface Statistics

Use this procedure to view the MACsec interface statistics using EDM.

Procedure

1. In the Device Physical View tab, select one or more ports for which you need to view the MACsec interface statistics.

The switch supports MACsec on specific ports. For more information, see your hardware documentation.

2. In the navigation pane, expand **Edit > Port > General**.
3. Select the **MACsec Interface Stats** tab.

Note

Use the **Clear Stats** button to clear MACsec interface statistics. The **Clear Stats** button is available to clear single-port as well as multiple-port MACsec interface statistics.

MACsec Interface Stats Field Descriptions

The following table describes the fields in the **MACsec Interface Stats** tab.

Field	Description
TxUntaggedPkts	Specifies the number of transmitted packets without the MAC security tag (SecTAG), with MACsec disabled on the interface.
TxTooLongPkts	Specifies the number of transmitted packets discarded because the packet length is greater than the maximum transmission unit (MTU) of the common port interface.
RxUntaggedPkts	Specifies the number of received packets without the MAC security tag (SecTAG), with MACsec <i>not</i> operating in strict mode.
RxNoTagPkts	Specifies the number of received packets without the MAC security tag (SecTAG), with MACsec operating in strict mode.
RxBadTagPkts	Specifies the number of received packets discarded with an invalid SecTAG, or with a zero value packet number (PN), or invalid Integrity Check Value (ICV).
RxUnknownSCIPkts	Specifies the number of packets received with an unknown secure channel identifier (SCI), and with MACsec <i>not</i> operating in strict mode.
RxNoSCIPkts	Specifies the number of packets received with an unknown secure channel identifier (SCI), and with MACsec operating in strict mode.
RxOverrunPkts	Specifies the number of packets discarded because the number of received packets exceeded the cryptographic performance capabilities.

View Secure Channel Inbound Statistics

Use this procedure to view the secure channel (SC) inbound statistics using EDM.

Procedure

1. In the Device Physical View tab, select one or more ports for which to view the SC inbound statistics.
For information about which ports support MACsec, see the hardware documentation.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.

4. Select the **SC Inbound Stats** tab.

Note

Use the **Clear Stats** button to clear single-port secure channel inbound statistics. The **Clear Stats** button is not available to clear multiple-port secure channel inbound statistics.

SC Inbound Stats Field Descriptions

The following table describes the fields in the **SC Inbound Stats** tab.

Field	Description
UnusedSAPkts	Specifies the summary of received unencrypted packets on all SAs of this secure channel, with MACsec <i>not</i> in strict mode.
NoUsingSAPkts	Specifies the summary of received packets that were discarded along with either encrypted packets or packets that were received with MACsec operating in strict mode.
LatePkts	Specifies the number of packets received that have been discarded for this secure channel (SC) with Replay Protect enabled. Note: Replay Protect is supported only by MACsec configurations using MACsec Key Agreement (MKA) protocol.
NotValidPkts	Specifies the summary of packets that were discarded in all SAs of the SC because they were not valid with one of the following conditions: <ul style="list-style-type: none"> • MACsec was operating in strict mode. • The packets received were encrypted but contained erroneous fields.
InvalidPkts	Specifies the summary of all packets received that were not valid for this SC, with MACsec operating in <i>check</i> mode.
DelayedPkts	Specifies the summary of packets for this SC, with the packet number (PN) of the packets lower than the lower bound replay protection PN. Note: Replay Protect is supported only by MACsec configurations using MACsec Key Agreement (MKA) protocol.

Field	Description
UncheckedPkts	The total number of packets for this SC that: <ul style="list-style-type: none"> • Were encrypted and failed the integrity check. • Were <i>not</i> encrypted and failed the integrity check. • Were received when MACsec validation was not enabled.
AcceptedPkts	Specifies the total number of Integrity Check Validated (ICV) packets for all SAs of this Secure Channel. The number of octets of User Data recovered from received frames that were integrity protected but not encrypted.
OctetsValidated	Specifies the number of octets of plain text recovered from received packets that were integrity protected but not encrypted.
OctetsDecrypted	Specifies the number of octets of plain text recovered from received packets that were integrity protected and encrypted.

View Secure Channel Outbound Statistics

Use this procedure to view the secure channel (SC) outbound statistics using EDM.

Procedure

1. In the Device Physical View tab, select one or more ports for which you need to view the SC outbound statistics.
For information about which ports support MACsec, see the hardware documentation.
2. In the navigation pane, expand **Configuration > Edit > Port** folders.
3. Select **General**.
4. Select the **SC Outbound Stats** tab.

Note

Use the **Clear Stats** button to clear single-port secure channel outbound statistics. The **Clear Stats** button is not available to clear multiple-port secure channel outbound statistics.

SC Outbound Stats Field Descriptions

The following table describes the fields in the **SC Outbound Stats** tab.

Field	Description
ProtectedPkts	Specifies the number of integrity protected but not encrypted packets for this transmitting SC.
EncryptedPkts	Specifies the number of integrity protected and encrypted packets for this transmitting SC.
OctetsProtected	Specifies the number of plain text octets that are integrity protected but not encrypted on the transmitting SC.
OctetsEncrypted	Specifies the number of plain text octets that are integrity protected and encrypted on the transmitting SC.

View MKA MACsec Statistics using EDM

Use the following procedure to view statistics for MKA MACsec using EDM.

Display MKA Statistics for a Port

Procedure

1. In the Device Physical View, select the port or ports for which to display MKA statistics.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **MACsec MKA Stats** tab.
5. (Optional) Select **Clear Stats** to clear MKA MACsec statistics for the selected port or ports.

Clearing MKA MACsec statistics can be useful for debugging purposes.

MACsec MKA Stats Field Descriptions

Use the data in the following table to use the **MACsec MKA Stats** tab.

Name	Description
MKPDUValidatedPkts	Specifies the number of MKPDU packets received and validated.
RxDistributedSAKPkts	Specifies the number of SAK packets received.
MKPDUTransmittedPkts	Specifies the number of MKPDU packets transmitted.
TxDistributedSAKPkts	Specifies the number of SAK packets transmitted.

This section provides the concepts and procedures you need to configure MultiLink Trunking (MLT) and Split MultiLink Trunking (SMLT).

Virtual Inter-Switch Trunk (vIST)

Table 206: Virtual Inter-Switch Trunk product support

Feature	Product	Release introduced
Switch cluster (multi-chassis LAG) -Virtual Inter-Switch Trunk (vIST)	4220 Series	Not Supported
	5320 Series	Not Supported
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Split MultiLink Trunking provides subsecond failover when a switch fails. Virtual Inter-Switch Trunk (vIST) improves upon that Layer 2 and Layer 3 resiliency by using a virtualized IST channel through the SPBM cloud. The vIST channel carries the vIST

control traffic and data traffic during an SMLT failover. This feature dramatically improves resiliency over other methods.

Because vIST uses a virtual channel and because IS-IS runs over it, vIST eliminates the potential single point of failure with a dedicated MLT. The vIST channel is always up as long as there is SPBM connectivity between the vIST peers.

vIST interoperates between any two devices that support vIST, and the devices do not have to be of the same type.

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

**Important**

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of the header size increase when transmitting packets over the SPBM cloud.

**Note**

- Users may observe a momentary increase in activity when a MAC delete message is received from a peer. This is due to vIST engaging in MAC learning activities. This is a normal operational procedure.
- For proper traffic flow, if a Layer 2 VSN is created on one vIST peer, it must also be created on the other vIST peer. For more information on Layer 2 VSN, see [Layer 2 VSN Configuration](#) on page 1514.

vIST Configuration Best Practice

If you need to update the vIST VLAN IP address on vIST peers by deleting and recreating the vIST vlan IP address (for example, as part of maintenance), ensure that you update one vIST BEB at a time.

**Caution**

Always perform vIST configuration updates under no traffic. Otherwise, it results in traffic loss.

Before you begin updating a device, as a first step, isolate the device by shutting down all the links and failing over the traffic to its vIST peer. Then, delete and recreate the vIST VLAN IP on the device and save your configuration. When bringing the device back into operation, first unshut those network-to-network interface (NNI) ports that bring up vIST, followed by the SMLT configured ports, and then all the remaining ports, to prevent network loops or duplicate traffic.

For information on vIST configuration, see [Create a Virtual IST](#) on page 2683 or [Create a Virtual IST using EDM](#) on page 2705.

vIST Operations

When you enable IST and boot the chassis, the SMLT enabled trunk ports (SMLT ports) are automatically locked. A timeout mechanism automatically unlocks the SMLT ports when the IST control channel fails to establish within a reasonable amount of time. The timeout mechanism prevents the SMLT ports from being locked forever. Initially 240 seconds are allowed for the switch to determine the IST VLAN status.

The IST VLAN is considered up if at least one port is forwarding traffic and an ARP entry is populated for the IP address of the IST peers. Once the IST VLAN is up, the timeout value is reset to 60 seconds. The IST control channel must be up within the timeout period. If the timeout period is exceeded, then the SMLT ports are automatically unlocked and a message is logged stating that the SMLT ports are unlocked due to a timeout.

Note

If the IST filter is enabled before the timeout, then the IST filter is unaffected and remains enabled.

If a virtual BMAC mismatch occurs between two vIST peers, incorrect information can show in CLI regarding the ports that the client information is learned on, such as MAC addresses or IPv6 neighbor addresses. This can occur before the mismatch is detected, because the two peers receive traffic from each other and learn the information on the local ports. Each vIST peer synchronizes the information as learned locally, even when learned from vIST peer. You can resolve the mismatch by changing the virtual BMAC on one of the vIST peers, but the traffic might remain affected. After confirming the mismatch is resolved from a log report, you can resolve the traffic issue by disabling and enabling the router ISIS on both vIST peers.

Simplified Virtual-IST

Simplified Virtual-IST (vIST) is for conventional switch clustering deployments that use SMLT and not SPB. The Simplified vIST feature provides a single CLI command to enable the virtual IST for SMLT deployments.

- Simplified vIST is available for conventional multicast deployments with PIM and IGMP only when the boot flag (**spbm-config-mode**) is disabled.

Important

PIM is supported with Simplified vIST only, not with SPB vIST.

- When the **spbm-config-mode** boot flag is enabled (default setting), Simplified vIST is not available. This means that you continue to configure SPB/IS-IS for vIST as described in [Create a Virtual IST](#) on page 2683 and [Create a Virtual IST using EDM](#) on page 2705.
- Simplified VIST requires that the two vIST devices be directly connected.
- For legacy IGMP snooping and IGMP snooping over Simplified vIST, the IGMP sender information is NOT synchronized across the vIST. This means that **show ip igmp sender** displays the sender record only on the switch that the multicast stream actually ingresses.

- In Simplified vIST mode, you should not use LACP on vIST MLT.
- In Simplified vIST mode, you cannot enable PIM Infinite Threshold Policy.

**Note**

For Simplified vIST deployment, if a VLAN is part of an SMLT it must be configured on both of the IST peers.

**Important**

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of a header size increase.

For configuration information, see [Configure Simplified vIST in SMLT Topologies](#) on page 2688 or [Configure Simplified vIST in SMLT Topologies](#) on page 2707.

For information about how to configure Simplified vIST with multicast, see [Enabling Multicast on the Switch](#) on page 1696.

MultiLink Trunking

Table 207: MultiLink Trunking product support

Feature	Product	Release introduced
MultiLink Trunking (MLT) / Link Aggregation Group (LAG)	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

MultiLink Trunking (MLT) is a point-to-point connection that aggregates multiple ports to logically act like a single port with aggregated bandwidth. Grouping multiple ports into a logical link provides a higher aggregate on a switch-to-switch or switch-to-server application.

To include ports as trunk group members of an MLT, you must statically configure the ports.

MLT Traffic Distribution Algorithm

You can use a multilink trunk to aggregate bandwidth between two switches. The MLT algorithm ensures that each packet in a flow does not arrive out of sequence, and that a flow always traverses the same link path.

The hashing algorithm uses the following packet fields and the incoming interface (source) port number to calculate the index to outgoing (destination) port number in an MLT:

Traffic type	Hashing algorithm
IPv4 traffic	Hash Key = [Destination IP Address (32 bits), Source IP Address (32 bits), Source TCP/UDP Port, Destination TCP/UDP port]
IPv4 traffic without TCP/UDP header	Hash Key = [Source IP Address (32 bits), Destination IP address (32 bits)]
IPv6 traffic	Hash Key = [Destination IPv6 Address (128 bits), Source IPv6 address (128 bits), Source TCP/UDP Port, Destination TCP/UDP port]
IPv6 traffic without TCP/UDP header	Hash Key = [Source IP Address (128 bits), Destination IP address (128 bits)]
Mac-In-Mac transit traffic	<ul style="list-style-type: none"> Inner Layer 2 non-IP packet: Hash Key = [Source Port (8bits), Customer VLAN(12bits), Customer Destination Mac Address (48 bits), Customer Source Mac Address (48 bits)] Inner IP packet: Hash Key = [Source Port (8bits), VLAN(12bits), Destination IP (32bits), Source IP (32bits)]
Layer 2 Non-IP traffic	Hash Key = [Destination MAC Address (48 bits), Source MAC Address(48 bits)]

MultiLink Trunking and Autonegotiation Interaction

To use MLT with the switch, you can have ports running at different speeds. After you use MLT with LACP, LACP dynamically checks for proper speed on all port members. You do not need to have similar physical connection types. After you use autonegotiation with MLT and not LACP, you need to ensure that all ports run at the same speed.

MLT Configuration Rules

Multilink trunks adhere to the following rules. Unless otherwise stated, these rules also apply to MLT with LACP.

- You cannot configure an MLT name that uses all numbers, for example, 222.
- Multilink trunk ports support mixed speed links, for example, one link can be 10Gb and another 1Gb. However, no weighting of traffic distribution occurs so if you mix links of different operational speeds, you can overload the lower speed link or underutilize a higher speed link.

This rule applies to multilink trunks only. MLT with LACP does not support different link speeds.

- All multilink trunk ports must be in the same Spanning Tree Group (STG) unless the port is tagged. Use tagging so ports can belong to multiple STGs, as well as multiple VLANs.
- After the port is made a member of MLT, it inherits the properties of the MLT and hence the STG properties are inherited from the VLAN associated with that MLT. After you remove the port from MLT or after you delete the MLT, the ports are removed from the MLT STG and added into the default STG.
- MLT is compatible with Multiple Spanning Tree Protocol (MSTP) (IEEE 802.1s) and Rapid Spanning Tree Protocol (RSTP) (IEEE 802.1w).
- Tagging (IEEE 802.1Q) is supported on a multilink trunk.

Multilink trunks have the following general features and requirements:

- Supports MLT groups with as many as 8 ports belonging to a single multilink trunk. For more information about the number of MLT groups supported for each hardware platform, see *Fabric Engine Release Notes*.
- Apply filters individually to each port in a multilink trunk.

With MSTP or RSTP enabled, ports in the same multilink trunk operate as follows:

- The designated port sends the Bridge Protocol Data Unit (BPDU).
- The multilink trunk port ID is the ID of the lowest numbered port.
- If identical BPDUs are received on all ports, the multilink trunk mode is forwarding.
- If ports do not receive BPDUs on a port or BPDU and port tagging do not match, the individual port is taken offline.
- Path cost is inversely proportional to the active multilink trunk bandwidth.

MLT with LACP LAG Rules

The Link Aggregation Group (LAG) adheres to the following rules:

- All LAG ports operate in full-duplex mode.
- All LAG ports operate at the same data rate.
- All LAG ports must belong to the same set of VLANs.
- Link aggregation is compatible with MSTP, and RSTP.
- Assign all LAG ports to the same MSTP or RSTP groups.
- You can configure a LAG with up to 24 ports, but only a maximum of 8 can be active at a time.
- After you configure a multilink trunk with LACP, you cannot add or delete ports or VLANs manually without first disabling LACP.

Split MultiLink Trunking

Split MultiLink Trunking (SMLT) is an option that improves Layer 2 and Layer 3 resiliency. The following sections discuss SMLT in more detail.

SMLT Overview

Split MultiLink Trunking is an option that improves Layer 2 (bridged) resiliency by providing for the addition of switch failure redundancy with subsecond failover, on top of all standard MLT link failure protection and flexible bandwidth scaling functionality. Use Split MultiLink Trunking to connect a device that supports some form of link aggregation, be it a switch or a server, to two distinct separate SMLT endpoints or switches. These SMLT devices form a virtualized Switch Cluster through the SPBM cloud and are referred to as a Virtual Inter-Switch Trunk (vIST) Core Switch pair.

Switch Clusters are always formed as a pair, but you can combine pairs of clusters in either a square or full-mesh fashion to increase the size and port density of the Switch Cluster. If you configure SMLT in a Layer 3 or routed topology, the configuration is referenced as Routed SMLT (RSMLT).

For information about Routed SMLT, see [RSMLT](#) on page 3285.

You can form SMLT connections through single links from the Switch Cluster to the edge connection, standard MLTs, or MLTs with LACP. Optionally, SMLT links can have VLACP enabled as well. You can mix these various link connections. Within the same Switch Cluster, you can configure both SMLT and RSMLT to allow a mixture of both Layer 2 and Layer 3 VLANs.

Split MultiLink Trunking networks do not need to use RSTP or MSTP to enable loop-free triangle topologies because SMLT inherently avoids loops due to its superior enhanced link aggregation protocol. The loop-free link is accomplished by having two aggregation switches, displays it as a single device to edge switches, which dual-home to the aggregation switches. The aggregation switches interconnect using a Virtual Inter-Switch trunk (vIST), exchanging addressing and state information (permitting rapid fault detection and forwarding path modification). Split MultiLink Trunking is designed for Layer 2 network connectivity, but you can configure in Layer 3 networks by working with VRRP or RSMLT Layer 2 edge.

SMLT Advantages

SMLT eliminates all single points of failure and creates multiple paths from all user access switches to the network core. In case of failure, SMLT recovers as quickly as possible using all capacity. SMLT provides a transparent and interoperable solution that requires no modification on the part of the majority of existing user access devices.

SMLT improves the reliability of Layer 2 networks that operate between user access switches and the network center aggregation switch by providing:

- load sharing among all links
- fast failover in case of link failure
- elimination of single points of failure
- fast recovery in case of node failure
- transparent and interoperable solutions
- removal of MSTP and RSTP convergence issues

SMLT, MSTP, and RSTP

Networks designed to have user access switches dual-home to two aggregation switches, and have VLANs spanning two or more user access switches, experience the following design constraints:

- no load sharing exists over redundant links
- network convergence is slow in case of failure

With the introduction of SMLT, all dual-home Layer 2 frame-switched network devices with dual homes are no longer dependent on the MSTP or RSTP for loop detection. A properly designed SMLT network inherently does not have logical loops.

SMLT solves the spanning tree problem by combining two aggregation switches into one logical MLT entity, thus making it transparent to all types of edge switches. In the process, it provides quick convergence, while load sharing across all available trunks.

If you use STP mode on a switch that is in an SMLT configuration, you can experience traffic loss for 30 seconds if you change the port membership of the MLT, even if the port is in a down state. The traffic loss is because the convergence time for STP is 30 seconds. Use MSTP or RSTP on all switches in SMLT configurations.

SMLT Topologies

The following are the three generic topologies in which you can deploy SMLT, depending on the resiliency and redundancy required:

- a triangle topology
- a square topology
- a full-mesh topology

SMLT and Virtual Inter-Switch Trunk (vIST)

The following illustration shows an SMLT configuration with a pair of switches as aggregation systems (E and F) and four separate switches as user access switches (A, B, C, and D).

Note

In the following figure, the pair of aggregation switches (E and F) are connected by a Virtual Inter-Switch Trunk (vIST). This means that although the system displays these two switches to be directly connected, they could be anywhere within the SPBM cloud.

Figure 181: SMLT aggregation switches and operations

You must connect SMLT aggregation switches through vIST. For example, user access switches B and C connect to the aggregation systems through multilink trunks split between the two aggregation systems. As shown in the previous figure, the implementation of SMLT only requires two SMLT-capable aggregation switches.

Aggregation switches use vIST to do the following:

- Confirm that they are alive and exchange MAC address forwarding tables.
- Send traffic between single switches attached to the aggregation switches.
- Serve as a backup if one SMLT link fails.

Because SMLT requires vIST, use multiple links on vIST to ensure reliability and high availability. Use Gigabit Ethernet links for vIST connectivity to provide enough bandwidth for potential cross traffic.

For more information about vIST, see [Virtual Inter-Switch Trunk \(vIST\)](#) on page 2657.

A vIST multilink trunk must contain at least two physical ports.

Other SMLT Aggregation Switch Connections

The previous figure includes end stations that connect to each of the switches. In this example, a, b1, b2, c1, c2, and d are clients and printers, while e and f are servers and routers.

User access switches B and C can use a method to determine which link of the multilink trunk connections to use to forward a packet, as long as the same link is used for a Source Address and Destination Address (SA/DA) pair. The packet is routed correctly regardless of whether B or C knows the DA. SMLT aggregation switches always send traffic directly to a user access switch, and only use vIST for traffic that they cannot forward in another, more direct way.

SMLT Environment Traffic Flow Rules

Traffic flow in an SMLT environment adheres to the following rules:

- If a packet is received from a vIST trunk port, it is not forwarded to an active SMLT group in order to prevent network loops.
- After a packet is received, the system performs a look-up on the forwarding database. If an entry exists, and if the entry was learned locally from the SMLT or through the vIST as a remote SMLT, it is forwarded to the local port (the packet must not be sent to the vIST for forwarding unless there is no local connection). Unknown and Broadcast packets flood out all ports that are members of this VLAN.
- For load sharing purposes in an SMLT configuration, the switch obeys the MLT traffic distribution algorithm.

For more information, see [SMLT Traffic Flow Examples](#) on page 2669 .

SMLT and LACP Support

The switch fully supports IEEE 802.3ad LACP on MLTs and on a pair of SMLT systems.

With LACP the switch provides a standardized external link aggregation interface to third-party vendor IEEE 802.3ad implementations. This protocol extension provides dynamic link aggregation mechanisms. Only dual-home devices benefit from this enhancement.

Advantages of this protocol extension include the following:

- MLT peers and SMLT client devices can be both network switches and a type of server or workstation that supports link bundling through IEEE 802.3ad.
- Single link and multilink trunk solutions support dual-home connectivity for attached devices, so that you can build dual-home server farm solutions.

Supported SMLT/LACP Scenarios

SMLT/IEEE link aggregation interaction supports all known SMLT scenarios in which an IEEE 802.3ad SMLT pair connects to SMLT clients, or in which two IEEE 802.3ad SMLT pairs connect to each other in a square or full-mesh topology.

Unsupported SMLT/LACP Scenarios

Some of the unsupported SMLT/LACP scenarios include the following factors, which lead to failure:

- Incorrect port connections.
- Mismatched MLT IDs assigned to SMLT client. SMLT switches can detect if MLT IDs are not consistent. The SMLT aggregation switch, which has the lower IP address, does not allow the SMLT port to become a member of the aggregation thereby avoiding misconfigurations.
- The SMLT client switch does not have automatic aggregation enabled (LACP disabled). SMLT aggregation switches can detect that aggregation is not enabled on the SMLT client, thus no automatic link aggregation is established until the configuration is resolved.

SMLT and the Virtual Router Redundancy Protocol

Use Virtual Router Redundancy Protocol (VRRP) to have one active primary router for each IP subnet, with all other network VRRP interfaces operating in backup mode.

The VRRP has only one active routing interface enabled. Users that access switches aggregated into two SMLT switches send their shared traffic load (based on source and destination MAC or IP addresses) on all uplinks towards the SMLT aggregation switches.

Note

A VRRP virtual IP address must not be the same as the VLAN IP address of the device.

The VRRP is less efficient if you use it with SMLT. All other interfaces are in backup (standby) mode. In this case, all traffic is forwarded over the vIST link towards the primary VRRP switch. All traffic that arrives at the VRRP backup interface is forwarded, so there is not enough bandwidth on the vIST link to carry all the aggregated riser traffic. However, an enhancement to VRRP overcomes this issue by ensuring that the vIST trunk is not used in such a case for primary data forwarding.

SMLT and VRRP BackupMaster

The VRRP BackupMaster acts as an IP router for packets destined for the logical VRRP IP address. The system directly routes all traffic to the destined subnetwork and not through Layer 2 switches to the VRRP master. This avoids a potential limitation in the available vIST bandwidth.

To avoid potential frame duplication problems, you can only use the VRRP BackupMaster feature for SMLT on interfaces that you configure for SMLT. You cannot use VRRP BackupMaster with hubs to avoid frame duplication or on brouter or VLAN interfaces.

If you use an SMLT with routing on SMLT aggregation switches, use VRRP for default gateway redundancy. In a VRRP environment, one switch is active and the other is a backup. In an SMLT environment, you can enable the VRRP BackupMaster and use an

active-active concept. The VRRP BackupMaster router routes traffic that is received on the SMLT VLAN and avoids traffic flow across the vIST. This provides true load-sharing abilities.

Follow these guidelines if you use VRRP BackupMaster with SMLT:

- The VRRP virtual IP address and the VLAN IP address cannot be the same.
- Configure the hold-down timer for VRRP to a value that is approximately one hundred and fifty percent of the Interior Gateway Protocol (IGP) convergence time to allow the IGP enough time to reconverge following a failure. For example, if OSPF takes 40 seconds to reconverge, configure the hold-down timer to 60 seconds.
- Enable hold-down times on both VRRP sides (Master and BackupMaster).

SMLT and SLPP

You can use Simple Loop Prevention Protocol (SLPP) to prevent loops in an SMLT network. SLPP focuses on SMLT networks but works with other configurations. Always use SLPP in an SMLT environment.

Note

If SLPP is used in a vIST environment, it must be enabled on both the vIST peers. Because, when an SLPP packet of a vIST peer is looped through UNI ports to the other device, that device will shut down its UNI port due to receiving SLPP packets from its peer. A device's own SLPP packets will go over a vIST connection but will not be forwarded by its vIST peer back onto its UNI ports.

For square and full-mesh configurations that use a routed core, create a separate core VLAN. Enable SLPP on the core VLAN and the square or full mesh links between switch clusters. This configuration detects loops created in the core and loops at the edge do not affect core ports. If you use RSMLT between the switch clusters, enable SLPP on the RSMLT VLAN. Because you enable SLPP only on one or two VLANs in the core, changing the RX threshold values will not be necessary.

The SLPP design is to shut down the port where the SLPP packets originate or to shut down the vIST peer switch port, after the counter reaches the threshold. A loop can still occur after ports are shut down. SLPP can shut down all SMLT ports on a triangle SMLT topology, which results in isolating the edge switch.

SLPP Guard

Table 208: SLPP Guard product support

Feature	Product	Release introduced
SLPP Guard	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.4
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Use SLPP Guard with SMLT to provide additional loop protection to protect wiring closets from erroneous connections.

SLPP Guard requires Simple Loop Prevention Protocol (SLPP) to be configured in the core of the network. SLPP detects loops in the SMLT network. Because SMLT networks disable Spanning Tree (STP), Rapid Spanning Tree (RSTP), or Multiple Spanning Tree Protocol (MSTP) for participating ports, SLPP Guard provides additional network loop protection, extending the loop detection to individual edge access ports.

SLPP Guard can be configured on MLT or LAG ports. If the edge switch with SLPP Guard enabled receives an SLPP-PDU packet on a port, SLPP Guard operationally disables the port for the configured timeout interval and appropriate log messages and SNMP traps are generated. If the disabled port does not receive any SLPP-PDU packets after the configured timeout interval expires, the port automatically reenables and generates a local log message, a syslog message, and SNMP traps, if configured.

SMLT Traffic Flow Examples

The first four traffic flow examples are based on [Figure 181](#) on page 2665.

Example 1: Traffic Flow From a to b1 or b2

Assuming a and b1/b2 are communicating through Layer 2, traffic flows from A to switch E and is forwarded over its direct link to B. Traffic coming from b1 or b2 to a is sent by B on one of its multilink trunk ports.

B can send traffic from b1 to a on the link to switch E, and traffic from b2 to a on the link to F. In the case of traffic from b1, switch E forwards the traffic directly to switch A, while traffic from b2, which arrived at F, is forwarded across the vIST to E and then to A.

Example 2: Traffic Flow From b1/b2 to c1/c2

Traffic from b1/b2 to c1/c2 is always sent by switch B through its multilink trunk to the core. No matter at which switch E or F arrives at, it is sent directly to C through the local link.

Example 3: Traffic Flow From a to d

Traffic from a to d (and d to a) is forwarded across vIST because it is the shortest path. The link is treated as a standard link; SMLT and vIST parameters are not considered.

Example 4: Traffic Flow From f to c1/c2

Traffic from f to c1/c2 is sent out directly from F. Return traffic from c1/c2 passes through one active VRRP Master for each IP subnet. The traffic is passed across vIST if switch C sends it to E.

SMLT and vIST Traffic Flow Example

In an SMLT environment, the two aggregation switches share the same forwarding database by exchanging forwarding entries using the vIST. The entry for 00:E0:7B:B3:04:00 is shown on switch C as an entry learned on MLT-1, but because SMLT Remote is true, this entry was actually learned from switch B. On B, that same entry is shown as directly learned through MLT-1 because SMLT Remote is false.

The following illustration shows the network topology.

Figure 182: Network topology for traffic flow example

After a packet arrives at switch C destined for 00:E0:7B:B3:04:00, if the SMLT Remote status is true, the switch tries to send the packet to MLT-1 rather than through vIST. Traffic rarely traverses vIST unless there is a failure. If this same packet arrives at B, it is then forwarded to MLT-1 on the local ports.

MLT and SMLT Configuration Requirements

Use the information in this section to understand the considerations and guidelines while configuring link aggregation into your network.

Note

Static MAC is not supported against SMLT.

MLT with LACP

After you configure MLT with LACP, you must enable the aggregation parameter. After you enable the aggregation parameter, the LACP aggregator maps one-to-one to the specified multilink trunk.

The following lists the steps that are involved to configure MLT with LACP:

1. Assign a numeric key to the ports you want to include.
2. Configure the LAG for aggregation.
3. Enable LACP on the port.
4. Create an MLT and assign to it the same key as in step 1.

The multilink trunk with LACP only aggregates ports whose key matches its own.

The newly created MLT with LACP adopts the VLAN membership of its member ports after the first port is attached to the aggregator associated with this LAG. After a port detaches from an aggregator, the associated LAG port deletes the member from its list.

After a multilink trunk is configured with LACP, you cannot add or delete ports manually without first disabling LACP. You can add or remove VLANs to an MLT without manually disabling LACP.

The following list identifies expected configuration behavior for all platforms when you add VLANs to an LACP-enabled MLT:

- If only one port is part of the MLT/LAG, use the **vlan members add <1-4059> {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}** command to add newer VLANs to the LAG.
- If two or more ports with several VLANs are active members of the MLT/LAG, you must use the **mlt <1-512> vlan <1-4059>** command to add new VLANs.
- If at least one port is active on the MLT/LAG (LACP), and you need to add a second port that is physically up and has the same key, you must use the **mlt <1-512> vlan <1-4059>** command. The port values must match otherwise the new port enters the churn condition.
- If the switch displays a persistent error that you cannot change the port VLAN membership, you must correct the configuration during a maintenance window:
 1. Shutdown the ports.
 2. Disable LACP on the ports.
 3. Add all VLANs to the port members being aggregated.

4. Enable LACP on the ports.
5. Enable the ports.

To enable tagging on ports belonging to a LAG, disable LACP on the port, and then enable tagging and LACP on the port.

If you enable Open Shortest Path First (OSPF) routing on a port, do not set the LACP periodic transmission timer to less than 1 second.

MLT with LACP and SMLT

You can configure Split MultiLink Trunking (SMLT) with MLT, or with MLT with LACP. Follow these guidelines while you configure SMLT with LACP:

- If you configure LACP for SMLT, you must configure the same LACP smlt-sys-id on both sides. After you configure the LACP system ID for SMLT, configure the same LACP smlt-sys-id on both aggregation switches to avoid loss of data. Configure the LACP smlt-sys-id to be the base MAC address of one of the aggregate switches, and include the MLT-ID. Configure the same system ID on both of the SMLT core aggregation switches.
- If you use LACP in an SMLT square configuration, the LACP ports must have the same keys for that SMLT LAG; otherwise, the aggregation can fail if a switch fails.
- If an SMLT aggregation switch has LACP enabled on some of its multilink trunks, do not change the LACP system priority.
- After you configure SMLT links, set the multicast packets per-second value to 6000 pps.
- To avoid traffic loss when an SMLT goes down during a CP switchover, distribute multiple SMLT links across different slots.
- To avoid unnecessary processing, do not enable LACP on vISTs. Use VLACP if an optical network between the SMLT core switches requires a failure detection mechanism.

Using the LACP smlt-sys-id enables you to use a third-party switch as a wiring closet switch in an SMLT configuration. This enhancement provides an option for the administrator to configure the SMLT Core Aggregation Switches to always use the system ID. In this way, the SMLT Core Aggregation Switch always uses the same LACP key regardless of the state of the SMLT Core Aggregation Switch neighbor (or the vIST link). Therefore no change in LAGs must occur on the attached device regardless of whether the device is a server or a third-party switch. This situation does not affect edge switches used in SMLT configurations. The actor system priority of LACP_DEFAULT_SYS_PRIO, the actor system ID the user configures, and an actor key equal to the MLT-ID are sent to the wiring closet switch. Configure the system ID to be the base MAC address of one of the aggregate switches along with its MLT-ID. The administrator must ensure that the same value for the system ID is configured on both of the SMLT Core Aggregation Switches.

You can configure the LACP smlt-sys-id used by SMLT core aggregation switches. After you set the LACP system ID for SMLT, configure the same LACP smlt-sys-id on both aggregation switches to avoid the loss of data.

The LACP System ID is the base MAC address of the switch, which is carried in Link Aggregation Control Protocol Data Units (LACPDU). If two links interconnect two switches that run LACP, each switch knows that both links connect to the same remote device because the LACPDUs originate from the same System ID. If you enable the links for aggregation using the same key, LACP can dynamically aggregate them into an MLT LAG.

If SMLT is used between the two switches, they act as one logical switch. Both aggregation switches must use the same LACP System ID over the SMLT links so that the edge switch sees one logical LACP peer, and can aggregate uplinks towards the SMLT aggregation switches. This process automatically occurs over the vIST connection, where the base MAC address of one of the SMLT aggregation switches is chosen and used by both SMLT aggregation switches.

However, if the switch that owns that Base MAC address restarts, the vIST goes down, and the other switch reverts to using its own Base MAC address as the LACP System ID. This action causes all edge switches that run LACP to think that their links are connected to a different switch. The edge switches stop forwarding traffic on their remaining uplinks until the aggregation can reform (which can take several seconds). Additionally, after the restarted switch comes back on line, the same actions occur, thus disrupting traffic twice.

The solution to this problem is to statically configure the same LACP smlt-sys-id MAC address on both aggregation switches.

**Note**

The SMLT ID is always the same as the MLT ID. For instance, both sides can have an MLT 10, but once SMLT is enabled on both sides it will function as an SMLT. Until SMLT is enabled on both peers however, it will function as a normal MLT.

MLT with LACP and Spanning Tree

Only the physical link state or its LACP peer status affects LACP module operation. After a link is enabled or disabled, an LACP module is notified. The MSTP or RSTP forwarding state does not affect LACP module operation. LACPDUs can be sent if the port is in an MSTP or RSTP blocking state.

Unlike legacy MultiLink trunks, configuration changes (such as speed and duplex mode) to a LAG member port are not applied to all member ports in the multilink trunks. The changed port is removed from the LAG and the corresponding aggregator, and the user is alerted that the configuration is created.

**Important**

Link Aggregation Control Protocol, as defined by IEEE, is a protocol that exists between two bridge endpoints; therefore, the LACP PDUs are terminated at the next Server Provider (SP) interface.

SMLT and VLACP

Use Virtual Link Aggregation Control Protocol (VLACP) for all SMLT access links configured as MultiLink Trunks to ensure both end devices can communicate. The switch does not support LACP and VLACP on the same links simultaneously.

VLACP for SMLT also protects against CPU failures by causing traffic to switch or reroute to the SMLT peer if the CPU fails or stops responding.

The following table provides the values for VLACP in an SMLT environment:

Table 209: VLACP values

Parameter	Value
SMLT access	
Timeout	Short
Timer	500ms
Timeout scale	5
VLACP MAC	01:80:C2:00:00:0F
SMLT core	
Timeout	Short
Timer	500ms
Timeout scale	5
VLACP MAC	01:80:C2:00:00:0F
vIST	
Timeout	Long
Timer	10000
Timeout scale	3
VLACP MAC	01:80:C2:00:00:0F

SMLT with NNI Ports

If you want to modify SMLTs that contain network-to-network interface (NNI) ports, do the modification during maintenance windows. Otherwise, if you create or delete SMLTs that contain NNI ports running MSTP, IS-IS adjacencies that connect to those ports can bounce even if the SMLT is not used.

MLT and Private VLANs

The switch supports private VLANs and E-Tree configuration. MLT and private VLANs operate as follows:

- When using static MLT, configure the private-vlan as part of the overall MLT configuration, not at the port member level. All ports in the MLT use the private VLAN type for that MLT.
- When using LACP, configure the private-vlan at the interface level.
- When the private VLAN port type is trunk, the MLT automatically becomes tagged.
- If there are other non-private VLANs using the MLT configured as isolated, the following message is displayed: `All non private VLANs using this interface will be removed once this mlt becomes isolated. Do you wish to continue (y/n) ?`
- If there are other non-private VLANs using the MLT configured as promiscuous, the following message is displayed: `All non private VLANs using this interface will be removed once this mlt becomes promiscuous. Do you wish to continue (y/n) ?`

MLT and SMLT Link Aggregation Configuration Using the CLI

This section describes how to configure and manage link aggregation using the CLI, including MultiLink Trunking (MLT), to increase the link speed and redundancy for higher availability.

Configure link aggregation to provide link level redundancy and increase load sharing. MultiLink Trunking (MLT) is a link aggregation technology that you can use to group several physical Ethernet links into one logical Ethernet link to provide fault-tolerance and high-speed links between routers, switches, and servers. Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency.

Configure an MLT

Before You Begin

See [MLT and SMLT Configuration Requirements](#) on page 2671 to understand the commands you can use to add VLANs to an LACP-enabled MLT. Ensure you use the correct command to avoid the LACP churn condition.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Create an MLT:
`mlt <1-512>`
3. (Optional) Set the private VLAN type for the MLT:
`mlt <1-512> private-vlan <isolated|promiscuous|trunk>`

4. Add a VLAN to the MLT:

```
mlt <1-512> vlan <1-4059>
```

5. (Optional) Change the name of the MLT:

```
mlt <1-512> name WORD<0-64>
```

6. Enable trunking on the MLT:

```
mlt <1-512> encapsulation dot1q
```

7. Enable the MLT:

```
mlt <1-512> enable
```

8. Display the MLT configuration:

```
show mlt <1-512>
```

Examples

Create MLT 40. Configure the private VLAN type for MLT 40 to isolated. Add VLAN 10 to the MLT. Enable the MLT.

```
Switch:1(config)#mlt 40
Switch:1(config)#mlt 40 private-vlan isolated
Switch:1(config)#mlt 40 vlan 10
Switch:1(config)#mlt 40 enable
```

Display the MLT configuration:

```
Switch:1(config)#show mlt 40
```

Mlt Info							
MLTID	IFINDEX	NAME	PORT TYPE	MLT ADMIN	MLT CURRENT	PORT MEMBERS	VLAN IDS
40	6183	MLT-40	access	norm	norm		CONFIG 10
MLTID	IFINDEX	DESIGNATED PORTS	LACP ADMIN	LACP OPER			
40	6183	null	disable	down			
MLTID	NAME	WHERE CREATED	LOCAL PORT MEMBERS	REMOTE PORT MEMBERS	WHICH PORTS PROGRAMMED IN DATA PATH		
40	MLT-40	LOCAL			NONE		
MLTID	IFINDEX	ENCAP DOT1Q	LOSSLESS	PVLAN	PVLAN TYPE	VID TYPE	FLEX-UNI
40	6183	disable	disable	enable	isolated	secondary	disable

Variable Definitions

Use the data in the following table to use the **mlt** command.

Variable	Value
<i>enable</i>	Creates and enables a new MLT.
<i>encapsulation dot1q</i>	Enables trunking on the MLT.
<i>member {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}</i>	<p>Adds ports to the MLT.</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<i><1-512></i>	Specifies the MLT ID.
<i>name WORD<0-64></i>	Configures the name for the MLT.
<i>private-vlan {isolated promiscuous trunk}</i>	Specifies a private VLAN type for the MLT.
<i>vlan <1-4059></i>	Specifies a VLAN ID to add to the MLT.

Display MLT Names

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the names of MLTs on the switch:

```
show mlt name [<1-512>]
```

Example

Display the name for MLT 2:

```
Switch:1>show mlt name 2
=====
Mlt Name
=====
MLTID IFINDEX NAME
-----
2      6145    BN1-BN8
```

View MLT Statistics

About This Task

View MLT statistics to display MultiLink Trunking statistics for the switch or for the specified MLT ID.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View MLT statistics:

```
show mlt stats [<1-512>]
```

Example

```
Switch:1#show mlt stats
```

```
=====
```

Mlt Interface				
ID	IN-OCTETS	OUT-OCTETS	IN-UNICST	OUT-UNICST
1	256676904	183670662	1397	456
2	61737348498	61584347982	1450182	1490619

```

```
--More-- (q = quit)
```

Variable Definitions

Use the data in the following table to help you use the **show mlt stats** command.

Variable	Value
<1-512>	Specifies the MLT ID.

View MLT Port Members

View the port members in the specified MLT, or for all MLTs.

MLTID	IFINDEX	NAME	TYPE	ADMIN	CURRENT	MEMBERS	ORIGIN	IDS
1	6144	MLT-1	trunk	norm	norm	1/5	CONFIG	1000 2000
MLTID	IFINDEX	DESIGNATED PORTS	LACP ADMIN	LACP OPER				
1	6144	1/5	disable	down				
MLTID	NAME	WHERE CREATED	LOCAL PORT MEMBERS	REMOTE PORT MEMBERS	WHICH PORTS PROGRAMMED IN DATA PATH			
1	MLT-1	LOCAL	1/5		LOCAL			
MLTID	IFINDEX	ENCAP DOT1Q	LOSSLESS	PVLAN	PVLAN TYPE	VID TYPE	FLEX-UNI	
1	6144	enable	disable	disable	-	-	disable	

Variable definitions

Use the data in the following table to use the **show mlt error collision** command.

Variable	Value
<1-512>	Specifies the MLT ID. The value ranges from 1–512.

Add Ports to an MLT LAG

Perform this procedure to add ports to an MLT LAG.

Procedure

- Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
- Add ports to an MLT LAG:

```
mlt <1-512> member {slot/port[-slot/port]}[,...][slot/all][all]}
```

Example

Add port 1/24 to MLT 40:

```
Switch:1(config)#mlt 40 member 1/24
```

Variable Definitions

Use the data in the following table to use the **mlt** command.

Variable	Value
<i>enable</i>	Creates and enables a new MLT.
<i>encapsulation dot1q</i>	Enables trunking on the MLT.
<i>member {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}</i>	<p>Adds ports to the MLT.</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<i><1-512></i>	Specifies the MLT ID.
<i>name WORD<0-64></i>	Configures the name for the MLT.
<i>private-vlan {isolated promiscuous trunk}</i>	Specifies a private VLAN type for the MLT.
<i>vlan <1-4059></i>	Specifies a VLAN ID to add to the MLT.

Remove Ports from an MLT LAG

About This Task

Important

Before removing a port member from an MLT, you must first disable the port. This ensures that the other side brings its corresponding port member down. This achieves parity on both sides and avoids traffic disruptions.

The shutdown port requires that you enter the interface GigabitEthernet configuration mode. However, to remove ports from an MLT LAG, you can enter any configuration mode.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable the ports:

```
shutdown port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/  
all][all]}
```

3. Remove ports from an MLT LAG:

```
no mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Example

Remove port 1/24 from MLT 40:

```
Switch:1(config)#interface GigabitEthernet 1/24  
Switch:1(config-mlt)#shutdown port 1/24  
Switch:1(config-mlt)#no mlt 40 member 1/24
```

Variable definitions

Use the data in the following table to use the **mlt** command.

Variable	Value
<1-512>	Specifies which MLT to add the ports to.
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}	<p>Specifies the ports to add to the MLT. Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Create an SMLT from an Existing MLT

Before You Begin

- Create an MLT before you create a split in the MLT.
- To create an SMLT from an existing MLT, first shut down the MLT ports. Configure the MLT as SMLT, and then enable the ports again.

Important

Failure to perform this operation can lead to ports in STP blocked state and traffic loss.

- If you are configuring SMLT with vIST, all the SMLT VLANs associated with vIST must have an I-SID.

About This Task

Create an SMLT from an existing MLT to split physical ports between two switches to improve resiliency and provide active load sharing.

Important

To remove an SMLT configuration from the MLT on a vIST switch, first shut down the SMLT MLT ports on its vIST peer.

Failure to perform this operation can lead to Layer 2 loops.

Procedure

1. Log on to the MLT Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface mlt <1-512>
```

2. Create an SMLT from an existing MLT:

```
smlt
```

Example

Create an SMLT on MLT 1:

```
Switch:1(config)#interface mlt 1  
Switch:1(config-mlt)#smlt
```

Virtual interswitch trunk (vIST)

Create a Virtual IST

Use this procedure to create a virtual IST (vIST).

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

**Important**

- When you create a vIST, VLANs assigned to SMLT ports must have an I-SID assigned.
- If you assign a VLAN to an I-SID on one SMLT-BEB node, then you must create the same VLAN and assign it to the same I-SID on the peer SMLT-BEB node even if no devices are connected to this second node.
- The vIST VLAN must also be associated with an I-SID. You can use the same vIST VLAN in another part of your network, but the I-SID associated with the vIST VLAN must not be used anywhere else.

**Note**

Simplified Virtual-IST (vIST) is for non-SPB customers who use SMLT with legacy IST. Simplified VIST is available for legacy multicast deployments only when the boot flag (**spbm-config-mode**) is disabled.

For more information, see [Configure Simplified vIST in SMLT Topologies](#) on page 2688 .

About This Task

The following list provides an overview of the configuration steps:

- Enable SPBM and IS-IS globally.
- Configure SPBM and IS-IS.
- Configure an Layer 2 VSN by assigning an I-SID to the C-VLAN, which is used by the vIST.

For information about SPBM and IS-IS, see [SPBM and IS-IS Infrastructure Fundamentals](#) on page 1178.

**Important**

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of the header size increase when transmitting packets over the SPBM cloud.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Create a vIST:
`virtual-ist peer-ip <A.B.C.D> vlan <1-4059>`
3. Verify your vIST configuration:
`show virtual-ist`

Example

The configuration example contains annotations (in parenthesis) to explain the configuration information.

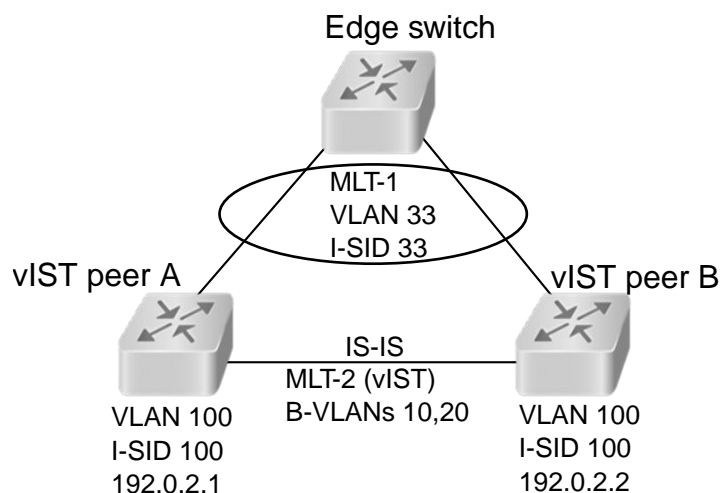

Figure 183: SMLT with vIST configuration example

Note

This configuration example is for vIST peer B.

```

Variable definitions

Use the data in the following table to use the **ist peer-ip** command.

Variable	Value
<A.B.C.D>	Specifies the peer IP address—the IP address of the vIST VLAN on the other aggregation switch.
<1-4059>	Specifies the VLAN ID for this vIST.

View vIST Statistics

View virtual IST (vIST) statistics for the switch.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display the vIST statistics:
show virtual-ist stat
3. To clear the vIST statistics:
clear virtual-ist stats

Example

```
Switch:1#show virtual-ist stat

Edit a vIST

If you need to change the virtual IST (vIST) **peer-ip** or **vlan**, use this procedure to delete the vIST first.

Note

- You must disable IS-IS globally before deleting a vIST, and then re-enable it after creating a new vIST.
- You do not have to set the SMLT peer system ID or the virtual BMAC to 0 before you change the vIST peer IP address or VLAN ID number.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Disable IS-IS globally:

```
no router isis enable
```
3. Delete the vIST:

```
no virtual-ist peer-ip
```
4. Create a vIST:

```
virtual-ist peer-ip <A.B.C.D> vlan <1-4059>
```
5. Enable IS-IS globally:

```
router isis enable
```

Configure Simplified vIST in SMLT Topologies

This procedure shows how to configure Simplified vIST in an SMLT environment. It includes steps to configure the following:

- Setting the boot config flag
- Configuring the vIST peer
- Enabling Simplified vIST

When you enable Simplified vIST with the **virtual-ist enable** command, two VLANs are automatically created to support vIST. The VLAN IDs are: 4086 and 4087.

Before You Begin

- SPBM must not be enabled on the vIST peers.

- Disable PIM Infinite Threshold Policy.

About This Task

Important

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of a header size increase.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Disable the boot flag:

```
no boot config flags spbm-config-mode
```

The system responds with these messages:

Warning: Please save the configuration and reboot the switch for this to take effect.

Warning: Please carefully save your configuration file before rebooting the switch. Saving configuration file when spbm-config-mode is changed to disable, removes SPBM configurations from the configuration file.

3. Save the configuration, and then reboot the switch.

Important

Any change to the **spbm-config-mode** boot flag requires a reboot for the change to take effect.

4. Create the vIST VLAN:

```
vlan create <2-4059> type port-mstprstp <0-63>
```

```
interface vlan <1-4059>
```

```
ip address <A.B.C.D/X>
```

5. Configure the vIST peer address and VLAN:

```
virtual-ist peer-ip <A.B.C.D> vlan <1-4059>
```

6. Configure the SMLT MLT:

```
mlt <1-512> enable
```

```
mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]
[slot/all][all]}
```

```
interface mlt <1-512>
```

```
smlt
```

7. Configure the vIST MLT:

```
mlt <1-512> enable

mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]
[slot/all][all]}

mlt <1-512> encapsulation dot1q

interface mlt <1-512>

virtual-ist enable
```

**Note**

The **virtual-ist enable** command enables Simplified vIST and is only available when the **spbm-config-mode** boot flag is disabled.

8. Create a customer VLAN and assign the SMLT MLT ID:

```
vlan create <2-4059>

vlan mlt <1-4059> <1-512>

interface vlan <1-4059>

ip address <A.B.C.D/X>
```

Example

```
enable
configure terminal
no boot config flags spbm-config-mode
```

Save the configuration and reboot the switch.

```
virtual-ist peer-ip 192.0.2.1 vlan 50

mlt 3 enable
mlt 3 member 1/35,1/36
interface mlt 3
smlt
exit
mlt 5 enable
mlt 5 member 2/1,2/2
mlt 5 encapsulation dot1q
interface mlt 5
virtual-ist enable
exit
vlan create 50 type port-mstprstp 0
interface vlan 50
ip address 192.0.2.2 255.255.255.0 1
exit
vlan create 100
vlan mlt 100 3
interface vlan 100
ip address 198.51.100.1 255.255.255.0 2
exit
```

Troubleshoot vIST Failure

About This Task

When you use Virtual Inter-Switch Trunk (vIST), all critical network traffic runs on this link. If vIST fails, network protocols such as RIP, VRRP, OSPF, and VLACP go down and eventually cause a network outage.

vIST uses an SPBM tunnel to virtually connect two nodes that can be anywhere in the SPBM cloud. Even if the two vIST nodes are directly connected by an MLT link, the vIST VLAN does not have MLT ports as members. Instead, it is configured to be an SPBM C-VLAN.

Note

For more information on vIST and a configuration example, see [MultiLink Trunking and Split MultiLink Trunking](#) on page 2657.

The vIST tunnel is up as long as there is SPBM connectivity between the IST peers. If there is a vIST failure, check the following procedure for some possible reasons:

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Verify that the vIST VLAN is configured on the vIST switch:

```
show virtual-ist
```

3. Verify that an I-SID is associated with the vIST VLAN:

```
show isis spbm i-sid discover
```

Important

The I-SID associated with the vIST VLAN should be the same on the vIST peer, and this I-SID should not be used anywhere else in the network.

4. Verify that the vIST peers are on the same subnet.
 5. If peer ARP is not resolved, enable **trace level 14** to see if ARP request/response are being sent/received.
 6. If vIST is not up, check the **mac fdb table** and verify that the peer MAC is synchronized:
- ```
show vlan mac-address-entry <1-4059>
```
7. If the vIST peer MAC is learned, check to see if the peer IP address is reachable.
    - a. Use **show virtual-ist** to obtain the vIST peer IP address.
    - b. Ping the peer IP address.
  8. If unable to **ping** the peer IP address, check to see if ARP is resolved.

```
show ip arp vlan <vid>
```

## View All Ports Configured for SMLT

View all ports for an SMLT to ensure the correct ports are configured.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View all ports configured for SMLT:  
show smlt mlt

### Example

```
Switch:1#show smlt mlt
```

```
=====
 Mlt SMLT Info
=====
MLT ADMIN CURRENT
ID TYPE TYPE

1 smlt smlt
4 smlt smlt
```

### Variable definitions

Use the data in the following table to use the **show smlt** command.

| Variable | Value                                            |
|----------|--------------------------------------------------|
| mlt      | Displays SMLT information for the MLT interface. |

## View Information about Collision Errors

View information about collision errors to obtain information about collision errors in the specified MLT, or for all MLTs.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View information about collision errors:  
show mlt error collision [<1-512>]

### Example

```
Switch:1#show mlt error collision 4
```

```
=====
 Mlt Collision Error
=====
MLT -----COLLISIONS-----
ID SINGLE MULTIPLE LATE EXCESSIVE

40 0 0 0 0
```

### Variable definitions

Use the data in the following table to use the **show mlt error collision** command.

| Variable | Value                                              |
|----------|----------------------------------------------------|
| <1-512>  | Specifies the MLT ID. The value ranges from 1-512. |

## View Information about Ethernet Errors

View information about Ethernet errors to display information about the types of Ethernet errors sent and received by a specific MLT or all MLTs.

### About This Task

#### Important

The IMAC columns refer to internal MAC address errors.

### Procedure

1. Enter Privileged EXEC mode:  
`enable`
2. View information about Ethernet errors:  
`show mlt error main [<1-512>]`

### Example

```
Switch:1#show mlt error main 40
```

```
=====
 Mlt Ethernet Error
=====
MLT ALIGN FCS IMAC IMAC CARRIER FRAMES SQETEST DEFER
ID ERROR ERROR TRNSMIT RECEIVE SENSE TOOLONG ERROR TRNSMSS

40 0 0 0 0 0 0 0 0
```

### Variable definitions

Use the data in the following table to use the **show mlt error main** command.

| Variable | Value                                              |
|----------|----------------------------------------------------|
| <1-512>  | Specifies the MLT ID. The value ranges from 1-512. |

SLPP Guard configuration

This section provides the procedures to configure Simple Loop Prevention Protocol (SLPP) Guard.

**Important**

Enable SLPP Guard on the edge switches of an SMLT network and SLPP on the aggregation layer switches.

Configure SLPP Guard

Configure SLPP Guard on MLT and LAG ports to provide additional network loop protection.

SLPP Guard is disabled by default.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:
- ```
enable

configure terminal

interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable SLPP Guard on the port:
- ```
slpp-guard enable
```
3. (Optional) Configure the timeout value on the port:
- ```
slpp-guard timeout {<10-65535> | 0}
```

Example

```
Switch:1(config-if)#slpp-guard enable
Switch:1(config-if)#slpp-guard timeout 120
```

Variable definitions

Use the data in the following table to use the **slpp-guard** command.

Variable	Value
timeout <0 10-65535>	Specifies the time period, in seconds, for which SLPP Guard disables the port. After the timeout period expires, the switch reenables the port. The timeout value can be 0 or a value ranging from 10 to 65535. With a value of 0, the port remains disabled until it is manually re-enabled. The default timeout value is 60 seconds.

Reenable an Operationally Disabled Port

Reenable a port that has been operationally disabled by SLPP Guard.

Note

You cannot reenable a disabled port if the timer count has not reached its timeout value. Either wait until it reaches the timeout or disable SLPP Guard for that port and then re-enable it.

Procedure

- 1. Enter GigabitEthernet Interface Configuration mode:

```
enable

configure terminal

interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

- 2. Reenable SLPP Guard on the port:
slpp-guard enable
- 3. (Optional) Configure the timeout value on the port:
slpp-guard timeout {<10-65535> | 0}

Example

```
Switch:1(config-if)#slpp-guard enable
Switch:1(config-if)#slpp-guard timeout 120
```

Variable definitions

Use the data in the following table to use the **slpp-guard** command.

Variable	Value
timeout <0 10-65535>	Specifies the time period, in seconds, for which SLPP Guard disables the port. After the timeout period expires, the switch reenables the port. The timeout value can be 0 or a value ranging from 10 to 65535. With a value of 0, the port remains disabled until it is manually re-enabled. The default timeout value is 60 seconds.

View SLPP Guard Status

View current SLPP Guard settings.

Procedure

- 1. To enter User EXEC mode, log on to the switch.

2. Display SLPP Guard status:

```
show slpp-guard {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]
[slot/all] [all]}
```

Example

```
Switch:1#>show slpp-guard
```

SLPP Guard							
SLPP-guard Ethertype: 0x8102							
Port Interface							
Port	Link	Oper	SLPP-guard State		Timeout	TimerCount	ORIGIN
1/1	Up	Down	Disabled	N/A	60	N/A	RADIUS
1/2	Up	Down	Enabled	N/A	120	N/A	RADIUS
1/3	Up	Up	Enabled	Monitoring	60	N/A	RADIUS
1/4	Up	Down	Enabled	N/A	120	N/A	RADIUS
1/5	Down	Down	Disabled	N/A	60	N/A	RADIUS
1/6	Down	Down	Disabled	N/A	60	N/A	RADIUS
1/7	Down	Down	Disabled	N/A	60	N/A	RADIUS
1/8	Down	Down	Disabled	N/A	60	N/A	RADIUS
1/9	Down	Down	Disabled	N/A	60	N/A	RADIUS
1/10	Down	Down	Disabled	N/A	60	N/A	RADIUS
1/11	Down	Down	Disabled	N/A	60	N/A	RADIUS
1/12	Down	Down	Disabled	N/A	60	N/A	RADIUS

Note

The TimerCount column in the preceding example output indicates the time, in seconds, that elapses after SLPP Guard disables a port. When the value TimerCount value equals the Timeout value, the switch re-enables the port.

Variable definitions

Use the data in the following table to use the **show slpp-guard** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

MLT and SMLT Link Aggregation Configuration using EDM

Configure link aggregation to provide link level redundancy and increase load sharing. MultiLink Trunking (MLT) is a link aggregation technology that you can use to group

several physical Ethernet links into one logical Ethernet link to provide fault-tolerance and high-speed links between routers, switches, and servers. Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency.

Add a Multilink or LACP Trunk

Perform this procedure to add a multilink or LACP trunk.

About This Task

Important

Ensure that all ports that belong to the same MLT/LACP group use the same port speed, for example, 1 Gbit/s, even if autonegotiation is used. This requirement is not enforced by the software.

When you add a VLAN to a dynamic MLT, only the active ports of the MLT are added as port members of the VLAN. Ports configured with the same aggregation key, but not active, are not added to the VLAN. If these inactive ports become active later, the system does not automatically add them to the VLAN port member list.

You must add all inactive ports to the VLAN. If you do not add the inactive ports to the VLAN, when they become active later, hashing can result in choosing a newly active port for traffic forwarding. Because the port is not a port member of the VLAN, traffic will be dropped. When you add the VLAN to the MLT, also add the inactive aggregation ports to the VLAN. You may have to disable LACP on the inactive ports before you can add them to the VLAN. Because the ports are inactive, disabling LACP does not cause a traffic interruption.

Similarly when you remove a VLAN from a dynamic MLT, all active ports of the MLT are removed from the VLAN port member list but the inactive members are not removed. You must remove the inactive aggregation members from the VLAN.

If you later configure a port for the same aggregation, you must add this port to all VLANs that are members of the MLT.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **MLT/LACP**.
3. Select the **MultiLink/LACP Trunks** tab.
4. Select **Insert**.
5. In **Id**, type the ID number of the MLT.
6. In **PortType**, select **access** or **trunk**.
7. (Optional) In **Name**, type a name for the MLT, or accept the default.
8. In **PortMembers**, select the ellipsis (...).
9. In **Port Editor: PortMembers**, select the desired ports.
10. Select **Ok**.
11. In **VlanIdList**, select the ellipsis (...).
12. In **VlanIdList**, select the desired VLANs.

13. Select **Ok**.
14. In **MltType**, select the MLT type.
15. (Optional) In **Aggregatable**, select **enable** or **disable**.
16. (Optional) In **PrivateVlanType**, select **trunk**, **isolated**, or **promiscuous**.
17. Select **Insert**.

MultiLink/LACP Trunks *Field Descriptions*

Use the data in the following table to use the **MultiLink/LACP Trunks** tab.

Name	Description
Id	Specifies a unique value for this MLT.
PortType	Specifies the value to access or trunk port. If the aggregatable field is set to enable, this field is read-only. The default value is access.
Name	Configures the name given to the MLT.
PortMembers	Assigns ports to the MLT. All ports in an MLT must have the same settings for speed and duplex, but can have different media types. All untagged ports must belong to the same STG. Up to eight same-type ports can belong to a single MLT. If the aggregatable field is set to enable, this field becomes read-only. Important: Ensure that all ports that belong to the same MLT/LACP group use the same port speed, for example, 1 Gbps, even if autonegotiation is enabled.
VlanIdList	Indicates to which ports the VLANs belong. If the aggregation field is set to enable, this field is read-only.
MltType	Specifies the type of MLT <ul style="list-style-type: none"> • normalMLT (default) • istMLT • splitMLT
RunningType	Specifies the MLT running type.
IfIndex	Specifies the interface of the trunk.
ClearLinkAggregate	Clears the link aggregate, disabling and reenabling the trunk.
DesignatedPort	Specifies the designated port of this trunk.

Name	Description
Origin	Displays if the MLT is configured manually or dynamically.
Aggregatable	Enables or disables link aggregation. The default value is disable.
AggOperState	Specifies the aggregation state of the trunk.
AggTimeOfLastOperChange	Specifies the time value since the interface entered its current operational state.
PeerPortMembersList	Specifies the peer ports connected to the local ports of this trunk.
EntryOwner	Defines the owner of the MLT.
DatapathProgrammingState	Defines the datapath programming state of the MLT.
PrivateVlanType	Specifies the type of private VLAN for the MLT.
FlexUniEnable	Specifies whether the Flex UNI is enabled or disabled on the port. The default value is disable.
NodeAliasClear	Specifies whether the Node Alias is enabled or disabled for the MLT.

Add Ports to an MLT

Add ports to an MLT to insert MultiLink/LACP trunks.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **MLT/LACP**.
3. Select the **MultiLink/LACP Trunks** tab.
4. In the **PortMembers** column, double-click the field associated with the MLT to which you want to add ports to.
5. Select the port numbers to add, or select **All** to add all ports to the MLT.
Up to 16 same-type ports can belong to a single MLT.
6. Select **Ok**.
7. Select **Apply**.

View SMLT Statistics

View SMLT statistics to manage network performance.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.

2. Select **MLT/LACP**.
3. Select the **Ist/SMLT Stats** tab.

IST/SMLT Stats Field Descriptions

The following table describes parameters on the **IST/SMLT Stats** tab.

Name	Description
SmltIstDownCnt	The number of times the session between the two peering switches has gone down since last boot.
SmltHelloTxMsgCnt	The count of transmitted hello messages.
SmltHelloRxMsgCnt	The count of received hello messages.
SmltLearnMacAddrTxMsgCnt	The count of transmitted learned MAC address messages.
SmltLearnMacAddrRxMsgCnt	The count of received learned MAC address messages.
SmltMacAddrAgeOutTxMsgCnt	The count of transmitted aging out MAC address messages.
SmltMacAddrAgeOutRxMsgCnt	The count of received aging out MAC address messages.
SmltMacAddrAgeExpTxMsgCnt	The count of transmitted MAC address age expired messages.
SmltMacAddrAgeExpRxMsgCnt	The count of received MAC address age expired messages.
SmltStgInfoTxMsgCnt	The count of transmitted STG information messages.
SmltStgInfoRxMsgCnt	The count of received STG information messages.
SmltDelMacAddrTxMsgCnt	The count of transmitted MAC address deleted messages.
SmltDelMacAddrRxMsgCnt	The count of received MAC address received messages.
SmltSmltDownTxMsgCnt	The count of transmitted SMLT down messages.
SmltSmltDownRxMsgCnt	The count of received SMLT down messages
SmltUpTxMsgCnt	The count of transmitted SMLT up messages.
SmltUpRxMsgCnt	The count of received SMLT up messages.
SmltSendMacTblTxMsgCnt	The count of sent send MAC table messages.
SmltSendMacTblRxMsgCnt	The count of received send MAC table messages.
SmltIgmpTxMsgCnt	The count of sent IGMP messages.

Name	Description
SmltIcmpRxMsgCnt	The count of received ICMP messages.
SmltPortDownTxMsgCnt	The count of sent port down messages.
SmltPortDownRxMsgCnt	The count of received port down messages.
SmltReqMacTblTxMsgCnt	The count of sent MAC table request messages.
SmltReqMacTblRxMsgCnt	The count of received MAC table request messages.
SmltRxUnknownMsgTypeCnt	The count of received unknown message type messages.
SmltPortTblSyncReqTxMsgCnt	The count of sent sync request messages.
SmltPortTblSyncReqRxMsgCnt	The count of received sync request messages.
SmltPortTblSyncTxMsgCnt	The count of sent sync messages.
SmltPortTblSyncRxMsgCnt	The count of received sync messages.
SmltPortUpdateTxMsgCnt	The count of sent update messages.
SmltPortUpdateRxMsgCnt	The count of received update messages.
SmltEntryUpdateTxMsgCnt	The count of sent entry update messages.
SmltEntryUpdateRxMsgCnt	The count of received entry update messages.
SmltDialectNegotiateTxMsgCnt	The count of sent protocol ID messages.
SmltDialectNegotiateRxMsgCnt	The count of received protocol ID messages.
SmltUpdateRespTxMsgCnt	The count of sent update response messages.
SmltUpdateRespRxMsgCnt	The count of received update response messages.
SmltTransQHighWaterMarkMsgCnt	The count of transaction queue high watermark messages.
SmltPollCountHighWaterMarkCnt	The count of poll count high watermark.

View MLT Interface Statistics

About This Task

Use MLT interface statistics tab to view interface statistics for the selected MLT.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **MLT/LACP**.
3. Select the **MultiLink/LACP Trunks** tab.

4. Select an MLT.
5. Select **Graph**.
6. Select the **Interface** tab.

Interface Field Descriptions

Use the data in the following table to use the **Interface** tab.

Name	Description
InOctets	Specifies the total number of octets received on the MLT interface, including framing characters.
OutOctets	Specifies the total number of octets transmitted out of the MLT interface, including framing characters.
InUcastPkts	Specifies the number of packets delivered by this MLT to higher level protocols that were not addressed to a multicast or broadcast address at this sublayer.
OutUcastPkts	Specifies the number of packets that higher-level protocols requested be transmitted that were not addressed to a multicast address at this MLT. This total number includes discarded or unsent packets.
InMulticastPkt	Specifies the number of packets delivered to this MLT that were addressed to a multicast address at this sublayer. For a MAC layer protocol, this number includes both Group and Functional addresses.
OutMulticast	Specifies the total number of packets that higher-level protocols requested be transmitted, and that were addressed to a multicast address at this MLT, including those that were discarded or unsent. For a MAC layer protocol, this number includes both Group and Functional addresses.
InBroadcastPkt	Specifies the number of packets delivered to this MLT that were addressed to a broadcast address at this sublayer.
OutBroadcast	Specifies the total number of packets that higher-level protocols requested be transmitted, and that were addressed to a broadcast address at this MLT, including those that were discarded or not sent.
InLsmPkts	Specifies the total number of Link State Messaging (LSM) packets delivered on this MLT.
OutLsmPkts	Specifies the total number of Link State Messaging (LSM) packets transmitted on this MLT.

View MLT Ethernet Error Statistics

About This Task

Use MLT Ethernet error statistics to view the error statistics.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.

2. Select **MLT/LACP**.
3. Select the **MultiLink/LACP Trunks** tab.
4. Select an MLT, and then select **Graph**.
5. Select the **Ethernet Errors** tab.

Ethernet Errors *Field Descriptions*

Use the data in the following table to use the **Ethernet Errors** tab.

Name	Description
AlignmentErrors	Specifies the frame count frames received on a particular MLT that is not an integral number of octets in length and does not pass the FCS check. The count represented by an instance of this object increments when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions occur are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
FCSErrors	Specifies the frame count received on an MLT that is an integral number of octets in length, but does not pass the Frame Check Sequence (FCS) check. The count represented by an instance of this object increments when the FrameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions occur are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
IMacTransmitError	Specifies the frame count for which transmission on a particular MLT fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the LateCollisions object, the ExcessiveCollisions object, or the CarrierSenseErrors object.
IMacReceiveError	Specifies the frame count for which reception on a particular MLT fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the FrameTooLongs object, the AlignmentErrors object, or the FCSErrors object. The precise meaning of the count represented by an instance of this object is implementation specific. In particular, an instance of this object can represent receive errors on a particular interface that are not otherwise counted.
CarrierSenseError	Specifies the number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular MLT. The count represented by an instance of this object increments at most once for each transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt.

Name	Description
FrameTooLong	Specifies the frame count received on a particular MLT that exceeds the maximum permitted frame size. The count represented by an instance of this object increments when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions occur are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
SQETestError	Specifies the number of times that the SQE test error message is generated by the PLS sublayer for a particular MLT. The SQE test error message is defined in section 7.2.2.2.4 of ANSI/ IEEE 802.3-1985.
DeferredTransmiss	Specifies the frame count for which the first transmission attempt on a particular MLT is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions.
SingleCollFrames	Specifies a count of successfully transmitted frames on a particular MLT for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts object, the ifOutMulticastPkts object, or the ifOutBroadcastPkts object, and is not counted by the corresponding instance of the MultipleCollisionFrames object.
MultipleCollFrames	Specifies the successfully transmitted frame count on a particular MLT for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts object, the ifOutMulticastPkts object, or the ifOutBroadcastPkts object, and is not counted by the corresponding instance of the SingleCollisionFrames object.
LateCollisions	Specifies the number of times that a collision is detected on a particular MLT later than 512 bit-times into the transmission of a packet; 512 corresponds to 51.2 microseconds on a 10 Mb/s system. A late collision included in a count represented by an instance of this object is also considered as a generic collision for purposes of other collision-related statistics.
ExcessiveCollis	Specifies the frame count for which transmission on a particular MLT fails due to excessive collisions.

View Trunks

Perform this procedure to view the MLT-based SMLT configuration.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **SMLT**.

3. Select the **SMLT Info** tab.

SMLT Info Field Descriptions

Use the data in the following table to use the **SMLT Info** tab.

Name	Description
Id	Shows the MLT ID for this SMLT Read-only.
MltType	Shows the MLT type of this trunk.
RunningType	Shows the SMLT running type.

Create a Virtual IST using EDM

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

Important

- When you create a vIST, VLANs assigned to SMLT ports must have an I-SID assigned.
- If you assign a VLAN to an I-SID on one SMLT-BEB node, then you must create the same VLAN and assign it to the same I-SID on the peer SMLT-BEB node even if no devices are connected to this second node.
- The vIST VLAN must also be associated with an I-SID. You can use the same vIST VLAN in another part of your network, but the I-SID associated with the vIST VLAN must not be used anywhere else.

Note

Simplified Virtual-IST (vIST) is for non-SPB customers who use SMLT with legacy IST. Simplified VIST is available only for legacy multicast deployments when the boot configuration flag (**spbm-config-mode**) is disabled.

Before You Begin

- Enable SPBM and IS-IS globally.
- Configure SPBM and IS-IS.
- Configure a Layer 2 VSN by assigning an I-SID to the C-VLAN, which is used by the vIST.

About This Task

Important

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of the header size increase when transmitting packets over the SPBM cloud.

Procedure

1. In the navigation pane, expand **Configuration > VLAN > MLT/LACP**.
2. Select the **Virtual IST** tab.
3. In the **PeerIp** field, type the peer IP address.
4. In the **VlanId** field, enter a VLAN ID.
5. Select **Apply**.

Virtual IST Field Descriptions

Use the data in the following table to use the **Virtual IST** tab.

Name	Description
SessionStatus	Displays the status of the vIST session.
PeerIp	Specifies the peer IP address, which is the IP address of the vIST VLAN on the other aggregation switch.
VlanId	Configures a vIST VLAN ID number.

Edit a Virtual IST

If you need to change the virtual IST **PeerIp** or **VlanId**, use this procedure to delete the vIST first.

Note

- You must disable IS-IS globally before deleting a vIST, and then re-enable it after creating a new vIST.
- You do not have to set the SMLT peer system ID or the virtual BMAC to 0 before you change the virtual IST peer IP address or VLAN ID number.

Procedure

1. Disable IS-IS globally.
 - a. In the navigation pane, expand **Configuration > Fabric > IS-IS**.
 - b. Select the **Globals** tab.
 - c. In the **AdminState** field, select **off**.
 - d. Select **Apply**.
2. Delete the vIST.
 - a. In the navigation pane, expand **Configuration > VLAN > MLT/LACP**.
 - b. Select the **Virtual IST** tab.
 - c. Select **Apply**.
3. Create a vIST:
 - a. In the navigation pane, expand **Configuration > VLAN > MLT/LACP**.
 - b. Select the **Virtual IST** tab.
 - c. In the **PeerIp** field, enter the peer IP address.

- d. In the **VlanId** field, enter a VLAN ID.
 - e. Select **Apply**.
4. Enable IS-IS globally.
 - a. In the navigation pane, expand **Configuration > Fabric > IS-IS**.
 - b. Select the **Globals** tab.
 - c. In the **AdminState** field, select **on**.
 - d. Select **Apply**.

Configure Simplified vIST in SMLT Topologies

This procedure shows how to configure Simplified vIST in an SMLT environment. It includes steps to configure the following:

- Setting the boot config flag
- Configuring the vIST peer
- Enabling Simplified vIST

Important

When you enable Simplified vIST with the **virtual-ist enable** command, two VLANs are automatically created to support vIST. The VLAN IDs are: 4086 and 4087.

Before You Begin

SPBM must not be enabled on the vIST peers.

About This Task

Important

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of a header size increase.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Chassis**.
2. Select the **Boot Config** tab.
3. Clear **EnableSpbmConfigMode** to disable the boot flag.

The system responds with the following messages:

```
Warning: Please save the configuration and reboot the switch for this
to take effect.
```

```
Warning: Please carefully save your configuration file before
rebooting the switch. Saving configuration file when spbm-config-
mode is changed to disable, removes SPBM configurations from the
configuration file.
```

4. Select **Apply**.

5. Save the configuration, and then reboot the switch.

**Important**

A change to the **EnableSpbmConfigMode** boot flag requires a reboot for the change to take effect.

6. Configure the SMLT MLT:
 - a. Expand **Configuration > VLAN**.
 - b. Select **MLT/LACP**.
 - c. Select the **MultiLink/LACP Trunks** tab.
 - d. Select **Insert**.
 - e. In **Id**, type the ID number of the MLT.
 - f. In **PortType**, select **access** or **trunk**.
 - g. In **Name**, type a name for the MLT, or accept the default.
 - h. In **PortMembers**, select the ellipsis (...).
 - i. In **Port Editor: PortMembers** dialog box, select the desired ports.
 - j. Select **Ok**.
 - k. In **VlanIdList**, select the ellipsis (...).
 - l. In **VlanIdList** dialog box, select the desired VLANs.
 - m. Select **Ok**.
 - n. In **MltType**, select **splitMLT**.
 - o. Select **Insert**.

The switch adds the SMLT MLT to the MultiLink/LACP Trunks tab in the MLT_LACP box.
7. Configure the vIST MLT:
 - a. Repeat steps [6.a](#) on page 2708 to [6.o](#) to configure the MLT.
 - b. Select **virtualistMLT** to enable Simplified vIST.
 - c. Select **Insert**.
8. Create the vIST VLAN:
 - a. Expand **Configuration > VLAN > VLANs**.
 - b. In **Basic**, select **Insert**.
 - c. In **Id**, type an unused VLAN ID, or use the ID provided.
 - d. In **MstpInstance**, select the down arrow, and then choose an MSTI instance from the list.
 - e. In **Type**, select **byPort**.
 - f. In **PortMembers**, select the ellipsis (...) .
 - g. In **Port Editor: PortMembers** dialog box, select the desired ports.
 - h. Select **OK**.
 - i. Select **Insert**.
 - j. Select the vIST VLAN from the list of VLANs, and then select **IP**.
 - k. Select **Insert**.
 - l. Configure the IP address for the vIST VLAN.
9. Repeat step [8](#) to create an SMLT VLAN and assign the SMLT MLT ID to it. Do not use the vIST MLT ID.

SLPP Guard Configuration

This section provide the procedures to configure Simple Loop Prevention Protocol (SLPP) Guard using EDM.

Important

Enable SLPP Guard on the edge switches of an SMLT network and SLPP on the aggregation layer switches.

Configure SLPP Guard

Configure SLPP Guard on MLT and LAG ports to provide additional network loop protection.

SLPP Guard is disabled by default.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **SLPP**.
3. Select the **SLPP Guard** tab.
4. In the port row, double-click the cell in the **Enabled** column.
5. Select true from the drop-down list to enable SLPP Guard, or false to disable SLPP Guard for the port.
6. (Optional) In the port row, double-click the cell in the **Timeout** column.
7. (Optional) Type a value in the **Timeout** field.
8. Select **Apply**.
9. On the toolbar, select **Refresh** to update the work area data display.

SLPP Guard Field Descriptions

Use the data in the following table to use the **SLPP Guard** tab.

Name	Description
IfIndex	Specifies the port on which to configure SLPP Guard.
Enable	Enables (true) or disables (false) SLPP Guard for the port. The default is disabled.
Timeout	Specifies the time period, in seconds, for which SLPP Guard disables the port. After the timeout period expires, the switch re-enables the port. The timeout value can be 0 or a value ranging from 10 to 65535. With a value of 0, the port remains disabled until it is manually re-enabled. The default Timeout value is 60 seconds.
Status	Displays the SLPP Guard status for the port.

Name	Description
TimerCount	Indicates the time, in seconds, that elapses after SLPP Guard disables a port. When the TimerCount value equals the Timeout value, the switch re-enables the port.
GuardOrigin	Specifies the origin of SLPP Guard configuration on the port. The supported values are: <ul style="list-style-type: none">• config - Set by the user.• radius - Set by the Remote Authentication Dial-In User Service (RADIUS) attribute.

Reenable an Operationally Disabled Port

Reenable a port that has been operationally disabled by SLPP Guard.

Note

You cannot reenable a disabled port if the timer count has not reached its timeout value. Either wait until it reaches the timeout or disable SLPP Guard for that port and then re-enable it.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **SLPP**.
3. Select the **SLPP Guard** tab.
4. In the port row, double-click the cell in the **Enabled** column.
5. Select true from the drop-down list to enable SLPP Guard, or false to disable SLPP Guard for the port.
6. (Optional) In the port row, double-click the cell in the **Timeout** column.
7. (Optional) Type a value in the **Timeout** field.
8. Select **Apply**.
9. On the toolbar, select **Refresh** to update the work area data display.

View SLPP Guard Status

View current SLPP Guard settings.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **SLPP**.
3. Select the **SLPP Guard** tab.

SLPP Guard Field Descriptions

Use the data in the following table to use the **SLPP Guard** tab.

Name	Description
IfIndex	Specifies the port on which to configure SLPP Guard.
Enable	Enables (true) or disables (false) SLPP Guard for the port. The default is disabled.
Timeout	Specifies the time period, in seconds, for which SLPP Guard disables the port. After the timeout period expires, the switch re-enables the port. The timeout value can be 0 or a value ranging from 10 to 65535. With a value of 0, the port remains disabled until it is manually re-enabled. The default Timeout value is 60 seconds.
Status	Displays the SLPP Guard status for the port.
TimerCount	Indicates the time, in seconds, that elapses after SLPP Guard disables a port. When the TimerCount value equals the Timeout value, the switch re-enables the port.
GuardOrigin	Specifies the origin of SLPP Guard configuration on the port. The supported values are: <ul style="list-style-type: none"> • config - Set by the user. • radius - Set by the Remote Authentication Dial-In User Service (RADIUS) attribute.

MLT Configuration Examples

This section contains configuration examples for configuring MultiLink Trunking (MLT) and MLT with Link Aggregation Control Protocol (LACP) using the Command Line Interface (CLI).

Note

Examples and network illustrations in this document may not include your specific platform. Unless otherwise noted, the concept illustrated applies to all supported platforms. For information about high-level feature support, see *Fabric Engine and VOSS Feature Matrix*.

MultiLink Trunking

This configuration example shows you how to create a multilink trunk and a Virtual Local Area Network (VLAN) between two switches.

The following illustration shows you an MLT within a VLAN used to carry user traffic.

Figure 184: MLT within a VLAN

Switch A and B configuration

Configure MLT 10 on VLAN 100 on each device.

```
#
# MLT CONFIGURATION
#

mlt 10 enable
interface mlt 10
exit
#
# VLAN CONFIGURATION
#
vlan create 100 name VLAN-MLT-10 type port-mstprstp 0 color 1
vlan mlt 100 10
vlan members 100 1/1-1/4 portmember
```

MultiLink Trunking with Link Aggregation Control Protocol

This configuration example shows you how to configure and enable a multilink trunk with LACP.

You must configure all aggregatable ports to use the same aggregator key so they can form an MLT.

The following illustration shows you an MLT created with LACP within a VLAN used to carry user traffic.

Figure 185: MLT within a VLAN

The following procedures show you how to configure both switches.

Switch A and B configuration

Configure the two devices to connect with MLT with LACP.

```
#
# MLT CONFIGURATION
#

mlt 10 enable
interface mlt 10
```

```
lacp enable key 10
exit
#
# VLAN CONFIGURATION
#
vlan create 100 name VLAN-MLT-10" type port-mstprstp 0 color 1
vlan mlt 100 1
vlan mlt 100 10
vlan members 100 1/1-1/4 portmember

#
# PORT CONFIGURATION - PHASE II
#

interface GigabitEthernet 1/1
lacp key 10 aggregation enable
lacp enable
exit
interface GigabitEthernet 1/2
lacp key 10 aggregation enable
lacp enable
exit
```

MLT Network Topology and Configuration Reference

The following reference information contains examples of MLT network topology and configuration. The same topologies apply to MLT with LACP.

Note

Examples and network illustrations in this document may not include your specific platform. Unless otherwise noted, the concept illustrated applies to all supported platforms. For information about high-level feature support, see *Fabric Engine and VOSS Feature Matrix*.

Example 1: Switch-to-switch MLT

The following illustration shows two multilink trunks (MLT1 and MLT2) connecting three switches.

Figure 186: Switch-to-switch multilink trunks configuration

In this example, you can configure each trunk with multiple switch ports to increase bandwidth and redundancy. If traffic between switch-to-switch connections approaches single port bandwidth limitations, you can create a multilink trunk to supply the additional bandwidth required to improve performance, as well as providing physical link layer redundancy.

Example 2: Switch-to-server MLT

In this example, File server 1 uses dual MAC addresses, with one MAC address for each Network Interface Card (NIC). No multilink trunk is configured on File server 1. File server 2 is a single MAC server (with a four-port NIC) configured as multilink trunk configuration MLT1.

The following illustration shows a typical switch-to-server multilink trunk configuration.

Figure 187: Switch-to-server multilink trunk configuration

In this example, one port on File server 1 is blocked and unused and File server 2 benefits from aggregated bandwidth on multilink trunk T1.

Example 3: Client/Server MLT

In this example, both servers are connected directly to the switch. File server 2 is connected through multilink trunk MLT 1. The switch-to-switch connections are through MLT 2, MLT 3, and MLT 4. Clients access data from the servers (File server 1 and File server 2) and receive maximized bandwidth through MLT 1, MLT 2, MLT 3, and MLT 4.

The following illustration shows how you can use multilink trunks in a client/server configuration.

Figure 188: Client/server multilink trunk configuration

Network Operating System Personalities

[Base MAC Address Assignment for Universal Hardware Switches](#) on page 2719

[Change the Network Operating System Personality](#) on page 2719

Table 210: Network operating system personality product support

Feature	Product	Release introduced
Dual-boot personalities	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7720 Series	Fabric Engine 8.10
	7520 Series	Fabric Engine 8.10
	7830 Series	Not Supported
	VSP 4900 Series	Not Applicable
	VSP 7400 Series	Not Applicable

Extreme Networks offers universal hardware products that support more than one Network Operating System (NOS) personality. These hardware products ship with a default NOS personality but you can select a non-default personality. After you log in using the default NOS user name and password for the first time, you can respond to an initialization question to change the NOS personality.

The following table identifies hardware products capable of running Fabric Engine and indicates the default NOS personality, if multiple are supported.

Table 211: Hardware with Fabric Engine support

Product	NOS support
4220 Series	Switch Engine (default) Fabric Engine
5320 Series	Switch Engine (default) Fabric Engine

Table 211: Hardware with Fabric Engine support (continued)

Product	NOS support
5420 Series	Switch Engine (default) Fabric Engine Note: VOSS support on this platform ends with VOSS 8.5.x
5520 Series	Switch Engine (default) Fabric Engine Note: VOSS support on this platform ends with VOSS 8.5.x
5720 Series	Switch Engine (default) Fabric Engine
7520 Series	Switch Engine (default) Fabric Engine
7720 Series	Switch Engine (default) Fabric Engine
7830 Series	Fabric Engine only

Network Operating System Selection

The primary method to select a NOS personality is by using ExtremeCloud IQ or ExtremeCloud IQ Site Engine. To select a NOS personality using ExtremeCloud IQ, see *Read Me First – Universal Hardware*. If the network is not accessible, or if you do not use Extreme Networks management software, you can also change the NOS personality manually by using CLI commands in the running NOS.

The procedure in this document includes the commands you use if the personality is Fabric Engine and you need to change the NOS personality manually. To change the personality to Fabric Engine, see the documentation for the running NOS.

Fabric Engine Default Behavior

The following list provides details about the default behavior after you deploy a universal hardware product with the Fabric Engine personality:

- Port behavior:
 - All ports are isolated members of private VLAN 4040 and 4049.
 - The Segmented Management Instance Management VLAN (non-routing mode) and Management OOB interfaces are enabled.
 - All ports are administratively enabled.
 - To provide loop protection, no switching occurs between ports.

- DHCP:
 - DHCP client requests are cycled between In-Band, all ports untagged, and Out-of-Band ports.
- DNS:
 - The DHCP client issues a DNS query on the interface selected by Zero Touch Deployment to look for ExtremeCloud IQ. For information about Zero Touch Deployment, see [Zero Touch Deployment](#) on page 91.
 - You can then use ExtremeCloud IQ to upgrade or change the switch configuration. If you do not use ExtremeCloud IQ, you can use ExtremeCloud IQ Site Engine or on-switch user interfaces.

Base MAC Address Assignment for Universal Hardware Switches

When running Switch Engine, each universal hardware switch uses a base MAC address at offset 0 for both the default management port, if available, and in-band VLAN utilizing DHCP, for example, 00:c0:cc:8b:68:00. When the switch runs Fabric Engine, it uses a base MAC at offset 0x81 for the default management port (for example, 00:c0:cc:8b:68:81) and offset 256 for the in-band VLAN (for example, 00:c0:cc:8b:69:00).

Note

The address assignment for the in-band VLAN assumes that the VLAN has a mac-offset value of 0 assigned. If a different mac-offset value is assigned, the MAC address changes accordingly. For example, if mac-offset is 10, then the associated MAC address is 00:c0:cc:8b:69:0A.

When using a DHCP client on the switch, the switch sends a common DHCP client identifier equal to the base MAC address of the switch that is printed on the switch label. Because of this, assuming a standard DHCP pool configuration, the DHCP server always recognizes the switch by the same IP address, regardless of whether Switch Engine or Fabric Engine runs on the switch.

To statically assign IP addresses on the DHCP server, assign them based upon the DHCP client ID. This assignment will ensure that the bindings do not change when the switch alternates between Switch Engine and Fabric Engine. If you assign the DHCP IP addresses based on MAC addresses, configure multiple entries, one for the 0 offset and one for the 0x81 offset, to account for the different ways in which the two operating systems assign base MAC addresses.

Change the Network Operating System Personality

Use this procedure on a Fabric Engine switch to change the Network Operating System (NOS) personality.

The primary method to select a NOS personality for the switch is by using ExtremeCloud IQ. If the network is not accessible, or if you do not use Extreme Networks management software, you can change the NOS personality by using Fabric Engine CLI commands.

Before You Begin

Use FTP to transfer the NOS image to the `/intflash/` directory.

About This Task

If you change the NOS personality, the system deletes all configuration, licensing, and log files that pertain to the previous NOS personality.

If a power interruption occurs during a personality change, the system restarts the process after you restore power to the switch.

As part of the NOS personality change, you must restart the switch. If, during the restart, the system detects a failure, the NOS personality does not change. After the original NOS restarts, it logs an error message and raises a persistent alarm.

Note

This procedure does not provide information about upgrading Fabric Engine. For details about upgrading the Fabric Engine release, see [Upgrade the Software](#) on page 233.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Unpack the NOS image:

```
software add WORD<1-99> -y
```

Note

The NOS image file is removed after the **software add** command runs.

3. Install the NOS image:

```
software activate WORD<1-99>
```

4. Confirm you want to change the NOS personality by entering `y`.

5. Confirm the new image has been added and will become active after the next restart:

```
show software
```

Important

If you decide not to change the NOS personality, before you restart the switch, you can run the **software activate** command again with the primary release as the image name and the system cancels the NOS personality change.

6. Restart the switch.

Example

Change the NOS personality to Switch Engine.

```
5520-24W-FabricEngine:1>enable
5520-24W-FabricEngine:1#software add summit_arm-31.6.0.459.xos

Variable Definitions

The following table defines parameters for the **software** command.

Variable	Value
<i>activate</i> <i>WORD</i> <1-99>	Specifies the software version to copy to the boot flash file.
<i>add</i> <i>WORD</i> <1-99>	Specifies the software version to unpack.
-y	Suppresses the confirmation message to automatically overwrite the non-primary image. If you omit this parameter, you must confirm the action to overwrite the non-primary image.

The following sections provide information on NTPv4.

**Important**

For NTPv4:

- The switch can operate as both NTPv4 client and NTPv4 server.
- The server selection algorithm can deem a server to be unfit to sync even though there is connectivity.
- It can take several iterations (intervals) for the server to sync.
- You must configure a Segmented Management Instance on applicable switches before you use NTPv4.

NTP Fundamentals

This section provides conceptual material about the Network Time Protocol (NTP). Review this content before you make changes to the NTP configuration.

NTP Overview

NTP synchronizes the internal clocks of various network devices across large, diverse networks to universal standard time. NTP protocol runs over the User Datagram Protocol (UDP), which in turn runs over IP.

The NTPv4 specification is documented in RFC 5905 and supports both IPv4 and IPv6 addresses. If you configure the server using a fully qualified domain name (FQDN), the switch resolves the name to an IP address.

Every network device relies on an internal system clock to maintain accurate time. On local devices, the internal system clock is typically manually set to within a minute or two of the actual time and is rarely reset at regular intervals. Many local clocks are battery-backed devices that use room temperature clock oscillators that can drift as much as several seconds each day. NTP adjusts the time of the devices so that they synchronize within a millisecond (ms) on LANs and up to a few tens of milliseconds on WANs relative to Coordinated Universal Time (UTC).

The NTP client on the switch supports only unicast client mode. In this mode, the NTP client sends NTP time requests to other remote time servers in an asynchronous fashion. The NTP client collects four samples of time from each remote time server. A clock selection algorithm determines the best server among the selected samples based on stratum, delay, dispersion and the last updated time of the remote server. The real time clock (RTC) is adjusted to the selected sample from the chosen server.

NTP Terms

A peer is a device that runs NTP software. However, this implementation of NTP refers to peers as remote time servers that provide time information to other time servers on the network and to the local NTP client. An NTP client refers to the local network device, the switch, that accepts time information from other remote time servers.

NTP System Implementation Model

NTP is based on a hierarchical model that consists of a local NTP client that runs on the switch and on remote time servers. The NTP client requests and receives time information from one or more remote time servers. The local NTP client reviews the time information from all available time servers and synchronizes its internal clock to the time server whose time is most accurate. The NTP client does not forward time information to other devices that run NTP.

Two types of time servers exist in the NTP model: primary time servers and secondary time servers. A primary time server is directly synchronized to a primary reference source, usually a wire or radio clock that is synchronized to a radio station that provides a standard time service. The primary time server is the authoritative time source in the hierarchy, meaning that it is the one true time source to which the other NTP devices in the subnet synchronize their internal clocks.

A secondary time server uses a primary time server or one or more secondary time servers to synchronize its time, forming a synchronization subnet. A synchronization subnet is a self-organizing, hierarchical master-backup configuration with the primary servers at the root and secondary servers of decreasing accuracy at successive levels.

The following figure shows NTP time servers forming a synchronization subnet.

Figure 189: NTP time servers forming a synchronization subnet

In the NTP model, the synchronization subnet reconfigures in a hierarchical primary-secondary configuration to produce accurate and reliable time, even if one or more primary time servers or the path between them fails. This feature applies in a case in which all the primary servers on a partitioned subnet fail, but one or more backup primary servers continue to operate. If all of the primary time servers in the subnet fail, the remaining secondary servers synchronize among themselves.

Time Distribution Within a Subnet

NTP distributes time through a hierarchy of primary and secondary servers, with each server adopting a stratum, see [NTP System Implementation Model](#) on page 2725. A stratum defines how many NTP hops away a particular secondary time server is from

an authoritative time source (primary time server) in the synchronization subnet. A stratum 1 time server is located at the top of the hierarchy and is directly attached to an external time source, typically a wire or radio clock; a stratum 2 time server receives its time through NTP from a stratum 1 time server; a stratum 3 time server receives its time through NTP from a stratum 2 time server, and so forth.

Each NTP client in the synchronization subnet chooses as its time source the server with the lowest stratum number with which it is configured to communicate through NTP. This strategy effectively builds a self-organizing tree of NTP speakers. The number of strata is limited to 15 to avoid long synchronization loops.

NTP avoids synchronizing to a remote time server with inaccurate time. NTP never synchronizes to a remote time server that is not itself synchronized. NTP compares the times reported by several remote time servers.

Synchronization

Unlike other time synchronization protocols, NTP does not attempt to synchronize the internal clocks of the remote time servers to each other. Rather, NTP synchronizes the clocks to universal standard time, using the best available time source and transmission paths to that time source.

Use the **show NTP statistics** command to verify the NTP synchronization status. NTP uses the following criteria to determine the best available time server:

- The time server with the lowest stratum.
- The time server closest in proximity to the primary time server (reduces network delays).
- The time server that offers the highest claimed precision.

NTP accesses several (at least three) servers at the lower stratum level because it can apply an agreement algorithm to detect a problem on the time source.

NTP Modes of Operation

NTP uses unicast client mode to enable time servers and NTP clients to communicate in the synchronization subnet. The switch supports only unicast client mode.

After you configure a set of remote time servers (peers), NTP creates a list that includes each time server IP address. If you configure the server address using a fully qualified domain name (FQDN), the switch resolves the FQDN to the IP address. The NTP client uses this list to determine the remote time servers to query for time information.

Note

Using FQDNs requires a DNS configuration for address resolution. If you add a new DNS server or change the operational state of a DNS server, NTP also restarts. For more information about how to configure DNS on the switch, see [Domain Name Service](#) on page 908.

After the NTP client queries the remote time servers, the servers respond with various timestamps, along with information about their clocks, such as stratum, precision, and time reference. The NTP client reviews the list of responses from all available servers and chooses one as the best available time source from which to synchronize its internal clock.

The following figure shows how NTP time servers operate in unicast mode.

Figure 190: NTP Time Servers Operating in Unicast Client Mode

NTP Master Mode

The switch can operate as both an NTPv4 client and an NTPv4 server. You can configure the NTPv4 server by enabling the master mode. When the master mode is configured, peers can synchronize themselves with the local clock when the NTPv4 server loses synchronization or if an external NTPv4 source is not reachable. For information about configuring NTPv4 server master mode, see [Configure NTP Master Mode](#) on page 2733 and [Configure NTP Globally](#) on page 2736.

NTP Restrict

The switch offers the restrict capability on the NTPv4 server. When the NTPv4 server master mode is disabled, the restrict capabilities are disabled by default. All addresses or networks except for those configured as servers are ignored. For addresses configured as servers, traffic is allowed but there are some default restriction values.

When the NTPv4 server master mode is enabled, there are no restrict rules configured, which means all connections are allowed or there are one or multiple rules configured and only those addresses or networks with the configured rules are allowed. For more information about creating NTP restrict entries, see [Create NTP Restrict Entries](#) on page 2735.

NTP Authentication

You can authenticate time synchronization to ensure that the local time server obtains its time services only from known sources. NTP authentication adds a level of security to your NTP configuration. By default, network time synchronization is not authenticated.

If you select authentication, the switch uses the Message Digest 5 (MD5) or the Secure Hash Algorithm 1 (SHA1) algorithm to produce a message digest of the key. The message digest is created using the key and the message, but the key itself is not sent. Depending on which algorithm you select, the MD5 or SHA1 algorithm verifies the integrity of the communication, authenticates the origin, and checks for timeliness.

To authenticate the message, the client authentication key must match that of the time server. Therefore, you must securely distribute the authentication key in advance (the client administrator must obtain the key from the server administrator and configure it on the client).

While you can configure a server with many keys (identified by many key IDs), it is possible to declare only a subset of these as trusted. The time server uses this feature to share keys with a client that requires authenticated time and that trusts the server, but that is not trusted by the time server.

NTP Configuration Using CLI

This section describes how to configure the Network Time Protocol (NTP) using Command Line Interface (CLI).

Before you configure NTPv4, you must create a Segmented Management Instance and configure routing for that instance.

Important

NTP server MD5 authentication or SHA1 authentication does not support passwords (keys) that start with a special character or that contain a space between characters.

Enable NTP Globally

Enable NTP globally. Default values are in effect for most parameters. You can customize NTP by modifying parameters.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. (Optional) Configure the NTP interval time (between successive NTP updates):
`ntp interval <4-17>`
3. Enable NTP globally:
`ntp`

4. Confirm the global configuration:

```
show ntp
```

Example

Specify the time interval between NTP updates, and then enable NTP globally.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ntp interval 10
Switch:1(config)#ntp
```

Confirm the configuration:

```
Switch:1(config)#show ntp

=====
                                NTP Master
=====
Version   Enabled   Stratum
-----
4         False    10

=====
                                NTP Client
=====
Version   Enabled   Interval   Last Update Time                Synchronized To
-----
4         True     10         Thu Jul 18 08:32:59 2019 EDT    192.0.2.0 (Stratum:2)
```

Variable Definitions

The following table defines parameters for the **ntp** command.

Variable	Value
<i>authentication-key</i> <1-65534> <i>WORD</i> <0-20>	Creates an authentication key for MD5 or SHA1 authentication. The default configuration is to delete the authentication key. NTP server MD5 or SHA1 authentication does not support passwords (keys) that start with a special character or contain a space between characters. <i>WORD</i> <0-20> specifies the secret key.
<i>type</i> <md5 sha1>	Specifies the type of authentication as MD5 or SHA1. The default is MD5 authentication.
<i>interval</i> <4-17>	Specifies the time interval between successive NTP updates as a power of 2, in seconds. The default for NTPv4 is 2 to the power of 8 seconds.

Add an NTP Server

Add a remote NTP server to the configuration by specifying its IP address or fully qualified domain name (FQDN). NTP adds the IP address to a list of servers, which the local NTP client uses to query remote time servers for time information. The list of qualified servers called to is a peer list.

Before You Begin

If you specify an FQDN for the server, you must configure DNS for address resolution.

About This Task

For NTPv4, this procedure adds the NTP server information to the switch that is acting as an NTP client. You can configure a maximum of 20 NTP servers.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Add an NTP server:

```
ntp server WORD<1-110>
```
3. Configure additional options for the NTP server:

```
ntp server WORD<1-110> [auth-enable] [authentication-key <0-65534>]
[enable]
```

The NTP server is automatically enabled by default.

4. Confirm the configuration:

```
show ntp server [name]
```

Examples

Configure a server using an IPv4 address:

```
Switch:>enable
Switch:1configure terminal
Switch:1(config)#ntp server 192.0.2.187 enable
Switch:1(config)#show ntp server
```

```
=====
                        NTP Server
=====
Server Ip                Enabled Auth    Key Id    Auth Type
-----
192.0.2.187              true      false    0         N/A
```

Configure a server using an FQDN:

```
Switch:>enable
Switch:1configure terminal
Switch:1(config)#ntp server host.example.com enable
Switch:1(config)#show ntp server
```

```
=====
                        NTP Server
=====
Server Ip                Enabled Auth    Key Id    Auth Type
-----
host.example.com         true      false    0         N/A
```

Variable Definitions

The following table defines parameters for the **ntp server** command.

Variable	Value
<i>auth-enable</i>	Activates MD5 or SHA1 authentication on this NTP server. Without this option, the NTP server will not have any authentication by default.
<i>authentication-key <0-65534></i>	Specifies the key ID value used to generate the MD5 or SHA1 digest for the NTP server. The default authentication key is 0, which indicates disabled authentication.
<i>enable</i>	Activates the NTP server.
<i>WORD<1-110></i>	Specifies the IPv4 address, IPv6 address, or fully qualified domain name (FQDN) of the NTP server. If you use an FQDN, you must also configure the switch to use DNS.

The following table defines parameters for the **show ntp server** command.

Variable	Value
<i>name</i>	Displays all NTP server names.

View NTP Statistics

About This Task

Use the **show ntp statistics** command to view the output for each NTP stratum regardless of whether authentication is enabled.

If two host names resolve to the same IP address, only the first one displays in the output for the **show ntp statistics** command.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View NTP statistics:
show ntp statistics

Examples

```
Switch:1#show ntp statistics

      NTP Server : 192.0.2.187
-----
      Stratum : 16
      Version : NTPv4
      Broadcast : No
      Auth Enabled : Disabled
      Auth Status : Not-Auth
      Sync Status : Rejected
      Reachability : Unreachable
      Root Delay : 0.000
      Root Disp : 0.000
      Delay : 0.000
```

```

Dispersion : 15937.500
Offset : 0.000
Precision : -23
Jitter : 0.000
Last Event : Mobilize

NTP Server : 192.0.2.201
-----
Stratum : 4
Version : NTPv4
Broadcast : No
Auth Enabled : Enabled
Auth Status : Ok
Sync Status : Candidate
Reachability : Reachable
Root Delay : 18.448
Root Disp : 128.677
Delay : 18.448
Dispersion : 0.366
Offset : 0.202
Precision : -24
Jitter : 1.041
Last Event : Popcorn

```

Configure Authentication Keys

About This Task

Configure up to 10 NTP authentication keys to use MD5 or SHA1 authentication.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Create an authentication key:

```
ntp authentication-key <1-65534> type <md5|sha1>
```
3. Enter the secret key:

```
WORD <1-20>
```
4. Re-enter the secret key:

```
WORD <1-20>
```
5. Enable MD5 or SHA1 authentication for the server:

```
ntp server WORD<1-110> auth-enable
```
6. Assign an authentication key to the server:

```
ntp server WORD<1-110> authentication-key <0-65534>
```

Note

If you must disable authentication on the server, you must also disable authentication on the switch for example: `no ntp server WORD<1-110> auth-enable`

7. Confirm the configuration:

```
show ntp key
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ntp authentication-key 5 type md5
Enter the NTP secret key: *****
Reenter the NTP secret key: *****
Switch:1(config)#ntp server 192.0.2.187 auth-enable
Switch:1(config)#ntp server 192.0.2.187 authentication-key 5
Switch:1(config)#show ntp key
=====
                        NTP Key
=====
Key_Id      Type
-----
5           MD5
10          SHA1
20          MD5
30          SHA1
100         MD5
```

Variable Definitions

The following table defines parameters for the **ntp** and **ntp server** commands.

Variable	Value
<i>auth-enable</i>	Activates MD5 or SHA1 authentication on this NTP server. The default is no authentication.
<i>authentication-key <0-65534></i>	Specifies the key ID value used to generate the MD5 or SHA1 digest for the NTPv4 server. The default value is 0, which indicates disabled authentication.
<i>type <md5 sha1></i>	Specifies the type of authentication, whether MD5 or SHA1. The default is MD5 authentication.
<i>WORD<1-110></i>	Specifies the IPv4 address, IPv6 address, or fully qualified domain name (FQDN) of the NTP server. If you use an FQDN, you must also configure the switch to use DNS.

Configure NTP Master Mode

About This Task

Perform the following procedure to set the switch to act as the Network Time Protocol (NTP) server, which means it will run in the master mode. The default value is disabled. You can also enable NTP master mode for a specific stratum.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. (Optional) Enable NTP master mode:

```
ntp master [ <1-16>]
```
3. Verify the configuration:

```
show ntp
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ntp master
Switch:1(config)#show ntp
```

NTP Master				
Version	Enabled	Stratum		
4	True	11		
NTP Client				
Version	Enabled	Interval	Last Update Time	Synchronized To
4	False	60		

Variable Definitions

The following table defines parameters for the **ntp master** command:

Variable	Value
<1-16>	Specifies an optional stratum value. The default value is 10. Note: If there is a better stratum available, it is preferred than what is configured.

Create NTP Restrict Entries

About This Task

Perform the following procedure to configure the NTP restrict capability for a specific IPv4 or IPv6 address, which means the switch permits NTP traffic flow from the specified IP addresses only. By default, the NTP restrict capability is disabled.

Note

- You can configure a maximum of 128 NTP Restrict entries (IPv4 or IPv6 addresses).
- 0.0.0.0/0 or ::/0 NTP restrict entries are equivalent to no NTP restrict rules configured.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Configure a specific NTP restrict IP address:
`ntp restrict WORD<0-255>`
3. Verify the restricted IP address:
`show ntp restrict`

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ntp restrict 192.0.0.0
Switch:1(config)#show ntp restrict
=====
                        NTP Restrict Information
=====
TYPE      ADDRESS                                MASK/PREFIX  LEN
-----
IPv4      192.0.0.0                                23
=====
```

Variable Definitions

The following table defines parameters for the **ntp restrict** command:

Variable	Value
<i>WORD<0-255></i>	Specifies the IPv4 or IPv6 address. Note: You can configure a maximum of 128 IPv4 and IPv6 addresses in the NTP restrict list.

NTP Configuration Using EDM

This section describes how to configure the Network Time Protocol (NTP) using EDM.

Before you configure NTPv4, you must create a Segmented Management Instance and configure routing for that instance.

**Important**

NTP server MD5 authentication or SHA1 authentication does not support passwords (keys) that start with a special character or that contain a space between characters.

Configure NTP Globally

You can use the following procedure to globally enable NTP.

You can also enable master mode on the NTP server configured on the switch. When the master mode is configured, peers can synchronize themselves with the local clock when the NTP server loses synchronization or if an external NTP source is not reachable.

Before You Begin

You must globally disable NTP before you change the version.

Procedure

1. In the navigation pane, expand **Configuration > Edit > NTP**.
2. Select **General**.
3. Select the **Globals** tab.
4. Select **Enable**.
5. Enter a time interval.
6. (Optional) To configure the switch as an NTP server, in the **NTP Master** section, select **Enable**.
7. (Optional) In the **Stratum** field, enter a value.
8. Select **Apply**.

Globals *Field Descriptions*

Use data in the following table to use the **Globals** tab.

NTP Client section:

Name	Description
Enable	Enables the client NTP server. By default, NTP is disabled.
Interval	Specifies the time interval between successive NTP updates as a power of 2 in seconds. The default value for NTPv4 is 2 to the power of 8 seconds.

NTP Master section:

Name	Description
Enable	Enables master mode for the configured NTP server. The default value is disabled.
Stratum	Specifies the stratum for the master NTP server. The default value is 10. Note: If a better stratum is available, it is preferred over what is configured.

Add an NTPv4 Server

Add a remote NTP server to the configuration by first specifying its IP address or fully qualified domain name (FQDN). NTP adds the IP address to a list of servers, which the local NTP client uses to query remote time servers for time information. The list of qualified servers called to is a peer list.

Before You Begin

If you specify an FQDN for the server, you must configure DNS for address resolution.

About This Task

For NTPv4, this procedure adds the NTP server information to the switch that is acting as an NTP client. You can configure a maximum of 20 NTP servers.

Procedure

1. In the navigation pane, expand **Configuration > Edit > NTP**.
2. Select **NTPv4**.
3. Select the **Server** tab.
4. Select **Insert**.
5. Specify if the IP address is an IPv4 or IPv6 address or select **dns** to use a Fully Qualified Domain Name (FQDN) instead.
6. Specify the IP address or FQDN of the NTP server.
7. Select **Insert**.

Server Field Descriptions

Use the data in the following table to use the **Server** tab.

Name	Description
ServerAddressType	Specifies the address type as either IPv4 or IPv6, or DNS for a Fully Qualified Domain Name (FQDN).
ServerAddress	Specifies the IP address or FQDN of the remote NTP server.

Name	Description
Enable	Activates or disables the remote NTP server. The default is enabled.
Authentication	Activates or disables MD5 or SHA1 authentication on this NTP server. MD5 or SHA1 produces a message digest of the key. MD5 or SHA1 verifies the integrity of the communication, authenticates the origin, and checks for timeliness. The default is no authentication.
KeyId	Specifies the key ID used to generate the MD5 or SHA1 digest for this NTP server. The default is 0, which indicates that authentication is disabled.
Stratum	Shows the stratum of the server.
Version	Shows the NTP version of the server.
Broadcast	Shows if broadcast is enabled or disabled
AuthEnabled	Shows if authentication is enabled or disabled
AuthStatus	Shows the authentication status.
Synchronized	Shows the status of synchronization with the server.
Reachable	Shows the NTP reachability status of the server.
RootDelay	Shows the root delay of the server.
RootDisp	Shows the root dispersion of the server.
ServerDelay	Shows the delay of the server.
Dispersion	Shows the dispersion of the server.
Offset	Shows the offset of the server.
Precision	Shows the NTP precision of the server in seconds.
Jitter	Shows the jitter of the server
LastEvent	Shows the last event of the server.

Configure Authentication Keys for NTPv4

Assign an NTP key to use MD5 or SHA1 authentication on the server.

Procedure

1. In the navigation pane, expand **Configuration > Edit > NTP**.
2. Select **NTPv4**.
3. Select the **Key** tab.
4. Select **Insert**.
5. Complete the fields.
6. Select **Insert**.

Key Field Descriptions

Use the data in the following table to use the **Key** tab.

Name	Description
KeyId	Specifies the key ID that generates the MD5 or SHA1 digest.
KeyType	Specifies the type of authentication as MD5 or SHA1. The default is MD5 authentication.

Create NTPv4 Restrict Entries

Before You Begin

You must enable NTPv4 server master mode. For more information, see [Configure NTP Globally](#) on page 2736.

About This Task

Perform the following procedure to configure the NTP restrict capability for a specific IPv4 or IPv6 address(es), which means the switch permits traffic flow from the specified IP address only. By default the NTP restrict capability is disabled.

Note

- You can configure a maximum of 128 NTP Restrict entries (IPv4 or IPv6 addresses).
- 0.0.0.0/0 or ::/0 NTP restrict entries are equivalent to no NTP restrict rules configured.

Procedure

1. In the navigation pane, expand **Configuration > Edit > NTP**.
2. Select **Restrict**.
3. Select the **Restrict Info** tab.
4. Select **Insert**.
5. In **RowIndex**, type a value.
6. Select the IP address type.
7. Type the IPv4 or IPv6 address.
8. Type the restrict mask value.
9. Select **Insert**.

Restrict Info Field Descriptions

Use data in the following table to use the **Restrict Info** tab.

Name	Description
RowIndex	Specifies the NTP Restrict entry.
AddressType	Specifies the NTP Restrict address type.

Name	Description
RestrictAddress	Specifies the NTP address to be restricted.
RestrictMask	Specifies the prefix length of the IPv4 or IPv6 NTP address to be restricted.

OpenAPI

[Configure OpenAPI Local Port Access](#) on page 2742
[Display OpenAPI Local Port Access Information](#) on page 2743
[Display OpenAPI Log File Information](#) on page 2743
[Configure OpenAPI Authentication on a Local Port](#) on page 2744
[Display the OpenAPI Authentication State](#) on page 2745
[OpenAPI Troubleshooting](#) on page 2746

Table 213: OpenAPI product support

Feature	Product	Release introduced
OpenAPI local access	4220 Series	Fabric Engine 9.3
	5320 Series	Fabric Engine 9.3
	5420 Series	Fabric Engine 9.3
	5520 Series	Fabric Engine 9.3
	5720 Series	Fabric Engine 9.3
	7720 Series	Fabric Engine 9.3
	7520 Series	Fabric Engine 9.3
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 9.3
	VSP 7400 Series	VOSS 9.3

You can use the Command Line Interface (CLI) to use OpenAPI through local port access for third-party management platforms and software tools.

Operational Considerations

Consider the following when you use OpenAPI for local port access:

- This feature requires a Premium, Pilot or Extreme Platform ONE Networking license.
- You must have an API authentication token to perform requests on the local port.
- You must have read-write-all (rwa) user access level to authenticate.

Configure OpenAPI Local Port Access

About This Task

Perform this procedure to configure local port access for OpenAPI.

Important

If you change the TCP port or TLS configuration, you must disable and then reenable the local port state.

Procedure

1. Enter Application Configuration mode:
`enable`

`configure terminal`

`application`
2. Enable local port access:
`openapi local-mgmt enable`
3. (Optional) Configure the local port number:
`openapi local-mgmt tcp-port <1-9443>`
4. (Optional) Enable secure communication for local port access:
`openapi local-mgmt tls enable`
5. (Optional) Configure the minimum TLS version:
`openapi local-mgmt minimum-tls {1.2 | 1.3}`
6. (Optional) Configure the OpenAPI server local port for the authentication token:
`openapi local-mgmt ttl <60-86400>`
7. Save the configuration file:
`save config`

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch:1(config)#application
Switch:1(config-app)#openapi local-mgmt enable
Switch:1(config-app)#openapi local-mgmt tcp-port 1025
Switch:1(config-app)#openapi local-mgmt enable
Switch:1(config-app)#save config
```

Variable Definitions

The following table defines parameters for the **openapi local-mgmt** command.

Variable	Value
<i>enable</i>	Enables local port access.
<i>minimum-tls {1.2 1.3}</i>	Specifies the OpenAPI server local port minimum TLS version. The default is 1.2.
<i>tcp-port <1-9443></i>	Specifies the local port number. The default is 9443.
<i>ttl <60-86400></i>	Specifies the time-to-live value for the authentication token. The default is 86400.
<i>tls enable</i>	Enables the secure communication for local port access. The default is enabled.

Display OpenAPI Local Port Access Information

About This Task

Display OpenAPI local port access information on the switch.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the local port access information:

```
show application openapi
```

Example

```
Switch:1>show application openapi
=====
OpenAPI Info
=====
Server State           : Enabled
Server State Local Port : Disabled
Local Port State       : Disabled
Local TCP Port         : 9443
TLS                    : Enabled
TLS version            : 1.2
TTL(in seconds)        : 60
Server Version         : 0.1.10.3
Specification Version   :
```

Display OpenAPI Log File Information

About This Task

Use this procedure to display OpenAPI server log file information such as the type of request, the IP address of the requester, and the URL string.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display OpenAPI log file information:

```
show application openapi log [action WORD<1-7>] [reverse] [source WORD<1-64>] [url <WORD<1-128>]
```
3. Display the last few lines of the OpenAPI log:

```
show application openapi log |tail
```

Example

The following example output displays last few lines of the OpenAPI log:

```
Switch:1(config-app)#show application openapi log | tail
2025-10-07 06:05:22,176:INFO:voss-openapi:__main__.py:main:81:: [1|1] Starting openapi webserver version 0.1.11.2
2025-10-07 07:25:29,803:INFO:voss-openapi:__main__.py:main:39:: [1|1] Starting voss-openapi application
2025-10-07 07:25:32,996:INFO:voss-openapi:__main__.py:main:81:: [1|1] Starting openapi webserver version 0.1.11.2
2025-10-08 06:22:28,263:INFO:voss-openapi:__main__.py:main:39:: [1|1] Starting voss-openapi application
2025-10-08 06:22:30,943:INFO:voss-openapi:__main__.py:main:81:: [1|1] Starting openapi webserver version 0.1.11.2
2025-10-08 12:40:28,025:INFO:voss-openapi:__main__.py:main:39:: [1|1] Starting voss-openapi application
2025-10-08 12:40:31,011:INFO:voss-openapi:__main__.py:main:81:: [1|1] Starting openapi webserver version 0.1.11.2
2025-10-09 06:35:06,360:INFO:voss-openapi:__main__.py:main:39:: [1|1] Starting voss-openapi application
2025-10-09 06:35:09,039:INFO:voss-openapi:__main__.py:main:81:: [1|1] Starting openapi webserver version 0.1.11.2
```

Variable Definitions

The following table defines parameters for the **show application openapi log** command.

Variable	Value
<i>action WORD<1-7></i>	Filters the OpenAPI log based on the following action types: <ul style="list-style-type: none"> • DELETE • GET • PATCH • POST • PUT
<i>reverse</i>	Displays the OpenAPI log in chronological order.
<i>source WORD<1-64></i>	Filters the OpenAPI log based on the application that initiated the request.
<i>url WORD<1-128></i>	Filters the OpenAPI log based on the endpoint URL.
<i>tail</i>	Limits the output of a command to the last few lines. For more information, see GREP with CLI show command on page 191.

Configure OpenAPI Authentication on a Local Port

About This Task

Perform the following procedure to configure OpenAPI authentication on a local port.

This command is used for debugging purposes.

**Important**

You must disable and then reenable the local port to apply changes.

Procedure

1. Enter Application Configuration mode:
enable

configure terminal

application
2. Enable the debug mode:
dbg enable
3. Configure authentication on a local port:
openapi local-mgmt auth enable

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#application
Switch:1(config-app)#dbg enable
Entering privilege command mode
Switch:1(config-app)#no openapi local-mgmt auth enable
Warning : openapi local-port must be restarted to disable token authentication
```

Display the OpenAPI Authentication State

About This Task

Perform the following procedure to display the OpenAPI authentication state.

This command is used for debugging purposes.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Enable the debug mode:
dbg enable
3. Display the OpenAPI authentication state:
show application openapi authentication

Example

```
Switch:1>enable
Switch:1#dbg enable
Entering privilege command mode
Switch:1#show application openapi authentication
=====
OpenAPI Auth
```

```
=====
OpenAPI authentication state      : Disabled
=====
```

OpenAPI Troubleshooting

Use the information in this section to troubleshoot OpenAPI.

OpenAPI Local Port Cannot be Enabled

```
Switch:1(config-app)#openapi local-mgmt enable
Error: Operation not allowed without a proper license file installed
```

Verify there is a valid license installed. A Premier, Pilot or Extreme Platform ONE license is required to enable use of OpenAPI.

curl Receives Error Code 401

```
curl -k -X GET
-H "X-Auth-Token:.eJxTMjcyNzczlIVSZslmaWbGZoZmybrGhsZGxuZGqcYGUGyoBADhWgoI.aIpWPA._q-4KvA-
s5A7AHCihwN0JaQr8rg" https://10.101.21.12:9443/rest/openapi/v0/configuration/vlan/1
{
  "errorCode": 401,
  "errorMessage": "Authentication was enforced please add X-Auth-Token to request
header",
  "resource": "/rest/openapi/v0/configuration/vlan/1"
}
```

The authentication token is available for 24 hours if the server is not restarted in the meantime.

In this case, the authentication token is not current one. Use curl to obtain another authentication token.

```
curl -X 'POST' 'http://10.101.24.120:9443/rest/openapi/v0/operation/auth-
token/:generate' -H 'accept: application/json' -H 'Content-Type: application/json'
-d '{"username": "rwa", "password":"rwa"}
```

curl Receives "Connection refused"

```
curl -k -X GET
-H "X-Auth-Token:.eJxTMjcyNzczlIVSZslmaWbGZoZmybrGhsZGxuZGqcYGUGyoBADhWgoI.aIpWPA._q-4KvA-
s5A7AHCihwN0JaQr8rg" https://10.101.21.12:9443/rest/openapi/v0/configuration/vlan/1
curl: (7) Failed connect to 10.101.21.12:9443; Connection refused
```

Check the local port state:

```
Switch:1(config-app)#show application openapi
=====
OpenAPI Info
=====
Server State           : Disabled
Server State Local Port : Enabled
Local Port State       : Enabled
Local TCP Port         : 2
TLS                    : Disabled
```

```

Server Version          : 0.1.10.3
Specification Version   :

```

If the local port state is enabled, use the openapi log to check if the OpenAPI process has started:

```

Switch:1(config-app)#show application openapi log | tail
2025-07-30 17:27:46,089:INFO:voss-openapi:__main__.py:main:39:: [1|1] Starting voss-
openapi application
2025-07-30 17:27:48,662:INFO:voss-openapi:__main__.py:main:81:: [1|1] Starting openapi
webserver version 0.1.10.3
2025-07-30 17:27:59,600:INFO:voss-openapi:log_requests.py:log_response:30:: [1|
1] 127.0.0.1(iqagent) POST http://127.0.0.1:7777/rest/openapi/v0/operation/auth-
token/generate {'username': 'hivemanager', 'password': '*****'} 200 OK 0.0184 seconds
2025-07-30 17:27:59,616:INFO:voss-openapi:log_requests.py:log_response:30:: [1|
1] 127.0.0.1(iqagent) POST http://127.0.0.1:7777/rest/openapi/v0/operation/auth-
token/disable None 204 NO CONTENT 0.0091 seconds
2025-07-30 17:28:23,549:INFO:voss-openapi:log_requests.py:log_response:30:: [1|1]
127.0.0.1(unknown) GET http://openapi.sm02235q-40020/rest/openapi/v0/state/system None
200 OK 0.0613 seconds

```

Check if the OpenAPI process is running. openapi.sh starts the process when the iqagent is running:

```

Switch:1(debug)#exec bash
bash-5.1# ps -ef | grep openapi
root      247514      14018    5 17:27 ttyS0      00:00:19 python /opt/appfs/bin/voss_openapi.pyz
root      247515      247514    0 17:27 pts/6        00:00:00 logger -p local0 err -t openapi.sh

```

If there is no cloud connectivity, openapi-local.sh starts the OpenAPI server:

```

Switch:1(debug)#exec bash
bash-5.1# ps -ef | grep openapi
root      252766      14018    0 17:35 ttyS0      00:00:00 /bin/bash /opt/appfs/bin/openapi-
local.sh
root      252767      252766    0 17:35 pts/6        00:00:00 logger -p local0 err -t openapi-
local.sh
root      252771      252766    91 17:35 ttyS0      00:00:08 python /opt/appfs/bin/
voss_openapi.pyz --local-port=2 --local-port-tls=0 --local-auth=1

```

If the OpenAPI process is running, use netstat to check if TCP is listening on the configured port. Confirm on which port the OpenAPI server was opened and then check if there is an opened socket on that particular port:

```

bash-5.1# tail /var/log/messages
Jul 30 17:43:40 aries64 local0.err openapi-local.sh:    WARNING: This is a development
server. Do not use it in a production deployment.
Jul 30 17:43:40 aries64 local0.err openapi-local.sh:    * Running on https://127.0.0.1:9443
Jul 30 17:43:40 aries64 local0.err openapi-local.sh:    * Running on https://
10.101.21.12:9443 (Press CTRL+C to quit)

bash-5.1# netstat -ntlp | grep 9443

OSPF Fundamentals

This section introduces the fundamental concepts of Open Shortest Path First (OSPF), including its operating model, key benefits, and protocol variants.

OSPF Overview

Open Shortest Path First (OSPF) is a link-state Interior Gateway Protocol (IGP) that distributes routing information within a single autonomous system. OSPF routers build and synchronize a link-state database (LSDB) and use the Shortest Path First (SPF) algorithm to compute optimal routes.

OSPF converges quickly after link or node failures, minimizes routing traffic compared to distance-vector protocols, and supports IP subnetting, Type of Service (TOS)-based routing, external route tagging, and equal-cost multipath (ECMP) forwarding.

The OSPF protocol includes two versions: OSPFv2 for IPv4 networks and OSPFv3 for IPv6 networks.

In large networks, OSPF offers the following benefits:

- Fast convergence—After network topology changes, OSPF recalculates routes quickly.
- Minimal routing protocol traffic—Unlike distance vector routing protocols, such as Routing Information Protocol (RIP), OSPF generates a minimum of routing protocol traffic.
- Load sharing—OSPF provides support for Equal Cost Multipath (ECMP) routing. If several equal-cost routes to a destination exist, ECMP distributes traffic equally among them.
- Type of service routing—OSPF can calculate separate routes for each IP TOS.

In an OSPF network, each router maintains a link-state database that describes the topology of the AS. The database contains the local state for each router in the AS, including its usable interfaces and reachable neighbors. Each router periodically checks for changes in its local state and shares detected changes by flooding link-state advertisements (LSA) throughout the AS. Routers synchronize their topological databases based on the sharing of information from LSAs.

From the topological database, each router constructs a shortest-path tree, with itself as the root. The shortest-path tree provides the optimal route to each destination in the AS. Routing information from outside the system displays the AS on the tree as leaves. OSPF routes IP traffic based on the destination IP address, subnet mask, and IP TOS.

Autonomous System and Areas

The AS subdivides into areas that group contiguous networks, routers that connect to these networks, and attached hosts. Each area has a topological database, which is invisible from outside the area. Subdividing the AS into areas significantly reduces the amount of routing protocol traffic compared to treating the entire AS like a single link-state domain.

You can attach a router to more than one area. When you perform this action, you can maintain a separate topological database for each connected area. Two routers within the same area maintain an identical topological database for that area. Each area uses a unique area ID and the area ID 0.0.0.0 is reserved for the backbone area.

The router routes packets in the AS based on their source and destination addresses. If the source and destination of a packet reside in the same area, the router uses intra-area routing. If the source and destination of a packet reside in different areas, the router uses inter-area routing. Intra-area routing protects the area from bad routing information because it does not use routing information obtained from outside the area. Inter-area routing must pass through the backbone area. For more information about the backbone area, see [Backbone Area](#) on page 2752.

In large networks with many routers and networks, the link-state database (LSDB) and routing table can become excessively large. Large route tables and LSDBs consume memory. The processing of link-state advertisements results in additional CPU cycles to make forwarding decisions. To reduce these undesired effects, you can divide an OSPF network into subdomains called areas.

An area comprises a number of OSPF routers that have the same area identification (ID).

By dividing a network into multiple areas, the router maintains a separate LSDB, which consists of router LSAs and network LSAs, for each area. Each router within an area maintains an LSDB only for the area to which it belongs. Area router LSAs and network LSAs do not flood beyond the area borders.

The impact of a topology change is localized to the area in which it occurs. The only exception is for the area border router (ABR), which must maintain an LSDB for each area to which they belong. The area border routers advertise changes in topology to the remainder of the network by advertising summary LSAs.

A 32-bit area ID, expressed in IP address format (x.x.x.x), identifies areas. Area 0 is the backbone area and distributes routing information to all other areas.

If you use multiple areas, they must all attach to the backbone through an ABR, which connects area 0.0.0.0 to the nonbackbone areas. If you cannot physically and directly connect an area through an ABR to area 0, you must configure a virtual link to logically connect the area to the backbone area.

Backbone Area

The backbone area consists of the following network types:

- networks and attached routers that do not exist in other areas
- routers that belong to multiple areas

The backbone is usually contiguous but you can create a noncontiguous area by configuring virtual links.

You can configure virtual links between two backbone routers that have an interface to a nonbackbone area. Virtual links belong to the backbone and use intra-area routing only.

The backbone distributes routing information between areas. The topology of the backbone area is invisible to other areas, while it knows nothing of the topology of those areas.

In inter-area routing, a packet travels along three contiguous paths in a point-to-multipoint configuration:

- an intra-area path from the source to an ABR
- a backbone path between the source and destination areas
- another intra-area path to the destination

The OSPF routing algorithm finds the set of paths that has the smallest cost. The topology of the backbone dictates the backbone paths used between areas. OSPF selects inter-area paths by examining the routing table summaries for each connected ABR. The router cannot learn OSPF routes through an ABR unless it connects to the backbone or through a virtual link.

Stub Area

Configure a stub area at the edge of the OSPF routing domain. A stub area has only one ABR. A stub area does not receive LSAs for routes outside its area, which reduces the size of its link-state database. A packet destined outside the stub area is routed to the ABR, which examines it before forwarding the packet to the destination. The network behind a passive interface is treated as a stub area and does not form adjacencies. The network is advertised into the OSPF area as an internal route.

Not so Stubby Area

A not-so-stubby area (NSSA) prevents the flooding of external LSAs into the area by replacing them with a default route. An NSSA can import small stub (non-OSPF) routing domains into OSPF. Like stub areas, NSSAs are at the edge of an OSPF routing

domain. Non-OSPF routing domains attach to the NSSAs to form NSSA transit areas. Accessing the addressing scheme of small stub domains permits the NSSA border router to also perform manual aggregation.

In an OSPF NSSA, the NSSA N/P bit notifies the ABR which external routes to advertise to other areas. If the NSSA N/P bit is set (the value is 1), the ABR exports the external route. This configuration is the default. When the NSSA N/P bit is not set (the value is 0), the ABR drops the external route. You can create a route policy to manipulate the N/P bit.

Multiarea OSPF Configuration

The following figure shows five devices (R1 to R5) in a multi-area configuration.

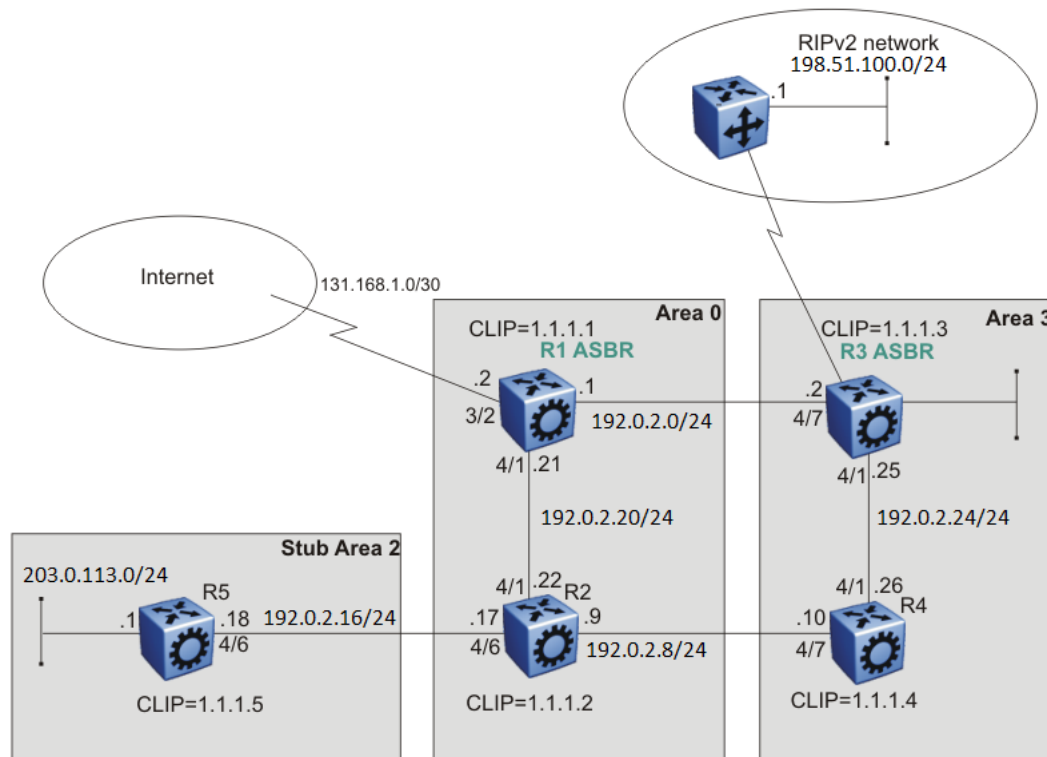

Figure 191: Multiarea configuration example

The following list explains the configuration for devices R1 through R5:

- R1 is an OSPF AS boundary router (ASBR) that is associated with OSPF Area 0 and OSPF Area 3. R1 distributes a default route for Internet traffic.
- R2 is an OSPF stub ABR for OSPF Area 2 and ABR to OSPF Area 3.
- R3 is an OSPF ASBR and distributes OSPF to RIP and RIP to OSPF.
- R4 is an OSPF internal router in Area 3.
- R5 is an internal OSPF subrouter in Area 2.
- All OSPF interfaces are brouter ports except R5.

Network 203.0.113.0/24 on R5 uses a VLAN configuration instead of a brouter port. This example uses brouter ports rather than VLANs because the spanning tree algorithm is disabled by default if you use brouter interfaces.

- All interfaces are Ethernet; therefore, the OSPF interfaces are broadcast, except the circuitless IP (CLIP) interfaces, which are passive.
- The interface priority on R5 is 0; therefore, R5 cannot become a DR.
- Configure the OSPF router priority so that R1 becomes the DR (priority 100) and R2 becomes the backup designated router (BDR) with a priority value of 50.

Use stub or NSSA areas to reduce the LSDB size by excluding external LSAs. The stub ABR advertises a default route into the stub area for all external routes.

Router types

Routers in an OSPF network can have various roles depending on how you configure them.

The following table describes the router types you can configure in an OSPF network.

Table 216: Router types in an OSPF network

Router type	Description
AS boundary router (ASBR)	A router that attaches at the edge of an OSPF network is an ASBR. An ASBR generally has one or more interfaces that run an interdomain routing protocol such as Border Gateway Protocol. In addition, a router that distributes static routes or RIP routes into OSPF is an ASBR. The ASBR forwards external routes into the OSPF domain. In this way, routers inside the OSPF network learn about destinations outside their domain.
Area border router (ABR)	A router that attaches to two or more areas inside an OSPF network is an ABR. ABRs play an important role in OSPF networks by condensing the amount of disseminated OSPF information.
Internal router (IR)	A router that has interfaces only within a single area inside an OSPF network is an IR. Unlike ABRs, IRs have topological information only about the area in which they reside.
Designated router (DR)	In a broadcast or NBMA network, the routers elect a single router as the DR for that network. A DR makes sure that all routers on the network synchronize and advertises the network to the rest of the AS.
Backup designated router (BDR)	A BDR is elected in addition to the DR and, if the DR fails, can assume the DR role quickly.

To limit the amount of routing protocol traffic, the Hello protocol elects a DR and a BDR on each multiaccess network. Instead of neighboring routers forming adjacencies and swapping link-state information, which on a large network can mean significant routing protocol traffic, all routers on the network form adjacencies with the DR and the BDR only, and send link-state information to them. The DR redistributes this information to every other adjacent router.

If the BDR operates in backup mode, it receives link-state information from all routers on the network and listens for acknowledgments. If the DR fails, the BDR can transition quickly to the role of DR because its routing tables are up-to-date.

OSPF Neighbors

In an OSPF network, two routers that have an interface to the same network are neighbors. Routers use the Hello protocol to discover their neighbors and to maintain neighbor relationships. On a broadcast or point-to-point network, the Hello protocol dynamically discovers neighbors. On an NBMA network, you must manually configure neighbors for the network.

The Hello protocol provides bidirectional communication between neighbors. Periodically, OSPF routers send hello packets over all interfaces. Included in these hello packets is the following information:

- router priority
- router hello timer and dead timer values
- list of routers that sent the router hello packet on this interface
- router choice for DR and backup designated router (BDR)

Bidirectional communication is determined after one router discovers itself listed in the hello packet of its neighbor.

NBMA interfaces whose router priority is a positive, nonzero value are eligible to become DRs for the NBMA network and are configured with a list of all attached routers. The neighbors list includes each neighbor IP address and router priority. In an NBMA network, a router with a priority other than zero is eligible to become the DR for the NBMA network. You must manually configure the IP address, mask, and router priority of neighbors on routers that are eligible to become the DR or BDR for the network.

Log messages indicate when an OSPF neighbor state change occurs. Each log message indicates the previous state and the new state of the OSPF neighbor. The log message generated for system traps also indicates the previous state and the current state of the OSPF neighbor.

Neighbors can form an adjacency to exchange routing information. After two routers form an adjacency, they perform a database exchange process to synchronize their topological databases. After the databases synchronize, the routers are fully adjacent. Adjacency conserves bandwidth because, from this point, the adjacent routers pass only routing change information.

All routers connected by a point-to-point network or a virtual link always form an adjacency. All routers on a broadcast or NBMA network form an adjacency with the DR and the BDR.

In an NBMA network, before the routers elect a DR, the router sends hello packets only to those neighbors eligible to become a DR. The NBMA DR forms adjacencies only with its configured neighbors and drops all packets from other sources. The neighbor configuration also notifies the router of the expected hello behavior for each neighbor.

If a router receives a hello packet from a neighbor with a priority different from that which is already configured for the neighbor, the router can automatically change the configured priority to match the dynamically learned priority.

OSPF Interfaces

Configure an OSPF interface, or link, on an IP interface. An IP interface can be either a single link (brouter port) or a logical interface configured on a VLAN (multiple ports). The state information associated with the interface is obtained from the underlying lower-level protocols and the routing protocol itself.

Important

To change the interface type of an enabled OSPF interface, you must first disable it, change the type, and then reenabling it. For an NBMA interface, you must first delete manually configured neighbors.

OSPF network types allow OSPF-neighboring between routers over various types of network infrastructures. You can configure each interface to support various network types.

The following table describes the supported OSPF network interface types:

Table 217: OSPF Network Types

Network interface type	Description
Broadcast Interfaces on page 2757	Broadcast interfaces automatically discover every OSPF router on the network by sending OSPF hello packets to the multicast group All OSPF Routers (224.0.0.5). Neighboring is automatic and requires no configuration.
Non-Broadcast Multiple Access Interfaces on page 2757	The NBMA network type models network environments that do not have native Layer 2 broadcast or multicast capabilities, such as Frame Relay and X.25. OSPF hello packets are unicast to manually configured neighbors.

Table 217: OSPF Network Types (continued)

Network interface type	Description
Passive Interfaces on page 2761	A passive interface is an interfacing network in OSPF that does not generate LSAs or form adjacencies. Use a passive interface on an access network or on an interface used for BGP peering. Using passive interfaces limits the amount of CPU cycles required to perform the OSPF routing algorithm.
Point-to-Point Interfaces on page 2761	A point-to-point interface is a single connection between two specific points or OSPF routers. Point-to-Point interfaces automatically discover OSPF routers (up to two) on the network by sending OSPF hello packets to the multicast group AllSPFRouters (224.0.0.5). Neighboring is automatic and requires no configuration.

Broadcast Interfaces

Broadcast interfaces support many attached routers and can address a single physical message to all attached broadcast routers (sent to AllSPFRouters and AllDRouters).

Broadcast interfaces dynamically discover neighboring routers using the OSPF Hello protocol. Each pair of routers on a broadcast network, such as an Ethernet, communicate directly.

Non-Broadcast Multiple Access Interfaces

An NBMA network interconnects multiple devices through point-to-point links. NBMA does not use broadcast and multicast data transmission.

NBMA interfaces support many routers, but cannot broadcast. NBMA networks perform the following activities:

- Statically establish OSPF neighbor relationships.
You must establish neighbor relationships because hub-and-spoke Wide Area Network (WAN) topologies do not support any-to-any broadcasting.
- Control meshed WAN connections.

In contrast to a broadcast network, where some OSPF protocol packets are multicast (sent to AllSPFRouters and AllDRouters), OSPF packets on an NBMA interface are replicated and sent in turn to each neighboring router as unicast. NBMA networks drop all OSPF packets with destination address AllSPFRouters and AllDRouters.

The following figure shows an example of four routers attached to an NBMA subnet. The NBMA segment uses a single IP subnet and each router uses an IP address within the subnet.

Figure 192: NBMA Subnet

NBMA Interface Operations and Parameters

OSPF treats an NBMA network much like it treats a broadcast network. Because many routers attach to the network, the Hello protocol elects a designated router (DR) to generate the network link-state advertisements.

Because the NBMA network does not broadcast, you must manually configure neighbors for each router eligible to become DR (those networks with a positive, nonzero router priority value). You must also configure a poll interval for the network.

NBMA interfaces with a positive, nonzero router priority can become DR for the NBMA network and contain a list of all attached routers, or neighbors. This neighbors list includes each neighbor IP address and router priority.

The router uses neighbor information both during and after the DR election process. After an interface to a nonbroadcast network with a nonzero priority initializes, and before the Hello protocol elects a DR, the router sends hello packets only to those neighbors eligible to become DR. After the Hello protocol elects a DR, it forms adjacencies only with its configured neighbors and drops all packets from other sources. This neighbor configuration also notifies the router of the expected hello behavior of each neighbor.

If a router eligible to become the DR receives a hello packet from a neighbor that shows a different priority from that which is already configured for this neighbor, the DR changes the configured priority to match the dynamically learned priority.

Configure an NBMA interface with a poll interval. The poll interval designates the interval at which the router sends hello packets to inactive neighboring routers. The router typically sends hello packets at the Hello interval, for example, every 10 seconds. If a neighboring router becomes inactive, or if the router does not receive hello packets for the established RouterDeadInterval period, the router sends hello packets at the specified poll interval, for example, every 120 seconds.

You must configure a neighbors list for the DR to allow an NBMA network to send hello packets. If the router is eligible to become a DR, it periodically sends hello packets to all neighbors that are also eligible. The effect of this action is that two eligible routers always exchange hello packets, which is necessary for the correct DR election. You can minimize the number of hello packets by minimizing the number of eligible routers on a nonbroadcast network.

After the Hello protocol elects a DR, it sends hello packets to all manually configured neighbors to synchronize their link-state databases, establish itself as the DR, and identify the backup designated router (BDR).

If a router is not eligible to become DR, it periodically sends hello packets to both the DR and the BDR. The router also sends a hello packet in reply to a hello packet received from an eligible neighbor (other than the current DR and BDR). This process establishes an initial bidirectional relationship with a potential DR.

When a router sends hello packets to a neighbor, the neighbor state determines the interval between hello packets. If the neighbor is in the down state, the router sends hello packets at the designated poll interval, for example, every 120 seconds. Otherwise, the router sends hello packets at the designated hello interval, for example, every 10 seconds.

OSPF and NBMA Example: Adjacency Formation

In an NBMA network, as in a broadcast network, all routers become adjacent to the DR and the BDR. The adjacencies form after you assign the router priorities, configure the neighbors, and the Hello protocol elects the network DR.

The following figure shows an NBMA subnet with router priorities and manually configured neighbors.

Figure 193: NBMA Subnet Configuration Example

Because R1 and R2 have a router priority of 0, they are not eligible to become the DR. Also, R1 and R2 do not require configuration of a neighbors list; R1 and R2 discover neighbors dynamically through the Hello protocol.

R3 and R4 both have a positive, nonzero priority and are eligible to become the DR. Manually configure neighbor lists on R3 and R4.

To create this NBMA network, configure the following parameters:

1. On each router: NBMA interface type, poll interval, router priority
2. On R3: R1, R2, and R4 as neighbors
3. On R4: R1, R2, and R3 as neighbors

If all routers start at the same time, the routers perform the following steps:

1. R3 and R4 send each other a hello packet to elect a DR.
2. The Hello protocol elects R3 as the DR, and R4 as the BDR.
3. R3 (DR) and R4 (BDR) send hello packets to all other routers on the NBMA subnet to synchronize their link-state databases and establish themselves as DR and BDR.

4. R1 and R2 reply to R3 and R4.
5. R3 and R4 each form three adjacencies (one with each router on the NBMA subnet).
6. R1 and R2 each form two adjacencies (one with the DR and one with the BDR).

Passive Interfaces

Use a passive interface to enable an interface to advertise into an OSPF domain while limiting its adjacencies.

After you change the interface type to passive, the router advertises the interface into the OSPF domain as an internal stub network with the following behaviors:

- Does not send hello packets to the OSPF domain.
- Does not receive hello packets from the OSPF domain.
- Does not form adjacencies in the OSPF domain.

If you configure an interface as passive, the router advertises it as an OSPF internal route. If the interface is not a passive interface, to advertise a network into OSPF and not form OSPF adjacencies, you must configure the interface as nonOSPF, and the router must redistribute the local network as an autonomous system external (ASE) LSA.

Point-to-Point Interfaces

A point-to-point interface supports a single OSPF router on either end of the link and can address a single physical message between the two routers (sent to AllSPFRouters). A point-to-point link does not elect a designated router (DR) or a backup designated router (BDR).

Note

Unnumbered point-to-point interfaces are not supported.

OSPF Packets

All OSPF packets start with a 24-octet header that contains information about the OSPF version, the packet type and length, the ID of the router that transmits the packet, and the ID of the OSPF area that sends the packet. An OSPF packet is one of the following types:

- The router transmitted hello packets between neighbors and never forwards them. The Hello protocol requires routers to send hello packets to neighbors at predefined hello intervals. A neighbor router that does not receive a hello packet declares the other router dead.
- The router exchanges DD packets after neighboring routers establish a link, which synchronizes their LSDBs.
- Link-state request packets describe one or more link-state advertisements that a router requests from its neighbor. Routers send link-state requests if the information received in DD packets from a neighbor is not consistent with its own link-state database.

- Link-state update packets contain one or more LSAs and the router sends them following a change in network conditions.
- The router sends link-state acknowledgement packets to acknowledge receipt of link-state updates. Link-state acknowledgement packets contain the headers of the received LSAs.

Intra-area Link-state Advertisements

OSPF does not require each router to send its entire routing table to its neighbors. Instead, each OSPF router floods only link-state change information in the form of Link-state advertisements (LSA) throughout the area or Autonomot System (AS). LSAs in OSPF are one of the following five types:

- A router links advertisement is flooded only within the area and contains information about neighbor routers and the LANs to which the router attaches. A backbone router can flood router link advertisements within the backbone area.
- A DR on a LAN generates network links advertisement to list all routers on that LAN, and floods network links advertisements only within the area. A backbone DR can flood network links advertisements within the backbone area.
- An ABR floods a network summary link advertisement into an area and describes networks that are reachable outside the area. An ABR attached to two areas generates a different network summary link advertisement for each area. ABRs also generate area summary link advertisements that contain information about destinations within an area that are flooded to the backbone area.
- An ASBR summary link advertisement describes the cost of the path to an ASBR from the router that generates the advertisement.
- An ASBR sends an ASE link advertisement to describe the cost of the path to a destination outside the AS from the ASBR that generates the advertisement. This information is flooded to all routers in the AS.

OSPF and IP

OSPF runs over IP, which means that an OSPF packet transmits with an IP data packet header. The protocol field in the IP header is 89, which identifies it as an OSPF packet and distinguishes it from other packets that use an IP header.

An OSPF route advertisement expresses a destination as an IP address and a variable-length mask. Together, the address and the mask indicate the range of destinations to which the advertisement applies.

Because OSPF can specify a range of networks, it can send one summary advertisement that represents multiple destinations. For example, a summary advertisement for the destination 192.0.2.0 with a mask of 255.255.0.0 describes a single route to destinations 192.0.2.0 to 192.0.2.255.

ASE routes

OSPF considers the following routes as ASE routes:

- a route to a destination outside the AS
- a static route
- a default route
- a route derived by RIP
- a directly connected network that does not run OSPF

Dijkstras algorithm

A separate copy of the OSPF routing algorithm (Dijkstra's algorithm) runs in each area. Routers that connect to multiple areas run multiple copies of the algorithm. The sequence of processes governed by the routing algorithm is as follows:

1. After a router starts, it initializes the OSPF data structures, and then waits for indications from lower-level protocols that the router interfaces are functional.
2. A router then uses the Hello protocol to discover neighbors. On point-to-point and broadcast networks the router dynamically detects neighbors by sending hello packets to the multicast address AllSPFRouters. On Non-Broadcast Multiple Access (NBMA) networks, you must provide some configuration information to discover neighbors.
3. On all multiaccess networks (broadcast or nonbroadcast), the Hello protocol elects a designated router (DR) for the network.
4. The router attempts to form adjacencies with some of its neighbors. On multiaccess networks, the DR determines which routers become adjacent. This behavior does not occur if you configure a router as a passive interface because passive interfaces do not form adjacencies.
5. Adjacent neighbors synchronize their topological databases.
6. The router periodically advertises its link state, and does so after its local state changes. LSAs include information about adjacencies, enabling quick detection of dead routers on the network.
7. LSAs flood throughout the area to ensure that all routers in an area have an identical topological database.
8. From this database each router calculates a shortest-path tree, with itself as the root. This shortest-path tree in turn yields a routing table for the protocol.

OSPF Metrics

For OSPF, the best path to a destination is the path that offers the least-cost metric (least-cost delay). You can configure OSPF cost metrics to specify preferred paths. You can configure metric speed globally or for specific ports and interfaces on the network. In addition, you can control redistribution options between non OSPF interfaces and OSPF interfaces.

Assign default metric speeds for different port types, such as 10 Mb/s or 1 Mb/s ports. You can specify a new metric speed for an IP interface. An IP interface can be a brouter port or a VLAN.

OSPF virtual links

On an OSPF network, a switch that acts as an ABR must connect directly to the backbone. If no physical connection is available, you can automatically or manually configure a virtual link.

An automatic virtual link can provide redundancy support for critical network connections. Automatic virtual linking creates virtual paths for vital traffic paths in your OSPF network. If a connection fails on the network, such as after an interface cable that provides connection to the backbone (either directly or indirectly) disconnects from the switch, the virtual link is available to maintain connectivity.

Use automatic virtual linking to ensure that a link is created to another router. If automatic virtual linking uses more resources than you want to expend, creating a manual virtual link can be the better solution. Use this approach to conserve resources and control virtual links in the OSPF configuration.

On the switch, OSPF behavior follows OSPF standards; the router cannot learn OSPF routes through an ABR unless the ABR connects to the backbone or through a virtual link.

The following figure shows how to configure a virtual link between the ABR in area 2.2.2.2 and the ABR in area 0.0.0.0.

Figure 194: Virtual link between ABRs through a transit area

To configure a virtual link between the ABRs in area 1 and area 3, define area 2 as the transit area between the other two areas, and identify R2 as the neighbor router through which R2 must send information to reach the backbone through R1.

OSPF ASBRs

ASBRs advertise nonOSPF routes into OSPF domains so that they can pass through the OSPF routing domain. A router can function as an ASBR if one or more interfaces connects to a nonOSPF network, for example, RIP, BGP, or Exterior Gateway Protocol (EGP).

An ASBR imports external routes into the OSPF domain by using ASE LSAs (LSA type 5) originated by the ASBR.

ASE LSAs flood across area borders. When an ASBR imports external routes, it imports OSPF route information using external type 1 or type 2 metrics. The result is a four-level routing hierarchy, as shown in the following table, according to routing preference.

Table 218: ASBR routing hierarchy

Level	Description
1	Intra-area routing
2	Inter-area routing
3	External type 1 metrics
4	External type 2 metrics

The use of these metrics results in a routing preference from most preferred to least preferred of

- routing within an OSPF area
- routing within the OSPF domain
- routing within the OSPF domain and external routes with external type 1 metrics
- routing within the OSPF domain and external routes with external type 2 metrics

For example, an ASBR can import RIP routes into OSPF with external type 1 metrics. Another ASBR can import Internet routes and advertise a default route with an external type 2 metric. This results in RIP-imported routes that have a higher preference than the Internet-imported default routes. In reality, BGP Internet routes must use external type 2 metrics, whereas RIP imported routes must use external type 1 metrics.

Routes imported into OSPF as external type 1 are from IGP's whose external metric is comparable to OSPF metrics. With external type 1 metrics, OSPF adds the internal cost of the ASBR to the external metric. EGP's, whose metric is not comparable to OSPF metrics, use external type 2 metrics. External type 2 metrics use only the internal OSPF cost to the ASBR in the routing decision.

To conserve resources, you can limit the number of ASBRs in your network or specifically control which routers perform as ASBRs to control traffic flow.

Area link-state advertisements

The following table explains the seven LSA types exchanged between areas. LSAs share link-state information among routers. LSAs typically contain information about the

router and its neighbors. OSPF generates LSAs periodically to ensure connectivity or after a change in state of a router or link (that is, up or down).

Table 219: OSPF LSA types

LSA type	Description	Area of distribution
1	A router originates type 1 LSAs (router LSAs) to describe its set of active interfaces and neighbors.	Passed only within the same area
2	Type 2 LSAs (network LSAs) describe a network segment such as broadcast or NBMA. In a broadcast network, the DR originates network LSAs.	Passed only within the same area
3	The ABR originates type 3 LSAs (network-summary LSAs) to describe the networks within an area.	Passed between areas
4	Type 4 LSAs (ASBR-summary LSAs) advertise the location of the ASBRs from area to area.	Passed between areas
5	Type 5 LSAs (ASE LSAs) describe networks outside of the OSPF domain. The ASBR originates type 5 LSAs. In stub and NSSA areas, a single default route replaces type 5 LSA routes.	Passed between areas
6	Type 6 LSAs (group membership LSAs) identify the location of multicast group members in multicast OSPF.	Passed between areas
7	Type 7 LSAs import external routes in OSPF NSSAs.	Translated between areas

OSPF Security Mechanisms

The switch implementation of OSPF includes security mechanisms to prevent unauthorized routers from attacking the OSPF routing domain. These security mechanisms prevent a malicious person from joining an OSPF domain and advertising false information in the OSPF LSAs. Likewise, security prevents a misconfigured router from joining an OSPF domain.

Simple password

The simple password security mechanism is a simple-text password; only routers that contain the same authentication ID in their LSA headers can communicate with each other.

Do not use this security mechanism because the system stores the password in plain text. A user or system can read the password from the configuration file or from the LSA packet.

Message Digest 5

Message Digest 5 (MD5) for OSPF security provides standards-based (RFC1321) authentication using 128-bit encryption, usually expressed as a 32-digit hexadecimal

number. When you use MD5 for OSPF security, it is almost impossible for a malicious user to compute or extrapolate the decrypting codes from the OSPF packets.

If you use MD5, each OSPF packet has a message digest appended to it. The digest must match between the sending and receiving routers. Both the sending and receiving routers calculate the message digest based on the MD5 key and padding, and then compare the results. If the message digest computed at the sender and receiver does not match, the receiver rejects the packet.

Secure hash algorithm 1

The secure hash algorithm 1 (SHA-1) is a cryptographic hash function that uses 160-bit encryption, usually given in a 40 digit hexadecimal number. SHA-1 is one of the most widely used of the existing SHA hash functions and is more secure than MD5.

SHA-1 takes a variable length input message and SHA-1 creates a fixed length output message referred to as the hash, or message digest, of the original message. If you use SHA-1 with OSPF, each OSPF packet has a message digest appended to it.

The message digest or hash must match between the sending and receiving routers. If the message digest computed at the sender and receiver does not match, the receiver rejects the packet. The hash functions produce a type of checksum or summary of the input.

It is almost impossible to determine the original input message based on the output hash message.

A cryptographic hash function is fully defined and uses no secret key.

Secure hash algorithm 2

Secure hash algorithm 2 (SHA-2) is also a cryptographic hash function. SHA-2 updates SHA-1 and offers six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits message digest size values. Output size depends on the hash function, so, for instance, SHA-256 is 256 bits.

SHA-2 is more secure than SHA-1 and MD5.

SHA-2 works similarly to SHA-1, in that SHA-2 takes a variable length input message and creates a fixed length output message referred to as the hash, or message digest, of the original message. If you use SHA-2 with OSPF, each OSPF packet has a message digest appended to it. Among the differences in SHA-2 from SHA-1 are an increased bit encryption length.

Similarly with other hash functions, for SHA-2, the message digest or hash must match between the sending and receiving routers. If the message digest computed at the sender and receiver does not match, the receiver rejects the packet. The hash functions produce a type of checksum or summary of the input.

OSPFv3

OSPFv3, defined in RFC 2740 and updated by RFC 5340, extends OSPF to support IPv6 and introduces several protocol changes for IPv6 networks. In OSPFv3, IPv6 replaces the IPv4 concepts of subnets and networks with links; a link can carry multiple prefixes and allows nodes with different prefixes to communicate directly. OSPFv3 operates on each link rather than each subnet and uses IPv6 link-local addresses for most control traffic. OSPFv3 packets do not carry IPv6 addresses in their headers; instead, LSAs include all addressing information, while area IDs, link-state IDs, and router IDs remain 32-bit values. Routers identify OSPFv3 neighbors by Router ID and use additional fields such as interface ID and instance ID to support multiple OSPFv3 instances on the same link.

Flooding Scope

LSA flooding scope is generalized in OSPFv3 and coded in the LS type field of the LSA. The following three flooding scopes are available for LSAs:

- Link scope: The LSA is not flooded beyond the local link.
- Area scope: The LSA is flooded in a single OSPF area. Area scope is used in router LSAs, network LSAs, Inter-Area-Prefix-LSAs, Inter-Area-Router LSAs, and Intra-Area-Prefix-LSAs.
- AS scope: The LSA is flooded through the routing domain. AS scope is used for ASexternal-LSAs.

Link-local Addresses

IPv6 uses link-local addresses on a single link. Link-local addresses facilitate features such as neighbor discovery and autoconfiguration. Datagrams with link-local sources are not forwarded. Instead, routers assign link-local unicast addresses from the IPv6 address range.

OSPF for IPv6 does not assign link-local unicast addresses to physical segments attached to a router; it assumes that each router already has link-local unicast addresses assigned. The source for all OSPF packets sent on OSPF physical interfaces is the associated link-local unicast address. Routers learn link-local addresses for all other nodes on links. The nexthop information during packet forwarding includes the learned addresses.

OSPFv3 packets always use link-local addresses as the source and destination, except on a virtual link. All OSPFv3 packets sent over a virtual link use global addresses.

Link LSA is the only OSPF LSA type that includes link-local addresses. Link-local addresses must not be advertised in other LSA types.

Authentication

OSPFv3 for IPv6 requires the IP authentication header and the IP encapsulating security payload for authentication and security. OSPFv3 does not support the authentication feature from OSPFv2.

Packet Format

OSPFv3 runs directly over IPv6. All other addressing information is absent in OSPF packet headers. OSPFv3 is network-protocol-independent. LSA types contain addressing information.

OSPFv3 implements the following packet changes from OSPFv2:

- The hello packet and database description packet operations fields are expanded to 24 bits.
- The packet header does not include Authentication and AuType fields.
- The interface ID replaces the address information in the hello packet. The Interface ID becomes the network LSA link-state ID, if the router becomes the designated router on the link.
- Router-bit (R-bit) and V6-bit in the options field process router LSAs during Shortest Path First (SPF) calculation. R-bits and V6-bits determine participation in topology distribution. The V6-bit specializes the R-bit. If the V6-bit is clear, the OSPF speaker can participate in the OSPF topology distribution without forwarding IPv6 datagrams. If the R-bit is set and the V6-bit is clear, the OSPF speaker still does not forward IPv6 datagrams, but it can forward IPv4 datagrams.
- The packet header includes the instance ID, which allows multiple OSPF protocol instances on the same link.

R-bit

Unlike OSPF for IPv4, OSPFv3 for IPv6 supports the R-bit. The R-bit indicates whether the originating node is an active router. If the R-bit is cleared, routes that transit the advertising node cannot be calculated.

For example, if a multi-homed host participates in routing without forwarding non-locally-addressed packets, the R-bit is cleared.

An IPv6-enabled switch can continue to operate as an OSPFv3 neighbor even if you disable IPv6 forwarding on the switch. This behavior differs from IPv4 OSPF, in which the switch drops a neighbor, if IP forwarding on the neighbor is disabled.

If an OSPFv3 neighbor does not provide the R-bit in the Network Discovery (ND) packet, the system enables R-bit for every OSPFv3 neighbor with dependent routes to avoid neighbor deletion from inactivity. This IPv6 enhancement is to ensure an OSPFv3 neighbor without R-bit that experiences a timeout can trigger the Network Unreachability Detection (NUD) instead of being deleted.

Link LSAs

The link LSA uses link flooding scope, not flooded beyond the associated link.

Link LSAs have three purposes:

- to provide the link-local address of the router to all other nodes on the link
- to provide the list of IPv6 prefixes associated with the link
- to allow the router to associate options bits with the network LSA for the link

Intra-Area-Prefix LSA

The Intra-Area-Prefix-LSA carries all IPv6 prefix information. In IPv4, this information is in router LSAs and network LSAs.

Unknown LSA types

In OSPFv3, unknown LSA types are either stored and flooded as though understood or given link flooding scope. Specific behavior is coded in the LS type field of the header.

Link LSA Suppression

To decrease unnecessary link LSA generation and flooding for non-broadcast and non-NBMA interfaces, the Link LSA Suppression interface configuration parameter has been added in RFC 5340. If Link LSA Suppression is configured for an interface, and the interface type is not broadcast or NBMA, the originated link LSA may be suppressed. Link LSA suppression is disabled, by default. For more information on configuration see, [Configure OSPF on a Port or VLAN](#) on page 2837.

Stub Area

OSPFv3 retains the concept of stub areas, which minimize link-state databases and routing table sizes.

IPv6 stub areas carry only router LSAs, network LSAs, Inter-Area-Prefix-LSAs, link LSAs, and Intra-Area-Prefix-LSAs.

Unlike IPv4, IPv6 can store LSAs with unrecognized link-state (LS) types or flood them as though they are understood. Rules applied to the stub area prevent the excessive growth of the link-state database.

Deprecation of MOSPF for IPV6

OSPFv3 in RFC 5340 deprecates Multicast Extensions to OSPF (MOSPF) support, and its attendant protocol fields.

NSSA Specification

RFC 2740 partially specifies this protocol feature, the level of specification was insufficient to implement it. However, RFC 5340 includes an NSSA specification unique to OSPFv3. This specification coupled with NSSA provide sufficient specification for implementation. Current Infinity IPv6 OSPF has full support for NSSA feature and is consistent with the additional specifications in RFC 5340.

Stub Area Unknown LSA Flooding Restriction Deprecated

In RFC 2740, flooding of unknown LSA was restricted within stub and NSSA areas. Following were the restrictions:

- Unlike IPv4, in IPv6 you can label unrecognized LS types as "Store and flood the LSA, as if type understood". Uncontrolled introduction of such LSAs could cause a stub area's link-state database to grow larger than its component router's capacities
- To guard against this situation, the following rule regarding stub areas has been established:

An LSA whose LS type is unrecognized can be flooded only into a stub area, if both the LSAs have area or link-local flooding scope, and the LSA has U-bit set to 0

Now these restrictions have been deprecated. OSPFv3 routers flood link and area scope LSAs whose LS type is unrecognized and U-bit is set to 1 throughout stub and NSSA areas. The only backward compatibility issue is that the OSPFv3 routers still supporting the restrictions may not propagate newly defined LSA types.

LSA Options and Prefix Options Updates

The LSA Options and Prefix Options fields have been updated to reflect recent protocol additions. Specifically, bits related to MOSPF have been deprecated, Options field bits common with OSPFv2 have been reserved, and the DN-bit has been added to the prefix- options.

IPv6 Site-Local Address

All references to IPv6 site-local addresses have been removed in RFC 5340. Infinity IPv6 OSPF does not contain any reference to IPv6 site-local addresses and is already compliant with RFC 5340 for this.

IPsec Support with OSPFv3

You can use Internet Protocol Security (IPsec) with OSPFv3 virtual link for the security protection of communication between the end points. You can also use IPsec with OSPFv3 on a brouter port or VLAN interface, for example, if you want to encrypt OSPFv3 control traffic on a broadcast network.

OSPF virtual link provides connectivity to the OSPF backbone area for redundancy or to provide a virtual link if a physical connection is not possible.

Because the device does not know the IPv6 addresses of the OSPFv3 virtual link end points at the time of configuration, you cannot manually configure the security policy ahead of time. The system must self-manage its security policy dynamically. The device also dynamically manages the IPsec enable flag, which the virtual link uses on a Layer 2 interface, either a VLAN or brouter port interface.

The following events can trigger an IPsec policy activation:

1. An OSPFv3 routing module detects the establishment of a virtual link.
2. IPsec is enabled on the already established virtual link.

On the other hand, the following two events can dynamically trigger an IPsec policy deactivation:

1. The virtual link is turn down.
2. IPsec is disabled on the virtual link.

IPsec policies can also change dynamically if a neighbor address or a local address changes.

You can enable IPsec support for IPv6 OSPF virtual link at the system level through CLI. You must disable IPsec before you can perform virtual link policy configuration changes.

Until you enable IPsec on both sides of the virtual links, the links cannot exchange OSPFv3 control messages, and the system drops OSPFv3 exchange packets.

You can configure the direction you want IPsec to protect, either, ingress, egress, or both. In addition, you can permit or drop communication for the OSPF virtual link.

You can also use IPsec with OSPFv3 on a router port or VLAN interface. For a full configuration example, see [OSPFv3 IPsec configuration example](#) on page 2085 and [OSPFv3 virtual link IPsec configuration example](#) on page 2092.

OSPF and Route Redistribution

Redistribution imports routes from one protocol to another. Redistribution sends route updates for a protocol-based route through another protocol. For example, if OSPF routes exist in a router and they must travel through a BGP network, then configure redistribution of OSPF routes through BGP. This configuration sends OSPF routes to a router that uses BGP.

You can redistribute routes

- on an interface basis
- on a global basis between protocols on a single VRF instance (intraVRF)
- between the same or different protocols on different VRF instances (interVRF)

To configure interface-based redistribution, configure a route policy, and then apply it to the interface. Configure the match parameter to the protocol from which to learn routes.

Use the **ip ospf redistribute** command to accomplish the (intraVRF) redistribution of routes through OSPF, so that OSPF redistribution occurs globally on all OSPF-

enabled interfaces. This redistribution does not require a route policy, but you can use one for more control.

**Note**

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

OSPF Route Redistribution and DvR

DvR Controllers redistribute routes (direct routes, static routes and the default route) into the DvR domain. You can configure redistribution of DvR host routes into OSPF.

Tagged Routes

You can enable route filtering to ensure tagged IS-IS routes are not redistributed into OSPF. For more information, see [IS-IS Route Tagging](#) on page 1200.

ECMP with OSPFv3

The ECMP feature supports and complements OSPFv3 protocol.

With Equal Cost Multipath (ECMP), you can use multiple paths for load sharing of traffic. These multiple paths allow faster convergence to other active paths in case of network failure. By maximizing load sharing among equal-cost paths, you can use your links between routers more efficiently when sending IP and IPv6 traffic. Equal Cost Multipath is formed using routes from the same protocol.

**Note**

To add OSPFv3 equal cost paths in the routing table, you must first enable IPv6 ECMP feature globally.

For scaling information on the ECMP paths supported per destination prefix, see *Fabric Engine Release Notes*.

OSPFv3 and Route Redistribution

Redistribution imports routes from one protocol to another. Redistribution sends route updates for a protocol-based route through another protocol. For example, if OSPFv3 routes exist in a router and they must travel through a BGP network, then configure

redistribution of OSPFv3 routes through BGP. This configuration sends OSPFv3 routes to a router that uses BGP.

You can redistribute routes on a global basis between protocols on a single VRF instance (intraVRF).

Use the **ipv6 ospf redistribute** command to accomplish the (intraVRF) redistribution of routes through OSPF, so that OSPF redistribution occurs globally on all OSPF-enabled interfaces. This redistribution does not require a route policy, but you can use one for more control.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For a redistribute policy (OSPFv3) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

OSPFv3 Support for CLIP Interfaces

You can configure the Open Shortest Path First Version 3 (OSPFv3) instance on circuitless IP (CLIP) interfaces for the Global Router or a specific Virtual Router Forwarding (VRF) instance. The switch supports a maximum of 64 OSPFv3 CLIP interfaces.

The CLIP interfaces are virtual interfaces and are not associated with the physical ports on the switch. The system considers the OSPFv3 CLIP instances as passive and the system copies the IPv6 address associated with the OSPFv3 instance into the intra-area-prefix-LSA. You must follow a two-step configuration to create an OSPFv3 instance on the CLIP interface and enable the instance, for the system to send the intra-area-prefix-LSA of the OSPFv3 instance to the neighbors. For more information, see [Configure OSPFv3 on the CLIP Interface for the Global Router](#) on page 2843 and [Configure OSPFv3 on the CLIP Interface for a VRF Instance](#) on page 2844 for CLI or [Configure OSPFv3 on a CLIP Interface](#) on page 2906. for EDM.

OSPF Graceful Restart

In many OSPF networks, OSPF routers remove a restarting OSPF router from the network topology, if the router is restarted. This action causes all OSPF routers to re-converge and route around the restarting router. The OSPF Graceful Restart feature is an OSPF enhancement to allow an OSPF router to stay on the forwarding path when the software is restarting.

This feature is documented under RFC 3623 for OSPFv2 (IPv4) and RFC 5187 for OSPFv3 (IPv6). The switch software supports only helper mode for both OSPFv2 and OSPFv3 protocols.

Helper Mode

Helper mode is a part of the OSPF Graceful restart feature. Helper mode uses the OSPF routers to help other OSPF routers on the network stay on the forwarding path while the software is restarting. The OSPF router sends a type of LSA called a GRACE-LSA to inform the other OSPF routers that it is restarting the software. When an OSPF router receives a GRACE-LSA from a neighbor OSPF Router, it enters the Helper mode for that neighbor on that network. An OSPF router supports Helper mode by default.

Operations of Helper Mode

The following section describes the operations in the Helper mode:

- Entering Helper mode — An OSPF router enters the Helper mode provided the following conditions are true:
 - The router is fully adjacent with the neighbor already.
 - No changes have been made in the LSDB since the neighbor router started.
 - The grace period has not expired.
 - Local policy configured parameters allow it to help the neighbor.
 - The router is not in the process of restarting itself.

The OSPF router does not help the neighbor if the preceding conditions are not met.

If the OSPF router is already helping a neighbor, and receives another GRACE-LSA from the neighbor, it accepts the latest GRACE-LSA, and updates the grace period accordingly. The OSPF router in Helper mode continues to advertise its LSAs like the neighbor it is helping is still full, until any changes are made on the network during the grace period.

- Exiting Helper mode — An OSPF router exits the Helper mode, under the following conditions:
 - The GRACE-LSA is flushed. It means graceful restart has successfully terminated.
 - The GRACE-LSA's grace period expires.
 - There is a network topology change.

When an OSPF router exits Helper mode, the following actions occur:

- It recalculates the DR for the network.
- It re-originates its router LSA.
- If it is the DR, it re-originates the network LSA for the network.
- If it is a virtual link, it re-originates the router LSA for the virtual link transit area.

OSPF Configuration Considerations

This section describes considerations to keep in mind as you configure OSPF.

OSPF host route advertisements and nonbackbone areas

The switch does not associate a host route with a specific area. Therefore, if you create a host route in a nonbackbone area, nonbackbone (nonOSPF core) areas do not advertise it.

For example, in an OSPF network with multiple areas, including areas not adjacent to the core, which use virtual links, a host route on a router that belongs to a nonOSPF core area is not advertised on noncore routers.

To ensure host route advertisement, disable and enable OSPF on the noncore routers.

OSPF with switch clustering

If the network loses the DR, the BDR immediately becomes the new DR on the broadcast segment. After OSPF elects the new DR, all routers perform an SPF run and issue new LSAs for the segment. The new DR generates a new network LSA for the segment and every router on the segment must refresh the router LSA.

Each router performs the SPF run as soon as it detects a new DR. Depending on the speed of the router, the router can perform the SPF run before it receives the new LSAs for the segments, which requires a second SPF run to update and continue routing across the segment. The OSPF hold-down timer does not permit two consecutive SPF runs within the value of the timer. This limitation can lead to traffic interruption of up to 10 seconds.

In a classical OSPF routed design, this situation never causes a problem because OSPF runs over multiple segments so even if a segment is not usable, routes are recalculated over alternative segments. Typical Routed Split MultiLink Trunking (RSMLT) designs only deploy a single OSPF routed vlan, which constitutes a single segment.

You can use RSMLT in a configuration with dual core VLANs to minimize traffic interruption when the network loses the DR. This configuration creates a second OSPF core VLAN, forcing different nodes to become the DR for each VLAN. Each OSPF core VLAN has a DR (priority of 100) and no BDRs. This configuration does not require a BDR because the two VLANs provide backup for each other from a routing perspective. See the following figure for a network example.

Figure 195: RSMLT with dual core VLANs

Open Shortest Path First guidelines

Use OSPF to ensure that the switch can communicate with other OSPF routers. This section describes some general design considerations and presents a number of design scenarios for OSPF.

OSPF LSA limits

To determine OSPF link-state advertisement (LSA) limits:

1. Use the command **show ip ospf area** to determine the LSA_CNT and to obtain the number of LSAs for a given area.
2. Use the following formula to determine the number of areas. Ensure the total is less than 16,000 (16K):

$$\sum Adj_N * LSA_CNT_N < 16k$$

$N = 1$ to the number of areas for each switch

Adj_N = number of adjacencies for each Area N

LSA_CNT_N = number of LSAs for each Area N

For example, assume that a switch has a configuration of three areas with a total of 18 adjacencies and 1000 routes. This includes:

- 3 adjacencies with an LSA_CNT of 500 (Area 1)
- 10 adjacencies with an LSA_CNT of 1000 (Area 2)
- 5 adjacencies with an LSA_CNT of 200 (Area 3)

Calculate the number as follows:

$$3*500+10*1000+5*200=12.5K < 16K$$

This configuration ensures that the switch operates within accepted scalability limits.

OSPF design guidelines

Follow these additional OSPF guidelines:

- OSPF timers must be consistent across the entire network.
- Use OSPF area summarization to reduce routing table sizes.
- Use OSPF passive interfaces to reduce the number of active neighbor adjacencies.
- Use OSPF active interfaces only on intended route paths.

Configure wiring-closet subnets as OSPF passive interfaces unless they form a legitimate routing path for other routes.

- Minimize the number of OSPF areas for each switch to avoid excessive shortest-path calculations.

The switch executes the Dijkstra algorithm for each area separately.

- Ensure that the OSPF dead interval is at least four times the OSPF hello-interval.
- Use MD5 authentication on untrusted OSPF links.
- Use stub or NSSAs as much as possible to reduce CPU overhead.

OSPF and CPU utilization

After you create an OSPF area route summary on an area border router, the summary route can attract traffic to the area border router for which the router does not have a specific destination route. Enabling ICMP unreachable-message generation on the switch can result in a high CPU utilization rate.

To avoid high CPU utilization, use a discard static route configuration. The discard static route is a route (equal to the OSPF summary route) with a next hop of 255.255.255.255. This configuration ensures that all traffic that does not have a specific next-hop destination route is dropped.

OSPF network design examples

You can use OSPF routing in the core of a network.

The following figure describes a simple implementation of an OSPF network: enabling OSPF on two switches (S1 and S2) that are in the same subnet in one OSPF area.

Figure 196: Example 1: OSPF on one subnet in one area

The routers in the preceding figure use the following configuration:

- S1 has an OSPF router ID of 1.1.1.1, and the OSPF port uses an IP address of 192.0.2.1.
- S2 has an OSPF router ID of 1.1.1.2, and the OSPF port uses an IP address of 192.0.2.2.

The general method to configure OSPF on each routing switch is:

1. Enable OSPF globally.
2. Enable IP forwarding on the switch.
3. Configure the IP address, subnet mask, and VLAN ID for the port.
4. Disable RIP on the port, if you do not need it.
5. Enable OSPF for the port.

After you configure S2, the two switches elect a designated router and a backup designated router. They exchange hello packets to synchronize their link state databases.

The following figure shows a configuration in which OSPF operates on three switches. OSPF performs routing on two subnets in one OSPF area. In this example, S1 directly connects to S2, and S3 directly connects to S2, but traffic between S1 and S3 is indirect, and passes through S2.

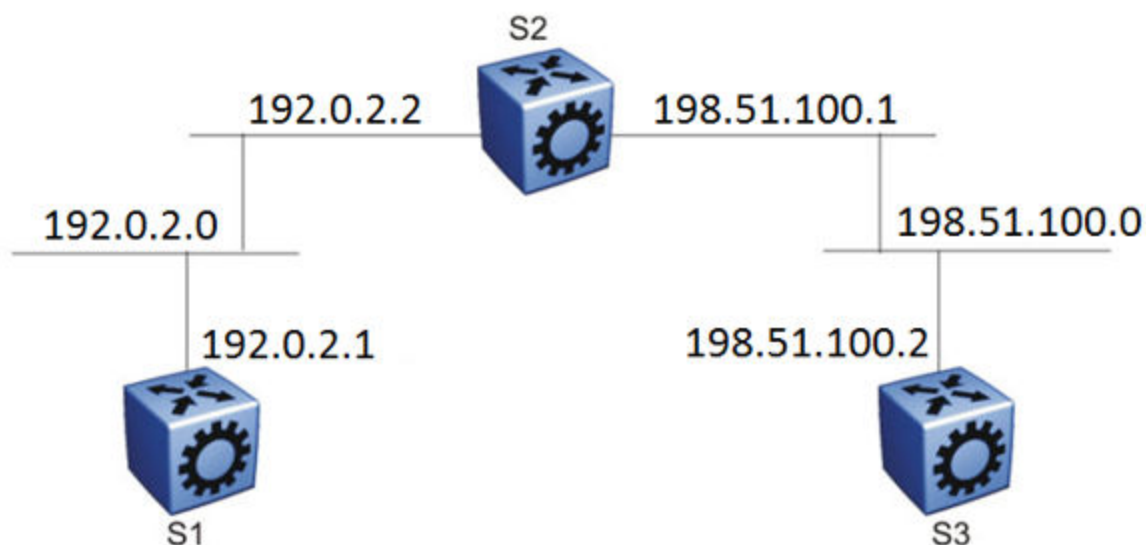

Figure 197: Example 2: OSPF on two subnets in one area

The routers in example 2 use the following configuration:

- S1 has an OSPF router ID of 1.1.1.1, and the OSPF port uses an IP address of 192.0.2.1.
- S2 has an OSPF router ID of 1.1.1.2, and two OSPF ports use IP addresses of 192.0.2.2 and 198.51.100.1.
- S3 has an OSPF router ID of 1.1.1.3, and the OSPF port uses an IP address of 198.51.100.2.

The general method to configure OSPF on each routing switch is:

1. Enable OSPF globally.
2. Insert IP addresses, subnet masks, and VLAN IDs for the OSPF ports on S1 and S3, and for the two OSPF ports on S2. The two ports on S2 enable routing and establish the IP addresses related to the two networks.
3. Enable OSPF for each OSPF port allocated with an IP address.

After you configure all three switches for OSPF, they elect a designated router and a backup designated router for each subnet and exchange hello packets to synchronize their link-state databases.

The following figure shows an example where OSPF operates on two subnets in two OSPF areas. S2 becomes the area border router for both networks.

Figure 198: Example 3: OSPF on two subnets in two areas

The routers in scenario 3 use the following configuration:

- S1 has an OSPF router ID of 1.1.1.1. The OSPF port uses an IP address of 192.0.2.1, which is in OSPF area 1.
- S2 has an OSPF router ID of 1.1.1.2. One port uses an IP address of 192.0.2.2, which is in OSPF area 1. The second OSPF port on S2 uses an IP address of 198.51.100.1, which is in OSPF area 2.
- S3 has an OSPF router ID of 1.1.1.3. The OSPF port uses an IP address of 198.51.100.2, which is in OSPF area 2.

The general method to configure OSPF for this three-switch network is:

1. On all three switches, enable OSPF globally.
2. Configure OSPF on one network.

On S1, insert the IP address, subnet mask, and VLAN ID for the OSPF port. Enable OSPF on the port. On S2, insert the IP address, subnet mask, and VLAN ID for the OSPF port in area 1, and enable OSPF on the port. Both routable ports belong to the same network. Therefore, by default, both ports are in the same area.

3. Configure three OSPF areas for the network.
4. Configure OSPF on two additional ports in a second subnet.

Configure additional ports and verify that IP forwarding is enabled for each switch to ensure that routing can occur. On S2, insert the IP address, subnet mask, and VLAN ID for the OSPF port in area 2, and enable OSPF on the port. On S3, insert the IP address, subnet mask, and VLAN ID for the OSPF port, and enable OSPF on the port.

The three switches exchange hello packets.

In an environment with a mix of switches and routers from different vendors, you may need to manually modify the OSPF parameter `RtrDeadInterval` to 40 seconds.

OSPFv3 Configuration Example

This section shows an example of OSPFv3 configuration. The following figure shows the network.

Figure 199: OSPFv3 configuration

To complete the configuration, you must perform the following actions:

- Configure an IPv6 VLAN (VLAN 2) with port member 1/1.
- Configure an IPv6 brouter port (1/2).
- Use IPv6 address 2001:100:102::/64.

Configure VLAN 2 and add port members.

```
vlan create 2 type port-mstprstp 0
vlan mlt 2 4
vlan members 2 1/1 portmember
interface vlan 2
ipv6 interface
ipv6 interface enable
ipv6 interface address 2001:100:102:202:0:0:0:1/64
exit
```

Enable OSPFv3 on VLAN 2.

```
# IPV6 OSPF VLAN CONFIGURATION
interface vlan 2
ipv6 ospf area 0.0.0.0
ipv6 ospf poll-interval 0
ipv6 ospf enable
exit
```

Create brouter port 1/2 with IPv6 and OSPFv3.

```
interface gigabitethernet 1/2
ipv6 interface vlan 3999
ipv6 interface enable
ipv6 interface address 2001:100:102:201:0:0:0:1/64
ipv6 ospf area 0.0.0.0
ipv6 ospf enable
exit
```

Verification

The following example shows the Global Router example for OSPFv3 Area configuration:

```
Switch:1#show ipv6 ospf area
```

```
=====
OSPF Area - GlobalRouter
```

```

=====

```

OSPF configuration using CLI

Configure Open Shortest Path First (OSPF) so that the switch can use OSPF routing to communicate with other OSPF routers and to participate in OSPF routing.

Configure OSPF Globally

Configure OSPF parameters on the switch so that you can control OSPF behavior on the system. The switch uses global parameters to communicate with other OSPF routers. Globally configure OSPF before you configure OSPF for an interface, port, or VLAN.

Before You Begin

- Ensure that the switch has an IP interface.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf** to commands. Not all parameters are configurable on non0 VRFs.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```

2. Configure the OSPF router ID:

```
router-id {A.B.C.D}
```

3. Configure the router as an autonomous system boundary router (ASBR):

```
as-boundary-router enable
```

Note

Configure the following steps as and when needed.

4. Enable the automatic creation of OSPF virtual links:

```
auto-vlink
```

5. Configure the OSPF default metrics:

```
default-cost {ethernet|fast-ethernet|forty-gig-ethernet|gig-ethernet|
hundred-gig-ethernet|ten-gig-ethernet|twentyfive-gig-ethernet}
<1-65535>]

default-cost vlan <1-65535>]
```

6. Configure the OSPF hold-down timer value:

```
timers basic holddown <3-60>
```

7. Enable the RFC1583 compatibility mode:

```
rfc1583-compatibility enable
```

8. Enable the router to issue OSPF traps:

```
trap enable
```

9. Verify the OSPF configuration:

```
show ip ospf [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

10. Exit OSPF Router Configuration mode:

```
exit
```

You return to Global Configuration mode.

11. Enable OSPF for the switch:

```
router ospf enable
```

Example

Configure the OSPF router ID to 192.0.2.2, enable the automatic creation of OSPF virtual links, and enable traps. Configure the default cost metric for Ethernet to 101,

for fast Ethernet to 110, and for gig-Ethernet, ten-gig-Ethernet, twentyfive-gig-ethernet, forty-gig-Ethernet, and hundred-gig-ethernet to 20, and vlan to 1. Configure the basic holddown to 10. Enable OSPF for the switch, and review the configuration.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#router-id 192.0.2.2
Switch:1(config-ospf)#auto-vlink
Switch:1(config-ospf)#default-cost ethernet 101
Switch:1(config-ospf)#default-cost fast-ethernet 110
Switch:1(config-ospf)#default-cost gig-ethernet 20
Switch:1(config-ospf)#default-cost ten-gig-ethernet 20
Switch:1(config-ospf)#default-cost twentyfive-gig-ethernet 20
Switch:1(config-ospf)#default-cost Forty-gig-ethernet 20
Switch:1(config-ospf)#default-cost hundred-gig-ethernet 20
Switch:1(config-ospf)#default-cost vlan 2
Switch:1(config-ospf)#timers basic holddown 10
Switch:1(config-ospf)#trap enable
Switch:1(config-ospf)#exit
Switch:1(config)#router ospf enable
Switch:1(config)#show ip ospf
```

```

Variable definitions

The following table defines parameters for the **router-id** command.

Variable	Value
<A.B.C.D>	Configures the OSPF router ID IP address, where A.B.C.D is the IP address.

The following table defines parameters for the **default-cost** command.

Variable	Value
<i>ethernet</i> <1-65535>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>ethernet</i> is for 10 Mb/s Ethernet (default is 100).
<i>fast-ethernet</i> <1-65535>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>fast-ethernet</i> is for 100 Mb/s (Fast) Ethernet (default is 10).
<i>forty-gig-ethernet</i> <1-65535>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>forty-gig-ethernet</i> is for 40 Gigabit Ethernet (default is 1).
<i>gig-ethernet</i> <1-65535>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>gig-ethernet</i> is for Gigabit Ethernet (default is 1).
<i>hundred-gig-ethernet</i> <1-65535>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>hundred-gig-ethernet</i> is for 100 Gigabit Ethernet (default is 1).
<i>ten-gig-ethernet</i> <1-65535>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>ten-gig-ethernet</i> is for 10 Gigabit Ethernet (default is 1).
<i>twentyfive-gig-ethernet</i> <1-65535>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. On a channelized 100 Gbps port, the default-cost for each 25 Gbps channel is 1.
<i>vlan</i> <1-65535>	Configures the OSPF default metrics. <i>vlan</i> is for Vlan interfaces (default is 10).

The following table defines parameters for the **timers basic holddown** command.

Variable	Value
<3-60>	Configures the OSPF hold-down timer value in seconds. The default is 10.

The following table defines parameters for the **show ip ospf** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies a VRF by name.
<code>vrfids WORD<0-512></code>	Specifies a range of VRF IDs.

Configure OSPF for a Port or VLAN

Configure OSPF parameters on a port or VLAN so you can control OSPF behavior on the port or VLAN.

Before You Begin

- Enable OSPF globally.
- Ensure IP interfaces exist.

About This Task

To configure OSPF on a VRF instance for a port or VLAN, you configure OSPF on the port or VLAN, and then associate the port or VLAN with the VRF.

Important

When you enable OSPF on a VLAN or a port, the switch automatically creates an area 0.0.0.0, and advertises it on the specific VLAN or port, by default. To avoid this behavior, you must manually configure the VLAN or port into a properly configured area on the switch.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the OSPF interface area ID:

```
ip ospf area {A.B.C.D}
```

3. Enable OSPF routing:

```
ip ospf enable
```

4. Choose the OSPF update authentication method:

```
ip ospf authentication-type <message-digest|none|sha-1|sha-2|simple>
```

Both sides of an OSPF connection must use the same authentication type and key.

5. If you choose simple, you must configure the password.

```
ip ospf authentication-key WORD<0-8>
```

6. If you choose an authentication key other than simple such as MD5, Sha-1 or Sha-2, you must configure the digest key first and then assign it to the authentication type.

- a. Create the digest-key:

```
ip ospf digest-key <1-255> key WORD<0-16>
```

- b. Assign the newly created digest key to the authentication type:

```
ip ospf authentication-type <message-digest|none|sha-1|sha-2|simple>
primary-digest-key <1-255>
```

7. Specify the interface type:

```
ip ospf network <broadcast|nbma|passive|p2p>
```

8. Configure the remaining parameters as required, or accept their default values. View the following variable definitions table for more information.

Example

Configure the OSPF interface area ID to 192.0.2.2, enable OSPF routing, choose the OSPF update authentication method as message-digest, and specify the interface type as broadcast.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 1
Switch:1(config-if)#ip ospf area 192.0.2.2
Switch:1(config-if)#ip ospf enable
Switch:1(config-if)#ip ospf authentication-type message-digest
Switch:1(config-if)#ip ospf network broadcast
```

Variable Definitions

The following table defines parameters for the **ip ospf** commands.

Variable	Value
<i>advertise-when-down</i> <i>enable</i>	Enables or disables AdvertiseWhenDown. If enabled, OSPF advertises the network on this interface as up, even if the port is down. The default is disabled. After you configure a port with no link and enable advertise-when-down, OSPF does not advertise the route until the port is active. OSPF advertises the route even when the link is down. To disable advertising based on link status, you must disable this parameter.
<i>area {A.B.C.D}</i>	Configures the OSPF identification number for the area, typically formatted as an IP address.
<i>authentication-key</i> <i>WORD<0-8></i>	Configures the eight-character simple password authentication key for the port or VLAN.

Variable	Value
<i>authentication-type</i> <message-digest none sha-1 sha-2 simple>	<p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha-1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note: SHA-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
<i>bfd</i>	Enable Bidirectional Forwarding Detection (BFD) at the OSPF application level. The default is disabled.
<i>cost</i> <0-65535>	Configures the OSPF cost associated with this interface and advertised in router link advertisements. The default is 0.
<i>dead-interval</i> <0-2147483647>	Configures the router OSPF dead interval, which is the number of seconds the OSPF neighbors of a switch must wait before they assume the OSPF router is down. The default is 40. The value must be at least four times the hello interval.
<i>enable</i>	Enables OSPF on the port or VLAN.
<i>hello-interval</i> <1-65535>	Configures the OSPF hello interval, which is the number of seconds between hello packets sent on this interface. The default is 10.

Variable	Value
<i>message-digest-key</i> <1-255> md5 WORD<0-16>	<p>Configures the MD5 key. You can configure a maximum of two MD5 keys for an interface.</p> <p>If you configure two keys, the interface uses only the first key. To transition to the second key, configure a <i>primary-md5-key</i> to use the ID of the second configured key, and then delete the first key.</p> <p>Important: Use the correct key id when two keys are configured. The key id and md5 password must match with the other OSPF routers, to form the OSPF adjacencies.</p> <p><1-255> is the ID for the MD5 key WORD<0-16> is an alphanumeric password of up to 16 bytes {string length 0-16}</p>
<i>primary-digest-key</i> <1-255>	<p>Use this parameter to transition to a new MD5 key. The new MD5 key changes the primary key used to encrypt outgoing packets.</p> <p><1-255> is the ID for the new MD5 key.</p>
<i>mtu-ignore enable</i>	Enables maximum transmission unit (MTU) ignore. To allow the switch to accept OSPF database description (DD) packets with a different MTU size, enable mtu-ignore. The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes.
<i>network</i> <broadcast nbma passive p2p>	Specifies the type of OSPF interface.
<i>poll-interval</i> <0-2147483647>	Configures the OSPF poll interval in seconds. The default is 120.
<i>priority</i> <0-255>	Configures the OSPF priority for the port during the election process for the designated router. The port with the highest priority number is the best candidate for the designated router. If you configure the priority to 0, the port cannot become either the designated router or a backup designated router. The default is 1.
<i>retransmit-interval</i> <0-3600>	Configures the retransmit interval for the virtual interface, which is the number of seconds between link-state advertisement retransmissions.

Variable	Value
<code>transit-delay <0-3600></code>	Configures the transit delay for the virtual interface, which is the estimated number of seconds required to transmit a link-state update over the interface.
<code><1-4059></code>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This variable applies only to VLAN interfaces, not to ports.

View OSPF Errors on a Port

Check OSPF errors for administrative and troubleshooting purposes.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display extended information about OSPF errors for the specified port or for all ports:
show ip ospf port-error [port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]] [vrf WORD<1-16>] [vrfids WORD<0-512>]

Variable definitions

The following table defines parameters for the **show ip ospf port-error** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}</code>	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<code>vrf WORD<1-16></code>	Specifies the VRF by name.
<code>vrfids WORD<0-512></code>	Specifies a range of VRFs by ID number.

Configure OSPF Areas on the Router

Import information from other areas to learn their OSPF relationships. Perform this procedure to create normal, stubby, or not-so-stubby areas (NSSA).

Before You Begin

- Ensure that the VLAN exists if you configure OSPF on a VLAN.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

About This Task

Place stubby or NSSAs at the edge of an OSPF routing domain. Ensure that you configure all routers in a stubby or NSSA as stubby or NSSA, respectively.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```
2. Create an OSPF area:

```
area {A.B.C.D}
```
3. Specify the area type:

```
area {A.B.C.D} import <external|noexternal|nssa>
```
4. Configure other OSPF area parameters as required.
5. Ensure that the configuration is correct:

```
show ip ospf area [vrf WORD<1-16>] [vrfsids WORD<0-255>]
```

Example

Create the OSPF area 192.0.2.10, and specify the area type as NSSA. Configure the area support to import summary advertisements into a stub area and configure the import external option for this area as stub. Ensure the configuration is correct.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#area 192.0.2.10
Switch:1(config-ospf)#area 192.0.2.10 import nssa
Switch:1(config-ospf)#area 192.0.2.10 import stub
Switch:1(config-ospf)#area 192.0.2.10 import-summaries enable
Switch:1(config-ospf)#show ip ospf area
```

OSPF Area - GlobalRouter								
AREA_ID	STUB_AREA	NSSA	IMPORT_SUM	ACTIVE_IFCNT	NSSA_TRANSLATOR	NSSA_TRANSLATOR	NSSA_TRANSLATOR	NSSA_TRANSLATOR
TRANSLATOR					ROLE	STATE	STABILITY_INTERVAL	EVENTS

0.0.0.0	false	false	true	0	candidate	disabled	40	0
STUB_COST	INTRA_AREA_SPF_RUNS	BDR_RTR_CNT	ASBDR_RTR_CNT	LSA_CNT	LSACK_SUM			
-								
0	0	0	0	0	0			

Variable Definitions

The following table defines parameters for the **area {A.B.C.D}** command.

Variable	Value
<i>default-cost</i> <0-16777215>	Specifies the stub area default metric for this stub area, which is the cost from 0-16777215. This metric value applies at the indicated type of service.
<i>import</i> <external noexternal nssa>	Specifies the type of area: <ul style="list-style-type: none"> external—stub and NSSA are both false noexternal—configures the area as stub area. nssa—configures the area as NSSA.
<i>import-summaries enable</i>	Configures the area support to import summary advertisements into a stub area. Use this variable only if the area is a stub area.
<i>stub</i>	Configures the import external option for this area as stub. A stub area has only one exit point (router interface) from the area.

The following table defines parameters for the **show ip ospf area** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies a VRF.
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

View the OSPF Area Information

View the OSPF area information.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the OSPF area information:
show ip ospf area [vrf WORD<1-16>] [vrfids WORD<0-512>]

Example

View the OSPF area information:

```
Switch:1>enable
Switch:1#show ip ospf area
```

OSPF Area - GlobalRouter									
AREA_ID	STUB_AREA	NSSA	IMPORT_SUM	ACTIVE_IFCNT	NSSA TRANSLATOR ROLE	NSSA TRANSLATOR STATE	NSSA TRANSLATOR STABILITY INTERVAL	NSSA TRANSLATOR EVENTS	

0.0.0.0	false	false	true	0	candidate	disabled	40	0
STUB_COST	INTRA_AREA_SPF_RUNS	BDR_RTR_CNT	ASBDR_RTR_CNT	LSA_CNT	LSACK_SUM			
0	0	0	0	0	0			

Variable definitions

The following table defines parameters for the **show ip ospf area** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies a VRF by name.
<code>vrfids WORD<0-512></code>	Specifies a range of VRF IDs.

Configure OSPF Aggregate Area Ranges on the Router

Use aggregate area ranges to reduce the number of link-state advertisements required within the area. You can also control advertisements.

Before You Begin

- Enable OSPF globally.
- Ensure that an area exists.
- You configure OSPF area ranges on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```
2. Configure an OSPF area range:

```
area range {A.B.C.D} {A.B.C.D/X} <summary-link|nssa-extlink>
```
3. Configure the advertised metric cost:

```
area range {A.B.C.D} {A.B.C.D/X} <summary-link|nssa-extlink>
advertise-metric <0-65535>
```
4. Configure the advertisement mode:

```
area range {A.B.C.D} {A.B.C.D/X} <summary-link|nssa-extlink>
advertise-mode <summarize|suppress|no-summarize>
```
5. Ensure that the configuration is correct:

```
show ip ospf area-range [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Example

Configure an OSPF area range to 192.0.2.2, configure the advertised metric cost to 10, and the advertisement mode to summarize.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)# area range 192.0.2.2 255.255.255.0/32 summary-link
Switch:1(config-ospf)# area range 192.0.2.2 255.255.255.0/32 summary-link advertise-
metric 10
Switch:1(config-ospf)# area range 192.0.2.2 255.255.255.0/32 summary-link advertise-mode
summarize
```

Variable definitions

The following table defines parameters for the **area range** command.

Variable	Value
<i>{A.B.C.D}</i> <i>{A.B.C.D/X}</i>	<i>{A.B.C.D}</i> identifies an OSPF area and <i>{A.B.C.D/X}</i> is the IP address and subnet mask of the range, respectively.
<i>advertise-metric</i> <i><0-65535></i>	Changes the advertised metric cost of the OSPF area range.
<i>advertise-mode</i> <i><summarize suppress no-summarize></i>	Changes the advertisement mode of the range.
<i><summary-link nssa-extlink></i>	Specifies the link-state advertisement (LSA) type. If you configure the range as type nssa-extlink, you cannot configure the advertise-metric.

The following table defines parameters for the **show ip ospf area-range** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies a VRF by name.
<i>vrfids WORD<0-512></i>	Specifies a range of VRF IDs.

View the OSPF Area Range Information

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the OSPF area range information:
show ip ospf area-range [vrf WORD<1-16>] [vrfids WORD<0-512>]

Variable definitions

The following table defines parameters for the **ip ospf area-range** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies a VRF by name.
<code>vrfids WORD<0-512></code>	Specifies a range of VRF IDs.

Enable Automatic Virtual Links

Use automatic virtual links to provide an automatic, dynamic backup link for vital OSPF traffic. Automatic virtual links require more system resources than manually configured virtual links.

Before You Begin

- You configure automatic virtual links on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

Procedure

- Enter OSPF Router Configuration mode:

```
enable  
  
configure terminal  
  
router ospf
```
- Enable the automatic virtual links feature for the router:

```
auto-vlink
```

Configure an OSPF Area Virtual Interface

Use manual virtual interfaces to provide a backup link for vital OSPF traffic with a minimum of resource use.

Before You Begin

- Enable OSPF globally.
- You configure an OSPF area virtual interface on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

About This Task

Both sides of the OSPF connection must use the same authentication type and key.

You cannot configure a virtual link using a stub area or an NSSA.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Create an OSPF area virtual interface:

```
area virtual-link {A.B.C.D} {A.B.C.D}
```

3. Choose the OSPF update authentication method:

```
area virtual-link {A.B.C.D} {A.B.C.D} authentication-type <message-  
digest|none|sha-1|sha-2|simple>
```

Both sides of an OSPF connection must use the same authentication type and key.

4. If required, configure an MD5 key for the virtual interface:

```
area virtual-link message-digest-key {A.B.C.D} {A.B.C.D} <1-255> md5-  
key WORD<1-16>
```

5. Configure optional parameters, as required.

6. Ensure that the configuration is correct:

```
show ip ospf virtual-link {A.B.C.D} {A.B.C.D} [vrf WORD<1-16>] [vrfrids  
WORD<0-512>]
```

Example

Create an OSPF area virtual interface with an area ID of 192.0.2.12 and the virtual interface ID of 198.51.100.2, choose the OSPF update authentication method to simple, and the hello-interval to 100.

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#router ospf  
Switch:1(config-ospf)#area virtual-link 192.0.2.12 198.51.100.2 198.51.100.2  
Switch:1(config-ospf)#area virtual-link 192.0.2.12 198.51.100.2 198.51.100.2  
authentication-type simple  
Switch:1(config-ospf)#area virtual-link 192.0.2.12 198.51.100.2 198.51.100.2 hello-  
interval 100
```

Variable Definitions

The following table defines parameters for the **area virtual-link** command.

Variable	Value
{A.B.C.D} {A.B.C.D}	Specifies the area ID and the virtual interface ID.
authentication-key WORD<0-8>	Configures the authentication key of up to eight characters.

Variable	Value
<i>authentication-type</i> <message-digest none sha-1 sha-2 simple>	<p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha-1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note: sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
<i>dead-interval</i> <0-2147483647>	Configures the number of seconds between router hello packets before neighbors declare the router down. This value must be at least four times the hello interval value. The default is 60.
<i>hello-interval</i> <1-65535>	Configures the hello interval, in seconds, on the virtual interface for the length of time (in seconds) between the hello packets that the router sends on the interface. The default is 10.
<i>primary-digest-key</i> <1-255>	<p>Use this parameter to transition to a new MD5 key; It changes the primary key used to encrypt outgoing packets.</p> <p><1-255> is the ID for the MD5 key.</p>
<i>retransmit-interval</i> <0-3600>	<p>Configures the retransmit interval for the virtual interface, the number of seconds between LSA retransmissions.</p> <p>The range is from 1–3600.</p>
<i>transit-delay</i> <0-3600>	<p>Configures the transit delay for the virtual interface, the estimated number of seconds required to transmit a link-state update over the interface.</p> <p>The range is from 1–3600.</p>

The following table defines parameters for the **area virtual-link message-digest-key** command.

Variable	Value
<i>{A.B.C.D} {A.B.C.D}</i>	Specifies the area ID and the virtual interface ID.
<i><1-255></i>	Specifies the ID for the message digest key
<i>md5-key WORD<1-16></i>	<p>Configures the MD5 key, you can configure a maximum of two MD5 keys for an interface.</p> <p>If you configure two keys, the interface uses only the first key. To transition to the second key, configure a primary-md5-key to use the ID of the second configured key, and then delete the first key.</p> <p>Important: Use the correct key id when two keys are configured. The key id and md5 password must match with the other OSPF routers, to form the OSPF adjacencies.</p> <p><i>WORD<1-16></i> is an alphanumeric password of up to 16 characters.</p>

The following table defines parameters for the **show ip ospf virtual-link** command.

Variable	Value
<i><A.B.C.D> <A.B.C.D></i>	Specifies the area ID and the virtual interface ID.
<i>vrf WORD<1-16></i>	Specifies a VRF.
<i>vrfids WORD<0-512></i>	Specifies a range of VRF IDs.

Configure an OSPF area on a VLAN or port

Import information from other areas to learn their OSPF relationships. Perform this procedure to create normal, stubby, or NSSA. Place stubby or NSSAs at the edge of an OSPF routing domain.

Before You Begin

- Enable OSPF globally.
- Ensure that the VLAN exists.

About This Task

Ensure that you configure all routers in a stubby or NSSA as stubby or NSSA, respectively.

To configure OSPF areas on a VRF instance for a port or VLAN, you configure OSPF on the port or VLAN, and then associate the port or VLAN with the VRF.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create an OSPF area on the VLAN or port:

```
ip ospf area {A.B.C.D}
```

3. Specify the type of network:

```
ip ospf network <broadcast|nbma|passive|p2p>
```

4. Configure other OSPF area parameters as required.

Example

Create an OSPF area 192.0.2.2 on VLAN 1, and specify the type of network as broadcast.

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface vlan 1  
Switch:1(config-if)#ip ospf area 192.0.2.2  
Switch:1(config-if)#ip ospf network broadcast
```

Variable Definitions

The following table defines parameters for the **ip ospf** command.

Variable	Value
{A.B.C.D}	Specifies the area ID.
authentication-key WORD<0-8>	Configures the eight-character simple password authentication key for the port or VLAN.

Variable	Value
<i>authentication-type</i> <message-digest none sha-1 sha-2 simple>	<p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha-1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note: sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
<i>cost</i> <0-65535>	Configures the OSPF cost associated with this interface and advertised in router link advertisements. The default is 0.
<i>dead-interval</i> <0-2147483647>	Configures the number of seconds between router hello packets before neighbors declare the router down. This value must be at least four times the hello interval value. The default is 60.
<i>hello-interval</i> <1-65535>	Configures the hello interval, in seconds, on the virtual interface for the length of time (in seconds) between the hello packets that the router sends on the interface. The default is 10.
<i>mtu-ignore enable</i>	Enables MTU ignore. To allow the switch to accept OSPF database description (DD) packets with a different MTU size, enable mtu-ignore. The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes.
<i>network</i> <broadcast nbma passive p2p>	Specifies the type of OSPF interface.
<i>poll-interval</i> <0-2147483647>	Configures the OSPF poll interval in seconds. The default is 120.
<i>primary-digest-key</i> <1-255>	<p>Use this parameter to transition to a new MD5 key; it changes the primary key used to encrypt outgoing packets.</p> <p><1-255> is the ID for the message digest key.</p>

Variable	Value
<code>priority <0-255></code>	Configures the OSPF priority for the port during the election process for the designated router. The port with the highest priority number is the best candidate for the designated router. If you set the priority to 0, the port cannot become either the designated router or a backup designated router. The default is 1.
<code>retransmit-interval <0-3600></code>	Configures the retransmit interval: the number of seconds between LSA retransmissions.
<code>transit-delay <0-3600></code>	Configures the transit delay: the estimated number of seconds it takes to transmit a link-state update over the interface.

Configure an OSPF Host Route

Configure host routes when the switch resides in a network that uses routing protocols other than OSPF. A host route is a more-specific route and is used even if it is higher cost than a network route.

Before You Begin

- Globally enable OSPF.
- You configure an OSPF host route on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

About This Task

Use a host route to create a custom route to a specific host to control network traffic.

You can specify which hosts directly attach to the router, and the metrics and types of service to advertise for the hosts.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
configure terminal
router ospf
```
2. Create a host route:

```
host-route {A.B.C.D} [metric <0-65535>]
```
3. Ensure that the configuration is correct:

```
show ip ospf host-route [vrf WORD<1-16>] [vrfs WORD<0-512>]
```

Example

Create a host route on IP address 192.0.2.20 with a metric of 20.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#host-route 192.0.2.20 metric 20
Switch:1(config-ospf)#show ip ospf host-route
Switch:1(config-ospf)#show ip ospf host-route
```

```
=====
                        OSPF Host Route - GlobalRouter
=====
HOSTIPADDR      TOS  METRIC
-----
192.0.2.20      -    20
```

Variable definitions

The following table defines parameters for the **host-route** command.

Variable	Value
<i>{A.B.C.D}</i>	Specifies the IP address of the host router in a.b.c.d format.
<i>metric <0-65535></i>	Configures the metric (cost) for the host route.

The following table defines parameters for the **show ip ospf host-route** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies a VRF by name.
<i>vrfids WORD<0-512></i>	Specifies a range of VRF IDs.

Configure OSPF NBMA Neighbors

Configure NBMA neighbors so that the interface can participate in designated router election. All OSPF neighbors that you manually configure are NBMA neighbors.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- Ensure that the interface is NBMA.
- You configure OSPF NBMA neighbors on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```
2. Create an NBMA OSPF neighbor:

```
neighbor {A.B.C.D} priority <0-255>
```
3. Ensure that the configuration is correct:

```
show ip ospf neighbor [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Example

Create an NBMA OSPF neighbor.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#neighbor 198.51.100.2 priority 10
```

Variable definitions

The following table defines parameters for the **neighbor** command.

Variable	Value
<i>{A.B.C.D}</i>	Identifies an OSPF area in IP address format a.b.c.d.
<i>priority <0-255></i>	Changes the priority level of the neighbor.

The following table defines parameters for the **show ip ospf neighbors** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies a VRF by name.
<i>vrfids WORD<0-512></i>	Specifies a range of VRF IDs.

Disable Helper Mode for OSPFv2

About This Task

By default, OSPF Helper mode is enabled when OSPF is configured.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Disable Helper mode:
`helper-mode-disable`

Apply OSPF Route Acceptance Policies

Use a route policy to define how the switch redistributes external routes from a specified source into an OSPF domain. The policy defines which route types the switch accepts and redistributes.

Before You Begin

- Enable OSPF globally.
- Ensure that a route policy exists.
- Ensure that the area exists.
- You apply OSPF route acceptance policies on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix `ip ospf`. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter OSPF Router Configuration mode:
`enable`

`configure terminal`

`router ospf`
2. Create an acceptance policy instance:
`accept adv-rtr {A.B.C.D}`
3. Configure the type of metric to accept:
`accept adv-rtr {A.B.C.D} metric-type <type1|type2|any>`
4. Indicate the route policy:
`accept adv-rtr {A.B.C.D} route-map WORD<0-64>`

5. Enable a configured OSPF route acceptance instance:

```
accept adv-rtr {A.B.C.D} enable
```

6. Ensure that the configuration is correct:

```
show ip ospf accept [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Example

Create an acceptance policy instance, configure the type of metric to accept, indicate the route policy and enable the OSPF route acceptance instance. Ensure the configuration is correct.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1#router ospf
Switch:1(config-ospf)#accept adv-rtr 192.0.2.11
Switch:1(config-ospf)#accept adv-rtr 192.0.2.11 metric-type type1
Switch:1(config-ospf)#accept adv-rtr 192.0.2.11 route-map test1
Switch:1(config-ospf)#accept adv-rtr 192.0.2.11 enable
Switch:1>show ip ospf accept
=====

Variable definitions

The following table defines parameters for the **show ip ospf ase** command.

Variable	Value
<i>metric-type</i> <1-2>	Specifies the metric type.
<i>vrf</i> WORD<1-16>	Identifies the VRF by name.
<i>vrfids</i> WORD<0-512>	Specifies a VRF by ID.

Configure Route Redistribution to OSPF

Before You Begin

- Enable OSPF globally.
- Ensure that a route policy exists.
- Ensure that you configure OSPF as the boundary router.

About This Task

Configure a redistribute entry to announce certain routes into the OSPF domain, including DvR host routes, static routes, direct routes, Routing Information Protocol (RIP) routes, OSPF routes, IS-IS routes or Border Gateway Protocol (BGP) routes. Optionally, use a route policy to control the redistribution of routes.

Note

Route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Create the redistribution instance:

```
redistribute <bgp|direct|isis|ospf|rip|static|dvr> [vrf-src  
WORD<1-16>]
```

3. Apply a route policy if required:

```
redistribute <bgp|direct|isis|ospf|rip|static|dvr> route-map  
WORD<0-64> [vrf-src WORD<1-16>]
```

4. (Optional) Enable route filtering using tags:

```
redistribute isis auto-filter-tag
```

5. Configure other parameters, as required.

6. Enable the redistribution.

```
redistribute <bgp|direct|isis|ospf|rip|static|dvr> enable [vrf-src  
WORD<1-16>]
```

7. Ensure that the configuration is correct:

```
show ip ospf redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

8. Exit to Global Configuration mode:

```
exit
```

9. Apply the redistribution.

```
ip ospf apply redistribute <bgp|direct|isis|ospf|rip|static|dvr> [vrf  
WORD<1-16>] [vrf-src WORD<1-16>]
```

Changes do not take effect until you apply them.

10. View all routes (including DvR host routes) that are redistributed into OSPF:

- a. View the routes that are redistributed from the GRT to OSPF:

```
show ip ospf lsdb
```

- b. View the routes that are redistributed to OSPF for a specific VRF instance:

```
show ip ospf lsdb [vrf WORD<1-64>] [vrfids WORD<0-512>]
```

Examples

Redistribute static routes from the GRT to OSPF. Create the redistribution instance, apply a route policy, enable redistribution, and apply the redistribution.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#redistribute static

WARNING: Routes will not be injected until apply command is issued after enable command
Switch:1(config-ospf)#redistribute static route-map policy1
Switch:1(config-ospf)#redistribute static enable
Switch:1(config-ospf)#exit
Switch:1(config)#ip ospf apply redistribute static
```

```
Switch:1(config)#show ip ospf redistribute
```

```

Variable Definitions

The following table defines parameters for the **redistribute** command.

Variable	Value
<i>auto-filter-tag</i>	Enables route filtering to ensure tagged routes are not redistributed into OSPF. The default is disabled.
<i>enable</i>	Enables the OSPF route redistribution instance.
<i>metric</i> <0-65535>	Configures the metric to apply to redistributed routes.
<i>metric-type</i> <type1 type2>	Specifies a type 1 or a type 2 metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone.

Variable	Value
<code>route-map WORD<0-64></code>	Configures the route policy to apply to redistributed routes.
<code>subnets <allow suppress></code>	Allows or suppresses external subnet route advertisements when routes are redistributed into an OSPF domain.
<code>vrf-src WORD<1-16></code>	Specifies the optional source VRF instance. You can use this variable with the other command variables.
<code><bgp direct isis ospf rip static dvr></code>	Specifies the type of routes to redistribute (the protocol source).

The following table defines parameters for the **ip ospf apply redistribute** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies the VRF instance.
<code>vrf-src WORD<1-16></code>	Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF.
<code>WORD<0-32></code>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static.

View the OSPF Redistribution Configuration Information

Displays the OSPF redistribution configuration information.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter Privileged EXEC mode:
enable

2. View the OSPF redistribution configuration information:

```
show ip ospf redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Example

```
Switch:1#show ip ospf redistribute
```

```
=====
                        OSPF Redistribute List - GlobalRouter
=====

SRC-VRF          SRC  MET  MTYPE  SUBNET  ENABLE  RPOLICY  AUTO-FILTER
-----
GlobalRouter     STAT  0   type2  allow   TRUE
```

Variable definitions

The following table defines parameters for the **show ip ospf redistribute** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies a VRF by name.
<code>vrfids WORD<0-512></code>	Specifies a range of VRF IDs.

Configure InterVRF Route Redistribution for OSPF

Use route redistribution so that a VRF interface can announce routes learned by other protocols, for example, OSPF or BGP. The switch supports interVRF route redistribution. Use a route policy to control the redistribution of routes.

You can also redistribute inter-VRF DvR routes to OSPF.

Before You Begin

- Enable OSPF globally.
- Ensure that a route policy exists.

- Ensure that the VRFs exist.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

Note

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Create the redistribution instance:

```
ip ospf redistribute <bgp|direct|isis|ospf|rip|static|dvr>
```

3. Apply a route policy if required:

```
ip ospf redistribute <bgp|direct|isis|ospf|rip|static|dvr> route-map  
WORD<0-64> [vrf-src WORD<1-16>]
```

4. Configure other parameters, as required.

5. Enable the redistribution:

```
ip ospf redistribute <bgp|direct|isis|ospf|rip|static|dvr> enable  
[vrf-src WORD<1-16>]
```

6. Ensure that the configuration is correct:

```
show ip ospf redistribute [vrf WORD<1-16>] [vrffids WORD<0-512>]
```

7. Exit to Global Configuration mode:

```
exit
```

8. Apply the redistribution:

```
ip ospf apply redistribute <bgp|direct|isis|ospf|rip|static|dvr> [vrf  
WORD<1-16>] [vrf-src WORD<1-16>]
```

Example

Example 1:

Create the redistribution instance, apply a route policy, enable the redistribution, and apply the redistribution.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router vrf red
Switch:1(router-vrf)#ip ospf redistribute isis
Switch:1(router-vrf)#ip ospf redistribute isis route-map test2
Switch:1(router-vrf)#ip ospf redistribute isis enable
Switch:1(router-vrf)#exit
Switch:1(config)#ip ospf apply redistribute isis
```

Example 2:

This example demonstrates redistribution of inter-VRF routes (both direct and DvR routes) to OSPF, with a route policy configured.

Redistribute inter-VRF DvR routes between VRFs (with VRF IDs 10 and 30), to OSPF.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router vrf 10
Switch:1(router-vrf)#ip prefix-list "test10" 192.0.2.0/24 ge 25 le 32
Switch:1(router-vrf)#route-map "test10" 1
Switch:1(router-vrf)#permit
Switch:1(router-vrf)#enable
Switch:1(router-vrf)#match network "test10"
Switch:1(router-vrf)#set metric 99
Switch:1(router-vrf)#exit

Switch:1(config)#router vrf 30
Switch:1(router-vrf)#ip ospf redistribute direct vrf-src 10
Switch:1(router-vrf)#ip ospf redistribute direct enable vrf-src 10
Switch:1(router-vrf)#ip ospf redistribute dvr vrf-src 10
Switch:1(router-vrf)#ip ospf redistribute dvr route-map "test10" vrf-src 10
Switch:1(router-vrf)#ip ospf redistribute dvr enable vrf-src 10
Switch:1(router-vrf)#exit

Switch:1(config)#ip ospf apply redistribute direct vrf 30 vrf-src 10
Switch:1(config)#ip ospf apply redistribute dvr vrf 30 vrf-src 10
```

Variable definitions

The following table defines parameters for the **ip ospf redistribute** command.

Variable	Value
<i>enable</i>	Enables the OSPF route redistribution instance.
<i>metric <0-65535></i>	Configures the metric to apply to redistributed routes.
<i>metric-type <type1 type2></i>	Specifies a metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone.

Variable	Value
<code>route-map WORD<0-64></code>	Configures the route policy to apply to redistributed routes.
<code>subnets <allow suppress></code>	Allows or suppresses external subnet route advertisements when routes are redistributed into an OSPF domain.
<code>vrf-src WORD<1-16></code>	Specifies the optional source VRF instance. You can use this variable with the other command variables.
<code><bgp direct isis ospf rip static dvr></code>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, static or dvr.

The following table defines parameters for the **ip ospf apply redistribute** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies the VRF instance.
<code>vrf-src WORD<1-16></code>	Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF.
<code>WORD<0-32></code>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static.

Force Shortest-Path Calculation Updates

Force the switch to update its shortest-path calculations so that the switch uses the latest OSPF routing information. Manually initiate a shortest path first (SPF) run, or calculation, to immediately update the OSPF LSDB. This action is useful in the following circumstances:

- when you need to immediately restore a deleted OSPF-learned route
- when the routing table entries and the LSDB do not synchronize

Before You Begin

- You can perform this procedure in one of the following CLI modes: User EXEC, Privileged EXEC, or Global Configuration.

About This Task

This process is computationally intensive. Use this command only if required.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Force the router to update its shortest-path calculations:

```
ip ospf spf-run [vrf WORD<1-16>]
```

Example

Force the router to update its shortest-path calculations:

```
Switch:1>ip ospf spf-run
```

Variable definitions

The following table defines parameters for the **ip ospf spf-run** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies a VRF instance by name.

View the OSPF Default Cost Information

View the OSPF default cost information to ensure accuracy.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the OSPF cost information:
show ip ospf default-cost [vrf WORD<1-16>] [vrfids WORD<0-512>]

Example

View the OSPF cost information on the switch:

```
Switch:1#show ip ospf default-cost vrf 3
```

```

Variable definitions

The following table defines parameters for the **show ip ospf int-timers** command.

Variable	Value
vrf WORD<1-16>	Specifies a VRF by name.
vrfids WORD<0-512>	Specifies a range of VRF IDs.

View the OSPF Neighbor Information

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the OSPF neighbor information:
show ip ospf neighbor [vrf WORD<1-16>] [vrfids WORD<0-512>]

Example

View OSPF neighbor information:

```
Switch:1#show ip ospf neighbor
```

```
=====
                        OSPF Neighbors - GlobalRouter
=====
```

INTERFACE	NBRROUTERID	NBRIPADDR	PRI	STATE	RTXQLEN	PERM	TTL	HELPER STATUS	HELPER AGE	HELPER EXIT	ACCESS REASON
192.0.2.5	192.0.2.1	192.0.2.6	1	Full	0	Dyn	31		0	None	GlobalRouter
198.51.100.7	198.51.100.1	198.51.100.8	128	Restart	0	Dyn	147	H	0	None	GlobalRouter

Total ospf neighbors: 2

Variable definitions

The following table defines parameters for the **show ip ospf neighbor** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies a VRF by name.
<code>vrfids WORD<0-512></code>	Specifies a range of VRF IDs.

View the OSPF Authentication Information

Display OSPF authentication information to ensure accuracy.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the OSPF authentication information:
show ip ospf int-auth [vrf WORD<1-16>] [vrfids WORD<0-512>]

Example

View the OSPF authentication information:

```
Switch:1#show ip ospf int-auth

=====
                        OSPF Interface AuthKey - GlobalRouter
=====
INTERFACE      AUTHTYPE  AUTHKEY
-----
192.0.2.1       none
192.0.2.11      none
192.0.2.3       none
```

Variable definitions

The following table defines parameters for the **show ip ospf int-auth** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies a VRF by name.
<code>vrfids WORD<0-512></code>	Specifies a range of VRF IDs.

View the OSPF Interface Statistics

Use statistics to help you monitor OSPF performance.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View the OSPF interface statistics:

```
show ip ospf ifstats [detail vrf WORD<1-16> vrfids WORD<0-512>]
[mismatch vrf WORD<1-16> vrfids WORD<0-512>] [vlan <1-4059>] [vrf
WORD<1-16>] [vrfids WORD<0-512>]
```

Example

View the OSPF interface statistics:

```
Switch:1>show ip ospf ifstats
=====
                        OSPF Interface Statistics - GlobalRouter
=====
---HELLOS--- ---DBS--- -LS REQ-- --LS UPD--- --LS ACK---
INTERFACE      RX      TX      RX      TX      RX      TX      RX      TX      RX      TX
-----
192.0.2.3      76035  76355  33     32     4       9     2483  2551  2525  1247
192.0.2.8      76038  76349  0       0       0       0       0     0     0     0
```

Variable definitions

The following table defines parameters for the **show ip ospf ifstats** command.

Variable	Value
<i><1-4059></i>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
<i>detail</i>	Displays the details of the OSPF.
<i>mismatch</i>	Specifies the number of times the area ID is not matched.
<i>vrf WORD<1-16></i>	Specifies a VRF by name.
<i>vrfids WORD<0-512></i>	Specifies a range of VRF IDs.

View OSPF Range Statistics

Use statistics to help you monitor Open Shortest Path First (OSPF) performance. You can also use statistics in troubleshooting procedures. OSPF range statistics include area ID, range network address, range subnet mask, range flag, and LSDB type.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. Display the OSPF range statistics:

```
show ip ospf stats [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Example

```
Switch:1>show ip ospf stats
```

```

          NumOspfNbrs: 3
NumEnabledOspfAreas:0
```

Variable Definitions

Use the data in the following table to use the **show ip ospf stats** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies a VRF instance by VRF name.
<i>vrfids WORD<0-16></i>	Specifies a VRF or range of VRFs by ID.

Clear IP OSPF Statistics

Use the following procedure to clear all IPv4 OSPF statistics.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Clear IPv4 OSPF statistics:

```
clear ip ospf stats [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Variable Definitions

Use the data in the following table to use the **clear ip ospf stats** command.

Variable	Value
vrf WORD<1-16>	Specifies a VRF instance by VRF name.
vrfids WORD<0-512>	Specifies the ID of the VRF.

View OSPF Error Statistics on a Port

Use statistics to help you monitor Open Shortest Path First (OSPF) performance. You can also use statistics in troubleshooting procedures.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display extended information about OSPF errors for the specified port or for all ports:
show interfaces GigabitEthernet error ospf [{slot/port[-slot/port]}
[,...][slot/all][all]]

Variable Definitions

The following table defines parameters for the **show interfaces GigabitEthernet error ospf** command.

Variable	Value
{slot/port[/sub-port][-slot/port[/sub-port]][,...][slot/all][all]}	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

View Basic OSPF Statistics for a Brouter Port

Use statistics to help you monitor Open Shortest Path First (OSPF) performance. You can also use statistics in troubleshooting procedures.

About This Task

This command provides values for brouter port implementations. For IP protocol-based VLAN interface statistics, use [View the OSPF Interface Statistics](#) on page 2820.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View basic OSPF statistics:

```
show ports statistics ospf main [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```

Example

View basic OSPF statistics:

```
Switch:1>enable
Switch:1#show ports statistics ospf main
```

```
=====
                        Port Stats Ospf
=====
```

PORT_NUM	RX_HELLO	TX_HELLO	RXDB_DESCR	TXDB_DESCR	RXLS_UPDATE	TXLS_UPDATE
1/3	0	0	0	0	0	0

Variable Definitions

Use the data in the following table to use the **show ports statistics ospf main** command.

Variable	Value
<code>{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

View Extended OSPF Statistics for a Brouter Port

Use statistics to help you monitor Open Shortest Path First (OSPF) performance. You can also use statistics in troubleshooting procedures.

About This Task

This command provides values for brouter port implementations. For IP protocol-based VLAN interface statistics, use [View the OSPF Interface Statistics](#) on page 2820.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. Display extended OSPF information about the specified port or for all ports:

```
show ports statistics ospf extended [{slot/port[/sub-port]}[-slot/
port[/sub-port]][,...][slot/all][all]]
```

Example

Display extended OSPF information:

```
Switch:1>enable
Switch:1#show ports statistics ospf extended

=====
                        Port Stats Ospf Extended
=====
PORT_NUM  RXLS_REQS  TXLS_REQS  RXLS_ACKS  TXLS_ACKS
-----
1/3        0            0          0          0
```

Variable Definitions

Use the data in the following table to use the **show ports statistics ospf extended** command.

Variable	Value
<code>{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

View the OSPF Virtual Link Information

Displays the OSPF virtual link information to ensure accuracy.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View the OSPF virtual link information:

```
show ip ospf virtual-link {A.B.C.D} {A.B.C.D} [vrf WORD<1-16>] [vrfs
WORD<0-512>]
```

Example

View the OSPF virtual link information:

```
Switch:1#show ip ospf virtual-link

=====
                        OSPF Interface AuthKey - GlobalRouter
=====
INTERFACE          AUTHTYPE AUTHKEY
-----
192.0.2.11          none
```

Variable definitions

The following table defines parameters for the **show ip ospf virtual-link** command.

Variable	Value
<i>{A.B.C.D}</i> <i>{A.B.C.D}</i> <i>vrf WORD<1-16></i>	Specifies the area ID and the virtual interface ID. The first IP address specifies the area ID and the second specifies the virtual interface ID.
<i>{A.B.C.D}</i> <i>{A.B.C.D}</i> <i>vrfids WORD<0-512></i>	Displays OSPF configuration for a particular VRF. Specifies a VRF by name.
<i>{A.B.C.D}</i> <i>{A.B.C.D}</i>	Specifies a range of VRF IDs.

View the OSPF Configuration for a VRF

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the configuration by VRF name:
show ip ospf vrf *WORD<1-16>*
3. View the configuration by VRF ID:
show ip ospf vrfids *WORD<0-512>*

Example

View the configuration for VRF named virtualrandf1:

```
Switch:1#show ip ospf vrf virtualrandf1

=====
                        OSPF General - VRF virtualrandf1
=====

RouterId: 192.0.2.1

VersionNumber: 2
AreaBdrRtrStatus: false
ASBdrRtrStatus: true
Bad-Lsa-Ignore: false
```

```

    ExternLsaCount: 0
    ExternLsaChecksumSum: 0 (0x0)
    TOSupport: 0
    OriginateNewLsas: 0
    RxNewLsas: 0
    TrapEnable: false
    AutoVirtLinkEnable: false
    SpfHoldDownTime: 10
    Rfc1583Compatibility: disable
--More-- (q = quit)

```

Variable Definitions

The following table defines parameters for the **show ip ospf vrf** command.

Variable	Value
<code>vrfids WORD<0-512></code>	Specifies a range of VRF IDs.
<code>vrf WORD<1-16></code>	Specifies a VRF by name.

OSPFv3 Configuration using CLI

Use the procedures in this section to configure OSPFv3 using CLI.

Configure OSPF Globally

Configure OSPFv3 globally to enable it on the system and to configure the router ID.

Procedure

1. Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

Optional: `router vrf WORD<1-16>`

Note

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Enable OSPFv3 for IPv6:

```
router ospf ipv6-enable
```

The default is disabled.

3. Log on to OSPF Router Configuration mode:

```
router ospf
```

4. Specify the router ID:

```
ipv6 router-id {A.B.C.D}
```

- Optionally, make the router an autonomous system (AS) boundary router (BR):

```
ipv6 as-boundary-router enable
```

Enable the ASBR if the router attaches at the edge of the OSPF network, and has one or more interfaces that run an interdomain routing protocol. The default is disabled.

Example

Enable OSPFv3 for IPv6:

```
Switch:1(config)#router ospf ipv6-enable
```

Log on to OSPF Router Configuration mode:

```
Switch:1(config)#router ospf
```

Specify the router ID:

```
Switch:1(config-ospf)#ipv6 router-id 1.1.1.1
```

Variable definitions

Use the data in the following table to use the **ipv6 router-id** command.

Variable	Value
<i>{A.B.C.D}</i>	Specifies a 32-bit integer that identifies the router in the autonomous system. This value must be unique. The default value will be one of the IPv4 interface addresses.

Create an OSPF Area

Create an area to subdivide the autonomous system (AS) into areas that group contiguous networks, routers that connect to these networks, and attached hosts. Subdividing the AS into areas significantly reduces the amount of routing protocol traffic compared to treating the entire AS like a single link-state domain.

Before You Begin

You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace *ipv6* with *ipv6 ospf*.

About This Task

A stub area does not receive advertisements for external routes, which reduces the size of the link-state database (LSDB). A stub area uses only one area border router (ABR). Any packets destined for outside the area are routed to the area border exit point, examined by the ABR, and forwarded to a destination.

A not so stubby area (NSSA) prevents the flooding of AS-External link-state advertisements into the area by replacing them with a default route. NSSAs also import small stub (non- OSPF) routing domains into OSPF.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```

2. Specify the area ID:

```
ipv6 area {A.B.C.D}
```

3. Configure optional area parameters if the default values do not meet your requirements:

- a. Configure the area type if you need a stub or NSSA area:

```
ipv6 area {A.B.C.D} type <nssa|stub>
```

By default, the area is a normal area; neither a stub nor NSSA area.

- b. Configure the default cost:

```
ipv6 area {A.B.C.D} default-cost <0-16777215>
```

You do not need to configure this parameter if the area is a normal area.

- c. Configure the area support for importing advertisements:

```
ipv6 area {A.B.C.D} import <external|noexternal|nssa>
```

The default is external.

- d. Disable the importation of summary advertisements into a stub area:

```
no ipv6 area {A.B.C.D} import-summaries enable
```

The default is enabled.

- e. Configure translation of Type 7 LSAs into Type 5 LSAs:

```
ipv6 area {A.B.C.D} translator-role <1-2>
```

The default value is 2-candidate.

Example

Specify the area ID:

```
Switch:1(config-ospf)#ipv6 area 0.0.0.1
```

Variable definitions

Use the data in the following table to use the **ipv6 area** command.

Variable	Value
{A.B.C.D}	Specifies a 32-bit integer to uniquely identify an area. Use 0.0.0.0 for the OSPFv3 backbone.
default-cost <0-16777215>	Configures the metric value advertised for the default route to stub and NSSA areas.

Variable	Value
<code>import <external noexternal nssa></code>	Configures area support for importing AS-external LSAs: <ul style="list-style-type: none"> external—normal area noexternal—stub area nssa—not-so-stubby area AS-scope LSAs are not imported into stub areas or NSSAs. NSSAs import AS-External data at Type 7 LSAs, which use area scope. The default is external.
<code>import-summaries enable</code>	Controls the import of inter-area LSAs into a stub area. If you disable this parameter, the router does not originate nor propagate inter-area LSAs into the stub area. If you enable this parameter (the default), the router both summarizes and propagates inter-area LSAs.
<code><nssa stub></code>	Configures the type of area. By default, the area is neither a stub area or an NSSA.
<code>translator-role <1-2></code>	Indicates if the NSSA border router can perform NSSA translation of Type 7 LSAs to Type 6 LSAs. The possible values are always (1) or candidate (2). The default is candidate (2).

Create OSPF Area Ranges

Create an area address range on the OSPF router to reduce the number of area border router (ABR) advertisements into other OSPF areas. An area address range is an implied contiguous range of area network addresses for which the ABR advertises a single summary route.

Before You Begin

- You must create the OSPF area.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace `ipv6` with `ipv6 ospf`.

About This Task

If you create two ranges, and one range is a subset of the other, the router uses the most specific match.

Procedure

- Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

- Create an area range:

```
ipv6 area range {A.B.C.D} WORD<0-255> [inter-area-prefix-link|nssa-extlink] advertise-mode <advertise|not-advertise> [advertise-metric <0-65535>]
```

Example

Create an area range:

```
Switch:1(config-ospf)#ipv6 area range 0.0.0.1 3000::0/16 advertise-mode advertise
```

Variable definitions

Use the data in the following table to use the **ipv6 area range** command.

Variable	Value
<i>{A.B.C.D}</i>	Specifies the area in which the address aggregate exists. Use dotted decimal notation to specify the area name.
<i>advertise-metric</i> <i><0-65535></i>	Specifies a cost value to advertise for the OSPF area range. This value applies to summary LSAs (Type 3). If the value is 0, OSPF uses the cost to the farthest point in the network that is summarized.
<i>advertise-mode</i> <i><advertise not-advertise></i>	Specifies the advertisement mode for prefixes in the range. <i>advertise</i> advertises the aggregate summary LSA with the same link-state ID. <i>not-advertise</i> does not advertise networks that fall within the range. The default is <i>advertise</i> .
<i><inter-area-prefix-link nssa-extlink></i>	Specifies the area LSDB type to which the address aggregate applies. <i>inter-area-prefix-link</i> generates an aggregated summary. <i>nssa-extlink</i> generates an NSSA link summary.
<i>WORD<0-255></i>	Specifies the IPv6 address and prefix.

Create an OSPF Virtual Link

Create a virtual link if the switch does not connect directly to the backbone. The switch can create automatic virtual links or you can perform this procedure to create virtual links manually. Manual virtual links conserve resources and provide specific control over virtual link placement in your OSPF configuration.

Before You Begin

- The router must be an ABR to create a virtual router interface.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace *ipv6* with *ipv6 ospf*.

About This Task

Virtual linking is similar to backup redundancy. The switch creates a virtual link for vital traffic paths in your OSPF configuration if traffic is interrupted, such as when an interface cable that provides a connection to the backbone (either directly or indirectly) is disconnected from the switch. Automatic virtual linking ensures that a link is created by using another switch.

OSPF routes cannot be learned through an ABR unless it connects to the backbone directly or through a virtual link.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Create a virtual link:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D}
```

3. Configure optional parameters for the virtual link if the default values do not meet your requirements:

- a. Configure the router dead interval:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} dead-interval <1-65535>
```

The default is 60 seconds.

- b. Configure the hello interval:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} hello-interval <1-65535>
```

The default is 10 seconds.

- c. Configure the retransmit interval:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} retransmit-interval  
<1-1800>
```

The default is 5 seconds.

- d. Configure the transit delay:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} transit-delay <1-1800>
```

The default is 1 second.

Example

Create a virtual link:

```
Switch:1(config-ospf)#ipv6 area virtual-link 0.0.0.1 2.2.2.2
```

Configure optional parameters for a virtual link:

```
Switch:1(config-ospf)#ipv6 area virtual-link 0.0.0.1 4.4.4.4 dead-interval 90 retransmit-  
interval 10
```

Variable definitions

Use the data in the following table to use the **ipv6 area virtual-link** command.

Variable	Value
<i>{A.B.C.D}</i> <i>{A.B.C.D}</i>	Specifies the ID for the transit area that the virtual link traverses and the router ID of the virtual neighbor. Do not use 0.0.0.0 for the transit area.
<i>dead-interval</i> <i><1-65535></i>	Specifies the number of seconds after which the neighbor declares the router down if it does not receive hello packets. Configure this value as a multiple of the hello interval. You must configure the same value on the virtual neighbor. The default is 60 seconds.
<i>hello-interval</i> <i><1-65535></i>	Specifies the number of seconds between hello packets that the router sends on this interface. Configure the same value on the virtual neighbor. The default is 10 seconds.
<i>retransmit-interval</i> <i><1-1800></i>	Specifies the number of seconds between link-state advertisement retransmissions for adjacencies that belong to this interface. This value also applies to the retransmissions of database description and link-state request packets. The default is 5 seconds.
<i>transit-delay</i> <i><1-1800></i>	Specifies the estimated number of seconds to transmit a link-state update packet over this interface. The default is 1 second.

Configure IPsec for the OSPF Virtual Link

Use the following procedure to configure and enable IPsec for the OSPF virtual link.

IPsec is disabled by default.

Before You Begin

- Configure the OSPF virtual link.
- Create the IPsec security association.

About This Task

Until you enable IPsec on both sides of the virtual links, the links cannot exchange OSPFv3 control messages, and the system drops OSPFv3 exchange packets.

You must disable IPsec before you can perform virtual link policy configuration changes.

For configuration examples of IPsec used with OSPFv3 virtual link, see [OSPFv3 virtual link IPsec configuration example](#) on page 2092.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Create the IPsec policy under the OSPF virtual link:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec
```

3. Configure the action of the IPsec policy under the OSPF virtual link:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec action <drop|permit>
```

4. Configure the direction of the IPsec policy under the OSPF virtual link:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec direction <both|in|out>
```

5. Link the security association to the OSPF virtual link:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec security-association WORD<0-32>
```

6. Enable the IPsec policy created under the OSPF virtual link:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec enable
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1#(config)router ospf
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec action permit
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec direction both
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec security-association test1
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec enable
```

Variable definitions

Use the data in the following table to use the **ipv6 area virtual link {A.B.C.D} {A.B.C.D} ipsec** command.

Variable	Value
<code>{A.B.C.D} {A.B.C.D}</code>	The first IP address specifies the area IP address, and the second IP address specifies the virtual-link IP address.
<code>action <drop permit></code>	Configures the action of the IPsec policy under the OSPF virtual tunnel to one of the following: <ul style="list-style-type: none"> • drop—Drops the IP packets. • permit—Permits the IP packets. The default is permit.

Variable	Value
<code>direction <both in out></code>	Specifies the direction you want to protect with IPsec: <ul style="list-style-type: none"> in—Specifies ingress traffic. out—Specifies egress traffic. both—Specifies both ingress and egress traffic. The default is both.
<code>enable</code>	Enables the IPsec policy under the OSPF virtual link.
<code>security-association WORD<0-32></code>	Links the security association to the OSPF virtual link.

Configure OSPF Default Metrics

Before You Begin

You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace `ipv6` with `ipv6 ospf`.

About This Task

Use the following procedure to configure global OSPF default metrics.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Configure OSPF default-cost:

```
ipv6 default-
```

```
cost {ethernet|fast-ethernet|forty-gig-ethernet|hundred-gig-ethernet|gig-ethernet|ten-gig-ethernet|twentyfive-gig-ethernet|vlan} <1-65535>
```

Note

Different hardware platforms support different port speeds. For more information, see your hardware documentation.

Example

Configure IPv6 default cost metric for Ethernet to 100, for fast Ethernet to 20, for gig-ethernet, twentyfive-gig-ethernet, forty-gig-Ethernet, and hundred-gig-ethernet to 2, and VLAN to 1.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#ipv6 default-cost ethernet 100
```

```

Switch:1(config-ospf)#ipv6 default-cost fast-ethernet 20
Switch:1(config-ospf)#ipv6 default-cost gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost ten-gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost Forty-gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost twentyfive-gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost hundred-gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost vlan 1

```

Variable definitions

Use the data in the following table to use the **ipv6 default-cost** command.

Note

Different hardware platforms support different port speeds. For more information, see your hardware documentation.

Variable	Value
<i>ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>ethernet</i> is for 10 Mb/s Ethernet (default is 100).
<i>fast-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>fast-ethernet</i> is for 100 Mb/s Fast-Ethernet (default is 10).
<i>forty-gig-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>forty-gig-ethernet</i> is for 10 Mb/s Forty-Gigabit-Ethernet (default is 1).
<i>gigabit-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>gigabit-ethernet</i> is for 10 Mb/s Gigabit-Ethernet (default is 1).
<i>hundred-gig-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>hundred-gig-ethernet</i> is for 100 Gigabit Ethernet (default is 1).
<i>ten-gig-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>ten-gig-ethernet</i> is for 10 Mb/s Ten-Gigabit-Ethernet (default is 1).

Variable	Value
<code>twentyfive-gig-ethernet <1-65535></code>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. On a channelized 100 Gbps port, the default-cost for each 25 Gbps channel is 1.
<code>vlan <1-65535></code>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <code>vlan</code> is for Vlan interfaces (default is 10).

Configure OSPF on a Port or VLAN

Configure the OSPF protocol on IPv6 interface to support dynamic routing on the interface.

Before You Begin

- The IPv6 interface must exist.

Procedure

- Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

- Create an OSPF area on the interface:

```
ipv6 ospf area {A.B.C.D}
```

- Enable OSPFv3 on the interface:

```
ipv6 ospf enable
```

The default is disabled.

4. Configure optional parameters to meet your requirements:

a. Configure the interface metric:

```
ipv6 ospf cost <0-65535>
```

The default for a brouter port or VLAN is 1.

**Note**

If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface.

b. Configure the router dead interval:

```
ipv6 ospf dead-interval <1-65535>
```

The default is 40 seconds.

c. Configure the hello interval:

```
ipv6 ospf hello-interval <1-65535>
```

The default is 10 seconds.

d. Configure the link LSA suppression:

```
ipv6 ospf link-lsa-suppression
```

**Note**

Before configuring Link LSA suppression for OSPF, configure Link LSA suppression for OSPF area for point to point (p2p) or point to multipoint interfaces (p2mp), otherwise it defaults to a broadcast interface type where you cannot use Link LSA suppression.

e. Configure the poll interval:

```
ipv6 ospf poll-interval <0-65535>
```

The default is 120 seconds.

f. Configure the interface priority:

```
ipv6 ospf priority <0-255>
```

The default is 1.

g. Configure the retransmit interval:

```
ipv6 ospf retransmit-interval <1-1800>
```

The default is 5 seconds.

h. Configure the transit delay:

```
ipv6 ospf transit-delay <1-1800>
```

The default is 1 second.

Example

Create an OSPF area on the interface:

```
Switch:1(config-if)#ipv6 ospf area 0.0.0.0
```

Enable OSPFv3 on the interface:

```
Switch:1(config-if)#ipv6 ospf enable
```

Variable Definitions

Use the data in the following table to use the **ipv6 ospf** command.

Variable	Value
<i>area {A.B.C.D}</i>	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.
<i>cost <0-65535></i>	Specifies the cost for the interface. The default for a brouter port or VLAN is 1.
<i>dead-interval <1-65535></i>	Specifies the number of seconds after which the neighbor declares the router down, if it does not receive hello packets. Configure this value as a multiple of the hello interval. You must configure the same value on the virtual neighbor. The default is 40 seconds.
<i>enable</i>	Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is disabled.
<i>hello-interval <1-65535></i>	Specifies the number of seconds between hello packets that the router sends on this interface. Configure the same value on the virtual neighbor. The default is 10 seconds.
<i>link-lsa-suppression</i>	Configures link LSA suppression on the specified port or VLAN. It is only used for point to point or point to multipoint interfaces. By default, it is disabled.
<i>poll-interval <0-65535></i>	Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120.
<i>priority <0-255></i>	Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election. A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router. The default is 1.

Variable	Value
<i>retransmit-interval</i> <1-1800>	Specifies the number of seconds between link-state advertisement retransmissions for adjacencies that belong to this interface. This value also applies to the retransmissions of database description and link-state request packets. The default is 5 seconds.
<i>transit-delay</i> <1-1800>	Specifies the estimated number of seconds to transmit a link-state update packet over this interface. The default is 1 second.

Use the data in the following table to use the **interface** command.

Variable	Value
<1-4059>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Configure OSPF on a Tunnel

Configure the OSPF protocol on IPv6 interface to support dynamic routing on the interface.

Before You Begin

- The IPv6 interface must exist.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```
2. Create an OSPF area on the interface:

```
ipv6 tunnel <1-2000> area {A.B.C.D}
```
3. Enable OSPFv3 on the interface:

```
ipv6 tunnel <1-2000> enable
```

4. Configure optional parameters to meet your requirements:

a. Configure the router dead interval:

```
ipv6 tunnel <1-2000> dead-interval <1-65535>
```

The default is 40 seconds.

b. Configure the hello interval:

```
ipv6 tunnel <1-2000> hello-interval <1-65535>
```

The default is 10 seconds.

c. Configure the interface metric:

```
ipv6 tunnel <1-2000> metric <0-65535>
```

d. Configure the poll interval:

```
ipv6 tunnel <1-2000> poll-interval <0-65535>
```

The default is 120 seconds.

e. Configure the interface priority:

```
ipv6 tunnel <1-2000> priority <0-255>
```

The default is 1.

f. Configure the retransmit interval:

```
ipv6 tunnel <1-2000> retransmit-interval <1-1800>
```

The default is 5 seconds.

g. Configure the transit delay:

```
ipv6 tunnel <1-2000> transit-delay <1-1800>
```

The default is 1 second.

Example

Create an OSPF area on the interface:

```
Switch:1(config-if)#ipv6 tunnel 4 area 0.0.0.0
```

Enable OSPFv3 on the interface:

```
Switch:1(config-if)#ipv6 tunnel 4 enable
```

Variable definitions

Use the data in the following table to use the **ipv6 tunnel** command.

Variable	Value
<1-2000>	Specifies the tunnel ID.
area {A.B.C.D}	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.

Variable	Value
<i>dead-interval</i> <1-65535>	<p>Specifies the number of seconds after which the neighbor declares the router down if it does not receive hello packets. Configure this value as a multiple of the hello interval.</p> <p>Tip: You must configure the same value on the virtual neighbor.</p> <p>The default is 40 seconds.</p>
<i>enable</i>	<p>Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas.</p> <p>If you disable the status, the interface is external to OSPFv3. The default is enabled.</p>
<i>hello-interval</i> <1-65535>	<p>Specifies the number of seconds between hello packets that the router sends on this interface.</p> <p>Tip: You must configure the same value on the virtual neighbor.</p> <p>The default is 10 seconds.</p>
<i>metric</i> <0-65535>	<p>Specifies the cost for the interface.</p> <p>The default for a tunnel is 100.</p>
<i>poll-interval</i> <0-65535>	<p>Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor.</p> <p>The default is 120.</p>
<i>priority</i> <0-255>	<p>Specifies the priority of this interface.</p> <p>Multiaccess networks use the priority in the designated router election.</p> <p>A higher priority value increases the likelihood that the router becomes the designated router.</p> <p>A value of zero (0) indicates the router cannot become the designated router for the network.</p> <p>If more than one router uses the same priority value, the system uses the router ID to determine which router becomes the designated router.</p> <p>The default is 1.</p>
<i>retransmit-interval</i> <1-1800>	<p>Specifies the number of seconds between link-state advertisement retransmissions for adjacencies that belong to this interface.</p> <p>The retransmit-interval value also applies to the retransmissions of database description and link-state request packets.</p> <p>The default is 5 seconds.</p>
<i>transit-delay</i> <1-1800>	<p>Specifies the estimated number of seconds required to transmit a link-state update packet over this interface.</p> <p>The default is 1 second.</p>

Configure OSPFv3 on the CLIP Interface for the Global Router

About This Task

Perform this task to configure an Open Shortest Path First Version 3 (OSPFv3) instance for a specific circuitless IP address on the Global Router (GRT).

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enter OSPF Configuration mode:
`router ospf`
3. Create the IPv6 OSPF area:
`ipv6 area {A.B.C.D}`
4. Return to Global Configuration mode:
`end`
5. Enable IPv6 OSPF router configuration:
`router ospf ipv6-enable`
6. Enter Loopback Interface Configuration mode:
`interface loopback <1-256>`
7. Create the IPv6 loopback interface address:
`ipv6 interface address WORD<0-255>`
8. Create the OSPFv3 instance:
`ipv6 ospf [<1-256>] area {A.B.C.D}`
9. Enable the OSPFv3 instance:
`ipv6 ospf [<1-256>] enable`

Example

Configuring the OSPFv3 instance on the loopback interface on the GRT:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#ipv6 area 192.2.0.1
Switch:1(config-ospf)#end
Switch:1(config)#router ospf ipv6-enable
Switch:1(config)#interface Loopback 2
Switch:1(config-if)#ipv6 interface address 2001::10:10:0:1/128
Switch:1(config-if)#ipv6 ospf 2 area 192.2.0.1
Switch:1(config-if)#ipv6 ospf 2 enable
```

Variable Definitions

The following table defines parameters for the **ipv6 area** command.

Variable	Value
<i>{A.B.C.D}</i>	Specifies the area address.

The following table defines parameters for the **interface loopback** command.

Variable	Value
<i><1-256></i>	Specifies the interface ID.

The following table defines parameters for the **ipv6 interface address** command.

Variable	Value
<i>WORD<0-255></i>	Specifies the IPv6 address for the loopback interface.

The following table defines parameters for the **ipv6 ospf** command.

Variable	Value
<i><1-256></i>	Specifies the interface ID for this IPv6 ospf interface.
<i>area {A.B.C.D}</i>	Specifies the IPv6 OSPF area, typically formatted as an IP address. Enter the address in the <i>{A.B.C.D}</i> portion.

Configure OSPFv3 on the CLIP Interface for a VRF Instance

About This Task

Perform this task to configure an Open Shortest Path First Version 3 (OSPFv3) instance for a specific circuitless IP address on the Virtual Router Forwarding (VRF) instance.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Create a VRF instance and specify a VRF name:
`ip vrf WORD<1-16>`
3. Enter VRF Router Configuration mode:
`router vrf WORD<1-16>`
4. Create an OSPFv3 instance on the specific VRF instance:
`ipv6 ospf`
5. Enable OSPFv3 on the specific VRF instance:
`ipv6 ospf enable`

6. Enter Loopback Interface Configuration mode:

```
interface Loopback <1-256>
```
7. Create the IPv6 loopback interface address for the specific VRF instance:

```
ipv6 interface address WORD<0-255> vrf WORD<1-16>
```
8. Create the OSPFv3 instance:

```
ipv6 ospf [<1-256>] area {A.B.C.D}
```
9. Enable the OSPFv3 instance:

```
ipv6 ospf [<1-256>] enable
```

Example

Configuring the OSPFv3 instance on the loopback interface on the VRF test:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ip vrf test
Switch:1(config)#router vrf test
Switch:1(config-vrf)#ipv6 ospf
Switch:1(router-vrf)#ipv6 ospf enable
Switch:1(router-vrf)#interface Loopback 10
Switch:1(config-if)#ipv6 interface address 2001::10:10:0:1/128 vrf test
Switch:1(config-if)#ipv6 ospf 10 area 192.2.0.1
Switch:1(config-if)#ipv6 ospf 10 enable
```

Variable Definitions

The following table defines parameters for the **ip vrf** command and the **router vrf** command.

Variable	Value
<i>WORD<1-16></i>	Specifies the name of the VRF.

The following table defines parameters for the **interface loopback** command.

Variable	Value
<i><1-256></i>	Specifies the ID of the loopback interface.

The following table defines parameters for the **ipv6 interface** command.

Variable	Value
<i>address WORD<0-255></i>	Specifies the IPv6 loopback interface address. Enter the interface address in the <i>WORD<0-255></i> portion.
<i>vrf WORD<1-16></i>	Specifies the name of the VRF. Enter the VRF name in the <i>WORD<1-16></i> portion.

The following table defines parameters for the **ipv6 ospf** command.

Variable	Value
<1-256>	Specifies the interface ID value.
area {A.B.C.D}	Specifies the IPv6 OSPFv3 area address, typically formatted as an IP address. Enter the IP address in the {A.B.C.D} portion.

View OSPFv3 Information

View information about OSPF to view the current configuration.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View OSPF global information:
show ipv6 ospf [vrf WORD <1-16>] [vrfids WORD <0-512>]
3. View OSPF areas:
show ipv6 ospf area [vrf WORD <1-16>] [vrfids WORD <0-512>]
4. View OSPF interface information
show ipv6 ospf interface [gigabitEthernet {slot/port[sub-port]}|vlan <1-4059>] [vrf WORD <1-16>] [vrfids WORD <0-512>]
5. View OSPF interface timers:
show ipv6 ospf int-timers [vrf WORD <1-16>] [vrfids WORD <0-512>]
6. View the link-state database (LSDB) table:
show ipv6 ospf lsdb [adv-rtr <A.B.C.D>] [area <A.B.C.D>] [interface gigabitEthernet {slot/port[sub-port]}|vlan <1-4059>] [lsa-type <1-11>] [lsid <0-4294967295>] [scope <1-3>] [tunnel <1-2000>] [detail] [vrf WORD <1-16>] [vrfids WORD <0-512>]
7. View OSPF neighbors to see routers with interfaces to a common network, including neighbors on the virtual link to the OSPF backbone:
show ipv6 ospf neighbor [vrf WORD <1-16>] [vrfids WORD <0-512>]

Examples

```
Switch:1#show ipv6 ospf
```

```

Variable Definitions

Use the data in the following table to use the **show ipv6 ospf lsdb** commands.

Variable	Value
<i>adv-rtr</i> <A.B.C.D>	Shows information for the specified advertising router.
<i>area</i> <A.B.C.D>	Shows information for the specified area.
<i>detail</i>	Shows information beyond the basic information.
<i>interface</i> <i>gigabitethernet</i> { <i>slot/port</i> [/ <i>sub-port</i>]}	Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<i>lsa-type</i> <1-11>	Shows information for the specified LSA type.
<i>lsid</i> <0-4294967295>	Shows information for the specified link-state ID.

Variable	Value
<i>scope</i> <1-3>	Shows information for the specified scope: <ol style="list-style-type: none"> 1. link-scope LSAs: View the link-scope LSDB to view the LSAs that are not flooded beyond the local link. 2. area-scope LSAs: View the area-scope LSDB to see the LSAs that are flooded in a single OSPF area. Area scope is used in router LSAs, network LSAs, Inter-Area-Prefix-LSAs, Inter-Area-Router LSAs, and Intra-Area-Prefix-LSAs. 3. AS-scope LSAs: View the AS-scope LSDB to see the LSAs that are flooded through the routing domain. The AS scope is used for ASexternal- LSAs.
<i>tunnel</i> <1-2000>	Specifies the ID number of the tunnel.
<i>vrf</i> <i>WORD</i> <1-16>	Specifies the VRF name.
<i>vrfids</i> <i>WORD</i> <0-512>	Specifies VRF IDs.

View OSPFv3 Default Cost Information

About This Task

Use the following procedure to view the OSPF default cost information, to ensure accuracy.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the OSPF cost information:
show ipv6 ospf default-cost [*vrf* *WORD* <1-16>] [*vrfids* *WORD* <0-512>]

Example

```
Switch:1#show ipv6 ospf default-cost
=====
IPv6 OSPF Default Metric - GlobalRouter
=====
 10MbpsPortDefaultMetric: 100
 100MbpsPortDefaultMetric: 10
 1000MbpsPortDefaultMetric: 1
 10000MbpsPortDefaultMetric: 1
 25000MbpsPortDefaultMetric: 1
 40000MbpsPortDefaultMetric: 1
 100000MbpsPortDefaultMetric: 1
      VlanDefaultMetric: 10
```

Add an NBMA Neighbor

Add an NBMA neighbor for each interface that is eligible to become the DR.

An NBMA interface with a positive nonzero router priority is eligible to become the DR for the NBMA network and is configured with the identification of all attached routers, IPv6 addresses, and router priorities.

Before You Begin

- Identify the following information:
 - specific interfaces to include in the NBMA network
 - the IPv6 address for each interface
 - the router priority for each interface
 - the hello interval for the network
 - the router dead interval for the network
 - the poll interval for the network

About This Task

In contrast to a broadcast network where switches multicast (send to AllSPFRouters and AllDRouters) certain OSPF protocol packets, switches replicate and send NBMA packets to each neighboring router as unicast. NBMA networks drop all OSPF packets with destination addresses AllSPFRouters and AllDRouters. Because the NBMA network does not broadcast, you must manually configure a list of neighbors and priorities for all routers in the network that can become the DR. Potential DRs use a positive nonzero router priority.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create a new NBMA neighbor:

```
ipv6 ospf nbma-nbr WORD<0-43> <0-255>
```

3. Change the priority of an existing NBMA neighbor:

```
ipv6 ospf nbma-nbr WORD<0-43> priority <0-255>
```

Example

Create an NBMA neighbor that will not become the DR:

```
Switch:1(config-if)#ipv6 ospf nbma-nbr fe80:0:0:0:8217:7dff:fe76:8a03 0
```

Variable definitions

Use the data in the following table to use the **ipv6 ospf nbma-nbr** command.

Variable	Value
<i>priority</i> <0-255>	Specifies the priority to use for this neighbor in the designated router election process. A value of 0 indicates the neighbor cannot become the designated router. The higher the priority value, the higher chance the switch will win the election process. The default is 1.
<i>WORD</i> <0-43>	Specifies the IPv6 address of the neighbor.

Configure Link LSA Suppression

About This Task

Use the following procedure to configure link LSA suppression on a port or a VLAN, to decrease unnecessary link LSA generation and flooding for non-broadcast and non-NBMA interface.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enter the following command:

```
ipv6 ospf area {A.B.C.D} network {p2p | p2mp} link-lsa-suppression
```

Example

Variable definitions

Following table describes the variables to the **ipv6 ospf area {A.B.C.D} network p2p link-lsa-suppression** command.

Variable	Description
<i>area</i> {A.B.C.D}	Create an IPv6 OSPF area.
<i>network</i>	Sets the type of interface.

Variable	Description
<i>[eth NBMA p2mp p2p passive]</i>	Specifies the type of interface.
<i>link-lsa-suppression</i>	Enables link LSA suppression.

Configure Route Redistribution to OSPFv3 in GRT Mode

Configure a redistribute entry to announce certain routes into the OSPFv3 domain, including static routes, direct routes, RIPng, OSPF routes, IS-IS routes, or Border Gateway Protocol (BGP) routes. Optionally, use a route policy to control the redistribution of routes.

Note

RIPng is not virtualized, therefore RIPng redistribution in OSPFv3 works only in GRT.

Before You Begin

- Enable OSPFv3 globally.
- Ensure that a route policy exists.
- Ensure that you set OSPFv3 as the boundary router.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For a redistribute policy (OSPFv3) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace *ipv6* with *ipv6 ospf*.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Create the redistribution instance:

```
ipv6 redistribute <bgp|direct|isis|rip|static>
```

Note

The switch loads the existing configuration when you upgrade to the current release. Once you have the configuration file saved using the current release, only the new configuration will be loaded.

3. Apply a route policy if required:

```
ipv6 redistribute <bgp|direct|isis|rip|static> route-map WORD<0-64>
```

Note

No inter-vrf Route Redistribution is supported for IPv6.

4. Configure other parameters, as required.

5. Enable the redistribution.

```
ipv6 redistribute <bgp|direct|isis|rip|static> enable
```

6. Ensure that the configuration is correct:

```
show ipv6 ospf redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

7. Exit to Global Configuration mode:

```
exit
```

8. Apply the redistribution.

```
ipv6 ospf apply redistribute <bgp|direct|isis|rip|static> [vrf WORD<1-16>]
```

Changes do not take effect until you apply them.

9. View all routes that are redistributed into OSPFv3:

- a. View the routes that are redistributed from the GRT to OSPFv3:

```
show ipv6 ospf redistribute
```

- b. View the routes that are redistributed to OSPFv3 for a specific VRF instance:

```
show ipv6 ospf redistribute [vrf WORD<1-64>] [vrfids WORD<0-512>]
```

Example

Redistribute static routes from the GRT to OSPF.

Create the redistribution instance, apply a route policy, enable redistribution, and apply the redistribution.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#ipv6 redistribute static

WARNING: Routes will not be injected until apply command is issued after enable command
Switch:1(config-ospf)#ipv6 redistribute static route-map policy1
Switch:1(config-ospf)#ipv6 redistribute static enable
Switch:1(config-ospf)#exit
Switch:1(config)#ipv6 ospf apply redistribute static
Switch:1(config)#show ipv6 ospf redistribute
```

OSPFv3 Redistribute List - GlobalRouter				
SRC	MET	MTYPE	ENABLE	RPOLICY
STAT	0	type2	TRUE	policy1

Variable Definitions

Use the data in the following table to use the **ipv6 redistribute** command.

Variable	Value
<i>enable</i>	Enables the OSPF route redistribution instance.
<i>metric <0-65535></i>	Configures the metric to apply to redistributed routes.
<i>metric-type <type1 type2></i>	Specifies a type 1 or a type 2 metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone.
<i>route-map WORD<0-64></i>	Configures the route policy to apply to redistributed routes.
<i><bgp direct isis rip static></i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, or static.

Use the data in the following table to use the **ipv6 ospf apply redistribute** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies the VRF instance.
<i><bgp direct isis rip static></i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, or static.

View the Status of OSPFv3 Redistribution

View the status of OSPFv3 route redistribution to verify the current configuration. You can redistribute directly connected routes and IPv6 static routes into OSPFv3.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the current configuration:
show ipv6 ospf redistribute [vrf WORD <1-16>] [vrfids WORD <0-512>]

Example

```
Switch:1#show ipv6 ospf redistribute
```

```
=====
OSPFv3 Redistribute List - GlobalRouter
=====
```

```

SOURCE  MET      MTYPE      ENABLE  RPOLICY
-----
Static  0          external  TRUE
-----

```

Variable Definitions

Use the data in the following table to use the **show ipv6 ospf redistribute** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies the VRF name.
<i>vrfids WORD<0-512></i>	Specifies VRF IDs.

View OSPFv3 Statistics

View OSPFv3 statistics to analyze trends.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View statistics:

```
show ipv6 ospf statistics [vrf WORD <1-16>] [vrfids WORD <0-512>]
```

Example

View IPv6 OSPF statistics:

```

Switch:1>enable
Switch:1#show ipv6 ospf statistics

=====
                        OSPFv3 Statistics - GlobalRouter
=====
      NumTxPkt: 9958
      NumRxPkt: 8982
    NumTxDropPkt: 33
    NumRxDropPkt: 0
    NumRxBadPkt: 0
      NumSpfRun: 42
    LastSpfRun: 0 day(s), 02:44:32
    LsdbTblSize: 45
    NumBadLsReq: 0
    NumSeqMismatch: 0
    NumOspfAdjacencies: 7

```

Variable Definitions

Use the data in the following table to use the **show ipv6 ospf stats** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies the VRF name.
<i>vrfids WORD<0-512></i>	Specifies VRF IDs.

Clear OSPFv3 Statistics

About This Task

Use the following procedure to clear all OSPFv3 statistics.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Clear the statistics:
`clear ipv6 ospf stats [vrf WORD<1-16>] [vrfids WORD<0-512>]`

Variable Definitions

Use the data in the following table to use the **clear ipv6 ospf stats** command.

Variable	Value
<code>vrf WORD<1-16></code>	Specifies the VRF name.
<code>vrfids WORD<0-512></code>	Specifies VRF IDs.

Disable Helper Mode for OSPFv3

Before You Begin

You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace *ipv6* with *ipv6 ospf*.

About This Task

By default, OSPF Helper mode is enabled when OSPF is configured. You can disable helper mode by the following command and re-enable it again by using “no” or “default” commands.

Procedure

1. Enter OSPF Router Configuration mode:
`enable`

`configure terminal`

`router ospf`
2. Enter the following command to disable Helper mode:
`ipv6 helper-mode-disable`
3. Enter the following command to enable Helper mode:
`no ipv6 helper-mode-disable`

Or

`default ipv6 helper-mode disable`

Example

Disabling Helper mode:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#ipv6 helper-mode-disable
```

Enabling Helper mode:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#no ipv6 helper-mode-disable
```

OSPF Configuration Using EDM

Configure Open Shortest Path First (OSPF) parameters so that the switch can participate in OSPF routing operations. The following section describes procedures that you use while you configure OSPF using Enterprise Device Manager (EDM).

Configure OSPF Globally

Configure OSPF parameters, such as automatic virtual links and OSPF metrics, so you can control OSPF behavior on the system.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.
- Assign an IP address to the switch.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **General** tab.
4. Specify the OSPF router ID.
5. In AdminStart, select **enabled**.
6. (Optional) If required, configure the metrics that OSPF uses for different link speeds. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet.
7. (Optional) To enable the switch to use OSPF SNMP traps, select the **TrapEnable** check box.
8. (Optional) To enable the automatic creation of virtual links, select the **AutoVirtLinkEnable** check box.
9. (Optional) Configure the OSPF holddown timer as required.
10. Select **Apply**.

General Field Descriptions

Use the data in the following table to use the **General** tab.

Name	Description
RouterId	Specifies the OSPF router ID. This variable has the same format as an IP address but distinguishes this router from other routers in the OSPF domain.
AdminStat	Shows the administrative status of OSPF for the router. Enabled denotes that the OSPF process is active on at least one interface; disabled disables it for all interfaces. The default is disabled.
VersionNumber	Specifies the OSPF version.
AreaBdrRtrStatus	Denotes if this router is an area border router (ABR). AreaBdrRtrStatus value must be true to create a virtual router interface.
ASBdrRtrStatus	Specifies ASBR status. If you select the ASBdrRtrStatus check box, the router is an autonomous system boundary router (ASBR).
ExternLsaCount	Shows the number of external (LS type 5) link-state advertisements in the link-state database.
ExternLsaCksumSum	Shows the 32-bit unsigned sum of the link-state checksums of the external link-state advertisements in the link-state database. This sum determines if a change occurred in a router link-state database and compares the link-state databases of two routers.
OriginateNewLsas	Shows the number of new link-state advertisements originated from this router. This number increments each time the router originates a new link-state advertisement (LSA).
RxNewLsas	Shows the number of received link-state advertisements that are new instances. This number does not include new instances of self-originated link-state advertisements.
Rfc1583Compatability	Controls the preference rules used when the router chooses among multiple autonomous system external (ASE) LSAs which advertise the same destination. If enabled, the preference rule is the same as that specified by RFC 1583. If disabled, the preference rule is as described in RFC 2328, which can prevent routing loops when ASE LSAs for the same destination originate from different areas. The default is disable.
OpaqueLsaSupport	Specifies support for Opaque LSA types.
10MbpsPortDefaultMetric	Indicates the default cost applied to 10 Mbps interfaces (ports). The default is 100.
100MbpsPortDefaultMetric	Indicates the default cost applied to 100 Mbps interfaces (ports). The default is 10.

Name	Description
1000MbpsPortDefaultMetric	Indicates the default cost applied to 1 Gbps interfaces (ports). The default is 1.
10000MbpsPortDefaultMetric	Indicates the default cost applied to 10 Gbps interfaces (ports). The default is 1.
25000MbpsPortDefaultMetric	Indicates the default cost applied to 25 Gbps interfaces (channelized 100 Gbps ports). The default is 1.
40000MbpsPortDefaultMetric	Indicates the default cost applied to 40 Gbps interfaces (ports). The default is 1.
100000MbpsPortDefaultMetric	Indicates the default cost applied to 100 Gbps interfaces (ports). The default is 1.
VlanDefaultMetric	Configures the VLAN interfaces default metric. The default is 10.
TrapEnable	Indicates whether to enable traps for OSPF. The default is false.
AutoVirtLinkEnable	Enables or disables the automatic creation of virtual links. The default is false.
SpfHoldDownTime	Specifies the OSPF holddown timer (3–60 seconds). The default is 10 seconds. The holddown timer delays a metric change due to a routing table update by x seconds. If you configure the timer to 0, OSPF accepts a new metric change immediately.
OspfAction	Initiates a new Shortest Path First (SPF) run to update the routing table. The default is none.
LastSpfRun	Indicates the time since the last SPF calculation made by OSPF.
HelperModeDisable	Disables the helper mode. It is enabled by default.

Enable OSPF Globally

Enable OSPF globally enabled to use the protocol on the router. If you disable OSPF globally, all OSPF actions cease.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **General** tab.
4. For **AdminStat**, select the **enabled** or **disabled** option button, as required.

5. Select **Apply**.

Configure Global Default Metrics

Configure the metrics that OSPF uses for different link speeds. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **General** tab.
4. Change the metric for one or all of the following:
 - 10MbpsPortDefaultMetric
 - 100MbpsPortDefaultMetric
 - 1000MbpsPortDefaultMetric
 - 10000MbpsPortDefaultMetric
 - 25000MbpsPortDefaultMetric
 - 40000MbpsPortDefaultMetric
 - 100000MbpsPortDefaultMetric
5. Select **Apply**.

Configure an OSPF interface

Configure OSPF parameters, such as authentication and priority, so you can control OSPF interface behavior. You can specify the interface as passive, broadcast, Non-Broadcast Multiple Access (NBMA), or Point-to-Point (p2p).

Before You Begin

- Enable OSPF globally.
- Ensure that the interface exists (the port or VLAN has an IP address).
- You must know the network OSPF password to use password authentication.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Interfaces** tab.
4. Select **Insert**.

5. Select the IP address for the interface from the IP Address list.
6. To designate a router priority, in the **RtrPriority** box, type a new value.
7. In the **Type** area, select the type of OSPF interface you want to create.
8. Select the authentication type you want in the **AuthType** field.
9. If you chose **simplePassword**, in the **AuthKey** box, type a password of up to eight characters.
10. To change their values, select the current value in the **HelloInterval**, **RtrDeadInterval**, or **PollInterval** boxes, and then type new values.
11. Select **Insert**.
12. On the **Interfaces** tab, Select **Apply**.

Interfaces Field Descriptions

Use the data in the following table to use the **Interfaces** tab.

Name	Description
IP Address	Specifies the IP address of the current OSPF interface.
AddressLessIf	Designates whether an interface has an IP address: Interfaces with an IP address = 0 Interfaces without IP address = ifIndex
Areald	Specifies the OSPF area name in dotted-decimal format. For VLANs, keeping the default area setting on the interface causes link-state database (LSDB) inconsistencies. The area name is not related to an IP address. You can use a suitable value for the OSPF area name (for example, 1.1.1.1 or 200.200.200.200).
AdminStat	Specifies the current administrative status of the OSPF interface (enabled or disabled).
State	Specifies the current state of the OSPF interface. The value can be one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesignatedRouter • otherDesignatedRouter
RtrPriority	Specifies the OSPF priority to use during the election process for the designated router. The interface with the highest priority becomes the designated router. The interface with the second-highest priority becomes the backup designated router. If the priority is 0, the interface cannot become the designated router or the backup. The range is 0–255. The default is 1.
DesignatedRouter	Specifies the IP address of the designated router.

Name	Description
BackupDesignatedRouter	Specifies the IP address of the backup designated router.
Type	<p>Specifies the type of OSPF interface (broadcast, NBMA, and p2p).</p> <p>Note: To make it passive:</p> <ol style="list-style-type: none"> 1. Create the interface. 2. After interface creation, select VLAN > VLANs to select the VLAN that is created with the OSPF interface. 3. Select the IP tab and select the IP interface that is created with the OSPF interface. 4. Select the OSPF tab and select Passive for the IfType.
AuthType	<p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note: sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
AuthKey	Specifies the key (up to 8 characters) required when you specify simple password authentication in the AuthType parameter.
HelloInterval	<p>Specifies the length of time, in seconds, between hello packets. This value must be the same for all routers attached to a common network. The default is 10 seconds.</p> <p>After you change the hello interval values, you must save the configuration file, and then restart the switch. After the switch restarts, it restores the values and checks for consistency.</p>

Name	Description
TransitDelay	Specifies the length of time, in seconds, required to transmit an LSA update packet over the interface. The default is 1.
RetransInterval	Specifies the length of time, in seconds, required between LSA retransmissions. The default is 5.
RtrDeadInterval	Specifies the interval used by adjacent routers to determine if the router was removed from the network. This interval must be identical on all routers on the subnet and a minimum of four times the Hello interval. To avoid interpretability issues, the RtrDeadInterval value for the OSPF interface must match with the RtrDeadInterval value for the OSPF virtual interface. The default is 40 seconds.
PollInterval	Specifies the length of time, in seconds, between hello packets sent to an inactive OSPF router. The default is 120.
Events	Indicates the number of times this OSPF interface has changed state, or an error has occurred.
LsaCount	Specifies the total number of link state advertisements in this area LSDB, excluding AS-external LSAs.
LsaChecksumSum	Specifies the number of link-state advertisements. This sum excludes external (LS type 5) link-state advertisements. The sum determines if a change occurred in a router LSDB and compares the LSDB of two routers.
DesignatedRouterId	Specifies the router ID of the designated router.
BackupDesignatedRouterId	Specifies the router ID of the backup designated router.

Change an OSPF Non-Passive Interface Type

Change the interface type to designate the interface as either passive, NBMA, or broadcast.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- If the interface is currently an NBMA interface with manually configured neighbors, you must first delete all manually configured neighbors.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Interfaces** tab.

4. To disable the interface, double-click the **AdminStat** cell, and then select **disabled**.
5. Select **Apply**.
6. To change the interface type, double-click the **Type** cell, and then choose the new interface type.
7. Select **Apply**.
8. To enable the interface, double-click the **AdminStat** cell, and then select **enabled**.
9. Select **Apply**.

Change an OSPF Passive Interface Type

Change the interface type to designate the interface as either passive, NBMA, or broadcast.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- If the interface is currently an NBMA interface with manually configured neighbors, you must first delete all manually configured neighbors.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **VLANs**.
3. Select on the VLAN where the OSPF interface is created.
4. Select **IP**.
5. Select the IP Address where the OSPF interface is created.
6. Select the **OSPF** tab.
7. Clear the **Enable** check box to disable the OSPF interface.
8. Select **Apply**.
9. Modify the interface type to passive.
10. Select the **Enable** check box.
11. Select **Apply**.

Configure NBMA Interface Neighbors

Configure NBMA neighbors so that the interface can participate in designated router election. All neighbors that you manually insert on the Neighbors tab are NBMA neighbors.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.

- Ensure that the interface type is NBMA.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Neighbors** tab.
4. Select **Insert**.
5. Enter the IP address and priority for the first neighbor.
6. Select **Insert**.
7. Add all required neighbors.
8. Select **Apply**.

Neighbors Field Descriptions

Use the data in the following table to use the **Neighbors** tab.

Name	Description
NbrIpAddr	Specifies the neighbor IP address.
AddressLessIndex	Indicates addressed and addressless interfaces. This value is 0 on an interface with an IP address. On addressless interfaces, the corresponding value of ifIndex in the Internet standard management information base (MIB).
NbrRtrId	Specifies the router ID of the neighboring router. The router ID has the same format as an IP address but identifies the router independent of its IP address.
Options	Specifies the bit mask that corresponds to the neighbor options parameter.
Priority	Specifies the priority.
State	Specifies the OSPF interface state.
Events	Specifies the number of state changes or error events that occur between the OSPF router and the neighbor router.
Retransmission Queue Length	Specifies the number of elapsed seconds between advertising retransmissions of the same packet to a neighbor.
ospfNbmaNbrPermanence	Indicates whether the neighbor is a manually configured NBMA neighbor; permanent indicates it is an NBMA neighbor.
HelloSuppressed	Indicates whether hello packets to a neighbor are suppressed.
RestartHelperStatus	Specifies whether the router is acting as a graceful restart helper for the neighbor.

Name	Description
RestartHelperAge	Specifies the remaining time in the current OSPF graceful restart interval, if the router is acting as a restart helper for the neighbor.
RestartHelperExitReason	Specifies the outcome of the last attempt at acting as a graceful restart helper for the neighbor.

Configure OSPF Interface Metrics

Configure the metrics associated with the peer layer interface to control OSPF behavior. For finer control over port-specific metric speed, you can specify the metric speed when you configure OSPF on a port.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **If Metrics** tab.
4. Double-click the value cell, and type a new value.
5. Select **Apply**.

When you enable a port for OSPF routing, the default metric in the port tab is 0. A value of 0 means that the port uses the default metrics for port types that you specify on the OSPF General tab.

If Metrics Field Descriptions

Use the data in the following table to use the **If Metrics** tab.

Name	Description
IP Address	Specifies the IP address of the device used to represent a point of attachment in a TCP/IP internetwork.
AddressLessIf	Indicates addressed and addressless interfaces. This variable is 0 on interfaces with IP addresses and equals ifIndex for interfaces that have no IP address.
TOS	Specifies the type of service (TOS). The TOS is a mapping to the IP type of service flags as defined in the IP forwarding table management information base (MIB).

Name	Description
Value	Indicates the metric from the OSPF router to a network in the range.
Status	Specifies the status of the interface as active or not active. This variable is read-only.

View All OSPF Enabled Interfaces

View all OSPF enabled interfaces to determine which interfaces use OSPF routing.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Interfaces** tab.
4. To ensure the system displays the latest information, select **Refresh**.

View OSPF Statistics

View OSPF statistics.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Stats** tab.

Stats Field Descriptions

Use the data in the following table to use the OSPF **Stats** tab.

Name	Description
AbsoluteValue	Displays the counter value.
Cumulative	Displays the total value since you opened the Stats tab.
Average/sec	Displays the average value for each second.
Minimum/sec	Displays the minimum value for each second.
Maximum/sec	Displays the maximum value for each second.
LastVal/sec	Displays the last value for each second.
LsdbTblSize	Displays the number of entries in the link state database table.
TxPackets	Displays the number of packets transmitted by OSPF.
RxPackets	Displays the number of packets received by OSPF.
TxDropPackets	Displays the number of packets dropped before transmitted by OSPF.
RxDropPackets	Displays the number of packets dropped before received by OSPF.

Name	Description
RxBadPackets	Displays the number of packets received by OSPF that are bad.
SpfRuns	Displays the total number of SPF calculations performed by OSPF, which includes the number of partial route table calculation for incremental updates.
BuffersAllocated	Displays the number of buffers allocated for OSPF.
BuffersFreed	Displays the number of buffers that are freed by the OSPF.
BufferAllocFailures	Displays the number of times that OSPF has failed to allocate buffers.
BufferFreeFailures	Displays the number of times that OSPF has failed to free buffers.
Routes	Displays the number of OSPF routes added to RTM.
Adjacencies	Displays how many adjacencies are learned through the interface.
Areas	Displays the number of areas configured.
Nbrs	Indicates the number of OSPF neighbors.
BadLsReqs	Indicates the number of bad link state requests.
SeqMismatches	Indicates the number of sequence mismatched packets.
NumAllocDDP	Indicates the number of database description (DD) packet buffers allocated for OSPF.
NumFreeDDP	Indicates the number of DD packet buffers that are freed by the OSPF.

Graph OSPF Statistics

Graph OSPF statistics. The graph formats available are: line chart, area chart, bar chart, and pie chart.

Procedure

1. In the navigation pane, expand **Configuration > IP**
2. Select **OSPF**.
3. Select the **Stats** tab.
4. (Optional) To refresh the values in the table, select **Clear Counters**.
5. To specify the polling interval, from the **Poll Interval** drop down menu, select a value. The options are:

Option	Description
5s	The polling interval is 5 seconds.
10s	The polling interval is 10 seconds.
30s	The polling interval is 30 seconds.
1m	The polling interval is 1 minute.

Option	Description
5m	The polling interval is 5 minutes.
30m	The polling interval is 30 minutes.
1h	The polling interval is 1 hour.

6. Select one value; for example, AbsoluteValue or Cumulative.

- Or, select two values; for example, AbsoluteValue and Cumulative.

To select a second value, press the **Ctrl** key, then select the second value. You cannot select more than two values.

7. From the toolbar, select a chart icon. The options are:

Option	Description
Line Chart	Displays a line chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
Area Chart	Displays an area chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
Bar Chart	Displays a bar chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
Pie Chart	Displays a pie chart for the values you selected against the polling interval.

The Chart Legend uses different colors to identify the values you selected that are plotted on the graph.

8. To switch the horizontal and vertical axes values, on the chart toolbar, select **Horizontal**.
9. To switch views of the log scale from high to low values, or low to high values, on the chart toolbar, select **Log Scale**.
10. To switch to another chart using the same values, on the chart toolbar, select a chart icon.

Configure OSPF on a Port

Configure OSPF parameters on a port so you can control OSPF behavior on the port.

Important

When you enable OSPF on a port, the switch automatically creates an area 0.0.0.0, and advertises it on the specific port, by default. To avoid this behavior, you must manually configure the port into a properly configured area on the switch.

Before You Begin

- Enable OSPF globally .
- Ensure that the port uses an IP address.
- Ensure that the ospf_md5key.txt file is on the switch to use MD5 authentication.
- You must know the network OSPF password to use password authentication.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **IP**.
4. Select the **OSPF** tab.
5. Select **Enable**.
6. Specify the hello interval.
7. Specify the router dead interval.
8. Designate a router priority.
9. Configure a metric.
10. If you want, select an authentication type.
11. If you select **simplePassword** authentication, type a password in the **AuthKey** box.
12. Configure the area ID.
13. If desired, select the **AdvertiseWhenDown** check box.
14. Select an interface type.
15. Type a value in the **PollInterval** box.
16. For IfMtuIgnore, select either **enable** or **disable**.
17. For **BfdEnable**, select **enable**.
18. Select **Apply**.

OSPF Field Descriptions

Use the data in the following table to use the **OSPF** tab.

Name	Description
Enable	Enables or disables OSPF routing on the specified port. The default is false.
HelloInterval	<p>Specifies the length of time, in seconds, between the transmission of hello packets. This value must be the same for all routers attached to a common network. The default is 10 seconds.</p> <p>After you change the hello interval values, you must save the configuration file, and then restart the switch. After the switch restarts, it restores the values and checks for consistency.</p>
RtrDeadInterval	<p>Specifies the interval used by adjacent routers to determine if the router was removed from the network. This interval must be identical on all routers on the subnet, and a minimum of four times the hello interval. To avoid interoperability issues, the RtrDeadInterval value for the OSPF interface needs to match with the RtrDeadInterval value for the OSPF virtual interface. The default is 40 seconds.</p>
DesigRtrPriority	<p>Specifies the priority of this port in multiaccess networks to use in the designated router election algorithm. The value 0 indicates the router is not eligible to become the designated router on this particular network. If a tie occurs, routers use their router ID as a tie breaker. The default is 1.</p>
Metric	<p>Specifies the metric for the type of service (TOS) on this port. The value of the TOS metric is $(10^9 / \text{interface speed})$. The default is 1.</p> <ul style="list-style-type: none"> FFFF—No route exists for this TOS. IPCP links—Defaults to 0. 0—Use the interface speed as the metric value when the state of the interface is up.

Name	Description
AuthType	<p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha1—Specifies secure hash algorithm (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. You can only access and enable the SHA-1 authentication type after you enable enhanced secure mode. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note: sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
AuthKey	Specifies the key (up to 8 characters) when you specify simple password authentication in the port AuthType variable.
AreaId	<p>Specifies the OSPF area name in dotted-decimal format.</p> <p>The area name is not related to an IP address. You can use a suitable value for the OSPF area name (for example, 1.1.1.1 or 200.200.200.200).</p>
AdvertiseWhenDown	<p>Advertises the network on this port as up, even if the port is down. The default is false.</p> <p>After you configure a port with no link and enable AdvertiseWhenDown, it does not advertise the route until the port is active. Then, OSPF advertises the route even if the link is down. To disable advertising based on link-states, disable AdvertiseWhenDown.</p>
IfType	<p>Specifies the type of OSPF interface (broadcast, NBMA, passive, or p2p).</p> <p>Before you change an OSPF interface type, you must first disable the interface. If the interface is an NBMA interface, you must also delete all configured neighbors.</p>
PollInterval	Specifies the length of time, in seconds, between hello packets sent to an inactive OSPF router. Neighbors must have the same poll interval.

Name	Description
IfMtuIgnore	Specifies whether the interface ignores the global maximum transmission unit (MTU) configuration. To allow the switch to accept OSPF database description (DD) packets with a different MTU size, enable MtuIgnore. The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes.
BfdEnable	Enable Bidirectional Forwarding Detection (BFD) for OSPF.

Enable OSPF on a CLIP Interface

Before You Begin

- You must globally enable OSPF.
- The OSPF area must already exist.

About This Task

Enable Open Shortest Path First (OSPF) on a CLIP interface so that it can participate in OSPF routing.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **IP**.
3. Select the **Circuitless IP** tab.
4. Select the required CLIP interface.
5. Select **OSPF**.
6. Select the **Enable** check box.
You must enable OSPF on the CLIP interface for CLIP to function.
7. In the current **AreaId** field, enter the IP address of the OSPF backbone area.
8. Select **Apply**.

Circuitless OSPF Field Descriptions

Use the data in the following table to use the **Circuitless OSPF** tab.

Name	Description
Enable	Enables OSPF on the CLIP interface.
AreaId	Specifies the OSPF area ID.

View Port OSPF Statistics

View port OSPF statistics to manage network performance.

Procedure

1. On the Device Physical View, select a port.

2. In the navigation pane, expand **Configuration > Graph**.
3. Select **Port**.
4. Select the **OSPF** tab.

OSPF Field Descriptions

The following table describes parameters on the **OSPF** tab.

Name	Description
VersionMismatches	Specifies the number of version mismatches received by this interface.
AreaMismatches	Specifies the number of area mismatches received by this interface.
AuthTypeMismatches	Specifies the number of authentication type mismatches received by this interface.
AuthFailures	Specifies the number of authentication failures.
NetmaskMismatches	Specifies the number of net mask mismatches received by this interface.
HelloIntervalMismatches	Specifies the number of hello interval mismatches received by this interface.
DeadIntervalMismatches	Specifies the number of dead interval mismatches received by this interface.
OptionMismatches	Specifies the number of option mismatches in the hello interval or dead interval fields received by this interface.
RxHellos	Specifies the number of hello packets received by this interface.
RxDBDescrs	Specifies the number of database descriptor packets received by this interface.
RxLSUpdates	Specifies the number of link state update packets received by this interface.
RxLSReqs	Specifies the number of link state request packets received by this interface.
RxLSAcks	Specifies the number of link state acknowledge packets received by this interface.
TxHellos	Specifies the number of hello packets transmitted by this interface.
TxDBDescrs	Specifies the number of database descriptor packets transmitted by this interface.
TxLSUpdates	Specifies the number of link state update packets transmitted by this interface.
TxLSReqs	Specifies the number of link state request packets transmitted by this interface.
TxLSAcks	Specifies the number of link state acknowledge packets transmitted by this interface.

Graph OSPF Statistics for a Port

Use statistics to help you monitor OSPF performance on a port. You can also graph statistics for all OSPF packets.

Procedure

1. On the Device Physical View, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **IP**.
4. Select the **OSPF** tab.
5. Select **Graph**.
6. Select one or more values.
7. Select the type of graph.

OSPF Field Descriptions

Use the data in the following table to use the **OSPF** tab.

Name	Description
VersionMismatches	Indicates the number of version mismatches received by this interface.
AreaMismatches	Indicates the number of area mismatches received by this interface.
AuthTypeMismatches	Indicates the number of AuthType mismatches received by this interface.
AuthFailures	Indicates the number of authentication failures.
NetMaskMismatches	Indicates the number of net mask mismatches received by this interface.
HelloIntervalMismatches	Indicates the number of hello interval mismatches received by this interface.
DeadIntervalMismatches	Indicates the number of dead interval mismatches received by this interface.
OptionMismatches	Indicates the number of options mismatches received by this interface.
RxHellos	Indicates the number of hello packets received by this interface.
RxDBDescrs	Indicates the number of database descriptor packets received by this interface.
RxLSUpdates	Indicate the number of Link state update packets received by this interface.
RxLsReqs	Indicates the number of Link state request packets received by this interface.
RxLSAcks	Indicates the number of Link state acknowledge packets received by this interface.

Name	Description
TxHellos	Indicates the number of hello packets transmitted by this interface.
TxDBDescrs	Indicates the number of database descriptor packets transmitted by this interface.
TxLSUpdates	Indicate the number of Link state update packets transmitted by this interface.
TxLSReqs	Indicates the number of Link state request packets transmitted by this interface.
TxLSAcks	Indicates the number of Link state acknowledge packets transmitted by this interface.

Configure OSPF on a VLAN

Configure OSPF parameters on a VLAN to control OSPF behavior on the VLAN.

Important

When you enable OSPF on a VLAN, the switch automatically creates an area 0.0.0.0, and advertises it on the specific VLAN, by default. To avoid this behavior, you must manually configure the VLAN into a properly configured area on the switch.

Before You Begin

- Enable OSPF globally.
- Ensure that the VLAN uses an IP address.
- Ensure that the ospf_md5key.txt file is on the switch to use MD5 authentication.
- Ensure that you know the network OSPF to use password authentication.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select a VLAN.
5. Select **IP**.
6. Select the **OSPF** tab.
The information on the OSPF tab applies only to a routed port or VLAN, which means the VLAN uses an IP address.
7. To enable OSPF on the VLAN interface, select the **Enable** check box.
8. To change their values, select the current value in the **HelloInterval**, **RtrDeadInterval**, or **PollInterval** boxes, and then type new values.

9. To designate a router priority, in the **DesigRtrPriority** box, type the new value.
10. Select the authentication type in the **AuthType** field.
11. If you chose **simplePassword**, in the **AuthKey** box, type a password of up to eight characters.
12. Select the interface type you want to create.
13. Select **Apply**.

OSPF Field Descriptions

Use the data in the following table to use the **OSPF** tab.

Name	Description
Enable	Enables or disables OSPF routing on the specified VLAN. The default is false.
HelloInterval	Specifies the length of time, in seconds, between the transmission of hello packets. This value must be the same for all routers attached to a common network. The default is 10 seconds. After you change the hello interval values, you must save the configuration file, and then restart the switch. After the switch restarts, it restores the values and checks for consistency.
RtrDeadInterval	Specifies the interval used by adjacent routers to determine if the router was removed from the network. This interval must be identical on all routers on the subnet and a minimum of four times the hello interval. To avoid interoperability issues, the RtrDeadInterval value for the OSPF interface needs to match with the RtrDeadInterval value for the OSPF virtual interface. The default is 40 seconds.
DesigRtrPriority	Specifies the priority of this VLAN in multiaccess networks to use in the designated router election algorithm. The value 0 indicates the router is not eligible to become the designated router on this particular network. If a tie occurs, routers use their router ID as a tie breaker. The default is 1.
Metric	Specifies the metric for this TOS on this VLAN. The value of the TOS metric is $(10^9 / \text{interface speed})$. The default is 1. <ul style="list-style-type: none"> FFFF—No route exists for this TOS. IPCP links—Defaults to 0. 0—Use the interface speed as the metric value when the state of the interface is up.

Name	Description
AuthType	<p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. You can only access and enable the SHA-1 authentication type after you enable enhanced secure mode. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note: sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
AuthKey	Specifies the key (up to eight characters) when you specify simple password authentication in the VLAN AuthType variable.
AreaId	Specifies the OSPF area name in dotted-decimal format. The area name is not related to an IP address. You can use a suitable value for the OSPF area name (for example, 1.1.1.1 or 200.200.200.200).
AdvertiseWhenDown	<p>Advertises the network even if the port is down. If true, OSPF advertises the network on this VLAN as up, even if the port is down. The default is false.</p> <p>After you configure a port without a link and enable AdvertiseWhenDown, it does not advertise the route until the port is active. Then, OSPF advertises the route even when the link is down. To disable advertising based on link states, disable AdvertiseWhenDown.</p>
IfType	<p>Specifies the type of OSPF interface (broadcast, NBMA, passive, or p2p).</p> <p>Before you change an OSPF interface type, you must first disable the interface. If the interface is an NBMA interface, you must also delete all configured neighbors.</p>
PollInterval	Specifies the length of time, in seconds, between hello packets sent to an inactive OSPF router. Neighbors must use the same poll interval.

Name	Description
IfMtuIgnore	Specifies whether the VLAN ignores the MTU configuration. To allow the switch to accept OSPF DD packets with a different MTU size, enable MtuIgnore. The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes.
BfdEnable	Enables Bidirectional Forwarding Detection (BFD) for OSPF.

View Graphs for OSPF on a VLAN

Perform the following procedure to view graphs for OSPF on a VLAN. You can use graph statistics to monitor OSPF performance on a VLAN. The graph formats available are: line chart, area chart, bar chart, and pie chart.

Before You Begin

- OSPF must be enabled.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select a VLAN, and then select **IP**.
5. Select the **OSPF** tab.
6. Select **Graph**.
7. (Optional) To refresh the values in the table, select **Clear Counters**.
8. To specify the polling interval, from the **Poll Interval** drop down menu, select a value. The options are:

Choice Option	Choice Description
5s	The polling interval is 5 seconds.
10s	The polling interval is 10 seconds.
30s	The polling interval is 30 seconds.
1m	The polling interval is 1 minute.
5m	The polling interval is 5 minutes.
30m	The polling interval is 30 minutes.
1h	The polling interval is 1 hour.

9. Select one or two values.
To select two values, for example, AbsoluteValue and Cumulative. Select the first value, and then press the **Control** key to select the second value. You cannot select more than two values.

10. From the toolbar, select a chart icon. The options are:

Choice Option Choice Description

Line Chart	Displays a line chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
Area Chart	Displays an area chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
Bar Chart	Displays a bar chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
Pie Chart	Displays a pie chart for the values you selected against the polling interval.

The Chart Legend uses different colors to identify the values you selected that are plotted on the graph.

11. To switch the horizontal and vertical axes values, on the chart toolbar, select **Horizontal**.
12. To switch views of the log scale from high to low values, or low to high values, on the chart toolbar, select **Log Scale**.
13. To switch to another chart using the same values, on the chart toolbar, select a chart icon.

OSPF Field Descriptions

Use the data in the following table to use the **OSPF** tab.

Name	Description
AbsoluteValue	Displays the counter value.
Cumulative	Displays the total value since you opened the OSPF-Graph tab.
Average/sec	Displays the average value for each second.
Minimum/sec	Displays the minimum value for each second.
Maximum/sec	Displays the maximum value for each second.
LastVal/sec	Displays the last value for each second.
VersionMismatches	Displays the number version mismatches received by this interface.
AreaMismatches	Displays the number area mismatches received by this interface.
AuthTypeMismatches	Displays the number AuthType mismatches received by this interface.
AuthFailures	Displays the number Authentication failures.

Name	Description
NetMaskMismatches	Displays the number net mask mismatches received by this interface.
HelloIntervalMismatches	Displays the number hello interval mismatches received by this interface.
DeadIntervalMismatches	Displays the number dead interval mismatches received by this interface.
OptionMismatches	Displays the number options mismatches received by this interface.
RxHellos	Displays the number hello packets received by this interface.
RxDBDescrs	Displays the number database descriptor packets received by this interface.
RxLSUpdates	Displays the number Link state update packets received by this interface.
RxLSReqs	Displays the number Link state request packets received by this interface.
RxLSAcks	Displays the number Link state acknowledge packets received by this interface.
TxHellos	Displays the number hello packets transmitted by this interface.
TxDBDescrs	Displays the number database descriptor packets transmitted by this interface.
TxLSUpdates	Displays the number Link state update packets transmitted by this interface.
TxLSReqs	Displays the number Link state request packets transmitted by this interface.
TxLSAcks	Displays the number Link state acknowledge packets transmitted by this interface.

Create Stubby or Not-so-Stubby OSPF Areas

Import information from other areas to learn their OSPF relationships. Perform this procedure to create normal, stubby, or not-so-stubby areas (NSSA).

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

Place stubby areas or NSSAs at the edge of an OSPF routing domain. Ensure that you configure all routers in the stubby or NSSA as stubby or NSSA, respectively.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Areas** tab.
The backbone ID has an area ID of 0.0.0.0.
4. Select **Insert**.
5. Configure the area ID.
6. Select an option in the ImportAsExtern area.
To add a not-so-stubby (NSSA) area, select **importNssa**. To import external LSAs (create a normal OSPF area), select **importExternal**. To not import external LSAs (create a stubby area), select **importNoExternal**.
7. Select **Apply**.

Areas Field Descriptions

Use the data in the following table to use the **Areas** tab.

Name	Description
AreaId	Specifies a 32-bit integer that uniquely identifies an area. Area ID 0.0.0.0 is the OSPF backbone. For VLANs, using the default area on the interface causes LSDB inconsistencies.
ImportAsExtern	Specifies the method to import ASE link-state advertisements. The value can be importExternal (default), importNoExternal, or importNssa.
SpfRuns	Specifies the number of SPF calculations performed by OSPF.
AreaBdrRtrCount	Specifies the number of area border routers reachable within this area. Each SPF pass calculates this value, initially zero.
AsBdrRtrCount	Specifies the number of autonomous system border routers reachable within this area. Each SPF pass calculates this value, initially zero.
AreaLsaCount	Specifies the total number of link state advertisements in this area LSDB, excluding AS-external LSAs.
AreaLsaCksumSum	Specifies the number of link-state advertisements. This sum excludes external (LS type 5) link-state advertisements. The sum determines if a change occurred in a router LSDB and compares the LSDB of two routers.
AreaSummary	Specifies whether to send summary advertisements in a stub area.
ActiveIfCount	Specifies the number of active interfaces in this area.
AreaNssaTranslatorRole	Indicates if the NSSA border router can perform NSSA translation of Type 7 LSAs to Type 5 LSAs. The possible values are always or candidate. The default is candidate.

Name	Description
AreaNssaTranslatorState	Indicates if and how an NSSA border router translates Type 7 LSAs to Type 5 LSAs. The possible values are: <ul style="list-style-type: none">• enabled — the border router always translates the LSAs• elected — a candidate border router translates the LSAs• disabled — a candidate border router does not translate the LSAs
AreaNssaTranslatorStabilityInterval	Specifies number of seconds after an elected translator determines its services are no longer required.
AreaNssaTranslatorEvents	Specifies the number of translator state changes that have occurred since the last boot up.

Configure Stub Area Metrics Advertised by an ABR

Configure metrics to control the use of routes in a routing domain.

Before You Begin

- Enable OSPF globally.
- Ensure that the port uses an IP address.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Stub Area Metrics** tab.
4. Double-click the metric value to specify a new metric speed for the required stub areas.
5. Select **Apply**.

Stub Area Metrics *Field Descriptions*

Use the data in the following table to use the **Stub Area Metrics** tab.

Name	Description
AreaId	Specifies the 32-bit identifier for the stub area.
TOS	Specifies the type of service associated with the metric.
Metric	Specifies the metric value applied at the indicated type of service. By default, the value equals the lowest metric value at the type of service among the interfaces to other areas.
Status	Specifies the status of the stub area. This variable is read-only.

Insert OSPF Area Aggregate Ranges

Use aggregate area ranges to reduce the number of link-state advertisements required within the area. You can also control advertisements.

Before You Begin

- Enable OSPF globally.
- Ensure that the port uses an IP address.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Area Aggregate** tab.
4. Select **Insert**.
5. Type the area ID.
6. Select the type of link-state database.
7. Type the IP address of the network.
8. Type the subnet mask.
9. Select the effect.
10. In **AdvertiseMetric**, type a cost to advertise for the OSPF area range.
11. Select **Insert**.

Area Aggregate Field Descriptions

Use the data in the following table to use the **Area Aggregate** tab.

Name	Description
AreaID	Specifies the area in which the address exists.
LsdbType	Specifies the LSDB type: <ul style="list-style-type: none">• summaryLink—aggregated summary link• nssaExternalLink—not so stubby area link
IP Address	Specifies the IP address of the network or subnetwork indicated by the range.
Mask	Specifies the network mask for the area range.
Effect	Specifies advertisement methods: <ul style="list-style-type: none">• advertiseMatching means advertise the aggregate summary LSA with the same LSID.• doNotAdvertiseMatching means suppress all networks that fall within the entire range.• advertiseDoNotAggregate means advertise individual networks.

Name	Description
AdvertiseMetric	Changes the advertised metric cost for the OSPF area range.
ExtRouteTag	Specifies the external route tag to be included in NSSA (type-7) LSAs.

Enable Automatic Virtual Links

Use automatic virtual links to provide an automatic, dynamic backup link for vital OSPF traffic.

Before You Begin

- Enable OSPF globally.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **General** tab.
4. Select **AutoVirtLinkEnable**.
5. Select **Apply**.

Configure a Manual Virtual Interface

Use manual virtual links (interfaces) to provide a backup link for vital OSPF traffic with a minimum of resource use.

Before You Begin

- Enable OSPF globally.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Virtual If** tab.
4. Select **Insert**.
5. Specify the area ID of the transit area.
The transit area is the common area between two ABRs.
6. Specify the neighbor ID.
The neighbor ID is the IP router ID of the ABR that the other ABR needs to reach the backbone.

7. Select **Insert**.
8. To verify that the virtual link is active, select **Refresh** and check the **State** column.
If the state is point-to-point, the virtual link is active. If the state is down, the virtual link configuration is incorrect.

Virtual If Field Descriptions

Use the data in the following table to use the **Virtual If** tab.

Name	Description
Areald	Specifies the transit area ID that the virtual link traverses.
Neighbor	Specifies the router ID of the virtual neighbor.
TransitDelay	Specifies the estimated number of seconds required to transmit a link-state update packet over this interface. The default is 1.
RetransInterval	Specifies the number of seconds between link-state advertisement, and retransmissions for adjacencies that belong to this interface. This variable also applies to DD and link-state request packets. This value must exceed the expected round-trip time. The default is 5.
HelloInterval	Specifies the length of time, in seconds, between the hello packets that the router sends on the interface. This value must be the same for the virtual neighbor. The default is 10.
RtrDeadInterval	Specifies the number of seconds that expires before neighbors declare the router down. This value must be a multiple of the hello interval. This value must be the same for the virtual neighbor. The default is 60.
State	Specifies the OSPF virtual interface state.
Events	Specifies the number of state changes or error events on this virtual Link.
AuthType	Specifies the authentication type specified for a virtual interface. You can locally assign additional authentication types. The default is none.
AuthKey	Specifies the authentication password. If AuthType is a simple password, the device adjusts and zeros fill the eight octets. Unauthenticated interfaces need no authentication key, and simple password authentication cannot use a key with more than eight octets.
LsaCount	Specifies the total number of link state advertisements in this virtual interface LSDB.
LsaCksumSum	Specifies the number of link-state advertisements. The sum determines if a change occurred in a virtual interface LSDB and compares the virtual interfaceLSDB of the virtual neighbors.

View Virtual Neighbors

View virtual neighbors to view the area and virtual link configuration for the neighboring device.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Virtual Neighbors** tab.

Virtual Neighbors Field Descriptions

Use the data in the following table to use the **Virtual Neighbors** tab.

Name	Description
Area	Specifies the sub-network in which the virtual neighbor resides.
RtrId	Specifies the 32-bit integer (represented as an IP address) that uniquely identifies the neighbor router in the autonomous system.
IP Address	Specifies the IP address of the virtual neighboring router.
Options	Specifies the bit mask that corresponds to the neighbor options parameter.
State	Specifies the OSPF interface state.
Events	Specifies the number of state changes or error events that occurred between the OSPF router and the neighbor router.
LsRetransQLen	Specifies the number of elapsed seconds between advertising retransmissions of the same packet to a neighbor.
HelloSuppressed	Specifies whether hello packets from the neighbor are suppressed.
RestartHelperStatus	Specifies whether the router is acting as a graceful restart helper for the neighbor.
RestartHelperAge	Specifies the remaining time in the current OSPF graceful restart interval, if the router is acting as a restart helper for the neighbor.
RestartHelperExitReason	Specifies the outcome of the last attempt at acting as a graceful restart helper for the neighbor.

Configure Host Routes

Configure host routes when the switch resides in a network that uses routing protocols other than OSPF. A host route is a more-specific route and is used even if it is higher cost than a network route.

Before You Begin

- Enable OSPF globally.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

You can specify which hosts directly connect to the router and the metrics and types of service to advertise for the hosts.

Use a host route to create a custom route to a specific host to control network traffic.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Hosts** tab.
4. To insert a new host, select **Insert**.
5. In **IP Address**, type the area IP address of the new host.
6. In **Metric**, type the metric to advertise.
7. Select **Insert**.
8. Select **Apply**.

Hosts Field Descriptions

Use the data in the following table to use the **Hosts** tab.

Name	Description
IpAddress	Specifies the IP address of the host that represents a point of attachment in a TCP/IP internetwork.
TOS	Specifies the type of service of the route.
Metric	Specifies the metric advertised to other areas. The value indicates the distance from the OSPF router to a network in the range.
AreaID	Specifies the area where the host is found. By default, the area that submits the OSPF interface is in 0.0.0.0.

Enable ASBR Status

Enable the ASBR status to make the switch an autonomous system boundary router (ASBR). Use ASBRs to advertise nonOSPF routes into OSPF domains so that the routes pass through the domain. A router can function as an ASBR if one or more of its

interfaces connects to a non-OSPF network, for example, Routing Information Protocol (RIP), BGP, or Exterior Gateway Protocol (EGP).

Before You Begin

- Enable OSPF globally.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

To conserve resources, you can limit the number of ASBRs on your network or specifically control which routers perform as ASBRs to control traffic flow.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **General** tab.
4. Select **ASBdrRtrStatus**.
5. Select **Apply**.

Manage OSPF Neighbors

View or delete OSPF neighbors to control OSPF operations.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

The OSPF Hello protocol initiates and maintains neighbor relationships. The exception is that, in an NBMA network, you must manually configure permanent neighbors on each router eligible to become the DR. You can add neighbors for NBMA interfaces, but all other neighbors are dynamically learned.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Neighbors** tab.
4. To delete a manually configured neighbor, select the neighbors with a value of **permanent** in the **ospfNbmaNbrPermanence** column.
5. Select **Delete**.
6. Select **Apply**.

View the Link-State Database

View the area advertisements and other information in the LSDB to ensure correct OSPF operations.

Before You Begin

- To perform this procedure on a non-default VRF, you must first change the VRF instance. You cannot launch a VRF Context View for the derived name of the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100. All parameters might not be available in non-default VRFs.
- The VRF must have an RP trigger of OSPF.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Link State Database** tab.

Link State Database Field Descriptions

Use the data in the following table to use the **Link State Database** tab.

Name	Description
AreaId	Identifies the area. The OSPF backbone uses the area ID 0.0.0.0.
Type	Specifies the OSPF interface type. Broadcast LANs, such as Ethernet and IEEE 802.5, use broadcast; X.25 and similar technologies use NBMA; and links that are point-to-point use pointToPoint.
Lsid	Identifies the piece of the routing domain that the advertisement describes.
RouterId	Identifies the router in the autonomous system.
Sequence	Identifies old and duplicate link-state advertisements.
Age	Specifies the age, in seconds, of the link-state advertisement.
Checksum	Contains the checksum of the complete contents of the advertisement, except for the age parameter. The checksum does not include the age parameter so that advertisement age increments without updating the checksum.

View the Local Link-State Database

About This Task

View the link-local advertisements for each virtual interface in the link-state database.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Local Lsdb** tab.

Local Lsdb Field Descriptions

Use the data in the following table to use the **Local Lsdb** tab.

Name	Description
IpAddress	Specifies the IP address of the interface from which the link-state advertisement was received if the interface is numbered.
AddressLessIf	Specifies the interface index of the interface from which the LSA was received if the interface is unnumbered.
Type	Specifies the type of the link-state advertisement.
Lsid	Specifies the piece of the routing domain that the advertisement describes.
RouterId	Specifies the originating router in the Autonomous System.
Sequence	Identifies old and duplicate link-state advertisements.
Age	Specifies the age, in seconds, of the link-state advertisement.
Checksum	Contains the checksum of the complete contents of the advertisement, except for the age parameter. The checksum does not include the age parameter so that advertisement age increments without updating the checksum.
Advertisement	Specifies the size of the entire link-state advertisement.

View AS-Scope Link-State Advertisements

About This Task

View the AS-scope link-state advertisements.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **As Lsdb** tab.

As Lsdb Field Descriptions

Use the data in the following table to use the **As Lsdb** tab.

Name	Description
Type	Specifies the type of the link-state advertisement.
Lsid	Specifies the piece of the routing domain that the advertisement describes.
RouterId	Specifies the originating router in the Autonomous System.
Sequence	Specifies old and duplicate link-state advertisements.
Age	Specifies the age, in seconds, of the link-state advertisement.
Checksum	Contains the checksum of the complete contents of the advertisement, except for the age parameter. The checksum does not include the age parameter so that advertisement age increments without updating the checksum.
Advertisement	Specifies the size of the entire link-state advertisement.

View Virtual Links in the Link-State Database

About This Task

View virtual links in the link-state database.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Virt Local Lsdb** tab.

Virt Local Lsdb Field Descriptions

Use the data in the following table to use the **Virt Local Lsdb** tab.

Name	Description
TransitArea	Specifies the ID for the transit area that the virtual link traverses.
Neighbor	Specifies the router ID of the of the virtual neighbor.
Type	Specifies the type of the link-state advertisement.
Lsid	Specifies the piece of the routing domain that the advertisement describes.

Name	Description
RouterId	Specifies the originating router in the Autonomous System.
Sequence	Specifies old and duplicate link-state advertisements.
Age	Specifies the age, in seconds, of the link-state advertisement.
Checksum	Contains the checksum of the complete contents of the advertisement, except for the age parameter. The checksum does not include the age parameter so that advertisement age increments without updating the checksum.
Advertisement	Specifies the size of the entire link-state advertisement.

View the Area LSA Count

About This Task

View the link-state advertisements for a given area.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Area Lsa Count** tab.

Area Lsa Count Field Descriptions

Use the data in the following table to use the **Area Lsa Count** tab.

Name	Description
AreaId	Specifies the OSPF area.
LsaType	Specifies the link-state advertisement type.
Number	Specifies the number link-state advertisements of a given type for a given area.

Configure Route Redistribution to OSPF

Before You Begin

- Enable OSPF globally.
- Ensure that a route policy exists.

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

Configure a redistribute entry to announce routes of a certain source protocol type into the OSPF domain, for example, static, RIP, or direct. Optionally, use a route policy to control the redistribution of routes.

Important

Changing the OSPF redistribute context is a process-oriented operation that can affect system performance and network reachability while you perform this procedure. As a best practice, if you want to change default preferences for an OSPF redistribute context, do so before you enable the protocols.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Redistribute** tab.
4. Select **Insert**.
5. Select an option for the route source.
6. Select **enable**.
7. Select a route policy.
8. Configure the metric type.
9. Configure the subnet.
10. (Optional) Select **AutoFilterTag** to enable route filtering using tags.
11. Select **Insert**.

Redistribute Field Descriptions

Use the data in the following table to use the **Redistribute** tab.

Name	Description
DstVrflid	Specifies the destination virtual router forwarding instance. You cannot configure this variable.
Protocol	Specifies the dynamic routing protocol that receives the external routing information.
SrcVrflid	Specifies the source VRF instance.
RouteSource	Specifies the route source protocol for the redistribution entry.
Enable	Enables (or disables) an OSPF redistribute entry for a specified source type.

Name	Description
RoutePolicy	Configures the route policy (by name) to use for detailed redistribution of external routes from a specified source into an OSPF domain. Select the ellipsis (...) and choose from the list in the dialog box.
Metric	Configures the OSPF route redistribution metric for basic redistribution. A value of 0 indicates to use the original cost of the route.
MetricType	Configures the OSPF route redistribution metric type. The default is type 2. The cost of a type 2 route is the external cost, regardless of the interior cost. A type 1 cost is the sum of both the internal and external costs.
Subnets	Allows or suppresses external subnet route advertisements when routes are redistributed into an OSPF domain.
AutoFilterTag	Enables route filtering to ensure tagged routes are not redistributed into BGP. The default is disabled.

Force Shortest-Path Calculation Updates

Manually initiate an SPF run, or calculation, to immediately update the OSPF LSDB. This configuration is useful if

- you need to immediately restore a deleted OSPF-learned route
- the routing table entries and the LSDBs do not synchronize

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

Important

This process is computationally intensive. Use this command only if required.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **General** tab.
4. In **OspfAction**, select **runSpf**.
5. Select **Apply**.
6. Select **Yes** to force an SPF run.

After you initiate an SPF run, wait at least 10 seconds before you initiate another SPF run.

OSPFv3 Configuration using EDM

Use the procedures in this section to configure OSPFv3 using EDM.

Configure OSPFv3 Globally

Configure OSPFv3 globally to enable it on the system and to configure the router ID.

Before You Begin

- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

Note

Non-default VRFs do not support the configuration of the following parameters:

- OSPFv3 interfaces over IPv6 tunnels
- IPsec on OSPFv3 virtual link interfaces

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Globals** tab.
4. Type the router ID, in the format of an IPv4 address.
5. Select **enabled**.
6. (Optional) Select **ASBdrRtrStatus** to make the router an AS boundary router.
Enable the ASBR if the router attaches at the edge of the OSPF network, and has one or more interfaces that run an interdomain routing protocol. The default is disabled.
7. Select **Apply**.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

Note

Different hardware platforms support different port speeds. For more information, see your hardware documentation.

Name	Description
RouterId	Specifies a 32-bit integer that identifies the router in the autonomous system. This value must be unique. The default value will be one of the IPv4 interface addresses.
AdminStat	Enables or disables OSPFv3 on the router. If you disable OSPFv3 globally, you disable it on all interfaces. The default is disabled.

Name	Description
VersionNumber	Shows the OSPF version number, which for IPv6 is version 3.
AreaBdrRtrStatus	Shows if the router is an area border router.
ASBdrRtrStatus	Configures the router as an autonomous system boundary router. The default is disabled (clear).
HelperModeDisable	Disables Graceful Restart Helper Mode feature.
AsScopeLsaCount	Shows the number of AS-external link-state advertisements in the LSDB.
AsScopeLsaCksumSum	Shows the sum of the checksums for the link-scope LSAs in the LSDB. Use the sum to determine if a change in the LSDB occurs, and to compare the LSDBs of the two routers.
OriginateNewLsas	Shows the number of new link-state advertisements. The number increases each time the router originates a new LSA.
RxNewLsas	Shows the number of new link-state advertisements received. This number does not include new instances of self-originated link-state advertisements.
ExtLsaCount	Shows the number of external (LS type 0x4005) LSAs in the LSDB.
10MbpsPortDefaultMetric	Indicates the default cost applied to 10 Mbps interfaces (ports). The default is 100.
100MbpsPortDefaultMetric	Indicates the default cost applied to 100 Mbps interfaces (ports). The default is 10.
1000MbpsPortDefaultMetric	Indicates the default cost applied to 1 Gbps interfaces (ports). The default is 1.
10000MbpsPortDefaultMetric	Indicates the default cost applied to 10 Gbps interfaces (ports). The default is 1.
25000MbpsPortDefaultMetric	Indicates the default cost applied to 25 Gbps interfaces (channelized 100 Gbps ports). The default is 1.
40000MbpsPortDefaultMetric	Indicates the default cost applied to 40 Gbps interfaces (ports). The default is 1.
100000MbpsPortDefaultMetric	Indicates the default cost applied to 100 Gbps interfaces (ports). The default is 1.
vlanDefaultMetric	Indicates the default cost applied to VLAN interfaces. The default is 10.

Create an OSPFv3 Area

Create an area to subdivide the autonomous system (AS) into areas that group contiguous networks, routers that connect to these networks, and attached hosts. Subdividing the AS into areas significantly reduces the amount of routing protocol traffic compared to treating the entire AS like a single link-state domain.

Before You Begin

- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

Note

Non-default VRFs do not support the configuration of the following parameters:

- OSPFv3 interfaces over IPv6 tunnels
- IPsec on OSPFv3 virtual link interfaces

About This Task

A stub area does not receive advertisements for external routes, which reduces the size of the link-state database (LSDB). A stub area uses only one area border router (ABR). Any packets destined for outside the area are routed to the area border exit point, examined by the ABR, and forwarded to a destination.

A not so stubby area (NSSA) prevents the flooding of AS-External link-state advertisements into the area by replacing them with a default route. NSSAs also import small stub (non- OSPF) routing domains into OSPF.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Areas** tab.
4. Select **Insert**.
5. Type the area ID.
6. Select **Insert**.

Areas Field Descriptions

Use the data in the following table to use the **Areas** tab.

Name	Description
Id	Specifies a 32-bit integer to uniquely identify an area. Use 0.0.0.0 for the OSPFv3 backbone.
ImportasExtern	<p>Indicates the support for importing AS-external LSAs:</p> <ul style="list-style-type: none"> • importExternal—normal area • importNoExternal—stub area • importNssa—not-so-stubby-area <p>AS-scope LSAs are not imported into stub areas or NSSAs. NSSAs import AS-External data at Type 7 LSAs, which use area scope. importExternal is the default.</p>
SpfRuns	Shows the number of times the intra-area route table was calculated using the LSDB of this area.
BdrRtrCount	Shows the number of reachable ABRs in this area. The value starts at zero (0). The system calculates this value in each SPF run.
AsBdrRtrCount	Shows the number of reachable ASBRs in this area. The value starts at zero (0). The system calculates this value in each SPF run.
ScopeLsaCount	Shows the number of area-scope LSAs in the LSDB for this area.
ScopeLsaCksumSum	Shows the sum of the checksums for the area-scope LSAs in the LSDB. Use the sum to determine if a change in the LSDB occurs, and to compare the LSDBs of the two routers.
Summary	Controls the import of inter-area LSAs into a stub area. If the value is noAreaSummary , the router does not originate nor propagate inter-area LSAs into the stub area. If the value is sendAreaSummary (the default), the router both summarizes and propagates inter-area LSAs.
StubMetric	Configures the metric value advertised for the default route to stub and NSSA areas.
NssaTranslatorRole	Indicates if the NSSA border router can perform NSSA translation of Type 7 LSAs to Type 6 LSAs. The possible values are always or candidate. The default is candidate.

Name	Description
NssaTranslatorState	Indicates if and how an NSSA border router translates Type 7 LSAs to Type 5 LSAs. The possible values are <ul style="list-style-type: none"> • enabled—The border router always translates the LSAs. • elected—A candidate border router translates the LSAs. • disabled—A candidate border router does not translate the LSAs.
StubMetricType	Specifies the type of metric advertised as a default route. The possible values are: <ul style="list-style-type: none"> • ospfv3Metric—OSPF metric • comparableCost—external Type 1 • nonComparable—external Type 2 The default is ospfv3Metric.

Create OSPFv3 Area Ranges

Create an area address range on the OSPFv3 router to reduce the number of area border router (ABR) advertisements into other OSPF areas. An area address range is an implied contiguous range of area network addresses for which the ABR advertises a single summary route.

Before You Begin

- You must create the OSPF area.
- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

Note

Non-default VRFs do not support the configuration of the following parameters:

- OSPFv3 interfaces over IPv6 tunnels
- IPSec on OSPFv3 virtual link interfaces

About This Task

If you create two ranges, and one range is a subset of the other, the router uses the most specific match.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Area Aggregate** tab.
4. Select **Insert**.
5. Select the area ID.

6. Select the type of area.

interAreaPrefixLsa generates an aggregated summary.

nssaExternalLsa generates an NSSA link summary.

7. Type the prefix for the IPv6 area address.

8. Type the number of bits from the IPv6 address that you want to advertise.

9. Select **Insert**.

Area Aggregate *Field Descriptions*

Use the data in the following table to use the **Area Aggregate** tab.

Name	Description
AreaID	Specifies the area in which the address aggregate exists. Use dotted decimal notation to specify the area name.
AreaLsdbType	Specifies the area LSDB type to which the address aggregate applies. interAreaPrefixLsa generates an aggregated summary. nssaExternalLsa generates an NSSA link summary.
Prefix	Specifies the IPv6 prefix. The prefix and prefix length define the range.
PrefixLength	Specifies the length of the prefix, in bits. The prefix cannot be shorter than 3 bits. The prefix and prefix length define the range.
Effect	Specifies the advertisement mode for prefixes in the range. advertiseMatching advertises the aggregate summary LSA with the same link-state ID. doNotAdvertiseMatching does not advertise networks that fall within the range.
AdvertiseMetric	Specifies a cost value to advertise for the OSPF area range. This value applies to summary LSAs (Type 3). If the value is 0, OSPF uses the cost to the farthest point in the network that is summarized.

Create an OSPFv3 Virtual Link

Create a virtual link if the switch does not connect directly to the backbone. The switch can create automatic virtual links or you can perform this procedure to create virtual links manually. Manual virtual links conserve resources and provide specific control over virtual link placement in your OSPFv3 configuration.

Before You Begin

- The router must be an ABR to create a virtual router interface.

- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

**Note**

Non-default VRFs do not support the configuration of the following parameters:

- OSPFv3 interfaces over IPv6 tunnels
- IPsec on OSPFv3 virtual link interfaces

About This Task

Virtual linking is similar to backup redundancy. The switch creates a virtual link for vital traffic paths in your OSPFv3 configuration if traffic is interrupted, such as when an interface cable that provides a connection to the backbone (either directly or indirectly) is disconnected from the switch. Automatic virtual linking ensures that a link is created by using another switch.

OSPF routes cannot be learned through an ABR unless it connects to the backbone directly or through a virtual link.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Virtual If** tab.
4. Select **Insert**.
5. Specify the ID for the transit area.

The transit area is the common area between two ABRs.

6. Specify the router ID for the virtual neighbor.

The neighbor ID is the IP router ID of the ABR through which the other ABR must route traffic destined for the backbone.

7. Select **Insert**.
8. Select **Refresh** to verify that the virtual link is active.

If the state is point-to-point, the virtual link is active. If the state is down, the virtual link is configured incorrectly.

Virtual If Field Descriptions

Use the data in the following table to use the **Virtual If** tab.

Name	Description
Areaid	Specifies the ID for the transit area that the virtual link traverses. Do not use 0.0.0.0.
Neighbor	Specifies the router ID of the virtual neighbor.

Name	Description
TransitDelay	Specifies the estimated number of seconds to transmit a link-state update packet over this interface. The default is 1 second.
RetransInterval	Specifies the number of seconds between link-state advertisement retransmissions for adjacencies that belong to this interface. This value also applies to the retransmissions of database description and link-state request packets. The default is 5 seconds.
HelloInterval	Specifies the number of seconds between hello packets that the router sends on this interface. Configure the same value on the virtual neighbor. The default is 10 seconds.
RtrDeadInterval	Specifies the number of seconds after which the neighbor declares the router down if it does not receive hello packets. Configure this value as a multiple of the hello interval. You must configure the same value on the virtual neighbor. The default is 60 seconds.
State	Shows the state of the virtual interface: either down or pointToPoint.
Events	Shows the number of state changes or error events on the virtual link.
LinkScopeLsaCount	Shows the number of link-scope LSAs in the LSDB for the virtual link.
LinkLsaCksumSum	Shows the sum of the checksums for the link-scope LSAs in the LSDB. Use the sum to determine if a change in the LSDB occurs, and to compare the LSDBs of the two routers.

Create an OSPF Interface on a Brouter Port

Configure the OSPF protocol on an IPv6 interface to support dynamic routing on the interface. Perform this procedure to create an OSPF interface on a brouter port.

If you want to modify existing OSPFv3 interfaces, see [Modify an OSPFv3 Interface](#) on page 2920. To configure OSPFv3 on an IPv6 VLAN, see [Create an OSPF VLAN Interface](#) on page 2909.

Before You Begin

- The IPv6 interface must exist.

Procedure

1. In the Device Physical view, select a port.

2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **IPv6**.
4. Select the **IPv6 OSPF Interface** tab.
5. Select **Insert**.
6. Select the area ID.
7. Select **enabled**.
8. Select **Insert**.

IPv6 OSPFv3 Interface Field Descriptions

Use the data in the following table to use the **IPv6 OSPFv3 Interface** tab.

Name	Description
Index	Specifies the interface index for the IPv6 interface on which OSPFv3 is configured.
Areaid	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.
Type Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none"> • broadcast • NBMA • point-to-point • point-to-multipoint • passive
AdminStat	Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled.
RtrPriority Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election. A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router. The default is 1.
TransitDelay Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1.

Name	Description
RetransInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5.
HelloInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this parameter to the same value for all routers attached to a common network. The default is 10.
RtrDeadInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this parameter to the same value for all routers attached to a common network. The default is 40.
PollInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120.
State	Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesignatedRouter • otherDesignatedRouter
DesignatedRouter	Shows the router ID for the designated router.
BackupDesignatedRouter	Shows the router ID for the backup designated router.

Name	Description
MetricValue Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100. Note: If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface.
LinkLsaSuppression Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies whether Link LSA suppression is enabled.

Configure OSPFv3 on a CLIP Interface

Configure the Open Shortest Path First Version 3 (OSPFv3) instance on circuitless IP (CLIP) interfaces for the Global Router or a specific Virtual Router Forwarding (VRF) instance.

Before You Begin

- Ensure the CLIP interface exists.
- To perform this procedure on a non-default VRF, you must first change the VRF instance. You cannot launch a VRF Context View for the derived name of the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100. All parameters might not be available in non-default VRFs.

About This Task

You can also perform this configuration using [Create an OSPF Interface on a CLIP](#) on page 2907.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**
2. Select **IPv6**.
3. Select the **Circuitless IPv6** tab.
4. Select a CLIP interface.
5. Select **OSPF**.
6. Select **enabled**.
7. Select the ellipsis (...) to choose an area ID, and then select **Ok**.
8. Select **Apply**.

OSPF Field Descriptions

Use the data in the following table to use the **OSPF** tab.

Name	Description
AdminStat	Enables the OSPFv3 instance on the CLIP interface.
Areald	Assigns an OSPF area to the OSPFv3 instance.

Create an OSPF Interface on a CLIP

Before You Begin

- The CLIP interface must exist.

About This Task

Configure the OSPF protocol on an IPv6 interface to support dynamic routing on the interface. Perform this procedure to create an OSPFv3 interface on a circuitless IP (CLIP).

If you want to modify existing OSPFv3 interfaces, see [Modify an OSPFv3 Interface](#) on page 2920.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Interfaces** tab.
4. Select **Insert**.
5. Select **IPv6 Interfaces**.
6. Select the index associated to a CLIP interface, and then select **Ok**.
7. Select **enabled** from **AdminStat**.
8. Select **Insert**.

Interfaces Field Descriptions

Use the data in the following table to use the **Interfaces** tab.

Name	Description
Index	Specifies the interface index for the IPv6 interface on which OSPFv3 is configured.
Areald	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.

Name	Description
Type Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none"> • broadcast • NBMA • point-to-point • point-to-multipoint • passive
AdminStat	Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled.
RtrPriority Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election. A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router. The default is 1.
TransitDelay Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1.
RetransInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5.
HelloInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this parameter to the same value for all routers attached to a common network. The default is 10.
RtrDeadInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this parameter to the same value for all routers attached to a common network. The default is 40.

Name	Description
PollInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120.
State	Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesignatedRouter • otherDesignatedRouter
DesignatedRouter	Shows the router ID for the designated router.
BackupDesignatedRouter	Shows the router ID for the backup designated router.
MetricValue Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100. Note: If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface.
LinkLsaSuppression Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies whether Link LSA suppression is enabled.

Create an OSPF VLAN Interface

Configure the OSPF protocol on an IPv6 VLAN to support dynamic routing on the interface.

If you want to modify existing OSPFv3 interfaces, see [Modify an OSPFv3 Interface](#) on page 2920.

Before You Begin

- The IPv6 interface must exist.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **VLANs**.

3. Select the **Basic** tab.
4. Select a **VLAN**.
5. Select **IPv6**.
6. Select the **IPv6 OSPF Interface** tab.
7. Select **Insert**.
8. Select the area ID.
9. Select **enabled**.
10. Select **Insert**.

IPv6 OSPF Interface *Field Descriptions*

Use the data in the following table to use the **IPv6 OSPF Interface** tab.

Name	Description
Index	Shows the interface index for the IPv6 interface on which OSPFv3 is configured.
AreaId	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.
Type	Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none"> • broadcast • NBMA • point-to-point • point-to-multipoint • passive
AdminStat	Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled.
RtrPriority	Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election. A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router. The default is 1.
TransitDelay	Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1.

Name	Description
RetransInterval	Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5.
HelloInterval	Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this parameter to the same value for all routers attached to a common network. The default is 10.
RtrDeadInterval	Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this parameter to the same value for all routers attached to a common network. The default is 40.
PollInterval	Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120.
State	Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesignatedRouter • otherDesignatedRouter
DesignatedRouter	Shows the router ID for the designated router.
BackupDesignatedRouter	Shows the router ID for the backup designated router.
MetricValue	Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100. Note: If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface.

Name	Description
LinkLsaSuppression	Specifies whether Link LSA suppression is enabled.
BfdEnable	Enables Bidirectional Forwarding Detection (BFD) for OSPF.

Create an OSPF Interface on a Tunnel

Configure the OSPF protocol on an IPv6 interface to support dynamic routing on the interface. Perform this procedure to create an OSPF interface on a tunnel.

If you want to modify existing OSPFv3 interfaces, see [Modify an OSPFv3 Interface](#) on page 2920. To configure OSPFv3 on an IPv6 VLAN, see [Create an OSPF VLAN Interface](#) on page 2909.

Before You Begin

- The IPv6 interface must exist.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **Tunnel**.
3. Select the **Tunnel Config** tab.
4. Select a configured tunnel.
5. Select **IPv6 OSPF**.
6. Select **Insert**.
7. Select the area ID.
8. Select **enabled**.
9. Select **Insert**.

OSPF Interface Field Descriptions

Use the data in the following table to use the **OSPF Interface** tab.

Name	Description
Index	Shows the interface index for the IPv6 interface on which OSPFv3 is configured.
Areaid	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.
Type	Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none">• broadcast• NBMA• point-to-point• point-to-multipoint

Name	Description
AdminStat	Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled.
RtrPriority	Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election. A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router. The default is 1.
TransitDelay	Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1.
RetransInterval	Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5.
HelloInterval	Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this field to the same value for all routers attached to a common network. The default is 10.
RtrDeadInterval	Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this field to the same value for all routers attached to a common network. The default is 40.
PollInterval	Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120.

Name	Description
State	Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesignatedRouter • otherDesignatedRouter
DesignatedRouter	Shows the router ID for the designated router.
BackupDesignatedRouter	Shows the router ID for the backup designated router.
MetricValue	Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100. Note: If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface.
LinkLsaSuppression	Specifies whether Link LSA suppression is enabled.

View the AS-Scope Link-State Database

Before You Begin

- Change the VRF instance as required to view OSPFv3 on a specific VRF instance.

About This Task

View the AS-scope link-state database (LSDB) to see the LSAs that are flooded through the routing domain. The AS scope is used for AS external-LSAs.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **AS-scope LSDB** tab.

AS-scope LSDB *Field Descriptions*

Use the data in the following table to use the **AS-scope LSDB** tab.

Name	Description
Type	Shows the type of the link-state advertisement. Each link state type has a separate advertisement format. AS-scope LSAs not recognized by the router can be stored in the database.
RouterId	Shows the 32 bit number that uniquely identifies the originating router in the autonomous system.
Lsid	Identifies the piece of the routing domain that is being described by the advertisement.
Sequence	Shows a signed 32-bit integer that detects old and duplicate link-state advertisements. The larger the sequence number, the more recent the advertisement.
Age	Shows the age of the link-state advertisement in seconds.
Checksum	Indicates the checksum of the complete contents of the advertisement, except the age field. The age field is not affected so that the advertisement age value increments without updating the checksum. The checksum used is the same for ISO connectionless datagrams, the Fletcher checksum.

View the Area-Scope LSDB

Before You Begin

- Change the VRF instance as required to view OSPFv3 on a specific VRF instance.

About This Task

View the area-scope LSDB to see the LSAs that are flooded in a single OSPFv3 area. Area scope is used in router LSAs, network LSAs, Inter-Area-Prefix-LSAs, Inter-Area-Router LSAs, and Intra-Area-Prefix-LSAs.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Area-scope LSDB** tab.

Area-scope LSDB Field Descriptions

Use the data in the following table to use the **Area-scope LSDB** tab.

Name	Description
Areaid	Specifies the area ID from which the LSA is received. Area ID 0.0.0.0 is the OSPF backbone.
Type	Specifies the type of the link-state advertisement. Each link-state type has a separate advertisement format. Area-scope LSAs unrecognized by the router are also stored in this database.
RouterId	Specifies the originating router in the autonomous system.
Lsid	Specifies the piece of the routing domain that is described by the advertisement.
Sequence	Shows a signed 32-bit integer that detects old and duplicate link-state advertisements. The larger the sequence number, the more recent the advertisement.
Age	Shows the age of the link-state advertisement in seconds.
Checksum	Specifies the checksum of the complete contents of the advertisement, except the age field. The age field is not affected so that the advertisement age value increments without updating the checksum. The checksum used is the same for ISO connectionless datagrams, the Fletcher checksum.

View the Link-Scope LSDB

Before You Begin

- Change the VRF instance as required to view OSPFv3 on a specific VRF instance.

About This Task

View the link-scope LSDB to view the LSAs that are not flooded beyond the local link.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Link-scope LSDB** tab.

Link-scope LSDB Field Descriptions

Use the data in the following table to use the **Link-scope LSDB** tab.

Name	Description
IfIndex	Shows the identifier of the link from which the LSA was received.
Type	Shows the type of the link-state advertisement. Each link state type has a separate advertisement format. Link-scope LSAs not recognized by the router can be stored in the database.
RouterId	Shows the 32 bit number that uniquely identifies the originating router in the autonomous system.
Lsid	Specifies the piece of the routing domain that is being described by the advertisement.
Sequence	Shows a signed 32-bit integer that detects old and duplicate link-state advertisements. The larger the sequence number, the more recent the advertisement.
Age	Shows the age of the link-state advertisement in seconds.
Checksum	Specifies the checksum of the complete contents of the advertisement, except the age field. The age field is not affected so that the advertisement age value increments without updating the checksum. The checksum used is the same for ISO connectionless datagrams, the Fletcher checksum.

Add an NBMA Neighbor

Add an NBMA neighbor for each interface that is eligible to become the DR.

An NBMA interface with a positive nonzero router priority is eligible to become the DR for the NBMA network and is configured with the identification of all attached routers, IPv6 addresses, and router priorities.

Before You Begin

- Identify the following information:
 - specific interfaces to include in the NBMA network
 - the IPv6 address for each interface
 - the router priority for each interface
 - the hello interval for the network

- the router dead interval for the network
- the poll interval for the network
- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

About This Task

In contrast to a broadcast network where switches multicast (send to AllSPFRouters and AllDRouters) certain OSPF protocol packets, switches replicate and send NBMA packets to each neighboring router as unicast. NBMA networks drop all OSPF packets with destination addresses AllSPFRouters and AllDRouters. Because the NBMA network does not broadcast, you must manually configure a list of neighbors and priorities for all routers in the network that can become the DR. Potential DRs use a positive nonzero router priority.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **NBMA Neighbors** tab.
4. Select **Insert**.
5. Select the IPv6 port or VLAN interface.
6. Specify the IPv6 address for the neighbor.
7. Specify the priority for the neighbor.
8. Select **Insert**.

NBMA Neighbors Field Descriptions

Use the data in the following table to use the **NBMA Neighbors** tab.

Name	Description
IfIndex	Specifies the link ID for the link over which the switch reaches the neighbor.
Address	Specifies the IPv6 address of the neighbor.
Priority	Specifies the priority to use for this neighbor in the designated router election process. A value of 0 indicates the neighbor cannot become the designated router. The higher the priority value, the higher chance the switch will win the election process. The default is 1.

Name	Description
RtrId	Identifies the neighboring router in the autonomous system. The value is 0.0.0.0 until the switch receives a hello message from the neighbor.
State	Identifies the state of the relationship with the neighbor. The state can be one of the following: <ul style="list-style-type: none">• down• attempt• init• twoWay• exchangeStart• exchange• loading• full

Configure Route Redistribution to OSPFv3

Configure a redistribute entry to announce routes of a certain source protocol into the OSPFv3 domain. Optionally, use a route policy to control the redistribution of routes.

Before You Begin

- Enable OSPFv3 globally.
- Ensure that a route policy exists if you intend to use a route policy.
- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance. The VRF must have an RP trigger of OSPFv3. Not all parameters are configurable on non-default VRFs.

About This Task

Important

Changing the OSPFv3 redistribute context is a process-oriented operation that can affect system performance and network reachability while you perform this procedure. As a best practice, change the default preferences for an OSPFv3 redistribute context, you must do so before you enable the protocols.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Redistribute** tab.
4. Select **Insert**.
5. Select an option for the route source.
6. Select **enable**.
7. Select a route policy.
8. Configure the metric type.

9. Select **Insert**.

Redistribute *Field Descriptions*

Use the data in the following table to use the **Redistribute** tab.

Name	Description
DstVrflid	Specifies the destination virtual router forwarding instance. You cannot configure this variable.
Protocol	Specifies the dynamic routing protocol that receives the external routing information.
SrcVrflid	Specifies the source VRF instance. You cannot configure this variable.
RouteSource	Specifies the route source protocol for the redistribution entry.
Enable	Enables (or disables) an OSPF redistribute entry for a specified source type.
RoutePolicy	Configures the route policy (by name) to use for detailed redistribution of external routes from a specified source into an OSPF domain. Select the ellipsis (...) and choose from the list in the dialog box.
Metric	Configures the OSPF route redistribution metric for basic redistribution. A value of 0 indicates to use the original cost of the route.
MetricType	Configures the OSPF route redistribution metric type. The default is type 2. The cost of a type 2 route is the external cost, regardless of the interior cost. A type 1 cost is the sum of both the internal and external costs.

Modify an OSPFv3 Interface

Configure the OSPF protocol on IPv6 interface to support dynamic routing on the interface. The IPv6 interface can be a tunnel, port, or VLAN.

Before You Begin

- The OSPFv3 interface must exist.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Interfaces** tab.

4. Double-click a cell to edit the value.
5. Select **Apply**.

Interfaces Field Descriptions

Use the data in the following table to use the **Interfaces** tab.

Name	Description
Index	Specifies the interface index for the IPv6 interface on which OSPFv3 is configured.
AreaId	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.
Type Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none"> • broadcast • NBMA • point-to-point • point-to-multipoint • passive
AdminStat	Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled.
RtrPriority Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election. A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router. The default is 1.
TransitDelay Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1.
RetransInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5.
HelloInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this parameter to the same value for all routers attached to a common network. The default is 10.

Name	Description
RtrDeadInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this parameter to the same value for all routers attached to a common network. The default is 40.
PollInterval Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120.
State	Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesignatedRouter • otherDesignatedRouter
DesignatedRouter	Shows the router ID for the designated router.
BackupDesignatedRouter	Shows the router ID for the backup designated router.
MetricValue Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100. Note: If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface.
LinkLsaSuppression Note: Value is not configurable for OSPFv3 CLIP interfaces.	Specifies whether Link LSA suppression is enabled.

View OSPFv3 Neighbors

About This Task

View OSPFv3 neighbors to see routers with interfaces to a common network.

The OSPFv3 hello protocol maintains and dynamically discovers neighbor relationships.

The exception is an NBMA network; you manually configure permanent neighbors on each router eligible to become the designated router (DR).

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Neighbors** tab.

Neighbors Field Descriptions

Use the data in the following table to use the **Neighbors** tab.

Name	Description
IfIndex	Displays the local-link ID of the link over which the neighbor can be reached.
RtrId	Identifies the neighboring router in the Autonomous System. The value is the router ID of the neighboring router, which in OSPF uses the same format as an IPv6 address but identifies the router independent of IPv6 address.
Address	Displays the IPv6 address for the neighbor associated with the local link.
Options	Displays the bit mask that corresponds to the options field on the neighbor.
State	Displays the state of the relationship with the neighbor. The value can be one of the following: <ul style="list-style-type: none">• down• attempt• init• twoWay• exchangeStart• exchange• loading• full

Name	Description
NbrIfId	Displays the interface ID that the neighbor advertises in its hello packets on this link.
DeadIntCnt	<p>Displays the Dead interval Count or TTL (time to live) field that indicates how many seconds remain before the system declares the Neighbor down.</p> <p>The starting value is the Router Dead Interval value and it decrements to 0 if no Hello is received for that neighbor within the interval. If no Hello is received within the interval, then the system declares the neighbor down.</p> <p>When a hello is received for the neighbor, the system resets the value to the Router Dead Interval value.</p>

View Virtual Neighbors

About This Task

View information about the neighbors on the virtual link to the OSPFv3 backbone.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select the **Virtual Neighbors** tab.

Virtual Neighbors Field Descriptions

Use the data in the following table to use the **Virtual Neighbors** tab.

Name	Description
Area	Shows the ID for the transit area.
RtrId	Shows the ID for the neighboring router in the autonomous system.
LocalIfIndex	Shows the local interface ID for the virtual link over which the switch can reach the neighbor.
AddressType	<p>Shows the type of address as one of the following:</p> <ul style="list-style-type: none"> • ipv4 • ipv6 • ipv4z • ipv6z • dns <p>ipv4z and ipv6z indicate a scope zone.</p>

Name	Description
Address	Shows the IPv6 address that this virtual neighbor advertises. This value must be a global scope address.
Options	Shows a bit mask that corresponds to the OSPF options field of the neighbor.
State	Shows the state of the virtual neighbor relationship. The value can be one of the following: <ul style="list-style-type: none">• down• attempt• init• twoWay• exchangeStart• exchange• loading• full

View OSPFv3 Statistics

View OSPF statistics to analyze trends. You can also graph statistics for all OSPF packets transmitted by the switch.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **OSPFv3**.
3. Select **Stats**.

Stats Field Descriptions

Use the data in the following table to use the **Stats** tab.

Name	Description
TxPackets	Shows the count of sent packets.
RxPackets	Shows the count of received packets.
TxDropPackets	Shows the count of sent, dropped packets.
RxDropPackets	Shows the count of received, dropped packets.
RxBadPackets	Shows the count of received, bad packets.
SpfRuns	Shows the count of intra-area route table updates with calculations using this area link-state database.
LastSpfRun	Shows the count of the most recent SPF run.

Name	Description
LsdbTblSize	Shows the size of the link state database table.
BadLsReqs	Shows the count of bad link requests.
SeqMismatches	Shows the count of sequence mismatched packets.
Routes	Shows the number of OSPF routes added to the routing table.
Adjacencies	Shows the number of existing adjacencies.
Areas	Shows the number of configured areas.
Nbrs	Shows the number of OSPF neighbors.

Port Performance Management

[Digital Diagnostic Monitoring](#) on page 2927

[Port Performance Management Using CLI](#) on page 2927

[Port Performance Management using EDM](#) on page 2933

The topics in this section provide information to configure and view Digital Diagnostic Monitoring (DDM).

Digital Diagnostic Monitoring

Use Digital Diagnostic Monitoring (DDM) to monitor laser operating characteristics such as temperature, voltage, current, and power. This feature works at any time during active laser operation without affecting data traffic.

The following optical transceivers support DDM:

- 1 Gbps Small Form Factor Pluggable (SFP)
- 10 Gbps Small Form Factor Pluggable plus (SFP+)
- 25 Gbps Small Form Factor Pluggable 28 (SFP28)
- 40 Gbps Quad Small Form Factor Pluggable plus (QSFP+)
- 100 Gbps Quad Small Form Factor Pluggable 28 (QSFP28)
- 400 Gbps Quad Small Form-factor Pluggable Double Density (QSFP56-DD)

A Digital Diagnostic Interface (DDI) is an interface that supports DDM. These devices provide real-time monitoring of individual DDI transceivers. The DDM software provides warnings or alarms after the temperature, voltage, laser bias current, transmitter power or receiver power fall outside of vendor-specified thresholds during initialization.

For information about optical transceivers, see [Extreme Optics](#) website.

Port Performance Management Using CLI

This section contains procedures to monitor individual DDI transceivers using the CLI.

Configure DDM

Configure Digital Diagnostic Monitoring to get information concerning the status of the transmitted and received signals to allow better fault isolation and error detection.

About This Task

When you enable DDM, you see the internal performance condition (temperature, voltage, bias, Tx power and Rx power) of the pluggable transceiver. The default is disabled.

For information about how to reset a transceiver for troubleshooting purposes, see [Reset a Transceiver](#) on page 3938.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. (Optional) Enable the port to go down when an alarm occurs:
`pluggable-optical-module ddm-alarm-portdown`
3. (Optional) Configure the DDM interval:
`pluggable-optical-module ddm-monitor-interval <5-60>`
4. (Optional) Enable the sending of trap messages when an alarm occurs:
`pluggable-optical-module ddm-traps-send`
5. Enable DDM:
`pluggable-optical-module ddm-monitor`

Example

Configure the interval to 10 seconds and enable DDM.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#pluggable-optical-module ddm-monitor-interval 10
Switch:1(config)#pluggable-optical-module ddm-monitor
```

Variable Definitions

Use the data in the following table to use the **pluggable-optical-module** command

Variable	Value
<i>ddm-alarm-portdown</i>	When enabled, the port goes down when any alarm occurs. The default is disabled.
<i>ddm-monitor</i>	Enables DDM. When enabled, you see the internal performance condition (temperature, voltage, bias, Tx power and Rx power) of the pluggable transceiver. The default is disabled.

Variable	Value
<i>dmd-monitor-interval</i> <5-60>	Configures the DDM monitor interval. If an alarm occurs, the log message is received within the specific interval. The default value is 5 seconds.
<i>dmd-traps-send</i>	Enables or disables the sending of trap messages. When enabled, the trap message is sent to the device manager any time the alarm occurs. The default is enabled.

View DDI Port Information

Perform this procedure to view basic manufacturing information and characteristics, and the current configuration.

About This Task

This command displays information for DDI transceivers.

Note

Transceiver support differs across hardware platforms. For information about supported parts, see [Extreme Optics](#) website.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View basic manufacturing information and characteristics:
show pluggable-optical-modules basic [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
3. View configuration information:
show pluggable-optical-modules config
4. View detailed manufacturing information and characteristics:
show pluggable-optical-modules detail [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]

Examples

```
Switch:1#show pluggable-optical-modules config

=====
Pluggable Optical Module Global Configuration
=====

      ddm-monitor : disabled
ddm-monitor-interval : 5
      ddm-traps-send : enabled
ddm-alarm-portdown : disabled
```

The following example includes Extreme Networks extended diagnostic information. Not all parts support this information. A value of 254 indicates the part has not been initialized.

```
Switch:1#show pluggable-optical-modules detail 1/29

Port Performance Management using EDM

This section contains procedures to monitor individual DDI transceivers using EDM.

View DDI Information

About This Task

You can view Digital Diagnostic Interface (DDI) information, for example, port information, temperature, and voltages for DDI transceivers.

Note

Transceiver support differs across hardware platforms. For information about supported parts, see the [Extreme Optics](#) website.

Procedure

1. On the Physical Device view, select one or more ports.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **DDI/SFP** tab.

DDI/SFP Field Descriptions

Use the data in the following table to use the **DDI/SFP** tab.

Name	Description
ConnectorType	Specifies the type of connector.
SupportsDDM	Specifies if the transceiver supports DDM.
DdmStatusMask	Specifies the DDM status. A value other than ddm-ok represents a specific error.
CLEI	Specifies the Telcordia register assignment CLEI code.
VendorName	Specifies the name of the manufacturer.
VendorPartNumber	Specifies the part number for the transceiver. Select the part number to access the technical specifications for the part.
VendorRevNumber	Specifies the manufacturer revision level for the transceiver.
VendorSN	Specifies the manufacturer serial number for the transceiver.
VendorDateCode	Specifies the manufacturer date code for the transceiver.
Wavelength	Specifies the wavelength in nm. This field is valid for optical transceivers only.
Calibration	Specifies if the calibration is internal or external.
PowerMeasure	Specifies Rx power measurement as average or OMA.
Aux1Monitoring	Specifies if auxiliary monitoring is implemented for the transceiver.
Aux2Monitoring	Specifies if auxiliary monitoring is implemented for the transceiver.
TemperatureLowAlarmThreshold	Specifies the low alarm threshold in degrees Celsius.
TemperatureLowWarningThreshold	Specifies the low warning threshold in degrees Celsius.
Temperature	Specifies the current temperature in degrees Celsius of the transceiver.
TemperatureHighWarningThreshold	Specifies the high warning threshold in degrees Celsius.
TemperatureHighAlarmThreshold	Specifies the high alarm threshold in degrees Celsius.
TemperatureStatus	Specifies if any temperature thresholds were exceeded.
VoltageLowAlarmThreshold	Specifies the low alarm threshold in volts.
VoltageLowWarningThreshold	Specifies the low warning threshold in volts.

Name	Description
Voltage	Specifies the current voltage in volts.
VoltageHighWarningThreshold	Specifies the high warning threshold in volts.
VoltageHighAlarmThreshold	Specifies the high alarm threshold in volts.
VoltageStatus	Specifies if any voltage thresholds were exceeded.
BiasLowAlarmThreshold	Specifies the bias current low alarm threshold in mA.
BiasLowWarningThreshold	Specifies the bias current low warning threshold in mA.
Bias	Specifies the laser bias current in mA.
BiasHighWarningThreshold	Specifies the bias current high warning threshold in mA.
BiasHighAlarmThreshold	Specifies the bias current high alarm threshold in mA.
BiasStatus	Specifies if any bias thresholds were exceeded.
TxPowerLowAlarmThreshold	Specifies the low alarm threshold in dBm for the Tx power.
TxPowerLowWarningThreshold	Specifies the low warning threshold in dBm for the Tx power.
TxPower	Specifies the current Tx power in dBm.
TxPowerHighWarningThreshold	Specifies the high warning threshold in dBm for the Tx power.
TxPowerHighAlarmThreshold	Specifies the high alarm threshold in dBm for the Tx power.
TxPowerStatus	Specifies if any Tx power thresholds were exceeded.
RxPowerLowAlarmThreshold	Specifies the low alarm threshold in dBm for the Rx power.
RxPowerLowWarningThreshold	Specifies the low warning threshold in dBm for the Rx power.
RxPower	Specifies the current Rx power in dBm.
RxPowerHighWarningThreshold	Specifies the high warning threshold in dBm for the Rx power.
RxPowerHighAlarmThreshold	Specifies the high alarm threshold in dBm for the Rx power.
RxPowerStatus	Specifies if any Rx power thresholds were exceeded.
Aux1LowAlarmThreshold	Specifies the low alarm threshold auxiliary 1 reading.
Aux1LowWarningThreshold	Specifies the low warning threshold auxiliary 1 reading.

Name	Description
Aux1	Specifies the current auxiliary 1 reading.
Aux1HighWarningThreshold	Specifies the high warning threshold auxiliary 1 reading.
Aux1HighAlarmThreshold	Specifies the high alarm threshold auxiliary 1 reading.
Aux1Status	Specifies if any auxiliary 1 thresholds were exceeded.
Aux2LowAlarmThreshold	Specifies the low alarm threshold auxiliary 2 reading.
Aux2LowWarningThreshold	Specifies the low warning threshold auxiliary 2 reading.
Aux2	Specifies the current auxiliary 2 reading.
Aux2HighWarningThreshold	Specifies the high warning threshold auxiliary 2 reading.
Aux2HighAlarmThreshold	Specifies the high alarm threshold auxiliary 2 reading.
Aux2Status	Specifies if any auxiliary 2 thresholds were exceeded.
ExtremeExtraFeatures	Specifies if the device supports the extra Extreme Networks features. If the value is true, you can select Extended DDM to view more information.

Note

1. Threshold and actual values for TxBias, TxPower, and RxPower are provided for all four channels in SFP56-DD, QSFP+, and QSFP28 optical transceivers.
2. Auxiliary monitoring does not apply to SFP56-DD, QSFP+ or QSFP28.

View Extended DDI Information

About This Task

You can view extended information for DDI transceivers that support extra Extreme Networks features.

Note

Transceiver support differs across hardware platforms. For information about supported parts, see the [Extreme Optics](#) website.

Procedure

1. On the Physical Device view, select one or more ports.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.

4. Select the **DDI/SFP** tab.
5. Select **Extended DDM**.
6. Select the **Extended Diagnostic** tab.

Extended Diagnostic *Field Descriptions*

Use the data in the following table to use the **Extended Diagnostic** tab.

Name	Description
PowerOnCounter	Tracks the power-on-life of the part. This value increments by 1 every 48 hours of consecutive power. This value is never decremented or cleared. If you remove or reinsert the part, reset or reboot the chassis, reset the slot, or channelize or dechannelize the port, then the 48-hour time period restarts.
TxDdmInitial	Specifies the Tx dB from low alarm, which is the difference between the TxPower dBm and the TxPower low alarm. The host provides the value after the first 48 consecutive hours of operation.
TxDdmLastGasp	Specifies the last gasp of Tx dB from low alarm. The host updates this value every 48 hours.
RxDdmInitial	Specifies the Rx dB from low alarm, which is the difference between the RxPower dBm and the RxPower low alarm. The host provides the value after the first 48 consecutive hours of operation after a power cycle.
RxDdmLastGasp	Specifies the last gasp of Rx dB from low alarm. The host updates this value every 48 hours.

Power over Ethernet (PoE) is the implementation of IEEE 802.3af, IEEE 802.3at, and IEEE 802.3bt (Type 3 and Type 4), which allows for both data and power to pass over a copper Ethernet LAN cable. Typical power devices include wireless Access Points and VoIP telephones.

Depending on the technology and application requirements, PoE is classified into classes. Depending on the power requirements, the PoE devices are categorized by type. Classes range from Class 0 to 8 whereas types range from Type 1 to 4. Each type associates with an IEEE 802.3 PoE standard. These standards provide signaling between the power sourcing equipment (PSE) and the powered device (PD). PSE devices, such as switches, provide power on the network cable. The devices that PSE provides power to are called PDs, such as VoIP phones, wireless access points, and IP surveillance cameras.

To know which ports support PoE, see the hardware documentation.

The switch uses the Dynamic Power Allocation scheme when supplying power to devices. Only the power being consumed by the device is allocated, improving efficiency and enabling support for more number of devices.

You can configure PoE from CLI and Enterprise Device Manager (EDM).

PoE Overview

You can plug any IEEE 802.3af-compliant, 802.3at-compliant, or 802.3bt-compliant (Type 3 and Type 4) for PWR+ powered device into a front-panel port and receive power in that port. Data also can pass simultaneously on that port. This capability is called PoE.

The second power supply unit (PSU) in the switch adds budget to the total POE budget. See the product data sheet for information about the POE budget based on PSU selection.

The IEEE 802.3af draft standard regulates a maximum of 15.4 W of power for each port; that is, a power device cannot request more than 15.4 W of power. As different network devices require different levels of power, the overall available power budget of the switch depends on your power configuration and the particular connected network devices. If you connect an IP device that requires more than 16 W of power, you see an error on that port notifying you of an overload.

The switch automatically detects each IEEE 802.3af-compliant powered device attached to each front-panel port and immediately sends power to that appliance. The switch also automatically detects how much power each device requires and supply the required DC voltage at a set current based on the load conditions and current availability. The switch supports both PoE and standard LAN devices.

Similarly, the switch automatically detects any IEEE 802.3at-compliant (maximum 25.5 W) or IEEE 802.3bt-compliant (maximum 60W for Type 3, maximum 90W for Type 4) powered device attached to any PoE front panel port and immediately sends power to that appliance.

The power detection function of the switch operates independently of the data link status. A device that is already operating the link for data or a device that is not yet operational can request power. That is, the switch provides power to a requesting device even if the data link for that port is disabled. The switch monitors the connection and automatically disconnects power from a port when you remove or change the device, as well as when a short occurs.

The switch automatically detects devices that require no power connections from them, such as laptop computers or other switching devices, and sends no power to those devices. You control the supply of power to specific ports by setting the maximum allowed power to each port in 1 W increments, from 3 W to 98W.

**Important**

Wait for 30 seconds between unplugging and replugging an IP device to the switch to enable the IP device to discharge. If you attempt to connect earlier, the switch cannot detect the IP device.

The switch provides the capability to configure a PoE power threshold, which lets you specify a percentage of the total PoE power usage at which the switch sends a

warning message. If the power consumption is below the threshold, the switch logs an information message.

**Important**

- After you enable Fast PoE or Perpetual PoE or both, you must save the running configuration file.
- If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings (for example, power limits, or port power priority), you must resave the running configuration file.

PoE Detection Types

The configured detection type specifies the following versions of the IEEE standard to support. Standards are arranged from oldest (top) to newest (bottom).

Detection Type	Power Mode
802.3af	Normal
802.3af and legacy	Normal
802.3at	High
802.3at and legacy	High
802.3bt type 3	Normal
802.3bt type 4	Normal
802.3bt and legacy	Normal

The default detection type is automatically configured for the highest PoE standard supported on the switch.

**Note**

802.3at is backwards compatible with 802.3af. Therefore, both normal power and high power devices are supported in this mode.

Changing from a newer IEEE standard to an older IEEE standard is permitted, however power delivery is interrupted during this operation, and all PoE devices are reset. There is no service interruption when changing from an older IEEE standard to a newer IEEE standard.

The following table identifies product support for the different PoE types.

Table 221: PoE type support

Product	Highest PoE Standard
4220-12P-4X 4220-24P-4X	802.3at Type 2 PoE (30W) on BASE-T ports
4220-4MW-8P-4X 4220-4MW-20P-4X	802.3at Type 2 PoE (30W) on 10/100/1000 BASE-T ports 802.3bt Type 4 PoE (90W) on 4 1G/2.5G/5G ports
5320-16P-2MXT-2X 5320-16P-4XE 5320-16P-4XE-DC 5320-24P-8XE 5320-48P-8XE	802.3at Type 2 PoE (30W) on BASE-T ports
5420F-48P-4XE 5420F-48P-4XL 5420F-24P-4XE	802.3at Type 2 PoE (30W)
5420F-8W-16P-4XE	802.3bt Type 4 PoE (90W) on 8 ports 802.3at Type 4 PoE (30W) on 16 ports
5420F-16W-32P-4XE 5420F-16MW-32P-4XE	802.3bt Type 4 PoE (90W) on 16 ports 802.3at Type 4 PoE (30W) on 32 ports
5420M-24W-4YE 5420M-48W-4YE	802.3bt Type 4 PoE (90W)
5420M-16MW-32P-4YE	802.3bt Type 4 PoE (90W) on 16 ports 802.3at Type 4 PoE (30W) on 32 ports
5520-12MW-36W	802.3bt Type 4 PoE (90W)
5520-24W	802.3bt Type 4 PoE (90W)
5520-48W	802.3bt Type 4 PoE (90W)
5720-24MW 5720-48MW 5720-24MXW 5720-48MXW	802.3bt Type 4 PoE (90W)

Power Usage Threshold

The power usage threshold is a chassis configurable percent of the total power available on the switch. When the POE power consumption exceeds this threshold, a log message is generated to warn such an event. When power consumption transitions below the threshold, an informational log message is logged. The default threshold is 80%.

Port Power Limit

Each PoE port has a configurable power limit. This configuration attribute limits the amount of power supplied on a particular port and varies across different hardware platforms. If a PD requires more than the configured limit, the device will not connect properly or is forced to run at a lower limit.

The following table lists the power limit for different hardware platforms:

Table 222: Power Limits

Platform	Power Limit
4220 Series	32 watts: <ul style="list-style-type: none"> • 4220-12P-4X • 4220-24P-4X 98 watts: <ul style="list-style-type: none"> • 4220-4MW-8P-4X: 4MW ports only; 8P ports support 32 watts • 4220-4MW-20P-4X: 4MW ports only; 20P ports support 32 watts
5320 Series	32 watts
5420 Series	32 watts: <ul style="list-style-type: none"> • 5420F-24P-4XE • 5420F-48P-4XE • 5420F-48P-4XL 98 watts: <ul style="list-style-type: none"> • 5420F-8W-16P-4XE: 8W ports only; 16P ports support 32 watts • 5420F-16MW-32P-4XE: 16MW ports only; 32P ports support 32 watts • 5420F-16W-32P-4XE: 16W ports only; 32P ports support 32 watts • 5420M-16MW-32P-4YE: 16MW ports only; 32P ports support 32 watts • 5420M-24W-4YE • 5420M-48W-4YE
5520 Series	98 watts
5720 Series	98 watts

Port Power Priority

You can configure the power priority of each port by choosing low, high, or critical power priority settings.

The switch automatically drops low-priority ports when the power requirements exceed the available power budget. When the power requirements become lower than the switch power budget, the power returns to the dropped port. When several ports

have the same priority and the power budget is exceeded, the ports with the highest interface number are dropped until the consumption is within the power budget.

The priority methods are:

1. Port configured PoE priority

- Low: (default) standard priority for standard devices
- High: higher priority than low for important devices
- Critical: highest priority for critical devices like wireless APs

2. Port number priority where the lower port numbers have a higher priority.

PD Classification

The PDs are classified during initial connection establishment as defined in IEEE 802.3 standards. The classification defines the amount of power a device is expected to consume.

Table 223: Classification Chart for Various Standards

Name	Standard	Class	Type	PSE Min Output Power (in W)	PD Min Input Power (in W)	Example of Supported PDs
PoE	IEEE 802.3af	0	1	15.4	12.95	Static surveillance camera, VoIP phones, wireless access points
		1	1	4	3.84	IP phones
		2	1	7	6.49	IP camera
		3	1	15.4	12.95	Wireless access points
PoE+	IEEE 802.3at	4	2	30	25.5	High power PD
PoE++	IEEE 802.3bt	5	3	45	40	Video conferencing equipment, multi-radio wireless access points
		6	3	60	51	

Table 223: Classification Chart for Various Standards (continued)

Name	Standard	Class	Type	PSE Min Output Power (in W)	PD Min Input Power (in W)	Example of Supported PDs
PoE++	IEEE 802.3bt	7	4	75	62	Laptops, flat screens
		8	4	90	73	

PoE/PoE+ Allocation Using LLDP

Power over Ethernet/Power over Ethernet Plus allocation using Link Layer Discovery Protocol (LLDP) supports Ethernet switches, which do not support hardware-level power negotiation. With this feature, these switches support IEEE-based PoE and play the role of power sourcing equipment (PSE).

The devices that are powered using PoE, such as IP Phone and Video Surveillance Cameras, are classified as Powered Devices (PD). The maximum allowed continuous output power per cable for each standard is:

- IEEE 802.3af: 15.4 W
- IEEE 802.3at: 25.5 W
- IEEE 802.3bt Type 3: 60 W
- IEEE 802.3bt Type 4: 90 W

The negotiation of actual power supply and demand between a PSE and a PD can be executed at either the physical layer or at the data link layer. After the link is established at the physical layer, the PSE can use the IEEE 802.1AB LLDP protocol to repeatedly query the PD to discover its power needs. Communication using LLDP allows for a finer control of power allocation, making it possible for the PSE to dynamically supply the exact power levels needed by individual PDs, and globally for all PDs that are attached. Using LLDP is optional for the PSE, however, it is mandatory for a Type 2 PD that requires more than 12.95 watts of power.

Important

LLDP supports PoE discovery and power allocation because some switches do not support hardware-level power negotiation. This allows Type 2 PDs such as PTZ (pan-tilt-zoom) Video Surveillance Cameras to be fully functional when connected to one of these switches. This functionality is enabled by default and is not configurable.

Note

Some switches feature a hardware design that supports hardware-level detection. Therefore, they do not require LLDP.

Fast PoE and Perpetual PoE

Fast PoE minimizes the PoE controller recovery time in case of a power failure. With Fast PoE, the PoE controller initializes the moment the switch powers on, which results in a faster recovery period.

Perpetual PoE provides uninterrupted power to all connected devices during a switch reboot.

Important

- After you enable Fast PoE or Perpetual PoE or both, you must save the running configuration file.
- If Fast PoE or Perpetual PoE are enabled and you change global or port-specific PoE configuration, you must save the running configuration file.

PoE Ports in EDM

The front panel view of Enterprise Device Manager (EDM) provides additional information for Power over Ethernet (PoE) ports for switches that support PoE.

This additional information is in the form of a colored **P** that displays inside the graphical representation of the port. This colored P represents the current power aspect of the PoE port.

Table 224: Power Aspect color codes

Color	Description
Green	The port is currently delivering power.
Red	The power and detection mechanism for the port is disabled.
Orange	The power and detection mechanism for the port is enabled. The port is not currently delivering power.
White/Gray	The power and detection mechanism for the port is unknown.

Important

The data and power aspect coloring schemes are independent of each other. You can view the initial status for both data and power aspect for the port. To refresh the power status, right-click the unit, and then select **Refresh Port Tooltips** from the shortcut menu.

Power over Ethernet Configuration using CLI

This section provides details to configure PoE settings using CLI.

Important

- After you enable Fast PoE or Perpetual PoE or both, you must save the running configuration file.
- If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings, you must resave the running configuration file.

Disable PoE on a Port

About This Task

Perform the following procedure to disable PoE on a port. The Ethernet connected device does not receive any power over Ethernet if you shutdown PoE on the port.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable PoE on the port:

```
poe poe-shutdown [port <portlist>]
```

<portlist> is the port on which you want to disable PoE. The default is `enable`.

What to Do Next

To return power to the port, enter `no poe-shutdown [port <portlist>]`.

Configure the PoE Detection Type Globally

Perform the following procedure to configure the PoE powered device (PD) detection type globally on the switch. The default is automatically configured for the highest PoE

standard supported on the switch. For more information, see [PoE Detection Types](#) on page 2945.

Important

Changing from a newer IEEE standard to an older IEEE standard is permitted, however power delivery is interrupted during this operation, and all PoE devices are reset. There is no service interruption when changing from an older IEEE standard to a newer IEEE standard.

Procedure

1. Enter Global Configuration mode:
- ```
enable

configure terminal
```
2. Configure PoE detection type:
- ```
poe poe-pd-detect-type {802dot3af | 802dot3af_and_legacy | 802dot3at |
802dot3at_and_legacy | 802dot3bt_type3 | 802dot3bt_type4}
```

Variable Definitions

The following table defines parameters for the **poe-pd-detect-type** command.

Variable	Value
<code>{802dot3af 802dot3af_and_legacy 802dot3at 802dot3at_and_legacy 802dot3bt_type3 802dot3bt_type4}</code>	<div>Configures the detection type to one of the following values:</div> <ul style="list-style-type: none">802dot3af: Set PD detection mode in 802.3af802dot3af_and_legacy: Set PD detection mode in 802.3af and legacy802dot3at: Set PD detection mode in 802.3at802dot3at_and_legacy: Set PD detection mode in 802.3at and legacy802dot3bt_type3: Set PD detection mode in 802dot3bt Type3802dot3bt_type4: Set PD detection mode in 802dot3bt Type4 <div>Note: The default detection type is automatically configured for the highest PoE standard supported on the switch.</div>

Configure the PoE Detection Type on a Port

Perform the following procedure to configure the PoE powered device (PD) detection type on a specific port or ports.

About This Task

**Note**

This procedure applies to 5420 Series and 5520 Series.

Ensure the configuration aligns with hardware capabilities. The default is automatically configured for the highest PoE standard supported on the switch. For more information, see [PoE Detection Types](#) on page 2945.

Port-level configuration takes precedence over a global PoE PD detection type configuration.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the PD detection type:

```
poe poe-pd-detect-type [{slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]] {802dot3af | 802dot3af_and_legacy | 802dot3at  
| 802dot3at_and_legacy | 802dot3bt_type3 | 802dot3bt_type4}
```

Variable Definitions

The following table defines parameters for the **poe poe-pd-detect-type** command.

Variable	Value
{802dot3af 802dot3af_and_legacy 802dot3at 802dot3at_and_legacy 802dot3bt_type3 802dot3bt_type4}	<p>Configures the detection type to one of the following values:</p> <ul style="list-style-type: none"> 802dot3af: Specifies the PD detection mode as 802.3af 802dot3af_and_legacy: Specifies the PD detection mode as 802.3af and legacy 802dot3at: Specifies the PD detection mode as 802.3at 802dot3at_and_legacy: Specifies the PD detection mode as 802.3at and legacy 802dot3bt_type3: Specifies the PD detection mode as 802dot3bt Type3 802dot3bt_type4: Specifies the PD detection mode as 802dot3bt Type4 <p>Note: The default detection type is automatically configured for the highest PoE standard supported on the switch.</p>
port {slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/all][all]}	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> a single slot and port (slot/port) a range of slots and ports (slot/port-slot/port) a series of slots and ports (slot/port,slot/port,slot/port) all ports on the same slot (slot/all) all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Configure PoE Power Usage Threshold

About This Task

Perform the following procedure to configure the PoE power usage threshold limit globally as a percentage on the switch. The switch logs a warning message when a PoE PD power usage exceeds the configured threshold. The switch logs an informational message when a PoE PD power usage is below the configured threshold.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the power usage threshold:
`poe poe-power-usage-threshold <1-99>.`

Variable Definitions

The following table defines parameters for the **poe-power-usage-threshold** command.

Variable	Value
<1-99>	Specifies the PoE usage threshold in the range of 1—99 percent.

Configure Power Limits for Channels

About This Task

Perform the following procedure to configure the PoE power limit for specific ports or channels. You can limit the PoE wattage available from an individual port or list of ports.

Procedure

1. Enter Interface Configuration mode:
`enable`
`configure terminal`
`interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]`
`[,...][slot/all][all]} or interface vlan <1-4059>`

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure PoE channel limits:
`poe poe-limit [port <portlist>] <power_limit>`

Variable definitions

The following table defines parameters for the **poe-limit** command.

Variable	Value
<code><portlist></code>	Identifies the ports on which the limit is set.
<code><power_limit></code>	Specifies the configurable power limit, in watts on a particular port. To see the available range for the switch, use the CLI Help.

Configure Port Power Priority

About This Task

Perform the following procedure to configure the PoE power priority for a port or list of ports. You can configure the PoE power priority of ports to manage availability of the connected PDs. If the switch needs to shut down PDs because PoE exceeds the power limit threshold, low priority devices are shut down before high priority, and high priority are shut down before critical.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure port power priority:

```
poe poe-priority [port <portlist>] {critical| high| low}
```

Variable Definitions

The following table defines parameters for the **poe-priority** command.

Variable	Value
<code><portlist></code>	Identifies the ports to set priority for.
<code>{low high critical}</code>	Identifies the PoE priority.

Enable Fast PoE Globally

About This Task

Perform this procedure to enable Fast PoE on the switch. After you enable Fast PoE, you must save the running configuration file.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable Fast PoE:

```
poe fast-poe-enable
```

3. Save the configuration file:

```
save config
```

Enable Perpetual PoE Globally

About This Task

Perform this procedure to enable Perpetual PoE on the switch. After you enable Perpetual PoE, you must save the running configuration file.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable Perpetual PoE:

```
poe perpetual-poe-enable
```

3. Save the configuration file:

```
save config
```

Enable Fast PoE on a Port

About This Task

Perform this procedure to enable Fast PoE on a specific copper port of the switch. After you enable Fast PoE, you must save the running configuration file.

Procedure

- 1. Enter Interface Configuration mode:
`enable`

`configure terminal`

`interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]} or interface vlan <1-4059>`

Note If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

- 2. Enable Fast PoE on the copper port:
`poe fast-poe-enable [port {slot/port[-slot/port] [,...][slot/all]
[all]]}`
- 3. Save the configuration file:
`save config`

Variable Definitions

The following table defines parameters for the **fast-poe-enable** command.

Variable	Value
<code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/ all][all]}</code>	Specifies the port or ports to be configured.

Enable Perpetual PoE on a Port

About This Task

Perform this procedure to enable Perpetual PoE on a specific copper port of the switch. After you enable Perpetual PoE, you must save the running configuration file.

Procedure

- 1. Enter Interface Configuration mode:
`enable`

`configure terminal`

`interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]} or interface vlan <1-4059>`

Note If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable Fast PoE on the copper port:

```
poe perpetual-poe-enable [port {slot/port[-slot/port]][,...][slot/all]
[all]]
```

3. Save the configuration file:

```
save config
```

Variable Definitions

The following table defines parameters for the **fast-poe-enable** command.

Variable	Value
<code>port {slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/ all][all]}</code>	Specifies the port or ports to be configured.

Display Global PoE Configuration

About This Task

Perform the following procedure to display the global PoE configuration. You can view the global PoE status, power consumption, power limit threshold, and more.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the global configuration:
show poe-main-status

Example

```
Switch:1#show poe-main-status
=====
PoE Main Status - Stand-alone
=====
Available DTE Power      : 1855 Watts
DTE Power Status         : NORMAL
DTE Power Consumption    : 92 Watts
DTE Power Usage Threshold : 80
PD Detect Type           : 802.3at and Legacy
Power Source Present     : AC Only
Primary Power Status     : Present and operational
Redundant Power Status   : Present and Operational
Fast POE Status          : Enabled
Perpetual POE Status     : Enabled
POE Firmware Version:    : 3.0.0.6
```

Display PoE Port Status

About This Task

Perform the following procedure to display the PoE status for each port. You can use this information to view the status, classification, watts, and priority for each PoE port.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the port status:
show poe-port-status

Example

```
Switch:1#show poe-port-status
```

=====									
POE Port Status									
=====									
PORT	ADMIN STATUS	CURRENT STATUS	CLASSIFICATION	LIMIT (Watts)	PRIORITY	FAST POE	PERPETUAL POE	PD DETECTION TYPE	

1/1	Enable	DeliveringPower	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/2	Enable	DeliveringPower	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/3	Enable	DeliveringPower	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/4	Enable	Searching	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/5	Enable	Searching	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/6	Enable	Searching	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/7	Enable	Searching	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/8	Enable	Searching	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/9	Enable	Searching	Class0	32	Low	Disable	Disable	802.3at and Legacy	
1/10	Enable	Searching	Class0	32	Low	Disable	Disable	802.3at and Legacy	

Note

The PoE status of all ports is displayed. The preceding output is a sample of the full output.

Display Port Power Measurement

About This Task

Perform the following procedure to display the PoE power measurement. You can view the voltage, amperage, and wattage for every PoE port. PoE ports without a PD in use are measured as zeros.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View measurement information:
show poe-power-measurement

Example

```
Switch:1#show poe-power-measurement
```

=====			
POE Port Measurement			
=====			
PORT	Volt (V)	CURRENT (mA)	POWER (Watt)

1/1	34.0	117	6.200
1/2	34.0	94	5.000

1/3	34.0	535	28.500
1/4	0.0	0	0.000
1/5	0.0	0	0.000
1/6	34.0	525	27.900
1/7	34.0	152	8.100
1/8	34.0	49	2.600

**Note**

The PoE port measurement for all ports is displayed. The preceding output is a sample of the full output.

Power over Ethernet configuration using EDM

This section provides details to configure PoE settings using EDM.

Configure PoE Globally

About This Task

Configure PoE usage threshold and device type settings, and enable Fast PoE and Perpetual PoE globally on a switch.

**Important**

- After you enable Fast PoE or Perpetual PoE or both, you must save the running configuration file.
- If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings, you must resave the running configuration file.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **PoE** tab.
4. For **Usage Threshold%**, type the value in percentage for comparing the measured power.
5. For **DetectType**, select the PoE detection type depending on the capabilities of the switch.
6. Select **FastPoeEnable**.
7. Select **PerpetualPoeEnable**.
8. Select **Apply**.

PoE Field Descriptions

Use the data in the following table to use the **PoE** tab.

Name	Description
Power(watts)	Specifies the nominal power of the Power Sourcing Entity expressed in Watts.
OperStatus	Specifies the operational status of the main Power Sourcing Entity.
ConsumptionPower(watts)	Specifies the measured usage power expressed in Watts.
UsageThreshold%	Configures the usage threshold in percent for comparing the measured power and initiating an alarm if the threshold is exceeded.
DetectType	<p>Configures the mechanism used to detect powered ethernet devices attached to a powered ethernet port. The options are:</p> <ul style="list-style-type: none"> • 802.3af • 802.3af and legacy support • 802.3at • 802.3at and legacy support • 802.3bt Type 3 • 802.3bt Type 4 <p>Note: The default detection type is automatically configured for the highest PoE standard supported on the switch.</p>
PowerPresent	<p>Specifies the current power source present on the switch. Available power sources are AC and DC.</p> <p>A value of acOnly indicates that the only power supply is AC.</p> <p>A value of dcOnly indicates that the only power supply is DC.</p> <p>A value of acDc indicates that the two power supplies, AC and DC are supplying power.</p>
FastPoeEnable	Enables Fast PoE on the switch. The default is disabled.
PerpetualPoeEnable	Enables Perpetual PoE on the switch. The default is disabled.

Configure PoE on Ports

About This Task

Enable or disable PoE on a port, and configure PoE priority and power limit settings.

Important

If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings, you must resave the running configuration file.

For information about which ports support PoE, see the hardware documentation.

Procedure

1. In the Device Physical View, select one or more ports that support PoE.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **PoE** tab.
5. Configure the fields as required.
6. Select **Apply**.

PoE Field Descriptions

Use the data in the following table to use the **PoE** tab.

Name	Description
AdminEnable	Enabled or disables PoE on this port.
FastPoeEnable	Enables or disables Fast PoE on this port. The default is disabled.
PerpetualPoeEnable	Enables or disables Perpetual PoE on this port. The default is disabled.
DetectionStatus	Specifies the operational status of the power device detecting mode on this port: <ul style="list-style-type: none">• Disabled—detecting function disabled• Searching—detecting function is enabled and the system is searching for a valid powered device on this port• DeliveringPower—detection found a valid powered device and the port is delivering power• Fault (OtherFault)—a power-specific fault has been detected on the port• Test—detecting device is in test mode
PowerClassifications	Specifies the power classification of the device connected to this port. Power classification tags different terminals on the Power over LAN network according to their power consumption. Devices such as IP telephones, WLAN access points, and others can be classified according to their power requirements.

Name	Description
PowerPriority	Configures the power priority for this port: <ul style="list-style-type: none">• critical• high• low
PowerLimit(Watts)	Configures the maximum power that the switch can supply to a port.
DetectType Note: Exception: only supported on 5420 Series and 5520 Series.	Configures the PoE powered device (PD) detection type on a specific port or ports. The default detection type is automatically configured for the highest PoE standard supported on the switch.

View Power Consumption for a PoE Port

About This Task

Perform the following procedure to display the PoE power measurement. You can view the voltage, amperage, and wattage for every PoE port. PoE ports without a powered device (PD) in use are measured as zeros.

For information about which ports support PoE, see the hardware documentation.

Procedure

1. In the Device Physical View, select one or more ports that support PoE.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select **PoE Power Measurement**.

PoE Power Measurement *Field Descriptions*

Use the data in the following table to use the **PoE Power Measurement** tab.

Name	Description
Voltage(volts)	Displays the power measured in volts.
Current(amps)	Displays the power measured in amps.
Power(watts)	Displays the power measured in watts.

Power Savings

[Energy Saver](#) on page 2966

[Energy Efficient Ethernet](#) on page 2968

[Power Savings Configuration Using CLI](#) on page 2969

[Power Savings Configuration Using EDM](#) on page 2978

Power savings allow you to reduce network infrastructure power consumption during periods of low data activity without impacting network connectivity.

Depending on the power saving option you choose, you can implement power savings on a switch-wide, or on a per-port basis. The following power saving options are supported:

- Energy Saver (switch-wide or per-port)
- Energy Efficient Ethernet (EEE) (per-port only)

You must choose either Energy Saver, or Energy Efficient Ethernet (EEE)—you cannot use both options together.

The following sections describe the Energy Saver and Energy Efficient Ethernet (EEE) features, and how to configure them.

Energy Saver

Table 225: Energy Saver product support

Feature	Product	Release introduced
Energy Saver	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4 Not supported on 5420F-24S-4XE
	5520 Series	VOSS 8.2.5 Not supported on 5520-24X or 5520-48SE Supported on fixed ports only.
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10 Supported on 7520-48XT-6C
	7720 Series	Not Supported
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.1 Supported on VSP4900-48P and ports 1/1 to 1/12 on VSP4900-12MXU-12XE
	VSP 7400 Series	Not Supported

To reduce direct power consumption by up to 40%, Energy Saver uses intelligent-switching capacity reduction in off-peak mode by controlling port link speeds and optionally powering off low priority Power over Ethernet (PoE) devices during off-peak periods. You can schedule Energy Saver to activate during multiple specific time periods. These time periods can be as short as one minute, or can last a week, a weekend, or individual days.

Note

- Energy Saver is supported only on copper ports that have auto-negotiation enabled on them.
- Energy Saver does not operate on the 5720 Series when you configure local port Auto-Negotiation advertisements to *2500-full* or *5000-full*.
- If auto-negotiation is disabled on a port and a custom port speed is configured, Energy Saver will not change the speed of that port.

**Important**

- Configuring the port link speed to a low value impacts the overall network performance. The best practice is to use the Energy Saver feature during the hours when the network is not overburdened.
- If a switch is reset while Energy Saver is activated, the PoE power-saving calculation might not accurately reflect the power saving, and in some cases might display zero savings. This problem occurs because the switch did not have sufficient time to record PoE usage between the reset of the switch and the reactivation of Energy Saver. When Energy Saver is next activated, the PoE power saving calculation is correctly updated.
- When Energy Saver is active and you replace a unit, that unit will not be in Energy Saver mode. You must configure Energy Saver directly after replacing a unit.

Interaction with PoE

Energy Saver can use Power over Ethernet (PoE) port-power priority levels to shut down low-priority PoE ports and provide power savings. The power consumption savings of each switch is determined by the number of ports with Energy Saver enabled, and by the power consumption of PoE ports that are powered off. If Energy Saver is disabled on a port, the port is not powered off, irrespective of the PoE configuration. Energy Saver turns off the power to a port only when PoE is enabled globally, the port Energy Saver is enabled, and the PoE priority for the port is configured to Low.

Configuration Fundamentals

To fully configure and use Energy Saver, you must first enable Energy Saver on ports, create a schedule, and then enable Energy Saver globally.

Alternatively, you can configure Energy Saver using the Efficiency Mode quick configuration method, which enables Energy Saver on all ports, creates a default schedule, and enables Energy Saver globally.

You can manually deactivate and reactivate Energy Saver at any time, without affecting the port configurations.

**Note**

- Energy Saver is supported only on copper ports that have auto-negotiation enabled.
- Network Time Protocol (NTP) must be enabled and configured to use Energy Saver.

Energy Efficient Ethernet

Table 226: Energy Efficient Ethernet product support

Feature	Product	Release introduced
Energy Efficient Ethernet (EEE)	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4 Supported on fixed copper ports only Not supported on 5420F-24S-4XE
	5520 Series	VOSS 8.2.5 Supported on fixed copper ports only Not supported on 5520-24X or 5520-48SE
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10 Supported on 7520-48XT-6C
	7720 Series	Not Supported
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.1 Supported on all fixed copper ports on VSP4900-48P and ports 1/1-1/12 on VSP4900-12MXU-12XE
	VSP 7400 Series	Not Supported

Energy Efficient Ethernet (EEE) supports the IEEE 802.3az standard for power savings in Ethernet networks for a select group of physical layer devices. A physical device that can support low power idle (LPI) mode is considered EEE-capable. Legacy devices that do not support EEE can be made EEE-compliant with an EEE-compliant PHY and an SDK version that allows the MAC device to interact with the PHY EEE functionality.

In a typical configuration, the EEE protocol communicates with the switch and the physical device to determine when to enter LPI mode during a period of inactivity, and to exit LPI mode when data transmission resumes.

Note

EEE is supported only on copper ports that have auto-negotiation enabled on them.

Power Savings Configuration Using CLI

Configure Energy Saver or Energy Efficient Ethernet using the command line interface (CLI).

Enable Energy Saver on Ports

Before You Begin

- If you have previously enabled Energy Saver globally, you must disable it globally before enabling Energy Saver on individual ports.
- If you have previously enabled Efficiency Mode, you must disable it before enabling Energy Saver on individual ports.

About This Task

Perform this procedure to enable Energy Saver on a specific port or range of ports.

Note

Energy Saver does not operate on the 5720 Series when you configure local port Auto-Negotiation advertisements to *2500-full* or *5000-full*.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format *slot/port/sub-port*.

2. Enable Energy Saver on the specified port:

Identifies the slot and port in one of the following formats:

- a single slot and port (slot/port)
- a range of slots and ports (slot/port-slot/port)
- a series of slots and ports (slot/port,slot/port,slot/port)
- all ports on the same slot (slot/all)
- all ports on the switch (all)

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format *slot/port/sub-port*.

```
energy-saver port {slot/port[/sub-port] [-slot/port[/sub-port]][,...]  
[slot/all][all]} enable
```

Example

Enable energy savings on slot 1 port 2:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface GigabitEthernet 1/2
Switch:1(config-if)#energy-saver port 1/2 enable
```

What to Do Next

Configure an Energy Saver schedule.

Variable Definitions

The following table defines parameters for the **energy-saver** command.

Variable	Value
<i>enable</i>	Enables energy savings on ports. The default is disabled.
<i>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...] [slot/all] [all]}</i>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Create an Energy Saver Schedule

Before You Begin

- If you have previously enabled Energy Saver globally, you must disable it globally before creating a schedule.
- If you have previously enabled Efficiency Mode, you must disable it before creating a schedule. You cannot change the default Efficiency Mode schedule entries when Efficiency Mode is enabled.
- You must enable Energy Saver on every port affected by the schedule.

About This Task

Perform this procedure to configure scheduled time intervals during which the switch will operate in low power state. This time interval can be for a week, weekend, or individual days.

Note

You can configure a maximum of 84 entries in the Energy Saver schedule.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the Energy Saver schedule:

```
energy-saver schedule {friday | monday | saturday | sunday | thursday  
| tuesday | wednesday | weekday | weekend} <hhmm> {activate |  
deactivate}
```

Example

Configure an Energy Saver schedule:

```
Switch:1>enable  
Switch:1# configure terminal  
Switch:1(config)#energy-saver schedule weekend 0735 activate  
Switch:1(config)#energy-saver schedule monday 0600 deactivate
```

What to Do Next

Enable Energy Saver globally.

Variable Definitions

The following table defines parameters for the **energy-saver schedule** command.

Variable	Value
<i>{activate deactivate}</i>	Activates or deactivates the scheduled event.
<i><hhmm></i>	Specifies the hour and minutes to enable Energy Saver feature on the switch.
<i>{friday monday saturday sunday thursday tuesday wednesday weekday weekend}</i>	Specifies the day(s) to enable Energy Saver feature on the switch.

Enable Energy Saver Globally

Before You Begin

- You must enable Energy Saver on individual ports.
- You must create an Energy Saver schedule.

About This Task

Perform this procedure to enable Energy Saver globally on the switch. You can optionally configure PoE power savings, to power off low priority PoE devices during off-peak times.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. (Optional) Configure PoE power savings:

```
energy-saver poe-power-saving
```

Note

You must configure PoE power savings before you enable Energy Saver globally.

3. Enable Energy Saver:

```
energy-saver enable
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#energy-saver poe-power-saving
Switch:1(config)#energy-saver enable
```

Variable Definitions

The following table defines parameters for the **energy-saver** command.

Variable	Value
<i>enable</i>	Enables Energy Saver feature. The default is disabled.
<i>poe-power-saving</i>	Enables PoE power saving. The default is disabled.

Enable and Configure Energy Saver using Quick Configuration

About This Task

Perform this procedure to enable and configure Energy Saver globally using the quick configuration Efficiency Mode. Efficiency Mode automatically configures the following:

- enables Energy Saver on all ports.
- creates a default schedule with a weekday schedule of Energy Saver activated from 6:00 p.m. to 7:30 a.m., and during weekends. You cannot change this default schedule while Efficiency Mode is enabled.
- enables Energy Saver globally.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable efficiency mode:

```
energy-saver efficiency-mode
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#energy-saver efficiency-mode
```

Variable Definitions

The following table defines parameters for the **energy-saver** command.

Variable	Value
<i>efficiency-mode</i>	Enables efficiency mode. The default is disabled.

Activate or Deactivate Energy Saver Manually

Before You Begin

Before you can change any previously saved Energy Saver settings, you must disable Energy Saver globally.

About This Task

Perform this procedure to activate or deactivate Energy Saver on the switch at any time. Energy Saver is deactivated by default.

Activating Energy Saver reduces the port speed to the minimum value supported by the switch and enables PoE power saving, even if PoE is globally disabled. Deactivating Energy Saver restores the previous configuration.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Activate or deactivate Energy Saver:

```
energy-saver {activate | deactivate}
```

Example

```
Switch:1> enable
```

Activate Energy Saver:

```
Switch:1# energy-saver activate
```

Deactivate Energy Saver:

```
Switch:1# energy-saver deactivate
```

Variable Definitions

The following table defines parameters for the **energy-saver** command.

Variable	Value
<i>activate</i>	Activates Energy Saver manually.
<i>deactivate</i>	Deactivates Energy Saver manually.

Energy Saver Show Commands

Use the procedures in this section to display specific information about Energy Saver configuration on the switch.

Display Energy Saver Global Information

About This Task

Perform this procedure to display information about Energy Saver global configuration.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display global configuration:
`show energy-saver global`

Example

```
Switch:1#show energy-saver global
Energy Saver: Disabled
Energy Saver PoE Power Saving Mode: Disabled
Energy Saver Efficiency-Mode Mode: Disabled
Day/Time: Wednesday 02:31:12
Current Energy Saver state: Energy Saver is Inactive
```

Display Energy Saver Interface Information

About This Task

Perform this procedure to display information about Energy Saver configuration on the ports.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display information about all ports or specify a particular port:
`show energy-saver interface [{slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]`

Example

```
Switch:1>enable
Switch:1#show energy-saver interface
Port ES State PoE Savings PoE Priority
```

```

-----
1/1      Enabled  Enabled  Low
1/2      Enabled  Enabled  Low
1/3      Enabled  Enabled  Low
1/4      Enabled  Enabled  Low
1/5      Enabled  Enabled  Low
1/6      Enabled  Enabled  Low
1/7      Enabled  Enabled  Low
1/8      Enabled  Enabled  Low
1/9      Enabled  Enabled  Low
1/10     Enabled  Enabled  Low
1/11     Enabled  Enabled  Low
1/12     Enabled  Enabled  Low
1/13     Disabled N/A      N/A
1/14     Disabled N/A      N/A
1/15     Disabled N/A      N/A

```

Display Energy Saver Power Savings Information

About This Task

Perform this procedure to display information about Energy Saver power savings on the switch.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display information about energy savings:
show energy-saver savings

Example

```

Switch:1#show energy-saver savings
-----
Unit Model          Switch Capacity      Saving PoE Saving
-----
8404C                0.0 watts            N/A
=====

```

Display Energy Saver Schedule Information

About This Task

Perform this procedure to display information about Energy Saver schedules configured on the switch.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display information about Energy Saver schedules:
show energy-saver schedule

Example

```

Switch:1#show energy-saver schedule
-----
Day      Time  Action
-----

```

Monday	18:00	Activate
Monday	07:00	Deactivate

Enable Energy Efficient Ethernet (EEE)

About This Task

Perform this procedure to enable Energy Efficient Ethernet (EEE) on a port. The default is disabled.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]
```

```
[,...][slot/all][all]}
```
-  **Note**
If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
2. Enable Energy Efficient Ethernet:

```
energy-saver eee enable
```

Display Energy Efficient Ethernet (EEE) Statistics

About This Task

Perform this procedure to display information about Energy Efficient Ethernet (EEE) statistics for all ports on a switch, or for a specific port.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display information about all ports or specify a particular port:

```
show energy-saver eee statistics [{slot/port[/sub-port]}[-slot/port[/sub-port]]
```

```
[,...][slot/all][all]}
```

Example

Switch:1>show energy-saver eee statistics					
=====					
EEE Port Status					
=====					
PortId	EEE Status	Tx LPI Events	Tx Idle Duration (micro seconds)	Rx LPI Events	Rx Idle Duration (micro seconds)

1/1	enabled	847	963657920	115	965100020

Variable Definitions

Use the data in following table to use the `show energy-saver eee statistics` command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]][, ...] [slot/all] [all]}</code>	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none">• a single slot and port (slot/port)• a range of slots and ports (slot/port-slot/port)• a series of slots and ports (slot/port,slot/port,slot/port)• all ports on the same slot (slot/all)• all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Clear Energy Efficient Ethernet (EEE) Statistics

About This Task

Perform this procedure to clear information about Energy Efficient Ethernet (EEE) statistics for all ports on a switch, or for a specific port.

Procedure

1. Enter Privileged EXEC mode:

enable
2. Clear Energy Efficient Ethernet statistics on all ports or specify a particular port:

clear energy-saver eee stats [port {slot/port[/sub-port] [-slot/port[/sub-port]][, ...] [slot/all] [all]}

Variable Definitions

Use the data in following table to use the `clear energy-saver eee stats` command.

Variable	Value
<code>port</code>	Specifies one or more ports.
<code>{slot/port[/sub-port][-slot/port[/sub-port]][,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Power Savings Configuration Using EDM

Use the following procedures to configure either Energy Saver or Energy Efficient Ethernet EEE using Enterprise Device Manager (EDM).

Enable Energy Saver Globally

About This Task

Perform this procedure to enable Energy Saver globally.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Select **Energy Saver**.
3. Select the **Energy Saver Globals** tab.
4. Configure the fields as required.
5. Select **Apply**.

Energy Saver Globals Field Descriptions

Use the data in the following table to use the **Energy Saver Globals** tab.

Name	Description
EnergySaverEnabled	Enables Energy Saver globally on the switch. The default is disabled.
PoePowerSavingEnabled	Enables Energy Saver PoE power saving. The default is disabled.

Name	Description
EfficiencyModeEnabled	Enables Energy Saver efficiency mode. The default is disabled. Efficiency mode enables Energy Saver globally and on all ports, it also enables PoE power saving. It also creates a weekday schedule that starts at 6:00 p.m. and ends at 7:30 a.m., and during the weekend Energy Saver is always activated.
EnergySaverActive	Activates Energy Saver on the switch. Energy Saver is deactivated by default.

Configure Energy Saver Schedule

Before You Begin

- You must disable Energy Saver globally.
- You must enable Energy Saver on every port affected by the schedule.
- You must deactivate Energy Saver efficiency-mode.

About This Task

Perform this procedure to configure a scheduled time interval during which the switch will operate in low power state. This time interval can be for a week, weekend, or individual days.

Note

- You can configure maximum 84 entries in the Energy Saver schedule.
- If efficiency mode is enabled, you cannot configure any other entries in the Energy Saver schedule.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Select **Energy Saver**.
3. Select the **Energy Saver Schedules** tab.
4. Select **Insert**.
5. Configure the fields as required.
6. Select **Insert**.
7. Select **Apply**.

Energy Saver Schedules *Field Descriptions*

Use the data in the following table to use the **Energy Saver Schedules** tab.

Name	Description
ScheduleDay	Specifies the day on which Energy Saver is activated or deactivated. The options are: <ul style="list-style-type: none"> • monday • tuesday • wednesday • thursday • friday • saturday • sunday • weekdays • weekend
ScheduleHour	Specifies the hour at which Energy Saver is activated or deactivated. The range is 0 to 23. Note: 0 is equivalent to 12 a.m., and 12 is equivalent to 12 p.m.
ScheduleMinute	Specifies the minute at which Energy Saver is activated or deactivated. The range is 0 to 59.
ScheduleAction	Specifies if Energy Saver is activated or deactivated. The options are: <ul style="list-style-type: none"> • activate • deactivate

Enable Energy Saver or EEE on Ports

You can enable Energy Saver or EEE using the Energy Saver tab accessed by the Edit navigation path, or the Power Management navigation path. Use one of the following procedures to enable either Energy Saver or EEE on ports.

*Enable Energy Saver or EEE on Ports***About This Task**

Perform this procedure to enable Energy Saver or EEE on one or more ports.

Procedure

1. On the Device Physical View tab, select one or more ports.
2. In the navigation pane, expand **Edit > Port**.
3. Select **General**.
4. Select the **Energy Saver** tab.

5. Enable either Energy Saver or EEE:
 - To enable Energy Saver, select **EnergySaverEnabled**.
 - To enable EEE, select **EnergySaverEEEEEnable**.
6. Select **Apply**.

Energy Saver Field Descriptions

Use the data in the following table to use the **Energy Saver** tab.

Name	Description
Port	Specifies the port number.
EnergySaverEnabled	Configures whether Energy Saver is enabled on the specific port.
EnergySavedPoeStatus	Specifies the Energy Saver PoE status for the specific port.
EnergySaverEEEEEnable	Configures whether EEE is enabled on the specific port.

Enable Energy Saver or EEE on Ports

About This Task

Perform this procedure to enable Energy Saver or EEE on one or more ports.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Select **Energy Saver**.
3. Select the **Ports** tab.
4. Enable either Energy Saver or EEE:
 - To enable Energy Saver, in the **EnergySaverEnabled** column, double-click the field associated with the specific ports, and then select **true**.
 - To enable EEE, in the **EnergySaverEEEEEnable** column, double-click the field associated with the specific ports, and then select **true**.
5. Select **Apply**.

Ports Field Descriptions

Use the data in the following table to use the **Ports** tab.

Name	Description
Port	Specifies the port number.
EnergySaverEnabled	Configures whether Energy Saver is enabled on the port.
EnergySaverPoEStatus	Displays Energy Saver PoE status for the port.
EnergySaverEEEEEnable	Configures whether EEE is enabled on the port.

View Energy Savings

About This Task

Perform this procedure to view the amount of switch capacity and PoE power being saved on the units.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Select **Energy Saver**.
3. Select the **Energy Savings** tab.

Energy Savings Field Descriptions

Use the data in the following table to use the **Energy Savings** tab.

Name	Description
UnitIndex	Specifies the unit number.
UnitSavings(1/10 watts)	Specifies the amount of switch capacity power being saved on the specific unit.
PoeSavings(1/10 watts)	Specifies the amount of PoE power being saved on the specific unit.

Display Energy Efficient Ethernet Statistics

Perform this procedure to display information about Energy Efficient Ethernet (EEE) statistics for all ports on a switch, or for a specific port.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Select **Energy Saver**.
3. Select the **EEE Statistics** tab.
4. (Optional) Select **Clear Stats** to clear information about EEE statistics.

EEE Statistics Field Descriptions

Use the data in the following table to use the **EEE Statistics** tab.

Name	Description
Port	Shows the port number.
State	Shows the state of Energy Efficient Ethernet (EEE) on the port.
TxEvents	Shows the EEE Tx event count for the port.
TxDuration	Shows the EEE Tx durations for the port.
RxEvents	Shows the EEE Rx event count for the port.
RxDuration	Shows the EEE Rx durations for the port.

Quality of Service

This section provides conceptual and procedural information about Quality of Service (QoS).

QoS Fundamentals

Use the information in this section to help you understand Quality of Service (QoS).

This section describes a range of features that you can use on the switch to manage traffic flowing through your network. You can configure your network to prioritize specific types of traffic to ensure that the traffic receives the appropriate QoS level. For those cases where traffic levels are so high that congestion occurs despite management, the switch provides additional congestions handling features that are described in this section.

QoS refers to the ability to control network flows either by prioritizing traffic or by guaranteeing performance levels. QoS does not refer to a specifically achieved service quality. To provide QoS, you can use some combination of the switch's traffic management tools to help deliver provisioned network QoS. It is up to the network administrator to accurately analyze a given situation and select the proper tool(s) for the task.

Introduction to QoS

The switch comes with a set of traffic management tools that you can use to provide QoS for Layer 2 (bridged) or Layer 3 (routed) traffic flows. Many of these flows are multiplexed across a set of network switches and compete for network resources at convergence points. Without traffic management, the congested data flows compete for resources and the result is unpredictable. The resulting QoS can only be described as best-effort. The opposite is also true, without congestion there are sufficient network resources for all traffic to pass without competition. Without congestion, traffic management is not required. In this sense, you cannot separate discussions about QoS and traffic management from those on congestion. The switch provides a set of tools

that you can use to provide network services that are far superior to best-effort thereby enabling the delivery of provisioned QoS.

To deliver QoS, the switch uses two types of traffic management tools:

- Congestion management
- Congestion handling

Congestion management acts to prevent congestion by prioritizing traffic flows through priority queuing and priority-aware servicing methods. Other functions, such as policing, are also considered congestion management. Policing indirectly prioritizes some traffic by limiting the rates of other traffic.

Congestion handling alleviates existing congestion by dropping lower priority traffic before higher priority traffic. The switch handles the congestion by queue-specific tail dropping. The basic QoS architecture of the switch identifies three primary functional areas:

- Ingress QoS identification and classification
- the switch's internals and queuing architecture
- QoS marking/remarking for downstream use

Important

Remarking packets with an ACL filter does not change the internal QoS level of the packets. You must add the **permit internal-qos [value]** statement to the ACL filter.

The QoS architecture is coherent end-to-end across a network. The QoS at any particular network element can be marked in the relevant Layer 2 or Layer 3 protocol fields and provided to the next hop. The receiving next hop can then use this information to classify its own ingress traffic, apply its specific internal traffic management features, and remark the results for subsequent hops.

Depending on the product, the QoS implementation on the switch can support the following options:

1. Ingress priority mappings including: DSCP to internal QoS, 802.1p-bits to internal QoS, and port-level QoS configuration.
2. Egress priority mappings including: internal QoS to DSCP and internal QoS to 802.1p-bits.
3. Port-based rate limiting or ingress policers

Note

7520 Series and 7720 Series do not support port-based rate limiting or ingress policers.

4. Port-based broadcast and multicast rate limiting
5. Port-based egress shaping
6. Egress queue rate limiting

For information about feature support, see *Fabric Engine and VOSS Feature Matrix*.

Traffic Management

Prioritized traffic handling requires QoS classification first. The switch typically classifies traffic by using the endpoint switch configuration in conjunction with the protocol elements of the incoming frame such as *priority*. You can add additional classification by using access control lists (ACLs) and other filtering functionality.

The switch's internal traffic management functions use the results of classification to determine the prioritization of traffic. Examples of internal functions that prioritize traffic would be both strict and weighted round robin (WRR) queue scheduling. These mechanisms prioritize data by favorable scheduling or weighting.

The disposition of a particular data frame is not necessarily fully determined as a result of classification. You can apply additional traffic management functions such as Ingress Port Rate Limiting or Policing depending on your switch features. Ingress Port Rate Limiting is a congestion management mechanism to limit the traffic rate accepted by the specified ingress port. Policing is a congestion management method that limits incoming traffic at the ingress that could cause congestion at the egress. While queuing strategies affect prioritization by favoring some traffic; policing is essentially the opposite. Policing works not by favoring some traffic, but by penalizing the bursty traffic. Queue scheduling and policing are only two of the available tools for congestion management. Additional details are presented in subsequent sections of this document.

In addition to the traffic management tools which aid in the prevention of congestion, tools are also provided to handle congestion as it occurs. Congestion handling tools monitor congestion levels at convergence points in the switch and selectively discard frames if congestion begins to increase. Per queue tail dropping is the primary congestion handling function of the switch. You can also use ACLs and filtering as congestion handling tools.

Differentiated Services (DiffServ)

Table 227: Differentiated Services product support

Feature	Product	Release introduced
Differentiated Services (DiffServ) including Per-Hop Behavior	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Differentiated Services (DiffServ) is a traffic management tool that classifies network traffic into eight traffic classes, and then gives each class differentiated treatment. DiffServ networks map the traffic's class into a set of packet forwarding behavior, referred to as a *Per-Hop Behavior (PHB)*. A PHB could specify which egress queue to use. For example, a switch may classify a packet by determining its protocol to be IPv4, subsequently extract the DSCP value, and apply a PHB by directing the packet to a specific queue. DiffServ does not prescribe a set of traffic classes and does not predetermine which types of traffic should be handled by a given class. DiffServ simply provides a generic means of classifying packets so they may be treated differently.

DiffServ applies to IP packets only.

DiffServ Access and DiffServ Core

A fundamental characteristic of DiffServ networks is the distinction made between switches at the network edges and those residing in the network interior. The switch refers to this distinction as DiffServ Access (edge) and DiffServ Core (interior), respectively.

It is important to note that the switch operates simultaneously as both a DiffServ Access switch and a DiffServ Core switch. The architectural premise is that the edge or access nodes perform the bulk of the work (classification, policing, etc.) and mark the packet for downstream processing. In theory this would permit the interior or core switches to bypass much of the edge processing as they would “trust” the classification and marking performed by the access switch. The notion of trust is key to the access/core switch distinction.

- If you configure a port as an access port, the system does not trust packet markings.
- If you configure a port as a core port, the system trusts packet markings.

On the access side, malicious users can send packets into a network with intent to cause serious harm (e.g., denial of service attacks). However, on core switches, the only traffic sources are one's own upstream switches. As such, a core switch has the opportunity to trust the classification, markings (and implied PHB) determined by the previous hop.

The following figure shows DiffServ network operations. The devices are on the network edge where they perform classification, marking, policing, and shaping functions.

Figure 200: DiffServ network core and edge devices

Use a DiffServ Access port at the edge of a DiffServ network. The access port classifies traffic according to port QoS. Outgoing packet DSCP and 802.1p values are derived

from port QoS and QoS maps. The system strips Dot1Q headers at ingress, and adds them back at egress only if you configure the egress port as a tagged or trunk port.

A DiffServ Core port does not change packet classification or markings; the port trusts the incoming traffic markings. A core port preserves the DSCP marking of all incoming packets, and uses these markings to assign the packet to an internal QoS level. For tagged packets, the port honors the 802.1p bits within a Dot1Q header, and uses these bits to classify ingress traffic. You can control the honoring (or not) of 802.1p bits by configuring the 802.1p override.

Per-Hop Behavior (PHB)

Traffic entering the DiffServ network enters a queue according to their marking, which determines the PHB of the packets. For example, if the system marks a video stream to receive the highest priority, it enters a high-priority queue. As these packets traverse the DiffServ network, the system forwards the video stream before other packets.

As a standard, DiffServ is described in the context of Layer 3. Classification is accomplished by mapping a packet priority field from the packet and then applying a per-hop behavior. DiffServ standards define the IPv4 header's Differentiated Services Code Point (DSCP) field to determine classification and subsequent per-hop behavior.

The RFC2598 standard provides only the following four fundamental per-hop behaviors:

- Default (DF) — This PHB provides best-effort forwarding behavior.
- Expedited Forwarding (EF) — This PHB provides performance-critical forwarding.
- Assured Forwarding (AF) — This PHB classifies traffic based upon **class** (priority) only.

Important

The switch never classifies nor takes action based upon drop precedence. In response to congestion, the only drops available for a given traffic class are tail drops.

- Class Selector (CS) — This PHB provides a simple mapping of a DSCP to one of eight traffic classes. While the switch provides all four PHBs, the CS PHB is most analogous to the switch's internal processing – classification occurs to derive priority, which subsequently determine the per-hop behavior (e.g., queuing).

DiffServ and Filters

QoS (DiffServ) and filters operate independently; you do not have to use filters to provide QoS. However, filters can override QoS operations. For more information, see [Traffic Filtering Fundamentals](#) on page 3681.

DiffServ and VXLAN Gateway

DSCP bits in the outer IP header of VXLAN-encapsulated packets are always derived from the internal QoS, irrespective of the ingress port DiffServ configuration. Customer packet IP DSCP bits are not modified as part of VXLAN encapsulation. For more information about VXLAN, see [VXLAN Gateway](#) on page 4170.

Traffic Traversing the Switch

The switch's traffic management capabilities are best understood by examining the functionality that is invoked as packets flow from ingress ports, through the switch, to egress ports. The following list includes the set of features and processing that the switch performs as flows traverse the switch:

- Classification and ingress mapping
- Filtering
- Rate Limiting or Policing
- Queueing
- Remarking
- Shaping

The switch classifies packets to determine their priority. While DiffServ is traditionally defined as Layer 3 functionality, the switch extends the logical concept to Layer 2. The switch can, based upon user configuration, determine a packet's priority from either its Layer 2 (p-bits) or Layer 3 (DSCP) information.

- If the packet arrives on an untrusted port (DiffServ Access), then the packet's priority comes from user-configured parameters such as port priority.
- If the packet arrives on a trusted port, priority comes from information contained in the packet's header (p-bits or DSCP).

After the switch determines the packet's configured or marked priority, it maps that value to be used internally. The QoS level used by the switch is referred to as the **Internal QoS Level (IQL)**. The IQL is the internal numerical value that the switch uses to determine the packets per-hop behaviors such as queue selection and bandwidth guarantee.

The following list identifies the order of DiffServ operations for a packet:

- Packet classification: IEEE 802.1p and DSCP markings classify (map) the packet to its appropriate PHB and QoS level.
- Remarking: The switch can remark packets according to QoS actions you configure on the switch (internal QoS mappings).
- Shaping: The switch provides port-based shaping. Port-based shaping shapes all outgoing traffic to a specific rate.

Classification and Mapping

Traffic classification includes functions that examine a packet to determine further actions according to defined rules. Classification involves identifying flows so that the router can modify the packet contents or Per-Hop Behavior (PHB), apply conditioning treatments to the packet, and determine how to forward the packet to the egress interface. Packet classification depends on the service type of the packet and the point in the traffic management process where the classification occurs.

The device classifies traffic as it enters the DiffServ network, and assigns appropriate PHB based on the classification. To differentiate between classes of service, the device marks the DiffServ (DS) parameter in the IP packet header, as defined in RFC2474

and RFC2475. The DSCP marking defines the forwarding treatment of the packet at each network hop. This marking (or classification) occurs at the edge of the DiffServ domain, and is based on the policy (or filter) associated with the particular microflow or aggregate flow.

You can configure the mapping of DSCP-to-forwarding behaviors and DSCP re-markings. Re-marking the DSCP resets the treatment of packets based on new network specifications or desired levels of service.

Layer 3 marking uses the DSCP parameter. Layer 2 (Ethernet) marking involves the 802.1p-bits parameter.

For Layer 2 packets, priority bits (or 802.1p bits) define the traffic priority of the Ethernet packet. You can configure an interface to map DSCP or 802.1p bits to internal QoS levels on ingress. You can configure an interface to map internal QoS levels to DSCP or 802.1p bits at egress. 802.1p bit mapping provides the Ethernet VLAN QoS requirements.

Within the network, a packet PHB associated with the DSCP determines how a device forwards the packet to the next hop—if at all. Consequently, nodes can allocate buffer and bandwidth resources to each competing traffic stream. The initial DSCP value is based on network policies for the type of service required. The objective of DSCP-to-Service Class mapping is to translate the QoS characteristics defined by the packet DSCP marker to a Service Class. The DSCP-to-Service Class mapping occurs at ingress. For each received packet, the mapping function assigns a Service Class.

The switch maintains four mapping tables. These tables translate the ingress 802.1p-bits or DSCP markings to an internal QoS level, and then retranslate the internal QoS level to an egress DSCP or 802.1p-bits marking as follows:

- ingress 802.1p-bits to QoS level
- ingress DSCP to QoS level
- QoS level to egress 802.1p-bits
- QoS level to egress DSCP

Service Classes

Service classes define a standard architecture to provide end-to-end QoS on a broad range of Ethernet switching and voice products. They function as default QoS policies built into the product. They incorporate the various QoS technologies to provide a complete end-to-end QoS behavioral treatment. The switch includes a built-in QoS implementation for service classes.

The switch includes eight preconfigured queues (corresponding to the eight service classes) on each port of an interface module.

A service class domain classifies traffic as one of the following:

- Network control traffic (Critical/Network)
- Subscriber traffic (Premium, Metal, or Standard)

Queue 7 — Critical/Network Service Class (PHB of CS6/CS7)

The switch uses the Critical/Network Service Class for traffic within a single administrative network domain. If such traffic does not get through, the network cannot function.

Queue 6 — Premium Service Class (PHB of CS5/EF)

The switch uses the Premium Service Class for IP telephony services, and provides the low latency and low jitter required to support such services. IP telephony services include Voice over IP (VoIP), voice signaling, Fax over IP (FoIP), and voice-band data services over IP (for example, analog modem). The switch can also use the Premium Service Class for Circuit Emulation Services over IP (CESoIP).

Metal Service Classes

The Platinum, Gold, Silver, and Bronze Service Classes are collectively referred to as the metal classes. The metal Service Classes provide a minimum bandwidth guarantee and are for variable bit rate or bursty types of traffic. Applications that use the metal Service Class support mechanisms that dynamically adjust their transmit rate and burst size based on congestion (packet loss) detected in the network. The following list describes the individual metal classes:

- Queue 5 — Platinum Service Class (PHB of CS4/AF41)

The switch uses the Platinum Service Class for applications that require low latency, for example, real-time services such as video conferencing and interactive gaming. Platinum Service Class traffic provides the low latency required for interhuman (interactive) communications. The Platinum Service Class provides a minimum bandwidth assurance for Assured Forwarding (AF) 41 and Class Selector (CS) 4-marked flows.

- Queue 4 — Gold Service Class (PHB of CS3/AF31)

The switch uses the Gold Service Class for applications that require near-real-time service and are not as delay-sensitive as applications that use the Platinum service. Such applications include streaming audio and video, video on demand, and surveillance video.

The Gold Service Class assumes that traffic buffers at the source and destination and, therefore, the traffic is less sensitive to delay and jitter. By default, the Gold Service Class provides a minimum bandwidth assurance for AF31, AF32, AF33 and CS3-marked flows.

- Queue 3— Silver Service Class (PHB of CS2/AF21)

The switch uses the Silver Service Class for responsive (typically client- and server-based) applications. Such applications include Systems Network Architecture (SNA) terminals (for example, a PC or Automatic Teller Machine) to mainframe (host) transactions that use Data Link Switching (SNA over IP), Telnet sessions, web-based ordering and credit card processing, financial wire transfers, and Enterprise Resource Planning applications.

Silver Service Class applications require a fast response and have asymmetrical bandwidth needs. The client sends a short message to the server and the server

responds with a much larger data flow back to the client. For example, after a user selects a hyperlink (that sends a few dozen bytes) on a webpage, a new webpage opens (that downloads kilobytes of data). The Silver Service Class provides a minimum bandwidth assurance for AF21 and CS2-marked flows.

The Silver Service Class favors short-lived, low-bandwidth TCP-based flows.

- Queue 2 — Bronze Service Class (PHB of CS1/AF11)

The switch uses the Bronze Service Class for longer-lived TCP-based flows, such as file transfers, e-mail, or noncritical Operation, Administration, and Maintenance (OAM) traffic. The Bronze Service Class provides a minimum bandwidth assurance for AF11 and CS1-marked flows. As a best practice, use the Bronze Service Class for noncritical OAM traffic with the CS1 DSCP marking.

Queue 1 and 0 — Standard (PHB of CS0/DF) and Custom Service Classes

The switch uses the Standard and Custom Service Classes for best-effort services. Delays, loss, or jitter guarantees for these service classes are not specified. However, the Standard Service Class has more forwarding resources than the custom service classes.

Internal QoS level

The internal QoS level or effective QoS level is a key element in the switch QoS architecture. The internal QoS level specifies the kind of treatment a packet receives. The switch classifies every packet that enters and assigns it an internal QoS level.

Internal QoS levels map to the queues on a port. For example, for an access port the internal QoS level is derived from the port QoS level. For Layer 3 trusted (core) ports, the system honors incoming DSCP or type of service (TOS) bits. The system assigns the internal QoS level using the ingress DSCP to QoS level map.

Important

Remarking packets with an ACL filter does not change the internal QoS level of the packets. You must add the **permit internal-qos [value]** statement to the ACL filter. For more information, see [Internal QoS Level and Remarking](#) on page 3698.

Ingress Mappings

The system uses ingress maps to translate incoming packet QoS markings to the internal QoS level. The system uses the internal QoS level to classify packets.

Ingress mappings include

- 802.1p to (internal) QoS level
- DSCP to (internal) QoS level

The following logical table shows how the system performs ingress mappings for data packets and for control packets not destined for the Control Processor (CP).

Table 228: Data packet ingress mapping

DSCP	Layer 2 trusted	Layer 3 trusted (DiffServ enabled and Access-diffserv disabled)	IP packet	Routed packet	Ingress tagged	Internal QoS
x	No	x	No	x	x	Use port QoS
x	Yes	x	No	x	No	Use port QoS
x	Yes	x	No	x	Yes	Use ingress p-bits mapping
0x1B	x	x	Yes	x	x	4
0x23	x	x	Yes	x	x	5
0x29	x	x	Yes	x	x	5
0x2F	x	x	Yes	x	x	6
x	No	No	x	x	x	Use port QoS
x	No	Yes	Yes	x	x	Use ingress DSCP mapping
x	Yes	No	Yes	x	No	Use port QoS
x	Yes	No	Yes	x	Yes	Use ingress p-bits mapping
x	Yes	Yes	Yes	No	No	Use ingress DSCP mapping

Table 228: Data packet ingress mapping (continued)

DSCP	Layer 2 trusted	Layer 3 trusted (DiffServ enabled and Access-diffserv disabled)	IP packet	Routed packet	Ingress tagged	Internal QoS
x	Yes	Yes	Yes	No	Yes	Use ingress p-bits mapping
x	Yes	Yes	Yes	Yes	Yes	Use ingress DSCP mapping

**Important**

On a tagged port that is Layer-2 trusted, Layer-3 trusted and DiffServ enabled, all multicast packets honor the ingress DSCP value.

On the 7830 Series, an NNI port is always considered Layer-2 trusted regardless of the configuration on the NNI interface.

The QoS level for control packets destined for the CPU is assigned internally to ensure timely packet processing and scaling numbers. You cannot configure the QoS level for these control packets. The system assigns the highest QoS-level to time-critical protocols.

The following table shows ingress IEEE 802.1p to QoS level mappings.

Table 229: Default ingress 802.1p to QoS mappings

Ingress IEEE 802.1p	PHB	QoS Level	Network Service Class (NSC)
0	CS0/DF	1	Standard
1	Custom	0	Custom
2	CS1/AF11	2	Bronze
3	CS2/AF21	3	Silver
4	CS3/AF31	4	Gold
5	CS4/AF41	5	Platinum
6	CS5/EF	6	Premium/EF
7	CS6/CS7	7	Network/Critical

The following table shows DSCP to internal QoS level mappings.

Table 230: Default ingress DSCP to QoS mapping

Ingress				Internal QoS level	PHB level
DSCP (decimal)	DSCP (binary)	DSCP (hexadecimal)	TOS (hexadecimal)		
00	000000	00	00	1	CS0/DF
00	000000	00	00	1	DF

63	111111	3F	FC	1	CS0

Egress Mappings

Egress mappings include:

- QoS level to IEEE 802.1p mappings
- QoS level to DSCP mappings

When a packet is forwarded by the switch, the software does the following:

- Always performs 802.1p remarking before the packet egresses.
- If the ingress port has **enable-diffserv** and **access-diffserv** enabled, then the IP packet is DSCP remarked before the packet egresses.

If the ingress port is not configured this way, the packets are not DSCP remarked.

The following table shows egress QoS level to IEEE 802.1p mappings.

Table 231: Default egress QoS level to IEEE 802.1p mappings

QoS level	PHB	Default 1p remarking on egress	Network Service Class (NSC)
0	Custom	1	Custom
1	CS0/DF	0	Standard
2	CS1/AF11	2	Bronze
3	CS2/AF21	3	Silver
4	CS3/AF31	4	Gold
5	CS4/AF41	5	Platinum
6	CS5/EF	6	Premium/EF
7	CS6/CS7	7	Network/Critical

The following table shows QoS level to DSCP mappings.

The switch QoS implementation supports egress port-based shaping for bandwidth management and traffic control. Egress port-based shaping is the process by which the system delays and transmits packets to produce an even and predictable flow rate.

Each port has eight unicast and multicast queues, Class of Service (CoS) 0 to CoS 7. Traffic shaping exists on the egress CoS 6 and CoS 7, but you cannot change the configuration. CoS 6 and CoS 7 are strict priority queues, with traffic shaping for CoS 6 at 50 percent and CoS 7 to five percent of line rate.

Each feature is important to deliver DiffServ within a QoS network domain.

The switch supports an ingress flow-based policer for ACLs. For information, see [Ingress Policer and Port Rate Limiter](#) on page 3704.

Token Buckets

Tokens are a key concept in traffic control. A port-based rate limiter, policer, shaper, or an ingress flow-based policer calculates the number of packets that passed, and at what data rate. Each packet corresponds to a token, and the port-based rate limiter,

policer, shaper, or an ingress flow-based policer transmits or passes the packet if the token is available. For more information, see [Figure 201](#).

The token container is like a bucket. In this view, the bucket represents both the number of tokens that a port-rate limiter, policer, or shaper can use instantaneously (the depth of the bucket) and the rate at which the tokens replenish (how fast the bucket refills).

Each policer has two token buckets: one for the peak rate and the other for the service rate. The following figure shows the flow of tokens.

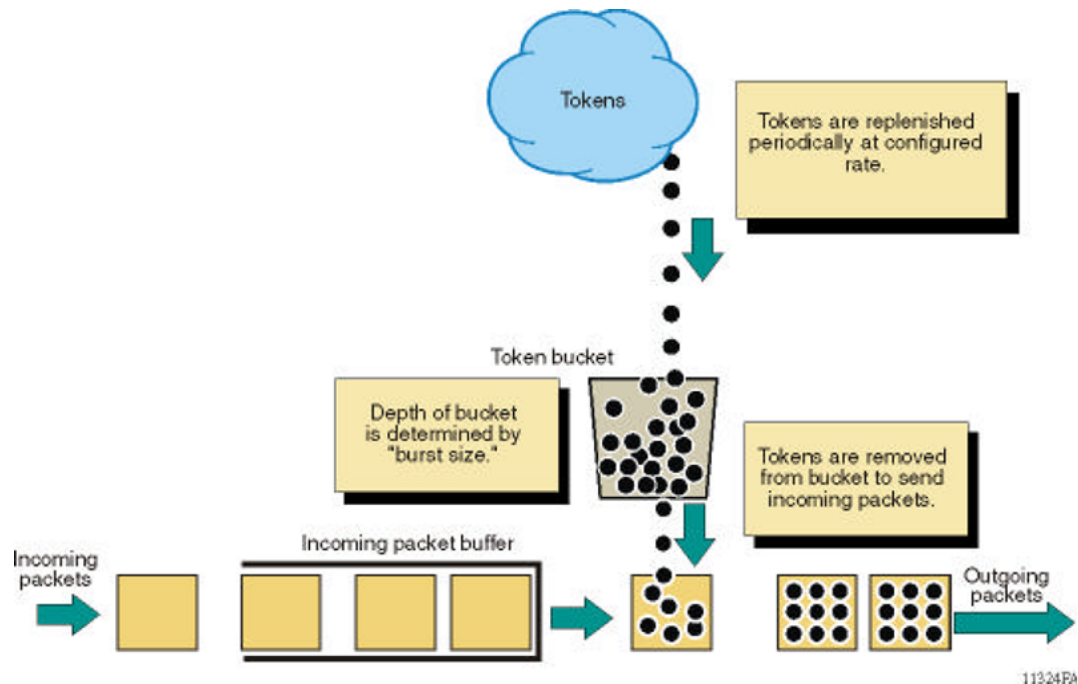

Figure 201: Token flow

Queuing

Queuing is a congestion-avoidance function that prioritizes packet delivery. Queuing ensures discriminate packet discard during network congestion, and can delay a packet in memory until the scheduled transmission.

You can use queuing to manage congestion. Congestion management involves the creation of queues, assignment of packets to the queues based on the classification of the packet, and scheduling of the packets in a queue for transmission.

The system schedules packets for transmission according to their assigned priority and the queuing mechanism configured for the interface. The scheduler determines the order of packet transmission by controlling how the system services queues with respect to each other. The switch uses 16 CPU queues (used by traffic destined to the CPU), and eight unicast and eight multicast queues for each port. The deepest queue does not go beyond 60,000 packets.

A scheduler services the eight queues for each port, using a combination of strict priority and round-robin. Queue zero through five use round robin, and queues six and seven drain completely, or up to certain rate limits.

There are eight priorities on each egress port. Each Weighted Round Robin (WRR) queue has a minimum guaranteed weight to ensure fair bandwidth allocation for each queue in case all QoS queues are utilized and there is congestion. With the default profile, Class of Service (CoS) 0 to CoS 5 are WRR, and the default weights are 5, 20, 30, 40, 50, and 50 respectively. CoS 6 and CoS 7 are strict priority queues. The switch subjects CoS 6 and CoS 7 to traffic shaping at 50 per cent and five per cent of line rate respectively.

Note

By default, rate limiting is enabled on queues 6 and 7. If you disable rate limiting on these queues on 7830 Series, no queue is considered a priority queue. Instead, all queues are managed using the Weighted Round Robin (WRR) scheduling algorithm with the following weights: 5, 20, 30, 40, 50, 50, 5.

All packets destined for the CPU are sent as unicast packets.

Front panel ports also have 8 queues. When a front panel port is oversubscribed with both unicast and multicast packets, the bandwidth is divided so that the unicast packets receive 80% of the bandwidth and multicast packets 20% of the bandwidth.

If there are no multicast packets using the reserved 20%, the bandwidth is evenly distributed between COS levels 0 to 6. This results in approximately 3.3% more bandwidth for each level. If a specific COS level is not oversubscribed, the unused bandwidth is evenly distributed between the other COS levels. The CLI provides commands to map ingressing packets to specific COS levels.

Note

Unicast packets will be tail dropped on the ingress card. Multicast packets will be dropped at egress card.

Among the WRR queues, the approximate bandwidth percentage is relative to the remaining bandwidth after subtracting the Strict Priority queues. The following tables provide the approximate bandwidth percentage based on queue congestion.

Table 234: Bandwidth for Queue 0 to 5 congestion

Queue	Approximate bandwidth percentage*
0	5%
1	10%
2	15%
3	20%
4	25%

Table 234: Bandwidth for Queue 0 to 5 congestion (continued)

Queue	Approximate bandwidth percentage*
5	25%
<p>* The approximate value assumes that all queues 0 to 5 are congested and similar packet sizes. Any queue that does not require bandwidth results in adding more bandwidth to the WRR queues.</p> <p>Percentage is relative to the total bandwidth minus the bandwidth consumed by Cos 6 and 7 (strict queues).</p>	

Table 235: Bandwidth for Queue 0 to 7 congestion

Queue	Approximate bandwidth percentage*
0	2.25%
1	4.5%
2	6.75%
3	9%
4	11.25%
5	11.25%
6	50%
7	5%
<p>* The approximate value assumes that all queues 0 to 7 are congested and similar packet sizes.</p>	

CPU Queues

The following table outlines the CPU traffic and which queue it uses.

Table 236: CPU traffic queues

Queue description	Queue ID	Queue pps, burst size	Traffic type
Other	0	1400 pps, 100 kbps	Others
BC_Other	1	1400 pps, 100 kbps	Broadcast
HI_CPU looper	2	4000 pps, 100 kbps	IP_COS01

Queue Profiles

Table 237: Queue Profiles product support

Feature	Product	Release introduced
QoS per queue rate limiting	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

This section identifies optional ways to customize the egress queues and scheduling depending on your need to override the default configuration. You can also enable egress queue rate limiting, if desired.

Use a queue profile to apply configured egress queue parameters and modify each queue individually. You can use the queue profile to configure a minimum weight for

the queue and to enable rate limiting for the queue. The queue profile applies to all ports in the switch.

Note

If you enable rate limiting for all queues, the scheduler treats all queues as strict priority queues. If all queues are strict priority, the scheduler services the highest priority queue first until the maximum bandwidth is met, and then it services the next highest priority queue. Queue 0 is the lowest priority queue, which means that when over-subscribed, the lower priority queues are serviced last, or not at all.

The switch supports six queue profiles. The default queue profile, with the name default and ID 1, is automatically created during system startup and cannot be deleted.

Note

The egress queues with rate limiting enabled must be contiguous. For example, you can configure queues 3–6, but you cannot configure 3 and 6.

After you make a configuration change to a queue profile, you must apply the profile before the changes take effect.

Configuration Considerations

If you modify the QoS configuration for a port that is a member of MultiLink Trunking (MLT), all ports in the MLT inherit the same configuration. If you remove the port from the MLT, it keeps the QoS configuration it inherited from the MLT.

QoS Support for 10 GbE Interface in 1GbE mode

If you use QoS with a 10 gigabit Ethernet (GbE) interface and re-purpose the interface as a 1 GbE interface, you must make the necessary configuration changes to accommodate the new link speed.

Check your rate limiting and shaping configuration, if you choose to change the port link speed from 10 GbE to 1 GbE.

Review the following commands to ensure proper configuration for the port speed you use.

Command	Description
qos if-rate-limiting [port {slot/port}] rate <1000-400000000>	Configures ingress port rate limiting in kbps. Note: The range can vary depending on your hardware platform.
rate-limit broadcast <1-65535>	Configures ingress port broadcast rate limiting in packets/second.

Command	Description
rate-limit multicast <1-65535>	Configures ingress port multicast rate limiting in packets/second.
rate-limit unknown-unicast <1-65535>	Configures ingress port unknown unicast rate limiting in packets/second.
qos if-shaper [port {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}] shape-rate WORD<1000-1000000000>	Specifies the shaping rate in Kb/s. If you try to configure a limit that is too high for the port speed, the switch displays the following message: Error: port slot/port, The QoS Egress shaper rate can not exceed the port capability.

802.1p and 802.1Q Best Practices

In a network, to map the 802.1p user priority bits, use 802.1Q-tagged encapsulation on customer-premises equipment (CPE). You require encapsulation because the switch does not provide classification when it operates in bridging mode.

To ensure consistent Layer 2 QoS boundaries within the service provider network, you must use 802.1Q encapsulation to connect CPE directly to the switch access node. If you do not require packet classification, use Ethernet Routing Switch 5600 to connect to the access node. In this case, configure the traffic classification functions in the Ethernet Routing Switch 5600.

At the egress access node, packets are examined to determine if their IEEE 802.1p or DSCP values must be re-marked before leaving the network. Upon examination, if the packet is a tagged packet, the IEEE 802.1p tag is configured based on the QoS level-to-IEEE 802.1p-bit mapping. For bridged packets, the DSCP is re-marked based on the QoS level.

Network Congestion and QoS Design

When you provide QoS in a network, one of the major elements you must consider is congestion, and the traffic management behavior during congestion. Congestion in a network is caused by many different conditions and events, including node failures, link outages, broadcast storms, and user traffic bursts.

At a high level, three main types or stages of congestion exist:

1. No congestion
2. Bursty congestion
3. Severe congestion

In a noncongested network, QoS actions ensure that delay-sensitive applications, such as real-time voice and video traffic, are sent before lower-priority traffic. The prioritization of delay-sensitive traffic is essential to minimize delay and reduce or eliminate jitter, which has a detrimental impact on these applications.

A network can experience momentary bursts of congestion for various reasons, such as network failures, rerouting, and broadcast storms. The switch has sufficient capacity to handle bursts of congestion in a seamless and transparent manner. If the burst is not sustained, the traffic management and buffering process on the switch allows all the traffic to pass without loss.

Severe congestion is defined as a condition where the network or certain elements of the network experience a prolonged period of sustained congestion. Under such congestion conditions, congestion thresholds are reached, buffers overflow, and a substantial amount of traffic is lost.

When you perform traffic engineering and link capacity analysis for a network, the standard design rule is to design the network links and trunks for a maximum average-peak utilization of no more than 80%. This value means that the network peaks to up to 100% capacity, but the average-peak utilization does not exceed 80%. The network is expected to handle momentary peaks above 100% capacity.

Layer 2 and Layer 3 Trusted and Untrusted Ports

You can configure interface module ports as trusted or untrusted at both Layer 2 (802.1p) or Layer 3 (DSCP) for ingress packet classification.

The switch provides eight internal QoS levels. These eight levels, numbered zero to seven, map to the queues through

- the ingress 8021p to (internal) QoS mapping table
- the ingress DSCP to (internal) QoS mapping table

To configure a port as trusted or untrusted, use the commands and the parameter values as shown in the following tables:

Layer 2 Trusted	Layer 2 Untrusted
802.1p-override	802.1p-override
disable	enable

Layer 3 Trusted		Layer 3 Untrusted	
enable-diffserv	access-diffserv *	enable-diffserv	access-diffserv *
enable	disable	disable	disable
		disable	enable
		enable	enable **

* Configure **access-diffserv** as either a core or access port. If enabled, this command specifies an access port and overrides incoming DSCP bits. If disabled, it specifies a core port that honors and services incoming DSCP bits.

** If the ingress port has **enable-diffserv** and **access-diffserv** enabled, then the packet is DSCP remarked at egress.

Layer 2 Untrusted and Layer 3 Untrusted

To configure a port as Layer 2 untrusted and Layer 3 untrusted, refer to the previous tables and assign the parameter values accordingly.

For more information, see [Table 228](#) on page 2992.

Layer 2 Untrusted and Layer 3 Trusted

To configure a port as Layer 2 untrusted and Layer 3 trusted, refer to the previous tables and assign the parameter values accordingly.

Use these configuration options to classify packet QoS through the DSCP parameter for all IP packets, whether tagged or untagged. Use this configuration when another QoS or DiffServ enabled and configured switch marks the IP packets at the edge. These already-marked packets arrive Layer 3 trusted, and the switch continues with the trust (DiffServ core port operation). For tagged packets, the system does not examine the 802.1p bits. For non-IP packets, this configuration causes classification by port QoS settings.

**Note**

For IP switched and tagged packets, use the 802.1p bits to derive the internal QoS. For untagged or routed packets, use the DSCP to derive the internal QoS.

For more information, see [Table 228](#) on page 2992.

Layer 2 Trusted and Layer 3 Trusted

To configure a port as Layer 2 trusted and Layer 3 trusted, refer to the previous tables and assign the parameter values accordingly.

Use these configuration options to classify packet QoS through DSCP for all IP packets, and through 802.1p for all tagged non IP packets. If it is an IP packet, DSCP is used. If it is a tagged non IP packet, 802.1p bits are used. If it is an untagged non IP packet, the port QoS is used.

For more information, see [Table 228](#) on page 2992.

Layer 2 Trusted and Layer 3 Untrusted

To configure a port as Layer 2 trusted and Layer 3 untrusted, refer to the previous tables and assign the parameter values accordingly.

Use these configuration options to classify packet QoS through 802.1p for all tagged packets, and port QoS levels for all untagged (IP or non-IP) packets. If the packet is an IP packet, the system does not modify or examine the DSCP parameter bits.

For more information, see [Table 228](#) on page 2992.

DiffServ Disabled

If you disable the DiffServ parameter, the system ignores the Layer 3 DSCP parameter. For more information, see [Table 228](#) on page 2992.

Broadcast, Unknown Unicast, and Multicast Traffic Bandwidth Limiters

The switch supports port-level bandwidth limiters for ingress broadcast, unknown unicast, and multicast traffic. The system drops traffic that violates the bandwidth limit. Enable this feature by configuring the rate limit, in packets per second (pps), on an individual port basis.

To see the number of packets a port drops because they exceeded the rate limit, use the following commands:

- **monitor ports error main**
- **show interfaces gigabitethernet error**

Configure Storm Control to determine the actions taken on the port after it drops packets for exceeding the rate limit. For more information, see [Storm Control](#) on page 3007.

Storm Control

Table 238: Storm Control product support

Feature	Product	Release introduced
Storm Control	4220 Series	Fabric Engine 9.3
	5320 Series	Fabric Engine 9.3 Not Supported on 5320-16P-2MXT-2X
	5420 Series	Fabric Engine 9.3
	5520 Series	Fabric Engine 9.3
	5720 Series	Fabric Engine 9.3
	7520 Series	Fabric Engine 9.3
	7720 Series	Fabric Engine 9.3
	7830 Series	Not Supported
	VSP 4900 Series	Not Applicable
	VSP 7400 Series	VOSS 9.3

A broadcast, unknown unicast, and multicast (BUM) traffic storm occurs when packets flood the LAN, which creates excessive traffic and degrades network performance. Use Storm Control to limit the amount of BUM ingress traffic on a specified physical interface.

Storm Control monitors ingress port traffic and records the number of packets dropped because they exceed the configured rate limit. The switch CPU then takes the configured action on the port to enforce traffic control policies and ensure network stability.

To use this feature on rate-limited ports, configure the following items:

- Configure a global polling interval—Periodically check the hardware counters on a port for dropped packets.
- Configure actions per port—Specify if the CPU shuts down the port or sends an SNMP trap.
- Configure a threshold per port— Specify the delta of dropped packets between polling intervals that triggers the shutdown action.

QoS and VoIP

Table 239: QoS and VoIP product support

Feature	Product	Release introduced
Automatic QoS	4220 Series	Not Supported Use Auto-sense with IP Phone support instead.

	5420 Series	Not Supported Use Auto-sense with IP Phone support instead.
	5520 Series	Not Supported Use Auto-sense with IP Phone support instead.
	5720 Series	Not Supported Use Auto-sense with IP Phone support instead.
	7520 Series	Not Supported Use Auto-sense with IP Phone support instead.
	7720 Series	Not Supported Use Auto-sense with IP Phone support instead.
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

VoIP traffic requires low latency and jitter.

If you use edge routers, configure ingress ports as core ports to treat VoIP traffic appropriately. In this case, the system trusts QoS markings that apply to VoIP traffic, and the system does not re-mark QoS settings. However, if this configuration is not sufficient, you can also apply filters, route policies, or re-mark traffic.

QoS Re-marking on a Transparent Port UNI

A Transparent Port UNI port is normally configured as a Layer 2 trusted port. The T-UNI port honors incoming customer 802.1p bits and derives an internal QoS level. The 802.1p bit marking of the Backbone VLAN (B-VLAN) is derived from the internal QoS level. If the T-UNI port is set as a Layer 2 untrusted port, a best-effort queue is assigned. Customer packet headers are not modified.

The T-UNI port QoS configurations are:

- DiffServ = disable
- Layer3Trusted = access (for EDM configuration)
- access-diffserv enable (for CLI configuration)

QoS Considerations When a Port is Associated with a T-UNI I-SID

- You cannot configure `access-diffserv` and `enable diffserv` on a T-UNI port.
- When a port is associated with a T-UNI I-SID, the T-UNI QoS configuration automatically takes effect.
- When the port is removed from the T-UNI I-SID, the default port QoS configuration takes effect.

QoS Considerations When an MLT is Associated with a T-UNI I-SID

- When an MLT, static or LACP, is added to a T-UNI I-SID, the T-UNI QoS configuration take effect on all the ports of the MLT.
- When an MLT, static or LACP, is removed from a T-UNI I-SID, the port default QoS configuration is configured on all the member ports of the MLT.
- If a port is added dynamically to a T-UNI MLT, static or LACP, the port inherits the QoS properties of the T-UNI MLT ports.
- If a port is dynamically removed from a T-UNI MLT, static or LACP, the port retains the QoS configuration inherited from the MLT.

QoS and Channelization

You can enable or disable channelization on a channelization-capable port. Enabling or disabling channelization on a port resets the port QoS configuration to default values. For more information on channelization, see [Channelization](#) on page 704 and [Enable Channelization](#) on page 724.

QoS Examples and Best Practices

The sections that follow present QoS network scenarios for bridged and routed traffic over the core network.

Bridged Traffic

If you bridge traffic over the core network, you keep customer VLANs separate (similar to a Virtual Private Network). Normally, a service provider implements VLAN bridging (Layer 2) and no routing. In this case, the 802.1p-bit marking determines the QoS level

assigned to each packet. If DiffServ is active on core ports, the level of service received is based on the highest of the DiffServ or 802.1p settings.

The following cases provide sample QoS design guidelines you can use to provide and maintain high service quality in a network.

If you configure a core port, you assume that, for all incoming traffic, the QoS value is properly marked. All core switch ports simply read and forward packets; they are not re-marked or reclassified. All initial QoS markings are performed at the customer device or on the edge devices.

The following figure illustrates the actions performed on three different bridged traffic flows (that is VoIP, video conference, and email) at access and core ports throughout the network.

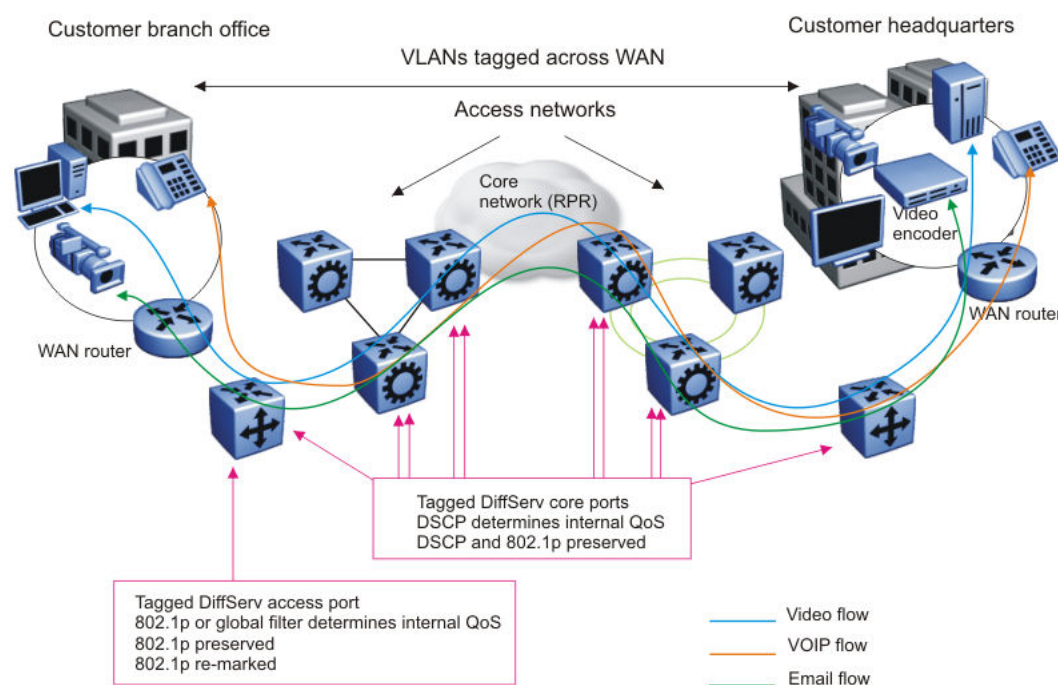

Figure 202: Trusted bridged traffic

For bridged, untrusted traffic, if you configure the port to access, mark and prioritize traffic on the access node using global filters. Reclassify the traffic to ensure it complies with the class of service specified in the SLA.

For Resilient Packet Ring (RPR) interworking, you can assume that, for all incoming traffic, the QoS configuration is properly marked by the access nodes. The core switch ports, configured as core or trunk ports, perform the RPR interworking. These ports preserve the DSCP marking and re-mark the 802.1p bit to match the 802.1p bit of the RPR. The following figure shows the actions performed on three different traffic flows (VoIP, video conference, and email) over an RPR core network.

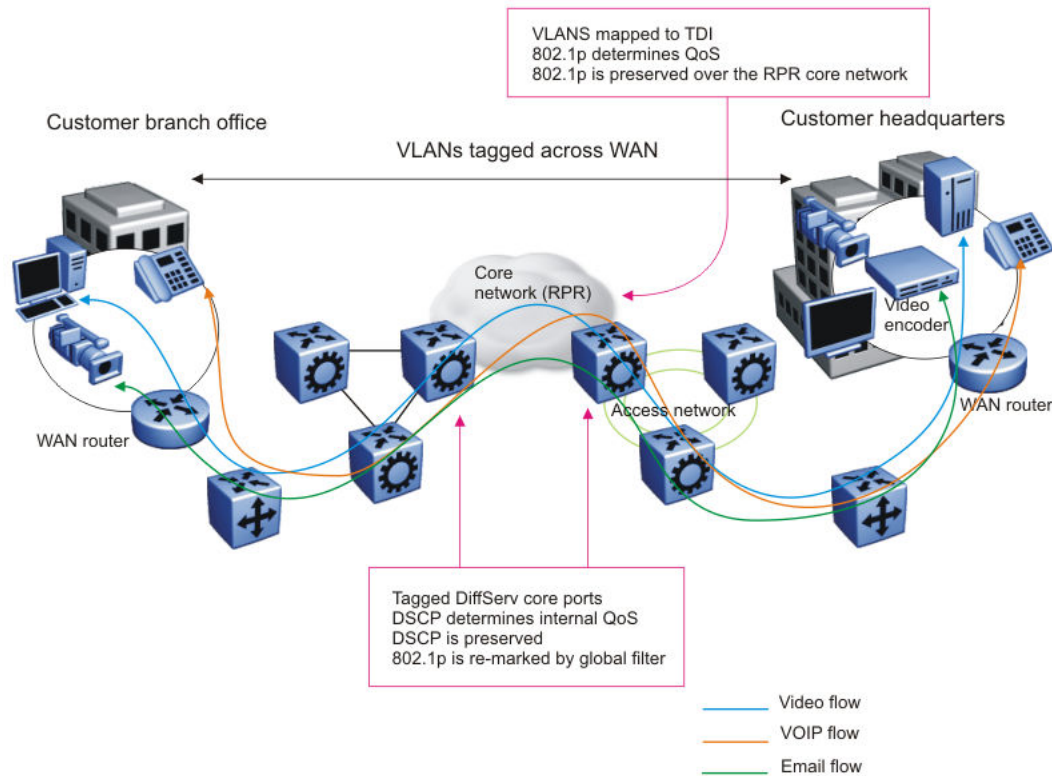

Figure 203: RPR QoS internetworking

Routed Traffic

If you route traffic over the core network, VLANs are not kept separate.

If you configure the port to core, you assume that, for all incoming traffic, the QoS configuration is properly marked. All core switch ports simply read and forward packets. The switch does not re-mark or classify the packets. The customer device or the edge devices perform all initial QoS markings.

The following figure shows the actions performed on three different routed traffic flows (that is VoIP, video conference, and email) at access and core ports throughout the network.

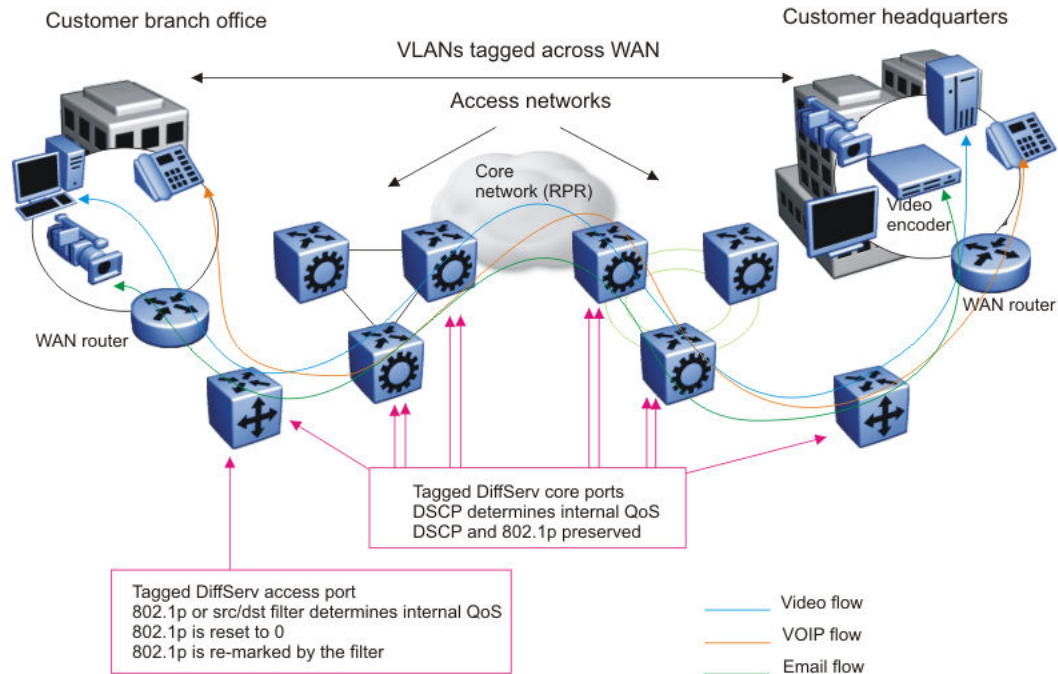

Figure 204: Trusted routed traffic

For routed, untrusted traffic, in an access node, packets that enter through a tagged or untagged access port exit through a tagged or untagged core port.

Basic DiffServ configuration using CLI

Use Differentiated Services (DiffServ) to provide appropriate Quality of Service (QoS) to specific traffic types.

Enabling DiffServ on a port

Enable DiffServ so that the system provides DiffServ-based QoS on the port. By default, DiffServ is enabled.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable DiffServ:

```
enable-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] [enable]
```

3. Disable DiffServ:

```
no enable-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] [enable]
```

Variable definitions

Use the data in the following table to use the **enable-diffserv** command.

Variable	Value
<i>enable</i>	Enables DiffServ for the specified port. The default is enabled.
<i>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}</i>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Configuring Layer 3 trusted or untrusted ports

Configure a port as trusted or untrusted to determine the Layer 3 QoS actions the switch performs. A trusted (core) port honors incoming Differentiated Services Code Point (DSCP) markings. An untrusted (access) port overrides DSCP markings. The default configuration is trusted.

Before You Begin

Enable DiffServ.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]} or interface vlan <1-4059>
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the port as an access port, use one of the following options:

```
no enable-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] [enable]
```

OR configure both parameters:

```
enable-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] [enable]
```

```
access-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] [enable]
```

3. Configure the port as a core port:

```
no access-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] [enable]
```

Variable definitions

Use the data in the following table to use the **access-diffserv** commands.

Variable	Value
<i>enable</i>	If enabled, specifies an access port and overrides incoming DSCP bits. If disabled, specifies a core port that honors and services incoming DSCP bits.
<i>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}</i>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Configuring Layer 2 trusted or untrusted ports

Configure a port as trusted or untrusted to determine the Layer 2 QoS actions the switch performs. A trusted port (override disabled) honors incoming 802.1p bit markings. An untrusted port (override enabled) overrides 802.1p bit markings.

Before You Begin

Enable DiffServ.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the port as Layer 2 untrusted:

```
qos 802.1p-override [enable]
```

3. Configure the port as Layer 2 trusted:

```
no qos 802.1p-override [enable]
```

Variable Definitions

Use the data in the following table to use the `qos 802.1p-override` command.

Variable	Value
<i>enable</i>	If you use this variable, the port overrides incoming 802.1p bits; if you do not use this variable, the port honors and services incoming 802.1p bits. The default is disable (Layer 2 trusted).

Viewing the port 802.1p override status

Use this procedure to view the port 802.1p override status. The system displays the port and 801.1p override status.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. View the port 802.1p override status:

```
show qos 802.1p-override
```

Example

```
Switch:1#show qos 802.1p-override
=====
Port 802.1p-Override Status
=====
PORT      802.1P OVERRIDE
-----
1/1       DISABLED
```

1/2	DISABLED
1/3	DISABLED
1/4	DISABLED
1/5	DISABLED
1/6	DISABLED
1/7	DISABLED
1/8	DISABLED
1/9	DISABLED
1/10	DISABLED
1/11	DISABLED
1/12	DISABLED
1/13	DISABLED
1/14	DISABLED
1/15	DISABLED
1/16	DISABLED

Configuring the port QoS level

Configure the port QoS level to assign a default QoS level for all traffic if the packet does not match an access control list (ACL) that re-marks the packet. If you configure port QoS levels, Layer 2 and Layer 3 traffic from the same port use the same QoS level. The default value is 1.

About This Task

For VoIP traffic, as a best practice, use QoS level 6.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the port QoS level:

```
qos level [port {slot/port[sub-port]]} <0-6>
```

Variable definitions

Use the data in the following table to use the **qos level** command.

Variable	Value
<0-6>	Specifies the default QoS level for the port traffic. The system reserves QoS level 7 for network control traffic. The default is 1.
<code>port {slot/port[/sub-port]}</code>	Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Basic DiffServ configuration using EDM

Use DiffServ to implement classification and mapping functions at the network boundary or access points to regulate packet behavior. You can configure a port as a trusted (core) or an untrusted (access) port at both Layer 2 and Layer 3.

You can also perform many of the procedures in this section on the Interface tab for the selected port. The procedures in this section show only one configuration method.

Enable DiffServ for a Port

About This Task

Enable DiffServ so that the switch provides DiffServ-based Quality of Service (QoS) on the port.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **Port QoS Config**.
3. In the row for the port, double-click the cell in the **DiffServ** column.
4. Select **true**.
5. Select **Apply**.

Port QoS Config *Field Descriptions*

Use the data in the following table to use the **Port QoS Config** tab.

Name	Description
Index	Specifies an index value that uniquely identifies a port.
DiffServ	Specifies whether DiffServ is enabled (true) or disabled (false) on the port. The default is true. This variable works in conjunction with Layer3Trust. The DiffServ variable is a global parameter that affects QoS DSCP operations. If the DiffServ parameter is false (DiffServ disabled), the system does not use the DSCP parameter for classification or modify it. If this variable is true, it activates the Layer3Trust parameter.
Layer3Trust	Configures the Layer 3 trusted port as an access or core port. The default is core. Core configures the port to a trusted state and access configures the port to an untrusted state. The DiffServ parameter determines the operation of this variable. If DiffServ is false, Layer3Trust has no effect; no modification of the DSCP or TOS bits occurs. If DiffServ is true, the core and access configuration take effect.
Layer2Override8021p	Specifies whether Layer 2 802.1p override is enabled (true) or disabled (false) on the port. The default is false. This variable primarily affects tagged packet treatment. If Layer2Override8021p is false, the port trusts the 802.1p-bits portion of a Q-tagged packet. The port trusts the 802.1p-bits marking regardless of the port setting (tagged or untagged); however, if the discard tagged packets parameter (DiscardTaggedFrames) on an untagged port is true, the system discards the packet. If Layer2Override8021p is true, the port does not trust the 802.1p bit marking. In this case, the QoS operation depends on other parameters, such as the port QoS level.
QosLevel	Specifies the QoS level to use when the system processes packets carried on this port. Values range from level 0–6 (the system reserves 7 for network control traffic). The default is 1.

Configure Layer 3 Trusted or Untrusted Ports

About This Task

Configure a port as trusted or untrusted to determine the Layer 3 QoS actions the switch performs. A trusted port honors incoming DSCP markings. An untrusted port overrides DSCP markings. The default is trusted.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **Port QoS Config**.
3. In the row for the port, double-click the cell in the **Layer3Trust** column.

4. Select **core** (trusted) or **access** (untrusted) as the port setting.
5. Select **Apply**.

Configure Layer 2 Trusted or Untrusted Ports

About This Task

Configure a port as trusted or untrusted to determine the Layer 2 QoS actions the switch performs. A trusted port (override false) honors incoming 802.1p bit markings. An untrusted port (override true) overrides 802.1p bit markings.

Procedure

1. In the navigation pane, expand **Configuration > QoS**.
2. Select **Port QoS Config**.
3. In the row for the port, double-click the cell in the **Layer2 Override 8021p** column.
4. To configure the port as a Layer 2 untrusted port, select **true**. To configure it as a Layer 2 trusted port, select **false**.
By default, all ports are Layer 2 trusted (Layer2 Override 8021p is false).
5. Select **Apply**.

Configure the Port QoS Level

About This Task

Use the default port QoS level to assign a default QoS level for all traffic, if the packet does not match an access control list (ACL) to remark the packet.

Procedure

1. In the navigation pane, expand **Configuration > QoS**.
2. Select **Port QoS Config**.
3. In the row for the port, double-click the cell in the **QosLevel** column.
4. Select the new level.
5. Select **Apply**.

QoS Configuration Using CLI

Use the procedures in this section to configure Quality of Service (QoS) on the switch.

Configure Broadcast, Unknown Unicast, and Multicast Bandwidth Limiting

Configure broadcast, unknown unicast, and multicast bandwidth limiting to limit the amount of ingress traffic on a port. The switch drops traffic that violates the bandwidth limit.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the bandwidth limiter to limit the amount of ingress traffic on a port:

```
rate-limit [port {slot/port[-slot/port]}[,...][slot/all][all]]  
{broadcast | multicast | unknown-unicast <1-65535>}
```

3. Verify the configuration:

```
show interfaces gigabitEthernet rate-limit [<1-4059> | {slot/port[/  
sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]]
```

Example

View the bandwidth limiter configuration for port 1/15:

```
Switch:1>show interfaces gigabitEthernet rate-limit 1/15
```

Port Rate(PPS) Limit							
PORT	TYPE	PPS-RATE	ENABLED/DISABLED	SHUTDOWN	THRESHOLD	SECS SINCE SHUTDOWN	TRAP-INTERVAL
1/15	BROADCAST	900	ENABLED	90	1	0	10
1/15	MULTICAST	900	ENABLED	90	1	0	10
1/15	UNKNOWN-UC	900	ENABLED	90	1	0	10

Variable Definitions

The following table defines parameters for the **rate-limit** command.

-

Variable	Value
<1-65535>	Specifies the bandwidth limit for broadcast, unknown unicast, and multicast traffic, in packets per second (pps).
<code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...] [slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Configure Storm Control

Before You Begin

Configure rate limiting on the port.

About This Task

Configure Storm Control to determine the actions taken on the port after it drops packets for exceeding the rate limit.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Configure the interval at which to check hardware counters for dropped packets:

```
rate-limit poll-interval <3-300>
```
3. Verify the polling configuration:

```
show rate-limit
```
4. Display the drop counter:

```
show interfaces gigabitethernet error [{slot/port[/sub-port] [-slot/port[/sub-port]] [,...] [slot/all] [all]}
```

5. Enter GigabitEthernet Interface Configuration mode:

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

6. Configure the action to take after Storm Control detects dropped packets on the port:

- Shut down the port: `rate-limit action shutdown [<60-3600>]`
- Configure the delta of dropped packets per polling interval: `rate-limit action threshold <1-4294967295>`
- Specify the SNMP trap notification frequency: `rate-limit action trap-interval <0-1000>`

7. Verify the port configuration:

```
show interfaces gigabitethernet rate-limit
```

Example

View the number of packets dropped on port 1/15 because they exceeded the configured rate limit.

```
Switch:1>enable
Switch:1#show interfaces gigabitethernet error 1/15
=====
Port Ethernet Error
=====
PORT  ERROR  ERROR  FRAMES  TOO    LINK    CARRIER  CARRIER  SQETEST  IN    RATE-LIMIT
NUM   ALIGN  FCS    LONG    SHORT  FAILURE  SENSE     ERROR     ERRORS   DISCARD  DROP-COUNTER
-----
1/15  0      0      0       0      2       0        0        0        7800   780
```

Configure Storm Control on port 1/15.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#rate-limit poll-interval 10
Switch:1(config)#interface gigabitEthernet 1/15
Switch:1(config-if)#rate-limit action shutdown 90
Switch:1(config-if)#rate-limit action trap-interval 10
```

Verify the configuration.

```
Switch:1>show rate-limit
=====
RATE LIMIT
=====
Rate Limit Poll Interval (seconds):10
Switch:1>show interfaces gigabitEthernet rate-limit 1/15
=====
Port Rate(PPS) Limit
=====
PORT  TYPE          PPS-RATE  ENABLED/DISABLED  SHUTDOWN  THRESHOLD  SHUTDOWN  SECS SINCE  TRAP-INTERVAL
```

1/15	BROADCAST	900	ENABLED	90	1	0	10
1/15	MULTICAST	900	ENABLED	90	1	0	10
1/15	UNKNOWN-UC	900	ENABLED	90	1	0	10

Variable Definitions

The following table defines parameters for the **rate-limit poll-interval** command.

Variable	Value
<3-300>	Specifies the interval, in seconds, at which this feature checks the hardware counters for packets dropped because they exceeded the configured port rate limit. The default is 3 seconds.

The following table defines parameters for the **rate-limit action** command.

Variable	Value
shutdown [<60-3600>]	Configures the port to shut down, and specifies how long, in seconds, the port remains shut down, after Storm Control detects dropped packets. If you do not specify the time value, the port remains shut down until you manually re-enable it. The default is to keep the port up, which is the no rate-limit action shutdown variation of the command.
threshold <1-4294967295>	Specifies a threshold value for the delta of dropped packets per polling interval that triggers the shut down. The default is 1.
trap-interval <0-1000>	Specifies the frequency, in polling cycles, of SNMP trap generation. Configure the value to 0 to disable traps and not generate log entries. The default is disabled.

Viewing the Port-Based Shaper Information

About This Task

Use this procedure to view the port-based shaper information. The system displays the port, egress rate limit in Kbps, and the rate limit status.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the ingress port-rate limit information:
show qos shaper interface gigabitEthernet [{slot/port[-slot/port]}
[,...][slot/all][all]]

Example

```
Switch:1#show qos shaper interface gigabitEthernet 1/1
=====
Port Egress Rate-Limiting (Shape)
=====
-----
PORT      EGRESS RATE-LIMIT (kbps)    ENABLED/DISABLED
-----
1/1       0                          DISABLED
```

Configure the Port-Based Shaper

Use port-based shaping to rate-limit all outgoing traffic to a specific rate.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure port-based shaping:

```
qos if-shaper [port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]] shape-rate WORD<1000-1000000000>
```

Variable Definitions

The following table defines parameters for the **qos if-shaper** command.

Variable	Value
<code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}</code>	<p>Specifies the slot and port number to which to apply shaping. This variable is optional.</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<code>shape-rate WORD<1000-100000000></code>	<p>Specifies the shaping rate in Kb/s. If you try to configure a limit that is too high for the port speed, the switch displays the following message:</p> <p>Error: port slot/port, The QoS Egress shaper rate can not exceed the port capability.</p> <p>The default is 0, which means shaping is disabled on the port.</p>

Configure Ingress Mappings

You can modify the ingress mappings to change traffic priorities. However, as a best practice, use the default mappings.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure 802.1p bit to QoS ingress mappings:

```
qos ingressmap lp <0-7> <0-6>
```
3. Configure DSCP to QoS ingress mappings:

```
qos ingressmap ds <0-63> <0-6>
```
4. Ensure the configuration is correct:

```
show qos ingressmap [lp <0-7>]
```

```
show qos ingressmap [ds <0-63>]
```

Variable Definitions

Use the data in the following table to use the **qos ingressmap** command.

Variable	Value
<i>lp</i> <0-7> <0-6>	<p>Maps the IEEE 802.1p bit to QoS level. Each QoS level has a default IEEE 1P value:</p> <ul style="list-style-type: none"> • level 0—1 • level 1—0 • level 2—2 • level 3—3 • level 4—4 • level 5—5 • level 6—6 <p>The system reserves level 7 for Network Control. To use the default configuration, use the default option in the command:</p> <pre>default qos ingressmap lp</pre>
<i>ds</i> <0-63> <0-6>	<p>Maps the DS byte to QoS level. The system reserves level 7 for Network Control. To use the default configuration, use the default option in the command:</p> <pre>default qos ingressmap ds</pre>

Configure Egress Mappings

You can modify the egress mappings to change traffic priorities. However, as a best practice, use the default mappings.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure QoS to 802.1p bit egress mappings:

```
qos egressmap lp <0-6> <0-7>
```
3. Configure QoS to DSCP egress mappings:

```
qos egressmap ds <0-7> WORD<1-6>
```
4. Ensure the configuration is correct:

```
show qos egressmap [lp <0-7>]
```

```
show qos egressmap [ds <0-7>]
```

Variable Definitions

Use the data in the following table to use the **qos egressmap** command.

Variable	Value
<i>1p</i> <0-6> <0-7>	<p>Maps the QoS level to IEEE 802.1p bit. Each QoS level has a default IEEE 1P value:</p> <ul style="list-style-type: none"> • level 0—1 • level 1—0 • level 2—2 • level 3—3 • level 4—4 • level 5—5 • level 6—6 <p>The system reserves level 7 for Network Control. To use the default configuration, use the default option in the command:</p> <pre>default qos egressmap 1p</pre>
<i>ds</i> <0-7> <i>WORD</i> <1-6>	<p>Maps the QoS level to DS byte. You can specify the DSCP in either hexadecimal, binary, or decimal format. To use the default configuration, use the default option in the command:</p> <pre>default qos egressmap ds</pre>

View Port Egress CoS Queue Statistics

View the port egress CoS queue statistics. The system displays the statistics of the forwarded packets and bytes, and the dropped packets and bytes.

About This Task

If you disable rate limiting on queue 6, bandwidth is shared based on the weights from queues 0 through 6. Based on equal weights assigned for queues 4 through 6, equal amounts of traffic egress queues 4 through 6. The system displays Queue 6 to provide much lower throughput than 50% of port bandwidth.

Note

If there is egress congestion when you enable the **boot config flags flow-control-mode** command, then the system does not drop the packets at egress, and does not increment the counters under the **show qos cosq-stats interface {slot/port[/sub-port]} [-slot/port[/sub-port]] [, ...] [slot/all] [all]** command output. Instead, the system drops the packets at the ingress port and the system counts them under the **INDISCARD** column of **show interfaces gigabitEthernet error {slot/port[/sub-port]} [-slot/port[/sub-port]] [, ...] [slot/all] [all]** command output.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. View the port egress CoS queue statistics:
`show qos cosq-stats interface <PT_PORT>`

Note

The show command output varies based on your hardware platform. The show command output displays Out Packets and Out Bytes per interface, which shows the number of unicast packets sent out on each queue for an egress port.

Variable Definitions

Use the data in the following table to use the **show qos cosq-stats interface <PT_PORT>** command.

Variable	Value
<PT_PORT>	PT indicates the slot number; PORT indicates the port number.

Clear Port Egress CoS Queue Statistics

Clear the port egress CoS queue statistics in the hardware.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Clear the port egress CoS queue statistics:
`clear qos cosq-stats interface <PT_PORT>`

Variable Definitions

Use the data in the following table to use the **clear qos cosq-stats interface <PT_PORT>** command.

Variable	Definition
<PT_PORT>	PT indicates the slot number; PORT indicates the port number.

View CPU Queue Statistics

View the statistics of the forwarded packets and bytes, and the dropped packets and bytes for the traffic sent toward CP. The queue assignment is based on the protocol types, not on the internal CoS value. These statistics are useful for debugging purposes.

When a neighbor transitions to the STALE state, to initiate Neighbor Unreachability detection (NUD), a duplicate copy of the traffic destined to this neighbor is sent to the switch Control Processor (CP) on a low priority queue (queue 0). The original packet is forwarded to this neighbor. When NUD is initiated, the hardware records are updated and the traffic is no longer sent to the CP. When a high rate of such traffic is sent to CP, the switch can drop some of these packets due to the in built CP rate limiting feature, which protects the CP from DOS attacks.

Use the command **show qos cosq-stats cpu-port** to view drop statistics on the CPU queue. This design does not result in loss of traffic.

Use the command **ipv6 nd reachable-time <0-3600000>** to increase the default value of 3000 milliseconds which in turn delays the scenario of data path sending STALE neighbor destined packets to the CP.

About This Task

Note

If you disable rate limiting on queue 6, bandwidth is shared based on the weights from queues 0 through 6. Based on equal weights assigned for queues 4 through 6, equal amounts of traffic egress queues 4 through 6. The system displays Queue 6 to provide much lower throughput than 50% of port bandwidth.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. View the CPU queue statistics:
`show qos cosq-stats cpu-port`

Note

The show command output varies based on your hardware platform. The output displays Out Packets and Out Bytes per interface, which shows the number of unicast packets sent out on each queue for an egress port.

Clear CPU Queue Statistics

Clear the CPU queue statistics.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Clear CPU queue statistics:
`clear qos cosq-stats cpu-port`

Configure an Egress QoS Queue Profile

Configure a queue profile to apply the configured egress queue parameters to queues and ports.

About This Task

After you make a configuration change to a queue profile, you must apply the profile before the changes take effect.

Note

The switch supports six queue profiles. The default queue profile, with the name default and ID 1, is automatically created during system startup and cannot be deleted.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the minimum weight for a specific queue:

```
qos queue-profile queue <1-6> <0-7> min-weight <1-100>
```

3. Enable rate limiting on a weighted queue:

```
qos queue-profile queue <1-6> <0-7> rate-limit-enable
```

4. Add a queue-profile port member:

```
qos queue-profile <1-6> member add {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}
```

5. Add a queue-profile name:

```
qos queue-profile <1-6> name WORD<0-64>
```

6. Apply the queue profile:

```
qos queue-profile <1-6> apply
```

7. Verify the egress queue configuration:

```
show qos queue-profile [<1-6> queue <0-7>|all]
```

8. (Optional) Configure the default values for an egress queue:

- Configure the default minimum weight using one of the following commands:

```
default qos queue-profile queue <1-6> <0-7> min-weight
```

```
no qos queue-profile queue <1-6> <0-7> min-weight
```

- Configure the default rate limiting on a weighted queue using one of the following commands:

```
default qos queue-profile queue <1-6> <0-7> rate-limit-enable
```

```
no qos queue-profile queue <1-6> <0-7> rate-limit-enable
```

**Note**

By default, rate limiting is enabled on queues 6 and 7. If you disable rate limiting on these queues on 7830 Series, no queue is considered a priority queue. Instead, all queues are managed using the Weighted Round Robin (WRR) scheduling algorithm with the following weights: 5, 20, 30, 40, 50, 50, 5.

Examples

Configure the queue profile for queue 6 to use a weight of 20.

```
Switch:1(config)#qos queue-profile 6
Switch:1(config)#qos queue-profile queue 6 1 min-weight 20
Switch:1(config)#qos queue-profile 6 apply
```

View the queue profile configuration.

```
Switch:1#show qos queue-profile
```

Qos Queue Profile		
Profile ID	Profile Name	Profile Port List
1	default	1/1-1/42,2/1-2/2
6		profile-6

The value in the **Weight Applied** column is the maximum bandwidth for Strict Priority queues (Rate Limit Enabled) and the weight in the WRR scheduling algorithm applied per queue. Strict Priority queues are serviced first and limited to the configured percentage of bandwidth. WRR queues (no rate limit applied) have no upper boundary, other than the delta between the available bandwidth per port and the one consumed by Strict Priority queues. For WRR queues, there is no association with the bandwidth percentage servicing this queue; the bandwidth that can be served is relative to the available bandwidth at a certain moment and the load of other queues.

```
Switch:1(config)#show qos queue-profile 1 queue 1
```

```

Variable Definitions

The following table defines parameters for the **qos queue-profile queue** command.

Variable	Value
<1-6>	Specifies the queue profile ID. Note: The switch supports six queue profiles. The default queue is 1.
<0-7>	Specifies the egress queue to configure.
<i>min-weight</i> <1-100>	Configures the queue weight for weighted round robin (WRR), or the rate-limit in percentage of the link rate for queue shaping enabled on the queue. For rate-limit-enabled queues, 50 indicates 50% bandwidth. The overall rate-limit-enabled queues cannot sum higher than 100 min-weight. If rate-limiting is not enabled, this parameter configures the weight in the WRR scheduler. These values are not associated with bandwidth percentage. The following list identifies the default minimum weight for each queue: <ul style="list-style-type: none"> • Queue 0 — 5 • Queue 1 — 20 • Queue 2 — 30 • Queue 3 — 40 • Queue 4 — 50 • Queue 5 — 50 • Queue 6 — Rate limited to 50% of configured shaper rate • Queue 7 — Rate limited to 5% of configured shaper rate

Variable	Value
<i>member add</i> {slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}	Specifies a port member of the queue-profile to add or remove.
<i>name</i> WORD<0-64>	Specifies a profile name.
<i>rate-limit-enable</i>	Enables rate limiting on the queue. By default, rate limiting is enabled for queues 6 and 7 only; it is disabled for queues 0 through 5.

The following table defines parameters for the **show qos queue-profile** command.

Variable	Value
<1-6>	Specifies the queue profile ID. If you do not include a queue profile ID, the command output displays all configured profiles. Note: The switch supports six queue profiles. The default queue is 1.
<0-7>	Specifies the egress queue. Displays configuration settings of the specified egress queue.
<i>all</i>	The command output displays the configuration settings of all eight egress queues of the queue profile.

View Logical Interface CoS Queue Statistics

View the QoS CoS queue statistics for IS-IS logical interfaces. These statistics are useful for debugging purposes.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the logical interface queue statistics:
show qos cosq-stats logical-intf [isis <1-255>]

Clear Logical Interface CoS Queue Statistics

Clear the QoS CoS queue statistics for IS-IS logical interfaces.

Procedure

1. Enter Privileged EXEC mode:
enable

2. Clear the logical interface queue statistics:

```
clear qos cosq-stats logical-intf [isis <1-255>]
```

QoS Configuration Using EDM

Configure Quality of Service (QoS) to allocate network resources where you need them most.

Configure Port-Based Shaping

Configure egress port-based shaping to bind the maximum rate at which traffic leaves the port.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **Interface** tab.
5. From **EgressRateLimitState**, select **enable**.
6. In **EgressRateLimit**, type an egress rate limit in kilobits per second (Kb/s).
7. Select **Apply**.

Graph Stat Rate Limit Statistics for a Port

View stat rate limit statistics to view the total dropped packets and bytes.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand **Configuration > Graph**.
3. Select **Port**.
4. Select the **Stat Rate Limit** tab.
5. Select one or more values.
6. Select the type of graph to create.

Stat Rate Limit Field Descriptions

Use the data in the following table to use the **Stat Rate Limit** tab.

Name	Description
DropPktRate	Indicates the drop packet rate.
DropByteRate	Indicates the drop byte rate.
DropTotalBytes	Indicates the total bytes dropped.
DropTotalPkts	Indicates the total packets dropped.

Modify Ingress 802.1p to QoS Mappings

About This Task

Modify the ingress mappings to change traffic priorities. As a best practice, use the default mappings.

Do not change the default values. If you change the values, make sure that the values are consistent on all other devices in the network. Inconsistent mapping of table values can result in unpredictable service levels.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **Mapping Tables**.
3. Select the **Ingress 8021p to QoS** tab.
4. Double-click a QosLevel to change the value.
5. Select **Apply**.

Ingress 8021p To QoS Field Descriptions

Use the data in the following table to use the **Ingress 8021p To QoS** tab.

Name	Description
Inleee8021P	Specifies the value of the IEEE 802.1p bit of the incoming packet.
QosLevel	Specifies the equivalent egress QoS level (0–7).

Modify Ingress DSCP to QoS Mappings

About This Task

Modify the ingress Differentiated Services Code Point (DSCP) to QoS mappings to change traffic priorities. As a best practice, use the default mappings. Changes to the mapping table take effect after you restart the system.

Do not change the default values. If you change the values, make sure that the values are consistent on all other devices in the network. Inconsistent mapping of table values can result in unpredictable service levels.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **Mapping Tables**.
3. Select the **Ingress Dscp To QoS** tab.
4. Double-click a QosLevel to change the value.
5. Select **Apply**.

Ingress Dscp To QoS Field Descriptions

Use the data in the following table to use the **Ingress Dscp To QoS** tab.

Name	Description
InDscp	Specifies the value of the DiffServ codepoint (in decimal format) in the IP header of the incoming packet.
InDscpBinaryFormat	Specifies the value of the DiffServ codepoint (in binary format) in the IP header of the incoming packet.
QosLevel	Specifies the equivalent QoS level.

Modify Egress QoS to 802.1p Mappings

About This Task

Modify the egress mappings to change the mappings between the QoS levels and the IEEE 802.1p bits.

Do not change the default values. If you change the values, make sure that the values are consistent on all other devices in the network. Inconsistent mapping of table values can result in unpredictable service levels.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **Mapping Tables**.
3. Select the **Egress QoS to 8021p** tab.
4. Double-click **Outleeee8021P** to change the value.
5. Select **Apply**.

Egress QoS to 8021p Field Descriptions

Use the data in the following table to use the **Egress QoS to 8021p** tab.

Name	Description
QosLevel	Specifies the QoS level of the outgoing packet.
Outleeee8021P	Specifies the equivalent value of the IEEE 802.1p bit.

Modify Egress QoS to DSCP Mappings

About This Task

Modify the egress QoS to DSCP mappings to change traffic priorities. As a best practice, use the default mappings.

Do not change the default values. If you change the values, make sure that the values are consistent on all other devices in the network. Inconsistent mapping of table values can result in unpredictable service levels.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **Mapping Tables**.
3. Select the **Egress QoS To Dscp** tab.
4. Double-click **OutDscp** to change the value.
5. Select **Apply**.

Egress QoS To Dscp Field Descriptions

Use the data in the following table to use the **Egress QoS To Dscp** tab.

Name	Description
QosLevel	Specifies the QoS level of the outgoing packet.
OutDscp	Specifies the equivalent value of the DiffServ code point (in decimal format).
OutDscpBinaryFormat	Specifies the equivalent value of the DiffServ code point (in binary format).

View Port Egress CoS Queue Statistics

About This Task

Use the following procedure to retrieve the port egress CoS queue statistics. The system displays the statistics of the forwarded packets and bytes, and the dropped packets and bytes.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **CoS Queue Stats**.
3. Select the **Interface** tab.

Interface Field Descriptions

The following table describes the fields from the CoS Queue Stats **Interface** tab.

Name	Description
Index	Indicates the loopback port number from 192(1/1) to 241(1/50).
ClearStat	Clears the port egress statistics.
Que<0-7>OutPackets	Indicates the out packets by CoS queue number 0-7.

Name	Description
Que<0–7>OutBytes	Indicates the out bytes by CoS queue number 0–7.
Que<0–7>DropPackets	Indicates the drop packets by CoS queue number 0–7.
Que<0–7>DropBytes	Indicates the drop bytes by CoS queue number 0–7.

Clear CPU Statistics for the Chassis

Use the following procedure to clear the CPU statistics for the chassis.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **CoS Queue Stats**.
3. Select the **CPU-Stats-Clear** tab.
4. Select **CpuStatsClear**.
5. Select **Apply**.

CPU-Stats-Clear Field Descriptions

Use the data in the following table to use the **CPU-Stats-Clear** tab.

Name	Description
CpuStatsClear	Clears CPU QOS queue statistics.

View CPU Queue Statistics

Use the following procedure to retrieve the statistics of the forwarded packets and bytes, and the dropped packets and bytes for the traffic sent toward CP. The queue assignment is based on the protocol types, not on the internal CoS value. These statistics are useful for debugging purposes.

Procedure

1. In the navigation pane, expand **Configuration > QOS**.
2. Select **CoS Queue Stats**.
3. Select the **CPU-Port** tab.

CPU-Port Field Descriptions

Use the data in the following table to use the **CPU-Port** tab.

Name	Description
Index	Indicates the CoS queue number.
OutPackets	Indicates the out packets for the CPU port.

Name	Description
OutBytes	Indicates the out bytes for the CPU port.
DropPackets	Indicates the drop packets for the CPU port.
DropBytes	Indicates the drop bytes for the CPU port.

Configure an Egress QoS Queue Profile

Configure a queue profile to apply the configured egress queue parameters to queues and ports. You must apply the profile before the changes take effect.

About This Task

The switch supports six queue profiles. The default queue profile, with the name default and ID 1, is automatically created during system startup and cannot be deleted.

Procedure

1. In the navigation pane, expand **Configuration > QoS**.
2. Select **Queue Profile**.
3. Select the **Queue Profile** tab.
4. Select **Insert**.
5. In **Id**, type the queue profile value.
6. (Optional) In **Name**, specify a name for the queue profile.
7. To add a port to this queue, select the **PortList** ellipsis (...), choose a port or ports, and then select **Ok**.
8. Select **Apply**.
9. Select **Insert**.

Queue Profile Field Descriptions

Use the data in the following table to use the **Queue Profile** tab.

Field	Description
Id	Specifies the ID for the queue profile.
Name	Specifies the queue profile name.
Apply	Applies the queue profile.
PortList	Indicates the port members of the queue profile.

Edit Queue Profile Information

About This Task

Use the following procedure to edit queues of a queue profile, to configure a queue weight or enable rate limiting on the queue.

Note

After you make the configuration changes, you must apply the queue profile before the changes take effect.

Procedure

1. In the navigation pane, expand **Configuration > QoS**.
2. Select **Queue Profile**.
3. Update a queue to configure queue weight or rate limiting:
 - a. Select the **Queue** tab.
 - b. Edit **AdminWeight** and **AdminRateLimitStatus** by double-clicking on them, and then selecting or typing the new value.
 - c. Select **Apply**.
4. Apply the queue profile for the queue configuration to take effect:
 - a. Select the **Queue Profile** tab.
 - b. In **Apply**, double-click and select **true**.
 - c. Select **Apply**.
5. Select the **Queue** tab to verify updates to **OperWeight** and **OperRateLimitStatus**, for the respective queue.

Queue Field Descriptions

Use the data in the following table to use the **Queue** tab.

Field	Description
PId	Displays the queue profile ID.
Id	Displays the queue ID.

Field	Description
AdminWeight	<p>Configures the queue weight for weighted round robin (WRR), or the rate-limit in percentage of the link rate for queue shaping enabled on the queue.</p> <p>For rate-limit-enabled queues, 50 indicates 50% bandwidth. The overall rate-limit-enabled queues cannot sum higher than 100 min-weight.</p> <p>If rate-limiting is not enabled, this field configures the weight in the WRR scheduler. These values are not associated with bandwidth percentage.</p> <p>The following list identifies the default minimum weight for each queue:</p> <ul style="list-style-type: none"> • Queue 0 — 5 • Queue 1 — 20 • Queue 2 — 30 • Queue 3 — 40 • Queue 4 — 50 • Queue 5 — 50 • Queue 6 — Rate limited to 50% of configured shaper rate • Queue 7 — Rate limited to 5% of configured shaper rate
OperWeight	Displays the operational weight of the profile, described as a percentage.
AdminRateLimitStatus	<p>Enables rate limiting on the queue. By default, rate limiting is enabled (true) for queues 6 and 7 only; it is disabled (false) for queues 0 through 5.</p> <p>AuthorsNote: The following Note was added for 7830 in 9.3 for VOSS-33291.</p> <p>Note: By default, rate limiting is enabled on queues 6 and 7. If you disable rate limiting on these queues on 7830 Series, no queue is considered a priority queue. Instead, all queues are managed using the Weighted Round Robin (WRR) scheduling algorithm with the following weights: 5, 20, 30, 40, 50, 50, 5.</p>
OperRateLimitStatus	Displays the operational status of the queue rate limit.

Configure Port Rate Limits

Configure broadcast, unknown unicast, and multicast bandwidth limiting to limit the amount of ingress traffic on a port. The switch drops traffic that violates the bandwidth limit.

Procedure

1. On the Device Physical View, select a port or multiple ports.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **Rate Limiting** tab.
5. In the row for the required traffic type, configure the bandwidth limit in **AllowedRatePps**.
6. In the row for the required traffic type, select true for **Enable**.
7. Select **Apply**.

Rate Limiting Field Descriptions

Use the data in the following table to use the **Rate Limiting** tab.

Name	Description
Index	Displays the port number.
TrafficType	Displays the type of traffic being rate limited, either broadcast, unknown unicast, or multicast traffic.
AllowedRatePps	Specifies the allowed traffic rate limit for the port in packets per second (pps). 1–65535 configures the limit in packets for each second. The default is 25.
Enable	Enables or disables rate limiting. The default is false (no rate limit).

Configure Rate Limits on an Extreme Integrated Application Hosting Port

Note

This procedure only applies to 5720-24MXW, 5720-48MXW, 7520 Series, and 7720 Series.

About This Task

Perform this procedure to configure the rate limit of broadcast or multicast packets and determine the total bandwidth limit on the Extreme Integrated Application Hosting (IAH) port.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Insight Port**.
2. Select the IAH port you want to configure.
3. Select the **Rate Limiting** tab.
4. In the **AllowedRatePps** column, enter a time duration for the specific Extreme Integrated Application Hosting port.
5. In the **Enable** column, select **true** to enable rate limiting for the specific IAH port.
6. Select **Apply**.

Rate Limiting *Field Descriptions*

Use the data in the following table to use the **Rate Limiting** tab.

Name	Description
Index	Specifies the Extreme Integrated Application Hosting (IAH) port.
TrafficType	Displays the type of traffic being rate limited, either broadcast, unknown unicast, or multicast traffic.
AllowedRatePps	Specifies the allowed traffic rate limit for the IAH port in packets per second (pps).
Enable	Enables or disables rate limiting for the specific IAH port. The default is false (disabled).

Configure the Storm Control Poll Interval**About This Task**

Configure the interval at which to check hardware counters for dropped packets.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **System Control** tab.
4. In **RateLimitActionPollInterval**, type the number of seconds.
5. Select **Apply**.

System Control *Field Descriptions*

Use the data in the following table to use the **System Control** tab.

Name	Description
TcpTimestampEnable	Enables or disables the TCP timestamp. The timestamp is enabled by default. The system displays the following warning message after you apply a new configuration: Warning: Existing TCP connections won't be affected. A config save and reboot is required to apply this configuration for all TCP connections.
KeepaliveTime	Specify the TCP keepalive time in seconds. The default is 60.
KeepaliveInterval	Specify the TCP keepalive interval in seconds. The default is 10.

Name	Description
KeepaliveProbes	Specify the TCP keepalive probes. The default is 5.
PrivExecPasswordEnable	Enables authentication to access Privileged EXEC CLI command mode. Authentication is disabled by default.
RateLimitActionPollInterval	Specifies the interval, in seconds, at which this feature checks the hardware counters for packets dropped because they exceeded the configured port rate limit. The default is 3 seconds.

Configure Storm Control Actions

About This Task

Configure the action to take after Storm Control detects dropped packets on the port.

Procedure

1. On the Device Physical View, select a port or multiple ports.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **Storm Control** tab.
5. In **ShutdownTimeout**, specify if the port remains permanently shutdown, or only for a specific time period.
6. In **TrapInterval**, specify the number of polling cycles for trap generation.
7. In **Threshold**, specify the packet threshold.
8. Select **Apply**.

Storm Control Field Descriptions

Use the data in the following table to use the **Storm Control** tab.

Name	Description
Index	Displays the port information.
ShutdownTimeout	Configures the port to shut down, and specifies how long, in seconds, the port remains shut down, after Storm Control detects dropped packets. A value of 0 indicates the port does not shutdown. A value of 1 indicates the port remains shut down until you manually re-enable it. The default is to keep the port up.
TrapInterval	Specifies the frequency, in polling cycles, of SNMP trap generation. Configure the value to 0 to disable traps and not generate log entries. The default is disabled.
Threshold	Specifies a threshold value for the delta of dropped packets per polling interval that triggers the shut down. The default is 1.

RADIUS Fundamentals

Remote Access Dial-In User Services (RADIUS) is a distributed client/server system that assists in securing networks against unauthorized access, allowing a number of communication servers and clients to authenticate users' identity through a central database. The database within the RADIUS server stores information about clients, users, passwords, and access privileges including the use of shared secret.

RADIUS is a fully open and standard protocol, defined by two Requests for Comments (RFC) (Authentication: RFC2865, Accounting: RFC2866). You use RADIUS authentication to get secure access to the system (console/Telnet/SSH/EDM), and RADIUS accounting to track the management sessions (CLI only).

If you configure RADIUS using a fully qualified domain name (FQDN), the switch resolves the name to an IP address. You must configure a DNS server in the network to resolve the FQDN to an IP address.

RADIUS Server Support for IPv6

RADIUS supports both IPv4 and IPv6 with no differences in functionality or configuration in all but the following case. When you add or update a RADIUS server in Enterprise Device Manager (EDM) you must specify if the address type is an IPv4 or an IPv6 address.

How RADIUS Works

A RADIUS application has two components:

<ul style="list-style-type: none">• RADIUS server	A computer equipped with server software (for example, a UNIX workstation) that is located at a central office or campus. The server has authentication and access information in a form that is compatible with the client. Typically, the database in the RADIUS server stores client information, user information, password, and access privileges, including the use of a shared secret. A network can have one server for both authentication and accounting, or one server for each service.
<ul style="list-style-type: none">• RADIUS client	A device, router, or a remote access server, equipped with client software, that typically resides on the same local area network (LAN) segment as the server. The client is the network access point between the remote users and the server.

The two RADIUS processes are

- RADIUS authentication—Identifies remote users before you give them access to a central network site.
- RADIUS accounting—Performs data collection on the server during a remote user's dial-in session with the client.

Configuration of the RADIUS Server and Client

For more information about how to configure a RADIUS server, see the documentation that came with the server software.

The switch software supports BaySecure Access Control (BSAC) and the Merit Network servers. To use these servers, you must first obtain the software for the server you will use. Also, you must make changes to one or more configuration files for these servers.

RADIUS Authentication

You can use RADIUS authentication to use a remote server to authenticate logons. The RADIUS server also provides access authority. RADIUS assists network security and authorization by managing a database of users. The device uses this database to verify user names and passwords as well as information about the type of access priority available to the user.

When the RADIUS client sends an authentication request requesting additional information such as a SecurID number, it sends it as a challenge-response. Along with the challenge-response, it sends a reply-message attribute. The reply-message is a text string, such as `Please enter the next number on your SecurID card:.` The RFC defined maximum length of each reply-message attribute is 253 characters. If you have multiple instances of reply-message attributes that together form a large message that displays to the user, the maximum length is 2000 characters.

You can use additional user names to access the device, in addition to the six existing user names of ro, L1, L2, L3, rw, and rwa. The RADIUS server authenticates the user name and assigns one of the existing access priorities to that name. Unauthenticated user names are denied access to the device. You must add user names ro, L1, L2, L3, rw, and rwa to the RADIUS server if you enable authentication. Users not added to the server are denied access.

The limitation on the number of characters in a user name for users logging into CLI or EDM configured with RADIUS authentication is 64 characters.

**Note**

RADIUS server used-by snmp does not support authentication.

The following list shows the user configurable options of the RADIUS feature:

- up to 10 RADIUS servers in each device for fault tolerance (each server is assigned a priority and is contacted in that order).
- secret key for each server to authenticate the RADIUS client
- server UDP port
- maximum retries allowed
- time-out period for each attempt

**Note**

If you enable enhanced secure mode with the **boot config flags enhancedsecure-mode** command, you enable different access levels, along with stronger password complexity, length, and minimum change intervals. With enhanced secure mode enabled, the switch supports the following access levels for RADIUS authentication:

- Administrator
- Privilege
- Operator
- Auditor
- Security

The switch associates each user name with a certain role and appropriate authorization rights to view and configure commands. For more information on system access fundamentals and configuration, see [Managing the Switch](#) on page 246.

Silent Devices Surviving Reboot

When the switch reboots, it retains authenticated client information, including MAC and IP addresses. To maintain device authentication, the switch sends regular ARP and ping messages. PINGs dispatch if an IP address is configured on the MGMT VLAN, while ARPs are sent if an IP address is configured on the platform VLAN associated with the port.

Use of RADIUS to Modify User Access to CLI Commands

The switch provides CLI command access based on the configured access level of a user. However, you can use RADIUS to override CLI command access provided by the switch.

To override user access to CLI commands, you must configure the command-access-attribute on the switch and on the RADIUS server. (The switch uses decimal value 194 as the default for this parameter.) On the RADIUS server, you can then define the commands that the user can or cannot access.

Important

When you enable RADIUS on the switch and configure a RADIUS server to be used by CLI or EDM, the server authenticates the connection, whether it is FTP, HTTPs, SSH, or TELNET. However, in the event that the RADIUS server is unresponsive or is unreachable, the switch falls back to the local authentication, so that you can access the switch using your local login credentials.

Regardless of the RADIUS server configuration, you must configure the user's access on the switch based on the six platform access levels.

RADIUS Accounting

RADIUS accounting logs all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Session-IDs for each RADIUS account generate as 12-character strings. The first four characters in the string form a random number in hexadecimal format. The last eight characters in the string indicate the number of user sessions started since the last restart, in hexadecimal format.

The Network Address Server (NAS) IP address for a session is the address of the device interface to which the remote session is connected over the network. For a console session, modem session, and sessions running on debug ports, this value is set to 0.0.0.0, as is the case with RADIUS authentication.

The following table summarizes the events and associated accounting information logged at the RADIUS accounting server.

Table 241: Accounting Events and Logged Information

Event	Accounting information logged at server
Accounting is turned on at router	<ul style="list-style-type: none">Accounting on request: NAS IP address
Accounting is turned off at router	<ul style="list-style-type: none">Accounting off request: NAS IP address
User logs on	<ul style="list-style-type: none">Accounting start request: NAS IP addressSession IDUser name

Table 241: Accounting Events and Logged Information (continued)

Event	Accounting information logged at server
More than 40 CLI commands are executed	<ul style="list-style-type: none"> Accounting interim request: NAS IP address Session ID CLI commands User name
User logs off	<ul style="list-style-type: none"> Accounting stop request: NAS IP address Session ID Session duration User name Number of input octets for session Number of octets output for session Number of packets input for session Number of packets output for session CLI commands

When the device communicates with the RADIUS accounting server, the following actions occur:

1. If the server sends an invalid response, the response is silently discarded and the server does not make an attempt to resend the request.
2. User-specified number of attempts are made if the server does not respond within the user-configured timeout interval. If a server does not respond to any of the retries, requests are sent to the next priority server (if configured). You can configure up to 10 RADIUS servers for redundancy.

**Note**

RADIUS server used-by endpoint-tracking does not support accounting.

RADIUS Attribute 8 Framed-IP-Address

The switch uses RADIUS Attribute 8 Framed-IP-Address to export the IPv4 address of an EAP/NEAP client to the RADIUS server.

You must enable EAP and Node Alias globally and on an interface. For more information, see [Extensible Authentication Protocol over LAN](#) on page 1008 and [Node Alias](#) on page 713.

RFC 4675 RADIUS Attributes: Egress VLAN

Egress VLAN controls egress traffic. Egress VLAN supports two standard RADIUS attributes as defined in RFC 4675:

- Egress-VLANID
- Egress-VLAN-Name

RADIUS attributes control the 802.1Q tagging for traffic egressing a port where RADIUS authentication is performed for a connected EAP or NEAP client.

Egress VLANs are standard attributes, therefore the RADIUS server supports the attributes by default and offer the ability to configure the attributes. Each attribute has two parts:

1. Indicates if the frames on the VLAN egress must be tagged or untagged
2. Specifies the VLAN name or VLAN ID

The switch applies the VLAN received in the Egress-VLAN attributes to the port where the client is authenticated through RADIUS and then sets the tagging rules (tagged or untagged) accordingly.

The switch processes the Egress-VLAN attributes when decoding the RADIUS packet, therefore the switch adds the port to the VLANs first and then sets the proper tagging for the VLANs. You must create VLANs in advance on the switch.

In the MultiVlan operation mode, the EAP applies ingress hardware rules to ensure untagged traffic from each authenticated client goes into its own VLAN. The unauthenticated clients send traffic to the Guest VLAN, which matches the default VLAN ID.

For more information, see [VLAN RADIUS Attributes](#) on page 3133.

RADIUS Server Reachability

Configure up to 10 EAP RADIUS servers on the switch to manage fault tolerance. Each server is assigned a priority and is contacted in the priority order. If the first server is unavailable, the switch tries the second server, and so on, until the switch establishes a successful connection. Higher priority means lower integer value.

RADIUS server reachability prevents clients from trying to establish a connection with non reachable servers. RADIUS server reachability runs a periodic check in the background to identify the available servers. The switch is aware of the first available EAP RADIUS server without going through each of the servers and wait for time-outs.

Use RADIUS server reachability to configure the switch to use RADIUS requests to determine the reachability of the RADIUS server. The switch regularly performs the reachability test to determine if the switch should fail over to the secondary RADIUS server or activate the Fail Open VLAN, if configured on the switch.

Use one of the following modes to configure RADIUS reachability:

- **status-server mode:** Status-Server packets provide a standard-compliant alternative to configuring dummy RADIUS requests. You can configure the switch to send status-server packets when the keep-alive timer or the unreachable timer expires. In order to use status-server mode, the configured RADIUS servers must support RFC5997.
- **use-radius mode:** Configure user-radius mode if any of the RADIUS servers do not support RFC5997. In user-radius mode, the switch regularly generates a dummy RADIUS request with the user name `reachme` and password `reachme`. The switch interprets either Request Accept or Request Reject responses as a confirmation for server reachability, therefore it is not necessary to add the credentials on the server to test server reachability. You can configure the user name and password

for the dummy account through CLI. Use-radius is the default mode for RADIUS reachability.

You can configure the RADIUS reachability mode in either CLI or EDM.

**Note**

RADIUS server reachability is enabled on the switch and is not a configurable option. The reachability process starts when at least one RADIUS server used by EAP is configured, and RADIUS is enabled globally.

Based on the number of EAP RADIUS servers configured, the switch performs the following:

- If the highest priority EAP RADIUS server is reachable, the server status is updated to reachable and further authentication will use this server. As long as the highest priority EAP RADIUS server is reachable, the rest of the EAP RADIUS servers are not tested for reachability.
- If the highest priority EAP RADIUS server is not reachable, then the switch tests the rest of the EAP RADIUS servers for reachability. The servers are checked one by one for reachability based on their priority from highest to lowest. The first server that is reachable is used for authentication and the rest of the lower priority EAP RADIUS servers if any, are skipped from the reachability test.
- If all the EAP RADIUS servers are unreachable, then no further authentication occurs until the next successful reachability check.

The intervals between two consecutive reachability checks can be configured. The default values are as follows:

- one minute, if the last check result was unreachable
- three minutes, if the last check result was reachable

A server is marked as unreachable after a number of retries and time-outs.

RFC 3580 RADIUS Attributes: IEEE 802.1X Remote Authentication Dial In User Service

RFC 3580 provides support for EAP and NEAP clients for the following RADIUS attributes:

- Called-Station ID attribute: For IEEE 802.1X authenticators, the Called-Station ID stores the bridge or access point MAC address in upper case ASCII format, with octet values separated by a hyphen (-). For example: 00-10-A4-23-19-C0.

In IEEE 802.11, where the SSID is known, the SSID must be appended to the access point MAC address and separated from the MAC address with a colon (:). For example: 00-10-A4-23-19-C0:AP1.

- Calling-Station ID: For IEEE 802.1X authenticators, the Calling-Station ID is used to store the supplicant MAC address in upper case ASCII format, with octet values separated by a hyphen (-). For example: 00-10-A4-23-19-C0.

- **NAS-Port ID:** The NAS-Port ID is used to identify the IEEE 802.1X Authenticator port which authenticates the Supplicant. The NAS-Port-Id differs from the NAS-Port in that it is a string of variable length whereas the NAS-Port is a 4 octet value.

RFC 5176 — Dynamic Session Change

RFC 5176 allows you to dynamically change the following user session characteristics:

- You can disconnect an authenticated user on a port and remove all associated session context.

If the RADIUS server issues a disconnect command to the switch and the switch identifies a user (that satisfies all attributes of the RADIUS server request) on a port that has enabled RADIUS dynamic extensions commands, the switch performs the following actions:

- Notify the user of the disconnect by sending an 802.1x disconnect message to the client.
 - Remove all session context from the port.
 - Remove the port from the RADIUS-assigned VLAN, if applicable.
 - Send the disconnect response Disconnect-ACK to the RADIUS server if the user session is disconnected and all steps successfully performed.
 - Send the Disconnect-NAK response to the RADIUS server if the user session is not found or if the Network Access Server (NAS) cannot disconnect the session and discard the session context.
- You can use the Change of Authorization command to dynamically change the VLAN used by the RADIUS server.

If the RADIUS server issues a Change of Authorization command to the switch and the switch identifies a user (that satisfies all attributes of the RADIUS server request) on a port that has enabled RADIUS dynamic extensions commands, the switch performs the following actions:

- If the Change of Authorization command specifies a valid VLAN ID for a port, the port is removed from the VLAN specified by RADIUS and added to the VLAN specified in the request.
 - A CoA-ACK response is sent to the RADIUS server.
 - If the user session is not found or an error is encountered in processing the Change of Authorization command, then a CoA-NAK response is sent to the RADIUS server.
 - If the Change of Authorization request specifies a VLAN that is not port-based, a CoA-NAK response is sent to the RADIUS server.
- You can dynamically initiate client re-authentication.

Re-authenticate requests can be made with Change of Authorization or Disconnect packet IDs, but they must have the Re-authentication Request Vendor-Specific Attributes (VSA) set to True.

Dynamic session changes are directed to specific user sessions, as identified by RADIUS attributes.

To enable dynamic session changes, configure the following:

- You must enable EAP or Endpoint Tracking globally and at the port level.
- You must enable RADIUS dynamic extensions commands at the port level.

You can use the **show radius dynamic-server statistics** command to view statistics about dynamic session changes.

```
Switch:1#enable
Switch:1#show radius dynamic-server statistics

=====
                        RADIUS Dynamic Authorization Global Statistics
=====
Disconnects From Invalid Client Addresses:      0
CoAs From Invalid Client Addresses:              0
=====
```

RADSec

Table 242: RADSec product support

Feature	Product	Release introduced
RADIUS Security (RADSec)	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.2
	VSP 7400 Series	VOSS 8.2

Remote Access Dial-In User Services (RADIUS) Security (RADSec) provides secure communication between RADIUS peers using Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP), or Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP).

Certificates

RADSec peers use certificates to establish trust relationships. Certificates are specified in the RADSec profile on the switch, which can be the default profile or a profile that you configure.

- Manually install certificates, certificate chains, and private keys into designated folders for each RADIUS secure profile.

The client and secure server must use the same certificate authority (CA) certificate file, server certificate, certificate key file and password to establish a RADSec connection. The password is used for packet encryption and decryption.

Secure Mode

Configure the RADSec security mode to use the TLS protocol or DTLS protocol. Both TLS and DTLS modes support IPv4 addresses, but only TLS mode supports IPv6 addresses.

Important

To avoid TLS handshake issues if the switch and RADsec proxy server run different versions of OpenSSL, manually force TLS version 2 negotiation through the RADsec proxy by adding the following text to the `radsecproxy.conf` configuration file:

```
tls default{
    ...
    TlsVersion TLS1_2
}
```

radsecproxy

RADSec uses radsecproxy to encrypt packets sent between RADIUS clients and a secure server. A radsecproxy process starts when RADIUS and secure-mode are enabled both globally and for the current server. Radsecproxy uses multiple instances on the switch, one for each security-configured RADIUS server. The maximum number of radsecproxy instances is 10, which is equivalent to the maximum number of RADIUS servers you can configure on the switch.

Note

As a best practice, use radsecproxy version 1.9.1 or later. Using an earlier version of radsecproxy can result in authentication failures.

The following events cause all radsecproxy processes to restart:

- A Segmented Management Instance interface is deleted, enabled, or disabled.
- An IPv4 address or route is changed.
- An IPv6 address or route is changed.
- RADIUS global enable and secure-enable change.

The following changes only affect a radsecproxy instance and result only in the associated process restarting:

- Enabling or disabling the RADIUS server state or secure state.
- Modifying the RADIUS server secure mode, associated profile, or secure log level.

If one of the global RADIUS flags (radius state, radius secure state) is disabled, all radsecproxy instances stop.

A RADSec profile configuration change causes all processes associated with the profile to restart.

A RADSec process automatically stops when the corresponding RADIUS server entry is deleted, or if RADIUS or secure mode is disabled for the server.

RADIUS configuration using CLI

You can configure Remote Access Dial-In User Services (RADIUS) to secure networks against unauthorized access, and allow communication servers and clients to authenticate users identity through a central database.

The database within the RADIUS server stores client information, user information, password, and access privileges, including the use of shared secret.

RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration using CLI.

RADIUS is a fully open and standard protocol, defined by RFCs (Authentication: RFC2865, accounting RFC2866). With the switch, you use RADIUS authentication to secure access to the device (console/Telnet/SSH), and RADIUS accounting to track the management sessions for Command Line Interface (CLI) only.

RADIUS authentication allows the remote server to authenticate logons. RADIUS accounting logs all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Configure RADIUS Attributes

Configure RADIUS to authenticate user identity through a central database.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure RADIUS access priority:
`radius access-priority-attribute <192-240>`
3. Configure RADIUS accounting:
`radius accounting {attribute-value <192-240>|enable|include-cli-commands}`
4. Configure the RADIUS authentication info attribute value:
`radius auth-info-attr-value <0-255>`
5. Clear RADIUS statistics:
`radius clear-stat`
6. Configure the value of the CLI commands:
`radius cli-commands-attribute <192-240>`

7. Configure the value of the command access attribute:

```
radius command-access-attribute <192-240>
```

8. Configure the maximum number of servers allowed:

```
radius maxserver <1-10>
```

9. Configure the multicast address attribute:

```
radius mcast-addr-attr-value <0-255>
```

10. Enable RADSec globally:

```
radius secure-flag
```

11. Configure the RADSec profile:

```
radius secure-profile WORD<1-16> [ca-cert-file | cert-file | key-file  
| key-pwd]
```

Example

Configure RADIUS access priority:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#radius access-priority-attribute 192
```

Configure RADIUS accounting to include CLI commands:

```
Switch:1(config)#radius accounting include-cli-commands
```

Variable Definitions

The following table defines parameters for the **radius** command.

Variable	Value
<i>access-priority-attribute</i> <i><192-240></i>	Specifies the value of the access priority attribute. The default is 192.
<i>accounting {attribute-value</i> <i><192-240> enable </i> <i>include-cli-commands}</i>	Configures the accounting attribute value, enable accounting, or configure if accounting includes CLI commands. The default is false.
<i>auth-info-attr-value</i> <0-255>	Specifies the value of the authentication information attribute. The default is 91.
<i>clear-stat</i>	Clears RADIUS statistics.
<i>cli-cmd-count</i> <1-40>	Specifies how many CLI commands before the system sends a RADIUS accounting interim request. The default value is 40.
<i>cli-commands-attribute</i> <i><192-240></i>	Specifies the value of CLI commands attribute. The default is 195.
<i>cli-profile</i>	Enable RADIUS CLI profiling. CLI profiling grants or denies access to users being authenticated by way of the RADIUS server. You can add a set of CLI commands to the configuration on the RADIUS server, and you can specify the command-access more for these commands. The default is false.

Variable	Value
<i>command-access-attribute</i> <192-240>	Specifies the value of the command access attribute. The default is 194.
<i>enable</i>	Enable RADIUS authentication globally on the switch.
<i>maxserver</i> <1-10>	Specific to RADIUS authentication, configures the maximum number of servers allowed for the device. The default is 10.
<i>mcast-addr-attr-value</i> <0-255>	Specifies the value of the multicast address attribute. The default is 90.
<i>secure-flag</i>	Specifies whether RADIUS Security (RADSec) is globally enabled. The default is disabled.

Variable	Value
<i>secure-profile</i>	Specifies the RADSec profile name.
<pre>server host WORD<0-113> key WORD<0-32> [used-by {cli snmp web} [acct-enable] [acct-port <1-65536>] [enable] [port <1-65536>] [priority <1-10>] [retry <0-6> secure-enable secure-ocsp secure-log-level {critical debug error info warning} secure-mode {dtls tls} secure-profile WORD<1-16>] [timeout <1-60>]</pre>	<ul style="list-style-type: none"> • <i>host WORD<0-113></i> Creates a host server. <i>WORD<0-113></i> signifies an IP address or Fully Qualified Domain Name (FQDN). • <i>key WORD<0-32></i> Specifies a secret key in the range of 0-32 characters. • <i>used-by {cli eapol endpoint-tracking snmp web}</i> Specifies how the server functions. Configures the server for: <ul style="list-style-type: none"> ◦ cli authentication ◦ eapol authentication ◦ endpoint-tracking authentication ◦ snmp accounting ◦ web authentication • <i>acct-enable</i> Enables RADIUS accounting on this server. The system enables RADIUS accounting by default. • <i>acct-port <1-65536></i> Specifies a UDP port of the RADIUS accounting server. The default value is 1816. The UDP port value set for the client must match the UDP value set for the RADIUS server. • <i>enable</i> Enables the server. The default is true. • <i>port <1-65536></i> Specifies a UDP port of the RADIUS server. The default value is 1812. • <i>priority <1-10></i> Specifies the priority value for this server. The default is 10. • <i>retry <0-6></i> Specifies the maximum number of authentication retries. The default is 3. • <i>secure-enable</i> Enable secure mode on the server. • <i>secure-ocsp</i>

Variable	Value
	<p>Enable RADIUS secure Online Certificate Status Protocol (OCSP) checking for this server. The default is disabled.</p> <ul style="list-style-type: none"> <code>secure-log-level{critical debug error info warning}</code> <p>Specifies the RADIUS secure server log severity level.</p> <ul style="list-style-type: none"> <code>secure-mode{dtls tls}</code> <p>Specifies the protocol for establishing the secure connection with the server. IPv4 supports both dtls and tls modes. IPv6 only supports tls mode.</p> <ul style="list-style-type: none"> <code>secure-profileWORD<1-16></code> <p>Specifies the secure profile name.</p> <ul style="list-style-type: none"> <code>timeout <1-60></code> <p>Specifies the number of seconds before the authentication request times out. The default is 3.</p>

Configure RADIUS Profile

Use RADIUS CLI profiling to grant or deny CLI command access to users being authenticated by way of the RADIUS server. You can add a set of CLI commands to the configuration file on the radius server, and you can specify the command-access mode for these commands. The default is false.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable RADIUS CLI profiling:

```
radius cli-profile
```

Example

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# radius cli-profile
```

Enable RADIUS Authentication

About This Task

Enable or disable RADIUS authentication globally on the device to allow further configuration to take place. Use the no option to disable RADIUS authentication globally. The default is false or disabled.

Procedure

- 1. Enter Global Configuration mode:
`enable`
`configure terminal`
- 2. Enable RADIUS authentication globally on the switch:
`radius enable`

Enable RADIUS Accounting

Before You Begin

- You must configure a RADIUS server before you can enable RADIUS accounting.

About This Task

Enable Remote Access Dial-in User Services (RADIUS) accounting to log all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Procedure

- 1. Enter Global Configuration mode:
`enable`
`configure terminal`
- 2. Enable RADIUS accounting globally:
`radius accounting enable`
- 3. Include or exclude CLI commands in RADIUS accounting updates:
`radius accounting include-cli-commands`
- 4. Specify the integer value of the CLI commands attribute:
`radius accounting attribute-value <192-240>`

Example

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# radius accounting enable
Switch:1(config)# radius accounting include-cli-commands
```

Variable Definitions

The following table defines parameters for the **radius accounting** command.

Variable	Value
<i>enable</i>	Enable RADIUS globally.
<i>include-cli-commands</i>	Include CLI commands in RADIUS accounting updates.
<i>attribute-value</i> <i><192-240></i>	Specify the integer value of the CLI commands attribute.

Enable RADIUS-SNMP Accounting

Before You Begin

- You must configure a RADIUS server before you can enable RADIUS-SNMP accounting.

About This Task

Enable Remote Access Dial-in User Services (RADIUS) Simple Network Managing Protocol (SNMP) accounting globally. Use SNMP to remotely collect management data. An SNMP agent is a software process that monitors the UDP port 161 for SNMP messages. Each SNMP message sent to the agent contains a list of management objects.

Procedure

- Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
- Enable RADIUS Simple Network Management Protocol (SNMP) accounting globally:

```
radius-snmp acct-enable
```
- Set a timer to send a stop accounting message for RADIUS Simple Network Management Protocol (SNMP):

```
radius-snmp abort-session-timer <30-65535>
```
- Set the timer for re-authentication of the SNMP session:

```
radius-snmp re-auth-timer <30-65535>
```
- Specify the user name for SNMP access:

```
radius-snmp user WORD <0-20>
```

Example

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# radius-snmp acct-enable
Switch:1(config)# radius-snmp abort-session-timer 30
```

Variable Definitions

The following table defines parameters for the **radius-snmp** command.

Variable	Value
<i>acct-enable</i>	Enables RADIUS accounting globally. You cannot enable RADIUS accounting before you configure a valid server. The system disables RADIUS accounting by default. The default is false. Use the no option to disable RADIUS accounting globally: no radius-snmp acct-enable
<i>abort-session-timer</i> <i><30-65535></i>	Set the timer, in seconds, to send a stop accounting message. The default is 180.

Variable	Value
<code>re-auth-timer <30-65535></code>	Sets timer for re-authentication of the SNMP session. The timer value ranges from 30 to 65535 seconds. The default is 180.
<code>user WORD <0-20></code>	Specifies the user name for SNMP access. WORD <0-20> specifies the user name in a range of 0 to 20 characters. The default is <code>snmp_user</code> .

Configure RADIUS Accounting Interim Request

About This Task

Configure RADIUS accounting interim requests to create a log whenever a user executes more than the number of CLI commands you specify.

If the packet size equals or exceeds 1.8 KB, an interim request packet is sent even if the configured limit is not reached. Therefore, the trigger to send out the interim request is either the configured value or a packet size greater than, or equal to 1.8 KB, whichever happens first.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure RADIUS accounting interim requests:
`radius cli-cmd-count <1-40>`
3. Include or exclude CLI commands in RADIUS accounting:
`radius accounting include-cli-commands`

Important

You must configure the **`radius accounting include-cli-commands`** command for accounting interim requests to function.

Example

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# radius cli-cmd-count 30
Switch:1(config)# radius accounting include-cli-commands
```

Variable Definitions

The following table defines parameters for the **radius cli-cmd-count** command.

Variable	Value
<1-40>	Specifies how many CLI commands, from 1 to 40, before the system sends a RADIUS accounting interim request. The default value is 40.

Configure RADIUS Authentication and RADIUS Accounting Attributes

About This Task

Configure RADIUS authentication and RADIUS accounting attributes to determine the size of the packets received.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure the RADIUS authentication attribute value:

```
radius command-access-attribute <192-240>
```
3. Configure the RADIUS accounting attribute value:

```
radius accounting attribute-value <192-240>
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#radius command-access-attribute 192
Switch:1(config)#radius accounting attribute-value 192
```

Variable Definitions

The following table defines parameters for the **radius** command.

Variable	Value
<i>access-priority-attribute</i> <192-240>	Specifies the value of the access priority attribute. The default is 192.
<i>accounting {attribute-value <192-240> enable include-cli-commands}</i>	Configures the accounting attribute value, enable accounting, or configure if accounting includes CLI commands. The default is false.
<i>auth-info-attr-value</i> <0-255>	Specifies the value of the authentication information attribute. The default is 91.
<i>clear-stat</i>	Clears RADIUS statistics.
<i>cli-cmd-count</i> <1-40>	Specifies how many CLI commands before the system sends a RADIUS accounting interim request. The default value is 40.

Variable	Value
<i>cli-commands-attribute</i> <192-240>	Specifies the value of CLI commands attribute. The default is 195.
<i>cli-profile</i>	Enable RADIUS CLI profiling. CLI profiling grants or denies access to users being authenticated by way of the RADIUS server. You can add a set of CLI commands to the configuration on the RADIUS server, and you can specify the command-access more for these commands. The default is false.
<i>command-access-attribute</i> <192-240>	Specifies the value of the command access attribute. The default is 194.
<i>enable</i>	Enable RADIUS authentication globally on the switch.
<i>maxserver</i> <1-10>	Specific to RADIUS authentication, configures the maximum number of servers allowed for the device. The default is 10.
<i>mcast-addr-attr-value</i> <0-255>	Specifies the value of the multicast address attribute. The default is 90.
<i>secure-flag</i>	Specifies whether RADIUS Security (RADSec) is globally enabled. The default is disabled.

Variable	Value
<i>secure-profile</i>	Specifies the RADSec profile name.
<pre>server host WORD<0-113> key WORD<0-32> [used-by {cli snmp web} [acct-enable] [acct-port <1-65536>] [enable] [port <1-65536>] [priority <1-10>] [retry <0- 6> secure-enable secure-ocsp secure-log-level {critical debug error info warning} secure-mode {dtls tls} secure-profile WORD<1-16>] [timeout <1- 60>]</pre>	<ul style="list-style-type: none"> • <i>host WORD<0-113></i> Creates a host server. <i>WORD<0-113></i> signifies an IP address or Fully Qualified Domain Name (FQDN). • <i>key WORD<0-32></i> Specifies a secret key in the range of 0-32 characters. • <i>used-by {cli eapol endpoint-tracking snmp web}</i> Specifies how the server functions. Configures the server for: <ul style="list-style-type: none"> ◦ cli authentication ◦ eapol authentication ◦ endpoint-tracking authentication ◦ snmp accounting ◦ web authentication • <i>acct-enable</i> Enables RADIUS accounting on this server. The system enables RADIUS accounting by default. • <i>acct-port <1-65536></i> Specifies a UDP port of the RADIUS accounting server. The default value is 1816. The UDP port value set for the client must match the UDP value set for the RADIUS server. • <i>enable</i> Enables the server. The default is true. • <i>port <1-65536></i> Specifies a UDP port of the RADIUS server. The default value is 1812. • <i>priority <1-10></i> Specifies the priority value for this server. The default is 10. • <i>retry <0-6></i> Specifies the maximum number of authentication retries. The default is 3. • <i>secure-enable</i> Enable secure mode on the server. • <i>secure-ocsp</i>

Variable	Value
	<p>Enable RADIUS secure Online Certificate Status Protocol (OCSP) checking for this server. The default is disabled.</p> <ul style="list-style-type: none"> <code>secure-log-level{critical debug error info warning}</code> <p>Specifies the RADIUS secure server log severity level.</p> <ul style="list-style-type: none"> <code>secure-mode{dtls tls}</code> <p>Specifies the protocol for establishing the secure connection with the server. IPv4 supports both dtls and tls modes. IPv6 only supports tls mode.</p> <ul style="list-style-type: none"> <code>secure-profileWORD<1-16></code> <p>Specifies the secure profile name.</p> <ul style="list-style-type: none"> <code>timeout <1-60></code> <p>Specifies the number of seconds before the authentication request times out. The default is 3.</p>

Add a RADIUS Server

About This Task

Add a RADIUS server to provide RADIUS service on the switch.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Add a RADIUS server:

```
radius server host WORD<0-113> key WORD<0-32> [acct-enable | acct-port
<1-65536> | enable | port <1-65536> | priority <1-10> | retry <0-6>
| secure-enable |secure-log-level <critical | debug | error | info
| warning> | secure-mode <dtls | tls> |secure-profile WORD<1-16> |
timeout <1-180> | used-by {cli|eapol|endpoint-tracking|snmp|web}]
```

Examples

Add a RADIUS server using an IPv6 address:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#radius server host 4717:0000:0000:0000:0000:0000:7933:0001 key testkey1
used-by snmp port 12 retry 5 timeout 10 enable
```

Add a RADIUS server using a Fully Qualified Domain Name (FQDN):

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#radius server host host.example.com key testkey1 used-by snmp port 12
retry 5 timeout 10 enable
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

Variable	Value
<i>host</i> <i>WORD</i> <0-113>	Configures a host server. <i>WORD</i> <0-113> specifies the IPv4 address, IPv6 address, or fully qualified domain name (FQDN). If you use an FQDN, you must also configure the switch to use DNS.
<i>acct-enable</i>	Enables RADIUS accounting on this server. The system enables RADIUS accounting by default.
<i>acct-port</i> <1-65536>	Configures the UDP port of the RADIUS accounting server. The default value is 1813. Important: The UDP port value set for the client must match the UDP value set for the RADIUS server.
<i>enable</i>	Enables the RADIUS server. The default is true.
<i>key</i> <i>WORD</i> <0-32>	Configures the secret key of the authentication client.
<i>port</i> <1-65536>	Configures the UDP port of the RADIUS authentication server. The default value is 1812.
<i>priority</i> <1-10>	Configures the priority value for this server. The default is 10.
<i>retry</i> <0-6>	Configures the number of authentication retries the server will accept. The default is 1.
<i>secure-enable</i>	Enable RADIUS Security (RADSec).
<i>secure-log-level</i> < <i>critical</i> <i>debug</i> <i>error</i> <i>info</i> <i>warning</i> >	Specifies the log severity level. The default is error.

Variable	Value
<code>secure-mode <dtls tls></code>	<p>Specifies the protocol for establishing the secure connection with the server. The possible values are:</p> <ul style="list-style-type: none"> • dtls - Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP) • tls - Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP) <p>The default is TLS.</p> <p>Important: To avoid TLS handshake issues if the switch and RADsec proxy server run different versions of OpenSSL, manually force TLS version 2 negotiation through the RADsec proxy by adding the following text to the <code>radsecproxy.conf</code> configuration file:</p> <pre> tls default{ ... TlsVersion TLS1_2 } </pre>
<code>secure-ocsp</code>	<p>Enable RADIUS Online Certificate Status Protocol (OCSP) checking.</p> <p>The default is disabled.</p>
<code>secure-profile WORD<1-16></code>	<p>Configures the secure profile for the server.</p>
<code>timeout <1-180></code>	<p>Configures the number of seconds before the authentication request times out. The default is 8.</p>
<code>used-by {cli eapol endpoint-tracking snmp web}</code>	<p>Configures how the server functions:</p> <ul style="list-style-type: none"> • cli—configure the server for CLI authentication. • eapol—configure the server for EAPoL authentication. • endpoint-tracking—configure the server for Endpoint Tracking authentication. • snmp—configure the server for SNMP accounting. • web—configure the server for HTTP(s) authentication. <p>The default is cli.</p>

Modify RADIUS Server Settings

About This Task

Change a specified RADIUS server value without having to delete the server and recreate it again.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Modify a RADIUS server:

```
radius server host WORD <0-255> used-by {cli|eapol|endpoint-tracking|
snmp|web} [acct-enable | acct-port <1-65536> | enable | key WORD<0-32>
| port <1-65536> | priority <1-10> | retry <0-6> | secure-enable |
secure-log-level <critical | debug | error | info | warning> | secure-
mode <dtls | tls> |secure-profile WORD<1-16> | timeout <1-180>]
```

Example

Modify a RADIUS server:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#radius server host 4717:0000:0000:0000:0000:7933:0001 used-by snmp
port 12 retry 5 timeout 10 enable
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

Variable	Value
<i>host WORD<0-113></i>	Configures a host server. <i>WORD<0-113></i> specifies the IPv4 address, IPv6 address, or fully qualified domain name (FQDN). If you use an FQDN, you must also configure the switch to use DNS.
<i>acct-enable</i>	Enables RADIUS accounting on this server. The system enables RADIUS accounting by default.
<i>acct-port <1-65536></i>	Configures the UDP port of the RADIUS accounting server. The default value is 1813. Important: The UDP port value set for the client must match the UDP value set for the RADIUS server.
<i>enable</i>	Enables the RADIUS server. The default is true.
<i>key WORD<0-32></i>	Configures the secret key of the authentication client.
<i>port <1-65536></i>	Configures the UDP port of the RADIUS authentication server. The default value is 1812.
<i>priority <1-10></i>	Configures the priority value for this server. The default is 10.
<i>retry <0-6></i>	Configures the number of authentication retries the server will accept. The default is 1.
<i>secure-enable</i>	Enable RADIUS Security (RADSec).

Variable	Value
<code>secure-log-level</code> <critical debug error info warning>	Specifies the log severity level. The default is error.
<code>secure-mode</code> <dtls tls>	<p>Specifies the protocol for establishing the secure connection with the server. The possible values are:</p> <ul style="list-style-type: none"> • dtls - Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP) • tls - Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP) <p>The default is TLS.</p> <p>Important: To avoid TLS handshake issues if the switch and RADsec proxy server run different versions of OpenSSL, manually force TLS version 2 negotiation through the RADsec proxy by adding the following text to the <code>radsecproxy.conf</code> configuration file:</p> <pre>tls default{ .. TlsVersion TLS1_2 }</pre>
<code>secure-ocsp</code>	<p>Enable RADIUS Online Certificate Status Protocol (OCSP) checking.</p> <p>The default is disabled.</p>
<code>secure-profile</code> WORD<1-16>	Configures the secure profile for the server.
<code>timeout</code> <1-180>	Configures the number of seconds before the authentication request times out. The default is 8.
<code>used-by</code> {cli eapol endpoint-tracking snmp web}	<p>Configures how the server functions:</p> <ul style="list-style-type: none"> • cli—configure the server for CLI authentication. • eapol—configure the server for EAPoL authentication. • endpoint-tracking—configure the server for Endpoint Tracking authentication. • snmp—configure the server for SNMP accounting. • web—configure the server for HTTP(s) authentication. <p>The default is cli.</p>

View RADIUS Information

View the global status of RADIUS information to ensure you configured the RADIUS feature according to the needs of the network.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. View the global status of RADIUS information:

```
show radius
```

Example

```
Switch:1>show radius
      acct-attribute-value : 193
      acct-enable         : false
acct-include-cli-commands : false
access-priority-attribute : 192
      auth-info-attr-value : 91
command-access-attribute  : 194
      cli-commands-attribute : 195
      cli-cmd-count        : 40
      cli-profile-enable    : false
      enable               : false
      igap-passwd-attr     : standard
igap-timeout-log-fsize    : 512
      maxserver            : 10
mcast-addr-attr-value     : 90
supported-vendor-ids      : 1584, 562, 1916
      secure-flag          : false
```

View RADIUS Server Information

If your system is configured with a RADIUS server you can display the RADIUS server information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. To view the RADIUS server information enter the following command:

```
show radius-server
```

Note

If no RADIUS server is configured, the system displays the following message:

```
no RADIUS server configured
```

Example

```
Switch:1>show radius-server
=====
                        Radius Server Entries
=====
```

ACCT	NAME	USEDDBY	SECRET	PORT	PRIOR	RETRY	TIMEOUT	ENABLED	ENABLED	MODE	INSTANCE	PROFILE	LOG-LEVEL	OCSP	PORT
192.0.2.14	cli	*****	1812	10	1	8	true	true	tls	0	radsecp	error	false	1813	
192.0.2.15	cli	*****	1812	10	1	8	true	false	tls	-1	default	error	false	1813	

View RADIUS Server Statistics

About This Task

You cannot collect the following network statistics from a console port: the number of input and output packets, and the number of input and output bytes. All other statistics from console ports are available to assist with debugging.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display RADIUS server statistics:
`show radius-server statistics`
3. Clear server statistics:
`clear radius statistics`

Example

```
Switch:1#show radius-server statistics
```

```
Responses with invalid server address: 0
```

```
Radius Server(UsedBy) : 192.0.2.58 (cli)
```

```

```

Configure RADIUS Server Reachability

About This Task

Use this procedure to configure the RADIUS server reachability settings.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the RADIUS keep-alive timer:
`radius reachability keep-alive-timer <30-600>`
3. Configure the RADIUS reachability mode:
`radius reachability mode <status-server | use-radius>`
4. If you selected `use-radius` as the RADIUS reachability mode, configure the RADIUS request user name and password:
`radius reachability username WORD<1-16> password WORD<1-16>`
5. Configure the RADIUS reachability unreachable timer:
`radius reachability unreachable-timer <30-600>`

Example

Configure values for RADIUS server reachability:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

Configure the RADIUS keep-alive timer:

```
Switch:1(config)#radius reachability keep-alive-timer 30
```

Configure the RADIUS reachability mode:

```
Switch:1(config)#radius reachability mode status-server
```

Configure the RADIUS reachability unreachable timer:

```
Switch:1(config)#radius reachability unreachable-timer 30
```

Variable Definitions

The following table defines parameters for the **radius reachability** command.

Variable	Value
keep-alive-timer <30-600>	Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds.
mode <status-server use-radius>	Specifies status-server mode or use-radius mode. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode.
password <i>WORD</i> <1-16>	Configures the RADIUS request password. The default is extremenetworks.
unreachable-timer <30-600>	Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds.
username <i>WORD</i> <1-16>	Configures the RADIUS request user name. The default is extremenetworks.

Display RADIUS Server Reachability

About This Task

Use this procedure to display the RADIUS server reachability configuration.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the RADIUS server reachability configuration:

```
show radius reachability
```

Example

Display the RADIUS server reachability configuration.

```
Switch:1#show radius reachability
EAP RADIUS reachability mode      : use-radius
EAP RADIUS reachability status    : RADIUS is disabled globally
EAP RADIUS reachable server       : none
Time until next check             : N/A
RADIUS username                   : reachme
RADIUS password                   : reachme
RADIUS keep-alive-timer           : 180
RADIUS unreachable-timer          : 60
```

Display RADIUS SNMP Configurations

Display current RADIUS SNMP configurations.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. Display the current RADIUS server SNMP configurations:

```
show radius snmp
```

Example

```
Switch:1>show radius snmp
      abort-session-timer : 180
      acct-enable : false
      user : snmp_user
      enable : false
      re-auth-timer : 180
```

Display RADIUS Dynamic Server Information

About This Task

Use the following procedure to display information about the configuration of RADIUS dynamic session changes.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display information about dynamic change configuration:

```
show radius dynamic-server [client | statistics]
```

Examples

```
Switch:1>show radius dynamic-server
```

```
=====
                        RADIUS Dynamic Authorization General Info
=====
CLIENT      RESOLVED      UDP      CLIENT      SECRET
ADDRESS      ADDRESS      PORT      ENABLED      KEY
-----
192.0.2.15           1026      Disabled
192.0.2.16           1027      Disabled
host.example.com     3799      Enabled
=====
```

All 2 out of 2 Total Num of RADIUS Dynamic Authorization clients displayed

Display dynamic server statistics:

```
Switch:1>show radius dynamic-server statistics
```

```
=====
                        RADIUS Dynamic Authorization Global Statistics
=====
Disconnects From Invalid Client Addresses:      0
CoAs From Invalid Client Addresses:              0
=====
```

Variable Definitions

The following table defines parameters for the **show radius dynamic-server** command.

Variable	Value
client	Display RADIUS Dynamic Authorization configuration values for the specified client.
statistics	Display statistics for RADIUS Dynamic Authorization clients.

Configure a RADIUS Dynamic Client

Before You Begin

You must enable EAPOL globally and at the port level.

About This Task

Configure a client to enable processing of dynamic session changes. You can configure up to eight clients.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Configure client values:
`radius dynamic-server client WORD<0-255> [port <1024-65535>] [secret WORD<0-32>] enable`

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#radius dynamic-server client 192.0.2.15 port 1025 secret 123 enable
```

Variable Definitions

The following table defines parameters for the **radius dynamic-server** command.

Variable	Value
client WORD<0-255>	Specifies the address or fully qualified domain name (FQDN). If you use an FQDN, you must also configure the switch to use DNS.
enable	Enable processing of dynamic session changes.
port <1024-65535>	Specifies the port value.
secret WORD<0-32>	Specifies a value for secret key.

RADSec Configuration Using CLI

This section contains procedures for configuring RADSec using Command Line Interface (CLI).

Configure a RADIUS Secure Profile using Manual Certificates

Configure RADIUS secure profiles with certificate information, certificate key information, and password information, which enables RADSec peers to establish connections.

About This Task

A new profile directory is created for each new profile in the `/intflash/.radsec/profile/radsec` directory. Profile configuration file "profile_info.cfg" is available in `/intflash/.radsec/profile` directory.

Note

All the files (certificates and keys) must be in .pem format and you must copy them to the `/intflash` directory.

You can configure a maximum of 10 RADSec profiles.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure a name for the RADIUS profile:
`radius secure-profile WORD<1-16>`
3. Configure the full file path of the certificate authority (CA) certificate for the RADIUS secure profile:
`radius secure-profile WORD<1-16> ca-cert-file WORD<0-128>`
`[WORD<1-128>]`
4. Configure the full path of the server certificate for the RADIUS secure profile:
`radius secure-profile WORD<1-16> cert-file WORD<0-128> [WORD<1-128>]`
5. Configure the full path of the private key file for the RADIUS secure profile:
`radius secure-profile WORD<1-16> key-file WORD<0-128> [WORD<1-128>]`
6. Configure the private key password for the RADIUS secure profile:
`radius secure-profile WORD<1-16> key-pwd WORD<0-255>`

Variable Definitions

The following table defines parameters for the **radius secure-profile** command.

Variable	Value
WORD<1-16>	Specifies the RADIUS secure profile name.
CA-cert-file WORD<0-128>	Specifies the full file path of the certificate authority (CA) certificate.
cert-file WORD<0-128>	Specifies the full file path of the server certificate.
key-file WORD<0-128>	Specifies the full file path of the private key file.
WORD<1-128>	Specifies the file name.
key-pwd WORD<0-255>	Specifies the private key password.

Display RADIUS Secure Profile information

About This Task

Use the following procedure to display information about the configuration of RADIUS secure profiles.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display information about RADIUS secure profile configuration:
`show radius secure-profile`

Example

```
Switch:1>show radius secure-profile
=====
                        Secure RADIUS profile
=====
Profile default:
  Name      : default
  RootCert  : n/a
  Cert      : n/a
  Key       : n/a
  Password  : *****
```

Associate a RADSec Profile with a RADIUS Server

Before You Begin

Add a RADIUS Server. For more information, see [Add a RADIUS Server](#) on page 3068.

About This Task

RADSec peers use certificates to establish trust relationships. You must associate a RADSec profile with a RADIUS server in order to use certificates.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Associate a RADSec profile with a RADIUS server:

```
radius server host WORD<0-113> used-by {cli | eapol | endpoint-  
tracking | snmp | web} secure-profile WORD<1-16>
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

Variable	Value
<i>WORD<0-255></i>	Configures a host server. <i>WORD<0-255></i> specifies the IPv4 address, IPv6 address, or fully qualified domain name (FQDN). If you use an FQDN, you must also configure the switch to use DNS.
<i>used-by</i>	Specifies how the server functions. Configures the server for one of the following: <ul style="list-style-type: none">• cli authentication• eapol authentication• endpoint-tracking authentication• snmp accounting• web authentication
<i>secure-enable</i>	Enables RADSec on the RADIUS server.

Configure RADSec Secure Mode

Configure the secure mode for RADSec as either Transport Layer Security (TLS) protocol or Datagram Transport Layer Security (DTLS) protocol.

Before You Begin

To avoid TLS handshake issues if the switch and RADsec proxy server run different versions of OpenSSL, manually force TLS version 2 negotiation through the RADsec proxy by adding the following text to the `radsecproxy.conf` configuration file:

```
tls default{  
    ...  
    TlsVersion TLS1_2  
}
```

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the secure mode:

```
radius server host WORD<0-113> used-by {cli | eapol | endpoint-
tracking | snmp | web} secure-mode {tls | dtls}
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

Variable	Value
<i>WORD<0-113></i>	Configures a host server. <i>WORD<0-113></i> specifies the IPv4 address, IPv6 address, or fully qualified domain name (FQDN). If you use an FQDN, you must also configure the switch to use DNS.
<i>used-by</i>	Specifies how the server functions. Configures the server for one of the following: <ul style="list-style-type: none"> cli authentication eapol authentication endpoint-tracking authentication snmp accounting web authentication
<i>secure-mode</i>	Specifies the RADSec security mode. Possible values are: <ul style="list-style-type: none"> tls - Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP) dtls - Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP) The default is tls.

Enable RADSec

About This Task

You must enable RADSec globally and at the RADIUS server level in order for RADSec to be enabled for a RADIUS server.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable RADSec globally:

```
radius secure-flag
```

3. Enable RADSec on the RADIUS server:

```
radius server host WORD<0-113> used-by {cli | eapol | endpoint-
tracking | snmp | web} secure-enable
```

Change the Logging Level for RADSec

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Change the logging level:

```
radius server host WORD<0-113> used-by {cli|eapol|endpoint-tracking|snmp|web} secure-log-level <critical | debug | error | info | warning>
```

Variable Definitions

The following table defines parameters for the **radius server host WORD<0-255> used-by {cli|eapol|endpoint-tracking|snmp|web} secure-log-level** command.

Variable	Value
<code><critical debug error info warning></code>	Specifies the RADIUS secure server log severity level. The default is error.
<code>used-by {cli eapol endpoint-tracking snmp web}</code>	Configures how the server functions: <ul style="list-style-type: none"> • cli - configures the server for CLI authentication. • eapol - configures the server for Extensible Authentication Protocol over LAN (EAPoL) authentication • endpoint-tracking - configures the server for Endpoint Tracking authentication • snmp - configures the server for Simple Network Management Protocol (SNMP) accounting • web - configures the server for web authentication
<code>WORD<0-113></code>	Configures a host server. <code>WORD<0-113></code> specifies the IPv4 address, IPv6 address, or fully qualified domain name (FQDN). If you use an FQDN, you must also configure the switch to use DNS.

Enable OCSP Checking

About This Task

Perform the following procedure to enable RADIUS Online Certificate Status Protocol (OCSP) checking for this server.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enable RADIUS OCSP checking:
`radius server host WORD<0-113> used-by cli secure-ocsp`

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#radius server host 192.0.2.24 used-by cli secure-ocsp
```

Display Log Information for Secure RADIUS Instance

About This Task

Use the following procedure to display log information for secure instance of RADIUS.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display log information for a secure instance of RADIUS:
`show radius secure-server log <0-9>.`

Variable Definitions

The following table defines parameters for the **show radius secure-server** command.

Variable	Value
<code>log<0-9></code>	Specifies the log for a secure RADIUS instance.

RADIUS configuration using Enterprise Device Manager

You can configure Remote Access Dial-In User Services (RADIUS) to assist in securing networks against unauthorized access, and allow communication servers and clients to authenticate the identity of users through a central database.

The database within the RADIUS server stores client information, user information, password, and access privileges, including the use of shared secret.

RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration in all but the following case. When adding a RADIUS server in Enterprise Device Manager (EDM) or modifying a RADIUS configuration in EDM, you must specify if the address type is an IPv4 or an IPv6 address.

RADIUS is a fully open and standard protocol, defined by RFCs (Authentication: RFC2865, accounting RFC2866). With the switch, you use RADIUS authentication to

secure access to the device (console/Telnet/SSH), and RADIUS accounting to track the management sessions for Command Line Interface (CLI) only.

RADIUS authentication allows the remote server to authenticate logons. RADIUS accounting logs all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Enable RADIUS Authentication

About This Task

Enable RADIUS authentication globally to enable all features and functions of RADIUS to operate with the RADIUS server.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS Global** tab.
4. Select **Enable**.
5. In **MaxNumberServer**, type a value for the maximum number of servers.
6. In **AccessPriorityAttrValue**, type an access policy value (by default, this value is 192).
7. Configure the rest of the parameters in the RADIUS global tab.
8. Select **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

Name	Description
Enable	Enables the RADIUS authentication feature globally.
MaxNumberServer	Specifies the maximum number of servers to be used inclusive.
AccessPriorityAttrValue	Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The default is 192.
AcctEnable	Enables RADIUS accounting.
AcctAttriValue	Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The default value is 193.
AcctIncludeCli	Specifies whether you want CLI commands included in RADIUS accounting requests.
ClearStat	Clears RADIUS statistics from the device.

Name	Description
McastAttributeValue	Specifies the value of the Mcast attribute. The default value is 90.
AuthInfoAttrValue	Specifies the value of the authentication information attribute. The default value is 91.
CommandAccessAttrValue	Specifies the value of the command access attribute. The default value is 194.
CliCommandAttrValue	Specifies the value of the CLI command attribute. The default value is 195.
AuthInvalidServerAddress	Displays the number of access responses from unknown or invalid RADIUS servers.
CliCmdCount	Gives the value for the CLI command count. The default is 40.
CliProfEnable	Enables RADIUS CLI profiling.
SupportedVendorIds	Shows the vendor IDs that the software supports for RADIUS.
RadiusReachability	Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode.
SecureEnable	Enable RADIUS Security (RADSec).
UserName	Specifies the user name for RADIUS server reachability. The default is extremenetworks.
Password	Specifies the password for RADIUS server reachability. The default is extremenetworks.
Confirm Password	Confirms the password for RADIUS server reachability.
Unreachable Timer	Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds.
Keep Alive Timer	Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds.

Enable RADIUS Accounting

Before You Begin

- You must set up a RADIUS server and add it to the configuration file of the device before you can enable RADIUS accounting on the device. Otherwise, the system displays an error message.

About This Task

Enable RADIUS accounting to log all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS Global** tab.
4. Select **AcctEnable**.
5. In **AcctAttrValue**, type an access policy value (by default, this value is 193).
6. Select **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

Name	Description
Enable	Enables the RADIUS authentication feature globally.
MaxNumberServer	Specifies the maximum number of servers to be used inclusive.
AccessPriorityAttrValue	Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The default is 192.
AcctEnable	Enables RADIUS accounting.
AcctAttrValue	Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The default value is 193.
AcctIncludeCli	Specifies whether you want CLI commands included in RADIUS accounting requests.
ClearStat	Clears RADIUS statistics from the device.
McastAttributeValue	Specifies the value of the Mcast attribute. The default value is 90.
AuthInfoAttrValue	Specifies the value of the authentication information attribute. The default value is 91.
CommandAccessAttrValue	Specifies the value of the command access attribute. The default value is 194.
CliCommandAttrValue	Specifies the value of the CLI command attribute. The default value is 195.
AuthInvalidServerAddress	Displays the number of access responses from unknown or invalid RADIUS servers.
CliCmdCount	Gives the value for the CLI command count. The default is 40.
CliProfEnable	Enables RADIUS CLI profiling.
SupportedVendorIds	Shows the vendor IDs that the software supports for RADIUS.

Name	Description
RadiusReachability	Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode.
SecureEnable	Enable RADIUS Security (RADSec).
UserName	Specifies the user name for RADIUS server reachability. The default is extremenetworks.
Password	Specifies the password for RADIUS server reachability. The default is extremenetworks.
Confirm Password	Confirms the password for RADIUS server reachability.
Unreachable Timer	Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds.
Keep Alive Timer	Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds.

Disable RADIUS Accounting

Before You Begin

- You cannot globally disable RADIUS accounting unless a server entry exists.

About This Task

Disabling RADIUS accounting removes the accounting function from the RADIUS server.

Procedure

- In the navigation pane, expand **Configuration > Security > Control Path**.
- Select **RADIUS**.
- Select the **RADIUS Global** tab.
- Disable RADIUS accounting by clearing **AcctEnable**.
- Select **Apply**.

Enable RADIUS Accounting Interim Request

About This Task

Enable the RADIUS accounting interim request feature to create a log whenever more than the specified number of CLI commands are executed.

Procedure

- In the navigation pane, expand **Configuration > Security > Control Path**.
- Select **RADIUS**.

3. Select the **RADIUS Global** tab.
4. Type the number of CLI commands in **CliCmdCount**.
5. Select **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

Name	Description
Enable	Enables the RADIUS authentication feature globally.
MaxNumberServer	Specifies the maximum number of servers to be used inclusive.
AccessPriorityAttrValue	Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The default is 192.
AcctEnable	Enables RADIUS accounting.
AcctAttriValue	Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The default value is 193.
AcctIncludeCli	Specifies whether you want CLI commands included in RADIUS accounting requests.
ClearStat	Clears RADIUS statistics from the device.
McastAttributeValue	Specifies the value of the Mcast attribute. The default value is 90.
AuthInfoAttrValue	Specifies the value of the authentication information attribute. The default value is 91.
CommandAccessAttrValue	Specifies the value of the command access attribute. The default value is 194.
CliCommandAttrValue	Specifies the value of the CLI command attribute. The default value is 195.
AuthInvalidServerAddress	Displays the number of access responses from unknown or invalid RADIUS servers.
CliCmdCount	Gives the value for the CLI command count. The default is 40.
CliProfEnable	Enables RADIUS CLI profiling.
SupportedVendorIds	Shows the vendor IDs that the software supports for RADIUS.
RadiusReachability	Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode.
SecureEnable	Enable RADIUS Security (RADSec).

Name	Description
UserName	Specifies the user name for RADIUS server reachability. The default is extremenetworks.
Password	Specifies the password for RADIUS server reachability. The default is extremenetworks.
Confirm Password	Confirms the password for RADIUS server reachability.
Unreachable Timer	Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds.
Keep Alive Timer	Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds.

Add a RADIUS Server

Before You Begin

If you specify an FQDN for the server, you must configure DNS for address resolution.

About This Task

Add a RADIUS server to provide RADIUS service on the switch.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS Servers** tab.
4. Select **Insert**.
5. Select a value for **AddressType**.
6. In **Address**, type the address or FQDN.
7. In **UsedBy**, select the RADIUS server purpose.
8. (Optional) Configure optional parameters as required.
9. Select **Insert**.

RADIUS Servers Field Descriptions

Use the data in the following table to use the **RADIUS Servers** tab.

Name	Description
AddressType	Specifies the address type as either an IPv4 address, IPv6 address, or dns for a Fully Qualified Domain Name (FQDN).
Address	Specifies the IP address or FQDN of the RADIUS server.

Name	Description
UsedBy	<p>Configures how the server functions:</p> <ul style="list-style-type: none"> • cli—configure the server for CLI authentication. • eapol—configure the server for EAPoL authentication. • endpointTracking—configure the server for Endpoint Tracking authentication. • snmp—configure the server for SNMP accounting. • web—configure the server for HTTP(s) authentication. <p>The default is cli.</p>
Priority	Specifies the priority of each server, or the order of servers to send authentication. The default is 10.
TimeOut	Specifies the time interval in seconds before the client retransmits the packet. The default is 8.
Enable	Enables or disables authentication on the server. The default is true.
MaxRetries	Specifies the maximum number of retransmissions allowed. The default is 1.
UdpPort	<p>Specifies the UDP port that the client uses to send requests to the server. The default value is 1812.</p> <p>The UDP port value set for the client must match the UDP value set for the RADIUS server.</p>
SecretKey	Specifies the RADIUS server secret key, which is the password used by the client to be validated by the server.
AcctEnable	Enables or disable RADIUS accounting. The default is true.
AcctUdpPort	<p>Specifies the UDP port of the RADIUS accounting server. The default value is 1813.</p> <p>The UDP port value configured for the client must match the UDP value configured for the RADIUS server.</p>
SecureEnable	Enable RADIUS Security (RADSec). The default is disabled.
SecureMode	<p>Specifies the RADSec security mode. Possible values are:</p> <ul style="list-style-type: none"> • tls - Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP) • dtls - Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP) <p>The default is tls.</p> <p>Important:</p> <p>To avoid TLS handshake issues if the switch and RADsec proxy server run different versions of OpenSSL, manually force TLS version 2 negotiation through the RADsec proxy by adding the following text to the <code>radsecproxy.conf</code> configuration file:</p> <pre> tls default{ ... TlsVersion TLS1_2 } </pre>

Name	Description
SecureProfile	Specifies the name of the secure profile.
SecureLogLevel	Specifies the log severity level. Possible values are: <ul style="list-style-type: none">• critical• error• warning• info• debug The default is error.
SecureOCSP	Enables or disable RADIUS Online Certificate Status Protocol (OCSP) checking for this server. The default is disabled.
ResolvedAddressType	Specifies the type of IP address of the RADIUS Server host. It can be IPv4 or IPv6.
ResolvedAddress	Specifies the RADIUS Server resolved IP address associated with the Fully Qualified Domain Name.

Show RADIUS Server Statistics

About This Task

Use the server statistics feature to display the number of input and output packets and the number of input and output bytes. Statistics from console ports are available to assist with debugging.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS Servers Stats** tab.

RADIUS Server Stats Field Descriptions

Use the data in the following table to use the **RADIUS Server Stats** tab.

Name	Description
AddressType	Specifies the type of IP address. RADIUS supports IPv4 addresses only.
Address	Shows the IP address of the RADIUS server.
Used by	Identifies the client.
AccessRequests	Shows the number of access-response packets sent to the server; does not include retransmissions.
AccessAccepts	Shows the number of access-accept packets, valid or invalid, received from the server.
AccessRejects	Shows the number of access-reject packets, valid or invalid, received from the server.

Name	Description
BadResponses	Shows the number of invalid access-response packets received from the server.
PendingRequests	Shows the access-request packets sent to the server that have not yet received a response or that have timed out.
ClientRetries	Shows the number of authentication retransmissions to the server.
AcctOnRequests	Shows the number of accounting on requests sent to the server.
AcctOffRequests	Shows the number of accounting off requests sent to the server.
AcctStartRequests	Shows the number of accounting start requests sent to the server.
AcctStopRequests	Shows the number of accounting stop requests sent to the server.
AcctInterimRequests	<p>Number of Accounting Interim requests sent to the server.</p> <p>Important: The AcctInterimRequests counter increments only if you select AcctIncludeCli from the RADIUS Global tab.</p>
AcctBadResponses	Shows the number of Invalid responses discarded from the server.
AcctPendingRequests	Shows the number of requests waiting to be sent to the server.
AcctClientRetries	Shows the number of retries made to this server.
RoundTripTime	Shows the time difference between the instance when a RADIUS request is sent and the corresponding response is received.
AccessChallenges	Shows the number of RADIUS access-challenges packets sent to this server. This does not include retransmission.
NasIpAddress	Shows the RADIUS client NAS Identifier for this server.

Reauthenticate the RADIUS SNMP Server Session

About This Task

Specify the number of challenges that you want the RADIUS SNMP server to send to authenticate a given session.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS SNMP** tab.
4. Select **Enable**.

5. In **ReauthenticateTimer**, type a value to specify the interval between RADIUS SNMP server reauthentications.

**Important**

To end the RADIUS SNMP server session, type a value for the **AbortSessionTimer**, and then select **Enable**.

6. (Optional) Select **AcctEnable**.
7. Select **Apply**.

RADIUS SNMP Field Descriptions

Use the data in the following table to use the **RADIUS SNMP** tab.

Name	Description
Enable	Enables or disables timer authentication on the server. The default is true.
AbortSessionTimer	Specifies the allowable time, in seconds, before aborting the RADIUS SNMP server session (30 to 65535). The default is 180.
ReAuthenticateTimer	Specifies the time, in seconds, between reauthentications of the RADIUS SNMP server (30 to 65535). The default is 180.
AcctEnable	Enables or disables the RADIUS SNMP session timer.
UserName	Specifies the user name for the RADIUS SNMP accounting.

Configure RADIUS SNMP

About This Task

Configure RADIUS SNMP parameters for authentication and session times.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS SNMP** tab.
4. Select **Enable** to enable RADIUS SNMP.
5. In **AbortSessionTimer**, type the period after which the session expires in seconds.
6. In **ReAuthenticateTimer**, type the period of time the system waits before reauthenticating in seconds.
7. Select **AcctEnable** to enable RADIUS accounting for SNMP.
8. In **UserName**, type the RADIUS SNMP user name.
9. Select **Apply**.

RADIUS SNMP *Field Descriptions*

Use the data in the following table to use the **RADIUS SNMP** tab.

Name	Description
Enable	Enables or disables timer authentication on the server. The default is true.
AbortSessionTimer	Specifies the allowable time, in seconds, before aborting the RADIUS SNMP server session (30 to 65535). The default is 180.
ReAuthenticateTimer	Specifies the time, in seconds, between reauthentications of the RADIUS SNMP server (30 to 65535). The default is 180.
AcctEnable	Enables or disables the RADIUS SNMP session timer.
UserName	Specifies the user name for the RADIUS SNMP accounting.

Modify a RADIUS Configuration

About This Task

Use this procedure to modify an existing RADIUS configuration or single function such as retransmissions and RADIUS accounting.

RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration in all except the following case. When modifying a RADIUS configuration in Enterprise Device Manager (EDM), you must specify if the address type is an IPv4 or an IPv6 address.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS Servers** tab.
4. In the row and field to modify, type the information or use the lists to make a selection. Access the lists by double-clicking in a field.
5. Select **Apply**.

RADIUS Servers *Field Descriptions*

Use the data in the following table to use the **RADIUS Servers** tab.

Name	Description
AddressType	Specifies the address type as either an IPv4 address, IPv6 address, or dns for a Fully Qualified Domain Name (FQDN).
Address	Specifies the IP address or FQDN of the RADIUS server.

Name	Description
UsedBy	<p>Configures how the server functions:</p> <ul style="list-style-type: none"> • cli—configure the server for CLI authentication. • eapol—configure the server for EAPoL authentication. • endpointTracking—configure the server for Endpoint Tracking authentication. • snmp—configure the server for SNMP accounting. • web—configure the server for HTTP(s) authentication. <p>The default is cli.</p>
Priority	Specifies the priority of each server, or the order of servers to send authentication. The default is 10.
TimeOut	Specifies the time interval in seconds before the client retransmits the packet. The default is 8.
Enable	Enables or disables authentication on the server. The default is true.
MaxRetries	Specifies the maximum number of retransmissions allowed. The default is 1.
UdpPort	<p>Specifies the UDP port that the client uses to send requests to the server. The default value is 1812.</p> <p>The UDP port value set for the client must match the UDP value set for the RADIUS server.</p>
SecretKey	Specifies the RADIUS server secret key, which is the password used by the client to be validated by the server.
AcctEnable	Enables or disable RADIUS accounting. The default is true.
AcctUdpPort	<p>Specifies the UDP port of the RADIUS accounting server. The default value is 1813.</p> <p>The UDP port value configured for the client must match the UDP value configured for the RADIUS server.</p>
SecureEnable	Enable RADIUS Security (RADSec). The default is disabled.
SecureMode	<p>Specifies the RADSec security mode. Possible values are:</p> <ul style="list-style-type: none"> • tls - Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP) • dtls - Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP) <p>The default is tls.</p> <p>Important:</p> <p>To avoid TLS handshake issues if the switch and RADsec proxy server run different versions of OpenSSL, manually force TLS version 2 negotiation through the RADsec proxy by adding the following text to the <code>radsecproxy.conf</code> configuration file:</p> <pre> tls default{ ... TlsVersion TLS1_2 } </pre>

Name	Description
SecureProfile	Specifies the name of the secure profile.
SecureLogLevel	Specifies the log severity level. Possible values are: <ul style="list-style-type: none">• critical• error• warning• info• debug The default is error.
SecureOCSP	Enables or disable RADIUS Online Certificate Status Protocol (OCSP) checking for this server. The default is disabled.
ResolvedAddressType	Specifies the type of IP address of the RADIUS Server host. It can be IPv4 or IPv6.
ResolvedAddress	Specifies the RADIUS Server resolved IP address associated with the Fully Qualified Domain Name.

Delete a RADIUS Configuration

About This Task

Delete an existing RADIUS configuration.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS Servers** tab.
4. Identify the configuration to delete by selecting anywhere in the row.
5. Select **Delete**.

Configure RADIUS Server Reachability

About This Task

Use this procedure to configure the RADIUS server reachability settings.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **RADIUS Global** tab.
4. In **RadiusReachability**, select either **useStatusServerPackets** or **useDummyRadiusRequests**.
5. In **UserName**, type the reachability user name.
6. In **Password**, type the reachability password.
7. In **Confirm Password**, retype the reachability password.

8. In **Unreachable Timer**, type the interval in seconds between checks when the RADIUS server is unreachable.
9. In **KeepAlive Timer**, type the interval in seconds between checks when the RADIUS server is reachable.
10. Select the **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

Name	Description
Enable	Enables the RADIUS authentication feature globally.
MaxNumberServer	Specifies the maximum number of servers to be used inclusive.
AccessPriorityAttrValue	Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The default is 192.
AcctEnable	Enables RADIUS accounting.
AcctAttrValue	Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The default value is 193.
AcctIncludeCli	Specifies whether you want CLI commands included in RADIUS accounting requests.
ClearStat	Clears RADIUS statistics from the device.
McastAttributeValue	Specifies the value of the Mcast attribute. The default value is 90.
AuthInfoAttrValue	Specifies the value of the authentication information attribute. The default value is 91.
CommandAccessAttrValue	Specifies the value of the command access attribute. The default value is 194.
CliCommandAttrValue	Specifies the value of the CLI command attribute. The default value is 195.
AuthInvalidServerAddress	Displays the number of access responses from unknown or invalid RADIUS servers.
CliCmdCount	Gives the value for the CLI command count. The default is 40.
CliProfEnable	Enables RADIUS CLI profiling.
SupportedVendorIds	Shows the vendor IDs that the software supports for RADIUS.

Name	Description
RadiusReachability	Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode.
SecureEnable	Enable RADIUS Security (RADSec).
UserName	Specifies the user name for RADIUS server reachability. The default is extremenetworks.
Password	Specifies the password for RADIUS server reachability. The default is extremenetworks.
Confirm Password	Confirms the password for RADIUS server reachability.
Unreachable Timer	Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds.
Keep Alive Timer	Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds.

Configure a RADIUS Dynamic-Server Client

Before You Begin

- You must enable EAPOL globally and at the port level.
- You must enable RADIUS dynamic extensions command processing at the port level.
- If you specify an FQDN, you must configure DNS for address resolution.

About This Task

Use this procedure to configure a client to process dynamic session changes. You can configure up to eight clients.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS CoA**.
3. Select **Global**.
4. Select **Insert**.
5. In **AddressType**, select **ipv4** or **dns**.
6. In **Address**, type a client address or FQDN.
7. (Optional) In **UdpPort**, type a value for the client port.
8. (Optional) In **Secret**, type a value for the secret key.
9. Select **Enable** to enable dynamic session processing for the client.
10. Select **Insert**.

Global Field Descriptions

Use the data in the following table to use the **Global** tab.

Name	Description
AddressType	Specifies the type of address contained in the corresponding instance of a RADIUS Dynamic Authorization Client configured in this entry. The address can be either an IPv4 address or dns for a Fully Qualified Domain Name (FQDN).
Address	Specifies the internet address or FQDN of a RADIUS Dynamic Authorization Client configured in this entry.
UdpPort	Specifies the UDP port number the server/NAS listens on for requests from the RADIUS Dynamic Authorization Client configured in this entry. The default is 3799.
Secret	Specifies the secret key shared between the RADIUS Dynamic Authorization Client and Server. Note that when this object is retrieved, the value always displays as a zero-length octet string.
Enable	Enable processing of dynamic session changes. The default is disabled.
ResolvedAddressType	Specifies the type of address that DNS resolves for the RADIUS Dynamic Authorization Client. The address can be an IPv4 address.
ResolvedAddress	Specifies the RADIUS Dynamic Authorization Client resolved IP address associated with the Fully Qualified Domain Name.

Display RADIUS CoA Disconnect Statistics

About This Task

Use this procedure to display RADIUS CoA Disconnect statistics.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS CoA**.
3. Select the **Disconnect Stats** tab.

Disconnect Stats *Field Descriptions*

Use the data in the following table to use the **Disconnect Stats** tab.

Name	Description
DisconRequests	Specifies the number of RADIUS disconnect requests received from this Dynamic Authorization Client. This also includes the RADIUS disconnect requests that have a Service-Type attribute with a value of Authorize Only.
DisconAuthOnlyRequests	Specifies the number of RADIUS disconnect requests that include a Service-Type attribute with a value of Authorize Only received from this Dynamic Authorization Client.
DupDisconRequests	Specifies the number of duplicate RADIUS Disconnect-Request packets received from this Dynamic Authorization Client.
DisconAcks	Specifies the number of RADIUS Disconnect-ACK packets sent to this Dynamic Authorization Client.
DisconNaks	Specifies the number of RADIUS Disconnect-NAK packets sent to this Dynamic Authorization Client. This includes the RADIUS Disconnect-NAK packets sent with a Service-Type attribute with a value of Authorize Only and the RADIUS Disconnect-NAK packets sent because no session context was found.
DisconNakAuthOnlyRequests	Specifies the number of RADIUS Disconnect-NAK packets that include a Service-Type attribute with a value of Authorize Only sent to this Dynamic Authorization Client.
DisconNakSessNoContext	Specifies the number of RADIUS Disconnect-NAK packets sent to this Dynamic Authorization Client because no session context was found.
DisconUserSessRemoved	Specifies the number of user sessions removed for the disconnect requests received from this Dynamic Authorization Client. Depending on site-specific policies, a single disconnect request can remove multiple user sessions. In cases where this Dynamic Authorization Server has no knowledge of the number of user sessions that are affected by a single request, each such disconnect request counts as a single affected user session only.

Name	Description
MalformedDisconRequests	Specifies the number of malformed RADIUS Disconnect-Request packets received from this Dynamic Authorization Client. Bad authenticators and unknown types are not included as malformed disconnect requests
DisconBadAuthenticators	Specifies the number of RADIUS Disconnect-Request packets that contain an invalid Authenticator field received from this Dynamic Authorization Client.
DisconPacketsDropped	Specifies the number of incoming disconnect requests from this Dynamic Authorization Client silently discarded by the server application for some reason other than malformed packets, bad authenticators, or unknown types.
UnknownTypes	Specifies the number of incoming requests that have an invalid ID type.

Display RADIUS CoA Reauthenticate Statistics

About This Task

Use this procedure to display RADIUS CoA Reauthenticate statistics.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS CoA**.
3. Select the **Reauthenticate Stats** tab.

Reauthenticate Stats Field Descriptions

Use the data in the following table to use the **Reauthenticate Stats** tab.

Name	Description
Requests	Specifies the number of RADIUS Reauthentication-Requests received from this Dynamic Authorization Client. This also includes the Reauthentication requests that have a Service-Type attribute with a value of Authorize Only.
AuthOnlyRequests	Specifies the number of RADIUS Reauthentication-Requests that include a Service-Type attribute with value Authorize Only received from this Dynamic Authorization Client.

Name	Description
DupRequests	Specifies the number of duplicate RADIUS Reauthentication-Request packets received from this Dynamic Authorization Client.
Acks	Specifies the number of incoming Reauthentication packets from this Dynamic Authorization Client silently discarded by the server application for some reason other than malformed, bad authenticators, or unknown types.
Nacks	Specifies the number of RADIUS Reauthentication-NAK packets sent to this Dynamic Authorization Client. This includes the RADIUS Reauthentication-NAK packets sent with a Service-Type attribute value of Authorize Only, and the RADIUS Reauthentication-NAK packets sent because no session context was found.
NacksAuthOnlyRequests	Specifies the number of RADIUS Reauthentication-NAK packets that include a Service-Type attribute with a value of Authorize Only sent to this Dynamic Authorization Client.
NacksNoSess	Specifies the number of RADIUS Reauthentication-NAK packets sent to this Dynamic Authorization Client because no session context was found.
SessReauthenticated	Specifies the number of user sessions reauthenticated for the Reauthentication-Requests received from this Dynamic Authorization Client. Depending on site-specific policies, a single Reauthentication-Request can change the authorization of multiple user sessions. In cases where the Dynamic Authorization Server has no knowledge of the number of user sessions that are affected by a single request, each CoA-Request counts as a single affected user session.
Malformed	Specifies the number of malformed RADIUS Reauthentication-Request packets received from the Dynamic Authorization Client. Bad authenticators and unknown types are not included as malformed Reauthentication-Requests.

Name	Description
Dropped	Specifies the number of incoming Reauthentication packets from the Dynamic Authorization Client silently discarded by the server application for some reason other than malformed, bad authenticators, or unknown types.
BadAuths	Specifies the number of RADIUS Reauthentication-Request packets that contained an invalid Authenticator field received from the Dynamic Authorization Client.
UnknownTypes	Specifies the number of incoming requests that have an invalid ID type.

Display RADIUS CoA Statistics

About This Task

Use this procedure to display information about RADIUS CoA statistics.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS CoA**.
3. Select the **CoA Stats** tab.

CoA Stats Field Descriptions

Use the data in the following table to use the **CoA Stats** tab.

Name	Description
AddressType	Specifies the RADIUS Dynamic Authorization Client IP address type.
Address	Specifies the RADIUS Dynamic Authorization Client IP address.
DisconRequests	Specifies the number of RADIUS Disconnect-Requests received from this Dynamic Authorization Client. This also includes the Disconnect requests that have a Service-Type attribute with a value of Authorize Only.
DisconAuthOnlyRequests	Specifies the number of RADIUS Disconnect-Requests that include a Service-Type attribute with value Authorize Only received from this Dynamic Authorization Client.
DupDisconRequests	Specifies the number of duplicate RADIUS Disconnect-Request packets received from this Dynamic Authorization Client.

Name	Description
DisconAcks	Specifies the number of RADIUS Disconnect-ACK packets sent to this Dynamic Authorization Client.
DisconNaks	Specifies the number of RADIUS Disconnect-ACK packets sent to this Dynamic Authorization Client. This includes the RADIUS Disconnect-ACK packets sent with a Service-Type attribute value of Authorize Only, and the RADIUS Disconnect-ACK packets sent because no session context was found.
DisconNakAuthOnlyRequests	Specifies the number of RADIUS Disconnect-NAK packets that include a Service-Type attribute with a value of Authorize Only sent to this Dynamic Authorization Client.
DisconNakSessNoContext	Specifies the number of RADIUS Disconnect-NAK packets sent to this Dynamic Authorization Client because no session context was found.
DisconUserSessRemoved	Specifies the number of user sessions removed for the Disconnect-Requests received from this Dynamic Authorization Client. Depending on site-specific policies, a single Disconnect-Request can change the authorization of multiple user sessions. In cases where the Dynamic Authorization Server has no knowledge of the number of user sessions that are affected by a single request, each Disconnect-Request counts as a single affected user session.
MalformedDisconRequests	Specifies the number of malformed RADIUS Disconnect-Request packets received from the Dynamic Authorization Client. Bad authenticators and unknown types are not included as malformed Disconnect-Requests.
UnknownTypes	Specifies the number of incoming requests that have an invalid ID type.

RADSec Configuration Using EDM

This section contains procedures to configure RADSec with Enterprise Device Manager (EDM).

Configure a RADIUS Secure Profile using Manual Certificates

Configure RADIUS secure profiles with certificate information, certificate key information, and password information, which enables RADSec peers to establish connections.

About This Task

A new profile directory is created for each new profile in the `/intflash/.radsec/profile/radsec` directory. Profile configuration file "profile_info.cfg" is available in `/intflash/.radsec/profile` directory.

Note

All the files (certificates and keys) must be in .pem format and you must copy them to the `/intflash` directory.

You can configure a maximum of 10 RADSec profiles.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **Secure Certificate Profile** tab.
4. Select **Insert**.
5. For **Name**, enter the name for the profile.
6. For **RootCert**, enter the full path for the profile root certificate.
7. For **Cert**, enter the full path for the profile certificate.
8. For **Key**, enter the full path for the profile private key.
9. For **Password**, enter the password for the profile private key.
10. For **RootCertDestFile**, enter the file name to use when installing the root certificate.
11. For **CertDestFile**, enter the file name to use when installing the certificate.
12. For **KeyDestFile**, enter the file name to use when installing the key.
13. Select **Insert**.

Secure Certificate Profile Field Descriptions

Use the data in the following table to use the **Secure Certificate Profile** tab.

Name	Description
Name	Specifies the profile name.
RootCert	Specifies the full path of the profile root certificate. This parameter applies to certificates you install and manage manually.
Cert	Specifies the full path of the profile certificate. This parameter applies to certificates you install and manage manually.

Name	Description
Key	Specifies the full path of the profile private key. This parameter applies to certificates you install and manage manually.
Password	Specifies the password used to decrypt the profile private key.
RootCertDestFile	Specifies the file name to use when installing the root certificate. This parameter applies to certificates you install and manage manually.
CertDestFile	Specifies the file name to use when installing the certificate. This parameter applies to certificates you install and manage manually.
KeyDestFile	Specifies the file name to use when installing the key. This parameter applies to certificates you install and manage manually.

RADIUS Attributes

[Vendor Specific Attributes](#) on page 3108

[IETF Attributes](#) on page 3133

The following topics list RADIUS attributes for EAP.

Vendor Specific Attributes

RADIUS Vendor Specific Frame Format

The following figure shows the frame format for RADIUS vendor specific attributes (VSA).

Figure 205: RADIUS vendor-specific frame format

FA-VLAN-ISID

On EAP-enabled Flex-UNI ports, the context for the authenticating MAC is the association using the FA-VLAN-ISID attribute. This attribute provides one VLAN:ISID binding.

- defined under vendor IDs 562 and 1584 and uses the value 171
- I-SID values are 0-15999999
- VLAN values are 0 - 4096 to create untagged S-UNIs in MHSA mode and MAC-BasedS-UNIs in MHMV mode
- RADIUS server provides up to 94 bindings
- for MHMV with multiple bindings, only the last binding is created

FA-Client-Type

This attribute is used in packets transmitted to the RADIUS server to inform that the current authenticated MAC is associated to a FA Client of type x. This attribute is defined under Nortel vendor id (562) and uses the value 182.

Only one FA Client per port is supported.

The following values are defined for FA Client type:

- 0: FA Element Not Found
- 1: FA Element Type Other
- 2: FA Server
- 3: FA Proxy
- 4: FA Server No Authentication
- 5: FA Proxy No Authentication
- 6: FA Client Wireless AP Type 1 [clients direct network attachment]
- 7: FA Client Wireless AP Type 2 [clients tunneled to controller]
- 8: FA Client Switch
- 9: FA Client Router
- 10: FA Client IP Phone
- 11: FA Client Camera
- 12: FA Client IP Video
- 13: FA Client Security Device
- 14: FA Client Virtual Switch
- 15: FA Client Server Endpoint
- 63: FA Client Unknown

Any integer value provided by the FA is sent to the RADIUS server without any check from the EAP application.

Extreme-Dynamic-MHSA

On EAP-enabled Flex UNI ports, this attribute changes the current interface EAPoL operating mode from MHMV to MHSA.

- defined under Extreme Networks vendor ID 1916 and uses the value 250
- parsed only on ports with Flex-UNI enabled
- value contained in this attribute must be 1

Extreme-Dynamic-ACL

See the following sections:

- [Introduction](#) on page 3110
- [Examples](#) on page 3112
- [List Parameter](#) on page 3112
- [List Examples](#) on page 3113
- [Shortened Syntax](#) on page 3114
- [Shortened Syntax Example](#) on page 3116

Introduction

This attribute assigns a dynamic ACL for an EAP-enabled port. The dynamic behavior of the ACL depends on the EAP port state (MHMV or MHSA).

This VSA is defined under Extreme Networks vendor ID 1916 and uses the value 251. The VSA must configure the following keywords in order:

Note

This requirement does not apply when you configure the default-action.

1. **CLIENT**—Each group of Extreme-Dynamic-ACL messages must begin with a **CLIENT** **<client_name>** command to identify the EAP client.
2. **acl**—Create an ACL for the client. The port type is mandatory (outPort or inPort) but the name is optional. Packet type (pktType) supports only nonipv6.
3. **ace**—Create ACEs to add rules to the ACL. Separate each rule by an ampersand (&). You must specify an ACE action and if the ACE is a security or QoS ACE.

The following tables identify the support differences between CLI and VSA, and show how to transform a CLI command to VSA.

Table 243: Support differences

Filter component	CLI	VSA
ACL type	inVlan inPort outPort inVsn	inPort outPort
Packet type	IPv4 IPv6	IPv4 (nonipv6)

Table 243: Support differences (continued)

Filter component	CLI	VSA
Default actions	permit deny control-packet-action policer	permit deny control-packet-action
ACE type	ARP Ethernet IP IPv6 protocol policer	ARP Ethernet IP protocol

Table 244: CLI to VSA transformation

CLI	VSA	Notes
<code>filter acl <1-2048> type { inPort outPort } [name <name>]</code>	<code>acl type { inPort outPort } [name <name>]</code>	ACL creation If you do not provide a name, then the implicit ACL name is EAP-MHMOV-<port> or EAP-MHSA-<port>.
<code>filter acl set <1-2048> {default- action {permit deny [control-packet- action]]} global- action { monitor-dst- mlt monitor-dst- ports} }</code>	<code>acl set {default-action {permit deny [control- packet-action]]} global-action { monitor-dst-mlt monitor-dst-ports} }</code>	ACL global configuration
<code>filter acl ace <1-2048> <1-2000> [name WORD<0-32>]</code>	<code>ace <number> qos sec</code>	ACE creation The ACE name is automatically created as HostName-Rule<ACE ID>.
<code>filter acl ace {arp ethernet ip protocol } <1-2048> <1-2000> <options></code>	<code>ace <number> qos sec {arp ethernet ip protocol } <options></code>	ACE qualifiers

Examples

The following examples provide a RADIUS configuration, followed by the VSA syntax for the same configuration. This example is for MAC 0a:0a:0a:0a:0a:0a on port 1/1 and EAP is in MHMV mode.

Note

Count is automatically added to the ACE even if you do not specify it explicitly.

```
filter acl 1 type inPort
filter acl port 1 1/1

filter acl ace 1 1 name RadiusGuest-Rule01
filter acl ace ethernet 1 1 src-mac eq 0a:0a:0a:0a:0a:0a
filter acl ace ethernet 1 1 ether-type eq 0x800
filter acl ace ip 1 1 ip-protocol-type eq 17
filter acl ace protocol 1 1 dst-port eq 53
filter acl ace 1 1 action permit count
filter acl ace 1 1 enable

filter acl ace 1 2 name RadiusGuest-Rule02
filter acl ace ethernet 1 2 src-mac eq 0a:0a:0a:0a:0a:0a
filter acl ace ethernet 1 2 ether-type eq 0x800
filter acl ace ip 1 2 dst-ip mask 192.0.2.1 24
filter acl ace 1 2 action permit count
filter acl ace 1 2 enable

filter acl ace 1 3 name RadiusGuest-Rule03
filter acl ace ethernet 1 3 src-mac eq 0a:0a:0a:0a:0a:0a
filter acl ace 1 3 action deny count
filter acl ace 1 3 enable
```

The RADIUS VSA does not specify the MAC nor the port number because they are already known at the EAP level.

```
Extreme-Dynamic-ACL = "CLIENT RadiusGuest",
Extreme-Dynamic-ACL += "acl inPort",
Extreme-Dynamic-ACL += "ace 1 sec ethernet ether-type eq 0x800 & ip ip-protocol-type eq 17 & protocol dst-port eq 53 action permit count",
Extreme-Dynamic-ACL += "ace 2 sec ethernet ether-type eq 0x800 & ip dst-ip mask 192.0.2.1 24 action permit count",
Extreme-Dynamic-ACL += "ace 3 sec action deny count"
```

The following ACE syntax example provides the ability to remark DSCP value for IP traffic (0x800):

```
Extreme-Dynamic-ACL = "ace 1 qos action permit internal-qos 5 remark-dot1p 5 remark-dscp phbaf41 & ethernet ether-type eq 0x800",
Extreme-Dynamic-ACL += "acl set default-action permit"
```

For more information and additional examples, see [RADIUS Dynamic User-Based Policies](#) on page 1023.

List Parameter

You can use the list parameter with the Extreme-Dynamic-ACL RADIUS VSA to increase the number of ACEs sent in a RADIUS response packet, which can only be 4,096 bytes long. Use the list parameter to group ACE match values like ports and masks when the rest of the ACE match criteria is common.

For example, if you need to create 10 ACLs for different destination ports, rather than create 10 individual VSAs with almost identical syntax, you can create one VSA using the list parameter to group the destination ports, separating each port in the list with a comma. For illustration purposes, see [List Examples](#).

Each Extreme-Dynamic-ACL can use only one list parameter.

List Examples

The following examples provide both the list and expanded syntax for the same configuration.

In the following table, the expanded syntax configures three ACEs, each for a specific destination port, that are then combined into one syntax statement by using the list parameter to group the different destination ports.

Table 245: Port list comparison

Expanded syntax	List syntax
Extreme-Dynamic-ACL += 'ace 1 ethernet ether-type equal ip & ip ip-protocol-type eq tcp & protocol dst-port equal 37 & action permit count', Extreme-Dynamic-ACL += 'ace 2 ethernet ether-type equal ip & ip ip-protocol-type eq tcp & protocol dst-port equal 38 & action permit count', Extreme-Dynamic-ACL += 'ace 3 ethernet ether-type equal ip & ip ip-protocol-type eq tcp & protocol dst-port equal 1427 & action permit count',	Extreme-Dynamic-ACL += 'ace 1 ethernet ether-type equal ip & ip ip-protocol-type eq tcp & protocol dst-port equal list 37, 38, 1427 & action permit count',

In the following table, the expanded syntax configures six ACEs, each for a specific source mask, that are then combined into one syntax statement by using the list parameter to group the different source masks.

Table 246: Mask list comparison

Expanded	List
<pre>Extreme-Dynamic-ACL += 'ace 1 ethernet ether-type equal ip & ip-protocol-type equal tcp & protocol source mask 9100 0xFFFFC & ip dst mask 172.16.0.0 12 & action permit count', Extreme-Dynamic-ACL += 'ace 2 ethernet ether-type equal ip & ip-protocol-type equal tcp & protocol source mask 9220 0xFFFFE & ip dst mask 172.16.0.0 12 & action permit count', Extreme-Dynamic-ACL += 'ace 3 ethernet ether-type equal ip & ip-protocol-type equal tcp & protocol source mask 9290 0xFFFFE & ip dst mask 172.16.0.0 12 & action permit count', Extreme-Dynamic-ACL += 'ace 4 ethernet ether-type equal ip & ip-protocol-type equal tcp & protocol source mask 49152 0xC000 & ip dst mask 172.16.0.0 12 & action permit count', Extreme-Dynamic-ACL += 'ace 5 ethernet ether-type equal ip & ip-protocol-type equal tcp & protocol source mask 800 0xFFFF8 & ip dst mask 172.16.0.0 12 & action permit count', Extreme-Dynamic-ACL += 'ace 6 ethernet ether-type equal ip & ip-protocol-type equal tcp & protocol source mask 808 0xFFFFE & ip dst mask 172.16.0.0 12 & action permit count',</pre>	<pre>Extreme-Dynamic-ACL += 'ace 1 ethernet ether-type equal ip & ip-protocol-type equal tcp & protocol source mask list 9100 0xFFFFC, 9220 0xFFFFE, 9290 0xFFFFE, 49152 0xC000, 800 0xFFFF8, 808 0xFFFFE & ip dst mask 172.16.0.0 12 & action permit count',</pre>

Shortened Syntax

The previous section explains how you can increase the number of ACEs the RADIUS server sends in a single RADIUS response. You can further reduce the character count of the syntax statements by using the same shortened command form used with [CLI Autocompletion](#) on page 187.

Use a shortened syntax to automatically fill in the unique parts of a command string rather than typing the entire command. Use the CLI to determine the appropriate shortened form for each command argument.

The same letter or letter combination can represent many arguments depending on the context of the preceding argument. For example, **r** is both **routed-only** and **routing-type** in the following CLI command completion examples:

```
Switch:1(config)#filter acl ace ip 1 1 r<TAB>
Switch:1(config)#filter acl ace ip 1 1 routed-only

#OR
```

```
Switch:1(config)#filter acl ace protocol 1 1 r<TAB>  
Switch:1(config)#filter acl ace protocol 1 1 routing-type
```

**Note**

Keep in mind that new releases can modify or add commands, which means the uniqueness for command completion can change. If another argument that begins with the letters **ro** is added under the **protocol** argument, **r** is no longer unique to routing-type.

Shortened Syntax Example

The following example illustrates how the list argument used with the CLI shortened syntax can reduce the character count. The full syntax is first reduced by using the list argument, and then further reduced with CLI shortened syntax.

Table 247: List and Shortened syntax example

Syntax	Character count
<pre>Extreme-Dynamic-ACL += "ace 13 ethernet ether-type equal 0x800 & ip ip-protocol- type equal tcp & protocol dst-port equal 5672 & action permit", Extreme-Dynamic-ACL += "ace 14 ethernet ether-type equal 0x800 & ip ip- protocol-type equal tcp & protocol dst- port equal 9734 & action permit", Extreme-Dynamic-ACL += "ace 15 ethernet ether-type equal 0x800 & ip ip- protocol-type equal tcp & protocol dst- port equal 1500 & action permit", Extreme-Dynamic-ACL += "ace 16 ethernet ether-type equal 0x800 & ip ip- protocol-type equal tcp & protocol dst- port equal 4000 & action permit", Extreme-Dynamic-ACL += "ace 17 ethernet ether-type equal 0x800 & ip ip- protocol-type equal tcp & protocol dst- port equal 3306 & action permit", Extreme-Dynamic-ACL += "ace 18 ethernet ether-type equal 0x800 & ip ip- protocol-type equal tcp & protocol dst- port equal 7000 & action permit", Extreme-Dynamic-ACL += "ace 19 ethernet ether-type equal 0x800 & ip ip- protocol-type equal tcp & protocol dst- port equal 5001 & action permit",</pre>	819
<pre>Extreme-Dynamic-ACL += "ace 13 ethernet ether-type equal 0x800 & ip ip-protocol- type equal tcp & protocol dst-port equal list 5672,9734,1500,4000,3306,7000,5001 & action permit",</pre>	152
<pre>Extreme-Dynamic-ACL += "ace 13 et e eq 0x800 & ip ip-p eq tcp & pr d eq list 5672,9734,1500,4000,3306,7000,5001 & action permit",</pre>	103

Introduction

This VSA configures port- and VLAN-based attributes.

- Name: Extreme-Dyn-Config
- Value: 252
- Type: String
- Vendor: Extreme Networks
- Extreme Networks Vendor ID is 1916

The following features can be configured using Extreme-Dynamic-Config RADIUS VSA:

- VLAN-based features:
 - DHCP Snooping
 - Dynamic ARP Inspection (DAI)
 - IGMP Snooping
 - IGMP version 3 (IGMPv3)
 - IGMP Fast Leave
- Port-based features:
 - Custom Auto-Negotiation Advertisements (CANA)
 - Bridge Protocol Data Unit (BPDU) Guard
 - IP Source Guard (IPSG)
 - Port bounce
 - Re-authentication

- Simple Loop Prevention Protocol (SLPP) Guard
- Traffic Control (Wake on LAN - WoL)

**Note**

If you use the Extreme-Dynamic-Config RADIUS VSA, then Dynamic ARP Inspection and DHCP Snooping are only enabled on the default VLAN if IPSP is present in the RADIUS attributes.

AN-ADVERTISEMENTS:100Half or AN-ADVERTISEMENTS:100H

AN-ADVERTISEMENTS:100Half or AN-ADVERTISEMENTS:100H settings configure CANA speed and duplex to the following supported values:

- 10Half
- 100Full
- 100Half
- 100Full
- 1000Full

BPDUGUARD

This attribute enables BPDU Guard on the port where the client resides.

DAI

This attribute enables DAI on the VLAN received from the RADIUS server. For a Flex-UNI port, DAI is enabled on the platform VLAN associated with the I-SID received from the RADIUS server.

DAI is also enabled on the default VLAN of the port to prepare for IPSP, which requires DAI and DHCP Snooping enabled on all VLANs. If the RADIUS server does not return a VLAN of I-SID, DAI is enabled on the default VLAN. For Flex-UNI ports, DAI is enabled on the platform VLAN associated with the untagged I-SID.

**Note**

If you use the Extreme-Dynamic-Config RADIUS VSA, then DAI is only enabled on the default VLAN if IPSP is present in the RADIUS attributes.

DHCP Snooping

This attribute enables DHCP Snooping on the VLAN received from the RADIUS server. For a Flex-UNI port, DHCP Snooping is enabled on the platform VLAN associated with the I-SID received from the RADIUS server.

DHCP Snooping is also enabled on the default VLAN of that port to prepare for IPSP, which requires DAI and DHCP Snooping enabled on all VLANs. If the RADIUS server does not return a VLAN of I-SID, DHCP Snooping is enabled on the default VLAN. For

Flex-UNI ports, DHCP Snooping is enabled for the platform VLAN associated with the untagged I-SID.

**Note**

If you use the Extreme-Dynamic-Config RADIUS VSA, then DHCP Snooping is only enabled on the default VLAN if IPSPG is present in the RADIUS attributes.

IGMPSNOOP

This attribute enables IGMP Snooping on the VLAN received from the RADIUS server. For a Flex-UNI port, IGMP Snooping is enabled on the platform VLAN associated with the I-SID received from the RADIUS server.

IGMPV3

This attribute enables IGMP version 3 on the VLAN specified by the RADIUS server. If IGMP Snooping is enabled on that VLAN, the IGMP version settings provided by the RADIUS VSA apply to the same VLAN interface. For a Flex-UNI port, IGMPv3 is enabled on the platform VLAN associated with the I-SID received from the RADIUS server. Applying this attribute disables IGMP Fast Leave (if previously enabled) and enables IGMPv3 compatibility mode.

IGMPFAST

This attribute enables IGMP Fast Leave on the VLAN specified by the RADIUS server. If IGMP Snooping is enabled on that VLAN, the IGMP Fast Leave settings provided by the RADIUS VSA apply to the same VLAN interface. For a Flex-UNI port, IGMP Fast Leave is enabled on the platform VLAN associated with the I-SID received from the RADIUS server. With IGMPv2, Fast Leave is enabled; with IGMPv3, Fast Leave is enabled along with explicit host tracking.

IPSG

This attribute enables IPSG on the port where the client resides.

In order to apply IPSG, DHCP Snooping and DAI must be configured on the RADIUS server. DHCP Snooping and DAI must be enabled on all VLANs.

The following is an example of a log message that displays if a setting is not configured correctly:

```
GlobalRouter EAP WARNING Cannot apply Radius IP Source Guard attribute
on port 1/15 without DHCP Snooping and DAI attributes.
```

PORTBOUNCE

This attribute runs a port bounce on an EAP port including Power over Ethernet (PoE), if capable. Current EAP sessions are preserved during the port bounce process.

Use this attribute for on-demand re-authentication, for example, to use a power cycle to trigger a port bounce for a PC behind a phone, which is being rebooted, as in the following use cases:

- To ensure a PC behind a phone acquires an IP address from the VLAN or I-SID assigned by the RADIUS server, the PC triggers a new DHCP negotiation if it receives the port-bounce attribute in the RADIUS-Accept packet.
- To force a client to renew its DHCP IP address by using a RADIUS dynamic Change-of-Authorization (CoA) or Disconnect request.

CLI and EDM output that displays the interface state indicates if a port is down because of a RADIUS VSA port bounce.

REAUTH or REAUTH:100

This attribute enables EAPOL re-authentication on a port either manually using CLI or dynamically through RADIUS. The origin identifies how re-authentication was configured, either CONFIG or RADIUS.

SLPPGUARD or SLPPGUARD:<xxxxxx>

This attribute enables SLPP Guard on the port where the client resides. You can configure a timer to enable the port only after the timer expires. The default timer value is 60 seconds.

WOL

This attribute enables EAP traffic-control (Wake On LAN) on the port where the client resides.

Session Timeout and Re-authentication VSA Behavior

Session	REAUTH status	Cause
EAP Session	Without REAUTH VSA	On MAC age out. Note: Session timeouts if the client is not connected.
	With REAUTH VSA	On periodically timer and MAC age out.

Session	REAUTH status	Cause
NEAP Session	Without REAUTH VSA	On MAC age out.
	With REAUTH VSA	Useful for silent devices, session stays active despite MAC age out. Session is removed only by manual intervention or RADIUS reject/timeout. Note: The same command activates both EAP and NEAP re-authentication. If re-authentication is needed for EAP, NEAP re-authentication for silent devices is automatically activated.

Command	Level	Processing	Configuration	Prerequisites
Session-timeout	per session basis.	Changes the reauth interval for a particular session.	none.	Enable port level re-authentication.
VSA (REAUTH:300 or REAUTH)	per port basis.	Changes the port configuration.	Enable re-authentication and configure interval. Caution: Configure the re-authentication period value to 0 to prevent EAP or NEAP sessions from aging out. Preventing re-authentication can introduce a security risk.	none.

Expected Behavior for DHCP Snooping and DAI Vendor Specific Attributes

The following table shows the behavior for Dynamic Host Configuration Protocol Snooping (DHCP Snooping) and Dynamic ARP Inspection (DAI) Vendor Specific Attributes (VSA) for each authentication scenario, depending on Extensible

Authentication Protocol (EAP) Operational mode, Flex-UNI mode, and IP Source Guard (IPSG) VSA or RADIUS VLAN/I-SID.

Table 248: Expected Behavior for DHCP Snooping and DAI VSAs

EAP Operational Mode	IPSG VSA received	Flexi-UNI	RADIUS VLAN/I-SID	DHCP Snooping and DAI VSA received
Mutiple Host Single Authentication (MHSA)	Yes	Yes	Yes	DHCP, DAI, and IPSG enabled on all associated Platform VLANs.
MHSA	Yes	Yes	No	DHCP, DAI, and IPSG enabled on all associated Platform VLANs.
MHSA	Yes	No	Yes	DHCP, DAI, and IPSG enabled on all associated Platform VLANs.
MHSA	Yes	No	No	DHCP, DAI, and IPSG enabled on all associated Platform VLANs.
MHSA	No	Yes	Yes	DHCP and DAI enabled on Platform VLAN associated with RADIUS I-SIDs.
MHSA	No	Yes	No	DHCP and DAI enabled on all static Platform VLANs.
MHSA	No	No	Yes	DHCP and DAI enabled on received RADIUS VLAN.
MHSA	No	No	No	DHCP and DAI enabled on default VLAN.
Mutiple Host Multiple VLAN (MHMV)	Yes	Yes	Yes	DHCP, DAI, and IPSG enabled on Platform VLAN associated with RADIUS I-SID and Platform VLAN associated with untagged I-SID.
MHMOV	Yes	Yes	No	DHCP, DAI, and IPSG enabled on Platform VLAN associated with untagged I-SID.
MHMOV	Yes	No	Yes	DHCP, DAI, and IPSG enabled on RADIUS VLAN and default VLAN.
MHMOV	Yes	No	No	DHCP, DAI, and IPSG enabled on default VLAN.
MHMOV	No	Yes	Yes	DHCP and DAI enabled on Platform VLAN associated with RADIUS I-SID.

Table 248: Expected Behavior for DHCP Snooping and DAI VSAs (continued)

EAP Operational Mode	IPSG VSA received	Flexi-UNI	RADIUS VLAN/I-SID	DHCP Snooping and DAI VSA received
MH MV	No	Yes	No	DHCP and DAI enabled on Platform VLAN associated with untagged I-SID.
MH MV	No	No	Yes	DHCP and DAI enabled on received RADIUS VLAN.
MH MV	No	No	No	DHCP and DAI enabled on default VLAN.
Note: If no RADIUS VLAN or Platform VLAN is associated with RADIUS I-SID, DHCP Snooping and DAI are enabled on the default VLAN or Platform VLAN associated with static untagged I-SID.				

Expected Behavior of IGMPV3 and IGMPFAST Vendor Specific Attributes

The following table shows the expected behavior of IGMPV3 and IGMPFAST Vendor Specific Attributes for each authentication scenario, depending on Extensible Authentication Protocol (EAP) and the attributes returned by the RADIUS server.

Table 249: Expected Behavior of IGMPV3 and IGMPFAST Vendor Specific Attributes

Mode	Port type	Condition	Action
MH MV	Regular port	VLAN attribute received from RADIUS	Apply IGMP VSA on that VLAN
MH MV	Regular port	No VLAN attribute received	Apply IGMP VSA on the default VLAN
MH MV	Flex-UNI port	I-SID attribute received from RADIUS	Apply IGMP VSA on the associated platform VLAN
MH MV	Flex-UNI port	No I-SID attribute received	Apply IGMP VSA on the platform VLAN associated with the default untagged I-SID
MH SA	Regular port	One or more VLAN attributes received from RADIUS	Apply IGMP VSA on only one VLAN (usually the last one received)
MH SA	Regular port	No VLAN attribute received	Apply IGMP VSA on the default VLAN

Table 249: Expected Behavior of IGMPV3 and IGMPFAST Vendor Specific Attributes (continued)

Mode	Port type	Condition	Action
MHSA	Flex-UNI port	One or more I-SID attributes received from RADIUS	Apply IGMP VSA on all platform VLANs associated with those I-SIDs
MHSA	Flex-UNI port	No I-SID attribute received	Apply IGMP VSA on all VLANs that contain the client port

Extreme-Dynamic-Config Operational Considerations

Consider the following when you use port and VLAN based attributes.

General Considerations

Only attributes that can be configured manually can be configured dynamically using EAP.

Dynamic cleanup is supported. When the last client to authenticate using a dynamic attribute is removed, the following dynamic attributes are also removed:

- Dynamic ARP Inspection (DAI)
- DHCP Snooping
- IGMP Snooping
- IP Source Guard
- Re-authentication

However, the following attributes can only be removed by disabling EAP:

- SLPP Guard
- BPDU Guard
- Traffic Control (Wake on LAN)
- Custom Auto-Negotiation Advertisements

VLAN-Based Features

- DHCP Snooping Option 82 is not supported.
- IGMP Snooping is not supported on a DvR Leaf.
- If multiple client authentication is permitted in MHMV mode, you can apply RADIUS attributes incrementally as subsequent clients authenticate.

If a client authenticates with DHCP Snooping, DAI, and IP Source Guard attributes on the VLAN and a second client attempts to authenticate with the same attributes, the following occurs:

- If the second client uses the same VLAN as the first client, only IP Source Guard applies on the RADIUS configuration port.

- If the second client uses a different VLAN, DHCP Snooping and DAI apply on the VLAN and the IP Source Guard applies on the RADIUS configuration port.
-  **Note**
The following consideration only applies if IP Source Guard is received from the RADIUS server. Otherwise DHCP Snooping and Dynamic ARP Inspection (DAI) is enabled based on the behavior described in [Expected Behavior for DHCP Snooping and DAI Vendor Specific Attributes](#) on page 3121.

If you configure a port in Multiple Host Single Association (MHSA) mode and VLAN based attributes are received from the RADIUS server, features are enabled on the default VLAN and on all VLANs that contain the authentication port.

Port-Based Features

- Configuring Custom Auto-Negotiation Advertisements (CANA) on a port triggers a port bounce, which generates new client authentication.
- Disconnect requests execute a disconnect command for the client. If the PORTBOUNCE attribute is included, then it only performs a port bounce.
- Re-authenticate requests execute a re-authentication of the client. These requests can include all attributes.
- Change-of-Authorization (CoA) requests perform the change of authorized configuration for the supported attributes. If the PORTBOUNCE attribute is included, then it only performs a port bounce.
- On Flex-UNI ports, if the I-SID received from the RADIUS server does not have a platform VLAN associated with it, attributes are not applied. When a platform VLAN is associated with the I-SID, EAP re-authentication is generated to apply the attribute by bouncing a port, bouncing EAP on a port, or by using CoA Re-authenticate.
- IP Source Guard restrictions apply even if the feature is configured on the RADIUS server.
 - Maximum 10 entries per port
 - Maximum 1000 entries per server
 - DHCP Snooping and DAI must be enabled on all VLAN members of the RADIUS configured port.
- If you configure a Guest VLAN on a port and the RADIUS server returns IP Source Guard as a result of EAP or NEAP authentication, then you should manually remove static VLANs from that port. Alternatively, you can enable DHCP Snooping and DAI on static VLANs.
- If you configure a port with multiple platform VLANs and the RADIUS server returns IP Source Guard as a result of EAP/NEAP authentication, then you must manually configure DHCP Snooping and DAI on static platform VLANs.

The re-authentication flag and re-authentication period attributes origin can be either CONFIG or RADIUS. Different origins for re-authentication flag and re-authentication period attributes are valid:

- You can configure the re-authentication flag with or without a time interval in CLI or RADIUS VSA. If you do not specify a time interval when you enable re-authentication on a port from RADIUS, the re-authentication period origin does not change.
- If a RADIUS client specifies the same value as the one that already exists in static configuration through CLI, the origin remains as CONFIG.
- If you enable re-authentication through CLI and you configure a specific period using the *re-authentication-period <0, 60-65535>* command, the origin is CONFIG.

The following message displays to indicate that RADIUS clients use the configuration:

```
WARNING: Setting used by Radius Client. Are you sure you want to
continue? (y/n)?
```

If the re-authentication period attribute was configured with the re-authentication flag through RADIUS VSA, the origin is RADIUS.

When you change the re-authentication period attribute in CLI, the following message displays to indicate that the origin of this parameter is RADIUS.

```
WARNING: Current port reauth period has RADIUS origin. Are you sure
you want to continue? (y/n)?
```

Changing a parameter in CLI that was originally configured using RADIUS, changes the origin to CONFIG.

For more information, see [Extreme-Dynamic-Config](#) on page 3116.

Extreme-Dynamic-Config Examples

The following example enables DHCP Snooping and Dynamic ARP Inspection (DAI) on VLAN 100 and IP Source Guard on authentication port:

```
Auth-Type := Local
User-Password == "000000000001"
Service-Type = Administrative-User
Tunnel-Type = VLAN
Tunnel-Medium-Type = IEEE-802
Tunnel-Private-Group-Id = 100
Extreme-Dynamic-Config = "DHCP Snooping"
Extreme-Dynamic-Config += "DAI"
Extreme-Dynamic-Config += "IPSG"
```

The following example configures the Custom Auto-Negotiation Advertisements (CANAs) to 100Half on authentication port:

```
Auth-Type := Local
User-Password == "000000000008"
Service-Type = Administrative-User
Extreme-Dynamic-Config = "AN-ADVERTISEMENTS:100H"
```

The following example enables BPDU Guard on authentication port:

```
Auth-Type := Local
User-Password == "00000000000006"
Service-Type = Administrative-User
Extreme-Dynamic-Config = "BPDU"
```

The following example enables DHCP Snooping and DAI on the platform VLAN associated with I-SID 10000 and IP Source Guard on authentication port:

```
Auth-Type := Local
User-Password == "00000000000002"
Service-Type = Administrative-User
Fabric-Attach-ISID = "0:10000"
Extreme-Dynamic-Config = "DHCP Snooping"
Extreme-Dynamic-Config += "DAI"
Extreme-Dynamic-Config += "IPSG"
```

The following example enables IGMP Snooping on VLAN 100:

```
Auth-Type := Local
User-Password == "00000000000003"
Service-Type = Administrative-User
Tunnel-Type = VLAN
Tunnel-Medium-Type = IEEE-802
Tunnel-Private-Group-Id = 100
Extreme-Dynamic-Config = "IGMP Snooping"
```

The following example enables IGMP Snooping platform VLAN associated with I-SID 10000:

```
Auth-Type := Local
User-Password == "00000000000004"
Service-Type = Administrative-User
Fabric-Attach-ISID = "0:10000"
Extreme-Dynamic-Config = "IGMP Snooping"
```

The following example enables reauthentication on a port without a configured time interval:

```
Auth-Type := Local
User-Password == "00000000000007"
Service-Type = Administrative-User
Extreme-Dynamic-Config = "REAUTH"
```

The following example enables reauthentication on a port with a configured time interval:

```
Auth-Type := Local
User-Password == "00000000000007"
Service-Type = Administrative-User
Extreme-Dynamic-Config = "REAUTH:1230"
```

The following examples enable SLPP Guard on authentication port:

```
Auth-Type := Local
User-Password == "00000000000007"
Service-Type = Administrative-User
Extreme-Dynamic-Config = "SLPPGUARD"

Auth-Type := Local
User-Password == "00000000000007"
```

```
Service-Type = Administrative-User
Extreme-Dynamic-Config = "SLPPGUARD:12345"
```

The following example enables EAP traffic-control on authentication port:

```
Auth-Type := Local
User-Password == "0000000000005"
Service-Type = Administrative-User
Extreme-Dynamic-Config = "WOL"
```

The following example triggers a PORTBOUNCE on the port that authenticates the user:

```
Auth-Type := Local, User-Password == "0000000000001"
Extreme-Dynamic-Client-Assignments += "create=vlan, pv=300, vni=100300",
Extreme-Dynamic-Config += "PORTBOUNCE"
```

Extreme-Dynamic-Client-Assignments

The Extreme-Dynamic-Client-Assignments Vendor Specific Attribute (VSA) is a RADIUS VSA for dynamic VLAN and Private VLAN (PVLAN) creation. You can also configure VLAN parameters, such as VLAN name, I-SID to VLAN association, I-SID name, I-SID to dynamic VRF association, and IGMP Querier address.

- Name: Extreme-Dynamic-Client-Assignments
- Value: 253
- Type: String
- Vendor: Extreme Networks
- Extreme Networks Vendor ID is 1916

The Extreme-Dynamic-Client-Assignments VSA supports the following VLAN-based features:

- IGMP Snooping
- DHCP Snooping
- Dynamic ARP Inspection (DAI)

Note

You can use Extreme-Dynamic-Config RADIUS VSA to configure the VLAN-based features.

Note the following points regarding VLAN creation with the Extreme-Dynamic-Client-Assignments VSA:

- Platform VLAN manual configuration—This maps the Extreme-Dynamic-Client-Assignments Radius VSA without `create`. Only the options used to define the existing functionality of mapping clients to VLAN on regular ports or `vlan:isid` on flex-uni ports are used—Primary VLAN (PV), Virtual Network Identifier (VNI), and Egress VLAN (EV). The Secondary VLAN (SV), VLAN Name (VN), and VNIN attributes for dynamic VLAN are ignored.
- Regular VLAN configuration—This maps the VSA with the option `create=vlan`. The Multiple Spanning Tree Protocol (MSTP) instance is 0. When platform VLAN is dynamically created, all VLAN parameters are also dynamically applied; a static VLAN

setting is not allowed. Dynamic platform VLANs and dynamic I-SIDs names exist as long as EAP clients reference them. If clients do not use them, then they are deleted and are not saved in the configuration file.

- PVLAN configuration—This maps with the usage of Extreme-Dynamic-Client-Assignments Radius VSA with the `create=pvlan` option. The EAP and Private VLANs on regular ports are not supported. But they are supported on flex-uni ports. The MSTP instance is 0. When you dynamically create a private VLAN, all VLAN parameters are also dynamically created; a static VLAN setting is not allowed. Dynamic PVLANS and dynamic I-SIDs names exist as long as EAP clients reference them. If clients do not use them, then they are deleted and are not saved in the configuration file.

Use the information in the following tables and this string format to create a dynamic VLAN:

```
create=vlan|pvlan|none, pv=Primary VLANID, sv=secondary VLANID,
vni=ISID, ev=EGRESS-VLAN-tag, vn=vlan-name, vnin=isid-name, mvni=ISID,
igmpqaddr=<IPv4 address>
```

Note

If `ev` is missing, it defaults to 0. You can also use `U` or `T` (case-sensitive). When `ev` is set to `U`, it is untagged or 0. When `ev` is set to `T`, it takes the value of `pv` or tagged. If `pv` is not specified, then an error occurs and the VSA is ignored.

Table 250: String Options for Dynamic VLAN Creation

Option	Description
<code>create=vlan pvlan none</code>	<p>If <code>create</code> is missing, the assumption is that a manually created VLAN exists. Note the following examples:</p> <ul style="list-style-type: none"> • <code>create=vlan</code>—dynamically creates a platform VLAN. • <code>create=pvlan</code>—dynamically creates a private VLAN. • <code>create=none</code>—dynamically uses an existing VLAN or PVLAN instead of creating a new one <p>This option is ignored on DvR Leafs.</p> <p>Note: <code>create</code> arguments are case sensitive.</p>
<code>pv=Primary VLANID</code>	<p>The platform VLAN that the client is assigned.</p> <p>This option is valid for any combination of the <code>create</code> command.</p>
<code>sv=Secondary VLANID</code>	<p>This option is only valid for a private VLAN and if the <code>create</code> option is used.</p>

Table 250: String Options for Dynamic VLAN Creation (continued)

Option	Description
vni=ISID	If you did not use <code>create</code> then you can use <code>vni</code> on flex-uni ports with <code>ev</code> to assign a client to a Switched UNI (S-UNI). The <code>vni</code> command also has the role of mapping the dynamic created VLAN to the VNI.
ev=EGRESS-VLAN-tag	Use this option on regular ports to tag or untag the egress for the PV. Use this option on flex-uni ports as <code>c-vid</code> in S-UNI creation.
vn=Vlan name	Valid only if you use <code>create</code> .
vnin=ISID name	Valid only if you use <code>create</code> .
mvni=ISID	Use this option to configure IP Multicast config-lite for Fabric Connect functionality. This option configures the I-SID value for the Layer 3 VSN VLAN and enables SPB Multicast on the VLAN. You can associate <code>mvni=ISID</code> to a dynamic or a static VLAN. For information about IP Multicast config-lite for Fabric Connect, see IP Multicast config-lite for Fabric Connect on page 1952.
igmpqaddr=<IPv4 address>	Use this option if the VLAN interface uses one of the following: <ul style="list-style-type: none"> IGMP Snooping—the switch configures the received IPv4 address as the IGMP Snooping Querier address and enables the IGMP Snooping Querier. Multicast Lite or Routed Multicast (Routed SPB)—the switch configures the received IPv4 address as the IGMP Routed SPB Querier address. The IGMP Querier address applies on the VLAN interface you specify in the <code>pv</code> argument.

Table 251: VSA Equivalency with Radius Attributes

Port Type	RADIUS Attribute	Extreme-Dynamic-Client-Assignments Radius VSA	Comment
Regular port	Tunnel Private GroupID	Without <code>create</code> . <code>pv=Primary VLANID</code>	This adds the port to the primary VLAN; tag is the port tag.
	Egress-VLANID	Without <code>create</code> .	Untagged: <code>ev = 0</code> .

Table 251: VSA Equivalency with Radius Attributes (continued)

Port Type	RADIUS Attribute	Extreme-Dynamic-Client-Assignments Radius VSA	Comment
		pv=Primary VLANID. ev= EGRESS-VLAN- tag	Tagged: ev = pv. This adds the port to the primary VLAN; The VLAN egress tag is dictated by the ev.
	Egress-VLAN-Name	Not Supported	
Flex-Uni ports	FA VLAN:ISID	Without create. vni=[ISID] ev= [EGRESS-VLAN- tag]	Untagged: ev = 0. Tagged: ev != 0. A S-UNI is created, either MAC-based or regular, depending on MHMV/MHSA setting; uses i-sid (vnid) and c-vid (ev) values.
	Egress-VLANID + FA VLAN:I-SID	Supported by the same combination for FA VLAN:ISID	
	Egress-VLANID + Tunnel Private GroupID + autoIsidOffset	Without create. pv=Primary VLANID. ev= EGRESS-VLAN- tag	Untagged: ev = 0. Tagged: ev != 0. A S-UNI is created, either MAC-based or regular, depending on MHMV/MHSA setting; uses auto configured i-sid from pv value and c-vid (ev) values.
	Egress-VLAN-Name + FA VLAN:I-SID >	Not supported	
	Egress-VLAN-Name + Tunnel Private GroupId + autoIsidOffset	Not supported	

The dynamic VLAN is deleted after you disconnect all of the clients across the Extensible Authentication Protocol (EAP) ports. The port is removed when the last client is disconnected and the saved I-SID name is restored.

You cannot delete a static VLAN if EAP ports are assigned to it. However, you can delete the VLAN if you have added EAP FlexUNI ports to it. This flushes all MAC addresses and deletes any Non-EAP (NEAP) sessions. The MAC address is re-learned in I-SID and a new RADIUS authentication can now create a dynamic VLAN. For EAP sessions, the session

moves to the re-authentication state, and the new RADIUS authentication can create a dynamic VLAN.

In Multiple Host Multiple VLAN (MHMV), if there are multiple assignments received for one session, the rule is to process only the last one and ignore the rest.

Operational Considerations

Consider the following when you use the Extreme-Dynamic-Client-Assignments Vendor Specific Attribute (VSA):

- Extreme-Dynamic-Client-Assignments takes precedence over FA-VLAN-ISID, EGRESS-VLAN-ID, EGRESS-VLAN-Name, and RAD_ATTR_TUNNEL_PRI_GROUP_ID.
- The RADIUS packet is limited to 4096 bytes, but can carry any VSA combination that does not exceed 4096 bytes. The Extreme-Dynamic-Client-Assignments VSA has a variable length and combinations can scale up to 94 VSAs in a packet. To reach 94 VSAs in a packet, each VSA should be about 40 bytes long.
- You cannot manually modify dynamic VLANs.
- You cannot use this VSA to dynamically create VLANs on a DvR Leaf node.
- Static VLAN configuration is only supported for IP Multicast config-lite for Fabric Connect functionality.
- MultiLink Trunk (MLT) and Split MultiLink Trunk (SMLT) ports are not supported.
- RADIUS Change-of-Authorization (CoA) and RADIUS Disconnect functions are not supported.

EAP-Port-Priority

Important

Configure these attributes only if you require dynamic port priority.

Port priority (vendor-specific) attributes:

- Vendor ID: value 562 (Nortel)

Note

Vendor ID 1916 (Extreme Networks) does not support port priority.

- Attribute Number: value 1, Port Priority
- Attribute Value: value 0 (zero) to 6 (this value indicates the port priority value assigned to the specified user)

The following list provides the switch Port Priority frame format:

- vendor specific type = 26
- length = 12
- vendor-id = 562
- string = vendor type = 1 + vendor length = 6 + attribute specific = priority

The following figure shows an example of the port priority frame format.

26	12	562	01	06	(0...6)
----	----	-----	----	----	---------

Figure 206: Port priority frame format

IETF Attributes

VLAN RADIUS Attributes

To control the tagging for traffic egressing a port, configure the preferred tagging option and one of the following attributes on the RADIUS server:

- EGRESS-VLAN-ID
- EGRESS-VLAN-NAME

VLAN attributes are defined by RFC 4675.

EGRESS-VLAN-ID

Functionality is combined with other RADIUS attributes and EAPoL configurations to create untagged S-UNIs.

This attribute supports the following combinations:

- untagged EGRESS-VLAN-ID + VLAN:ISID -> VLAN from S-UNI becomes untagged
- untagged EGRESS-VLAN-ID + vid[NEW_RADIUS_VID] + autolsidOffset -> create S-UNI for I-SID (VLAN+autolsidOffset)

Examples

From the RADIUS attributes, for untagged VLAN 15. The VLAN from S-UNI becomes untagged:

```
Egress-VLANID = "838860815" (untagged vlan 15)
Fabric-Attach-ISID += "15:23513"
```

The following example results in the value 0:1015 for creating an untagged S-UNI.

From the RADIUS attributes, for untagged VLAN 15 and RADIUS-assigned VLAN. Creates S-UNI for I-SID (VLAN+autolsidOffset):

```
Egress-VLANID = "838860815"
Tunnel-Private-Group-Id = "15"
```

From the EAP configuration:

```
eapol auto-isid-offset 1000
eapol auto-isid-offset enable
```

Considerations

Consider the following when using this attribute:

- Any combinations with EGRESS-VLAN-ID for a tagged VLAN are ignored.
- When EGRESS-VLAN-ID and VLAN:ISID binding attributes are used, the VLAN must have the same value.
- The RADIUS server can provide more than one VLAN:ISID binding but one must match the VLAN used in EGRESS-VLAN-ID to create an untagged S-UNI.
- Only one EGRESS-VLAN-ID attribute is used. If more than one is found in the packet, only the first one is used.
- If the untagged S-UNI is derived from EGRESS-VLAN-ID + VLAN-ID + VLAN attribute + auto-isid-offset, the packet must not contain any S-UNI bindings.

EGRESS-VLAN-NAME

Functionality is combined with other RADIUS attributes and EAPoL configurations to create untagged S-UNIs.

This attribute supports the following combinations:

- EGRESS-VLAN-ID + VLAN:I-SID
- EGRESS-VLAN-ID + VLAN + autolsidOffset

This attribute includes the following information:

- Egress-VLAN-Name = "1VLAN_NAME" for tagged VLAN
- Egress-VLAN-Name = "2VLAN_NAME" for untagged VLAN
- VLAN_NAME is the name of the VLAN on the switch

Example

The following example creates an untagged Switched UNI with I-SID 1000. VLAN 10 is named "Dummy_VLAN".

```
b0adaa41b830 Cleartext-Password := "b0adaa41b830"
Service-Type = Framed-User,
Framed-Protocol = PPP,
Auth-Type := Accept,
Fabric-Attach-ISID = "10:1000",
Egress-VLAN-name = "2Dummy_VLAN"
```

RADIUS Tunnel Attributes

The switch uses the RADIUS tunnel attributes to place a port into a particular VLAN to support dynamic VLAN switching based on authentication. The server must send these attributes together in the same RADIUS packet. If one attribute is missing, the switch ignores the others.

The RADIUS server indicates the desired VLAN by including the tunnel attribute within the Access-Accept message. RADIUS uses the following tunnel attributes for VLAN membership:

- RAD_ATTR_TUNNEL_TYPE(64)

Tunnel-Type: value 13, Tunnel-Type-VLAN

- RAD_ATTR_TUNNEL_MEDIUM_TYPE(65)

Tunnel-Medium-Type: value 6, Tunnel-Medium-Type-802

- RAD_ATTR_TUNNEL_PRI_GROUP_ID

Tunnel-Private-Group-ID: ASCII value 1-4094 (this value identifies the specified VLAN)

Tunnel attributes are defined by RFC 2868.

**Important**

Configure these attributes only if you require Dynamic VLAN membership.

The VLAN ID is 12 bits, uses a value from $\langle 1-4094 \rangle$, and is encoded as a string.

In addition, you can configure the RADIUS server to send a vendor-specific attribute (VSA) to configure port priority. You can assign the switch Supplicant port a QoS value from 0 to 6.

For more information, see [EAP-Port-Priority](#) on page 3132.

Representational State Transfer Configuration Protocol (RESTCONF)

[RESTCONF Configuration using EDM](#) on page 3143

[Use Representational State Transfer Configuration Protocol \(RESTCONF\) to Configure a Switch](#) on page 3145

[RESTCONF Operational Behavior Examples](#) on page 3147

Table 252: Representational State Transfer Configuration Protocol (RESTCONF) product support

Feature	Product	Release introduced
Representational State Transfer Configuration Protocol (RESTCONF)	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Representational State Transfer Configuration Protocol (RESTCONF) Fundamentals

Representational State Transfer Configuration Protocol (RESTCONF) is a next generation northbound interface that provides an additional way to configure and monitor the switch. RESTCONF is an HTTP-based protocol that provides a programmatic interface to access data defined in a YANG model using the datastore concepts defined in NETCONF. RESTCONF uses a client-server model. The server acts as an entry point to a datastore, a conceptual place to store and access information. Clients use HTTP or HTTPS to interface with the server to configure and monitor devices.

RESTCONF Client and Server

A typical RESTCONF interaction consists of an HTTP/HTTPS request sent by a RESTCONF client and an HTTP/HTTPS response sent by the server. The HTTP/HTTPS request and response contain a required set of expected HTTP headers and can also contain a request or response message body. The message body is encoded in JSON.

An HTTP request consists of the HTTP method (such as GET or POST) identifier, resource identifier, HTTP protocol version, HTTP headers, and HTTP body. The HTTP resource identifier is the string that identifies a service or resource that the server makes available to the client. The RESTCONF request contains the Universal Resource Identifier or URI which starts with `/rest/restconf/data/` or `/rest/restconf/operations/`.

YANG Model

YANG is the data modeling language used for modeling configuration and state data for manipulation by using remote procedure calls (RPCs). The RESTCONF interface is generated with YANG Data Model. The YANG model is based on Open config model, which is a non vendor specific model that captures the key components found in multiple vendor solutions. RESTCONF is described by the Internet Engineering Task Force (IETF) in RFC 8040.

RESTCONF Authentication

RESTCONF uses the CLI user account and supports both local and remote authentication. Local authentication uses the local CLI user account while remote authentication can use either a RADIUS or TACACS+ server.

You can only use a CLI account with the RWA access level.

With RADIUS or TACACS+ enabled, if the remote server is not available, authentication falls back to local authentication and uses the local CLI user on the switch.

When the RESTCONF client posts for authentication, the HTTP server validates the login user name and password if you have not enabled CLI remote authentication. If the remote server is not reachable, the HTTP server uses the local user for login validation.

For HTTPS access to the RESTCONF server, you must enable TLS and install a certificate. For the certificate, first you need to create a leaf certificate in .pem format and convert the private key to PKCS8 format. Then you need to create a .pem container that contains both the leaf certificate and the PCKS8 private key. The container will be used in the RESTCONF configuration and will have the following format:

```
-----BEGIN CERTIFICATE-----  
-----END CERTIFICATE-----  
-----BEGIN PRIVATE KEY-----  
-----END PRIVATE KEY-----
```

To install the certificate, copy your certificate and private key into the container between the appropriate BEGIN and END lines.

RESTCONF APIs

You can access the RESTCONF API documentation on your switch using the following URL:

`http(s)://<IP>:<tcp-port>/apps/restconfdoc/`

Replace <IP> with the management IP address of your switch and <tcp-port> with the TCP port configured for RESTCONF. For example, `http://192.0.2.16:8080/apps/restconfdoc/`.

The on-switch URL works only if you enable the RESTCONF feature on the switch.

You can also access the RESTCONF API documentation online through the Developer Center (<https://www.extremenetworks.com/support/documentation-api/>).

Server Support

The RESTCONF server in the network operating system (NOS) supports the following actions:

HTTP Action	VOSS Instrumentation
GET	Corresponds to SHOW
POST	Corresponds to SET for creation
PATCH	Corresponds to SET for modification
DELETE	Corresponds to SET for deletion

The following table details modules supported by RESTCONF:

Modules	
OpenConfig	Network Service
OpenConfig	Relay Agent (DHCP support)
OpenConfig	Interfaces Port: POE, port attributes, such as auto-sense, default-vlan-id, flex-uni, qos, untag-port-default-vlan
OpenConfig	Interfaces LAG: attributes, such as flex-uni
OpenConfig	Platform: ports, CPU, fans, power supply, optical devices - GET operations only
OpenConfig	Network Instance: VLAN interface - VRF association, CVLAN I-SID, IS-IS redistribute direct, IPVPN, I-SID, and IP DHCP relay forward path)
OpenConfig	STP: STP global information and port interface bpduguard state, RSTP global and port level information, MSTP global, MST instance level state - GET operations only
OpenConfig	System (aaa)

Modules	
OpenConfig	LLDP
OpenConfig	VLAN

The RESTCONF feature is disabled by default. The RESTCONF server uses the same management IP address as the other applications and TCP port. The default TCP port that RESTCONF server listens to is port 8080. The TCP port delivers the message to the HTTP server for RESTCONF.

RESTCONF configuration using CLI

This section provides procedures to configure Representational State Transfer Configuration Protocol (RESTCONF) using the command line interface (CLI).

Enable the RESTCONF Server

Before You Begin

Run the **show application restconf conflict-ifname** command to see if any conflict in interface names exist. To enable RESTCONF, the interface names (VLAN name, MLT name, and Port interface name) must be unique.

Run the **show application restconf invalid-name mlt** and **show application restconf invalid-name vlan** commands to see if any MLT or VLAN names contain special characters. To enable RESTCONF, VLAN and MLT names cannot contain special characters other than underscore (_), en dash (-), and colon (:).

About This Task

Use the following procedure to enable the RESTCONF server.

Procedure

1. Enter Application Configuration mode:

```
enable
```

```
configure terminal
```

```
application
```

2. Enable the RESTCONF server:

```
restconf enable
```

Note

If the interface names (VLAN, MLT, and Port) are not unique, or if VLAN or MLT names contain prohibited special characters, an error occurs indicating that you cannot enable RESTCONF. You must change the interface names before you enable RESTCONF.

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch:1(config)#application
Switch:1(config-app)#restconf enable
```

Configure HTTPS Access to the RESTCONF Server

Before You Begin

Ensure that you have the certificate file in the `/intflash` directory on the switch.

About This Task

By default, the RESTCONF server uses HTTP. If you need to use HTTPS, generate a certificate file and transfer the certificate file to the `/intflash` directory on the switch.

For more information on generating certificate files, see [Manage an SSL Certificate](#) on page 3357.

Procedure

1. Enter Application Configuration mode:
`enable`
`configure terminal`
`application`
2. If RESTCONF is enabled, disable RESTCONF:
`no restconf enable`
3. Install the certificate file for the RESTCONF server:
`restconf install-cert-file WORD<1-128>`
4. Enable HTTPS:
`restconf tls`
5. Enable RESTCONF:
`restconf enable`

Example

```
Switch:1>enable
Switch:1# configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch:1(config)#application
Switch:1(config-app)#no restconf enable
Switch:1(config-app)#restconf install-cert-file /intflash/.cert/restconf-cert.pem
Switch:1(config-app)#restconf tls
Switch:1(config-app)#restconf enable
```

Variable Definitions

The following table defines parameters for the **restconf** command.

Variable	Value
<code>enable</code>	Enables the RESTCONF Server.
<code>install-cert-file WORD<1-128></code>	Installs the certificate file for the RESTCONF server.
<code>tcp-port <1024-49151></code>	Configures the RESTCONF Server TCP port number.
<code>tls</code>	Enables TLS for the RESTCONF server. The default is disabled.
<code>trap-notification</code>	Enables trap notification.

Modifying the RESTCONF Server Settings

About This Task

Use this procedure to modify the RESTCONF server settings.

Note

These steps are considered optional and RESTCONF can operate with the default configuration of these values.

Procedure

1. Enter Application Configuration mode:
`enable`

`configure terminal`

`application`
2. Disable trap notification when the RESTCONF server is not available:
`no restconf trap-notification`
3. Modify the TCP port number for the RESTCONF server:
 - a. Disable RESTCONF: `no restconf enable`
 - b. Change the value of the TCP port: `restconf tcp-port <1024-49151>`
 - c. Enable RESTCONF: `restconf enable`
4. Disable TLS for the RESTCONF server:
 - a. Disable RESTCONF: `no restconf enable`
 - b. Disable TLS: `no restconf tls`
 - c. Enable RESTCONF: `restconf enable`

Variable Definitions

Use the data in the following table to modify the RESTCONF server settings.

Variable	Value
<i>enable</i>	Enables or disables the RESTCONF server. The default is disabled.
<i>tcp-port</i> <1024-49151>	Specifies the TCP port to use for the RESTCONF server. The default is 8080.
<i>trap-notification</i>	Enables or disables trap notification when the RESTCONF server is not available. The default is enabled.

Showing the RESTCONF Configuration Information

About This Task

Use this procedure to show the RESTCONF configuration information and operation status.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show the RESTCONF configuration:

```
show application restconf
```

Example

```
Switch:1>show application restconf
=====
                                RESTCONF Info
=====
Admin State           : true
TCP Port              : 8080
Certificate File Status : install
TLS Enable            : false
Trap Notification     : true
Oper State            : up
Web Server Version    : 1.0.1.11
RESTCONF Server Version : 1.0.1.39
=====
```

Show Conflicting Interface Name Information

About This Task

To enable RESTCONF, the interface name (VLAN name, MLT name, and Port interface name) must be unique. Use this procedure to display conflicting interface name information.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. Show the RESTCONF conflicting interface name information:

```
show application restconf conflict-ifname
```

Example

```
Switch:1>show application restconf conflict-ifname
-----
Conflicting Interface IfName - Port, VLAN Name and MLT Name
-----
Mlt 1 name is same as Vlan 1001 name - "Interface-1"
Mlt 2 name is same as Vlan 1002 name - "VLAN-1002"
Vlan 1003 name is Mlt 1 Default Name - "MLT-1"
-----
Total Conflict Count: 3
```

What to Do Next

If a conflict exists, change the conflicting interface name to a unique name.

Show Special Characters in VLAN or MLT Names

About This Task

To enable RESTCONF, VLAN and MLT names cannot contain special characters other than underscore (_), en dash (-), and colon (:). Use this procedure to display VLAN or MLT names that contain prohibited special characters.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show the RESTCONF VLAN or MLT names that contain prohibited special characters:

```
show application restconf invalid-name vlan
```

```
show application restconf invalid-name mlt
```

Example

```
Switch:1>show application restconf invalid-name mlt
-----
Invalid MLT names - Only "-", "_" and ":" special characters are allowed
-----
Mlt 3 name has special characters - "gigi#g"
Mlt 4 name has special characters - "my%mlt"
Mlt 5 name has special characters - "isa.text"
-----
Total Invalid Names Count: 3
```

What to Do Next

If any of the names contain prohibited special characters, change the names to remove the special characters.

RESTCONF Configuration using EDM

This section contains procedures for configuring RESTCONF with Enterprise Device Manager (EDM).

Configure the RESTCONF Server

About This Task

To configure the server, you must enable RESTCONF. RESTCONF is disabled by default.

After RESTCONF is enabled, you must disable RESTCONF to modify some of the RESTCONF parameters.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability**.
2. Select **RESTCONF**.
3. Select the **RESTCONF** tab.
4. Select the **GlobalEnable** check box to enable the RESTCONFserver.
5. Configure optional parameters as required.
6. Select **Apply**.

RESTCONF Field Descriptions

Use the data in the following table to use the **RESTCONF** tab.

Name	Description
GlobalEnable	Enables or disables the RESTCONF server. The default is disabled (cleared).
TcpPort	Specifies the TCP port to use for the RESTCONF server. The default is 8080. The RESTCONF status must be disabled before you can modify this field.
TlsEnable	Enables or disables TLS/SSL if you require HTTPS access to the RESTCONF server. The default is disabled. The RESTCONF status must be disabled before you can modify this field.
CertificateFilename	If HTTPS access is required, specifies the file name and path of the TLS/SSL certificate. The certificate file must be in the <code>/intflash</code> directory on the switch.
CertificateAction	Installs or uninstalls the TLS/SSL certificate file. It also shows the current status of the certificate installation.
NotificationEnable	Enables or disables trap notification when the RESTCONF server is not available. The default is enabled.
OperStatus	Shows the operational status of the RESTCONF server.
WebServerVersion	Shows the RESTCONF web server version that is running on the server.
RestConfServerVersion	Shows the RESTCONF server version that is running on the server.

Use Representational State Transfer Configuration Protocol (RESTCONF) to Configure a Switch

The documentation does not include information about how to use RESTCONF clients. This example documents some common tasks using Python.

For additional details, see [Extreme API with Python](#).

Before You Begin

Configure the RESTCONF server on the switch.

Procedure

1. Import classes, define variables, and prepare the session object:

```
#!/usr/bin/env python
import sys
import json
import requests
from requests import Request, Session
from requests.auth import HTTPBasicAuth
from requests.packages.urllib3.exceptions import InsecureRequestWarning
requests.packages.urllib3.disable_warnings(InsecureRequestWarning)
#####
Host      = '192.0.2.1'
TcpPort   = '8080'
UserName  = 'rwa'
Password  = 'rwa'
LoginUrl  = 'https://%s:%s/auth/token' % (Host, TcpPort)
QueryUrl  = 'https://%s:%s/rest/restconf/data/' % (Host, TcpPort)
vlan      = 123
#####
session   = Session()
session.verify = False
session.timeout = 5

session.headers.update({
    'Accept':          'application/json',
    'Accept-Encoding': 'gzip, deflate, br',
    'Connection':      'keep-alive',
    'Cache-Control':   'no-cache',
    'Pragma':          'no-cache', })
```

2. Learn the authentication token:

Note

The token expires after 24 hours.

```
body = '{"username": "%s", "password" : "%s" }' % (UserName, Password)

response = session.put( LoginUrl, body )

if response.status_code != 200:
    print "ERROR: Login failed"
    sys.exit(1)
else:
    session.headers.update({
        'X-Auth-Token': response.headers['X-Auth-Token']
    })
    print "INFO: login passed"
```

3. Query all VLANs:

```
response = session.get( QueryUrl + 'openconfig-vlan:vlan' )
if response.status_code != 200:
    print 'ERROR: can't fetch VLANs'
```

4. Query specific VLANs:

```
response = session.get( QueryUrl + 'openconfig-vlan:vlan=vlan=%s' % vlan )

if response.status_code != 200:
    print 'INFO: VLAN %s doesn't exists' % vlan
else:
    print 'INFO: VLAN %s exists' % vlan
```

5. Access data:

```
inbound_data = json.loads( response.text )

for vlan in inbound_data['openconfig-vlan:vlan']['vlan']:
    print 'VLAN: %s [%s]' % ( vlan['state']['name'], vlan['vlan-id'] )
```

6. Present data:

```
inbound_data = json.loads( response.text )

for dataVlan in inbound_data[ dataObject ]['vlan']:
    print ''
    print 'VLAN: ' + dataVlan['state']['name'] + '[' + dataVlan['vlan-id'] + ']'
    interfaces = ''
    if 'members' in dataVlan :
        for interface in dataVlan['members']['member ']:
            interfaces = interfaces + interface['interface-ref']['state']['interface']
    + ','

    print interfaces
```

7. Add a VLAN:

```
dataObject = 'openconfig-vlan:vlan'

data = { "openconfig-vlan:vlan": [
    {
        "config":
        { "name": "Test-VLAN",
          "extreme-mod-oc-vlan:stg-id": 1,
          "vlan-id": vlan
        }
    }
]

response = session.post( QueryUrl + dataObject, json=data )

if response.status_code != 201:
    print "ERROR: add VLAN %s failed" % vlan
else:
    print "INFO: VLAN %s added " % vlan
```

8. Update a VLAN:

```
dataObject = 'openconfig-vlan:vlan=vlan=%s/config' % vlan

data = { "openconfig-vlan:config":
    { "name": "New-VLAN-Name" }
}

response = session.patch( QueryUrl + dataObject )

if response.status_code != 204:
```

```
    print "ERROR: update VLAN %s fails" % vlan
else:
    print "INFO: VLAN %s updated" % vlan
```

9. Delete a VLAN:

```
dataObject = 'openconfig-vlan:vlan=vlan=%s' % vlan

response = session.delete( QueryUrl + dataObject )

if response.status_code != 204:
    print "ERROR: delete VLAN %s fails" % vlan
else:
    print "INFO: VLAN %s deleted" % vlan
```

RESTCONF Operational Behavior Examples

This section provides an example of RESTCONF operational behavior.

In the following example, RESTCONF sends a request that involves multiple commands where one command operation fails and other command operations proceed.

Example:

```
POST http://{vossip}:8080/rest/restconf/data/extreme-network-service:network-services
{
  "extreme-network-service:network-services": [
    {
      "network-service": {
        "id": "990099",
        "type": "elanTransparent",
        "name": "isid-990099",
        "interfaces": {
          "interface": [
            {
              "name": "1/8"
            }
          ]
        }
      }
    }
  ]
}

{
  "ietf-restconf:errors": {
    "error": [
      {
        "error-message": "Unable to push data - Manual configuration not allowed on Auto-Sense port",
        "error-tag": "operation-failed",
        "error-type": "protocol"
      }
    ]
  }
}
```

The following sample output displays the configured I-SID and the created ELAN-transparent based service. The port does not display because the command operation failed.

```
Switch:1(config)#i-sid name 990099 isid-990099
```

```
Switch:1(config)#i-sid 990099 elan-transparent
Switch:1(elan-tp:990099)#port 1/8
```

```
Switch:1>show i-sid
```

```
*****
```

RIP fundamentals

Use the information in these sections to help you understand the Routing Information Protocol (RIP). For more information about the Border Gateway Protocol (BGP), see [BGP](#) on page 536.

Routing Information Protocol

In routed environments, routers communicate with one another to track available routes. Routers can dynamically learn about available routes using the RIP. The switch software implements standard RIP to exchange IP route information with other routers.

RIP uses broadcast User Datagram Protocol (UDP) data packets to exchange routing information. Each router advertises routing information by sending a routing information update every 30 seconds (one interval). If RIP does not receive information about a network for 180 seconds, the metric associated with the network rises to infinity (U); that is, the metric resets to 16, which means the network becomes unreachable. If RIP does not receive information about a network for 120 seconds, it removes the network from the routing table.

RIP is a distance vector protocol. The vector is the network number and next hop, and the distance is the cost associated with the network number. RIP identifies network reachability based on cost, and cost is defined as hop count. One hop is the distance from one router to the next. This cost or hop count is the metric (see the following figure).

Figure 207: Hop count or metric in RIP

RIP version 1 (RIPv1) advertises default class addresses without subnet masking. RIP version 2 (RIPv2) advertises class addresses explicitly, based on the subnet mask.

The switch supports RIPv2, which supports variable length subnet masks (VLSM) and triggered router updates. RIPv2 sends mask information. If RIP does not receive information about a network for 90 seconds, the metric associated with the network rises to infinity (U); that is, the metric resets to 16, which means the network becomes unreachable. If RIP does not receive information about a network for 180 seconds (six update intervals), it removes the network from the routing table. You can change the default timers by configuring the RIP interface timeout timer and the holddown timer.

A directly connected network has a metric of zero. An unreachable network has a metric of 16. Therefore, the highest metric between two networks can be 15 hops or 15 routers.

RIP Updates

Choose one of three options for the switch to receive RIP updates:

- `rip1OrRip2`—accepts RIPv1 or RIPv2 updates
- `rip1`—accepts RIPv1 updates only
- `rip2`—accepts RIPv2 updates only

The following table describes the four RIP send modes that the switch supports. You can configure RIP send modes on all router interfaces.

Table 255: RIP send modes

Send mode	Description	Result
<code>rip1Compatible</code>	Broadcasts RIPv2 updates using RFC1058 route consumption rules. This is the default mode.	<ul style="list-style-type: none"> • Destination MAC is a broadcast, ff-ff-ff-ff-ff-ff • Destination IP is a broadcast for the network (for example, 192.0.2.255) • RIP update is formed as a RIP-2 update, including network mask • RIP version = 2
<code>ripVersion1</code>	Broadcasts RIP updates that are compliant with RFC 1058	<ul style="list-style-type: none"> • Destination MAC is a broadcast, ff-ff-ff-ff-ff-ff • Destination IP is a broadcast for the network (for example, 198.0.2.255) • RIP update is formed as a RIP-1 update, no network mask included • RIP version = 1
<code>ripVersion2</code>	Broadcasts multicast RIPv2 updates	<ul style="list-style-type: none"> • Destination MAC is a multicast, 01-00-5e-00-00-09 • Destination IP is the RIP-2 multicast address, 224.0.0.9 • RIP update is formed as a RIP-2 update including network mask • RIP version = 2
<code>doNotSend</code>	Does not send RIP updates on the interface	None

RIP Supply and Listen

The following table indicates the relationship between switch action and the RIP supply and listen configuration.

Table 256: RIP supply and listen configuration and switch action

RIP supply configuration		RIP listen configuration		Switch action
Supply	Default supply	Listen	Default listen	
Disabled (false)	Disabled (false)			Sends no RIP updates.
Enabled (true)	Disabled (false)			Sends RIP updates except the default.
Disabled (false)	Disabled (false)			Sends only the default (default route must exist in routing table).
Enabled (true)	Enabled (true)			Sends RIP updates including the default route (if it exists).
		Disabled (false)	Disabled (false)	Does not listen to RIP updates.
		Enabled (true)	Disabled (false)	Listens to all RIP updates except the default.
		Disabled (false)	Enabled (true)	Listens only to the default.
		Enabled (true)	Enabled (true)	Listens to RIP updates including the default route (if it exists).

RIP and Route Redistribution

Redistribution imports routes from one protocol to another. Redistribution sends route updates for a protocol-based route through another protocol. For example, if RIP routes exist in a router and they must travel through a BGP network, configure redistribution of RIP routes through BGP. Redistribution sends RIP routes to a router that uses BGP.

You can redistribute routes

- on an interface basis
- on a global basis between protocols on a single VRF instance (intraVRF)
- between the same or different protocols on different VRF instances (interVRF)

To configure interface-based redistribution, configure a route policy, and then apply it to the interface. Configure the match parameter to the protocol from which to learn routes.

You can redistribute routes on a global basis, rather than for every interface. The switch adds support for global RIP redistribution. Use the **ip rip redistribute**

command to accomplish the (intraVRF) redistribution of routes through RIP, so that RIP redistribution occurs globally on all RIP-enabled interfaces. This redistribution does not require a route policy, but you can use one for more control.

If you configure redistribution globally and on an interface, redistribution through the route policy takes precedence.

You can redistribute routes from a protocol in one VRF to RIP in another VRF. You can use a route policy for redistribution control. If you enable route redistribution between VRF instances, ensure that IP addresses do not overlap.

RIPng Fundamentals

Routing Information Protocol next generation (RIPng) allows routers to exchange information for computing routes through an IPv6-based network. You should implement RIPng only on routers. IPv6 provides neighbor router information required by RIPng protocol to function as intended. A RIPng router is assumed to have interfaces in several networks and the protocol relies primarily on the metric of each network to compute routes using the distance vector algorithm.

RIP identifies network reachability based on cost, and cost is defined as hop count. One hop is the distance from one router to the next. This cost, or hop count, is the metric.

RIPng-enabled routers use UDP port 521 (the RIPng port) to exchange routing information. RIPng responds to a request by sending a message to the port from which the request originates. Specific queries can be sent from ports other than the RIPng port, but they must be directed to the RIPng port on the target machine.

Each router advertises routing information by sending an update every 30 seconds (one interval). If RIPng does not receive information about a network for 180 seconds, the metric associated with the network rises to infinity (U); that is, the metric resets to 16, which means the network becomes unreachable. If RIP does not receive information about a network for 120 seconds, it removes the network from the routing table.

Note

These time interval values are default values which are configurable by the user.

Each router that implements RIPng contains a routing table. This table contains one entry for every destination that is reachable throughout the system operating RIPng. At a minimum, each routing table entry contains the following information:

- The IPv6 prefix of the destination.
- A metric that represents the total cost of getting a datagram from the router to that destination. The metric is the sum of the costs of traversing the networks to arrive at the destination.
- The IPv6 address of the next router in the path to the destination (the next hop). The next-hop IPv6 address is a linklocal address.
- The VLAN or brouter port on which the RIPng routes were learned.
- The age of the RIPng route.

RIPng protocol implementation is specified in IETF document RFC 2080.

RIPng messages and packet format

RIPng-enabled routers use UDP port 521 (the RIPng port) to send and receive datagrams.

The following figure shows the RIPng packet format:

Figure 208: RIPng packet format

A RIPng packet header consists of the following components:

- **command:** Specifies the purpose of the message.
- **version:** The version of RIPng.

Originate Default route

Generally you use a default route when it is not convenient to list every possible network in RIPng updates, and one or more routers in the system are able to handle traffic to networks that RIPng does not explicitly list.

RIPng is enabled with the default route only option. When you enable default route only on an interface, it suppresses all other routes in the update sent for the interface, and advertises only the default route.

Timers

RIPng states four different timer intervals for protocol operation:

- **Update timer:** The RIPng process sends a complete routing table to each neighboring router every 30 seconds. To prevent collisions on broadcast networks, the process adds an offset value to the timer.
- **Timeout time interval:** This is a 180 second time interval associated with every route. If the time interval expires, the metric for this route updates to the value of infinity.

(16) and the route is no longer valid. However, the routing table retains the value for another 120 seconds.

- **Garbage collection time interval:** After the timeout time interval expires and the route becomes invalid, it remains in the routing table until the garbage collection time interval expires. The garbage collection time interval is 120 seconds. Until the garbage collection time interval expires all updates sent by this router include the invalid route. When the garbage collection timer expires, the process removes the route from the routing table.
- **Triggered update time interval:** The triggered update time interval is set to a random value between 1 and 5 seconds after a triggered update is sent. A single update is sent even if multiple triggered updates occur before the timer expires.

Configuration of timers or time intervals is supported only at the CLI/SNMP/EDM level. Configuration of timers or time intervals is not supported at the interface/port level.

F

RIP configuration using CLI

Use Routing Information Protocol (RIP) to perform dynamic routing within an autonomous system. This section describes how you use the command line interface (CLI) to configure and manage RIP.

Configure RIP Globally

Configure RIP parameters on the switch so you can control RIP behavior on the system.

Before You Begin

- You configure RIP on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip rip**. The VRF must have an RP Trigger of RIP. Not all parameters are configurable on non0 VRFs.

About This Task

All router interfaces that use RIP use the RIP global parameters. Both brouter ports and VLAN virtual routing interfaces use the same RIP global parameters.

You can configure RIP on interfaces while RIP is globally disabled. This way, you can configure all interfaces before you enable RIP for the switch.

Procedure

1. Enter RIP Router Configuration mode:

```
enable  
  
configure terminal  
  
router rip
```
2. Define the default-import-metric for the switch:

```
default-metric <0-15>
```

3. (Optional) Configure one or more timer values:
`timers basic timeout <15-259200> [holddown <0-360>] [update <1-360>]`
4. Enable RIP on an IP network:
`network {A.B.C.D}`
5. Exit to Global Configuration mode:
`exit`
6. After the configuration is complete, enable RIP globally:
`router rip enable`
- 7.
8. Check that your configuration is correct:
`show ip rip [vrf WORD<1-16>] [vrfids WORD<0-512>]`

Example

Define the default-import-metric as 1, the timeout interval as 180, the holddown time as 120, and the update time as 30. Enable RIP on an IP network, and ensure your configuration is correct.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1#router rip
Switch:1(config-rip)#default-metric 1
Switch:1(config-rip)#timers basic timeout 180 holddown 120 update 30
Switch:1(config-rip)#network 192.0.2.11
Switch:1(config-rip)#exit
Switch:1(config)#router rip enable
Switch:1(config)#show ip rip
=====
                        RIP Global - GlobalRouter
=====
Default Import Metric : 1
      HoldDown Time   : 120
        Queries       : 0
          Rip          : Enabled
      Route Changes    : 0
    Timeout Interval   : 180
        Update Time    : 30
```

Variable definitions

The following table defines parameters for the RIP commands.

Variable	Value
<code>default-metric <0-15></code>	Configures the value of default import metric to import a route into a RIP domain. To announce OSPF internal routes into RIP domain, if the policy does not specify a metric value, the default is used. For OSPF external routes, the external cost is used. The default is 8.
<code>domain <0-39321></code>	Specifies the RIP domain from 0–39321. The default is 0.
<code>holddown <0-360></code>	Configures the RIP hold-down timer value, the length of time (in seconds) that RIP continues to advertise a network after it determines that the network is unreachable. The default is 120.

Variable	Value
<i>network</i> {A.B.C.D}	Enables RIP on an IP network.
<i>timeout</i> <15-259200>	Configures the RIP timeout interval. The default is 180.
<i>update</i> <1-360>	Configures the RIP update timer. The update time is the time interval, in seconds, between RIP updates. The default is 30.

The following table defines parameters for the **show ip rip** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies a VRF by name.
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

Configure RIP on an Interface

Configure RIP on Ethernet ports and VLANs so that they can participate in RIP routing.

Before You Begin

- Assign an IP address to the port or VLAN.
- Configure RIP and enable it globally.
- Configure in and out policies.

About This Task

RIP does not operate on a port or VLAN until you enable it both globally and on the port or VLAN.

To configure RIP on a VRF instance for a port or VLAN, you configure RIP on the port or VLAN, and then associate the port or VLAN with the VRF.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Define the cost:

```
ip rip cost <1-15>
```

3. Specify an in policy for filtering inbound RIP packets:

```
ip rip in-policy WORD<0-64>
```

4. Specify an out policy for filtering outbound RIP packets:
`ip rip out-policy WORD<0-64>`
5. Enable RIP:
`ip rip enable`
6. Specify the send mode:
`ip rip send version <notsend|rip1|rip1comp|rip2>`
7. Specify the receive mode:
`ip rip receive version <rip1|rip2|rip1orrip2>`
8. Change other RIP parameters from their default values as required.

Example

The following configuration example shows how to configure the switch (labeled R1) to operate only in RIP version 2 mode.

Figure 209: Configuration example-RIPv2 only

Enable RIPv2 send mode on VLAN 2:

```
Switch:1(config-if)# ip rip send version rip2
```

Enable RIPv2 receive mode on VLAN 2:

```
Switch:1(config-if)# ip rip receive version rip2
```

Repeat these commands on VLAN 3 and the port interfaces.

Variable Definitions

The following table defines parameters for the **ip rip** command.

Variable	Value
<i>advertise-when-down enable</i>	Enables or disables AdvertiseWhenDown. If enabled, RIP advertises the network on this interface as up, even if the port is down. The default is disabled. If you configure a port with no link and enable advertise-when-down, it does not advertise the route until the port is active. RIP advertises the route even when the link is down. To disable advertising based on link status, you must disable this parameter.
<i>auto-aggregation enable</i>	Enables or disables automatic route aggregation on the port. If enabled, the switch automatically aggregates routes to their natural mask when an interface in a different class network advertises them. The default is disable.
<i>cost <1-15></i>	Configures the RIP cost for this port (link).
<i>default-listen enable</i>	Enables DefaultListen. The switch accepts the default route learned through RIP on this interface. The default is disabled.
<i>default-supply enable</i>	Enables DefaultSupply. If enabled, this interface must advertise a default route. The default is false. RIP advertises the default route only if it exists in the routing table.
<i>enable</i>	Enables RIP routing on the port.
<i>holddown <0-360></i>	Configures the RIP holddown timer value, the length of time (in seconds) that RIP continues to advertise a network after it determines that the network is unreachable. The default is 120.
<i>in-policy WORD<0-64></i>	Configures the policy name for inbound filtering on this RIP interface. This policy determines whether to learn a route on this interface and specifies the parameters of the route when RIP adds it to the routing table.
<i>listen enable</i>	Specifies that the routing switch learns RIP routes through this interface. If enabled, the switch listens for a default route without listening for all routes. The default is enable.
<i>out-policy WORD<0-64></i>	Configures the policy name for outbound filtering on this RIP interface. This policy determines whether to advertise a route from the routing table on this interface. This policy also specifies the parameters of the advertisement. <i>WORD<0-64></i> is a string of length 0–64 characters.

Variable	Value
<code>poison enable</code>	<p>Enables Poison Reverse. If you disable Poison Reverse (no <code>poison enable</code>), Split Horizon is enabled.</p> <p>By default, Split Horizon is enabled. If you enable Split Horizon, the interface does not advertise IP routes learned from an immediate neighbor back to the neighbor. If you enable Poison Reverse, the RIP updates sent to a neighbor from which a route is learned are poisoned with a metric of 16. Therefore, the receiver neighbor ignores this route because the metric 16 indicates infinite hops in the network. These mechanisms prevent routing loops.</p>
<code>port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<code>receive version <rip1 rip2 rip1orrip2></code>	Indicates which RIP update version to accept on this interface. The default is rip1orrip2.
<code>send version <notsend rip1 rip1comp rip2></code>	Indicates which RIP update version the router sends from this interface. ripVersion1 implies sending RIP updates that comply with RFC1058. rip1comp implies broadcasting RIP2 updates using RFC1058 route subassumption rules. The default is rip1Compatible.
<code>supply enable</code>	Specifies that the switch advertises RIP routes through the port. The default is enable.
<code>timeout <15-259200></code>	Configures the RIP timeout interval in seconds. The default is 180.
<code>triggered enable</code>	Enables automatic triggered updates for RIP.

Configure Route Redistribution to RIP

Configure a redistribute entry to announce certain routes into the RIP domain, including static routes, direct routes, RIP, Open Shortest Path First (OSPF), IS-IS, or Border Gateway Protocol (BGP). Optionally, use a route policy to control the redistribution of routes.

Before You Begin

- Enable RIP globally.
- Configure a route policy.

Procedure

1. Enter RIP Router Configuration mode:

```
enable

configure terminal

router rip
```
2. Create the redistribution instance:

```
redistribute <bgp|direct|isis|ospf|rip|static> [vrf-src WORD<1-16>]
```
3. Apply a route policy, if required:

```
redistribute <bgp|direct|isis|ospf|rip|static> route-map WORD<0-64>
[vrf-src WORD<1-16>]
```
4. Configure other parameters.
5. Enable the redistribution:

```
redistribute <bgp|direct|isis|ospf|rip|static> enable [vrf-src
WORD<1-16>]
```
6. Ensure that the configuration is correct:

```
show ip rip redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```
7. Exit to Global Configuration mode:

```
exit
```
8. Apply the redistribution:

```
ip rip apply redistribute <bgp|direct|isis|ospf|rip|static> [vrf
WORD<1-16>] [vrf-src WORD<1-16>]
```

Example

Create the redistribution instance, apply a route policy, enable the redistribution, and apply the redistribution.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router rip
Switch:1(config-rip)#redistribute rip
Switch:1(config-rip)#redistribute rip route-map test1
Switch:1(config-rip)#redistribute rip enable
Switch:1(config-rip)#exit
Switch:1(config)#ip rip apply redistribute rip
```

Variable definitions

The following table defines parameters for the **redistribute** command.

Variable	Value
<i>metric</i> <0-65535>	Configures the metric to apply to redistributed routes.
<i>route-map</i> WORD<0-64>	Configures the route policy to apply to redistributed routes.

Variable	Value
<i>[vrf-src WORD<1-16>]</i>	Specifies the optional source VRF instance. You can use this variable with the other command variables.
<i>WORD<0-32></i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static.

The following table defines parameters for the **show ip rip redistribute** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies the VRF instance.
<i>vrfids WORD<1-512></i>	Specifies a range of VRF IDs.

The following table defines parameters for the **ip rip apply redistribute** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies the VRF instance.
<i>vrf-src WORD<1-16></i>	Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF.
<i><bgp direct isis ospf rip static></i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static.

Configure InterVRF Route Redistribution for RIP

Configure a redistribute entry to announce certain routes into the RIP domain, including static routes, direct routes, RIP, OSPF, IS-IS, or BGP. Use a route policy to control the redistribution of routes.

Before You Begin

- Enable RIP globally.
- Configure a route policy.
- Configure the VRFs.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

Note

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Create the redistribution instance:

```
ip rip redistribute <bgp|direct|isis|ospf|rip|static>
```

3. Apply a route policy, if required:

```
ip rip redistribute <bgp|direct|isis|ospf|rip|static> route-map  
WORD<0-64> [vrf-src WORD<1-16>]
```

4. Configure other parameters.

5. Enable the redistribution:

```
ip rip redistribute <bgp|direct|isis|ospf|rip|static> enable [vrf-src  
WORD<1-16>]
```

6. Ensure that the configuration is correct:

```
show ip rip redistribute [vrf WORD<1-16>] [vrfids WORD<1-512>]
```

7. Exit to Global Configuration mode:

```
exit
```

8. Apply the redistribution:

```
ip rip apply redistribute <bgp|direct|isis|ospf|rip|static> [vrf  
WORD<1-16>] [vrf-src WORD<1-16>]
```

Example

Create the redistribution instance, apply a route policy, enable the redistribution, and apply the redistribution.

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1#router vrf red  
Switch:1(router-vrf)#ip rip redistribute ospf  
Switch:1(router-vrf)#ip rip redistribute ospf route-map test1  
Switch:1(router-vrf)#ip rip redistribute ospf enable  
Switch:1(router-vrf)#exit  
Switch:1(config)#ip rip apply redistribute ospf
```

Variable definitions

The following table defines parameters for the **ip rip redistribute** *<bgp|isis|ospf|static|direct|rip>* command.

Variable	Value
<i><bgp direct isis ospf rip static></i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static.
<i>vrf-src WORD<1-16></i>	Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF.
<i>metric <0-65535></i>	Configures the metric to apply to redistributed routes.
<i>route-map WORD<0-64></i>	Configures the route policy to apply to redistributed routes.

The following table defines parameters for the **show ip rip redistribute** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies the VRF instance.
<i>vrfids WORD<1-512></i>	Specifies a range of VRF IDs.

The following table defines parameters for the **ip rip apply redistribute** command.

Variable	Value
<i>vrf WORD<1-16></i>	Specifies the VRF instance.
<i>vrf-src WORD<1-16></i>	Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF.
<i><bgp direct isis ospf rip static></i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static.

Force a RIP Update for a Port or VLAN

Force RIP to update the routing table so that the port or VLAN uses the latest routing information.

About This Task

If you perform this procedure, you also update the tables for all VRFs associated with the port or VLAN.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable the triggered-update flag:

```
ip rip triggered enable
```

Note

You can enable this flag in either the GigabitEthernet or VLAN Interface Configuration mode. However, you can update the RIP routes in the GigabitEthernet Interface Configuration mode only.

3. Update the routing table:

```
action triggerRipUpdate
```

Example

Update the routing table:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface vlan 1  
Switch:1(config-if)#ip rip triggered enable
```

Display the RIP Redistribution Configuration Information

Displays the RIP redistribution configuration information.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display the RIP redistribution configuration information:

```
show ip rip redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Example

View the RIP redistribution configuration information:

```
Switch(config-ospf)#show ip rip redistribute
```

```
=====
RIP Redistribute List - GlobalRouter
=====
```

SRC-VRF	SRC	MET	ENABLE	RPOLICY

GlobalRouter	ISIS	0	FALSE	

Variable definitions

The following table defines parameters for the **show ip rip redistribute** command or the **show ipv6 rip redistribute** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies a VRF by name.
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

RIPng Configuration using CLI

Use the procedures in this section to configure RIPng using CLI.

Configure RIPng Globally

Configure RIPng parameters on the router so you can control RIPng behavior on the system.

Before You Begin

You can configure RIPng only on a global router. You cannot configure RIPng on a VRF instance.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enable RIPng globally:
`router rip ipv6-enable`

Configure RIPng on an Interface

Configure RIPng on Ethernet ports and VLANs so that they can participate in RIPng routing.

Before You Begin

- Assign an IP address to the port or VLAN.
- Configure RIPng and enable it globally.

About This Task

RIPng does not operate on a port or VLAN until you enable it both globally and on the port or VLAN.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create a RIPng interface:

```
ipv6 rip
```

3. Enable the RIPng interface:

```
ipv6 rip enable
```

4. Verify the operational status of the RIPng interface:

```
show ipv6 rip interface
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface vlan 22
Switch:1(config-if)#ipv6 rip
Switch:1(config-if)#ipv6 rip enable
Switch:1(config-if)#show ipv6 rip interface
```

Total RIPng interfaces: 2

RIPng Interface - GlobalRouter						
IFINDX	COST	POISON STATUS	SEND DEFAULT	ADMIN STATUS	OPER STATUS	
257 (2/2)	2	disable	disable	enable	enable	
2070 (22)	5	disable	disable	enable	disable	

2 out of 2 Total Num of RIPng interfaces displayed

Variable Definitions

The following table defines parameters for the **ipv6 rip** command.

Variable	Value
<1-4059>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This variable applies only to VLAN interfaces, not ports.
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...][slot/all][all]}	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Configure RIPng Custom Values

Configure custom values for RIPng parameters to replace default values.

Before You Begin

- Configure RIPng and enable it globally.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable RIPng poison:

```
ipv6 rip poison enable
```

3. Specify the RIPng cost:
`ipv6 rip cost <1-15 Cost>`
4. Access router RIPng configuration mode:
`router rip`
5. Specify the RIPng holddown timer value:
`ipv6 timers basic holddown <0-360>`
6. Specify the RIPng timeout timer value:
`ipv6 timers basic timeout <15-259200>`
7. Specify the RIPng update timer value:
`ipv6 timers basic update <1-360>`
8. Specify the default route metric value:
`ipv6 default-information metric <1-15>`
9. Enable default information globally:
`ipv6 default-information enable`
10. Ensure the configuration is correct:
`show ipv6 rip`

Example

Configure custom values for RIPng.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#router rip
Switch:1(config-rip)#ipv6 default-information metric 1
Switch:1(config-rip)#ipv6 default-information enable
Switch:1(config-rip)#ipv6 timers basic update 30
Switch:1(config-rip)#ipv6 timers basic timeout 180
Switch:1(config-rip)#ipv6 timers basic holddown 120
Switch:1(config-rip)#router rip ipv6-enable
Switch:1(config)#show ipv6 rip
```

```
=====
                        RIPng Global - GlobalRouter
=====

      Rip : Enabled
      HoldDown Time : 120
      Timeout Interval : 180
      Update Time : 30
      Default Info Metric : 1
      Default Info State : Enabled
      Default Import Metric : 1
```

Variable definitions

Use the data in the following table to use the **ipv6 rip poison**, **ipv6 default-information** and **ipv6 timers basic** commands.

Variable	Value
<1-4059>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This variable applies only to VLAN interfaces, not ports.
port {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
poison enable	Enables Poison Reverse. If you disable Poison Reverse (no poison enable), Split Horizon is enabled. By default, Split Horizon is enabled. If you enable Split Horizon, the interface does not advertise IP routes learned from an immediate neighbor back to the neighbor. If you enable Poison Reverse, the RIP updates sent to a neighbor from which a route is learned are poisoned with a metric of 16. Therefore, the receiver neighbor ignores this route because the metric 16 indicates infinite hops in the network. These mechanisms prevent routing loops.
<1-15 Cost>	Configures the RIPng cost for this port (link).
holddown <0-360>	Configures the RIPng holddown timer value, the length of time (in seconds) that RIPng continues to advertise a network after it determines that the network is unreachable. The default is 120.
timeout <15-259200>	Configures the RIPng timeout interval. The default is 180.
update <1-360>	Configure the RIPng update timer. The update time is the time interval between RIPng updates.
default-information <1-15>	Configure the default route metric value.

Configure RIPng Route Distribution

Configure a redistribute entry to announce certain routes into the RIPng domain, including static routes, direct routes, Open Shortest Path First (OSPFv3), IS-IS, or Border Gateway Protocol (BGP+).

Before You Begin

- Enable RIPng globally.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Access router RIP configuration mode:

```
router rip
```
3. Enable the redistribution:

```
ipv6 redistribute {direct|isis|static|ospf|bgp} enable
```
4. Ensure the configuration is correct:

```
show ipv6 rip redistribute
```

Example

Enable the redistribution instance.

```
Switch:1#enable
Switch:1#configure terminal
Switch:1(config)#router rip
Switch:1(config-rip)#ipv6 redistribute bgp enable
Switch:1(config-rip)#ipv6 redistribute direct enable
Switch:1(config-rip)#ipv6 redistribute isis enable
Switch:1(config-rip)#ipv6 redistribute ospf enable
Switch:1(config-rip)#ipv6 redistribute static enable
Switch:1(config-rip)#show ipv6 rip redistribute
```

```
=====
                        RIPng Redistribute List
=====
```

direct	: enabled
static	: enabled
ospf	: enabled
bgp	: enabled
isis	: enabled

```
-----
```

Variable definitions

Use the data in the following table to use the **ipv6 redistribute** command.

Variable	Value
<bgp direct isis ospf static>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, ospf, or static.

RIP configuration using EDM

Use Routing Information Protocol (RIP) to perform dynamic routing within an autonomous system. This section describes how you use Enterprise Device Manager (EDM) to configure and manage RIP.

Configure RIP Globally

Configure RIP global parameters on the switch so you can control RIP behavior on the system.

Before You Begin

- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

About This Task

All router interfaces that use RIP use the RIP global parameters. Both brouter ports and VLAN virtual routing interfaces use the same RIP global parameters.

You can configure RIP on interfaces while RIP is globally disabled. This way, you can configure all interfaces before you enable RIP for the switch.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RIP**.
3. Select the **Globals** tab.
4. Select the **enable** option button.
5. Configure other global RIP parameters as required.
6. Select **Apply**.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

Name	Description
Operation	Enables or disables RIP on all interfaces. The default is disabled.
UpdateTime	Specifies the time interval between RIP updates for all interfaces. The default is 30 seconds, and the range is 0–360.
RouteChanges	Specifies the number of route changes RIP made to the IP route database. RouteChanges does not include the refresh of a route age.
Queries	Specifies the number of responses sent to RIP queries received from other systems.

Name	Description
HoldDownTime	Configures the length of time that RIP continues to advertise a network after the network is unreachable. The range is 0–360 seconds. The default is 120 seconds.
TimeOutInterval	Configures the RIP timeout interval. The range is 15–259200 seconds. The default is 180 seconds.
DeflImportMetric	Configures the default import metric used to import a route into a RIP domain. To announce OSPF internal routes into a RIP domain, if the policy does not specify a metric, you must use the default import metric. OSPF external routes use the external cost. The range is 0–15 and the default is 8.

View RIP status

View RIP status.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RIP**.
3. Select the **Status** tab.

Status Field Description

Use the data in the following table to use the **RIP Status** tab.

Name	Description
Address	Specifies the IP address of the router interface.
RcvBadPackets	Specifies the number of RIP response packets received by the RIP process which were subsequently discarded; for example, version 0 packet, or an unknown command type.
RcvBadRoutes	Specifies the number of routes, in valid RIP packets, that are ignored; for example, unknown address family, or invalid metric.
SentUpdates	Specifies the number of triggered RIP updates sent on this interface, that do not include full updates sent containing new information.

Configure RIP Interface Compatibility

Configure RIP parameters on an interface so you can control RIP behavior on the interface. You can specify the RIP version to use on interfaces that you configure to send (supply) or receive (listen to) RIP updates.

Before You Begin

- Configure a routing interface (either a router port or a virtual routing interface).
- Assign an IP address to the interface.

- Enable RIP globally.
- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

About This Task

On an interface, RIP does not operate until you enable it globally and on the interface.

Although visible, the switch does not support the AuthType and AuthKey parameters.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RIP**.
3. Select the **Interface** tab.
4. Double-click the **Send** value to edit it, and then select the RIP version datagrams the router sends.
5. Double-click the **Receive** value to edit it, and then select the RIP version datagrams for which the router listens.
6. Select **Apply**.

Interface Field Descriptions

Use the data in the following table to use the **Interface** tab.

Name	Description
Address	Specifies the IP address of the router interface.
Domain	Specifies the value inserted into the routing domain parameter of all RIP packets sent on this interface.
AuthType	Specifies the type of authentication to use on this interface.
AuthKey	Specifies the authentication key whenever AuthType is not noAuthentication.
Send	<p>Specifies the update version the router sends on this interface:</p> <ul style="list-style-type: none"> • DoNotSend—no RIP updates sent on this interface • ripVersion1—RIP updates compliant with RFC1058 • rip1Compatible—broadcast RIPv2 updates using RFC1058 route subassumption rules • ripVersion2—multicast RIPv2 updates <p>The default is rip1compatible.</p>
Receive	<p>Indicates which versions of RIP updates to accept:</p> <ul style="list-style-type: none"> • rip1 • rip2 • rip1OrRip2 <p>The default is rip1OrRip2. Rip2 and rip1OrRip2 imply receipt of multicast packets.</p>

Configure RIP on an Interface

Configure RIP parameters to control and optimize RIP routing for the interface.

Before You Begin

- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RIP**.
3. Select the **Interface Advance** tab.
4. Double-click a RIP parameter to edit it, as required.
5. Select **Apply**.

Interface Advance Field Descriptions

Use the data in the following table to use the RIP **Interface Advance** tab.

Name	Description
Address	Shows the address of the entry in the IP RIP interface table.
Interface	Indicates the index of the RIP interface.
Enable	Shows if the RIP interface is enabled or disabled.
Supply	Enables (true) or disables (false) the ability to send RIP updates on this interface.
Listen	Configures whether the switch learns routes on this interface.
Poison	Configures whether to advertise RIP routes learned from a neighbor back to the neighbor. If disabled, the interface invokes Split Horizon and does not advertise IP routes learned from an immediate neighbor back to the neighbor. If enabled, RIP poisons the RIP updates, sent to the neighbor from which a route is learned, with a metric of 16. Therefore, the receiver neighbor ignores this route because the metric 16 indicates infinite hops in the network.
DefaultSupply	Enables (true) or disables (false) an advertisement of a default route on this interface. This command takes effect only if a default route exists in the routing table.
DefaultListen	Enables (true) or disables (false) the switch to accept the default route learned through RIP on this interface. The default is disabled. Enable DefaultListen to add a default route to the route table if another route advertises it.
TriggeredUpdate	Enables (true) or disables (false) the switch to send RIP updates from this interface.

Name	Description
AutoAggregate	Enables (true) or disables (false) automatic route aggregation on this interface. If enabled, the switch automatically aggregates routes to their natural mask when an interface advertises them. The default is disabled.
InPolicy	Determines if RIP can learn routes on this interface. This variable also specifies the parameters of the route when RIP adds it to the routing table.
OutPolicy	Determines if RIP advertises a route from the routing table on this interface. This policy also specifies the parameters of the advertisement.
Cost	Indicates the RIP cost for this interface. The range is 1–15. The default is 1.

Configure RIP on a Port

Configure RIP on a port so that the port can participate in RIP routing.

Before You Begin

- Assign an IP address to the port.
- Configure RIP and enable it globally.

Both brouter ports and VLAN virtual routing interfaces use the same RIP global parameters.

- Enable RIP on the interface.

About This Task

On an interface, RIP does not operate until you enable it globally and on the interface.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **IP**.
4. Select the **RIP** tab.
5. Configure the RIP parameters as required.
6. Select **Apply**.

RIP Field Descriptions

Use the data in the following table to use the **RIP** tab.

Name	Description
Enable	Enables or disables RIP on the port.
Supply	Specifies that the routing switch advertises RIP routes through the interface. The default is enable.

Name	Description
Listen	Specifies that the routing switch learns RIP routes through this interface. The default is enable.
Poison	If disabled, the interface invokes Split Horizon and does not advertise IP routes learned from an immediate neighbor back to the neighbor. If enabled, the RIP update sent to a neighbor from which a route is learned is poisoned with a metric of 16. In this manner, the route entry is not passed to the neighbor, because 16 is infinity in terms of hops on a network. The default is disable.
DefaultSupply	Enables or disables DefaultSupply. Enable DefaultSupply if a default route exists in the routing table. The default is false. RIP advertises the default route only if it exists in the routing table.
DefaultListen	Enables or disables DefaultListen. Enable DefaultListen if this interface must learn a default route after another router that connects to the interface advertises it. The default is false (disabled). Enable DefaultListen to add a default route to the route table if another router advertises it.
TriggeredUpdateEnable	Enables or disables triggered RIP updates. The default is false (disabled).
AutoAggregateEnable	Enables or disables RIP automatic aggregation. RIPv2 automatically aggregates routes to their natural mask. You can enable automatic aggregation only in RIPv2 mode or RIPv1 compatibility mode. The default is false.
AdvertiseWhenDown	Enables or disables AdvertiseWhenDown. If true, RIP advertises the network on this interface as up, even if the port is down. The default is false. If you configure a port with no link and enable AdvertiseWhenDown, the port does not advertise the route until the port is active. RIP advertises the route even when the link is down. To disable advertising based on link-states, disable AdvertiseWhenDown.
InPolicy	Determines whether the RIP can learn a route on this interface. This variable also specifies the parameters of the route when RIP adds it to the routing table.
OutPolicy	Determines if this interface advertises a route from the routing table on this interface. This policy also specifies the parameters of the advertisement.
Cost	Indicates the RIP cost for this interface. The default is 1, and the range is 1–15.
HolddownTime	Configures the length of time that RIP continues to advertise a network after determining it is unreachable. The range is 0–360 seconds. The default is 120 seconds
TimeOutInterval	Configures the RIP timeout interval in seconds. The range is 15–259200 seconds. The default is 180 seconds.

Configure RIP on a VLAN

Configure RIP on a VLAN so that the VLAN acts as a routed VLAN (a virtual router).

Before You Begin

- Configure the VLAN.
- Assign an IP address to the VLAN.
- Enable RIP globally.
- Enable RIP on the interface.
- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select a VLAN.
5. Select **IP**.
6. Select the **RIP** tab.
7. Configure the VLAN RIP parameters as required.
8. Select **Apply**.

RIP Field Descriptions

Use the data in the following table to use the **RIP** tab.

Name	Description
Enable	Enables or disables RIP on the VLAN.
Supply	Specifies that the routing switch advertises RIP routes through the interface. The default is enable.
Listen	Specifies that the routing switch learns RIP routes through this interface. The default is enable.
Poison	If disabled, the interface invokes Split Horizon and does not advertise IP routes learned from an immediate neighbor back to the neighbor. If enabled, the RIP update sent to a neighbor from which a route is learned is poisoned with a metric of 16. In this manner, the route entry is not passed to the neighbor, because 16 is infinity in terms of hops on a network. The default is disable.
DefaultSupply	Enables or disables DefaultSupply. Enable DefaultSupply if a default route exists in the routing table. The default is false. RIP advertises the default route only if it exists in the routing table.

Name	Description
DefaultListen	Enables or disables DefaultListen. Enable DefaultListen if this interface must learn a default route after another router that connects to the interface advertises it. The default is false (disabled). Enable DefaultListen to add a default route to the route table if another router advertises it.
TriggeredUpdateEnable	Enables or disables triggered RIP updates. The default is false (disabled).
AutoAggregateEnable	Enables or disables RIP automatic aggregation. RIPv2 automatically aggregates routes to their natural mask. You can enable automatic aggregation only in RIPv2 mode or RIPv1 compatibility mode. The default is false.
AdvertiseWhenDown	Enables or disables AdvertiseWhenDown. If true, RIP advertises the network on this interface as up, even if the interface is down. The default is false. If you configure a VLAN with no link and enable AdvertiseWhenDown, the VLAN does not advertise the route until the VLAN is active. RIP advertises the route even when the link is down. To disable advertising based on link-states, disable AdvertiseWhenDown.
InPolicy	Determines whether the RIP can learn a route on this interface. This variable also specifies the parameters of the route when RIP adds it to the routing table.
OutPolicy	Determines if this interface advertises a route from the routing table. This policy also specifies the parameters of the advertisement.
Cost	Indicates the RIP cost for this interface. The default is 1, and the range is 1–15.
HolddownTime	Configures the length of time that RIP continues to advertise a network after determining it is unreachable. The range is 0–360 seconds. The default is 120 seconds
TimeOutInterval	Configures the RIP timeout interval in seconds. The range is 15–259200 seconds. The default is 180 seconds.

Configure Route Redistribution to RIP

Configure a redistribute entry to announce routes of a certain source protocol type into the RIP domain, for example, static, RIP, or direct. Use a route policy to control the redistribution of routes.

Before You Begin

- Enable RIP globally.
- Configure a route policy.
- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

About This Task

Important

Changing the RIP redistribute context is a process-oriented operation that can affect system performance and network reachability while you perform the procedures. As a best practice, change default preferences for a RIP redistribute context, you must do so before you enable the protocols.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RIP**.
3. Select the **Redistribute** tab.
4. Select **Insert**.
5. Configure the source of the routes to redistribute.
6. Select **enable**.
7. Select the route policy to apply to redistributed routes.
8. Configure a metric value.
9. Select **Insert**.

Redistribute Field Descriptions

Use the data in the following table to use the **Redistribute** tab.

Name	Description
DstVrfId	Specifies the destination VRF instance. You cannot configure this variable.
Protocol	Specifies the dynamic routing protocol that receives the external routing information.
SrcVrfId	Specifies the source VRF instance.
RouteSource	Specifies the route source protocol for the redistribution entry.
Enable	Enables (or disables) a RIP redistribute entry for a specified source type.
RoutePolicy	Configures the route policy (by name) that redistributes external routes from a specified source into an RIP domain. Select the ellipsis (...) and choose from the list in the Route Policy dialog box.
Metric	Configures the RIP route redistribution metric for basic redistribution. The value can be in the range 0–65535. A value of 0 indicates to use the original cost of the route.

RIPng Configuration using EDM

Use the procedures in this section to configure RIPng using EDM.

Configure RIPng Globally

Configure RIPng global parameters on the switch so you can control RIPng behavior on the system.

About This Task

All router interfaces that use RIPng use the RIPng global parameters. Both brouter ports and VLAN virtual routing interfaces use the same RIPng global parameters.

You can configure RIPng on interfaces while RIPng is globally disabled. This way, you can configure all interfaces before you enable RIPng for the switch

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **IPv6 RIPng**.
3. Select the **Globals** tab.
4. Select **enable**.
5. Configure other global RIPng parameters as required.
6. Select **Apply**.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

Name	Description
AdminState	Enables or disables RIPng globally. The default is disabled.
UpdateTime	Specifies the time interval between RIPng updates for all interfaces. The default is 30 seconds, and the range is 1–360.
GlobalHoldDownTime	Configures the length of time that RIPng continues to advertise a network after the network is unreachable. The range is 0–360 seconds. The default is 120 seconds.
GlobalTimeOutInterval	Configures the RIPng timeout interval. The range is 15–259200 seconds. The default is 180 seconds.
DefaultInfoMetric	RIPng default-information metric.
DefaultInfoState	Default-information enable or disable at the global level
DefaultImportMetric	Specifies the RIPng default import metric.

Configure an IPv6 RIPng Interface

Configure RIPng parameters on an interface so you can control RIPng behavior on the interface.

Before You Begin

- Configure a routing interface (either a brouter port or a virtual routing interface).
- Assign an IP address to the interface.

- Enable RIPng globally.

About This Task

RIPng does not operate on an interface until you enable it globally and on the interface.

You can also configure an IPv6 RIPng interface for a brouter port by selecting **Device Physical View**, selecting a port, and following the **Edit > Port > IPv6** navigation path. You can configure an IPv6 RIPng interface for a VLAN through the **VLAN > VLANs > Basic > IPv6** navigation path. This procedure uses the main IPv6 RIPng navigation path where you can create both types of interfaces.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **IPv6 RIPng**.
3. Select the **Interfaces** tab.
4. Select **Insert**.
5. In **IfIndex**, type a value to identify the IPv6 interface.
6. In **RipAdminStatus**, select **enable**.
7. Configure other parameters as required.
8. Select **Insert**.

Interfaces Field Descriptions

Use the data in the following table to use the **Interfaces** tab.

Name	Description
IfIndex	RIPng interface index.
RipAdminStatus	Enable or disable RIPng on an interface.
DefaultInfoState	Enable or disable default information at the interface level.
Cost	Specifies the RIPng metric cost.
Poison	Enable or disable poison reverse on an RIPng interface.
RipOperStatus	Enable or disable the RIPng operational state on an interface.

Configure an IPv6 RIPng VLAN Interface

Configure RIPng parameters on a VLAN interface so you can control RIPng behavior on the interface.

Before You Begin

- Configure a routing interface (either a brouter port or a virtual routing interface).
- Assign an IP address to the interface.
- Enable RIPng globally.

About This Task

RIPng does not operate on an interface until you enable it globally and on the interface.

You can also configure an IPv6 RIPng interface for a brouter port by selecting **Device Physical View**, selecting a port, and following the **Edit > Port > IPv6** navigation path.

Procedure

1. In the navigation pane, expand **Configuration >VLAN**.
2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select a row, and then select **IPv6**.
5. Select **Insert**.
6. Configure other parameters, as required.
7. Select **Insert**.
8. Select **Apply**.

IPv6 Interfaces VLAN Field Descriptions

Use the data in the following table to use the **IPv6 Interfaces** tab.

Name	Description
Interface	Specifies the port or VLAN.
Identifier	Shows the IPv6 address interface identifiers. This value is a binary string of up to 8 octets in network byte-order.
IdentifierLength	Shows the length of the identifier, in bits.
Descr	Specifies a description of the interface. The network management system also configures this string.
VlanId	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This value corresponds to the lower 12 bits of the IEEE 802.1Q VLAN tag.
Type	Shows the interface type.
ReasmMaxSize(MTU)	Specifies the maximum size of the MTU of this IPv6 interface. This value must be the same for all the IP addresses defined on this interface. The default value is 1500.
PhysAddress	Specifies the media-dependent physical address. For Ethernet, this is a MAC address.
AdminStatus	Specifies if IPv6 is active on this interface. The default is false (disabled).
OperStatus	Specifies the current operational status of the interface.

Name	Description
ReachableTime	Specifies the time, in milliseconds, that a neighbor is considered reachable after receiving a reachability confirmation. The default is 30000.
RetransmitTimer	Specifies the time, in milliseconds, between retransmissions of neighbor solicitation messages to a neighbor when resolving the address, or when probing the reachability of a neighbor. The default is 1000.
CurHopLimit	Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet. A value of zero indicates that the advertisement does not specify a value for CurHopLimit. The default is 64.
MulticastAdminStatus	The option to select MulticastAdminStatus is disabled. You cannot configure the administrative status for multicast in this context.
MacOffset	Requests a particular MAC for an IPv6 VLAN. You can specify a MAC offset when you configure IPv6 on a VLAN, or the system can assign a MAC address from within the available range. Different hardware platforms support different MAC offset ranges.
ForwardingEnabled	Indicates whether IPv6 forwarding is enabled. The default is enabled.
RSMLTEnable	Shows whether RSMLT is enabled on the interface. The default value is disabled (false).

Configure an IPv6 RIPng Brouter Port Interface

Configure RIPng parameters on an interface so you can control RIPng behavior on the interface.

Before You Begin

- Configure a routing interface (either a brouter port or a virtual routing interface).
- Assign an IP address to the interface.
- Enable RIPng globally and on the interface.

About This Task

RIPng does not operate on an interface until you enable it globally and on the interface.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand **Configuration > EditPort**.
3. Select **IPv6**.
4. Select the **RIPng** tab.
5. In **RipAdminStatus**, select **enable**.

6. Configure other parameters as required.
7. Select **Apply**.

RIPng Field Descriptions

Use the data in the following table to use the **RIPng** tab.

Name	Description
RipAdminStatus	Enable or disable RIPng on an interface.
DefaultInfoState	Enable or disable default information at the interface level. The default is disable.
Cost	Specifies the RIPng metric cost. The default is 1.
Poison	Enable or disable poison reverse on an RIPng interface. The default is disable.
RipOperStatus	Shows the RIPng operational state on an interface.

Configure Route Redistribution to RIPng

Before You Begin

- Enable RIP globally.
- Configure a route policy.

About This Task

Configure a redistribute entry to announce routes of a certain source protocol type into the RIPng domain, for example, static, RIP, or direct. Use a route policy to control the redistribution of routes.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **IPv6 RIPng**.
3. Select the **Redistribute** tab.
4. Double-click the value in the **Enable** column that corresponds with the source protocol type you want to enable or disable.
5. Select **enable** or **disable**.
6. Select **Apply**.

Redistribute Field Descriptions

Use the data in the following table to use the **Redistribute** tab.

Name	Description
DstVrfiled	Specifies the destination VRF ID used in the redistribution.
Protocol	Specifies the dynamic routing protocol that receives the external routing information.

Name	Description
SrcVrflid	Specifies the source VRF ID used in the redistribution.
RouteSource	Specifies the route source protocol for the redistribution entry.
Enable	Enables (or disables) a RIPng redistribute entry for a specified source type.

View Statistics for RIPng Interfaces

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **IPv6 RIPng**.
3. Select the **Stats** tab.

Stats Field Descriptions

Use the data in the following table to use the **Stats** tab.

Name	Description
IfIndex	Shows the unique value to identify an IPv6 interface.
RcvBadPackets	The number of RIPng response packets received by the RIP process that were subsequently discarded for any reason (examples: a version 0 packet or an unknown command type).
RcvBadRoutes	The number of routes, in valid RIPng packets, that were ignored for any reason (examples: unknown address family or invalid metric).
SentUpdates	The number of triggered RIPng updates actually sent on this interface.
RcvUpdates	The number of triggered RIPng updates actually received on this interface. This explicitly does not include full updates received containing new information.

Graph IPv6 RIPng Statistics

Use the following procedure to graph RIPng statistics for monitoring RIPng behavior on the interface.

Before You Begin

- Configure a routing interface (either a brouter port or a virtual routing interface).
- Assign an IP address to the interface.
- Enable RIPng globally and on the interface.

About This Task

RIPng does not operate on an interface until you enable it globally and on the interface.

Procedure

1. In the navigation pane, expand **Configuration >Ipv6** .
2. Select **IPv6 RIPng**.
3. Select the **Stats** tab.
4. Select an interface row.
5. Select **Graph**.

Statistics Field Descriptions

Use the data in the following table to use the **Statistics** tab.

Name	Description
RcvBadPackets	The number of RIPng response packets received by the RIP process that were subsequently discarded for any reason (examples: a version 0 packet or an unknown command type).
RcvBadRoutes	The number of routes, in valid RIPng packets, that were ignored for any reason (examples: unknown address family or invalid metric).
SentUpdates	The number of triggered RIPng updates actually sent on this interface.
RcvUpdates	The number of triggered RIPng updates actually received on this interface. This explicitly does not include full updates received containing new information.
AbsoluteValue	Displays the counter value.
Cumulative	Displays the total value since you opened the Stats tab.
Average/Sec	Displays the average value for each second.
Minimum/Sec	Displays the minimum value for each second.
Maximum/Sec	Displays the maximum value for each second.
Last Val/Sec	Displays the last value for each second.

	VSP 7400 Series	VOSS 8.0

Remote Monitoring

Remote Monitoring (RMON) is a management information base (MIB) or a group of management objects that you use to obtain or configure values using the Simple Network Management Protocol (SNMP). Use CLI, or EDM, to globally enable RMON on the system. After you globally enable RMON, you enable monitoring for individual devices on a port-by-port basis.

RMON1 is the original version of the protocol, which collects information for OSI Layer 1 and Layer 2 in Ethernet networks. RMON1 provides traffic statistics at the MAC layer, and provides statistics on Ethernet segments for packets and bytes received and transmitted.

You can use RMON1 to:

- Configure alarms for user-defined events.
- Collect Ethernet statistics.
- Log events.
- Send traps for events.

Within EDM, you can configure RMON1 alarms that relate to specific events or variables. You can also specify events associated with alarms to trap or log-and-trap. In turn, the system traps or logs tripped alarms.

You can view all RMON1 information using CLI or EDM. Alternatively, you can use any management application that supports SNMP traps to view RMON1 trap information.

This section describes RMON1 alarms, RMON1 history, RMON1 events, and RMON1 statistics.

RMON1 Alarms

You can configure alarms to alert you if the value of a variable goes out of range. You can define RMON1 alarms on any MIB variable that resolves to an integer value. You cannot use string variables (such as system description) as alarm variables.

You can use RMON1 alarm to monitor anything that has a MIB OID associated with it and a valid instance.

All alarms share the following characteristics:

- A defined upper and lower threshold value.
- A corresponding rising and falling event.
- An alarm interval or polling period.

After you activate alarms, you can:

- View the activity in a log and/or a trap.
- Create a script directing the system to sound an audible alert at a console.
- Create a script directing the system to send an e-mail.
- Create a script directing the system to call a pager.

The system polls the alarm variable and the system compares the result against upper and lower limit values you select when you create the alarm. If the system reaches or crosses the alarm variable during the polling period, the alarm fires and generates an event that you can view in the event log or the trap log. You can configure the alarm to either create a log, or have the alarm send a Simple Network Management Protocol (SNMP) trap to a Network Management System (NMS). You can view the activity in a log or a trap log, or you can create a script to cause a console to beep, send an e-mail, or call a pager.

The upper limit of the alarm is the rising value, and the lower limit is the falling value. RMON1 periodically samples data based upon the alarm interval. During the first interval that the data passes above the rising value, the alarm fires as a rising event. During the first interval that the data drops below the falling value, the alarm fires as a falling event.

The following figure shows how alarms fire:

Figure 210: How alarms fire

The alarm fires during the first interval that the sample goes out of range. No additional events generate for that threshold until the system crosses the opposite threshold. Therefore, you must carefully define the rising and falling threshold values for alarms. Incorrect thresholds cause an alarm to fire at every alarm interval, or never at all.

You can define one threshold value to an expected, baseline value, and then define the opposite threshold as the out-of-bounds limit. Because of sample averaging, the value is equal to ± 1 baseline unit. For example, assume you define an alarm with octets leaving a port as the variable. The intent of the alarm is to notify you if excessive traffic occurs on that port. You enable spanning tree, and then 52 octets transmit from the port every 2 seconds, which is equivalent to baseline traffic of 260 octets every 10 seconds. This alarm notifies you if you define the lower limit of exiting octets at 260 and you define the upper limit at 320 (or at any value greater than $260 + 52 = 312$).

The rising alarm fires the first time outbound traffic, other than spanning tree Bridge Protocol Data Units (BPDUs), occurs. The falling alarm fires after outbound traffic, other than spanning tree, ceases. This process provides the time intervals of any nonbaseline outbound traffic.

If you define the alarm with a falling threshold of less than 260 and the alarm polling interval is at 10 seconds, for example, 250, then the rising alarm can fire only once, as shown in the following example. The falling alarm (the opposite threshold) must fire for the rising alarm to fire a second time. The falling alarm cannot fire unless the port becomes inactive or you disable spanning tree, which causes the value for outbound

octets to drop to zero, because the baseline traffic is always greater than the value of the falling threshold. By definition, the failure of the falling alarm to fire prevents the rising alarm from firing a second time.

The following figure shows an example of the alarm threshold:

Figure 211: Alarm example, threshold less than 260

When you create an alarm, you select a variable from the variable list and a port, or another system component to which it connects. Some variables require port IDs, card IDs, or other indexes, for example, spanning tree group IDs. You then select a rising and a falling threshold value. The rising and falling values compare to the actual value of the variable that you choose. If the variable falls outside of the rising or falling value range, an alarm triggers, and the system logs an event or trap.

When you create an alarm, you also select a sample type, which can be either absolute or delta. Define absolute alarms for alarms based on the cumulative value of the alarm variable. An example of an absolute alarm value is card operating status. Because this value is not cumulative, but instead represents states, such as card up (value 1) and card down (value 2), you configure the value as the absolute value. Therefore, you can create an alarm with a rising value of 2 and a falling value of 1 to alert you whether the card is up or down.

Configure most alarm variables related to Ethernet traffic as a delta value. Define delta alarms for alarms based on the difference in the value of the alarm variable between the start of the polling period and the end of the polling period.

Note

If you create an alarm that monitors a variable that does not exist, you will receive an error message and the creation will fail. Also, if the variable you are monitoring is no longer valid at the time of sampling, the switch removes the alarm automatically. For example, if you create an alarm that monitors some information about a VLAN, and that VLAN is later removed, then the switch silently removes the associated alarm at the next sampling interval.

RMON1 History

The RMON1 history group records periodic statistical samples from a network. A sample is a history and the system gathers the sample in time intervals referred to as buckets.

You can use RMON1 history for the MAC layer in the network. You cannot use RMON1 history for application and network layer protocols.

You enable and create histories to establish a time-dependent method to gather RMON1 statistics on a port. The following are the default values for history:

- Buckets are gathered at 30-minute intervals.
- The number of buckets gathered is 50.

You can configure both the time interval and the number of buckets. However, after the system reaches the last bucket, the system dumps bucket 1 and recycles the bucket to hold a new bucket of statistics. Then the system dumps bucket 2, and so forth.

RMON1 Events

RMON1 events and alarms work together to notify you when values in your network go out of a specified range. After a value passes the specified range, the alarm fires. The event specifies how the system records the activity.

You can use RMON1 events to monitor anything that has a MIB OID associated with it and a valid instance.

An event specifies whether a trap, a log, or both a trap and a log generates to view alarm activity.

You must create an event before associating it with an alarm, otherwise an error occurs. Also, you cannot delete an event as long as there are alarms associated with it. If you try to do so, an error message displays.

RMON1 Statistics

You can use EDM to gather and graph statistics in a variety of formats, or you can save the statistics to a file and export the statistics to a third-party presentation or graphing application.

RMON1 Scaling Limits

The following tables shows the scaling limits for RMON1 elements.

Note

When the log table reaches the maximum 500 log limit, the oldest third of the logs per event is removed to make room for new events. For all other elements, a message displays when you reach the maximum limit and no other element can be added.

Alarms	100
Events	100
History (entries in the history control table with 2000 buckets shared between them)	20

Logs	500
Statistics (entries in stats table)	100

RMON 2

Remote Monitoring (RMON) is a management information base (MIB) or a group of management objects that you use to obtain or configure values using the Simple Network Management Protocol (SNMP).

Use CLI or EDM to globally enable RMON on the system.

After you globally enable RMON, you enable monitoring for individual devices on a port-by-port basis.

RMON1 is the original version of the protocol, which collects information for OSI Layer 1 and Layer 2 in Ethernet networks. RMON1 provides traffic statistics at the MAC layer, and provides statistics on Ethernet segments for packets and bytes received and transmitted.

RMON2 monitors and counts network layer and application layer protocol packets on configured network hosts, either VLAN or port interfaces, that you enable for monitoring. RMON2 monitors Segmented Management Instances at the mgmt configuration level for out-of-band (OOB), circuitless IP (CLIP), and VLAN interfaces.

Note

RMON2 counters on Segmented Management Instance interfaces are cleared only when a Segmented Management Instance interface is newly enabled, or when RMON2 is newly enabled on a previously enabled Segmented Management Instance interface.

The following figure shows which form of RMON monitors which layers in the OSI model:

Figure 212: OSI model and RMON

The RMON2 feature is a management information base (MIB) or a group of management objects that you use to obtain or configure values using the Simple Network Management Protocol (SNMP). The switch supports a partial implementation of RMON2. The RMON2 feature adds the following MIBs: protocol directory, protocol distribution, address map, network-layer host and application layer host for the traffic passing through the (Control Processor) CP for these MIB tables.

The system only collects statistics for IP packets that pass through the CP. RMON2 does not monitor packets on other interfaces processed on the switch that do not pass through the CP. However, RMON2 monitors packets for applications listed in the RMON2 MIB, whether or not the application is enabled or supported on the switch.

After you globally enable RMON2, enable monitoring for individual devices. Identify the network hosts for the system to monitor with a manual configuration on the interfaces you want to monitor.

The RMON2 feature monitors a list of predefined protocols. The system begins to collect protocol statistics immediately after you enable RMON.

The RMON2 feature collects statistics on:

- Protocols predefined by the system.
- Address mapping between physical and network address on particular network hosts that you configure for monitoring.
- Network host statistics for particular hosts on a network layer protocol (IP) that you configure for monitoring.
- Application host statistics for a particular host on an application layer protocol that you configure for monitoring.

RMON2 MIBs

This section describes the following MIBs, on which RMON2 can collect statistics: protocol directory, protocol distribution, address map, network-layer host, and application layer host.

Protocol Directory MIB

The protocol directory lists all of the protocols RMON2 can monitor. The protocols include network layer, transport layer, and application layer protocols, under the OSI model. The system only monitors statistics for the predefined protocols. You cannot delete or add additional protocols to this table. The protocol directory MIB is enabled by default for the predefined protocols.

The predefined protocols include:

- Internet Protocol (IP)
- Secure Shell version 2 (SSHv2)
- Transmission Control Protocol (TCP)
- User Datagram Protocol (UDP)
- File Transfer Protocol (FTP)
- Hypertext Transfer Protocol (HTTP)
- Telnet
- Remote login (rlogin)

Note

RMON2 can count application packets received on a platform, even if the application is not enabled or supported, before dropping them.

- Trivial File Transfer Protocol (TFTP)
- Simple Network Management Protocol (SNMP)

Protocol Distribution MIB

The protocol distribution MIB collects traffic statistics that each protocol generates by local area network (LAN) segment. The switch acts as the probe and the system collects protocol statistics for the entire switch as part of the group for all of the protocols predefined in the protocol directory table. The protocol distribution control table is part of this group. The protocol distribution control table is predefined with an entry for the management IP for the switch to represent the network segment where the system collects the statistics.

No CLI or EDM support exists to add or delete entries in this table.

Address Map MIB

The address map MIB maps the network layer IP to the MAC layer address.

The system populates the address map control table MIB with an entry for each host interface that you enable for monitoring on the switch.

Network Layer Host MIB

The network layer host MIB monitors the Layer 3 traffic statistics for each host. The network layer host MIB monitors traffic packets in and out of hosts based on the network layer address. The network layer host controls the network and application layer host tables.

The system populates an entry for the management IP of the switch to represent the network segment where the system collects the statistics. You have to enable each host interface that you want to monitor on the switch.

The system only collects statistics for this group from packets that go to the CP.

Application Layer Host MIB

The application layer host MIB monitors traffic statistics by application protocol for each host.

The system populates an entry for the management IP of the switch to represent the network segment where the system collects the statistics. You have to enable each host interface that you want to monitor on the switch.

The system only collects statistics for this group from packets that go to the CP.

RMON2 Considerations

The following considerations apply to RMON2:

- You must enable RMON globally before you enable RMON2 monitoring for a Segmented Management Instance interface.
- You must configure an IPv4 address for the Segmented Management Instance management interface before you enable RMON2 monitoring.
- You can enable RMON on a maximum of 30 IP interfaces on a host.
- You cannot directly configure RMON for a routing VLAN that is an underlying management VLAN. In this case, RMON must be configured at the mgmt vlan configuration level for a non-routing VLAN.
- RMON2 is not available if DHCP Client is configured on a Management Instance. DHCP Client is not available if RMON2 is configured on a Management Instance.
- You cannot delete the IPv4 manual address from a Segmented Management Instance management interface that is RMON enabled. If the only IPv4 address is deleted outside of the normal configuration process, RMON is administratively disabled on the Segmented Management Instance management interface.

RMON Configuration Using CLI

This section contains procedures to configure RMON using Command Line Interface (CLI).

For information about RMON statistics, see the following sections:

- [Display RMON Statistics for Specific Ports](#) on page 3207
- [View RMON Statistics](#) on page 3207

Configure RMON

Enable RMON1 and RMON2 globally, and configure RMON1 alarms, events, history, statistics, and whether port utilization is calculated in half or full duplex. By default, RMON1 and RMON2 are disabled globally.

For RMON1, you enable RMON globally, and then you can use RMON1 alarm, history, events, and statistics for the MAC layer in the network. You cannot use RMON1 history or statistics for application and network layer protocols.

For RMON2, you enable RMON globally, and then you enable RMON on the host interfaces you want to monitor.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable RMON1 and RMON2 globally:

```
rmon
```
3. Configure an RMON1 alarm:

```
rmon alarm <1-65535> WORD <1-1536> <1-3600> {absolute|delta} [falling-  
threshold <-2147483647-2147483647> event <1-65535>] [owner WORD<1-  
127>] [rising-threshold <-2147483647-2147483647> event <1-65535>]
```
4. Configure an RMON1 event:

```
rmon event <1-65535> [community WORD<1-127>] [description WORD<0-127>]  
[log] [owner WORD<1-127>] [trap] [trap_dest [{A.B.C.D}]] [trap_src  
[{A.B.C.D}]]
```
5. Configure RMON1 history:

```
rmon history <1-65535> {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]} [buckets <1-65535>] [interval <1-3600>] [owner  
WORD<1-127>]
```
6. Configure RMON1 statistics:

```
rmon stats <1-65535> {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]} [owner <1-127>]
```
7. Configure whether the system calculates port utilization in half or full duplex:

```
rmon util-method [half|full]
```

Example

Configure RMON globally, an RMON1 alarm, and RMON1 event:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#rmon
Switch:1(config)#rmon event 60534 community public description "Rising Event" log trap
Switch:1(config)#rmon alarm 4 rcCliNumAccessViolations.0 10 absolute rising-threshold 2
event 60000
```

Variable Definitions

Use the data in this table to use the **rmon** command.

Variable	Value
<pre>alarm <1-65535> WORD <1-1536> <1-3600> {absolute delta} [falling-threshold <-2147483647-2147483647> event <1-65535>] [owner WORD<1-127>] [rising-threshold <- 2147483647-2147483647> event <1-65535>]</pre>	<p>Creates an alarm interface.</p> <ul style="list-style-type: none"> • <1-65535>— Specifies the interface index number from 1 to 65535. Each entry defines a diagnostics sample at a particular interval for an object on the device. The default is 1. • WORD <1-1536>— Specifies the variable name or OID. The entry is case sensitive and can have a string length of 1 to 1536. • {absolute delta}— Specifies the sample type. • rising-threshold <-2147483648-2147483647> [<event:1-65535>] — Specifies the rising threshold from -2147483648 to 2147483647, which is a threshold for the sampled statistic. After the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, the system generates a single event. The system also generates a single event if the first sample after this entry that becomes valid is greater than or equal to the rising alarm, or the rising or falling alarm. After the system generates a rising event, the system does not generate another such event until the sampled value falls below this threshold and reaches the alarm falling threshold. You cannot modify this object if the associated alarm status is equal to valid. • <1-65535>— Specifies the rising event index, which the system uses after the system crosses a rising threshold. The event entry identified by a particular value of this index is the same as identified by the same value of the event index object. If no corresponding entry exists in the event table, no association exists. In particular, if this value is zero, the system does not generate an associated event, as zero is not a valid event index. You cannot modify this object if the associated alarm status is equal to valid. • falling-threshold <-2147483648-2147483647> [<event:1-65535>] — Specifies the falling threshold from -2147483648 to 2147483647, which specifies a threshold for the sampled statistic. If the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, the system generates a single event. The system also generates a single event if the first sample after this entry that becomes valid

Variable	Value
	<p>is less than or equal to this threshold and the associated alarm startup alarm is equal to falling alarm or rising or falling alarm. After the system generates a falling event, the system does not generate another such event until the sampled value rises above this threshold, and reaches the alarm rising threshold. You cannot modify this object if the associated alarm status is equal to valid.</p> <p><1-65535> – Specifies the index of the event entry that the system uses after a falling threshold is crossed. The event entry identified by a particular value of this index is the same as identified by the same value of the event index object. If no corresponding entry in the event table exists, no association exists. In particular, if this value is zero, the system does not generate an event, as zero is not a valid event index. You cannot modify this object if the associated alarm status is equal to valid. The default is 60535.</p> <ul style="list-style-type: none"> • <i>owner WORD<1-127></i> — Specifies the name of the owner, with a string length 1 to 127. <p>Note: When configuring from CLI, the default owner is cli; when configuring with SNMP, the default owner is snmp. The default command only sets the owner to default. No other parameters can be changed after you create the alarm.</p>
<pre>event <1-65535> [community WORD<1-127>] [description WORD<0-127>] [log] [owner WORD<1-127>] [trap]</pre>	<p>Create an event.</p> <ul style="list-style-type: none"> • <1-65535>— Specifies the event index number. Each entry defines one event that the system generates after the appropriate conditions occur. The default is 1. • <i>log</i> — Specifies if this event stores a log when the event is triggered by the alarm. • <i>trap</i> — Specifies if this event sends a trap when the event is triggered by the alarm. The trap will be sent to all the snmp-server hosts configured in the snmp table. • <i>description WORD<0-127></i>— Specifies the event description, with a string length of 0 to 127. • <i>owner WORD<1-127></i> — Specifies the name of the owner, with a string length of 1 to 127. • <i>community WORD<1-127></i> — Specifies the SNMP community where you can send SNMP traps, with a string length 1 to 127.

Variable	Value
	<p>You can set the community, but the trap is not filtered out. The trap is sent to all configured snmp-server hosts, regardless of the value of this field.</p>
<pre>history <1-65535> {slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/all] [all]} [buckets <1-65535>] [interval <1-3600>] [owner WORD<1-127>]</pre>	<p>Configures RMON history.</p> <ul style="list-style-type: none"> • <i><1-65535></i> — Specifies the history index number that uniquely identifies an entry in the history control table. Each entry defines a set of samples at a particular interval for an interface on the default. The default value is 1. • {slot/port[/sub-port] [-slot/port[/sub-port]][,...][slot/all] [all]} <ul style="list-style-type: none"> — Specifies the single port interface. Identifies the source for which the system collects and places historical data in a media-specific table on behalf of this history control entry. The source is an interface on this device. The statistics in this group reflect all packets on the local network segment that attaches to the identified interface. • <i>buckets <1-65535></i>— Specifies the requested number of discrete time intervals where the system saves data in the part of the media-specific table associated with this history control entry. The default value is 50. • <i>interval <1-3600></i>— Specifies the time interval in seconds over which the system samples the data for each bucket in the part of the media-specific table associated with this history control entry. Because the counters in a bucket can overflow at their maximum value with no indication, you must take into account the possibility of overflow in all the associated counters. Consider the minimum time in which a counter can overflow on a particular media type, and then set the history control interval to a value less than this interval, which is typically most important for the octets counter in a media-specific table. The default value is 1800. • <i>owner WORD<1-127></i>— Specifies the name of the owner.

Variable	Value
<code>stats</code> <code><1-65535> {slot/port[/sub-port]</code> <code>[-slot/port[/sub-port]][,...][slot/all]</code> <code>[all]}owner WORD<1-127></code>	Configures RMON statistics. <ul style="list-style-type: none"> • <code><1-65535></code>— Specifies the control Ether statistics entry index number. • <code>{slot/port [/sub-port] [-slot/port [/sub-port] [, ...]}</code>— Specifies the single port interface. • <code>owner WORD<1-127></code> — Specifies the name of the owner.
<code>util-method [half full]</code>	Configures whether port utilization is calculated in half or full duplex to calculate port usage. <ul style="list-style-type: none"> • <code>half</code>—Configures the string to half duplex. • <code>full</code>—Configures the string to full duplex. <p>After you select half for half duplex, RMON uses InOctets and the speed of the port to calculate port usage (this is the standard RMON RFC 1271 convention). After you select full for full duplex, RMON uses InOctets and OutOctets, and 2X the speed of the port to calculate port usage. If you select full, but the port operates in half-duplex mode, the calculation defaults to the RFC 1271 convention. The default is half.</p>

Enable Remote Monitoring on an Interface

Use the following procedure to enable Remote Monitoring (RMON) on an interface.

Before You Begin

- Enable RMON globally.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable RMON on a particular VLAN:

```
vlan rmon <1-4059>
```

3. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

4. Enable RMON on a particular port:

```
rmon
```

Examples

Enable RMON on VLAN 2:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#vlan rmon 2
```

Enable RMON on port 1/8:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface gigabitethernet 1/8  
Switch:1(config-if)#rmon
```

Variable Definitions

Use the data in this table to use the **vlan rmon** command.

Variable	Value
<1-4059>	Specifies the VLAN ID on which to configure RMON.

Enable RMON2 on a Segmented Management Instance Interface

Before You Begin

You must enable RMON globally before you enable RMON2 monitoring for a Segmented Management Instance interface.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enter the configuration mode for the Management Instance:

```
mgmt <clip | oob | vlan>
```

3. Enable RMON2 on the Segmented Management Instance:

```
rmon
```

View RMON Information

View RMON1 and RMON2 information on the switch. You can view information about RMON1 alarms, events, history, logs, and statistics. You can also view RMON2 information about application host statistics, control tables, network host statistics, and protocol distribution statistics.

Procedure

1. View RMON1 information:

```
show rmon {alarm|event|history|log|stats}
```

2. View RMON2 information:

```
show rmon {address-map|application-host-stats WORD<1-64>|application  
protocols|ctl-table|protocol-dist-stats|network-host-stats}
```

Example

View RMON event, log, and statistics information:

```
Switch:1(config)#show rmon event

=====
Rmon Event
=====

INDEX DESCRIPTION      TYPE      COMMUNITY OWNER      LAST_TIME_SENT
-----
60534 Rising Event     log-and-trap public     192.0.2.155 none
60535 Falling Event    log-and-trap public     192.0.2.155 8 day(s), 19:14:32

Switch:1(config)#show rmon log

=====
Rmon Log
=====

-----
60535. 1 8 day(s), 19:14:45  1.3.6.1.4.1.2272.1.19.14.0 (absValue = 0, Falling
                                Threshold = 2, interval = 10)[alarmIndex.1][trap]
                                "Falling Event"
60535. 2 8 day(s), 19:14:45  1.3.6.1.4.1.2272.1.19.14.0 (absValue = 0, Falling
                                Threshold = 1, interval = 10)[alarmIndex.2][trap]
                                "Falling Event"

Switch:1(config)#show rmon stats

=====
Rmon Ether Stats
=====

INDEX PORT  OWNER
-----
1      1/10    monitor
```

Variable Definitions

The following table defines parameters for the **show rmon** command.

Variable	Value
<i>address-map</i>	Displays the RMON2 address map. This RMON2 parameter expands RMON capacity to display information on network, transport, and application layers.
<i>alarm</i>	Displays the RMON1 alarm table.
<i>application-host-stats WORD<1-64></i>	Displays RMON2 application host statistics from monitored protocols. This RMON2 parameter expands RMON capacity to display network, transport, and application layer information. Note: RMON2 can count application packets received on a platform, even if the application is not enabled or supported, before dropping them.
<i>ctl-table</i>	Displays the RMON2 control tables. This RMON2 parameter expands RMON capacity to display network, transport, and application layers.
<i>event</i>	Displays the RMON1 event table.
<i>history</i>	Displays the RMON1 history table. This RMON1 parameter displays and is limited to link layer information, including as MAC information.
<i>log</i>	Displays the RMON1 log table.
<i>network-host-stats</i>	Displays RMON2 network-host statistics. This RMON2 parameter expands RMON capacity to display network, transport, and application layers.
<i>protocol-dist-stats</i>	Displays RMON2 protocol distribution statistics. This RMON2 parameter expands RMON capacity to display network, transport, and application layers.
<i>stats</i>	Displays the RMON1 statistics table. This RMON1 parameter displays and is limited to link layer information, including as MAC information.

Display RMON Address Maps

View the maps of network layer address to physical address to interface.

The probe adds entries based on the source MAC and network addresses in packets without MAC-level errors.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON address maps:

```
show rmon address-map
```

Example

```
Switch:1# show rmon address-map
```

```
=====
                        Rmon Address Map Table
=====
PROTOIDX  HOSTADDR      SOURCE  PHYADDR      LASTCHANGE
-----
1         192.0.2.11    2060    b0:ad:aa:42:a5:03  10/09/15 17:30:41
```

View RMON Statistics

About This Task

View RMON statistics to manage network performance.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON statistics:

```
show rmon stats
```

Example

```
Switch:1#show rmon stats
```

```
=====
                        Rmon Ether Stats
=====
INDEX  PORT  OWNER
-----
1      1/10  monitor
```

Display RMON Statistics for Specific Ports

Display individual RMON statistics for specific ports to manage network performance.

**Note**

Slot and port information can differ depending on hardware platform.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. View statistics for specific ports:
`show interfaces GigabitEthernet statistics rmon {slot/port[/sub-port]} [-slot/port[/sub-port]][,...]`

Example

View RMON statistics:

```
Switch:1>enable
Switch:1#show interfaces gigabitEthernet statistics rmon 1/13
```

```
=====
```

Port Stats Rmon									
PORT NUM	OCTETS	PKTS	MULTI CAST	BROAD CAST	CRC ALIGN	UNDER SIZE	OVER SIZE	FRAG MENT	COLLI SION
1/13	1943	21	8	13	0	0	0	0	0

Variable Definitions

Use the data in the following table to use the **show interfaces GigabitEthernet statistics rmon** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> a single slot and port (slot/port) a range of slots and ports (slot/port-slot/port) a series of slots and ports (slot/port,slot/port,slot/port) all ports on the same slot (slot/all) all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

View RMON Application Host Statistics

View application host statistics to see traffic statistics by application protocol for each host.

Procedure

- To enter User EXEC mode, log on to the switch.
- View RMON application host statistics:

```
show rmon application-host-stats WORD<1-64>
```

Example

```
Switch:1# show rmon application-host-stats ?
WORD<1-64>  Select one of these application protocols
              {TCP|UDP|FTP|TELNET|HTTP|RLOGIN|SSH|TFTP|SNMP|HTTPS}
Switch:1# show rmon application-host-stats FTP
```

Rmon Application Host Stats					
HOSTADDR	INPKT	OUTPKT	INOC	OUTOC	CREATETIME
192.0.2.10	0	0	0	0	10/09/15 17:29:54

Note

Protocol support can vary across platforms.

Variable Definitions

The following table defines parameters for the **show rmon application-host-stats** command.

Variable	Value
WORD<1-64>	Specifies one of the following application protocols: TCP, UDP, FTP, TELNET, HTTP, rlogin, SSH, TFTP, SNMP, HTTPS. Note: RMON2 can count application packets received on a platform, even if the application is not enabled or supported, before dropping them.

View RMON Control Tables

View RMON control tables to see the data source for both network layer and application layer host statistics.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON control tables:

```
show rmon ctl-table
```

Example

Note

RMON2 can count application packets received on a platform, even if the application is not enabled or supported, before dropping them.

```
Switch:1# show rmon ctl-table
```

```

Display RMON Network Host Statistics

View network host statistics to see Layer 3 traffic statistics for each host. The network layer host MIB monitors traffic packets in and out of hosts based on the network layer address.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON network host statistics:

```
show rmon network-host-stats
```

View RMON Protocol Distribution Statistics

View protocol distribution statistics to see traffic statistics that each protocol generates by local area network (LAN) segment.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON protocol distribution statistics:

```
show rmon protocol-dist-stats
```

Example

Note

RMON2 can count application packets received on a platform, even if the application is not enabled or supported, before dropping them.

```
Switch:1# show rmon protocol-dist-stats
```

```
=====
Rmon Protocol Dist Stats
```

PROTOCOL	PKTS	OCTETS
IP	0	0
TCP	0	0
UDP	0	0
FTP	0	0
SSH	0	0
TELNET	0	0
HTTP	0	0
RLOGIN	0	0
TFTP	0	0
SNMP	0	0
HTTPS	0	0

Display RMON Status

View the current RMON status on the switch.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON status:

```
show rmon
```

Example

```
Switch:1# show rmon

RMON Info :
Status      : enable
```

View the RMON2 Configuration State of Management Interfaces

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View information about the RMON2 configuration state:

```
show mgmt rmon
```

Example

```
Switch:1>show mgmt rmon

=====
Mgmt Rmon Information

INST  DESCR  RMON-ADMIN-ENABLE  RMON-OPER-ENABLE  RMON-IP-ADDR
-----
1 Mgmt-oob1 disable disable 0.0.0.0
3 Mgmt-clip enable enable 192.0.2.72
4 Mgmt-vlan enable enable 198.51.100.72
```

RMON Configuration Using EDM

This section contains procedures to configure RMON using Enterprise Device Manager (EDM).

For information about RMON statistics, see the following sections:

- [Enable RMON Statistics](#) on page 3224
- [View RMON Statistics](#) on page 3225

Enable RMON Globally

About This Task

You must globally enable RMON before you can use RMON2 functions. If you attempt to enable an RMON2 function before the global flag is disabled, EDM informs you that the flag is disabled and prompts you to enable the flag. You can configure RMON1 while RMON is globally disabled.

If you want to use nondefault RMON parameter values, you can configure them before you enable RMON, or as you configure the RMON functions.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Options**.
3. Select the **Options** tab.
4. Select **Enable**.
5. In **UtilizationMethod**, select a utilization method.
6. Select **Apply**.

Options Field Descriptions

Use the data in the following table to use the **Options** tab.

Name	Description
Enable	Enables RMON. If you select Enable , the RMON agent starts immediately. To disable RMON, clear Enable , select Apply , and then restart the device. The default is disabled.
UtilizationMethod	Controls whether RMON uses a half-duplex or full-duplex formula to calculate port usage. After you select halfDuplex, RMON uses InOctets and the speed of the port to calculate port usage (this is the standard RMON RFC 1271 convention). After you select fullDuplex, RMON uses InOctets and OutOctets and 2X the speed of the port to calculate port usage. If you select fullDuplex, but the port operates in half-duplex mode, the calculation defaults to the RFC 1271 convention. The default is halfDuplex.

Enable RMON on a Port or VLAN

Before You Begin

- Enable RMON globally.

About This Task

Use the following procedure to enable RMON on an interface.

Procedure

1. Enable RMON on a VLAN:
 - a. In the navigation pane, expand **Configuration > VLAN**.
 - b. Select **VLANs**.
 - c. Select the **Advanced** tab.
 - d. In the row for the VLAN, double-click **RmonEnable**, and then select **enable**.
 - e. Select **Apply**.
2. Enable RMON on a port:
 - a. In the Device Physical View, select a port.
 - b. In the navigation pane, expand **Configuration > Edit > Port**.
 - c. Select **General**.
 - d. Select the **Interface** tab.
 - e. For **RmonEnable**, select **enable**.
 - f. Select **Apply**.

Enable RMON History

About This Task

Use RMON to establish a history for a port and configure the bucket interval. For example, to gather RMON statistics over the weekend, you must have enough buckets to cover two days. Configure the history to gather one bucket every hour, and cover a 48-hour period. After you configure the history characteristics, you cannot modify them; you must delete the history and create another one.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Control**.
3. In the **History** tab, select **Insert**.
4. In **Port**, select the ellipsis (...).
5. Select a port.
6. Select **OK**.
7. In **Buckets Requested**, type the number of discrete time intervals to save data.
8. In **Interval**, type the interval in seconds.
9. In **Owner**, type the owner information.
10. Select **Insert**.

History Field Descriptions

Use the data in the following table to use the **History** tab.

Name	Description
Index	Specifies an index that uniquely identifies an entry in the historyControl table. Each entry defines a set of samples at a particular interval for an interface on the device. Index value ranges from 1–65535. The default value is 1.
Port	Identifies the source for which the system collects and places historical data in a media-specific table on behalf of this historyControlEntry. The source is an interface on this device. To identify a particular interface, the object identifies the instance of the ifIndex object, defined in (4,6), for the desired interface. For example, if an entry receives data from interface 1, the object is ifIndex 1. The statistics in this group reflect all packets on the local network segment attached to the identified interface. You cannot modify this object if the associated historyControlStatus object is equal to valid(1).
BucketsRequested	Specifies the requested number of discrete time intervals over which the system save data in the part of the media-specific table associated with this historyControlEntry. After this object is created or modified, the probe configures historyControlBucketsGranted as closely to this object as possible for the particular probe implementation and available resources. Values range from 1–65535. The default value is 50.
BucketsGranted	Specifies the number of discrete sampling intervals over which the system save data in the part of the media-specific table associated with this historyControlEntry. After the associated BucketsRequested object is created or modified, the probe sets this object as closely to the requested value as possible for the particular probe implementation and available resources. The probe must not lower this value except as a result of a modification to the associated BucketsRequested object. Occasionally, the actual number of buckets associated with this entry is less than the value of this object. In this case, at the end of each sampling interval, the system adds a new bucket to the media-specific table. After the number of buckets reaches the value of this object and the system is going to add a new bucket to the media-specific table, the agent deletes the oldest bucket associated with this entry so the system can added the new bucket. After the value of this object changes to a value less than the current value, entries are deleted from the media-specific table associated with this entry. The agent deletes the oldest of these entries so that their number remains less than or equal to the new value of this object. After the value of this object changes to a value greater than the current value, the system allows the number of associated media-specific entries to grow.

Name	Description
Interval	Specifies the interval in seconds over which the system samples data for each bucket in the part of the media-specific table associated with this historyControlEntry. You can set this interval between 1–3600 seconds (1 hour). Because the counters in a bucket can overflow at their maximum value with no indication, you must take into account the possibility of overflow in all of the associated counters. Consider the minimum time in which a counter can overflow on a particular media type, and then set the historyControlInterval object to a value less than this interval, which is typically most important for the octets counter in a media-specific table. For example, on an Ethernet network, the etherHistoryOctets counter can overflow in approximately 1 hour at the maximum utilization. You cannot modify this object if the associated historyControlStatus object is equal to valid. The default value is 1800.
Owner	Specifies the entity that configured this entry and uses the assigned resources.

Disable RMON1 History

About This Task

Disable RMON1 history on a port if you do not want to record a statistical sample from that port.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Control**.
3. In **History**, select the row that contains the port ID to delete.
4. Select **Delete**.

View RMON1 History Statistics

About This Task

View RMON1 history statistics when you want to see a statistical sample from the switch. You can create a graph of the statistics in a bar, pie, chart, or line format.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand **Configuration > Graph**.
3. Select **Port**.
4. Select the **RMON History** tab.
5. Select the statistics you want to graph.
6. Select the button for the type of graph you require (bar, pie, chart, or line).

RMON History *Field Descriptions*

Use the data in the following table to use the **RMON History** tab.

Parameter	Description
SampleIndex	Identifies the particular sample this entry represents among all samples associated with the same history control entry. This index starts at one and increases by one as each new sample is taken.
Utilization	Specifies the best estimate of the mean physical layer network utilization on this interface during the sampling interval, in hundredths of a percent.
Octets	Specifies the total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets)
Pkts	Specifies the number of packets (including bad packets) received during this sampling interval.
BroadcastPkts	Specifies the number of good packets received during this sampling interval that were directed to the broadcast address.
MulticastPkts	Specifies the number of good packets received during this sampling interval that the system directs to a multicast address. This number does not include packets addressed to the broadcast address.
DropEvents	Specifies the total number of events in which the probe dropped packets due to lack of resources during this sampling interval. This number is not necessarily the number of packets dropped; it is only the number of times the system detects this condition.
CRCAAlignErrors	The number of packets the system receives during this sampling interval that had a length (excluding framing bits but including FCS octets) from 64–1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
UndersizePkts	Specifies the number of packets the system receives during this sampling interval that were less than 64 octets (excluding framing bits but including FCS octets), and were otherwise well formed.
OversizePkts	Specifies the number of packets the system receives during this sampling interval that were longer than 1518 octets (excluding framing bits but including FCS octets), but were otherwise well formed.

Parameter	Description
Fragments	<p>Specifies the total number of packets received during this sampling interval that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</p> <p>It is entirely normal for Fragments to increment because it counts both runts (which are normal occurrences due to collisions) and noise hits.</p>
Collisions	<p>Specifies the best estimate of the total number of collisions on this Ethernet segment during this sampling interval. The value returned depends on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision in the receive mode if three or more stations transmit simultaneously. A repeater port must detect a collision when two or more stations transmit simultaneously. Thus, a probe placed on a repeater port can record more collisions than a probe connected to a station on the same segment.</p> <p>Probe location plays a small role when 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can detect only collisions when it transmits. Thus, probes placed on a station and a repeater can report the same number of collisions.</p> <p>An RMON probe inside a repeater can ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.</p>

Create an RMON Alarm

Before You Begin

- You must globally enable RMON.

About This Task

After you enable RMON globally, you also create a default rising and falling event. The default for the events is log-and-trap, which means that you receive notification through a trap as well as through a log entry.

Procedure

- In the navigation pane, expand **Configuration > Serviceability > RMON**.
- Select **Alarms**.
- Select the **Alarms** tab.
- Select **Insert**.

5. In **Variable**, select a variable for the alarm.
If you select some variables, the system prompts for a port (or other object) on which you want to configure an alarm.
6. In **SampleType**, select a sample type.
7. In **Interval**, type a sample interval in seconds.
8. In **Index**, type an index number.
9. In **RisingThreshold**, type a rising threshold value.
10. In **RisingEventIndex**, type a rising threshold event index.
11. In **FallingThreshold**, type a falling threshold value.
12. In **FallingEventIndex**, type a falling threshold event index.
13. In **Owner**, type the owner of the alarm.
14. Select **Insert**.

Alarms Field Descriptions

Use the data in the following table to use the **Alarms** tab.

Name	Description
Index	Uniquely identifies an entry in the alarm table. Each entry defines a diagnostic sample at a particular interval for an object on the device. The default is 1.
Interval	Specifies the interval, in seconds, over which the data is sampled and compared with the rising and falling thresholds. deltaValue sampling—Configures the interval short enough that the sampled variable is unlikely to increase or decrease by more than $2^{31}-1$ during a single sampling interval.

Name	Description
Variable	<p>Specifies the object identifier of the particular variable to be sampled. Only variables that resolve to an ASN.1 primitive type of INTEGER (INTEGER, Counter, Gauge, or TimeTicks) can be sampled.</p> <p>Alarm variables exist in three formats, depending on the type:</p> <ul style="list-style-type: none"> • A chassis, power supply, or fan-related alarm ends in x where the x index is hard-coded. No further information is required. • A card, spanning tree group (STG), or EtherStat alarm ends with a dot (.). You must enter a card number, STG ID, IP address, or EtherStat information. • A port alarm ends with no dot or index and requires that you use the port shortcut menu. An example of a port alarm is ifInOctets (interface incoming octet count). <p>Because the system articulates SNMP access control entirely in terms of the contents of MIB views, no access control mechanism exists to restrict the value of this object to identify only those objects that exist in a particular MIB view. Because no acceptable means of restricting the read access that is obtained through the alarm mechanism exists, the probe must grant only write access to this object in those views that have read access to all objects on the probe.</p> <p>After you configure a variable, if the supplied variable name is not available in the selected MIB view, the system returns a badValue error. After the variable name of an established alarmEntry is no longer available in the selected MIB view, the probe changes the status of this alarmEntry to invalid.</p> <p>You cannot modify this object if the associated alarmStatus object is equal to valid.</p>
SampleType	<p>Specifies the method of sampling the selected variable and calculating the value to be compared against the thresholds. If the value of this object is absoluteValue, the value of the system compares the selected variable directly with the thresholds at the end of the sampling interval. If the value of this object is deltaValue, the system subtracts the value of the selected variable at the last sample from the current value, and the system compares the difference with the thresholds. You cannot modify this object if the associated alarmStatus object is equal to valid. The default is deltaValue.</p>
Value	<p>Specifies the value of the statistic during the last sampling period. For example, if the sample type is deltaValue, this value is the difference between the samples at the beginning and end of the period. If the sample type is absoluteValue, this value is the sampled value at the end of the period. This system compares the value with the rising and falling thresholds. The value during the current sampling period is not made available until the period is completed and remains available until the next period is complete.</p>

Name	Description
StartupAlarm	Specifies the alarm that is sent after this entry is first set to valid. If the first sample after this entry becomes valid is greater than or equal to the risingThreshold and alarmStartupAlarm is equal to the risingAlarm or the risingOrFallingAlarm, then the system generates a single rising alarm. If the first sample after this entry becomes valid is less than or equal to the fallingThreshold and alarmStartupAlarm is equal to the fallingAlarm or the risingOrFallingAlarm, then the system generates a single falling alarm. You cannot modify this object if the associated alarmStatus object is equal to valid.
RisingThreshold	Specifies a threshold for the sampled statistic. After the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, the system generates a single event. The system also generates a single event if the first sample after this entry becomes valid is greater than or equal to this threshold and the associated alarmStartupAlarm is equal to risingAlarm or risingOrFallingAlarm. After a rising event is generated, another such event is not generated until the sampled value falls below this threshold and reaches the alarmFallingThreshold. You cannot modify this object if the associated alarmStatus object is equal to valid.
RisingEventIndex	Specifies the index of the eventEntry that is used after a rising threshold is crossed. The eventEntry identified by a particular value of this index is the same as identified by the same value of the eventIndex object. If no corresponding entry exists in the eventTable, no association exists. In particular, if this value is zero, the system generates no associated event, as zero is not a valid event index. You cannot modify this object if the associated alarmStatus object is equal to valid. Note: You must create the event prior to associating it to an alarm.
FallingThreshold	Specifies a threshold for the sampled statistic. If the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, the system generates a single event. The system also generates a single event if the first sample after this entry becomes valid is less than or equal to this threshold and the associated alarmStartupAlarm is equal to fallingAlarm or risingOrFallingAlarm. After the system generates a falling event, the system does not generate another similar event until the sampled value rises above this threshold and reaches the alarmRisingThreshold. You cannot modify this object if the associated alarmStatus object is equal to valid.

Name	Description
FallingEventIndex	<p>Specifies the index of the eventEntry that the system uses after a falling threshold is crossed. The eventEntry identified by a particular value of this index is the same as identified by the same value of the eventIndex object. If there is no corresponding entry in the eventTable, no association exists. In particular, if this value is zero, the system generates no associated event, as zero is not a valid event index. You cannot modify this object if the associated alarmStatus object is equal to valid.</p> <p>Note: You must create the event prior to associating it to an alarm.</p>
Owner	Specifies the entity that configured this entry and is therefore using the resources assigned to it.
Status	Specifies the status of this alarm entry.

View RMON1 Alarms

About This Task

View the RMON1 alarm information to see alarm activity.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Alarms**.
3. Select the **Alarm** tab.

Delete an RMON1 Alarm

About This Task

Delete an RMON1 alarm if you no longer display it in the log.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Alarms**.
3. Select the alarm to delete.
4. Select **Delete**.

Create an RMON1 Event

About This Task

Create a custom rising and falling RMON1 event to specify if alarm information is sent to a trap, a log, or both.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Alarms**.
3. Select the **Events** tab.
4. Select **Insert**.
5. In **Description**, type an event name.
6. In **Type**, select an event type.

The default configuration is **log-and-trap**. To save memory, configure the event type to **log**. To reduce traffic from the system, configure the event type to **snmp-log**.

If you select **snmp-trap** or **log**, you must configure trap receivers.

7. In **Community**, type an SNMP community.
8. In **Owner**, type the owner of this event.
9. Select **Insert**.

Events Field Descriptions

Use the data in the following table to use the **Events** tab.

Name	Description
Index	Uniquely identifies an entry in the event table. Each entry defines one event that the system generates after the appropriate conditions occur. The default is 1.
Description	Specifies a comment that describes this event entry.
Type	Specifies the type of notification that the probe makes about this event. In the case of a log, the system makes an entry in the log table for each event. In the case of SNMP traps, the system sends an SNMP trap to one or more management stations.
Community	Specifies the SNMP community where you can send SNMP traps.
LastTimeSent	Specifies the value of sysUpTime at the time this event entry last generated an event. If this entry has not generated events, this value is zero.
Owner	Specifies the entity that configured this entry and is therefore using the assigned resources. If this object contains a string starting with monitor and has associated entries in the log table, all connected management stations retrieve those log entries, as they have significance to all management stations connected to this device.

View RMON1 Events

About This Task

View RMON1 events to see how many events occurred.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Alarms**.
3. Select the **Events** tab.

Events Field Descriptions

Use the data in the following table to use the **Events** tab.

Name	Description
Index	Uniquely identifies an entry in the event table. Each entry defines one event that the system generates after the appropriate conditions occur. The default is 1.
Description	Specifies a comment that describes this event entry.
Type	Specifies the type of notification that the probe makes about this event. In the case of a log, the system makes an entry in the log table for each event. In the case of SNMP traps, the system sends an SNMP trap to one or more management stations.
Community	Specifies the SNMP community where you can send SNMP traps.
LastTimeSent	Specifies the value of sysUpTime at the time this event entry last generated an event. If this entry has not generated events, this value is zero.
Owner	Specifies the entity that configured this entry and is therefore using the assigned resources. If this object contains a string starting with monitor and has associated entries in the log table, all connected management stations retrieve those log entries, as they have significance to all management stations connected to this device.

Delete an Event

About This Task

Delete an event after you no longer require the alarm information.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Alarms**.
3. Select the **Events** tab.
4. Select the event to delete.
5. Select **Delete**.

View the RMON Log

About This Task

View the trap log to see which activity occurred.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Alarms**.
3. Select the **Log** tab.

Log Field Descriptions

Use the data in the following table to use the **Log** tab.

Name	Description
EventIndex	Specifies an index that uniquely identifies an entry in the event table. Each entry defines one event that is generated under appropriate conditions.
Index	Specifies an index that uniquely identifies an entry in the log table generated by the same event entries.
Time	Specifies the creation time for this log entry.
Description	Specifies an implementation dependent description of the event that activated this log entry.

Enable RMON Statistics

About This Task

Enable Ethernet statistics collection for RMON.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Control**.
3. Select the **Ethernet Statistics** tab.
4. Select **Insert**.
5. Next to **Port**, select the ellipsis (...).
6. Select a port.
7. Select **OK**.
8. In **Owner**, type the name of the owner entity.
9. Select **OK**.
10. Select **Insert**.

Ethernet Statistics *Field Descriptions*

Use the data in the following table to use the **Ethernet Statistics** tab.

Name	Description
Index	Uniquely identifies an entry in the Ethernet Statistics table. The default is 1.
Port	Identifies the source of the data that this etherStats entry is configured to analyze.
Owner	Specifies the entity that configured this entry and therefore uses the assigned resources.

View RMON Statistics

Before You Begin

- You must enable RMON statistics collection.

About This Task

Use the following procedure to view RMON statistics for each port.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand **Configuration > Graph**.
3. Select **Port**.
4. Select the **RMON** tab.
5. Select the statistics you want to graph.
6. Select a graph type:
 - bar
 - pie
 - chart
 - line

RMON Field Descriptions

The following table describes fields on the **RMON** tab.

Name	Description
Octets	<p>Specifies the number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).</p> <p>You can use this object as a reasonable estimate of Ethernet utilization. If additional precision is desired, sample the Pkts and Octets objects before and after a common interval. The differences in the sampled values are Pkts and Octets, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows:</p> $\text{Pkts} * (9.6 + 6.4) + (\text{Octets} * .8)$ <p>Utilization = Interval * 10,000</p> <p>The result of this equation is the value Utilization, which is the percent utilization of the Ethernet segment on a scale of 0 to 100 percent.</p>
Pkts	Specifies the number of packets (including bad packets, broadcast packets, and multicast packets) received.
BroadcastPkts	Specifies the number of good packets received that were directed to the broadcast address. This number does not include multicast packets.
MulticastPkts	Specifies the number of good packets received that were directed to a multicast address. This number does not include packets directed to the broadcast address.
CRCAAlignErrors	Specifies the number of packets received that had a length (excluding framing bits, but including FCS octets) between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
UndersizePkts	Specifies the number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.
OversizePkts	Specifies the number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.

Name	Description
Fragments	<p>Specifies the number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</p> <p>It is entirely normal for Fragments to increment because it counts both runs (which are normal occurrences due to collisions) and noise hits.</p>
Collisions	<p>Specifies the best estimate of the number of collisions on this Ethernet segment. The value returned depends on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision in the receive mode if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations transmit simultaneously. Thus, a probe placed on a repeater port can record more collisions than a probe connected to a station on the same segment.</p> <p>Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus, probes placed on a station and a repeater reports the same number of collisions.</p> <p>An RMON probe inside a repeater reports collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.</p>

[View the Protocol Directory](#)

About This Task

View the protocol directory to see the list of protocols that RMON2 can monitor. You cannot change the list of protocols.

The protocol directory MIB is enabled by default for the predefined protocols.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Protocol Directory**.
3. Select the **Protocol Directories** tab.

Protocol Directories Field Descriptions

The following table defines parameters for the **Protocol Directories** tab.

Name	Description
Index	Shows a unique identifier for the entry in the table.
Protocol	<p>Shows the protocols RMON2 can monitor:</p> <ul style="list-style-type: none"> • Internet Protocol (IP) • Secure Shell version 2 (SSHv2) • Transmission Control Protocol (TCP) • User Datagram Protocol (UDP) • File Transfer Protocol (FTP) • Hypertext Transfer Protocol (HTTP) • Telnet • Remote login (rlogin) • Trivial File Transfer Protocol (TFTP) • Simple Networking Management Protocol (SNMP) <p>Note: RMON2 can count application packets received on a platform, even if the application is not enabled or supported, before dropping them.</p>
AddressMapConfig	<p>Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following:</p> <ul style="list-style-type: none"> • notSupported • supportedOff • supportedOn <p>If the value is supportedOn, the probe adds entries to the Address Map tab that maps the network layer address to the MAC layer address.</p>
HostConfig	<p>Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following:</p> <ul style="list-style-type: none"> • notSupported • supportedOff • supportedOn <p>If the value is supportedOn, the probe adds entries to the Host Control tab to collect statistics for network layer and application layer hosts.</p>

Name	Description
MatrixConfig	Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following: <ul style="list-style-type: none"> notSupported supportedOff supportedOn
Owner	Shows the entity that configured this entry.

View the Data Source for Protocol Distribution Statistics

About This Task

View the Distribution Control tab to see the network segment data source on which the protocol distribution statistics are measured. The management IP mentioned as a data source represents the IP that the SNMP agent uses to access the switch.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Protocol Distribution**.
3. Select the **Distribution Control** tab.

Distribution Control Field Descriptions

Use the data in the following table to use the **Distribution Control** tab.

Name	Description
Index	Shows a unique identifier for the entry in the table.
DataSource	Specifies the source of data for this protocol distribution.
DroppedFrames	Shows the total number of frames that the probe receives and drops but does not include in the StatsDropEvents value. This event can occur if the probe is out of resources and sheds the load from this collection. This value does not include packets that were not counted because they had MAC-layer errors.
CreateTime	Shows the value of the sysUpTime when the entry was last activated.
Owner	Shows the entity that configured this entry.

View Protocol Distribution Statistics

About This Task

View protocol distribution statistics to see traffic statistics that each protocol generates by local area network (LAN) segment.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Protocol Distribution**.
3. Select the **Distribution Stats** tab.

Distribution Stats Field Descriptions

Use the data in the following table to use the **Distribution Stats** tab.

Name	Description
LocalIndex	Identifies the protocol distribution an entry is part of, as well as the particular protocol that it represents.
Pkts	Shows the number of packets without errors received for this protocol type. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times.
Octets	Shows the number of octets in packets received for this protocol type since it was added to the table. This value does not include octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames.

View the Host Interfaces Enabled for Monitoring

About This Task

View the entries in the address map control tab to see which host interfaces are enabled for monitoring on the switch. Each entry in this table enables the discovery of addresses on a new interface.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Address Map**.
3. Select the **Address Map Control** tab.

Address Map Control Field Descriptions

Use the data in the following table to use the **Address Map Control** tab.

Name	Description
Index	Shows a unique identifier for the entry in the table.
DataSource	Shows the source of data for the entry.
DroppedFrames	Shows the total number of frames that the probe receives and drops but does not include in the StatsDropEvents value. This event can occur if the probe is out of resources and sheds the load from this collection. This value does not include packets that were not counted because they had MAC-layer errors.
Owner	Shows the entity that configured this entry.

View Address Mappings

About This Task

View the mappings of network layer address to physical address to interface.

The probe adds entries on this tab based on the source MAC and network addresses in packets without MAC-level errors.

The probe populates this table for all protocols on the **Protocol Directories** tab with a value of **AddressMapConfig** equal to **supportedOn**.

Procedure

1. In the navigation pane, expand **Configuration** > **Serviceability** > **RMON**.
2. Select **Address Map**.
3. Select the **Address Map** tab.

Address Map Field Descriptions

Use the data in the following table to use the **Address Map** tab.

Name	Description
LocalIndex	Shows a unique identifier for the entry in the table.
HostAddress	Shows the network address for this entry. The format of the value depends on the protocol portion of the local index.
Source	Shows the interface or port on which the network address was most recently seen.

Name	Description
PhysicalAddress	Shows the physical address on which the network address was most recently seen.
LastChange	Shows the value of the sysUpTime when the entry was created or last changed. If this value changes frequently, it can indicate duplicate address problems.

View the Data Source for Host Statistics

About This Task

View the Host Control tab to see the data source for both network layer and application layer host statistics.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Network Layer Host**.
3. Select the **Host Control** tab.

Host Control Field Descriptions

Use the data in the following table to use the **Host Control** tab.

Name	Description
Index	Shows a unique identifier for the entry in the table.
DataSource	Shows the source of data for the associated host table. The statistics in this group reflect all packets on the local network segment that attaches to the identified interface.
NHDropFrames	Shows the total number of frames that the probe receives and drops but does not include in the StatsDropEvents value. This event can occur if the probe is out of resources and sheds the load from this collection. This value does not include packets that were not counted because they had MAC-layer errors.

Name	Description
AHDropFrames	Shows the total number of frames that the probe receives and drops but does not include in the StatsDropEvents value. This event can occur if the probe is out of resources and sheds the load from this collection. This value does not include packets that were not counted because they had MAC-layer errors.
Owner	Shows the entity that configured this entry.

View Network Host Statistics

About This Task

View network host statistics to see Layer 3 traffic statistics for each host. The network layer host MIB monitors traffic packets in and out of hosts based on the network layer address.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Network Layer Host**.
3. Select the **Network Host Stats** tab.

Network Host Stats Field Descriptions

Use the data in the following table to use the **Network Host Stats** tab.

Name	Description
LocalIndex	Shows a unique identifier for the entry in the table.
HostAddress	Shows the host address for this entry.
InPkts	Shows the number of packets without errors transmitted to this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times.
OutPkts	Shows the number of packets without errors transmitted by this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times.

Name	Description
InOctets	Shows the number of octets transmitted to this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames.
OutOctets	Shows the number of octets transmitted by this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames.
CreateTime	Shows the value of the sysUpTime when the entry was last activated.

View Application Host Statistics

View application host statistics to see traffic statistics by application protocol for each host.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability > RMON**.
2. Select **Application Layer Host**.
3. Select the **Application Host Stats** tab.

Application Host Stats Field Descriptions

Use the data in the following table to use the **Application Host Stats** tab.

Name	Description
Index	Shows a unique identifier for the entry in the table.
HostAddress	Identifies the network layer address of this entry.
LocalIndex	Identifies the network layer protocol of the address.
InPkts	Shows the number of packets for this protocol type, without errors, transmitted to this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times.
OutPkts	Shows the number of packets for this protocol type, without errors, transmitted by this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times.

Name	Description
InOctets	Shows the number of octets transmitted to this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames.
OutOctets	Shows the number of octets transmitted by this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames.
CreateTime	Shows the value of the sysUpTime when the entry was last activated.

RMON Alarm Variables

RMON alarm variables are divided into three categories. Each category can have subcategories.

The topics in this section provide a brief variable description for the following alarm variable categories:

- [RMON Security Alarm Variables](#) on page 3236
- [RMON Error Alarm Variables](#) on page 3236
- [RMON Traffic Alarm Variables](#) on page 3242

Note

In addition to these elements that are offered in a graphical way by EDM, you can manually set any valid OID in the variable field to be monitored by an alarm. For these cases, the name of the variable cannot be translated automatically in OID, the exact OID must be set as a sequence of numbers.

RMON Security Alarm Variables

The following table lists the alarm variables for the security category and provides a brief variable description.

Table 258: RMON security alarm variables

Variable	Definition
rcCliNumAccessViolations.0	The number of CLI access violations detected by the system.
rcWebNumAccessBlocks.0	The number of accesses the web server blocked.
snmpInBadCommunityNames.0	The total number of SNMP messages delivered to the SNMP protocol entity that represented an SNMP operation not allowed by the SNMP community named in the message.

RMON Error Alarm Variables

The following tables list the alarm variables for subcategories within the Error category.

Table 259: Interface alarm variables

Variable	Definition
ifInDiscards	The number of inbound packets discarded even though no errors were detected to prevent the packets being deliverable to a higher-layer protocol. One possible reason for discarding a packet is to free buffer space.
ifInErrors	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors, preventing them from being deliverable to a higher-layer protocol.

Table 259: Interface alarm variables (continued)

Variable	Definition
ifOutDiscards	The number of outbound packets discarded even though no errors were detected to prevent the packets being transmitted. One possible reason for discarding such a packet is to free buffer space.
ifOutErrors	For packet-oriented interfaces, the number of outbound packets that were not transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that were not transmitted because of errors.

Table 260: Ethernet alarm variables

Variable	Definition
dot3StatsAlignmentErrors	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the Frame Check Sequence (FCS) check. The count represented by an instance of this object increments when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions exist are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
dot3StatsFCSErrors	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. The count represented by an instance of this object increments when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions occur are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
dot3StatsSingleCollisionFrames	A count of successfully transmitted frames on a particular interface where transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts object, the ifOutMulticastPkts object, or the ifOutBroadcastPkts object, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object.
dot3StatsMultipleCollisionFrames	A count of successfully transmitted frames on a particular interface where transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts object, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object.

Table 260: Ethernet alarm variables (continued)

Variable	Definition
dot3StatsSQETestErrors	A count of times that the SQE TEST ERROR message is generated by the PLS sublayer for a particular interface. The SQE TEST ERROR message is defined in section 7.2.2.2.4 of ANSI/IEEE 802.3-1985 and its generation is described in section 7.2.4.6 of the same document.
dot3StatsDeferredTransmissions	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions.
dot3StatsLateCollisions	The number of times that a collision is detected on a particular interface later than 512 bit-times into the transmission of a packet; 512 bit-times corresponds to 51.2 microseconds on a 10 Mb/s system. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics.
dot3StatsExcessiveCollisions	A count of frames where the transmission on a particular interface fails due to excessive collisions.
dot3StatsInternalMacTransmitErrors	<p>A count of frames where the transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object.</p> <p>The precise meaning of the count represented by an instance of this object is implementation specific. In particular, an instance of this object can represent a count of transmission errors on a particular interface that are not otherwise counted.</p>
dot3StatsCarrierSenseErrors	The number of times the carrier sense condition was lost or never asserted when the switch attempted to transmit a frame on a particular interface. The count represented by an instance of this object increments at most once for each transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt.

Table 260: Ethernet alarm variables (continued)

Variable	Definition
dot3StatsFrameTooLongs	A count of frames received on a particular interface that exceeds the maximum permitted frame size. The count represented by an instance of this object increments when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtained are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
dot3StatsInternalMacReceiveErrors	A count of frames where the transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is counted by an instance of this object only if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object. The precise meaning of the count represented by an instance of this object is implementation-specific. In particular, an instance of this object can represent a count of transmission errors on a particular interface that are not otherwise counted.

Table 261: IP alarm variables

Variable	Definition
ipInHdrErrors.0	The number of input datagrams discarded due to errors in the datagram IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, and errors discovered in processing IP options.
ipInDiscards.0	The number of discarded input IP datagrams where no problems were encountered to prevent continued processing. An example of why they were discarded can be lack of buffer space. This counter does not include any datagrams discarded while awaiting reassembly.
ipOutDiscards.0	The number of output IP datagrams where no problems were encountered to prevent transmission to the destination, but that were discarded (for example, for lack of buffer space). This counter includes datagrams counted in ipForwDatagrams if packets meet this (discretionary) discard criterion.
ipFragFails.0	The number of IP datagrams discarded because they needed to be fragmented at this entity but were not, for example, because the Don't Fragment flag was set.

Table 261: IP alarm variables (continued)

Variable	Definition
ipReasmFails.0	The number of failures detected by the IP reassembly algorithm (for whatever reason: timed out, errors, and so forth). This is not necessarily a count of discarded IP fragments because some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
icmpInParmProbs.0	The number of ICMP In parameter problem messages received.
icmpOutParmProbs.0	The number of ICMP Out parameter problem messages received.

Table 262: MLT alarm variables

Variable	Definition
rcStatMltEtherAlignmentErrors	The number of frames received on an MLT that are not an integral number of octets in length, but do not pass the FCS check.
rcStatMltEtherFCSErrors	The number of frames received on an MLT that are an integral number of octets in length, but do not pass the FCS check.
rcStatMltEtherSingleCollFrames	The number of successfully transmitted frames on a particular MLT where transmission is inhibited by exactly one collision.
rcStatMltEtherMultipleCollFrames	The number of successfully transmitted frames on a particular MLT where transmission is inhibited by more than one collision.
rcStatMltEtherSQETestError	A count of times that the SQE TEST ERROR message is generated by the PLS sublayer for a particular MLT.
rcStatMltEtherDeferredTransmissions	A count of frames where the first transmission attempt on a particular MLT is delayed because the medium is busy. The count represented by an instance of this object.
rcStatMltEtherLateCollisions	The number of times that a late collision is detected on a particular MLT later than 512 bit-times into the transmission of a packet; 512-bit-times corresponds to 51.2-microseconds on a 10 Mb/s system.
rcStatMltEtherExcessiveCollisions	The number of times that excessive collisions are detected on a particular MLT later than 512 bit-times into the transmission of a packet; 512 bit-times corresponds to 51.2 microseconds on a 10-Mb/s system.

Table 262: MLT alarm variables (continued)

Variable	Definition
rcStatMltEtherMacTransmitError	A count of frames where the transmission on a particular MLT fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the LateCollisions object, the ExcessiveCollisions object, or the CarrierSenseErrors object.
rcStatMltEtherCarrierSenseError	The number of times the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular MLT. The count represented by an instance of this object increments at most once for each transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt.
rcStatMltEtherFrameTooLong	A count of frames received on a particular MLT that exceeds the maximum permitted frame size. The count represented by an instance of this object increments when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user).
rcStatMltEtherMacReceiveError	A count of frames for which reception on a particular MLT fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the FrameTooLongs object, the AlignmentErrors object, or the FCSErrors object.

Table 263: Other alarm variables

Variable	Definition
rcTblArNoSpace	The number of entries not added to the address translation table due to lack of space.
snmplnAsnParseErrs.0	The total number of ASN.1 or BER errors encountered by the SNMP protocol entity when it decodes received SNMP messages.
rcStgPortInBadBpdus	The number of bad BPDUs received by this port.
dot1dTpPortInDiscards	Count of valid frames received that were discarded (that is, filtered) by the forwarding process.

**Note**

In addition to these elements that are offered in a graphical way by EDM, you can manually set any valid OID in the variable field to be monitored by an alarm. For these cases, the name of the variable cannot be translated automatically in OID, the exact OID must be set as a sequence of numbers.

RMON Traffic Alarm Variables

The following tables list the alarm variables for subcategories within the Traffic category.

Table 264: Interface alarm variables

Variable	Definition
ifInOctets	The total number of octets received on the interface, including framing characters.
ifInMulticastPkts	The number of packets, delivered by this sublayer to a higher sublayer, that are addressed to a multicast address at this sublayer. For a MAC layer protocol, this number includes both Group and Functional addresses.
ifInBroadcastPkts	The number of packets, delivered by this sublayer to a higher (sub) layer, that are addressed to a broadcast address at this sublayer.
ifInUnkownProtos	For packet-oriented interfaces, the number of packets received through the interface that are discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing, the number of transmission units received through the interface that are discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter is always 0.
ifOutOctets	The total number of octets transmitted from the interface, including framing characters.
ifOutMulticastPkts	The total number of packets that higher-level protocols requested be transmitted, and that are addressed to a multicast address at this sublayer, including those that are discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
ifOutBroadcastPkts	The total number of packets that higher level protocols requested transmitted, and that were addressed to a broadcast address at this sublayer, including those discarded or not sent.
ifLastChange	The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last reinitialization of the local network management subsystem, this object contains a value of zero.

Table 265: RMON Ether Stats alarm variables

Variable	Definition
etherStatsOctets	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). Use this object as a reasonable estimate of Ethernet utilization. For greater precision, sample the etherStatsPkts and

Table 265: RMON Ether Stats alarm variables (continued)

Variable	Definition
	etherStatsOctets objects before and after a common interval.
etherStatsPkts	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.
etherStatsBroadcastPkts	The total number of good packets received that are directed to the broadcast address. This number does not include multicast packets.
etherStatsMulticastPkts	The total number of good packets received that are directed to a multicast address. This number does not include packets directed to the broadcast address.
etherStatsCRCAlignErrors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of 64 to 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
etherStatsUndersizePkts	The total number of packets received that are less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.
etherStatsOversizePkts	The total number of packets received that are longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.
etherStatsFragments	The total number of packets received that are less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). It is entirely normal for etherStatsFragments to increment because it counts both runs (which are normal occurrences due to collisions) and noise hits.
etherStatsCollisions	The best estimate of the total number of collisions on this Ethernet segment.

Table 266: IP alarm variables

Variable	Definition
ipInReceives.0	All incoming IP packets.
ipInAddrErrors.0	The number of bad IP destination addresses.
ipForwDatagrams.0	IP packets forwarded.
ipInUnknownProtos.0	Number of unsupported IP protocols.
ipInDelivers.0	The number of IP In packets delivered.
ipOutRequests.0	The total number of IP datagrams that local IP user protocols supplied to IP in request for transmission.

Table 266: IP alarm variables (continued)

Variable	Definition
ipOutNoRoutes.0	The number of IP datagrams discarded because no route was found to transmit to the destination.
ipFragOKs.0	The number of IP datagrams successfully fragmented.
ipFragCreates.0	The number of IP datagram fragments generated as a result of fragmentation.
ipReasmReqds.0	The number of requests to reassemble fragments.
ipReasmOKs.0	The number of fragments reassembled successfully.

Table 267: ICMP alarm variables

Variable	Definition
icmpInSrcQuenchs.0	The number of ICMP Source Quench messages received.
icmpInRedirects.0	The number of ICMP redirect messages.
icmpInEchos.0	The number of ICMP Echo request messages received.
icmpInEchosReps.0	The number of ICMP Echo reply messages received.
icmpInTimeStamps.0	The number of ICMP timestamp request messages received.
icmpInTimeStampsReps.0	The number of ICMP timestamp reply messages received.
icmpInAddrMasks.0	The number of ICMP mask request messages reviewed.
icmpInAddrMasksReps.0	The number of ICMP mask reply messages reviewed.
icmpInDestUnreachs.0	The number of ICMP destinations unreachable messages received.
icmpInTimeExcds.0	The number of ICMP Time Exceeded messages received.
icmpOutSrcQuenchs.0	The number of ICMP Source Quench messages sent.
icmpOutRedirects.0	The number of ICMP redirect messages sent.
icmpOutEchos.0	The number of ICMP Echo request messages sent.
icmpOutEchosReps.0	The number of ICMP Echo reply messages sent.
icmpOutTimeStamps.0	The number of ICMP Timestamp request messages sent.
icmpOutTimeStampsReps.0	The number of ICMP Timestamp reply messages sent.
icmpOutAddrMasks.0	The number of ICMP Address mask messages sent.
icmpOutAddrMasksReps.0	The number of ICMP Address mask reply messages sent.

Table 267: ICMP alarm variables (continued)

Variable	Definition
icmpOutDestUnreachs.0	The number of ICMP destination unreachable messages sent.
icmpOutTimeExcds.0	The number of ICMP time exceeded messages sent.

Table 268: SNMP alarm variables

Variable	Definition
snmpInPkts.0	The total number of messages delivered to the SNMP entity from the transport service.
snmpOutPkts.0	The total number of SNMP messages passed from the SNMP protocol entity to the transport service.
snmpInBadVersions.0	The total number of SNMP messages delivered to the SNMP protocol entity that were intended for an unsupported SNMP version.
snmpInBadCommunityUses.0	The total number of SNMP messages delivered to the SNMP protocol entity that represented an SNMP operation that was not allowed by the SNMP community named in the message.
snmpInTooBigs.0	The total number of SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is tooBig.
snmpInNoSuchNames.0	The total number of SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is noSuchName.
snmpInBadValues. 0	The total number of SNMP PDUs received that were generated by the SNMP protocol entity and for which the value of the error-status field is badValue.
snmpInReadOnlys.0	The total number of valid SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is readOnly. It is a protocol error to generate an SNMP PDU that contains the value readOnly in the error-status field; as such, this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInGenErrs.0	The total number of SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is genErr.
snmpInTotalReqVars.0	The total number of MIB objects retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.
snmpInTotalSetVars.0	The total number of MIB objects altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.

Table 268: SNMP alarm variables (continued)

Variable	Definition
snmpInGetRequests.0	The total number of SNMP Get-Request PDUs accepted and processed by the SNMP protocol entity.
snmpInGetNexts.0	The total number of SNMP Get-Next PDUs accepted and processed by the SNMP protocol entity.
snmpInSetRequests.0	The total number of SNMP Set-Request PDUs accepted and processed by the SNMP protocol entity.
snmpInGetResponses.0	The total number of SNMP Get-Response PDUs accepted and processed by the SNMP protocol entity.
snmpInTraps.0	The total number of SNMP Trap PDUs accepted and processed by the SNMP protocol entity.
snmpOutTooBigs.0	The total number of SNMP PDUs generated by the SNMP protocol entity and for which the value of the error-status field is tooBig.
snmpOutNoSuchNames.0	The total number of SNMP PDUs generated by the SNMP protocol entity and for which the value of the error-status field is noSuchName.
snmpOutBadValues.0	The total number of SNMP PDUs sent that were generated by the SNMP protocol entity and for which the value of the error-status field is badValue.
snmpOutGenErrs.0	The total number of SNMP PDUs generated by the SNMP protocol entity and for which the value of the error-status field is genErr.
snmpOutGetRequests.0	The total number of SNMP Get-Request PDUs generated by the SNMP protocol entity.
snmpOutGetNexts.0	The total number of SNMP Get-Next PDUs generated by the SNMP protocol entity.
snmpOutSetRequests.0	The total number of SNMP Set-Request PDUs generated by the SNMP protocol entity.
snmpOutGetResponses.0	The total number of SNMP Get-Response PDUs generated by the SNMP protocol entity.
snmpOutTraps.0	The total number of SNMP Trap PDUs generated by the SNMP protocol entity.

Table 269: Bridge alarm variables

Variable	Definition
rcStgTimeSinceTopologyChange	The time (in hundredths of a second) since the last topology change was detected by the bridge entity.
rcStgTopChanges	The total number of topology changes detected by this bridge since the management entity was last reset or initialized.

Table 269: Bridge alarm variables (continued)

Variable	Definition
rcStgMaxAge	The maximum age of Spanning Tree Protocol information learned from the network on any port before it is discarded, in hundredths of a second. This is the actual value that this bridge is currently using.
rcStgPortForwardTransitions	The number of times this port transitioned from the Learning state to the Forwarding state.
rcStgPortInConfigBpdus	The number of Config BPDUs received by this port.
rcStgPortInTcnBpdus	The number of Topology Change Notification BPDUs received by this port.
rcStgPortOutConfigBpdus	The number of Config BPDUs transmitted by this port.
rcStgPortOutTcnBpdus	The number of Topology Change Notification BPDUs transmitted by this port.
dot1dTpPortInFrames	The number of frames received by this port from its segment. A frame received on the interface corresponding to this port is counted by this object only if it is for a protocol being processed by the local bridging function, including bridge management frames.
dot1dTpPortOutFrames	The number of frames transmitted by this port to its segment. A frame transmitted on the interface corresponding to this port is counted by this object if and only if it is for a protocol processed by the local bridging function, including bridge management frames.
dot1dTpLearnedEntryDiscards.0	The total number of Forwarding Database entries learned but discarded due to a lack of space to store them in the Forwarding Database. If this counter increases, it indicates that the forwarding database is regularly becoming full (a condition that has negative performance effects on the subnetwork). If this counter has a significant value but does not increase, it indicates that the problem occurred but is not persistent.

Table 270: Utilization alarm variables

Variable	Definition
rcSysBufferUtil.0	Buffer utilization as a percentage of the total amount of buffer space in the system. A high value indicates congestion.
rcSysNVRamUsed.0	Nonvolatile RAM (NVRAM) in use in kilobytes.

Table 270: Utilization alarm variables (continued)

Variable	Definition
rcSysLastChange.0	Last management-initiated configuration change since sysUpTime.
rcSysLastVlanChange.0	Last management-initiated VLAN configuration change since sysUpTime.

Table 271: MLT alarm variables

Variable	Definition
rcStatMltIfExtnIfInMulticastPkts	The total number of multicast packets delivered to this MLT interface.
rcStatMltIfExtnIfInBroadcastPkts	The total number of broadcast packets delivered to this MLT Interface.
rcStatMltIfExtnIfOutMulticastPkts	The total number of MLT interface multicast packets delivered to this MLT interface.
rcStatMltIfExtnIfOutBroadcastPkts	The total number of MLT interface broadcast packets delivered to this MLT interface.
rcStatMltIfExtnIfHCInOctets	The total number of octets received on this MLT interface including framing characters detected by the high-count (64-bit) register.
rcStatMltIfExtnIfHCInUcastPkts	The number of packets delivered by this MLT interface to a higher MLT that were not addressed to a multicast or broadcast address as detected by the high-count (64-bit) register.
rcStatMltIfExtnIfHCInMulticastPkt	The total number of multicast packets delivered to this MLT interface detected by the high-count (64-bit) register.
rcStatMltIfExtnIfHCInBroadcastPkt	The total number of broadcast packets delivered to this MLT interface detected by the high-count (64-bit) register.
rcStatMltIfExtnIfHCOctets	The total number of octets transmitted from the MLT interface, including framing characters.
rcStatMltIfExtnIfHCOOutUcastPkts	The number of packets transmitted by this MLT interface to a higher MLT that were not addressed to a multicast or broadcast address as detected by the high-count (64-bit) register.
rcStatMltIfExtnIfHCOOutMulticast	The total number of packets that higher-level protocols requested be transmitted, and that were addressed to a multicast address at this sublayer, including those that were discarded or not sent registered by the high-count (64-bit) register.
rcStatMltIfExtnIfHCOOutBroadcast	The total number of packets that higher-level protocols requested be transmitted, and that were addressed to a broadcast address at this sublayer, including those that were discarded or not sent registered by the high-count (64-bit) register.

Route Filtering and IP Policies

When the switch routes IP traffic, you can apply a number of filters to manage, accept, redistribute, and announce policies for unicast routing table information. Filters apply differently to different unicast routing protocols.

Note

IPv6 ingress QoS ACL/Filters and IPv6 Egress Security and QoS ACL/Filters are not supported. For information on the maximum number of IPv6 ingress port/vlan security ACL/filters supported on the switch, see *Fabric Engine Release Notes*.

The following figure shows how filters apply to BGP, RIP, and OSPF protocols.

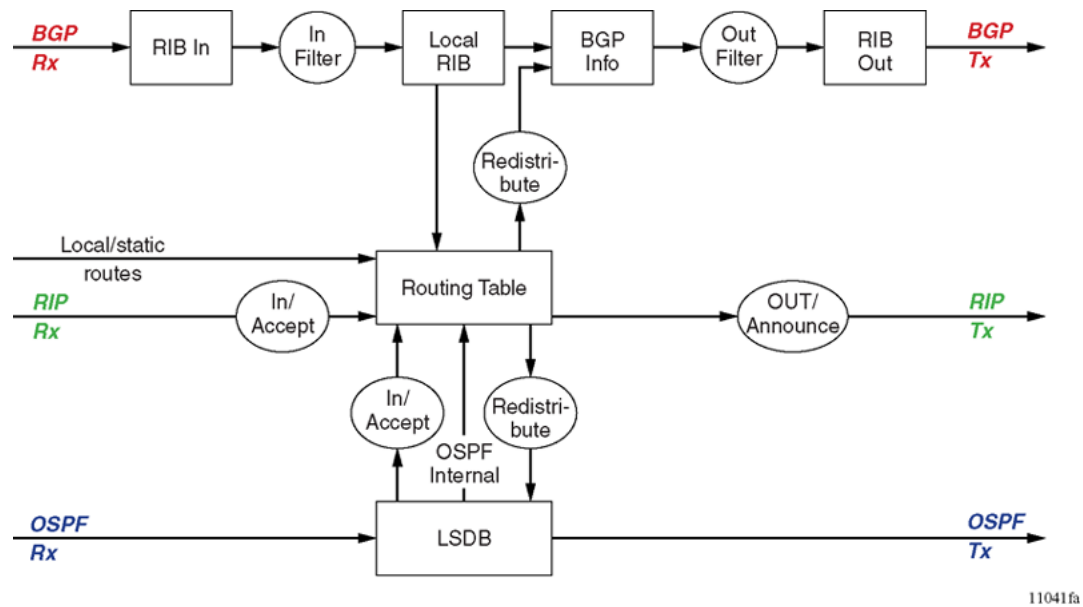

Figure 213: Route filtering for BGP, RIP, and OSPF routing protocols

The following figure shows how filters apply to the IS-IS protocol for Fabric Connect Layer 3 VSNs or IP Shortcuts.

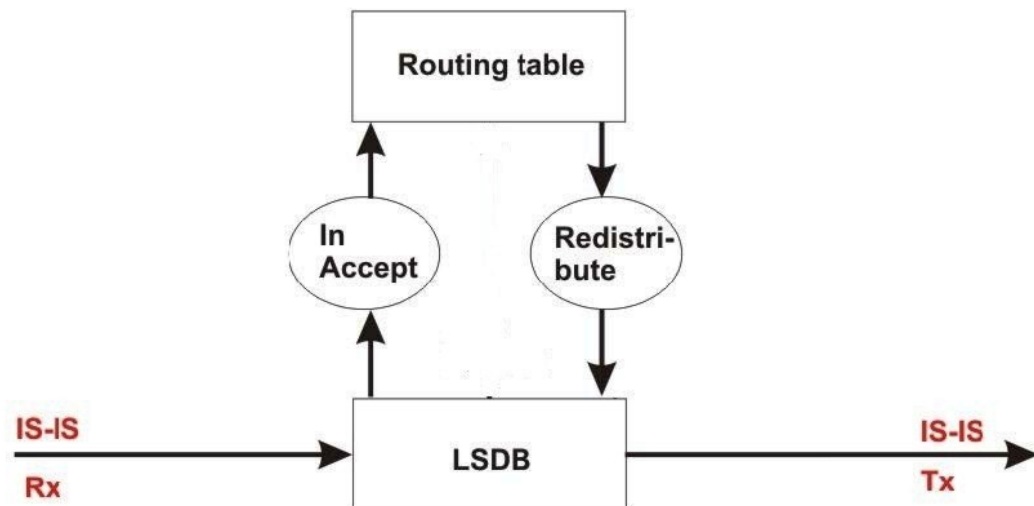

Figure 214: Route filtering for the IS-IS routing protocol

Accept Policies

Accept policies are applied to incoming traffic to determine whether to add the route to the routing table. Accept policies are applied differently to protocols, as follows:

- RIP and BGP—filters apply to all incoming route information.

- OSPF—filters apply only to external route information. Internal routing information is not filtered because otherwise, other routers in the OSPF domain can have inconsistent databases that can affect the router view of the network topology.
- IS-IS —filters apply to all incoming route information.

In a network with multiple routing protocols, you can prefer specific routes from RIP instead of from OSPF. The network prefix is a commonly used match criterion for accept policies.

Redistribution Filters

Redistribution filters notify changes in the route table to the routing protocol (within the device). With redistribution filters, providing you do not breach the protocol rules, you can choose not to advertise everything that is in the protocol database, or you can summarize or suppress route information. By default, no external routes are leaked to protocols that are not configured.

Announce Policies

Announce policies are applied to outgoing advertisements to neighbors or peers in the protocol domain to determine whether to announce specific route information. Out filtering applies to RIP updates and BGP NLRI updates.

In contrast, announce policies are not applied to IS-IS or OSPF information because routing information must always be consistent across the domain. To restrict the flow of external route information in the IS-IS or OSPF protocol database, apply redistribution filters instead of announce policies.

Route Filtering Stages

The following figure shows the three distinct filter stages that are applied to IP traffic.

These stages are:

- Filter stage 1 is the accept policy or in filter that applies to incoming traffic to detect changes in the dynamic (protocol-learned) routing information, which are then submitted to the routing table.
- Filter stage 2 is the redistribution filter that applies to the entries in the routing table to the protocol during the leaking process.
- Filter stage 3 is the announce policy or out filter that applies to outgoing traffic within a protocol domain.

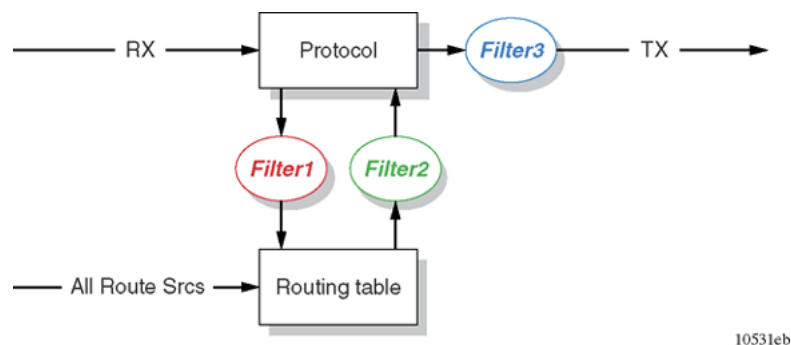

Figure 215: Route filtering stages

The following figure shows the logical process for route filtering on the switch.

Figure 216: Route filtering logic

Prefix list

In the switch software, you can create one or more IP prefix lists and apply these lists to IP route policy.

Route Policy Definition

You can define an IP route policy and its attributes globally, and then apply them individually to interfaces and protocols. You can also form a unified database of route policies that the RIP or OSPF protocol can use for type of filtering purpose. A name or ID identifies a policy.

Under a policy you can have several sequence numbers. If you do not configure a field in a policy, the system displays the field as 0 in CLI show command output. This value indicates that the device ignores the field in the match criteria. Use the clear option to remove existing configurations for the field.

Each policy sequence number contains a set of fields. Only a subset of those fields is used when the policy is applied in a certain context. For example, if a policy has a configured set-preference field, it is used only when the policy is applied for accept purposes. This field is ignored when the policy is applied for announce or redistribute purposes.

You can only apply one policy for each purpose (RIP Announce, for example) on a given RIP interface. In this case, all sequence numbers under the policy apply to that filter. A sequence number also acts as an implicit preference; a lower sequence number is preferred.

The following tables display the accept, announce, and redistribute policies for RIP, OSPF, IS-IS and BGP. The tables also display which matching criteria apply for a certain routing policy. Superscript numbers in the following table identify the following:

1. denotes advertise router
2. denotes RIP gateway
3. denotes that external type 1 and external type 2 are the only options

Note

IPv4 and IPv6 route-maps cannot be configured on the same match statement.

Permit and Deny Rules for Inbound and Outbound traffic

Route policies treat permit and deny rules differently for inbound and outbound traffic:

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- To permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

IP Policy Configuration Using the CLI

Configure IP policies to form a unified database of route policies that Routing Information Protocol (RIP) or Open Shortest Path First (OSPF) can use for filtering tasks.

A policy is identified by a name or an ID. Under a given policy you can have several sequence numbers, each of which is equal to one policy in the old convention. Each policy sequence number contains a set of fields. Only a subset of those fields is used when the policy is applied in a certain context. For example, if a policy has a configured set-preference field, use only when the policy is applied for accept purposes. This field is ignored when the policy is applied for announce and redistribute purposes.

You can apply one policy for one purpose, for example, RIP announce on a RIP interface. All sequence numbers under the given policy apply to that filter. A sequence number also acts as an implicit preference; a lower sequence number is preferred.

Configuring prefix lists

Configure a prefix list to allow or deny specific route updates. A prefix list policy specifies route prefixes to match. After a match occurs, the system uses the route.

The prefix list contains a set of contiguous or noncontiguous routes. Reference prefix lists by name from within a routing policy.

About This Task

Important

When you configure a prefix list for a route policy, add the prefix as a.b.c.d/32. You must enter the full 32-bit mask to exact a full match of a specific IP address.

You configure prefix lists on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure a prefix list:

```
ip prefix-list WORD<1-64> {A.B.C.D/X} [ge <0-32>] [id <1-2147483647>]
[le <0-32>]
```

3. (Optional) Rename an existing prefix list:

```
ip prefix-list WORD<1-64> name WORD<1-64>
```

4. Display the prefix list:

```
show ip prefix-list [prefix {A.B.C.D}] [vrf WORD<1-16>] [vrfids
WORD<0-512>] [WORD <1-64>]
```

Example

Configure a prefix-list. Display the prefix list.

```
Switch> enable
Switch# configure terminal
Switch(config)# ip prefix-list LIST1 192.0.2.1/255.255.255.0
Switch(config)# show ip prefix-list LIST1
=====
                        Prefix List - GlobalRouter
=====

```

	PREFIX	MASK	LEN	FROM	TO
List 1	LIST1:				
	192.0.1.2.1	24	24	24	

```
1 Total Prefix List entries configured
=====
Name Appendix for Lists Converted from Old Config:
@A=conv addr list, @N=conv net list, @NR=conv net list modified as range
```

Variable definitions

The following table defines parameters for the **ip prefix-list** command.

Variable	Value
{A.B.C.D/X}	Specifies the IP address and the mask in one of the following formats: <ul style="list-style-type: none"> • a.b.c.d/x • a.b.c.d/x.x.x.x • default
ge <0-32>	Specifies the minimum length to match. Lower bound and higher bound mask lengths together can define a range of networks.
id <1-2147483647>	Specifies the Prefix list ID.

Variable	Value
<i>le</i> <0-32>	Specifies the maximum length to match. Lower bound and higher bound mask lengths together can define a range of networks.
<i>name</i> WORD<1-64>	Renames the specified prefix list. The name length is 1-64 characters.
WORD<1-64>	Specifies the name for a new prefix list.

Use the data in the following table to use the **show ip prefix-list** command.

Variable	Value
{A.B.C.D}	Specifies the prefix to include in the command output.
<i>vrf</i> WORD<1-16>	Specifies the name of the VRF.
<i>vrfids</i> WORD<0-512>	Specifies the ID of the VRF and is an integer in the range of 0-512.
WORD<1-64>	Specifies a prefix list, by name, to use for the command output.

The following table defines parameters for the **show ip prefix-list** command output.

Variable	Value
PREFIX	Indicates the member of a specific prefix list.
MASKLEN	Indicates the prefix mask length in bits.
FROM	Indicates the prefix mask starting point in bits.
TO	Indicates the prefix mask endpoint in bits.

Configure IP Route Policies

Configure a route policy so that the device can control routes that certain packets can take. For example, you can use a route policy to deny certain Border Gateway Protocol (BGP) routes.

The route policy defines the matching criteria and the actions taken if the policy matches.

About This Task

After you create and enable the policy, you can apply it to an interface. You can apply one policy for one purpose, for example, RIP Announce, on a given RIP interface. In this case, all sequence numbers under the given policy apply to that filter.

Create and enable the policy for IS-IS accept policies for Fabric Connect for Layer 3 Virtual Services Networks (VSNs) and IP Shortcuts, then apply the IS-IS accept policy filters.

**Note**

After you create a route-map in Global Configuration mode or VRF Router Configuration mode, the device enters Route-Map Configuration mode, where you configure the action the policy takes, and define other fields the policy enforces.

**Note**

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

**Note**

You cannot configure IPv4 and IPv6 route-maps on the same match statement.

Procedure

1. Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

Optional: `router vrf WORD<1-16>`

**Note**

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Create a route-map policy by giving it a name and sequence number:

```
route-map WORD<1-64> <1-65535> [permit | deny]
```

After you enter the command, the switch automatically transitions to Route-Map Configuration mode for the new policy where you can complete the policy configuration. By default, a new policy permits the route.

3. Define the match criteria for the policy:

```
match {as-path WORD<0-256> | community WORD<0-256> | community-
exact enable | extcommunity WORD<0-1027> | interface WORD<0-259> |
local-preference <0-2147483647> |metric <0-65535> | metric-type-isis
<any|internal|external> | multicast-group WORD<0-259> | multicast-
source WORD<0-259> | network WORD<0-259> | next-hop WORD<0-259> |
protocol WORD<0-60> | route-source WORD<0-259> | route-type <any|
local|internal|external|external-1|external-2>| tag WORD<0-256> | vrf
WORD<1-16> | vrfids WORD<0-512> }
```

4. Define the action the policy takes, if not done at time of policy creation:

- Permit the route:

```
permit
```

- Ignore the route:

```
no permit
```

5. (Optional) Define the set criteria for the policy:

```
set {as-path WORD<0-256> | as-path-mode <tag|prepend> | automatic-
tag enable | community WORD<0-256> | community-mode <additive|none|
unchanged>| data-isid <1-15999999> | injectlist WORD<0-1027> | ip-
preference <0-255> | local-preference <0-2147483647> | mask <A.B.C.D>
| metric <0-65535> | metric-type <type1|type2> | metric-type-internal
<0-1> | metric-type-isis <none|internal|external>| metric-type-live-
metric | next-hop WORD<0-256> | nssa-pbit enable | origin <igp|egp|
incomplete> | origin-egp-as <0-65535>| rx-only | tag WORD<0-256> | tx-
only | weight <0-65535> }
```

6. Enable the policy:

```
enable
```

7. Display current information about the IP route policy:

```
show route-map [WORD<1-64>] [<1-65535>] [vrf WORD<1-16>] [vrfids
WORD<0-512>]
```

Example

Enter Route-Map Configuration mode for the named policy. At the route-map prompt, define the fields the policy enforces. Define the action the policy takes. Display current information about the IP route policy.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#route-map RedisStatic 1
Switch:1(route-map)#match metric 0
Switch:1(route-map)#permit
Switch:1(route-map)#show route-map RedisStatic

Variable Definitions

The following table defines the parameters for the **match** command.

Variable	Value
<i>as-path</i> WORD<0-256>	Configures the device to match the as-path attribute of the Border Gateway Protocol (BGP) routes against the contents of the specified AS-lists. This field is used only for BGP routes and ignored for all other route types. Specify the list IDs of up to four AS-lists, separated by a comma.
<i>community</i> WORD<0-256>	Configures the device to match the community attribute of the BGP routes against the contents of the specified community lists. This field is used only for BGP routes and ignored for all other route types. Specify the list IDs of up to four defined community lists, separated by a comma.
<i>community-exact</i> enable	When disabled, configures the device so match community-exact results in a match when the community attribute of the BGP routes match an entry of a community-list specified in match-community. When enabled, configures the device so match-community-exact results in a match when the community attribute of the BGP routes matches all of the entries of all the community lists specified in match-community. enable enables match community-exact.
<i>extcommunity</i> WORD <0-1027>	Configures the device to match the extended community. Specify an integer value that represents the community list ID you want to create or modify.
<i>interface</i> WORD <0-259>	If configured, configures the device to match the IP address of the interface by which the RIP route was learned against the contents of the specified prefix list. This field is used only for RIP routes and ignored for all other route types. Specify the name of up to four defined prefix lists, separated by a comma.
<i>local-preference</i> <0-2147483647>	Configures the device to match the local preference, applicable to all protocols.
<i>metric</i> <0-65535>	Configures the device to match the metric of the incoming advertisement or existing route against the specified value. If 0, this field is ignored. The default is 0.

Variable	Value
<code>multicast-group WORD<0-259></code>	Configures the device to match the multicast destination group address for the routed multicast policy. Specify the name of one or more prefix lists, separated by a comma..
<code>multicast-source WORD<0-259></code>	Configures the device to match the multicast source address for the routed multicast policy. Specify the name of one or more prefix lists, separated by a comma..
<code>network WORD <0-259></code>	Configures the device to match the destination network against the contents of the specified prefix lists. Specify the name of up to four defined prefix lists, separated by a comma.
<code>next-hop WORD<0-259></code>	Configures the device to match the next-hop IP address of the route against the contents of the specified prefix list. This field applies only to nonlocal routes. Specify the name of up to four defined prefix lists, separated by a comma.
<code>protocol WORD<0-60></code>	Configures the device to match the protocol through which the route is learned. <code>WORD <0-60></code> is xxx, where xxx is local, ospf, ebgp, ibgp,isis, rip, static, or a combination separated by a vertical bard ().
<code>route-source WORD<0-259></code>	Configures the system to match the next-hop IP address for RIP routes and advertising router IDs for OSPF routes against the contents of the specified prefix list. This option is ignored for all other route types. Specify the name of up to four defined prefix lists, separated by a comma.
<code>route-type {any local internal external external-1 external-2}</code>	Configures a specific route type to match (applies only to OSPF routes).
<code>tag WORD<0-256></code>	Specifies a list of tags used during the match criteria process. Contains one or more tag values. This parameter applies to BGP and OSPF.
<code>[vrf WORD<1-16>] [vrfs WORD<0-512>]</code>	Configures a specific VRF to match (applies only to RIP routes).

Use the data in the following table to use the **set** command.

Variable	Value
<i>as-path</i> WORD<0-256>	Configures the device to add the AS number of the AS-list to the BGP routes that match this policy. Specify the list ID of up to four defined AS-lists separated by a comma.
<i>as-path-mode</i> <tag prepend>	Configures the AS path mode. Prepend is the default configuration. The device prepends the AS number of the AS-list specified in set-as-path to the old as-path attribute of the BGP routes that match this policy. Note: Prepend does not apply to an internal BGP (iBGP) peer with outbound route policy. For more information about iBGP, see BGP on page 536.
<i>automatic-tag</i> enable	Configures the tag automatically. Used for BGP routes only.
<i>community</i> WORD<0-256>	Configures the device to add the community number of the community list to the BGP routes that match this policy. Specify the list ID of up to four defined community lists separated by a comma.
<i>community-mode</i> <additive none unchanged>	Configures the community mode. <i>additive</i> —the device prepends the community number of the community list specified in set-community to the old community path attribute of the BGP routes that match this policy. <i>none</i> —the device removes the community path attribute of the BGP routes that match this policy to the specified value.
<i>data-isid</i>	Configures the data service instance identifier (I-SID) for routed multicast policy.
<i>injectlist</i> WORD<0-1027>	Configures the device to replace the destination network of the route that matches this policy with the contents of the specified prefix list.
<i>ip-preference</i> <0-255>	Configures the preference. This applies to accept policies only.
<i>local-preference</i> <0-65535>	Configures the device to match the local preference, applicable to all protocols.
<i>mask</i> <A.B.C.D>	Configures the mask of the route that matches this policy. This applies only to RIP accept policies.

Variable	Value
<i>metric</i> <0-65535>	Configures the metric value for the route while announcing a redistribution. The default is 0. If the default is configured, the original cost of the route is advertised into OSPF for RIP, the original cost of the route or default-import-metric is used (applies to IS-IS routes also).
<i>metric-type</i> {type1 type2}	Configures the metric type for the routes to announce into the OSPF domain that matches this policy. The default is type 2. This field applies only for OSPF announce policies.
<i>metric-type-internal</i> <0-1>	Configures the MED value for routes advertised to ebgp neighbors to the IGP metric value.
<i>metric-type-isis</i> <none internal external>	Configures the metric type for IS-IS routes. The default is none. This field applies only for IS-IS policies.
<i>metric-type-live-metric</i>	Configures the metric type for BGP routes. The default is disabled. This field applies only for BGP policies.
<i>next-hop</i> WORD <1-256>	Specifies the IP address of the next-hop router. Both IPv4 and IPv6 addresses are supported.
<i>nssa-pbit</i> enable	Configures the not so stubby area (NSSA) translation P bit. Applicable to OSPF announce policies only.
<i>origin</i> {igp egp incomplete}	Configures the device to change the origin path attribute of the BGP routes that match this policy to the specified value.
<i>origin-egp-as</i> <0-65535>	Indicates the remote autonomous system number. Applicable to BGP only.
<i>rx-only</i>	Configures rx only for routed multicast policy.
<i>tag</i> <0-65535>	Configures the tag of the destination routing protocol. If not specified, the device forwards the tag value in the source routing protocol. A value of 0 indicates that this parameter is not configured. This parameter applies to BGP.
<i>tx-only</i>	Configures tx only for routed multicast policy.
<i>weight</i> <0-65535>	Configures the weight value for the routing table. For BGP, this value overrides the weight configured through NetworkTableEntry, FilterListWeight, or NeighborWeight. Used for BGP only. A value of 0 indicates that this parameter is not configured.

Use the data in the following table to use the **name** command.

Variable	Value
<i>WORD<1-64></i>	Renames a policy and changes the name field for all sequence numbers under the given policy.

Configure a Policy to Accept External Routes from a Router

Perform this procedure to configure a policy to accept external routes from a specified advertising router.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Create a policy to accept external routes from a specified advertising route:

```
accept adv-rtr <A.B.C.D>
```

3. Exit to the Privileged EXEC mode.

```
exit
```

4. Apply the OSPF accept policy change:

```
ip ospf apply accept adv-rtr <A.B.C.D>
```

5. Confirm your configuration:

```
show ip ospf accept
```

Example

Log on to the OSPF Router Configuration mode:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
```

Create a policy to accept external routes from a specified advertising route:

```
Switch:1(config-ospf)#accept adv-rtr 192.0.2.122
```

Enable an OSPF accept entry for a specified advertising route:

```
Switch:1(config-ospf)#accept adv-rtr 192.0.2.122 enable
```

Exit to the Privileged EXEC mode:

```
Switch:1(config-ospf)#exit
Switch:1(config)#exit
```

Apply the OSPF accept policy change and confirm your configuration:

```
Switch:1#ip ospf apply accept adv-rtr 192.0.2.122
Switch:1#show ip ospf accept
=====
Ospf Accept - GlobalRouter
=====
ADV_RTR      MET_TYPE ENABLE POLICY
-----
192.0.2.122  -      FALSE
```

Variable Definitions

Use the data in the following table to use the **accept adv-rtr** command.

Variable	Value
<A.B.C.D>	Specifies the IP address.
<i>enable</i>	Enables an OSPF accept entry for a specified advertising router.
<i>metric-type {any type1 type2 }</i>	Indicates the OSPF external type. This parameter describes which types of OSPF external routes match this entry. <i>any</i> means match all external routes. <i>type1</i> means match external type 1 only. <i>type2</i> means match external type 2 only.
<i>route-map WORD<0-64></i>	Specifies the name of the route policy to use for filtering external routes advertised by the specified advertising router before accepting into the routing table.

Apply OSPF Accept Policy Changes

Apply OSPF accept policy changes to enable the configuration changes in the policy to take effect in an OSPF Accept context (and to prevent the device from attempting to apply the changes one by one after each configuration change).

About This Task

Important

Changing OSPF Accept contexts is a process-oriented operation that can affect system performance and network accessibility while you perform the procedures. If you want to change the default preferences for an OSPF Accept or a prefix-list configuration (as opposed to the default preference), do so before enabling the protocols.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Apply an OSPF accept policy change:
`ip ospf apply accept [vrf WORD<1-16>]`
3. Display information about the configured OSPF entries:
`show ip ospf accept [vrf WORD<1-16>] [vrfs WORD<0-512>]`

Example

Apply the OSPF accept policy and confirm the configuration:

```
Switch:1>enable
Switch:1#ip ospf apply accept
Switch:1>show ip ospf accept
=====
Ospf Accept - GlobalRouter
=====
ADV_RTR      MET_TYPE ENABLE POLICY
-----
192.0.2.11   type1    true   test1
```

Variable Definitions

Use the data in the following table to use the **ip ospf apply accept adv-rtr** command.

Variable	Value
<i>adv-rtr</i>	Commits entered changes. Issue this command after you modify a policy configuration that affects an OSPF accept policy.
<i>vrf WORD<1-16></i>	Specifies the name of the VRF.

Configure Inter-VRF Redistribution Policies

Configure redistribution entries to allow a protocol to announce routes of a certain source type, for example, static, RIP, or direct.

Before You Begin

- Ensure the routing protocols are globally enabled.
- You must configure the route policy, if required.
- Ensure the VRFs exist.
- You must create the route policy and prefix list under the source VRF context.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

Note

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Create the redistribution instance:

```
ip <bgp|ospf|rip> redistribute <bgp|direct|ipv6-direct|ipv6-isis|ipv6-
static|isis|ospf|ospfv3|rip|static|dvr>
```

3. Apply a route policy if required:

```
ip <bgp|ospf|rip> redistribute <bgp|direct|ipv6-direct|ipv6-isis|ipv6-
static|isis|ospf|ospfv3|rip|static|dvr> route-map <WORD 0-64> [vrf-src
<WORD 1-16>]
```

4. Use the following variable definitions table to configure other parameters as required.

5. Enable the redistribution:

```
ip <bgp|ospf|rip> redistribute <bgp|direct|ipv6-direct|ipv6-isis|ipv6-
static|isis|ospf|ospfv3|rip|static|dvr> enable [vrf-src <WORD 1-16>]
```

6. Ensure that the configuration is correct:

```
show ip <bgp|ospf|rip> redistribute [vrf WORD<1-16>] [vrfids
WORD<0-512>]
```

For RIPng, use `show ipv6 rip redistribute`.

7. Apply the redistribution:

```
ip <bgp|ospf|rip> apply redistribute <bgp|direct|ipv6-direct|ipv6-
isis|ipv6-static|isis|ospf|ospfv3|rip|static|dvr> [vrf WORD<1-16>]
[vrf-src WORD<1-16>]
```

Example

```
Switch:1>enable
Switch:1#config terminal
```

Log on to the VRF Router Configuration mode:

```
Switch:1(config)#router vrf test
```

Create the redistribution instance:

```
Switch:1(router-vrf)#ip rip redistribute ospf
```

Enable the redistribution

```
Switch:1(router-vrf)#ip rip redistribute ospf enable
```

Ensure that the configuration is correct:

```
Switch:1(router-vrf)#show ip rip redistribute
```

Exit to Global Configuration mode:

```
Switch:1(router-vrf)#exit
```

Apply the redistribution:

```
Switch:1(config)#ip rip apply redistribute ospf
```

Variable definitions

Use the data in the following table to use the redistribution commands.

Variable	Value
<code><bgp direct isis ospf rip static dvr></code>	Specifies the type of routes to redistribute—the protocol source.
<code>vrf WORD<1-16></code>	Specifies the VRF instance.
<code>vrfids WORD<0-512></code>	Specifies a list of VRF IDs.
<code>vrf-src WORD<1-16></code>	Specifies the source VRF instance. This parameter is not required for redistribution within the same VRF.

Use the data in the following table to use the **ip <bgp|ospf|rip> redistribute <bgp|direct|isis|ospf|rip|static|dvr>** command.

Variable	Value
<code>apply [vrf-src WORD<1-16>]</code>	Applies the redistribution configuration.
<code>enable [vrf-src WORD<1-16>]</code>	Enables the OSPF route redistribution instance.
<code>metric <metric-value> [vrf-src WORD<1-16>]</code>	Configures the metric to apply to redistributed routes.
<code>metric-type <type1 type2> [vrf-src WORD<1-16>]</code>	Specifies a type 1 or a type 2 metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone.
<code>route-map <WORD 0-64> [vrf-src WORD<1-16>]</code>	Configures the route policy to apply to redistributed routes.
<code>subnets <allow suppress> [vrf-src WORD<1-16>]</code>	Allows or suppresses external subnet route advertisements when routes are redistributed into an OSPF domain.

IP Policy Configuration using Enterprise Device Manager

You can form a unified database of route policies that the protocols (RIP, OSPF or Border Gateway Protocol [BGP]) can use for any type of filtering task.

For information about configuring a prefix list, see [Configure a Prefix List](#) on page 3274. For more information about community list, see [Configure a Community Access List](#) on page 653. For more information about AS path list, see [Configure an AS Path List](#) on page 652.

A name or an ID identifies a policy. Under a policy you can have several sequence numbers, each of which is equal to one policy in the old convention. If a field in a policy is not configured, the system displays it as 0 or any when the system displays it in Enterprise Device Manager (EDM). This means that the field is ignored in the match criteria. You can use the clear option to remove existing configurations for any field.

Each policy sequence number contains a set of fields. Only a subset of those fields is used when the policy is applied in a certain context. For example, if a policy has a set-preference field set, it is used only when the policy is applied for accept purposes. This field is ignored when the policy is applied for announce and redistribute purposes.

You can apply only one policy for one purpose (for example, RIP Announce on a given RIP interface). In that example, all sequence numbers under the given policy are applicable for that filter. A sequence number also acts as an implicit preference: a lower sequence number is preferred.

Configure a Prefix List

Configure a prefix list to allow or deny specific route updates. A prefix list policy specifies route prefixes to match. After a match occurs, the system uses the route.

The prefix list contains a set of contiguous or non-contiguous routes. Reference prefix lists by name from within a routing policy.

Before You Begin

To perform this procedure on a non-default VRF, you must first change the VRF instance. You cannot launch a VRF Context View for the derived name of the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100. All parameters might not be available in non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **Policy**.
3. Select the **Prefix List** tab.
4. Select **Insert**.
5. For **Id**, type an ID for the prefix list.
6. For **Prefix**, type an IP address for the route.
7. For **PrefixMaskLength**, type the length of the prefix mask.
8. Configure the remaining parameters as required.
9. Select **Insert**.

Prefix List Field Descriptions

Use the data in the following table to use the **Prefix List** tab.

Name	Description
Id	Configures the list identifier.
Prefix	Configures the IP address of the route.
PrefixMaskLen	Configures the specified length of the prefix mask. You must enter the full 32-bit mask to exact a full match of a specific IP address, for example, if you create a policy to match on the next hop.

Name	Description
Name	Names a specified prefix list during the creation process or renames the specified prefix list. The name length can use from 1 to 64 characters.
MaskLenFrom	Configures the lower bound of the mask length. The default is the mask length. Lower bound and higher bound mask lengths together can define a range of networks.
MaskLenUpto	Configures the higher bound mask length. The default is the mask length. Lower bound and higher bound mask lengths together can define a range of networks.

Configure a Route Policy

Configure a route policy so that all protocols use them for In, Out, and Redistribute purposes.

Before You Begin

To perform this procedure on a non-default VRF, you must first change the VRF instance. You cannot launch a VRF Context View for the derived name of the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100. All parameters might not be available in non-default VRFs.

Procedure

1. In the navigation pane, expand: **Configuration > IP**.
2. Select **Policy**.
3. Select the **Route Policy** tab.
4. Select **Insert**.
5. Enter the appropriate information for your configuration in the Insert Route Policy dialog box.
6. Select **Insert**.

Route Policy Field Descriptions

Use the data in the following table to use the **Route Policy** tab.

Name	Description
Id	Specifies the ID of an entry in the Prefix list table.
SequenceNumber	Specifies a policy within a route policy group.
Name	Specifies the name of the policy. This command changes the name field for all sequence numbers under the given policy.

Name	Description
Enable	Indicates whether this policy sequence number is enabled or disabled. If disabled, the policy sequence number is ignored. The default is disabled.
Mode	Specifies the action to take when a policy is selected for a specific route. Select permit (allow the route) or deny (ignore the route). The default is permit.
MatchProtocol	Selects the appropriate protocol. If configured, matches the protocol through which the route is learned. This parameter applies only for RIP Announce purposes. The default is to enable all match protocols.
MatchNetwork	Specifies if the system matches the destination network against the contents of the specified prefix list.
MatchIpRouteSource	<p>Specifies if the system matches the next-hop IP address for RIP routes and advertising router IDs for OSPF routes against the contents of the specified prefix list. This option is ignored for all other route types.</p> <p>Select the ellipsis and choose from the list in the Match Route Source dialog box. You can select up to four entries. To clear an entry, use the ALT key.</p> <p>You can also change this field in the Route Policy tab of the Policy dialog box.</p>
MatchIpRouteDest	Specifies if the system matches the next-hop IP address for RIP routes and advertising router IDs for OSPF routes against the contents of the specified prefix list. This option is ignored for all other route types.
MatchNextHop	<p>Specifies if the system matches the next-hop IP address of the route against the contents of the specified prefix list. This field applies only to nonlocal routes.</p> <p>Select the ellipsis and choose from the list in the Match Next Hop dialog box. You can select up to four entries. To clear an entry, use the ALT key.</p>

Name	Description
MatchInterface	Specifies if the system matches the IP address of the interface by which the RIP route was learned against the contents of the specified prefix list. This field is used only for RIP routes and ignored for all other type of route. Select the ellipsis and choose from the list in the Match Interface dialog box. You can select up to four entries. To clear an entry, use the ALT key.
MatchRouteType	Configures a specific route type to match (applies only to OSPF routes). Externaltypel and Externaltypel2 specify the OSPF routes of the specified type only. OSPF internal refers to intra- and inter-area routes. The default is any.
MatchMetric	Specifies if the system matches the metric of the incoming advertisement or existing route against the specified value. If 0, this field is ignored. The default is 0.
MatchMetricTypeelsis	Specifies the match metric type field in the incoming IS-IS routes in accept policy.
IpRoutePolicyMatchIpMcastGroup	Specifies the system matches the IP multicast destination group for the routed multicast policy.
IpRoutePolicyMatchIpMcastSource	Specifies the system matches the IP multicast source address for the routed multicast policy.
MatchAsPath	Configures if the system matches the BGP autonomous system path. This parameter applies to BGP and overrides the BGP neighbor filter list information.
MatchCommunity	Filters incoming and outgoing updates based on a Community List. This parameter applies to BGP. The default is disable.
MatchCommunityExact	Indicates if the match must be exact (that is, all of the communities specified in the path must match). This parameter applies to BGP. The default is disabled.
MatchTag	Specifies a list of tags used during the match criteria process. This parameter applies to BGP and OSPF.
MatchVrf	Identifies the source VRFs that leaks routes to the local VRF (applies only to RIP routes).
MatchLocalPref	Specifies the local preference value to be matched.

Name	Description
NssaPbit	Configures or resets the P bit in specified type 7 link state advertisements (LSA). By default, the Pbit is always configured in case the user configures the Pbit to a disable state for a particular route policy other than all type 7. LSAs associated with that route policy have the Pbit cleared. With this intact, not so stubby area (NSSA) area border router (ABR) does not perform translation of these LSAs to type 5. The default is enable.
SetRoutePreference	Configures a preference value. The default value is 0. If the default is configured, the global preference value is used. When configured to a value greater than zero, specifies the route preference value assigned to the routes that matches the policy. This feature applies to accept policies only.
SetMetricTypeInternal	Identifies the MED value for routes advertised to BGP numbers to the Interior Gateway Protocol (IGP) metric value. The value must be 0 or 1. The default is 0.
SetMetricTypeIspis	Sets the metric type IS-IS.
SetMetric	Configures the system to use the metric value for the route while announcing or redistributing. The default-import-metric is 0. If the default is configured, the original cost of the route is advertised into OSPF; for RIP, the original cost of the route or the default value is used (applies to IS-IS routes also). The default is 0.
SetMetricType	Configures the metric type for the routes to announce into the OSPF routing protocol that matches this policy. Applicable to OSPF protocol only. The default is type 2. This field is applicable only for OSPF announce policies. The default is type2.
SetNextHop	Configures the IP address of the next-hop router. This parameter applies to BGP. The default is 0.0.0.0.
SetInjectNetList	Configures the destination network of the route that matches this policy with the contents of the specified prefix list. Select the ellipsis and choose from the list in the Set Inject NetList dialog box.
SetMask	Configures the mask of the route that matches this policy. This applies only to RIP accept policies.

Name	Description
SetAsPath	<p>Indicates the AS path value to use whether the SetAsPathMode field is Tag or Prepend. This parameter applies to BGP.</p> <p>Note: Prepend is not applicable to an internal BGP (iBGP) peer with outbound route policy.</p>
SetAsPathMode	<p>Configures if the system converts the tag of a route into an AS path. This parameter applies to BGP. The mode is either Tag or Prepend tag. The value is applicable only while redistributing routes to BGP. The default is prepend.</p> <p>Note: Prepend does not apply to an iBGP peer with outbound route policy.</p>
SetAutomaticTag	<p>Enables the automatic tag feature. This parameter applies to BGP. The default is disable.</p>
SetCommunityNumber	<p>Configures the community number for BGP advertisements. This value can be a number (1 to 42949672000) or no-export or no-advertise.</p>
SetCommunityMode	<p>Configures the community mode for the BGP protocol. This value can be either append, none, or unchanged. The default is unchanged.</p> <ul style="list-style-type: none"> Unchanged—keeps the community attribute in the route path as it is. None—removes the community in the route path additive. Append—adds the community number specified in SetCommunityNumber to the community list attribute.
SetExtCommunity	<p>Configures a BGP community.</p>
SetExtCommunityMode	<p>Configures the extended-community mode. The value can be append, unchanged, or overwrite. The default value is unchanged.</p> <ul style="list-style-type: none"> append — creates another community string. unchanged — keeps the community attribute as it is. overwrite — changes the current value.

Name	Description
SetOrigin	Configures the origin for BGP to IGP, EGP, incomplete, or unchanged. If not configured, the system uses the route origin from the IP routing table (protocol). The default is unchanged.
SetLocalPref	Configures the local preference for BGP. The system uses this value during the route decision process for the BGP protocol. The default is 0.
SetOriginEgpAs	Indicates the remote autonomous system number for BGP. The default is 0.
SetWeight	Configures the weight value for the routing table for BGP. This field must be used with the match as-path condition. For BGP, this value overrides the weight configured through the NetworkTableEntry, FilterListWeight, or NeighborWeight. The default is 0.
SetTag	Configures a tag. The default is 0. This parameter applies to BGP.
Ipv6SetNextHop	Specifies the address of the IPv6 next hop router.
SetDatalsid	Configures the data I-SID for SPB routed multicast Policy that associates with the IP multicast groups (sender and receiver). This field should match the route-map.
SetRxOnly	Configures SPB routed multicast policy with permit action that allows only local receivers, not local senders. The default is disabled.
SetTxOnly	Configures a route-map of SPB routed multicast policy with permit action that allows only local senders, not local receivers. The default is disabled.

Apply a Route Policy

Apply route policies to define route behavior.

About This Task

Important

Changing route policies or prefix lists that affect OSPF accept or redistribute is a process-oriented operation that can affect system performance and network reachability while you perform the procedures. Therefore, if you want to change a prefix list or a routing protocol, you configure all route policies and prefix lists before enabling the protocols.

Procedure

1. In the navigation pane, expand: **Configuration > IP**.
2. Select **Policy**
3. Select the **Applying Policy** tab.
4. Select the type of policy to apply.
5. Select **Apply**.

Applying Policy Field Descriptions

Use the data in the following table to use the **Applying Policy** tab.

Name	Description
RoutePolicyApply	Specifies that configuration changes in the policy take effect in an OSPF route policy context. This prevents the system from attempting to apply the changes one by one after each configuration change. The default is enabled.
RedistributeApply	Specifies that configuration changes in the policy take effect for an OSPF Redistribute context. This prevents the system from attempting to apply the changes one-by-one after each configuration change. The default is enabled.

Configure an OSPF Accept Policy

Perform the following procedure to create or configure an OSPF accept policy.

Before You Begin

To perform this procedure on a non-default VRF, you must first change the VRF instance. You cannot launch a VRF Context View for the derived name of the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100. All parameters might not be available in non-default VRFs.

Procedure

1. In the navigation pane, expand: **Configuration > IP**.
2. Select **Policy**.
3. Select the **OSPF Accept** tab.
4. Select **Insert**.
5. Configure the parameters as required.
6. Select **Insert**.

OSPF Accept *Field Descriptions*

Use the data in the following table to use the **OSPF Accept** tab.

Name	Description
AdvertisingRtr	Specifies the routing ID of the advertising router.
Enable	Enables or disables the advertising router. You can also enable or disable advertising in the OSPF Accept tab of the Policy dialog box by selecting in the field and selecting enable or disable from the menu. The default is disable.
MetricType	Specifies the OSPF external type. This parameter describes which types of OSPF ASE routes match this entry. <ul style="list-style-type: none">Any means match either ASE type 1 or 2Type1 means match any external type 1Type2 means match any external type 2 You can also select your entry in the OSPF Accept tab of the Policy dialog box by selecting in the field and selecting any, type1, or type2 from the menu. The default is any.
PolicyName	Specifies the name of the OSPF in filter policy. Select the ellipsis and choose from the list in the Policy Name dialog box. To clear an entry, use the ALT key.

Configure Inbound and Outbound Filtering Policies on a RIP Interface

Before You Begin

To perform this procedure on a non-default VRF, you must first change the VRF instance. You cannot launch a VRF Context View for the derived name of the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100. All parameters might not be available in non-default VRFs.

About This Task

Configure inbound filtering on a RIP interface to determine whether to learn a route on a specified interface and to specify the parameters of the route when it is added to the routing table. Configure outbound filtering on a RIP interface to determine whether to advertise a route from the routing table on a specified interface and to specify the parameters of the advertisement.

The port on which the multimedia filter is enabled becomes a DIFFSERV access port.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **Policy**.
3. Select the **RIP In/Out Policy** tab.
4. In the desired row, double-click the **InPolicy** or **OutPolicy** column.

5. Select a preconfigured In/Out policy, and then select **OK**.

RIP In/Out Policy Field Descriptions

Use the data in the following table to use the **RIP In/Out Policy** tab.

Name	Description
Address	Specifies the IP address of the RIP interface.
Interface	Specifies the internal index of the RIP interface.
InPolicy	Specifies the policy name used for inbound filtering on this RIP interface. This policy determines whether to learn a route on this interface and specifies the parameters of the route when it is added to the routing table.
OutPolicy	Specifies the policy name used for outbound filtering on this RIP interface. This policy determines whether to advertise a route from the routing table on this interface and specifies the parameters of the advertisement.

Delete Inbound or Outbound Filtering Policies on a RIP Interface

Delete a RIP In or Out policy when you no longer want the switch to learn a route on a specified interface or advertise a route from the routing table on a specified interface.

Before You Begin

To perform this procedure on a non-default VRF, you must first change the VRF instance. You cannot launch a VRF Context View for the derived name of the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100. All parameters might not be available in non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **Policy**.
3. Select the **RIP In/Out Policy** tab.
4. In the desired row, double-click the **InPolicy** or **OutPolicy** column for the policy you want to delete.
5. In the **InPolicy** or **OutPolicy** dialog box, press **CTRL** and then, select the policy you want to delete.
6. Select **OK**.
7. Select **Apply**.

RSMLT

In many cases, core network convergence time depends on the length of time a routing protocol requires to successfully converge. Depending on the specific routing protocol, this convergence time can cause network interruptions that range from seconds to minutes.

Routed Split MultiLink Trunking (RSMLT) permits rapid failover for core topologies by providing an active-active router concept to core SMLT networks.

RSMLT scenarios include SMLT triangles, squares, and SMLT full-mesh topologies, with routing enabled on the core VLANs.

Routing protocols include the following:

- IP Unicast Static Routes
- RIP1
- RIP2
- OSPF
- BGP

In the event of core router failures, RSMLT manages packet forwarding, thus eliminating dropped packets during the routing protocol convergence.

IPv6 RSMLT

Routed Split Multi-Link Trunking (RSMLT) is an enhancement to SMLT that enables the exchange of Layer 3 information between peer nodes in a switch cluster. RSMLT provides two main advantages over SMLT:

- provides backup for the peer after the peer goes down
- routes traffic on behalf of the peer to prevent Virtual Inter-Switch Trunk (vIST) overload

IPv6 RSMLT enables the subsecond failover for IPv6 forwarding.

The overall model for IPv6 RSMLT is essentially identical to that of IPv4 RSMLT. In short, RSMLT peers exchange their IPv6 configuration and track their states by using vIST messages. An RSMLT node always performs IPv6 forwarding on the IPv6 packets destined to the MAC addresses of the peer. If an RSMLT node detects that the RSMLT peer is down, the node forwards IPv6 traffic destined to the IPv6 addresses of the peer.

With RSMLT enabled, an SMLT switch performs IP forwarding on behalf of the SMLT peer, which prevents IP traffic from being sent over the vIST.

IPv6 RSMLT supports the full set of topologies and features supported by IPv4 RSMLT, including SMLT triangles, squares, and SMLT full-mesh topologies, with routing enabled on the core VLANs.

Because you configure RSMLT on a VLAN, not at the IP layer, the configuration applies to both IPv4 and IPv6. You cannot enable or disable RSMLT on a VLAN for IPv6 but not IPv4; or for IPv4 but not IPv6.

With IPv6, you must configure the RSMLT peers to use the same set of IPv6 prefixes.

Supported routing protocols include the following:

- IPv6 static routes

- OSPFv3

**Note**

IPv6 RSMLT is not virtualized, therefore it is not possible to enable IPv6 and RSMLT together on a VLAN which is associated with a VRF.

The system will display the configuration errors if you attempt to perform the following:

- Create an IPv6 interface on a VLAN which is associated with a VRF and RSMLT is enabled on the VLAN.
- Enable RSMLT on an IPv6 enabled VLAN which is associated with a VRF.

IPv6 differences

The following list identifies ways in which the IPv6 implementation of RSMLT differs from the IPv4 implementation of RSMLT.

- After the switch begins to forward traffic on behalf of the peer, duplicate address detection (DAD) is not executed for the IPv6 address of the peer. The implementation assumes that the peer IPv6 address is already known to be unique.
- An RSMLT switch installs a neighbor entry for the peer IPv6 address immediately after the peer disappearance is detected, possibly while a route for the peer still exists. This action can result in packets destined to the peer IPv6 address being delivered to the CP for a short period of time.
- You cannot configure a vIST with IPv6 peer address
- In a dual-stack VLAN, adding or deleting IPv4 or IPv6 does not affect the RSMLT functionality of one another. If you add IPv4 or IPv6 to an existing IPv6 or IPv4 RSMLT VLAN, the RSMLT state for the protocol you add second will be the same as the previous RSMLT state.

SMLT and RSMLT Operation in Layer 3 Environments

[Router R1 Failure](#) on page 3288 shows a typical redundant network example with user aggregation, core, and server access layers. To minimize the creation of many IP subnets, one VLAN (VLAN 1, IP subnet A) spans all wiring closets.

SMLT provides the loop-free topology and forwards all links for VLAN 1, IP subnet A.

The aggregation layer switches are configured with routing enabled and provide active-active default gateway functionality through RSMLT.

After you enable RSMLT on a VLAN (on both aggregation devices), the cluster devices simply inform each other (over vIST messaging) of their physical IP and MAC on that VLAN. Thereafter, the two cluster devices take mutual ownership of their IP addresses on that VLAN. This action means each cluster device routes IP traffic that is directed to the physical MAC of the IP or the physical MAC of the peer IP on that VLAN, and when one of them is down the other cluster device:

- Replies to ARP requests for both the IP and the peer IP on that VLAN
- Replies to pings to the IP and the peer IP on that VLAN

In this case, routers R1 and R2 forward traffic for IP subnet A. RSMLT provides both router failover and link failover. For example, if the Split MultiLink Trunk link between R2 and R4 is broken, the traffic fails over to R1 as well.

For IP subnet A, VRRP with a backup master can provide the same functionality as RSMLT, as long as no additional router is connected to IP subnet A.

RSMLT provides superior router redundancy in core networks (IP subnet B), where OSPF is used for the routing protocol. Routers R1 and R2 provide router backup for each other, not only for the edge IP subnet A, but also for the core IP subnet B. Similarly routers R3 and R4 provide router redundancy for IP subnet C and also for core IP subnet B.

Router R1 Failure

The following figure shows SMLT and RSMLT in Layer 3 environments.

Figure 217: SMLT and RSMIT in Layer 3 environments

R3 and R4 both use R1 as their next hop to reach IP subnet A. Even though R4 sends the packets to R2, they are routed directly at R2 into subnet A. R3 sends its packets to R1 and they are also sent directly into subnet A. After R1 fails, all packets are directed to R2, with SMLT. R2 still routes for R2 and R1. After OSPF convergence, the routing tables in R3 and R4 change their next hop to R2 to reach IP subnet A. You can configure the hold-up timer (that is, for the amount of time R2 routes for R1 in a failure) for a time period greater than the routing protocol convergence, you can configure it as indefinite (that is, the members of the pair always route for each other).

Use an indefinite hold-up timer value for applications that use RSMLT at the edge instead of VRRP.

Router R1 Recovery

When R1 restarts after a failure, it does not route traffic for R2, nor does it provide backup for R2, until the hold-down timer expires. Similar to VRRP, the hold-down timer value must be greater than the time the routing protocol requires to converge its tables.

During the hold-down interval, R1 routes traffic if the destination MAC of the packet is its own routable VLAN MAC. R1 bridges incoming traffic to R2 if the destination MAC of the packet is the routable VLAN MAC of R2. A temporary default route (one having a route preference equal to 4) that points to R2 is installed on R1. R1 uses this temporary route to forward traffic to R2 that it cannot route itself because of the incomplete routing table; the default route is not saved in the configuration file.

After the hold-down timer expires, the temporary default route that points to R2 is deleted; from this moment on, in addition to routing packets destined to itself, R1 starts routing packets for R2, as well.

RSMLT Network Design and Configuration

Because RSMLT is based on SMLT, all SMLT configuration rules apply. In addition, RSMLT is enabled on the SMLT aggregation switches for each VLAN. The VLAN must be a member of SMLT links and vIST's L2VSN. For more information about how to configure SMLT in a Layer 2 environment, see [MultiLink Trunking and Split MultiLink Trunking](#) on page 2657.

The VLAN also must be routable (IP address configured) and you must configure an Interior Gateway Protocol (IGP) such as OSPF on all four routers, although it is independent of RSMLT. All routing protocols, even static routes, work with RSMLT.

The RSMLT pair switches provide backup for each other. As long as one of the two routers of a vIST pair is active, traffic forwarding is available for both next hops R1/R2 and R3/R4.

RSMLT Edge Support

The switch stores the peer MAC and IP address pair in its local configuration file and restores the configuration if the peer does not restore after a simultaneous restart of both RSMLT-peer switches.

The RSMLT edge support feature adds an enhancement whereby the peer MAC (for the IP on the VLAN) is committed to the config.cfg file after you use the **save config** command. If you power off both devices, and then power up only one of them, that single device can still take ownership of its peer IP on that VLAN even if it has not seen that peer switch since it started. This enhancement is necessary if you configure the peer (the device which is still down) IP as the default gateway in end stations.

If you enable RSMLT edge support, you must also ensure that the hold-up timer for RSMLT on those edge VLANs equals infinity (9999). This timer value ensures that if one cluster device fails, the remaining cluster device maintains ownership of the failed peer IP indefinitely.

The edge VLAN can be tagged over SMLT links, single attached links, or more SMLT links.

**Important**

If you clear the peer information the device can stop forwarding for the peer.

RSMLT implementation does not use a virtual IP address but instead uses physical IP addresses for redundancy. At the same time, you can deploy RSMLT in either routed configurations, or edge configurations, where you previously used VRRP (and back-up master). Previously, if a power outage occurred or a shutdown of both switches within a dual core vIST pair, only one device came back up. Clients using the powered-off device IP/MAC as the default gateway lost connectivity to the network. In such a scenario, even with RSMLT enabled on the device, it cannot act as a backup for the peer as it was unaware of the peer IP or MAC address.

After both the dual core vIST switches come back, the vIST is operational. If an RSMLT peer-enabled message is received from the peer, normal RSMLT operation occurs.

If the peer has either an IP or MAC change, you must save the configuration for the RSMLT edge support to operate correctly. However, if the vIST peer up message is not received (for example, if you do not enable RSMLT properly), and you enable the RSMLT edge support flag, the RSMLT hold-down timer starts and permits routing protocols to converge; during this time user operation can be affected. After the hold-down timer expires, saved peer information is picked up and the device starts to act as backup for the peer by adding the previously saved MAC and ARP records.

The hold-up timer starts and after this timer expires the previously added MAC and ARP records are deleted and the device stops acting as backup for the peer, as the peer is not running proper RSMLT for the VLAN. The RSMLT is a parameter for each VLAN, and therefore all affects are on an individual VLAN basis, not necessarily a global device. Edge support mode uses the local values of the hold-down timer (default value of 60 seconds) and hold-up timer (default value of 180 seconds).

RSMLT Configuration using CLI

Use the procedures in this section to configure RSMLT using CLI.

Configure RSMLT on a VLAN

Configure RSMLT on a VLAN to exchange Layer 3 information between peer nodes in a switch cluster. This configuration applies to both IPv4 and IPv6.

Before You Begin

- An IP routing protocol is enabled on VLAN Layer 3 interfaces.
- VLANs with Layer 3 interfaces participate in Split MultiLink Trunking (SMLT).

About This Task

The VLAN can be either IPv4 or IPv6, or both. RSMLT configuration on a VLAN simultaneously affects both IPv4 and IPv6. By default, RSMLT is disabled on a VLAN.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```

2. Configure the holddown timer:

```
ip rsmlt holddown-timer <0-3600>
```

3. Configure the holdup timer:

```
ip rsmlt holdup-timer <0-9999>
```

4. Enable RSMLT on the VLAN:

```
ip rsmlt
```

Example

Configure and enable RSMLT on a VLAN:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 100
Switch:1(config-if)#ip rsmlt holddown-timer 100
Switch:1(config-if)#ip rsmlt holdup-timer 200
Switch:1(config-if)#ip rsmlt
```

Variable Definitions

The following table defines parameters for the **ip rsmlt** command.

Variable	Value
<i>holddown-timer</i> <0-3600>	<p>Defines how long the recovering or restarting system remains in a non-Layer 3 forwarding mode for the peer router MAC address. The default is 60.</p> <p>Configure this value to be longer than the anticipated routing protocol convergence.</p> <p>If you disable RSMLT on a VLAN, non default values for this variable do not save across restarts.</p>
<i>holdup-timer</i> <0-3600 9999>	<p>Defines how long the RSMLT system maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 1800.</p> <p>If you disable RSMLT on a VLAN, non default values for this variable do not save across restarts.</p>

The following table defines parameters for the **interface** command.

Variable	Value
<1-4059>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.

Enable RSMLT Edge Support

Enable RSMLT Edge support to store the RSMLT peer MAC and IP address-pair in the local configuration file and restore the configuration if the peer does not restore after a simultaneous restart of both RSMLT peer systems.

If enabled, peer MAC and IP information for all RSMLT-enabled VLANs is saved after you next use the **save config** command.

About This Task

RSMLT Edge support configuration applies to both IPv4 and IPv6. You do not configure IPv4 and IPv6 separately.

The RSMLT Edge support default is disabled.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable RSMLT Edge support:

```
ip rsmlt edge-support
```

Example

If you have enabled RSMLT Edge Support, disable the feature as follows:

```
Switch:1(config)#no ip rsmlt edge-support
```

View RSMLT Information

Show RSMLT information to view data about all RSMLT interfaces. The output of the command includes IPv6 information for the local and peer nodes.

About This Task

If you use the **show ip rsmlt** command after you delete an RSMLT, the RSMLT still shows in the command output until you restart the switch.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Show RSMLT information about the interface:
show ip rsmlt [local|peer] [vrf WORD<1-16>] [vrfrids WORD<0-512>]
3. View the status of the switch to act as a peer forwarder:
show ip rsmlt edge-support

Examples

```
Switch:1>show ip rsmlt
```

```

```

Variable definitions

Use the data in the following table to use the **show ip rsmlt** command.

Variable	Value
<i>local</i>	Shows local RSMLT information.
<i>peer</i>	Shows RSMLT information for the peer.
<i>vrf WORD<1-16></i>	Shows information for a specific VRF name.
<i>vrfids WORD<0-512></i>	Shows information for a specific VRF ID.

RSMLT Configuration using EDM

Use the procedures in this section to configure RSMLT using EDM.

Configure RSMLT on a VLAN

Before You Begin

- Enable an IP routing protocol on VLAN Layer 3 interfaces.
- Ensure VLANs with Layer 3 interfaces participate in Split MultiLink Trunking (SMLT).

About This Task

Configure RSMLT on a VLAN to exchange Layer 3 information between peer nodes in a switch cluster. This configuration applies to both IPv4 and IPv6.

The VLAN can be either IPv4 or IPv6, or both. RSMLT configuration on a VLAN simultaneously affects both IPv4 and IPv6.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.

2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select a VLAN.
5. Select **IP**.
6. Select the **RSMLT** tab.
7. Select **Enable**.
8. In **HoldDownTimer**, type a hold-down timer value.
9. In **HoldUpTimer**, type a holdup timer value.
10. Select **Apply**.

RSMLT Field Descriptions

Use the data in the following table to use the **RSMLT** tab.

Name	Description
Enable	Enables RSMLT. The default is disabled.
HoldDownTimer	<p>Defines how long the recovering or restarting system remains in a non-Layer 3 forwarding mode for the peer router MAC address.</p> <p>The range of this value is from 0 to 3600 seconds. The default is 60.</p> <p>If you disable RSMLT on a VLAN, non default values for this field do not save across restarts.</p>
HoldUpTimer	<p>Defines how long the RSMLT system maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 1800.</p> <p>If you disable RSMLT on a VLAN, non default values for this field do not save across restarts.</p>

Enable RSMLT Edge support

About This Task

Enable RSMLT Edge support to store the RSMLT peer MAC and IP address-pair in the local configuration file and restore the configuration if the peer does not restore after a simultaneous restart of both RSMLT peer systems.

The default is disabled.

RSMLT Edge support configuration applies to both IPv4 and IPv6.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RSMLT**.
3. Select the **Globals** tab.
4. Select **EdgeSupportEnable**.
5. Select **Apply**.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

Name	Description
EdgeSupportEnable	Enables RSMLT Edge, which stores the peer MAC and IP address pair in the local configuration file, and restores the configuration if the peer does not restore after a simultaneous restart of both RSMLT-peer switches. The default is disabled.

View and Edit IPv4 RSMLT Local Information

About This Task

Perform the following procedure to view and edit RSMLT local VLAN information.

Procedure

1. In the navigation pane, expand **ConfigurationIP**.
2. Select **RSMLT**.
3. Select the **Local** tab.
4. Configure the parameters as required.
5. Select **Apply**.

Local Field Descriptions

Use the data in the following table to use the **Local** tab.

Name	Description
IfIndex	IP interface identification.
VlanId	Specifies the VLAN ID of the chosen VLAN.
IpAddr	Specifies the IP address on the RSMLT VLAN.
MacAddr	Specifies the MAC address of the selected VLAN.
Enable	Displays the RSMLT operating status as enabled or disabled.
OperStatus	Displays the RSMLT operating status as either up or down. The default is down.
HoldDownTimer	Defines how long the recovering/restarting system remains in a non-Layer 3 forwarding mode for the peer router MAC address. The range of this value is from 0 to 3600 seconds. The default is 60.
HoldUpTimer	Defines how long the RSMLT system maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 1800.

Name	Description
SmltId	Specifies the ID range for the SMLT. A valid range is 1 to 512.
VrfId	Identifies the VRF.
VrfName	Indicates the VRF name.

Modify the IPv6 RSMLT Local Information

Edit the existing RSMLT configuration for the local node in the cluster.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **RSMLT**.
3. Select the **Local** tab.
4. Select a cell to change the value.
5. Select **Apply**.

Local Field Descriptions

Use the data in the following table to use the **Local** tab.

Name	Description
IfIndex	Shows the route SMLT operation index.
Ipv6Addr	Configures the IPv6 address of the RSMLT interface.
Ipv6PrefixLength	Configures the IPv6 prefix length.
Enable	Enables or disables RSMLT. The default is disabled.
HoldDownTimer	Defines how long the recovering/rebooting switch remains in a non-Layer 3 forwarding mode for the peer router MAC address. The default is 60.
HoldUpTimer	Defines how long the RSMLT switch maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 1800.
OperStatus	Displays the RSMLT operating status as either up or down.
SmltId	Specifies the ID range for the SMLT.
VlanId	Configures the VLAN ID.
MacAddr	Configures the MAC address of the VLAN.

Name	Description
VrfId	Indicates the virtual router ID to which the local RSMLT instance belongs.
VrfName	Indicates the virtual router name to which the local RSMLT instance belongs.

Modify IPv6 RSMLT Peer Information

Edit the existing configuration for the RSMLT peer node in the cluster.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **RSMLT**.
3. Select the **Peer** tab.
4. Select a cell to change the value.
5. Select **Apply**.

Peer Field Descriptions

Use the data in the following table to use the **Peer** tab.

Name	Description
IfIndex	Shows the route SMLT operation index.
Ipv6Addr	Configures the IPv6 address of the RSMLT interface.
Ipv6PrefixLength	Configures the IPv6 prefix length.
AdminStatus	Shows the administrative status of RSMLT on the peer.
HoldDownTimer	Defines how long the recovering/rebooting switch remains in a non-Layer 3 forwarding mode for the peer router MAC address. The default is 0.
HoldDownTimeRemaining	Indicates the time remaining in the HoldDownTimer.
HoldUpTimer	Defines how long the RSMLT switch maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 0.
HoldUpTimeRemaining	Indicates the time remaining in the HoldUpTimer.
OperStatus	Displays the RSMLT operating status as either up or down.
SmltId	Specifies the ID range for the SMLT.

Name	Description
VlanId	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
MacAddr	Configures the MAC address of the VLAN.
VrfId	Indicates the virtual router ID to which the peer belongs.
VrfName	Indicates the virtual router name to which the peer belongs.

View IPv4 RSMLT Peer Information

About This Task

Perform this procedure to view and edit RSMLT peer information.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RSMLT**.
3. Select the **Peer** tab.

Peer Field Descriptions

Use the data in the following table to use the **Peer** tab.

Name	Description
IfIndex	IP interface identification.
VlanId	Specifies the VLAN ID of the chosen VLAN.
IpAddr	Specifies the IP address on the RSMLT VLAN.
MacAddr	Specifies the MAC address of the selected VLAN.
Enable	Displays the RSMLT operating status as enabled or disabled.
OperStatus	Displays the RSMLT operating status as either up or down. The default is down.
HoldDownTimer	Defines how long the recovering/restarting system remains in a non-Layer 3 forwarding mode for the peer router MAC address. The range of this value is from 0 to 3600 seconds. The default is 0.

Name	Description
HoldUpTimer	Defines how long the RSMLT system maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 0.
HoldDownTimeRemaining	Displays the time remaining of the HoldDownTimer. The default is 0.
HoldUpTimeRemaining	Displays the time remaining of the HoldUpTimer. The default is 0.
SmltId	Specifies the ID range for the Split MultiLink Trunk. A valid range is 1 to 32.
VrfId	Identifies the VRF.
VrfName	Indicates the VRF name.

View IPv6 RSMLT Edge Peers

View the RSMLT peers for which the switch acts as a peer forwarder.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **RSMLT**.
3. Select the **Edge Peers** tab.

Edge Peers Field Descriptions

Use the data in the following table to use the **Edge Peers** tab.

Name	Description
PeerVlanId	Specifies the ID of the VLAN associated with this entry.
PeerIpv6Address	Specifies the IPv6 address of the peer RSMLT interface.
PeerIpv6PrefixLength	Specifies the peer IPv6 address prefix.
PeerMacAddress	Specifies the peer MAC address.

View IPv4 RSMLT Edge Support Information

About This Task

View RSMLT edge support information to verify the RSMLT peer MAC/IP address-pair in its local configuration file and restore the configuration if the peer does not restore it after a simultaneous restart of both RSMLT-peer systems.

Procedure

1. In the navigation pane, expand **Configuration > IP**.

2. Select **RSMLT**.
3. Select the **Edge Peers** tab.

Edge Peers Field Descriptions

Use the data in the following table to use the **Edge Peers** tab fields.

Name	Description
VlanId	Specifies the VLAN ID of the chosen VLAN.
PeerIpAddress	Specifies the peer IP address.
PeerMacAddress	Specifies the peer MAC address.
PeerVrfId	Identifies the Peer VRF.
PeerVrfName	Specifies the Peer VRF name.

Troubleshooting RSMLT

The following sections provide information for troubleshooting IPv4 Split Multi-Link Trunking (RSMLT).

RSMLT Peers Not Up

If, after a series of reconfiguration, RSMLT peers do not transition to the up state, use the following procedure to troubleshoot the issue. You can observe this issue on dual-stack VLANs after multiple delete and re-adds of IPv4 interfaces.

Procedure

1. Display the RSMLT configuration. This command shows whether the peers are up:
`show ip rsmlt peer`
2. Enter VLAN Interface Configuration mode:
`enable`
`configure terminal`
`interface vlan <1-4059>`
3. To recover the peers if they are down, disable and reenabling RSMLT on both IST peers:
`no ip rsmlt`
`ip rsmlt`
4. If the problem persists, boot from a saved configuration.

Example

Display the RSMLT configuration:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 1
Switch:1(config-if)#show ip rsmlt peer
```

```

=====

Switch:1(config-if)#ip rsmlt

```

Enable Trace Messages for RSMLT Troubleshooting

Use the following procedure to obtain additional RSMLT-related information.

Procedure

If the preceding information does not resolve the issue, you can use the following command to obtain additional RSMLT-related information:

```
trace level 173 4
```

Important

Enabling this trace on a loaded system can slow down the CPU, especially if executed through the console. Use Telnet if possible.

If you have remote branch sites with only Internet connectivity and you want to extend the capabilities of fabric to that site, or if you have a branch office with a private WAN connection and you want to have a backup link using the public Internet, you can extend the Fabric network over the Internet towards a remote branch by connecting Fabric switches through ExtremeCloud SD-WAN.

Fabric Extend Integration with ExtremeCloud SD-WAN integrates the following features for SD-WAN deployments:

- Automation of Fabric Extend Tunnels over IP WAN infrastructure
- MTU configuration per IS-IS logical interface for Layer 3 interfaces
- SD-WAN infrastructure adjusts packet size to accommodate restricted MTU paths, such as Internet, by fragmenting the end user IP packets.

This deployment provides the following benefits:

- Encrypted transport
- Automated provisioning of Fabric switches - Fabric Extend tunnels, MTU, and tunnel state exchange between the SD-WAN Appliance and Fabric switches. Only one port on the switch supports this capability. For more information, see [Auto-sense Port States](#) on page 28.

**Note**

On 4220 Series and 5320 Series models that support a single VRF, ensure you specify the VRF that Auto-sense uses for SD-WAN. For more information, see [Specify the VRF for Auto-sense ExtremeCloud SD-WAN Configuration](#) on page 3312.

- Enhanced branch resiliency - one or more Fabric switches must be connected to the LAN port or ports of the SD-WAN Appliance to achieve automated redundancy.
- Visibility of branch application traffic and optimized performance

SD-WAN Local Breakout

Auto-sense SD-WAN Local Breakout automatically provides connectivity to devices attached to a data VRF, through the SD-WAN VRF, towards the Internet. Use a Local Breakout (LBO) configuration for the following use cases:

- Send Internet-destined traffic directly to the Internet at the branch, through the SD-WAN Appliance and not through the Fabric.

- Provide the SD-WAN Appliance management access to a Fabric service for management and for NTP server reachability.

Table 280: SD-WAN Local Breakout product support

Feature	Product	Release introduced
ExtremeCloud SD-WAN Local Breakout configuration applied through Auto-sense	4220 Series	Not Applicable
	5320 Series	Fabric Engine 9.1 Not supported on models with a single active VRF.
	5420 Series	Fabric Engine 9.1
	5520 Series	Fabric Engine 9.1
	5720 Series	Fabric Engine 9.1
	7520 Series	Fabric Engine 9.1

	7830 Series	Not Supported
	VSP 4900 Series	VOSS 9.1
	VSP 7400 Series	VOSS 9.1

If you use SD-WAN Orchestrator to enable an LBO branch, Auto-sense on the switch can apply the LBO configuration to select VRFs. The switch configuration creates a BGP peering relationship with the SD-WAN Appliance in the dynamic VRF (SD-WAN), and then redistributes BGP routes it receives into the selected user-created VRFs.

This feature applies only to VRFs that exist on the same Fabric Extend switch that connects to the SD-WAN Appliance, and only for local or direct subnets on the same VRF. IS-IS does not advertise the LBO-injected routes further than the local switch. If you require LBO in the branch, make the directly-attached switch the default gateway with LBO enabled, and operate the other nodes in the branch as Layer 2 BEBs.

Manual Switch Configuration

You must identify which user-created VRFs accept the Local Breakout (LBO) routes. Auto-sense automatically configures BGP and RIP redistribution policies between the selected VRFs and the dynamic SD-WAN VRF. For more information about how to identify a VRF, see [Select a VRF for Local Breakout Configuration](#) on page 3314.

NEW! *Converting Auto-sense SD-WAN Configuration to a Manual Configuration*

Auto-sense automatically creates a default SD-WAN VRF and applies BGP configuration based on LLDP information from the SD-WAN appliance. If you require persistent or customized routing behavior, you can convert this dynamic configuration to a manual configuration.

When you issue the **auto-sense sd-wan vrf WORD<1-16>** command, the switch renames the default Auto-sense SD-WAN VRF. Use the **ip vrf sd-wan** command

to convert the SD-WAN VRF origin from DYNAMIC to CONFIG. The associated BGP instance remains dynamic through Auto-sense until you issue the **ip bgp** command in that VRF. This command converts the BGP instance to static (CONFIG), removes the Auto-sense BGP configuration, and saves the configuration.

Behavior Considerations

Consider the following key behavior rules:

- BGP origin states. A BGP instance can have one of the following origins:
 - AUTO-SENSE— Auto-sense manages the BGP instance and rejects any manual BGP configuration.
 - CONFIG—The BGP instance is user configured (static) and persistent.
 - DEFAULT (GRT only)— The Global Routing Table (GRT) always contains a BGP instance. You cannot delete it, but you can modify or disable it.
- When the SD-WAN port is down, Auto-sense creates the VRF when the **auto-sense sd-wan vrf <name>** command is issued; however, it does not create or activate a dynamic BGP instance until the port transitions to UP.
- When you remove Auto-sense from an SD-WAN VRF, the VRF and BGP origins determine how the switch handles Local Breakout (LBO). Static VRFs preserve user-configured BGP and LBO, while the switch removes dynamic objects that Auto-sense created whenever you relinquish Auto-sense control or the link state dictates removal.
- The Global Routing Table (GRT) always includes a BGP instance and starts with the DEFAULT origin at boot. When you change any SD-WAN applied BGP configuration, you change the GRT origin to CONFIG and Auto-sense stops applying LLDP-derived configuration. When Auto-sense manages the GRT BGP instance, the switch rejects global BGP settings and reports an Auto-sense error. The only exception is the AS-number command, which changes the origin to CONFIG and removes all Auto-sense applied configuration.
- Running configuration views show only BGP instances with origin CONFIG; the BGP configuration view displays AUTO-SENSE, CONFIG, and DEFAULT. Use these views to verify the origin state.

The following tables explain BGP origin behavior for SD-WAN VRFs and the Global Routing Table (GRT), and how the **auto-sense sd-wan vrf WORD<1-16>** command affects VRF creation. Use this reference to understand when Auto-sense applies

dynamic configuration, when manual configuration takes precedence, and how to achieve configuration persistence.

Table 281: Configuration options—SD-WAN VRFs (excludes the GRT)

Use Case	Command issued	SD-WAN port state	Current VRF origin	Current BGP origin	Result
Convert the Auto-sense default SD-WAN VRF from dynamic to static	ip vrf sd-wan	Any	AUTO-SENSE	AUTO-SENSE	Converts the SD-WAN VRF to CONFIG origin (static). Preserves BGP configuration.
Configure BGP on a VRF when BGP is statically configured	ip bgp	Any	CONFIG	CONFIG	Accepts the configuration and saves it.
Convert an Auto-sense configured BGP instance to static	ip bgp	Any	CONFIG	AUTO-SENSE	Removes all Auto-sense applied BGP configuration and changes BGP origin to CONFIG.
Convert a static BGP instance to Auto-sense (SD-WAN port is UP)	no ip bgp	UP	CONFIG	CONFIG	Removes the static BGP instance. Auto-sense applies a dynamic BGP instance and changes the BGP origin to AUTO-SENSE.
Apply Auto-sense to an existing VRF without BGP	auto-sense sd-wan vrf WORD<1-16>	UP	CONFIG		Creates a dynamic BGP instance and changes the BGP origin to AUTO-SENSE.
Apply Auto-sense to an existing VRF with static BGP	auto-sense sd-wan vrf WORD<1-16>	UP	CONFIG	CONFIG	Preserves the static BGP configuration; saves configuration.
Rename the default Auto-sense SD-WAN VRF to a new VRF	auto-sense sd-wan vrf WORD<1-16>	UP	AUTO-SENSE	AUTO-SENSE	Renames the dynamic sd-wan VRF and converts it to origin CONFIG. Preserves the Auto-sense BGP configuration unless a static configuration replaces it later.
Enable Local Breakout on a VRF	sd-wan local-breakout	Any	CONFIG or AUTO-SENSE	CONFIG or AUTO-SENSE	Enables LBO configuration on the specified VRF and preserves current origins.
Remove Auto-sense from the default SD-WAN VRF	no auto-sense sd-wan vrf	Any	AUTO-SENSE	AUTO-SENSE	Removes Auto-sense applied configuration, including BGP and LBO.

Table 281: Configuration options—SD-WAN VRFs (excludes the GRT) (continued)

Use Case	Command issued	SD-WAN port state	Current VRF origin	Current BGP origin	Result
Remove Auto-sense from a non-default VRF	no auto-sense sd-wan vrf WORD<1-16>	Any	CONFIG	CONFIG	Preserves static VRF and BGP configuration. Removes Auto-sense configuration.
SD-WAN port DOWN with non-default VRF		DOWN	AUTO-SENSE	AUTO-SENSE	Removes the VRF and BGP instance (Auto-sense objects)
SD-WAN port DOWN with non-default VRF		DOWN	CONFIG	AUTO-SENSE	Preserves the VRF; removes the Auto-sense BGP instance.
SD-WAN port DOWN with non-default VRF		DOWN	CONFIG	CONFIG	Preserves the VRF; removes LBO configuration.

Table 282: Configuration options – Global Routing Table (GRT)

Use Case	Command	Current GRT BGP origin	Result
GRT BGP origin at boot		DEFAULT	GRT BGP instance is present; origin is DEFAULT at boot.
Change any SD-WAN applied BGP configuration in GRT	ip bgp	DEFAULT	Changes GRT BGP origin to CONFIG. SD-WAN LLDP derived configuration no longer applies.
Attempt to configure GRT BGP when Auto-sense manages it	ip bgp	AUTO-SENSE	Rejects the configuration and indicates that Auto-sense controls the BGP instance.
Convert Auto-sense GRT BGP to static with 4-byte AS assignment	router bgp <as_number> enable	AUTO-SENSE	Removes all Auto-sense applied GRT BGP configuration and changes the origin to CONFIG.
Display behavior	show running-config show ip bgp conf	CONFIG	show running-config displays BGP instances origin CONFIG. show ip bgp conf displays the BGP origin as CONFIG, AUTO-SENSE, or DEFAULT.

Automatic Configuration using Auto-sense

The switch uses Auto-sense to read BGP Autonomous System Number (ASN) and neighbor information from the LLDP FE TLV, and apply a dynamic configuration. Auto-sense configures BGP and RIP for route redistribution purposes for ports with Auto-sense enabled and an ExtremeCloud SD-WAN appliance.

Optionally, you can apply a dynamic configuration in a VRF and a static BGP configuration in the global routing table (GRT) or another static VRF in parallel. To use this co-existence mode, you must globally enable BGP with 4-byte AS numbering format to apply the dynamic BGP configuration to the SD-WAN VRF. If you apply a static BGP configuration to the switch after the Auto-sense port transitions to the SDWAN state, Auto-sense enables BGP 4-byte AS number support, which allows you to apply the static BGP configuration.

Note

If you enable 4-byte AS numbering format, you can continue to use conventional 2-byte AS numbers.

If you apply a static configuration without a 4-byte AS number before you connect the SD-WAN appliance to an Auto-sense port, the Auto-sense port cannot complete the dynamic BGP configuration on the dynamic SD-WAN VRF and the Auto-sense port transitions to the SD-WAN-PENDING state. To resolve this situation, you must globally disable and then reenables BGP with a 4-byte AS number in the static configuration. The remaining static BGP configuration, including the AS number do not need to change.

Auto-sense performs the following dynamic configuration:

```
router bgp as-4-byte enable
router vrf sd-wan
  ip bgp
  ip bgp router-id <local_ip> #local_ip is received through LLDP
  ip bgp vrf-as <local_asn> #local_asn is received through LLDP
  no ip bgp synchronization
  no ip bgp auto-summary
  no ip bgp aggregation
  ip bgp enable
  ip bgp neighbor <vrouters_1> #vrouters_1,2,3 are IP addresses received through LLDP
  ip bgp neighbor <vrouters_1> remote-as <remote_asn> #remote_asn is received through LLDP
  ip bgp neighbor <vrouters_1> enable
exit

router vrf WORD<1-16>
  ip rip
  ip rip enable
  ip rip redistribute bgp vrf-src sd-wan
  ip rip redistribute bgp enable vrf-src sd-wan
  sd-wan-local-breakout
exit
ip rip apply redistribute bgp vrf WORD<1-16> vrf-src sd-wan

router vrf sd-wan
  ip bgp redistribute direct vrf-src WORD<1-16>
  ip bgp redistribute direct enable vrf-src WORD<1-16>
exit
```

```
ip bgp apply redistribute direct vrf sd-wan vrf-src WORD<1-16>  
ip more-specific-non-local-route
```

High Availability

For dual SD-WAN Appliance and switch pairings in High Availability deployments, you must manually configure BGP peering and a routed segment between the two switches. Auto-sense does not configure this deployment.

Restrictions

- You cannot configure LBO in the GRT.
- If you configure the SD-WAN VRF to use the GRT (**auto-sense sd-wan vrf GlobalRouter**), this configuration can interfere with BGP global configuration. For more information, see [Converting Auto-sense SD-WAN Configuration to a Manual Configuration](#) on page 3307.

ExtremeCloud SD-WAN Configuration Using CLI

The topics in this section provide the CLI configuration specific to interoperability with SD-WAN.

Specify the VRF for Auto-sense ExtremeCloud SD-WAN Configuration

Before You Begin

On switches that support only a single active VRF, ensure a user-defined VRF with a different name does not exist.

About This Task

Perform this procedure to specify the VRF that Auto-sense uses for the SD-WAN configuration. On models that support a single active VRF, Auto-sense cannot create the dynamic SD-WAN VRF if an IP configuration already exists.

Note

If the running switch configuration includes the Auto-sense-managed SD-WAN VRF and you complete this procedure, the switch renames the dynamic SD-WAN VRF to the specified name, and converts the VRF to a static (CONFIG) origin. The associated BGP instance remains Auto-sense-managed until you issue the **ip bgp** command in that VRF, which converts the BGP instance to a static (CONFIG) origin, removes Auto-sense-applied BGP configuration, and makes the configuration persistent.

Procedure

1. Enter Global Configuration mode:

```
enable  
  
configure terminal
```

- Specify the VRF name that Auto-sense uses for ExtremeCloud SD-WAN configuration:

```
auto-sense sd-wan vrf WORD<1-16>
```
- (Optional) To manually configure BGP in the static VRF, see [Configure BGP](#) on page 574.

Configure the IS-IS Area for a Specific Tunnel

About This Task

Note

You can only use this command on a switch with boundary-node abilities.

Perform this procedure to specify the IS-IS area where Auto-sense creates a specific ExtremeCloud SD-WAN-learned tunnel. This configuration overrides a global area configuration for all learned tunnels.

Procedure

- Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
- Configure the IS-IS area:

```
auto-sense sd-wan multi-area logical-intf-dest-ip {A.B.C.D} <home | remote>
```

Variable Definitions

The following table defines parameters for the **auto-sense sd-wan multi-area logical-intf-dest-ip {A.B.C.D} <home | remote>** command.

Variable	Value
{A.B.C.D}	Specifies the destination IP address of the SD-WAN logical interface.
<home remote>	Specifies the IS-IS area as home or remote. By default, Auto-sense creates SD-WAN logical interfaces in the home area.

Configure Auto-sense to Create All Learned Tunnels in the Remote Area

About This Task

Note

You can only use this command on a switch with boundary-node abilities.

Perform this procedure to create all ExtremeCloud SD-WAN learned tunnels in the IS-IS remote area. You can also configure exceptions for specific tunnels. For more information, see [Configure the IS-IS Area for a Specific Tunnel](#) on page 3313.

By default, Auto-sense creates SD-WAN logical interfaces in the home area.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Configure the IS-IS area:
`auto-sense sd-wan multi-area remote`

Select a VRF for Local Breakout Configuration

Enable Auto-sense to manage the VRF after it detects an ExtremeCloud SD-WAN peer.

Note

This procedure does not apply to switch models that support only a single active VRF with IP configuration.

Before You Begin

- Create the VRF on the switch.
- Enable Auto-sense on the port that connects to the SD-WAN Appliance.

About This Task

Auto-sense automatically configures BGP and RIP redistribution policies between the selected VRFs and the dynamic SD-WAN VRF.

This feature applies only to VRFs that exist on the same Fabric Extend switch that connects to the SD-WAN Appliance, and only for local or direct subnets on the same VRF. IS-IS does not advertise the LBO-injected routes further than the local switch.

Note

You cannot manually configure BGP on a VRF with an LBO configuration when the BGP instance origin is AUTO-SENSE.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:
`enable`

`configure terminal`

`router vrf WORD<1-16>`

Note

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Enable LBO on the VRF:
`sd-wan-local-breakout`

ExtremeCloud SD-WAN Configuration Using EDM

The topics in this section provide the EDM configuration specific to interoperability with SD-WAN.

Specify the VRF for Auto-sense ExtremeCloud SD-WAN Configuration

Before You Begin

On switches that support only a single active VRF, ensure a user-defined VRF with a different name does not exist.

About This Task

Perform this procedure to specify the VRF that Auto-sense uses for the SD-WAN configuration. On models that support a single active VRF, Auto-sense cannot create the dynamic SD-WAN VRF if an IP configuration already exists.

Note

If the running switch configuration includes the Auto-sense-managed SD-WAN VRF and you complete this procedure, the switch renames the dynamic SD-WAN VRF to the specified name, and converts the configuration to VRF to a static (CONFIG) origin. The associated BGP instance remains Auto-sense-managed until you enable BGP in that VRF, which converts the BGP instance to a static (CONFIG) origin, removes Auto-sense-applied BGP configuration, and makes the configuration persistent. For information about configuring BGP, see [Configure BGP](#) on page 618.

Procedure

1. In the navigation pane, expand **Configuration > Fabric**.
2. Select **AutoSense**.
3. Select the **SD-WAN** tab.
4. In **SD-WAN VRF**, type the name of the VRF.
5. Select **Apply**.

SD-WAN Field Descriptions

Use the data in the following table to use the **SD-WAN** tab.

Name	Description
SD-WAN Area Note: This field only displays on a switch with boundary-node abilities.	Specifies the IS-IS area, home or remote, where Auto-sense creates all ExtremeCloud SD-WAN learned tunnels. By default, Auto-sense creates SD-WAN logical interfaces in the home area. You can also configure exceptions for specific tunnels. For more information, see Configure the IS-IS Area for a Specific Tunnel on page 3316.
Sd-Wan Vrf	Specifies the VRF name that Auto-sense uses for the SD-WAN configuration. On models that support a single active VRF, Auto-sense cannot create the dynamic SD-WAN VRF if an IP configuration already exists.

Configure the IS-IS Area for a Specific Tunnel

About This Task

**Note**

You can only use this procedure on a switch with boundary-node abilities.

Perform this procedure to specify the IS-IS area where Auto-sense creates a specific ExtremeCloud SD-WAN-learned tunnel. This configuration overrides a global area configuration for all learned tunnels.

Procedure

1. In the navigation pane, expand **Configuration > Fabric**.
2. Select **AutoSense**.
3. Select the **Sd-Wan Multi-Area** tab.
4. Select **Insert**.
5. In **Ip**, type the destination IP address.
6. In **Area**, select **home** or **remote**.
7. Select **Insert**.

Sd-Wan Multi-Area Field Descriptions

Use the data in the following table to use the **Sd-Wan Multi-Area** tab.

Name	Description
Ip	Displays the destination IP address for an ExtremeCloud SD-WAN-learned tunnel.
Area	Specifies the IS-IS area where Auto-sense creates the tunnel. By default, Auto-sense creates SD-WAN logical interfaces in the home area.

Configure Auto-sense to Create All Learned Tunnels in the Remote Area

About This Task

Note

You can only use this procedure on a switch with boundary-node abilities.

Perform this procedure to create all ExtremeCloud SD-WAN learned tunnels in the IS-IS remote area.

By default, Auto-sense creates SD-WAN logical interfaces in the home area.

Procedure

1. In the navigation pane, expand **Configuration > Fabric**.
2. Select **AutoSense**.
3. Select the **SD-WAN** tab.
4. Select **remote**.
5. Select **Apply**.

SD-WAN Field Descriptions

Use the data in the following table to use the **SD-WAN** tab.

Name	Description
SD-WAN Area Note: This field only displays on a switch with boundary-node abilities.	Specifies the IS-IS area, home or remote, where Auto-sense creates all ExtremeCloud SD-WAN learned tunnels. By default, Auto-sense creates SD-WAN logical interfaces in the home area. You can also configure exceptions for specific tunnels. For more information, see Configure the IS-IS Area for a Specific Tunnel on page 3316.
Sd-Wan Vrf	Specifies the VRF name that Auto-sense uses for the SD-WAN configuration. On models that support a single active VRF, Auto-sense cannot create the dynamic SD-WAN VRF if an IP configuration already exists.

Select a VRF for Local Breakout Configuration

Enable Auto-sense to manage the VRF after it detects an ExtremeCloud SD-WAN peer.

Note

This procedure does not apply to switch models that support only a single active VRF with IP configuration.

Before You Begin

- Create the VRF on the switch.
- Enable Auto-sense on the port that connects to the SD-WAN Appliance.

About This Task

Auto-sense automatically configures BGP and RIP redistribution policies between the selected VRFs and the dynamic SD-WAN VRF.

This feature applies only to VRFs that exist on the same Fabric Extend switch that connects to the SD-WAN Appliance, and only for local or direct subnets on the same VRF. IS-IS does not advertise the LBO-injected routes further than the local switch.

Note

You cannot manually configure BGP on a VRF with an LBO configuration when the BGP instance origin is AUTO-SENSE.

Procedure

1. In the navigation pane, expand **Configuration > VRF**.
2. Select **VRF**.
3. Select the **VRF** tab.
4. In **Sd-Wan Local Breakout** for the applicable VRF row, select **true** to enable LBO on the VRF.
5. Select **Apply**.

VRF Field Descriptions

Use the data in the following table to help you use the **VRF** tab.

Name	Description
Id	Specifies the ID number of the VRF instance. VRF ID 0 is reserved for the GlobalRouter.
Name	Names the VRF instance.
ContextName	Identifies the VRF. The SNMPv2 Community String or SNMPv3 contextName denotes the VRF context and is used to logically separate the MIB port management.
TrapEnable	Enables the VRF to send VRF Lite-related traps (VrfUp and VrfDown). The default is enabled.
MaxRoutes Note: Exception: not supported on 5320-16P-4XE, 5320-16P-4XE-DC, 5320-24P-8XE, or 5320-24T-8XE.	Configures the maximum number of routes allowed for the VRF, which varies depending on the hardware. For scaling information, see <i>Fabric Engine Release Notes</i> . The default value varies for the GlobalRouter and non-default VRFs, depending on your hardware platform.
RpTrigger	Specifies the Routing Protocol (RP) triggers for the VRF. The triggers are used to initiate or shutdown routing protocols on a VRF. You can act upon multiple RPs simultaneously. You can also use this option to bring individual RPs up in steps.

Name	Description
Segmented Note: Exception: not supported on 7830 Series or switch models that support a single active VRF.	Specifies if the VRF is a Segmented VRF. The default is false, which indicates the VRF is not segmented.
MaxRoutesTrapEnable	Enables the generation of the VRF Max Routes Exceeded traps. The default is enabled.
Ipv6MaxRoutes Note: Exception: not supported on 5320-16P-4XE, 5320-16P-4XE-DC, 5320-24P-8XE, or 5320-24T-8XE.	Configures the maximum number of IPv6 routes allowed for the VRF, which varies depending on the hardware. For scaling information, see <i>Fabric Engine Release Notes</i> . The default value varies for the GlobalRouter and non-default VRFs, depending on your hardware platform.
Ipv6MaxRoutesTrapEnable	Enables SNMP trap generation after the maximum number of IPv6 routes are reached. The default is enabled.
Active	Displays if the VRF is active (true). Some switch models support only a single active VRF with IP configuration; the VRF can be the GlobalRouter (GRT) or a non-default VRF. For information about VRF support, see <i>Fabric Engine Release Notes</i> or <i>Fabric Engine and VOSS Feature Matrix</i> .
Origin	Displays the VRF origin: <ul style="list-style-type: none"> • config • dynamic • segmented The Default VRF and the MGMT VRF are considered DYNAMIC. Note: Only manually configured VRFs are visible in running-config.

Name	Description
Sd-Wan Local Breakout Note: Not supported on switch models that support only a single active VRF with IP configuration.	Enables Local Breakout on the VRF. The default is false (disabled).
BgpOrigin	Specifies the origin of the BGP configuration in the VRF. config indicates the BGP instance was created manually. autoSense indicates the BGP instance was generated from Auto-sense. default is for Global Routing Table (GRT) only and indicates no BGP configuration.

Secure Shell Fundamentals

Methods of remote access such as Telnet or FTP generate unencrypted traffic. Anyone that can see the network traffic can see all data, including passwords and user names. Secure Shell (SSH) is a client and server protocol that specifies the way to conduct secure communications over a network.

Note

7830 Series does not support SSH connection to the backbone MAC.

Secure Shell can replace Telnet. Secure File Transfer Protocol (SFTP) can replace FTP with an encrypted alternative.

Note

If both SSH and SFTP are concurrently active, you have the ability to disable SFTP while allowing SSH to remain active. For more information, see [Disabling SFTP without disabling SSH](#) on page 3358.

The switch software supports Secure CoPy protocol (SCP), which is a secure file transfer protocol. Use SCP to securely transfer files between a local host and a remote host. SCP is in off state by default, but you can turn it on when you enable SSH using the **boot config flags** command in the global config mode. The switch supports SCP only as an SCP server, which means that clients can send files to the switch or can request files from the switch. Secure CoPy (SCP) can replace FTP with an encrypted alternative.

Secure Shell supports a variety of the different public and private key encryption schemes available. Using the public key of the host server, the client and server negotiate to generate a session key known only to the client and the server. This one-time key encrypts all traffic between the client and the server. The switch supports Secure Shell version 2 (SSHv2).

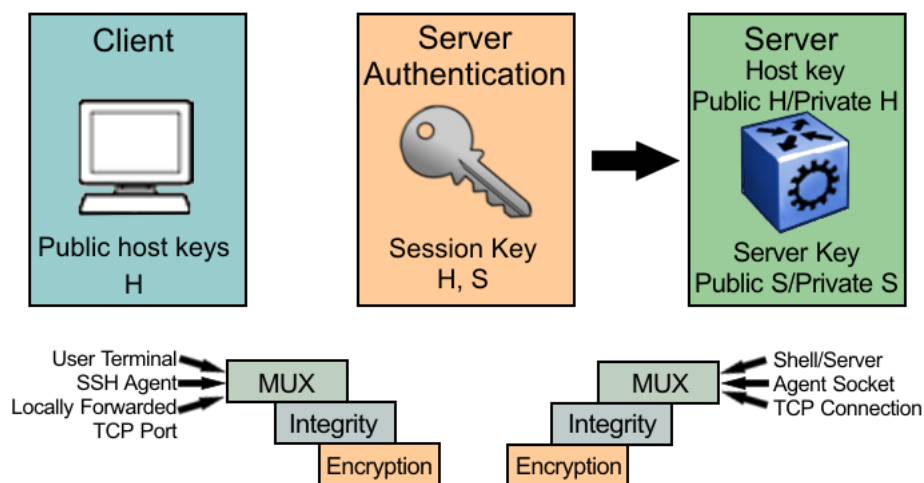

Figure 218: Overview of the SSHv2 protocol

By using a combination of host, server, and session keys, the SSHv2 protocol can provide strong authentication and secure communication over an insecure network, offering protection from the following security risks:

- IP spoofing
- IP source routing
- Domain name server (DNS) spoofing
- adversary-in-the-middle/TCP hijacking attacks
- Eavesdropping and password sniffing

Even if network security is compromised, traffic cannot be played back or decrypted, and the connection cannot be hijacked.

The SSH secure channel of communication does not provide protection against break-in attempts or denial-of-service (DoS) attacks.

With the SSHv2 server in the switch, you can use an SSHv2 client to make a secure connection to the switch and work with commercially available SSHv2 clients. For more information about supported clients, see [Third-Party SSH and SCP Client Software](#) on page 3333. The switch also supports outbound connections to remote SSHv2 servers to provide complete inbound and outbound secure access.

Outbound Connections

The SSHv2 client supports SSHv2 DSA public key authentication and password authentication.

**Note**

For certain switches in enhanced secure mode, all sensitive files are protected. You cannot access any sensitive files using Telnet, SSH, FTP, SFTP, TFTP, and SCP connections. For more information, see [Sensitive File Protection](#) on page 270.

**Note**

You must enable SSH globally before you can generate SSH DSA user keys.

The SSHv2 client is a secure replacement for outbound Telnet. Password authentication is the easiest way to use the SSHv2 client feature.

Instead of password authentication, you can use DSA public key authentication between the SSHv2 client and an SSHv2 server. Before you can perform a public key authentication, you must generate the key pair files and distribute the key files to all the SSHv2 server systems. Because passphrase encrypts and further protects the key files, you must provide a passphrase to decrypt the key files as part of the DSA authentication.

**Note**

SSH RSA and DSA public and private keys are copied from `/intflash/shared` to `/intflash/.ssh`.

To attempt public key authentication, the SSHv2 client looks for the associated DSA key pair files in the `/intflash/.ssh` directory. If no DSA key pair files are found, the SSHv2 client automatically prompts you for password authentication. If the SSHv2 client succeeds with the authentication, then a new secured SSHv2 session is established to the remote SSHv2 server. For more information, see [.DSA Authentication Access Level and File Name](#) on page 3335.

**Important**

If you configure the DSA user key with a passphrase but you do not supply the correct passphrase when you try to make the SSHv2 connection, then the system defaults back to the password authentication. If the SSHv2 client succeeds with the authentication, then a new secured SSHv2 session is established to the remote SSHv2 server.

SSH Version 2

SSH version 2 (SSHv2) protocol is a complete rewrite of the SSHv1 protocol. In SSHv2 the functions are divided among three layers:

- SSH Transport Layer (SSH-TRANS)

The SSH Transport Layer manages the server authentication and provides the initial connection between the client and the server. After the connection is established, the Transport Layer provides a secure, full-duplex connection between the client and server.

- SSH Authentication Protocol (SSH-AUTH)

The SSH Authentication Protocol runs on top of the SSH Transport Layer and authenticates the client-side user to the server. SSH-AUTH defines three authentication methods: public key, host-based, and password. SSH-AUTH provides a single authenticated tunnel for the SSH connection protocol.

- SSH Connection Protocol (SSH-CONN)

The SSH Connection Protocol runs on top of the SSH Transport Layer and user authentication protocols. SSH-CONN provides interactive logon sessions, remote execution of commands, forwarded TCP/IP connections, and forwarded X11 connections. These services are multiplexed into the single encrypted tunnel provided by the SSH transport layer.

The following figure shows the three layers of the SSHv2 protocol.

Figure 219: Separate SSH version 2 protocols

The modular approach of SSHv2 improves on the security, performance, and portability of the SSHv1 protocol.

Important

The SSHv1 and SSHv2 protocols are not compatible. The switch does not support SSHv1.

Security Features

The SSHv2 protocol supports the following security features:

- **Authentication.** This feature determines, in a reliable way, the SSHv2 client. During the log on process, the SSHv2 client is queried for a digital proof of identity.

Supported authentications with the switch as a server for SSHv2, are: RSA, DSA, and passwords. Supported authentications with the switch as a client for SSHv2, are: DSA and passwords. The switch does not support RSA when the switch acts as a client.

When the switch acts as an SSH server, by default the switch allows a maximum of only four sessions, although it can accommodate up to eight sessions at a time. However, only one SSH public key encryption per access level is allowed at a time. For instance, if multiple SSH public key encryption clients need to connect to the server with the same access level, such as rwa, then the clients must connect to the server one-by-one as the switch only supports one public key per access level.

- **Encryption.** The SSHv2 server uses encryption algorithms to scramble data and render it unintelligible except to the receiver.
- **Integrity.** This feature guarantees that the data transmits from the sender to the receiver without alterations. If a third party captures and modifies the traffic, the SSHv2 server detects this alteration.

Note

SCP is supported for RWA users only. RW or R level will not work and the switch logs a message on the device.

SSHv2 Considerations using EDM

You must use CLI to initially configure SSHv2. You can use Enterprise Device Manager (EDM) to change the SSHv2 configuration parameters. CLI is the user interface for SSHv2 configuration and use the console port to configure the SSHv2 parameters.

**Important**

Do not enable SSHv2 secure mode using Configuration and Orchestration Manager (COM). If you enable SSHv2 secure mode, then the system disables Simple Network Management Protocol (SNMP). This locks you out of a COM session. Enable SSH secure mode using CLI or EDM.

SSHv2 secure mode is different from enhanced secure mode and hsecure. SSHv2 secure mode disables unsecure management protocols on the device such as FTP, SNMP, Telnet, and TFTP. SSHv2 secure mode is enabled through the **ssh secure** command.

When you enable SSHv2 secure mode, the system disables FTP, SNMPv1, SNMPv2, SNMPv3, Telnet and TFTP. After SSHv2 secure mode is enabled, you can choose to enable individual non-secure protocols. However, after you save the configuration and restart the system, the non-secure protocol is again disabled, even though it is shown as enabled in the configuration file. After you enable SSHv2 secure mode, you cannot enable non-secure protocols by disabling SSHv2 secure mode.

You can disable block-snmp after you enable SSHv2 secure mode, and you can connect again using COM.

User ID Logs

User ID log of an SSH session established by SCP client

The switch logs the user ID of an SSH session initiated by the SCP client. If an SCP client establishes an SSH session, the system displays the message in the following format:

```
CP1 [08/06/15 09:43:42.230:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH user
authentication succeeded for user rwa on host 10.68.231.194
CP1 [08/06/15 09:43:42.232:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH SCP session
start by user rwa on host 10.68.231.194
CP1 [08/06/15 09:43:44.020:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SCP session
closed by user rwa on host 10.68.231.194
CP1 [08/06/15 09:43:44.021:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH session
closed by user rwa on host 10.68.231.194
```

In the preceding example log output, rwa is the user name.

User ID log of an SSH session established by SFTP

The switch logs the user ID of an SSH session initiated by SFTP. If SFTP establishes an SSH session, the system displays the message in the following format:

```
CP1 [08/06/15 09:45:32.903:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH user
authentication succeeded for user rwa on host 10.68.231.194
CP1 [08/06/15 09:45:32.905:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SFTP session
start: user rwa on host 10.68.231.194
CP1 [08/06/15 09:45:46.775:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SFTP session
closed by user rwa on host 10.68.231.194
```

```
CP1 [08/06/15 09:45:46.776:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH SFTP
session end: user rwa on host 10.68.231.194
CP1 [08/06/15 09:45:46.776:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH session
closed by server for user rwa on host 10.68.231.194
```

In the preceding example log output, rwa is the user name.

User Key Files

Generating keys requires that you have free space on the flash. A typical configuration requires less than 2 kbyte of free space. Before you generate a key, verify that you have sufficient space on the flash, using the **dir** command. If the flash is full when you attempt to generate a key, the system displays an error message and the key is not generated. You must delete some unused files and regenerate the key.

If you remove only the public keys, enabling the SSH does not create new public keys.

SSHv2 password authentication uses the same login and password authentication mechanism as Telnet. The SSHv2 client also supports DSA public key authentication compatible with the switch SSHv2 server and Linux SSHv2 server for SSHv2.

If the switch is the client, use the following table to locate the DSA user key files for DSA authentication for user access level `rwa`.

Note

For certain switches in enhanced secure mode, all sensitive files are protected. The home directory for enhanced secure mode is `/intflash/shared`. You cannot access any sensitive files using Telnet, SSH, FTP, SFTP, TFTP, and SCP connections. For more information, see [Sensitive File Protection](#) on page 270.

Table 284: DSA user key files

SSH server	SSH client side	SSH server side
switch with enhanced secure mode disabled	Private and public keys by access level: <ul style="list-style-type: none"> • <code>rwa—/intflash/.ssh/id_dsa_rwa</code> (private key), <code>/intflash/.ssh/id_dsa_rwa.pub</code> (public key) • <code>rw—/intflash/.ssh/id_dsa_rw</code> (private key), <code>/intflash/.ssh/id_dsa_rw.pub</code> (public key) • <code>ro—/intflash/.ssh/id_dsa_ro</code> (private key), <code>/intflash/.ssh/id_dsa_ro.pub</code> (public key) • <code>rw1—/intflash/.ssh/id_dsa_rw1</code> (private key), <code>/intflash/.ssh/id_dsa_rw1.pub</code> (public key) • <code>rw12—/intflash/.ssh/id_dsa_rw12</code> (private key), <code>/intflash/.ssh/id_dsa_rw12.pub</code> (public key) • <code>rw13—/intflash/.ssh/id_dsa_rw13</code> (private key), <code>/intflash/.ssh/id_dsa_rw13.pub</code> (public key) 	Public keys on the server side based on access level: <ul style="list-style-type: none"> • <code>rwa—/intflash/.ssh/dsa_key_rwa</code> (public key) • <code>rw—/intflash/.ssh/dsa_key_rw</code> (public key) • <code>ro—/intflash/.ssh/dsa_key_ro</code> (public key) • <code>rw1—/intflash/.ssh/dsa_key_rw1</code> (public key) • <code>rw12—/intflash/.ssh/dsa_key_rw12</code> (public key) • <code>rw13—/intflash/.ssh/dsa_key_rw13</code> (public key)
switch with enhanced secure mode enabled	Private and public keys by access role level: <ul style="list-style-type: none"> • <code>administrator—/intflash/shared/id_dsa_admin</code> (private key), <code>/intflash/shared/id_dsa_admin.pub</code> (public key) • <code>operator —/intflash/shared/id_dsa_operator</code> (private key), <code>/intflash/shared/id_dsa_operator.pub</code> (public key) • <code>security —/intflash/shared/id_dsa_security</code> (private key), <code>/intflash/shared/id_dsa_security.pub</code> (public key) • <code>auditor —/intflash/shared/id_dsa_auditor</code> (private key), <code>/intflash/shared/id_dsa_auditor.pub</code> (public key) 	Public keys on the server side based on access level: <ul style="list-style-type: none"> • <code>administrator—/intflash/shared/dsa_key_admin</code> (public key) • <code>operator—/intflash/shared/dsa_key_operator</code> (public key) • <code>security—/intflash/shared/dsa_key_security</code> (public key) • <code>privilege—/intflash/shared/dsa_key_priv</code> (public key) • <code>auditor—/intflash/shared/dsa_key_auditor</code> (public key)

Table 284: DSA user key files (continued)

SSH server	SSH client side	SSH server side
	key), /intflash/shared/ id_dsa_auditor.pub (public key) • privilege —/intflash/shared/ id_dsa_priv (private key), /intflash/ shared/id_dsa_priv.pub (public key)	
Linux with Open SSH	~/.ssh/id_dsa (private key) file permission 400 ~/.ssh/id_dsa.pub (public key) file permission 644	~/.ssh/authorized_keys (public key) file

When you attempt to make an SSH connection from the switch, the SSHv2 client looks in its own internal flash for the public key pair files. If the key files exist, the SSHv2 client prompts you for the passphrase to decrypt the key files. If the passphrase is correct, the SSHv2 client initiates the DSA key authentication to the remote SSHv2 server. The SSHv2 client looks for the login user access level public key file on the SSHv2 server to process and validate the public key authentication. If the DSA authentication is successful, then the SSHv2 session is established.

If no matching user key pair files exist on the client side when initiating the SSHv2 session, or if the DSA authentication fails, you are automatically prompted for a password to attempt password authentication.

If the remote SSHv2 server is a Linux system, the server looks for the login user public key file ~/.ssh/authorized_keys by default for DSA authentication. For a Linux SSHv2 client, the user DSA key pair files are located in the user home directory as ~/.ssh/id_dsa and ~/.ssh/id_dsa.pub.

Block SNMP

The boot flag setting for block-snmpp (**boot config flags block-snmpp**) and the runtime configuration of SSH secure (**ssh secure**) each modify the block-snmpp boot flag. If you enable SSH secure mode, the system automatically sets the block-snmpp boot flag to true; the change takes effect immediately. After enabling SSH in secure mode, you can manually change the block-snmpp flag to false to allow both SSH and SNMP access.

Important

The block flag setting for block-snmpp blocks Simple Network Management Protocol (SNMP)v1, SNMPv2, and SNMPv3.

SCP command

Use short file names with the Secure CoPy (SCP) command. The entire SCP command, including all options, user names, and file names must not exceed 80 characters.

The switch supports incoming SCP connections but does not support outgoing connections using an SCP client.

Third-Party SSH and SCP Client Software

Tested Software

The following table describes the third-party SSH and SCP client software that has been tested but is not included with the switch software.

Table 285: Tested software

SSH Client	Secure Shell (SSH)	Secure Copy (SCP)
Tera Term Pro with TTSSH extension MS Windows	<ul style="list-style-type: none"> • Supports SSHv2. • Authentication: <ul style="list-style-type: none"> - RSA is supported when the switch acts as a server. The switch does not support RSA as a client. - DSA - Password • Provides a keygen tool. • It creates both RSA and DSA keys. 	<ul style="list-style-type: none"> • Client distribution does not include SCP client.
Secure Shell Client Windows 2000	<ul style="list-style-type: none"> • Supports SSHv2 client. • Authentication <ul style="list-style-type: none"> ◦ DSA ◦ Password • Provides a keygen tool. • It creates a DSA key in SSHv2 format. • The switch generates a log message stating that a DSA key has been generated. 	<ul style="list-style-type: none"> • Client distribution includes an SCP client that is not compatible with switch.

Table 285: Tested software (continued)

SSH Client	Secure Shell (SSH)	Secure Copy (SCP)
OpenSSH Unix Solaris 2.5 / 2.6	<ul style="list-style-type: none"> • Supports SSHv2 clients. • Authentication: <ul style="list-style-type: none"> - RSA is supported when the switch acts as a server. The switch does not support RSA as a client. - DSA - Password • Provides a keygen tool. • It creates both RSA and DSA keys. 	<ul style="list-style-type: none"> • Client distribution includes an SCP client that is supported on switch.
WinSCP		This SCP client is unsupported on the switch.

Switch As Client

The switch acting as the SSHv2 client generates a DSA public and private server key pair. The public part of the key for DSA is stored in the following location:

```
/intflash/.ssh/dsa_key_rwa
```

**Note**

For certain switches in enhanced secure mode, all sensitive files are protected. The home directory for protected files is `/intflash/shared`. You cannot access any sensitive files using Telnet, SSH, FTP, SFTP, TFTP, and SCP connections. For more information, see [Sensitive File Protection](#) on page 270.

The public part of the key must be copied to the SSH server and be named according to the naming requirement of the server.

Consult [DSA Authentication Access Level and File Name](#) on page 3335 for proper naming convention.

If a DSA key pair does not exist, you can generate the DSA key pair using the **ssh dsa-user-key [WORD<1-15>] [size <1024-1024>]** command.

You need to copy the DSA public key to the SSHv2 server that you connect to using the switch as a client. RSA is not supported when using the switch as a client, but you can use RSA when the switch is acting as the server.

**Note**

SSH RSA and DSA public and private keys are copied from `/intflash/shared` to `/intflash/.ssh`.

Switch As Server

After you install one of the SSHv2 clients you must generate a client and server key using the RSA or DSA algorithms.

To authenticate an SSHv2 client using DSA, the administrator must copy the public part of the client DSA key to `/intflash/.ssh` directory on the switch that acts as the SSHv2 server. The file that is copied over to the SSHv2 server must be named according to [DSA Authentication Access Level and File Name](#) on page 3335.

DSA Authentication Access Level and File Name

The following table lists the access levels and file names that you must use to store the SSHv2 client authentication information using DSA onto the switch that acts as the SSHv2 server.

For certain switches in enhanced secure mode, all sensitive files are protected. The home directory for enhanced secure mode is `/intflash/shared`. You cannot access any sensitive files using Telnet, SSH, FTP, SFTP, TFTP, and SCP connections. For more information, see [Sensitive File Protection](#) on page 270.

Table 286: DSA authentication access levels and file names

Client key format or WSM	Access level	File name
Client key in non IETF and IETF format with enhanced secure mode disabled Note: The switch supports IETF and non-IETF for DSA.	RWA	/intflash/.ssh/dsa_key_rwa
	RW	/intflash/.ssh/dsa_key_rw
	RO	/intflash/.ssh/dsa_key_ro
	L3	/intflash/.ssh/dsa_key_rwl3
	L2	/intflash/.ssh/dsa_key_rwl2
	L1	/intflash/.ssh/dsa_key_rwl1
Client key in enhanced secure mode	administrator	/intflash/shared/dsa_key_admin
	operator	/intflash/shared/dsa_key_operator
	security	/intflash/shared/dsa_key_security
	privilege	/intflash/shared/dsa_key_priv
	auditor	/intflash/shared/dsa_key_auditor
Client key in enhanced secure mode	administrator	/intflash/.ssh/dsa_key_admin
	operator	/intflash/.ssh/dsa_key_operator
	security	/intflash/.ssh/dsa_key_security
	privilege	/intflash/.ssh/dsa_key_priv
	auditor	/intflash/.ssh/dsa_key_auditor

The switch generates an RSA public and private server key pair. The public part of the key for RSA is stored in `/intflash/.ssh/ssh_key_rsa_pub.key`. If an RSA key pair does not exist, then the switch automatically generates one when you enable the SSH server.

To authenticate a client using RSA, the administrator must copy the public part of the client RSA key to the switch.

For a certain switches in enhanced secure mode, sensitive files are protected. You cannot copy public or private keys directly to `/intflash/.ssh`. You must import the DSA/RSA private and public key from `/intflash/shared`. For more information, see [Import DSA and RSA Private or Public Keys](#) on page 3342.

RSA Authentication Access Level and File Name

For certain switches in enhanced secure mode, all sensitive files are protected. The home directory for enhanced secure mode is `/intflash/shared`. You cannot access any sensitive files using Telnet, SSH, FTP, SFTP, TFTP, and SCP connections. For more information, see [Sensitive File Protection](#) on page 270.

The following table lists the access levels and file names you can use for storing the SSH client authentication information using RSA.

Table 287: RSA authentication access levels and file names

Client key format or WSM	Access level	File name
Client key in IETF format with enhanced secure mode disabled.	RWA	/flash/ssh/rsa_key_rwa
	RW	/flash/ssh/rsa_key_rw
	RO	/flash/ssh/rsa_key_ro
	L3	/flash/ssh/rsa_key_rwl3
	L2	/flash/ssh/rsa_key_rwl2
	L1	/flash/ssh/rsa_key_rwl1
Client key with enhanced secure mode enabled	administrator	/intflash/shared/rsa_key_admin
	operator	/intflash/shared/rsa_key_operator
	security	/intflash/shared/rsa_key_security
	privilege	/intflash/shared/rsa_key_priv
	auditor	/intflash/shared/rsa_key_auditor

SSH Rekeying

An SSHv2 server or client can use the SSH rekeying feature to force a key exchange between server and client, while changing the encryption and integrity keys. After you enable SSH rekeying, key exchanges occur after a pre-determined time interval or after the data transmitted in the session reaches the data-limit threshold. You can configure these values using the **ssh rekey** command.

SSH rekeying is optional. You can enable SSH rekey only if SSH is enabled globally. Most SSH clients and servers do not provide a rekey mechanism; do not enable SSH rekey in such cases. Active sessions shut down if the rekey fails.

**Note**

You cannot enable SSH rekey selectively for the SSH client, SSH server, Secure Copy (SCP), or Secure File Transfer Protocol (SFTP); SSH rekey is enabled for all of these functions simultaneously.

Configure Secure Shell using CLI

Use Secure Shell version 2 (SSHv2) to enable secure communications support over a network for authentication, encryption, and network Integrity.

Before You Begin

- Disable the sshd daemon. All SSHv2 commands, except enable, require that you disable the sshd daemon.
- Set the user access level to read/write/all community strings.
- Disable all nonsecure access services. As a best practice, disable the following services: Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP), and Telnet. For more information about disabling access services, see [Enable Remote Access Services](#) on page 293.
- Use the console port to configure the SSHv2 parameters.

Enabling the SSHv2 server

Enable the SSHv2 server to provide secure communications for accessing the switch. The switch does not support SSHv1.

Before You Begin

To enable SSH, ensure to enable RSA or DSA authentication, or both using command **ssh rsa-auth** or **ssh dsa-auth**.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enable the SSH server:
`boot config flags sshd`
3. Save the configuration file:
`save config`

Example

Enable the SSHv2 server:

```
Switch:1>enable
Switch:1#configure terminal
```

```
Switch:1(config)#boot config flags sshd
Switch:1(config)#save config
```

Changing the SSH server authentication mode

Use this procedure to change the SSH server authentication mode from the default of password-authentication to keyboard-interactive.

About This Task

If you enable keyboard-interactive authentication mode, the server uses that mode over other authentication methods, except for public-key authentication, if the SSH client supports it.

If you enable keyboard-interactive authentication mode, the server generates the password prompts to display to the client rather than the client generating the prompts automatically like with password-authentication.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable keyboard-interactive authentication:
`ssh keyboard-interactive-auth`

Configure SSH Authentication Type

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the authentication type to use:
`ssh authentication-type {[aead-aes-128-gcm-ssh] [aead-aes-256-gcm-ssh]
[hmac-sha1] [hmac-sha2-256]}`

Variable Definitions

The following table defines parameters for the **ssh authentication-type** command.

Variable	Value
<code>[aead-aes-128-gcm-ssh] [aead-aes-256-gcm-ssh] [hmac-sha1] [hmac-sha2-256]</code>	<p>Specifies the authentication type. Select from one of the following:</p> <ul style="list-style-type: none">• aead-aes-128-gcm-ssh• aead-aes-256-gcm-ssh• hmac-sha1• hmac-sha2-256 <p>By default, all types are enabled.</p>

Enable DSA Authentication

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable DSA authentication:
`ssh dsa-auth`

Generate the DSA Host Key

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Generate a new DSA host key:
`ssh dsa-host-key [<1024-1024>]`

Variable Definitions

The following table defines parameters for the **ssh dsa-host-key** command.

Variable	Value
<code><1024-1024></code>	The DSA host key size is 1024.

Generate a DSA User Key

Before You Begin

You must enable SSH globally before you can generate DSA user keys.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create the DSA user key:

```
ssh dsa-user-key WORD<1-15> [size <1024-1024>]
```

Variable Definitions

The following table defines parameters for the **ssh dsa-user-key** command.

Variable	Value
<i>WORD</i> <1–15>	<p>Specifies the user access level.</p> <p>You must enable SSH globally before you can generate SSH DSA user keys.</p> <p>If enhanced secure mode is disabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • rwa — Specifies read-write-all. • rw — Specifies read-write. • ro — Specifies read-only. • rwl1 — Specifies read-write for Layer 1. • rwl2 — Specifies read-write for Layer 2. • rwl3 — Specifies read-write for Layer 3. <p>If you enable enhanced secure mode, the switch uses role-based authentication. You associate each user name with a specific role and the appropriate authorization rights to commands based on that role.</p> <p>If enhanced secure mode is enabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • admin—Specifies a user role with access to all of the configurations, show commands, and the ability to view the log file and security commands. The administrator role is the highest level of user roles. • operator—Specifies a user role with access to all of the configurations for packet forwarding on Layer 2 and Layer 3, and has access to show commands to view the configuration, but cannot view the audit logs and cannot access security and password commands. • auditor—Specifies a user role that can view log files and view all configurations, except password configuration. • security—Specifies a user role with access only to security settings and the ability to view the configurations. • priv—Specifies a user role with access to all of the commands that the administrator has access to, and is referred to as an emergency-admin. However, the user with the privilege role must be authenticated within the switch locally. RADIUS and TACACS+ authentication is not accessible. A user role at the privilege level must login to the switch through the console port only.
<i>size</i> <1024–1024>	Specifies the size of the DSA user key.

Import DSA and RSA Private or Public Keys

About This Task

Use this task to import SSH RSA and DSA public and private keys.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enter the following command to install the DSA or RSA public or private key:

```
ssh install-user-key WORD<1-15> {rwa | rw | ro | rwl1 | rwl2 | rwl3  
| admin | operator | auditor | security | priv} WORD<1-15> {public |  
private} WORD<1-15> {dsa | rsa}
```

Examples

```
Switch:1(config)#ssh install-user-key admin public dsa  
Switch(config)#1 2021-07-22T14:09:43.278+03:00 5520-24X-VOSS CP1 - 0x0041460b - 00000000  
GlobalRouter CLOUD_AGENT INFO  
Successfully installed SSH public key to path </intflash/.ssh/dsa_key_admin>.  
Switch:1(config)#ssh install-user-key admin private dsa  
Info: Successfully installed the private key to path /intflash/.ssh/id_dsa_admin  
Switch:1(config)#1 2021-07-22T14:08:00.354+03:00 5520-24X-VOSS CP1 - 0x0041460b -  
00000000  
GlobalRouter CLOUD_AGENT INFO Successfully installed SSH private key to path </  
intflash/.ssh/id_dsa_admin>.
```

Variable Definitions

The following table defines parameters for the **ssh install-user-key** command.

Variable	Value
<code>WORD<1-15>{ rwa rw ro rwl1 rwl2 rwl3, enhanced-secured mode : admin operator auditor security priv }</code>	<p>Specifies the user access level.</p> <p>You must enable SSH globally before you can generate SSH DSA user keys.</p> <p>If enhanced secure mode is disabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • rwa — Specifies read-write-all. • rw — Specifies read-write. • ro — Specifies read-only. • rwl1 — Specifies read-write for Layer 1. • rwl2 — Specifies read-write for Layer 2. • rwl3 — Specifies read-write for Layer 3. <p>If you enable enhanced secure mode, the switch uses role-based authentication. You associate each user name with a specific role and the appropriate authorization rights to commands based on that role.</p> <p>If enhanced secure mode is enabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • admin—Specifies a user role with access to all of the configurations, show commands, and the ability to view the log file and security commands. The administrator role is the highest level of user roles. • operator—Specifies a user role with access to all of the configurations for packet forwarding on Layer 2 and Layer 3, and has access to show commands to view the configuration, but cannot view the audit logs and cannot access security and password commands. • auditor—Specifies a user role that can view log files and view all configurations, except password configuration. • security—Specifies a user role with access only to security settings and the ability to view the configurations. • priv—Specifies a user role with access to all of the commands that the administrator has access to, and is referred to as an emergency-admin. However, the user with the privilege role must be authenticated within the switch locally. RADIUS and TACACS+ authentication is not accessible. A user

Variable	Value
	role at the privilege level must login to the switch through the console port only.
<i>WORD</i> <1-15>{ <i>public</i> <i>private</i> }	Specifies the public key or the private key type to copy from /intflash/shared to /intflash/.ssh.
<i>WORD</i> <1-15>{ <i>dsa</i> <i>rsa</i> }	Specifies the DSA or RSA signature algorithm for the public key or the private key to copy.

Configure Encryption Type

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the type of encryption to use:

```
ssh encryption-type {[3des-cbc][aead-aes-128-gcm-ssh ][aead-aes-256-  
gcm-ssh] [aes128-cbc][aes128-ctr][aes192-cbc][aes192-ctr][aes256-cbc]  
[aes256-ctr][blowfish-cbc] [rijndael128-cbc][rijndael192-cbc]}
```

Variable Definitions

The following table defines parameters for the **ssh encryption-type** command.

Variable	Value
<code>[3des-cbc] [aead-aes-128-gcm-ssh] [aead-aes-256-gcm-ssh] [aes128-cbc] [aes128-ctr] [aes192-cbc] [aes192-ctr] [aes256-cbc] [aes256-ctr] [blowfish-cbc] [rijndael128-cbc] [rijndael192-cbc]</code>	<p>Configures the encryption-type. Select an encryption-type from one of the following:</p> <ul style="list-style-type: none"> • 3des-cbc • aead-aes-128-gcm-ssh • aead-aes-256-gcm-ssh • aes128-cbc • aes128-ctr • aes192-cbc • aes192-ctr • aes256-cbc • aes256-ctr • blowfish-cbc • rijndael128-cbc • rijndael192-cbc <p>By default, all encryption types are enabled.</p> <p>If you configure the switch in Enhanced Secure Mode, the following encryption types are disabled by default:</p> <ul style="list-style-type: none"> • 3des-cbc • aes192-cbc • aes192-ctr • blowfish-cbc • rijndael128-cbc • rijndael192-cbc

Configure the SSH Key Exchange Method

About This Task

If you configure the switch in Enhanced Secure Mode, the following key exchange methods are disabled by default:

- diffie-hellman-group-exchange-sha256
- diffie-hellman-group14-sha1

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the key-exchange to use:

```
ssh key-exchange-method {[diffie-hellman-group-exchange-sha256]
[diffie-hellman-group14-sha1] [diffie-hellman-group14-sha256] [diffie-
hellman-group16-sha512] [diffie-hellman-group18-sha512]}
```

Configure the Maximum Number of SSH Sessions

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the maximum number of SSH sessions:
`ssh max-sessions <0-8>`

Variable Definitions

The following table defines parameters for the **ssh max-sessions** command.

Variable	Value
<0-8>	Specifies the maximum number of SSH sessions allowed. A value from 0 to 8. Default is 4.

Clear SSH Sessions

About This Task

Perform this procedure to clear SSH sessions on the switch, including Secure Copy (SCP) and Secure FTP (SFTP) sessions.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Clear a session using one of the following commands:
 - Clear an SSH session: `clear ssh <0-7>`
 - Clear an SCP session: `clear ssh scp <0-7>`
 - Clear an SFTP session: `clear ssh sftp <0-7>`

Enable SSH Password Authentication

Enable password authentication. The default is enabled.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable password authentication:
`ssh pass-auth`

Configure the SSH Connection Port

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the SSH connection port:
`ssh port <22,1024..49151>`

Variable Definitions

The following table defines parameters for the **ssh port** command.

Variable	Value
<22,1024-49151>	<p>Specifies the TCP port number. The default is 22.</p> <p>Important: You cannot configure TCP port 6000 as the SSH connection port.</p>

Enable RSA Authentication

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable the RSA authentication:
`ssh rsa-auth`

Generate an RSA Host Key

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Generate a new RSA host key:
`ssh rsa-host-key [<1024-2048>]`

Variable Definitions

The following table defines parameters for the **ssh rsa-host-key** command.

Variable	Value
<1024-2048>	Specify an optional key size from 1024 to 2048. The default is 2048.

Generate an RSA User Key

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Generate a new RSA user key.
`ssh rsa-user-key WORD<1-15> [size <1024-2048>]`

Variable Definitions

The following table defines parameters for the **ssh rsa-user-key** command.

Variable	Value
<i>WORD</i> <1-15>	<p>Specifies the user access level.</p> <p>If enhanced secure mode is disabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • rwa — Specifies read-write-all • rw — Specifies read-write • ro — Specifies read-only • rwl1 — Specifies read-write for Layer 1 • rwl2 — Specifies read-write for Layer 2 • rwl3 — Specifies read-write for Layer 3 <p>If you enable enhanced secure mode, the switch uses role-based authentication. You associate each user name with a specific role and the appropriate authorization rights to commands based on that role.</p> <p>If enhanced secure mode is enabled, the value user access levels for the switch are:</p> <ul style="list-style-type: none"> • admin—Specifies a user role with access to all of the configurations, show commands, and the ability to view the log file and security commands. The administrator role is the highest level of user roles. • operator—Specifies a user role with access to all of the configurations for packet forwarding on Layer 2 and Layer 3, and has access to show commands to view the configuration, but cannot view the audit logs and cannot access security and password commands. • auditor—Specifies a user role that can view log files and view all configurations, except password configuration. • security—Specifies a user role with access only to security settings and the ability to view the configurations • priv—Specifies a user role with access to all of the commands that the administrator has access to, and is referred to as an emergency-admin. However, the user with the privilege role must be authenticated within the switch locally. RADIUS and TACACS+ authentication is not accessible. A user role at the privilege level must log in to the switch through the console port only.
<i>size</i> <1024-1024>	Specifies the size of the RSA user key.

Enable SSH Secure Mode

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable SSH secure mode:
`ssh secure`

Configure the SSH version

Configure Secure Shell version 2 (SSHv2). The switch does not support SSHv1.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the SSH version:
`ssh version <v2only>`

Configure the SSH Authentication Timeout

Configure the timeout for SSH connection authentication.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the authentication timeout:
`ssh timeout <1-120>`

Variable Definitions

The following table defines parameters for the **ssh timeout** command.

Variable	Value
<1-120>	Specifies the SSH connection authentication timeout in seconds. Default is 60 seconds.

Resetting the SSH

About This Task

Perform this task to terminate all SSH sessions and restart SSH server.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Reset the SSH.

```
ssh reset
```

Configure X.509 V3 Authentication

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable X.509 V3 authentication:

```
ssh x509v3-auth enable
```

3. Configure X.509 V3 revocation:

```
ssh x509v3-auth revocation-check-method {none | ocsp}
```

4. Configure the X.509 V3 user name:

```
ssh x509v3-auth username {overwrite | strip-domain | use-domain  
WORD<1-254>}
```

5. Configure the X.509 V3 CA trustpoint name:

```
ssh x509v3-auth ca-name WORD<1-45>
```

6. Configure the X.509 V3 digital certificate subject name to use as the identity certificate:

```
ssh x509v3-auth cert-subject-name WORD<1-45>
```

Example

Display the certificate authority details:

```
Switch:1(config)#show certificate ca
```

Variable Definitions

The following table defines parameters for the **ssh x509v3-auth** command.

Variable	Value
<code><none oscp></code>	Specifies the X.509 V3 authentication revocation check method. The default is OSCP. <ul style="list-style-type: none"> none - Specifies no revocation check method. oscp - Specifies Online Certificate Status Protocol (OCSP) as revocation check method.
<code>overwrite strip-domain use-domain WORD<1-254></code>	Specifies the X.509 V3 user name configuration. The default is disabled. <ul style="list-style-type: none"> overwrite - Specifies the switch to send the principal name and domain name from the certificate to the RADIUS server for authorization. strip-domain - Specifies the switch to send the principal name from the certificate without the domain name to the RADIUS server for authorization. use-domain WORD<1-254> - Specifies the switch to send the principal name from the certificate, with the domain name you entered to the RADIUS server for authorization.
<code>ca-name WORD<1-45></code>	Specifies the X.509 V3 CA trustpoint name.
<code>cert-subject-nameWORD<1-45></code>	Specifies the digital certificate subject name to be used as the identity certificate.

Verify and Display SSH Configuration Information

Verify that SSH services are enabled on the switch and display SSH configuration information to ensure that the SSH parameters are properly configured.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Verify that SSH services are enabled and view the SSH configuration:

```
show ssh <global|session>
```

Example

Display global system SSH information:

```
Switch:1(config)#show ssh global
Total Active Sessions      : 1
version                   : v2only
port                      : 22
```

```

Variable Definitions

The following table defines parameters for the **show ssh** command.

Variable	Value
<i>global</i>	Display global system SSH information.
<i>session</i>	Display the current session SSH information.

Connect to a Remote Host using the SSH Client

Make an SSH connection to a remote host.

Before You Begin

Enable the SSH server on the remote host.

About This Task

You can also use the IS-IS host name or IS-IS system ID with the SSH client to establish a connection to another switch in the SPBM cloud.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Connect to a remote host:

```
ssh WORD<1-256> -l WORD<1-32> [-p <1-49151>]
```

Examples

Connect to the remote host using an IP address:

```
Switch:1>ssh 192.0.2.1 -l rwa
```

Connect to the SSH server on a remote switch using the IS-IS host name or system ID, as displayed in the **show isis spbm unicast-fib** command output. This example shows a partial ssh connection with only the relevant information.

```
Switch:1#show isis spbm unicast-fib
```

```
=====

```

Variable Definitions

The following table defines parameters for the **ssh** command.

Variable	Value
<code>-l WORD<1-32></code>	Specifies the user login name for the remote SSH server.
<code>-p <1-49151></code>	Specifies the port number to connect to the remote SSH server. The default is 22.
<code>WORD<1-256></code>	Specifies the remote SSH server using one of the following: <ul style="list-style-type: none"> • host name • IP address • IS-IS host name • IS-IS system ID <p>Note: You cannot establish an SSH connection from an IS-IS remote area.</p>

Generate User Key Files

Configure the SSH parameters to generate DSA user key files.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable SSH server.

3. Create the DSA user key file:

```
ssh dsa-user-key [WORD<1-15>][size <1024-1024>]
```

4. Enter the encryption password to protect the key file.

5. Copy the user public key file to the remote SSH servers.

**Note**

For certain switches in enhanced secure mode, the public key is copied from `/intflash/.ssh` to `/intflash/shared` after key pair generation to be available in enhanced secure mode.

6. If you are generating the compatible keys on a Linux system, use the following steps:
 - a. Create the DSA user key file:

```
ssh-keygen -t dsa
```
 - b. Copy the user public key to the remote SSH servers.

**Note**

The DSA pair key files can be generated on the Linux system and used by the SSH client on the switch.

Example

Create the DSA user key file with the user access level set to read-write-all and size of the DSA user key set to 1024 bits:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ssh dsa-user-key rwa size 1024
```

Variable Definitions

The following table defines parameters for the **ssh dsa-user-key** command.

Variable	Value
<code>WORD <1-15></code>	<p>Specifies the user access level. If enhanced secure mode is disabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • <code>rwa</code>—Specifies read-write-all. • <code>rw</code>—Specifies read-write. • <code>ro</code>—Specifies read-only • <code>rw13</code>—Specifies read-write for Layer 3. • <code>rw12</code>—Specifies read-write for Layer 2. • <code>rw11</code>—Specifies read-write for Layer 1. <p>If you enable enhanced secure mode, the switch uses role-based authentication. You associate each user name with a specific role and the appropriate authorization rights to commands based on that role.</p> <p>If enhanced secure mode is enabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • <code>admin</code>—Specifies a user role with access to all of the configurations, show commands, and the ability to view the log file and security commands. The administrator role is the highest level of user roles. • <code>operator</code>—Specifies a user role with access to all of the configurations for packet forwarding on Layer 2 and Layer 3, and has access to show commands to view the configuration, but cannot view the audit logs and cannot access security and password commands. • <code>auditor</code>—Specifies a user role that can view log files and view all configurations, except password configuration. • <code>security</code>—Specifies a user role with access only to security settings and the ability to view the configurations. • <code>priv</code>—Specifies a user role with access to all of the commands that the administrator has access to, and is referred to as an emergency-admin. However, the user with the privilege role must be authenticated within the switch locally. RADIUS and TACACS+ authentication is not accessible. A user role at the privilege level must login to the switch through the console port only.
<code>size <1024-1024></code>	Specifies the size of the DSA user key. The default is 1024 bits.

Manage an SSL Certificate

Note

For certain switches in enhanced secure mode, all sensitive files are protected. You cannot access any sensitive files using Telnet, SSH, FTP, SFTP, TFTP, and SCP connections. For more information, see [Sensitive File Protection](#) on page 270.

The TLS server selects a certificate authority (CA)-signed certificate if the certificate is already installed in the Digital Certificate module.

If the server certificates are not available, the TLS server generates a new self-signed certificate at startup and uses that by default. You can choose to use an online or an offline CA-signed certificate, which takes precedence over the self-signed certificate.

For more information about SSL certificate manipulation, see [Certificate Order Priority](#) on page 3384.

About This Task

If a certificate is already present, you must confirm that it can be deleted before a new one is created.

After you create a certificate, the system logs one of the following INFO alarms:

- New default Server Certificate and Key are generated and installed
- Current Server Certificate and Key are installed

The default certificate key length for a certificate generated on the switch is 2,048 bits.

Note

The **ssl certificate [validity-period-in-days <30-3650>]** command in this procedure does not require a system reboot.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Delete a certificate:

```
no ssl certificate
```

Note

The certificate loaded in memory remains valid until you use the **ssl reset** command or reboot the system.

3. Create and install a new self-signed certificate:

```
ssl certificate [validity-period-in-days <30-3650>]
```

Variable Definitions

The following table defines parameters for the **ssl certificate** command.

Variable	Value
<i>validity-period-in-days</i> <30-3650>	Specifies an expiration time for the certificate. The default is 365 days.

Disabling SFTP without disabling SSH

Disable SFTP while allowing SSH to remain active.

Before You Begin

Enhanced secure mode must be enabled. For information about enabling enhanced secure mode, see [Enable Enhanced Secure Mode](#) on page 324.

Procedure

- 1. Enter Global Configuration mode:
`enable`
`configure terminal`
- 2. Enable the SSHv2 server:
`no ssh sftp enable`
- 3. Save the configuration file:
`save config`

Enable SSH Rekey

You cannot enable SSH rekey selectively for the SSH client, SSH server, Secure Copy (SCP), or Secure File Transfer Protocol (SFTP); SSH rekey is enabled for all of these functions simultaneously.

Before You Begin

Enable SSH globally.

Procedure

- 1. Enter Global Configuration mode:
`enable`
`configure terminal`
- 2. Enter the following command:
`ssh rekey enable`

Variable Definitions

The following table defines parameters for the **ssh rekey** command.

Variable	Value
<i>enable</i>	Enables SSH rekey globally. The default is disabled.

Configure the SSH Rekey Data Limit Threshold

Use the following procedure to limit data transmission during the session.

Procedure

- 1. Enter Global Configuration mode:
`enable`
`configure terminal`
- 2. Enter the following command:
`ssh rekey data-limit <1-6>`

Example

Configure the data limit to 2 GB:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#ssh rekey data-limit 2
```

Variable Definitions

The following table defines parameters for the **ssh rekey data-limit** command.

Variable	Value
<1-6>	Specifies the SSH rekey data limit in GB. The default is 1 GB.

Configure the SSH Rekey Time Interval

Use the following procedure to configure a time interval, after which the key exchange takes place.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enter the following command:
`ssh rekey time-interval <1-6>`

Example

Configure the SSH rekey time-interval to 3 hours:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#ssh rekey time-interval 3
```

Variable Definitions

The following table defines parameters for the **ssh rekey time-interval** command.

Variable	Value
<1-6>	Specifies the time-interval for SSH rekeying in hours. The default is 1 hour.

Display SSH Rekey Information

Use the following procedure to display the SSH rekey information.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Enter the following command:
`show ssh rekey`

Example

```
Switch:1>show ssh rekey
Rekey Status      : TRUE
Rekey data limit   : 1 GB
Rekey time interval : 1 hours
```

Enable or Disable the SSH Client

Before You Begin

To enable the SSH client functionality, you must enable SSH globally.

About This Task

You can disable the SSH client functionality on the switch. By default, the SSH client functionality is enabled.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enable or disable the SSH client functionality:
 - To disable the client, enter the following command: `no ssh client enable`
 - To enable the client, enter the following command: `ssh client enable`

Downgrading or Upgrading from Releases that Support Different Key Sizes

Use this procedure if you need to downgrade or upgrade from a release that supports different key sizes.

Different releases can support different DSA host key, RSA host key, and DSA user key sizes. If you need to upgrade or downgrade to an earlier release that does not support the same key size, you must delete all of the keys from the `.ssh` directory and generate new keys for SSH. If you do not do this, key sizes that are no longer supported will no longer function.

You only need to perform this procedure if you have previously generated DSA host, RSA host, or DSA user keys with a release that supports different key sizes.

Procedure

1. Use the following command to disable SSH:
`no ssh`

2. From the config terminal go to the .ssh directory using the command:

```
cd /intflash/.ssh
```

3. After you upgrade or downgrade, delete the following keys from the .ssh directory.

```
ssh_dss.key
ssh_rsa.key
moc_sshc_dsa_file
moc_sshc_rsa_file
id_dsa_rwa
id_dsa_rwa.pub
id_rsa_rwa
id_rsa_rwa.pub
moc_sshc_dsa_file_fed
moc_sshc_rsa_file_fed
known_hosts
ssh_ecdsa.key
dsa_key <access level like rwa/rw/ro/admin/security/privilege/operator/auditor>,
example: dsa_key_rwa
rsa_key <access level like rwa/rw/ro/admin/security/privilege/operator/auditor>,
example: rsa_key_rwa
```

4. Generate a new DSA host key:

```
ssh dsa-host-key [<1024-1024>]
```

5. Generate a new SSH DSA user key:

```
ssh dsa-user-key WORD<1-15> [size <1024-1024>]
```

6. Generate a new RSA host key:

```
ssh rsa-host-key [<1024-2048>]
```

Secure Shell configuration using Enterprise Device Manager

Use Secure Shell version 2 (SSHv2) to enable secure communications support over a network for authentication, encryption, and network Integrity.

On IPv6 networks, the switch supports SSHv2 server only. The switch does not support outbound SSHv2 client over IPv6. On IPv4, the switch supports both SSHv2 server and SSHv2 client.

For more information, see [Change Secure Shell Parameters](#) on page 3362.

Change Secure Shell Parameters

You can use Enterprise Device Manager to change the SSHv2 configuration parameters. However, as a best practice, use the CLI to perform the initial configuration of SSHv2. The switch does not support SSHv1.

Before You Begin

- The user access level is read/write/all community strings.
- You must disable the SSH service before you configure the SSH service parameters. If the SSHv2 service is enabled, the system displays all fields dimmed until the SSH service is disabled.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **SSH**.
3. Select the **SSH** tab.
4. In the **Enable** field, select the type of SSH service you want to enable.
5. In the **Version** field, select a version.
6. In the **Port** field, type a port number.
7. In the **MaxSession** field, type the maximum number of sessions allowed.
8. In the **Timeout** field, type the timeout value in seconds.
9. From the **KeyAction** field, choose a key action.
10. In the **RsaKeySize** field, type the RSA key size in bytes.
11. In the **DSAKeySize** field, type the DSA key size in bytes.
12. Select the **RsaAuth** check box for RSA authentication.
13. Select the **DsaAuth** check box for DSA authentication.
14. Select the **PassAuth** check box for password authentication.
15. In the **AuthType** section, select the authentication types you want.
16. In the **Encryption Type** section, select the encryption types you want.
17. In the **KeyExchangeMethod** section, select the key exchange method you want.
18. Select **Apply**.

SSH Field Descriptions

Use the data in the following table to use the **SSH** tab.

Name	Description
Enable	<p>Enables, disables, or securely enables SSHv2. The options are:</p> <ul style="list-style-type: none"> • false • true • secure <p>Select false to disable SSHv2 services. Select true to enable SSHv2 services. Select secure to enable SSH and disable access services (SNMP, FTP, TFTP, and Telnet). The default is false.</p> <p>Important: Do not enable SSHv2 secure mode using EDM. Enabling secure mode disables SNMP, which locks you out of the EDM session. Enable SSHv2 secure mode using CLI.</p>
Version	<p>Configures the SSH version. The options are:</p> <ul style="list-style-type: none"> • v2only <p>The default is v2only.</p>

Name	Description
Port	Configures the SSHv2 connection port number. <22 or 1024–49151> is the port range of SSHv2. Important: You cannot configure the TCP port 6000 as SSHv2 connection port.
MaxSession	Configures the maximum number of SSHv2 sessions allowed. The value can be from 0 to 8. The default is 4.
Timeout	Configures the SSHv2 authentication connection timeout in seconds. The default is 60 seconds.
KeyAction	Configures the SSHv2 key action. The options are: <ul style="list-style-type: none"> • none • generateDsa • generateRsa • deleteDsa • deleteRsa
RsaKeySize	Configures SSHv2 RSA key size. The value can be from 1024 to 2048. The default is 2048.
DsaKeySize	Configures the SSHv2 DSA key size. The value can be from 512 to 1024. The default is 1024.
RsaAuth	Enables or disables SSHv2 RSA authentication. The default is enabled.
DsaAuth	Enables or disables SSHv2 DSA authentication. The default is enabled.
PassAuth	Enables or disables SSHv2 RSA password authentication. The default is enabled.
RekeyEnable	Enables SSH rekey globally. The default is disabled. Note: You cannot enable SSH rekey selectively for the SSH client, SSH server, Secure Copy (SCP), or Secure File Transfer Protocol (SFTP); SSH rekey is enabled for all of these functions simultaneously.
RekeyTimeInterval	Configures a time interval, after which the key exchange takes place. The default is 1 hour.
RekeyDataLimit	Configures the limit for data transmission during the session. The default is 1 GB.
SftpEnable	Enables or disables SFTP. You can use this check box to disable SFTP without affecting the SSH status. The default is enabled.
KeyboardInteractiveAuth	Changes the SSH server authentication mode from the default of password authentication to keyboard interactive.
ClientEnable	Enables SSH client functionality on the switch. By default, the SSH client functionality is enabled. To enable the SSH client functionality, SSH must be enabled globally.
X509AuthEnable	Enables SSH x509 authentication. The default is enabled.

Name	Description
X509AuthRevocationCheckMethod	Specifies the X.509 V3 authentication revocation check method. The default is OCSP. <ul style="list-style-type: none"> • none - Specifies no revocation check method. • oscp - Specifies Online Certificate Status Protocol (OCSP) as revocation check method.
X509AuthUserNameOverwrite	Enables the switch to send the principal name and domain name from the certificate to the RADIUS server for authorization. The default is disabled.
X509AuthUserNameStripDomain	Enables the switch to send the principal name from the certificate without the domain name to the RADIUS server for authorization. The default is disabled.
X509AuthUserNameUseDomain	Enables the switch to send the principal name from the certificate, with the domain name you entered to the RADIUS server for authorization.
X509AuthCertificateSubjectName	Specifies the digital certificate subject name used as identity certificate.
X509AuthCertificateCAName	Specifies the digital certificate CA trustpoint name to use.
AuthType	Specifies the authentication type. Select from one of the following: <ul style="list-style-type: none"> • hmacSha1 • hmacSha2256 • aeadAes128GcmSsh • aeadAes256GcmSsh By default, all authentication types are selected.

Name	Description
EncryptionType	<p>Configures the encryption-type. Select an encryption-type from one of the following:</p> <ul style="list-style-type: none"> • aes128Cbc • aes256Cbc • threeDesCbc • aeadAes128GcmSsh • aeadAes256GcmSsh • aes128Ctr • rijndael128Cbc • aes256Ctr • aes192Ctr • aes192Cbc • rijndael192Cbc • blowfishCbc <p>By default, all encryption types are enabled.</p> <p>If you configure the switch in Enhanced Secure Mode, the following encryption types are disabled by default:</p> <ul style="list-style-type: none"> • 3des-cbc • aes192-cbc • aes192-ctr • blowfish-cbc • rijndael128-cbc • rijndael192-cbc
KeyExchangeMethod	<p>Configures the key-exchange type. Select from one of the following:</p> <ul style="list-style-type: none"> • diffieHellmanGroup14Sha1 • diffieHellmanGroupExchangeSha256 • diffieHellmanGroup14Sha256 • diffieHellmanGgroup16Sha512 • diffieHellmanGroup18Sha512 <p>If you configure the switch in Enhanced Secure Mode, the following key exchange methods are disabled by default:</p> <ul style="list-style-type: none"> • diffieHellmanGroup14Sha1 • diffieHellmanGroupExchangeSha256

Security

[Security Fundamentals](#) on page 3367

[Security Configuration Using CLI](#) on page 3386

[Security Configuration using EDM](#) on page 3427

This section provides conceptual and procedural information about security services on the switch.

Security Fundamentals

This section provides conceptual content to help you configure and customize the security services on the switch.

For information about configuring access policies, see [Access Policies for Services](#) on page 283.

Security Overview

Security is a critical attribute of networking devices. Security features are split into two main areas:

- Control path—protects the access to the device from a management perspective.
- Data path—protects the network from malicious users by controlling access authorization to the network resources (such as servers and stations). This protection is primarily accomplished by using filters or access lists.

You can protect the control path using the following mechanism:

- logon and passwords
- access policies to specify the network and address that can use a service or daemon
- secure protocols, such as Secure Shell (SSH), Secure Copy (SCP), and the Simple Network Management Protocol version 3 (SNMPv3)
- the Message Digest 5 Algorithm (MD5) to protect routing updates, Open Shortest Path First (OSPF), and Border Gateway Protocol (BGP)

You can protect the data path using the following mechanism

- Media Access Control (MAC) address filtering
- Layer 3 filtering, such as Internet Protocol (IP) and User Datagram Protocol (UDP)/Transmission Control Protocol (TCP) filtering

- routing policies to prevent users from accessing restricted areas of the network
- mechanisms to prevent denial-of-service (DOS) attacks

Security Modes

The switch support three security modes:

- Enhanced secure
- Hsecure
- SSH secure

Enable SSH secure mode to permit only SSH and disable all other protocols, which include Telnet, FTP, SNMP, TFTP, HTTP, and HTTPS. Enabling this mode disables Telnet, FTP, SNMP, TFTP, HTTP, and HTTPS by setting the boot flags for these protocols to off. You can over-ride the configuration and enable required protocols individually for run-time use. The administrator must enable required protocols individually for run-time use again following a reboot even if you save the configuration. This is because the SSH secure mode enable takes precedence at the time of reboot and the other protocols will be disabled even though the configuration file has them set to enabled.

Note

Disabling SSH secure mode will not automatically enable the OAM protocols that were disabled. The boot flags for the required protocols will have to be individually set to enabled.

The following table lists the differences between enhanced secure mode and hsecure mode.

Table 288: Enhanced secure mode versus hsecure mode

Feature	Enhanced secure	Hsecure
Authentication	Role-based: <ul style="list-style-type: none"> • admin • privilege • operator • security • auditor 	Access-level based: <ul style="list-style-type: none"> • rwa • rw • ro • l3 • l2 • l1
Password length	Minimum of 8 characters with the exception of the Admin, which requires a minimum of 15 characters	10 characters, minimum
Password rules	1 or 2 upper case, lower case, numeric and special characters	Minimum of 2 upper case, 2 lower case, 2 numeric and 2 special characters
Password expiration	Per-user minimum change interval is enforced, which is programmed by the Administrator	Global expiration, configured by the Admin

Table 288: Enhanced secure mode versus hsecure mode (continued)

Feature	Enhanced secure	Hsecure
Password-unique	Previous passwords and common passwords between users are prevented	The same
Password renewal	Automatic password renewal is enforced	The same
Audit logs	Audit logs are encrypted, and authorized users are able to view, modify, and delete.	Standard operation
SNMPv3	Password rules apply to SNMPv3 Auth&Priv. SNMPv3 is required (V1/V2 disabled)	SNMPv1 and SNMPv2 can be enabled.
EDM	Site Admin to enable or disable	Disabled
Telnet and FTP	Site Admin to enable or disable	The same
DOS attack Prevention		Prevents DOS attacks by filtering IP addresses and IP address ranges.

For information on Enhanced secure mode and SSH, see [Enhanced Secure Mode](#) on page 266.

hsecure Mode

The switch supports a flag called high secure (hsecure). hsecure introduces the following behaviors for passwords:

- 10-character enforcement
- aging time
- limitation of failed logon attempts
- protection mechanism to filter certain IP addresses

After you enable the hsecure flag, the software enforces the 10-character rule for all passwords. This password must contain a minimum of two uppercase characters, two lowercase characters, two numbers, and two special characters.

After you enable hsecure, the system requires you to save the configuration file and reboot the system for hsecure to take effect. If the existing password does not meet the minimum requirements for hsecure, the system prompts you to change the password during the first login.

The default user name is rwa and the default password is rwa. In hsecure, the system prompts you to change these during first login because they do not meet the minimum requirements for hsecure.

When you enable hsecure, the system disables Simple Network Management Protocol (SNMP) v1, SNMPv2 and SNMPv3. If you want to use SNMP, you must re-enable SNMP, using the command **no boot config flag block-snmp**.

Aging Enforcement

After you enable the hsecure flag, you can configure a duration after which you must change your password. You configure the duration by using the aging parameter.

For SNMP and File Transfer Protocol (FTP), after a password expires, access is denied. Before you access the system, you must change a community string to a new string consisting of more than eight characters.

Important

Consider the following after you enable the hsecure flag:

- You cannot enable the web server for Enterprise Device Manager (EDM) access.
- You cannot enable the Secure Shell (SSH) password authentication.

Filtering Mechanism

Incorrect IP source addresses as network or broadcast addresses are filtered at the virtual router interface. Source addresses 192.168.168.0 and 192.168.168.255 are discarded.

This change is valid for all IP subnets, not only for /24.

You can filter addresses only if you enable the hsecure mode.

CLI Passwords

Table 289: Password Hash

Feature	Product	Release introduced
SHA512 Password Hashing Note: When upgrading, SHA1 password hashes and custom users are retained, until a factory default reset or until the password hash level is changed. During a factory default reset, SHA2 512-bit becomes the default password hash, all custom users are deleted, and SHA1 passwords are removed.	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.8
	5420 Series	Fabric Engine 8.8
	5520 Series	Fabric Engine 8.8
	5720 Series	Fabric Engine 8.8
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.8
	VSP 7400 Series	VOSS 8.8

Important

The default passwords are documented and well known. Change the default passwords and community strings immediately after you first log on.

The switch ships with default passwords assigned for access to Command Line Interface (CLI) through a console or management session. If you have read/write/all access authority, and you are using SNMPv3, you can change passwords that are in an encrypted format. If you use EDM, you can also specify the number of available Telnet sessions.

After a factory default or if your switch has no primary or backup configuration files, a password change is required to access the CLI. The system provides three attempts to change the password, if unsuccessful you are taken back to the login prompt but are not locked out. You cannot reuse a password and your password cannot be empty. A password change is required irrespective of security mode, console, SSH, or Telnet access.

You can select SHA1 for 160-bit or SHA2 for 512-bit password hash security. You can switch the password hashing with the **password hash** command. After a hashing change, all custom users and passwords are deleted, and on first login each default user must change their default password.

Note

If you upgrade to a release that supports password hash configuration, custom users are retained until a factory default reset or until a password hash level change. During a factory default reset, all customer users are deleted, all SHA1 passwords are removed, and SHA2 becomes the new default password hash.

If you enable enhanced secure mode with the **boot config flags enhancedsecure-mode** command, you enable different access levels, along with stronger password complexity, length, and minimum change intervals. For more information on system access fundamentals and configuration, see [Managing the Switch](#) on page 246.

User-Based Policy Support

You can set up a user-based policy (UBP) system by using Enterprise Policy Manager (EPM), a RADIUS server.

EPM is an application designed to manage the traffic prioritization and network access security for business applications. It provides centralized control of advanced packet classification and the ability to priority mark, police, meter, or block traffic.

EPM 5.0 supports UBPs, which allow security administrators to establish and enforce roles and conditions for each user for all access ports in the network. The UBP feature in EPM works in conjunction with Extensible Access Protocol (EAP) technology to enhance the security of the network. Users log on to the networks and are authenticated as the network connection is established.

The UBP feature works as an extension to the Roles feature in EPM. In a UBP environment, role objects are linked directly to specific users (as RADIUS attributes), as opposed to being linked simply to device interfaces. The role object then links the users to specific policies that control the user's access to the network.

When the RADIUS server successfully authenticates a user, the device sends an EAP session start event to the EPM policy server. The policy server then sends user-based policy configuration information for the new user roles to the interface, based on the role attribute that was assigned to that user on the RADIUS server.

Denial-of-Service Attack Prevention

Table 290: Denial-of-service attack prevention product support

Feature	Product	Release introduced
Directed Broadcast	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7

	7720 Series	Fabric Engine 8.10
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Table 290: Denial-of-service attack prevention product support (continued)

Feature	Product	Release introduced
High Secure mode (hsecure boot configuration flag)	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Hsecure

The switch supports a configurable flag, called high secure (hsecure). High secure mode introduces a protection mechanism to filter certain IP addresses, and two restrictions on passwords: 10-character enforcement and aging time.

If the device starts in hsecure mode with default factory settings, and no previously configured password, the system will prompt you to change the password. The new password must follow the rules mandated by high secure mode. After you enable hsecure and restart the system, if you have an invalid-length password you must change the password.

If you enable hsecure for the first time and the password file does not exist, then the device creates a normal default user name (rwa) and password (rwa). In this case, the password does not meet the minimum requirements for hsecure and as a result the system prompts you to change the password.

The following information describes hsecure mode operations:

- When you enable the hsecure flag, after a certain duration you are asked to change your password. If not configured, the aging parameter defaults to 90 days.
- For SNMP and FTP, access is denied when a password expires. You must change the community strings to a new string made up of more than eight characters before accessing the system.
- You cannot enable the web server at any time.
- You cannot enable the SSH password-authentication feature at any time.

Hsecure is disabled by default. When you enable hsecure, the desired behavior applies to all ports.

For more information, see [Prevent Certain Types of DOS Attacks](#) on page 3393.

Prioritization of Control Traffic

The switch uses a sophisticated prioritization scheme to schedule control packets on physical ports. This scheme involves two levels with both hardware and software queues to guarantee proper handling of control packets regardless of the switch load. In turn, this scheme guarantees the stability of the network. Prioritization also guarantees that applications that use many broadcasts are handled with lower priority.

You cannot view, configure, or modify control-traffic queues.

Directed Broadcast Suppression

You can enable or disable forwarding for directed broadcast traffic on an IP-interface basis. A directed broadcast is a frame sent to the subnet broadcast address on a remote IP subnet. By disabling or suppressing directed broadcasts on an interface, you cause all frames sent to the subnet broadcast address for a local router interface to be dropped. Directed broadcast suppression protects hosts from possible DoS attacks.

To prevent the flooding of other networks with DoS attacks, such as the Smurf attack, enable directed broadcast suppression. For more information, see [Configure Directed Broadcast](#) on page 3391.

ARP Request Threshold

The Address Resolution Protocol (ARP) request threshold defines the maximum number of outstanding unresolved ARP requests. The default value for this function is 500 ARP requests. To avoid excessive amounts of subnet scanning that a virus can cause, as a best practice, change the ARP request threshold to a value between 100 and 50. This configuration protects the CPU from causing excessive ARP requests, protects the network, and lessens the spread of the virus to other PCs. The following list provides further ARP threshold values:

- Default: 500
- Severe conditions: 50
- Continuous scanning conditions: 100
- Moderate: 200
- Relaxed: 500

For more information about how to configure the ARP threshold, see [Address Resolution Protocol](#) on page 385.

Multicast Learning Limitation

The Multicast Learning Limitation feature protects the CPU from multicast data packet bursts generated by malicious applications. If more than a certain number of multicast streams enter the CPU through a port during a sampling interval, the port is shut down until the user or administrator takes the appropriate action.

For more information, see [IP Multicast](#) on page 1696.

Authentication for Privileged EXEC Command Mode

Table 291: Authentication for Privileged EXEC Mode product support

Feature	Product	Release introduced
Authentication for Privileged EXEC CLI Command Mode	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.4
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.2
	VSP 7400 Series	VOSS 8.2

For enhanced security, you can enable user authentication to enter Privileged EXEC command mode. Use the **sys priv-exec-password** command to enable password authentication.

After you enable password authentication for Privileged EXEC command mode, the system prompts you to enter a password to access Privileged EXEC command mode from User EXEC command mode. You must enter the same password that you used to log on to the switch.

Considerations

- The same user name and password used to Telnet or SSH to the switch is used to access Privileged EXEC command mode when authentication is enabled.
- RADIUS and TACACS+ protocols are supported. If RADIUS and TACACS+ servers are not reachable, access to Privileged EXEC command mode is denied. You must open a new session and type the same user name and password used to Telnet or SSH to the switch.
- No timeout exists for the password used to log on to the Privileged EXEC command mode.
- No limit to the number of retries if you enter an incorrect password.

Configuration Considerations

Use the information in this section to understand the limitations of some security functions, such as BSAC RADIUS servers and Layer 2 protocols before you attempt to configure security.

Attribute Format for a Third-party RADIUS Server

If you use a third-party RADIUS server and need to modify the dictionary files, you must add a vendor-specific attribute (attribute #26) and use 1584 as vendor code for all the

devices and then send back access-priority vendor-assigned attribute number 192 with a decimal value of 1 to 6, depending upon whether you want read only to read-write-all.

Authentication for Privileged EXEC Command Mode

Authentication for Privileged EXEC command mode supports RADIUS and TACACS+ protocols. If RADIUS and TACACS+ servers are not reachable, access to Privileged EXEC command mode is denied. You must open a new session and type the same user name and password used to Telnet or SSH to the switch.

RADIUS on Management Ports

The management port supports the RADIUS protocol. When RADIUS packets are sent out of the management port, the SRC-IP address is properly entered in the RADIUS header.

For more information about the supported RADIUS servers, see the documentation of the RADIUS server.

RADIUS Server SNMP Accounting

An SNMP query sent by an unreachable RADIUS server configured as used-by snmp and with accounting enabled, can cause a timeout. A timeout can occur if the device that receives the SNMP query attempts to send accounting packets to the unreachable server. You can mitigate the timeout issue by configuring lower retry and timeout values on the RADIUS server. Alternatively, you can configure a higher timeout value for SNMP.

Single Profile Enhancement for BSAC RADIUS Servers

Before enabling Remote Access Dial-In User Services (RADIUS) accounting on the device, you must configure at least one RADIUS server.

The switch software supports Microsoft Radius Servers (NPS Windows 2008, Windows 2003 IAS Server), BaySecure Access Control (BSAC), Merit Network servers and Linux based servers. To use these servers, you must first obtain the software for the server. You must also make changes to one or more configuration files for these servers.

Single Profile is a feature that is specific to BSAC RADIUS servers. In a BSAC RADIUS server, when you create a client profile, you can specify all the returnable attributes. When you use the same profile for different products, you specify all the returnable attributes in the single profile.

SNMP Cloned User Considerations

If the user from which you are cloning has authentication, you can choose for the new user to either have the same authentication protocol as the user from which it was cloned, or no authentication. If you choose authentication for the new user, you must provide a password for that user. If you want a new user to have authentication, you must indicate that at the time you create the new user. You can assign a privacy protocol only to a user that has authentication.

If the user from which you are cloning has no authentication, then the new user has no authentication.

Source IP Configuration

The Source IP is the Internet Protocol address of the device sending the IP data packet. The system limits the Source IP to a maximum of three interfaces:

- the management Out-of-Band (OOB) management interface
- the VLAN management interface
- the Circuitless IP (CLIP) management interface

The system uses separate routing tables for each Segmented Management Instance interface, plus a default main table. Because multiple routing tables are in use, each management interface can have overlapping or identical static routes without interfering with each other. The main table has a super-set of all routes where the weight of the static route can tie-break routes to the same destination going through different segmented management interfaces. By default, the following weights are used and the default route priority is management CLIP, then management VLAN, then management OOB:

- mgmt CLIP - 100
- mgmt VLAN - 200
- mgmt OOB - 300

You can route packets through a different management interface than the default configuration, but you must add a specific static route or change the default weight of the management interface.

For example, if the default route uses mgmt CLIP and you want to use the mgmt OOB interface as the source IP to reach a RADIUS server, you must perform one of the following options:

- Configure a specific source IP static route for the mgmt OOB interface:

```
mgmt oob
ip route 192.0.2.0/24 next-hop 198.51.100.1
```

OR

- Configure the default mgmt OOB route weight lower than the default mgmt CLIP route weight:

```
mgmt oob
no ip route 0.0.0.0/24 next-hop 198.51.100.1
ip route 0.0.0.0/24 next-hop 198.51.100.1 weight 50
```

Note

If you change the default route weight, the management interface with the lowest weight value becomes the default route for all segmented management interface traffic.

Interoperability Configuration

The switch is compatible with RADIUS servers.

Unicast Reverse Path Forwarding (uRPF)

Table 292: Unicast Reverse Path Forwarding product support

Feature	Product	Release introduced
Unicast Reverse Path Forwarding (URPF) checking (IPv4)	4220 Series	Not Supported
	5320 Series	Fabric Engine 8.6 Supported on 5320-48P-8XE, 5320-48T-8XE, 5320-24T-24S-4XE-XT, and 5320-16P-2MXT-2X
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10

	VSP 7400 Series	VOSS 8.0
Unicast Reverse Path Forwarding (URPF) checking (IPv6)	4220 Series	Not Supported
	5320 Series	Fabric Engine 8.6 Supported on 5320-48P-8XE, 5320-48T-8XE, and 5320-24T-24S-4XE-XT
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

The Unicast Reverse Path Forwarding (uRPF) feature prevents packet forwarding for incoming unicast IP packets that have incorrect or forged (spoofed) IP addresses. The uRPF feature checks that the traffic received on an interface comes from a valid IP address, thereby preventing address spoofing. On a reverse path check, if the source IP address of the received packet at the interface is not reachable using the FIB, the system drops the packet as the packet may have originated from a misconfigured or a malicious source.

You can configure uRPF for each IP interface or VLAN. When uRPF is enabled on an interface, the switch checks all routing packets that come through that interface. It ensures that the system displays the source address and source interface in the routing table, and that it matches the interface, on which the packet was received.

You can use one of two modes for uRPF:

- **Strict mode:** In strict mode, uRPF checks whether the source IP address of the incoming packet exists in the FIB. If the incoming interface is not the best reverse path, the packet check fails and uRPF drops the packet. If the routing engine finds the source IP entry, uRPF further checks if the source IP interface matches the incoming interface of the packet. If they match, the system forwards the packet as usual, otherwise, the system discards the packet.

**Note**

The number of packets dropped due to uRPF check on the ingress interface gets incremented along with other general dropped statistics under the IN-DISCARD column in the output of the command `show interfaces gigabitEthernet error <collision|verbose> {slot/port[-slot/port]}[,...]`.

- **Loose mode:** In loose mode, uRPF checks whether the source IP address of the incoming packet exists in the FIB. The packet is dropped only if the source address is not reachable via any interface on that router.

uRPF can be enabled independently for IPv4 and IPv6. However, on a given interface, if uRPF is enabled for both IPv4 and IPv6, the uRPF mode can be either strict-mode or loose-mode for both IPv4 and IPv6. That means we cannot have IPv4 uRPF mode configured differently than that of IPv6.

**Note**

When you enable uRPF mode the MTU values for both IPv4 and IPv6 packets on the same VLAN are matched. Different Layer 3 MTU sizes on the same VLAN are not allowed in uRPF mode.

**Note**

uRPF check cannot detect spoofed source IP address if the source IP address belongs to a known subnet.

Digital Certificate/PKI

This section provides information on the digital certificate framework and offline certificate management.

A digital certificate is an electronic document that identifies the subject, proves the ownership of a public key, and is digitally signed by a certificate authority (CA) that certifies the validity of the information in the certificate. A digital certificate is valid for a specific time period.

The switch uses Public Key Infrastructure (PKI) support to obtain and use digital certificates for secure communication in the network.

To be certified, a switch performs the following tasks:

- Generate a certificate signing request.
- Verify that a present certificate has not been revoked.
- Validate the certificate.
- Renew the certificate before it expires.
- Remove the certificate, if required.

Subject

An administrator configures the subject parameters, such as common name, organization name, organization unit, locality, state, country, and subject name for requesting the identity certificate.

Subject Name

You can configure up to 10 distinguished subject names.

Subject Alternative Name

A subject alternative name associates host name values, such as an e-mail address, an IP address, or a Fully qualified domain name (FQDN) with a security certificate. You can protect these additional host names with a single certificate.

Challenge Password

A password is required for Simple Certificate Enrollment Protocol (SCEP) operations, such as the enrollment and renewal of identity certificates. This password is given offline by the CA during end entity registration. The administrator provides this password during enroll and renew operations.

UsePost

There are different types of CAs such as EJBCA, Win2012, and others. The `usePost` parameter enables you to choose the style of HTTP request. The value for the `usePost` parameter can be **True** or **False**.

For example, if Win2012 SCEP does not support the POST mode of HTTP request, configure the `usePost` as `False` for Win2012 and configure `usePost` as `True` for EJBCA.

Root CA Certificate

The Root CA certificate obtained offline from a CA must be installed for SCEP operations. This Root CA certificate is transferred to the device during the certificate installation. SCEP operations cannot be performed if the offline Root CA certificate is not installed and if error messages are logged.

Key Generation

The supported key type is RSA with RSA key of size 2048. There can be only one active key-pair associated with the trustpoint CA and digital certificate. A new key-pair cannot be generated if there is a key-pair already associated with the active digital certificate. The system logs the error message if such new key generation is attempted. In such a case, the certificate must be revoked before a new key-pair is generated.

Trustpoint CA

Use trustpoints to manage and track CAs and certificates. A trustpoint is a representation of a CA or of an identity pair. A trustpoint contains the identity of the CA, CA-specific configuration parameters, and an association with one generated key. The switch can enroll with a trustpoint to obtain an identity certificate. Trustpoint is configured after the RSA key pair is generated and the CA identity and other configuration parameters are available. You can configure up to eight CA trustpoints by providing the CA name.

You can configure a SHA-256 fingerprint to authenticate a received CA certificate that matches the configured common name. The switch first checks for an installed, offline root certificate and validates against it. If no root certificate is present, the switch checks the SHA-256 fingerprint in the received CA certificate. The SHA-256 fingerprint does not authenticate the root certificate.

Certificate Enrollment

Certificate enrollment involves generating a certificate signing request (CSR). Before certificate enrollment, the trustpoint CA must be configured and the user configuration parameters should be available. The key usage extension parameter is required as an input; it indicates the purpose of the key contained in the certificate, that the key can be used for encipherment, digital signature, certificate signing and so on.

The certificate enrollment is not allowed if there is an active certificate already available. If new certificate enrollment is required, the existing active certificate must be revoked first. The system logs the enrollment success or failure responses.

Certificate Renewal

The administrator must renew the certificate before it expires. A trap is configured for a pre-defined period before the expiry date of the certificate, and the system logs the certificate renewal due warning message. A certificate renewal request is not performed if an active certificate is not available. The system replaces the existing certificate with the newly obtained certificate on successful renewal. The system logs the renewal success or failure responses.

Certificate Revocation or Removal

The certificate can be revoked or withdrawn from the specific device for a specific reason at any time. A certificate revocation request is not performed if an active certificate is not available. The system releases the existing certificate on successful revocation. The system logs the revocation success or failure responses.

During boot up, the system checks whether an active installed certificate is available. If a valid certificate is not available, the system logs the warning message.

Offline Certificate Management

Offline certificate management supports switches that cannot communicate with the Certificate Authority to obtain the identity certificate or certificates online by certificate enrollment operation.

The certificate signing request (CSR) is used to obtain the offline identity certificate. Configure the subject and RSA key-pair to obtain the offline identity certificate. You can generate and store up to 10 RSA keys identified by the key name label. To obtain multiple offline certificates, you must specify a distinguished subject-name and key-name.

You must install the Root CA certificate and all the intermediate CA certificates of the certificate chain in the device before installing the offline identity or device certificate. All the intermediate and Root CA certificates are stored in the certificate store and are used for CA certificate chain validation. The CA certificate chain validation is performed starting from the issuing CA certificate to the Root CA certificate during the installation of offline identity certificate. The offline identity certificate is installed only if the CA certificate chain validation, subject, and key match.

Storage

No digital certificate configuration is visible if you use the **show running-config** command. Instead, use the commands appropriate for displaying digital certificate information. For more information, see [View the Certificate Details](#) on page 3410.

Certificate Order Priority

Table 294: Certificate order priority product support

Feature	Product	Release introduced
Certificate order priority	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Use the following information to understand the certificate order priority when the Transport Layer Security (TLS) server and switch connect.

**Note**

For certain switches in enhanced secure mode, all sensitive files are protected. You cannot access any sensitive files using Telnet, SSH, FTP, SFTP, TFTP, and SCP connections. For more information, see [Sensitive File Protection](#) on page 270.

The TLS server selects a certificate authority (CA)-signed certificate if the certificate is already installed in the Digital Certificate module.

If the server certificates are not available, the TLS server generates a new self-signed certificate at startup and uses that by default. You can choose to use an online or an offline CA-signed certificate, which takes precedence over the self-signed certificate.

SAN Entries in Default TLS Certificates

The default TLS certificates add hostname.domainname and management IP address as subject alternative name (SAN) entries:

- If you configure both hostname and domain-name, the self-signed certificate uses `hostname.domain-name` for both common name (CN) and SAN DNS.
- If you configure domain-name but not hostname, the self-signed certificate uses `*.domain-name` for both CN and SAN DNS.
- If you configure hostname but not domain-name, the self-signed certificate uses `hostname.extremenetworks.com` for both CN and SAN DNS.
- If you do not configure either hostname or domain-name, the self-signed certificate uses `*.extremenetworks.com` for both CN and SAN DNS.
- All management IP addresses are added as SAN IP entries.

If you use default self-signed certificates generated in a release that did not include SAN entries in the certificate, generate the certificate again to avoid certificate errors in Web browsers that require these entries.

Note

As a best practice, use custom Public Key Infrastructure (PKI) certificates rather than the default self-signed certificates.

Two-Factor Authentication for SSH

Table 295: Two-Factor Authentication for SSH product support

Feature	Product	Release introduced
Two-Factor Authentication for SSH	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Use the following information to understand the Two-Factor Authentication feature.

Two-Factor Authentication uses smart card technology for remote device management. Two-Factor Authentication requires enhanced secure mode with Secure Shell (SSH) and X.509 V3 authorization enabled on the switch. You must provide the digital certificates to enable the identity management for the SSH client and SSH server. Two-Factor Authentication requires the following items:

- a Fabric Engine switch
- a computer with Secure CRT 8.3.2 or 8.3.3 as the SSH client
- a smart card reader
- a Common Access Card (CAC) or Personal Identity Verification (PIV) card for each configured user

You can also use a Windows Server 2008, or newer, configured with a Remote Access Dial-In User Services (RADIUS) server and Active Directory.

Digital certificates in the X.509 V3 format provide identity management. A chain of signatures by a trusted certificate authority (CA) and its intermediate certificate CAs binds a given public signing key to a given digital identity. For user authentication, the SSH client sends the user certificate stored on the CAC or PIV card to the SSH server

for verification. The SSH server validates the incoming user certificate using Public Key Infrastructure (PKI) trust-store.

After the switch validates the SSH certificate, the system parses for a user name to forward to the RADIUS server for authorization. The switch prompts you to enter a password for the user name. If the RADIUS server is unreachable or not configured, the authorization occurs locally on the switch for the user name and password.

Two-Factor Authentication on the switch uses SSH and the X.509 V3 certificates stored on the smart card. X.509 V3 digital certificates are documented in RFC5280.

Smart Card Authentication Process

The process for PIV or CAC card authentication is as follows:

1. The PIV Authentication or the Card Authentication certificate is read from the PIV Card Application.
2. The relying system validates the PIV Authentication certificate from the PIV Card Application using standards-compliant PKI path validation to ensure that the certificate is valid and from a trusted source.
3. The cardholder is prompted to submit a PIN to activate the card.
4. The relying system issues a challenge string to the card and requests an asymmetric operation in response.
5. The card responds to the previously issued challenge by signing using the PIV Authentication private key.
6. The relying system verifies that the response from the card is expected for the issued challenge.
7. A unique identifier from the PIV Authentication certificate is extracted and passed as input to the access control decision.

Security Configuration Using CLI

Configure security information used on the control and data paths to protect the network from uncontrolled access to network resources.

For more information about how to configure passwords and access policies, see [Managing the Switch](#) on page 246.

Enable hsecure

Enables High Secure mode. This mode provides the following password behavior:

- 10 character enforcement
- The password must contain a minimum of 2 uppercase characters, 2 lowercase characters, 2 numbers, and 2 special characters.
- Aging time
- Failed login attempt limitation

About This Task

If you enable the hsecure flag, you cannot enable the flags for the web server or SSH password-authentication.

When you upgrade from a previous release, if the password does not have at least 10 characters, you receive a prompt to change your password to the mandatory 10-character length.

If you enable hsecure for the first time and the password file does not exist, then the device creates a normal default user name (rwa) and password (rwa). In this case, the password does not meet the minimum requirements for hsecure and as a result the system prompts you to change the password.

The default value is disabled. If you enable High Secure mode, you must restart the switch to enforce secure passwords. If you operate the switch in High Secure mode, the switch prompts a password change if you enter invalid-length passwords.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable hsecure mode:

```
boot config flags hsecure
```

The system displays the following warning messages:

```
Warning: For security purposes, all unsecure services -
        TFTP, FTP, Telnet, SNMP and IQAgent are disabled.
        Individually enable the required services.
Warning: Please save configuration and reboot the switch
        for this to take effect.
```

3. Save the configuration and restart the device for the change to take effect.

Example

Enable hsecure mode. Save the configuration. Restart the switch.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#boot config flags hsecure
Warning: For security purposes, all unsecure services -
        TFTP, FTP, Telnet, SNMP and IQAgent are disabled.
        Individually enable the required services.
Warning: Please save configuration and reboot the switch
        for this to take effect.
Switch:1(config)#save config
Switch:1(config)#reset
Are you sure you want to reset the switch (y/n)?y
```

Change an Invalid-Length Password

Before You Begin

Important

When you enable hsecure, passwords must contain a minimum of 10 characters or numbers. The password must contain a minimum of: two uppercase characters, two lowercase characters, two numbers, and two special characters.

About This Task

After you enable hsecure mode and restart the system, change your password if you have an invalid-length password.

Procedure

1. At the CLI prompt, log on to the system.
2. Enter the password.

If you have an invalid-length password, the system displays the following message:

```
Your password is valid but less than mandatory 10 characters.  
Please change the password to continue.
```

3. When prompted, enter the new password.
4. When prompted, re-enter the new password.

Example

Log on to the switch:

```
Login: rwa
```

Enter the password:

```
Password: ***  
Your password is valid but less than mandatory 10 characters. Please change the password  
to continue.
```

Enter the new password:

```
Enter the new password: *****
```

Re-enter the new password:

```
Re-enter the new password: *****  
Password successfully changed.
```

Configure New Passwords

Configure new passwords for each access level, or change the logon or password for the different access levels of the switch. After you receive the switch, use default passwords to initially access CLI. If you use Simple Network Management Protocol version 3 (SNMPv3), you can change encrypted passwords.

Before You Begin

- You must use an account with read-write-all privileges to change passwords. For security, the switch saves passwords to a hidden file.

About This Task

If you enable the hsecure flag, after the aging time expires, the system prompts you to change your password. If you do not configure the aging time, the default is 90 days.

Procedure

- Enter Global Configuration mode:
`enable`

`configure terminal`
- Change a password:
`cli password WORD<1-20> {layer1|layer2|layer3|read-only|read-write|read-write-all}`
- Enter the old password.
- Enter the new password.
- Enter the new password a second time.
- Configure password options:
`password access-level WORD<2-8>`

`password aging-time day <1-365>`

`password default-lockout-retries <1-255>`

`password default-lockout-time <60-65000>`

`password lockout WORD<0-46> [time <60-65000>]`

`password min-passwd-len <10-20>`

`password password-history <3-32>`

Example

```
Switch:1>enable
Switch:1#configure terminal
```

Change a password:

```
Switch:1(config)# password smith read-write-all
```

Enter the old password:

```
Switch:1(config)#*****
```

Enter the new password:

```
Switch:1(config)#*****
```

Enter the new password a second time:

```
Switch:1(config)#*****
```

Set password to an access level of read-write-all and the expiration period for the password to 60 days:

```
Switch:1(config)#access-level rwa aging-time 60
```

Variable Definitions

The following table defines parameters for the **cli password** command.

Variable	Value
<i>layer1 layer2 layer3 read-only read-write read-write-all</i>	Changes the password for the specific access level.
<i>WORD<1-20></i>	Specifies the user logon name.

The following table defines parameters for the **password** command.

Variable	Value
<i>access level WORD<2-8></i>	Permits or blocks this access level. The available access level values are as follows: <ul style="list-style-type: none"> • l1 • l2 • l3 • ro • rw • rwa
<i>aging-time day <1-365></i>	Configures the expiration period for passwords in days, from 1–365. The default is 90 days.
<i>default-lockout-retries <1-255></i>	Configures the default number of login attempts. The default is 3.
<i>default-lockout-time <60-65000></i>	Changes the default lockout time after three invalid attempts. Configures the lockout time, in seconds, and is in the 60–65000 range. The default is 60 seconds.
<i>lockout WORD<0-46> time <60-65000></i>	Configures the host lockout time. <ul style="list-style-type: none"> • <i>WORD<0-46></i> is the host IP address in the format a.b.c.d. • <i><60-65000></i> is the lockout-out time, in seconds, in the 60–65000 range. The default is 60 seconds.
<i>min-passwd-len <10-20></i>	Configures the minimum length for passwords in high-secure mode. The default is 10 characters.
<i>password-history <3-32></i>	Specifies the number of previous passwords the switch stores. You cannot reuse a password that is stored in the password history. The default is 3.

Configure Password Hash

You can configure the Secure Hash Algorithm (SHA) level for password hash security. After a password hash level change, all custom users and passwords are deleted, and on first login each default user must change their default password.

Before You Begin

- You must use an account with read-write-all privileges to change password hash.

About This Task

Configure the password hash level as SHA1 or SHA2.

Procedure

- Enter Global Configuration mode:
`enable`
`configure terminal`
- Change the password hash level:
`password hash sha1|sha2`
- Read the warning prompt, then confirm the password hash change:
`y`

Example

Change password hash to SHA2 512-bit hash value:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#password hash sha2
Warning: Changing the password
        hash will reset all existing passwords and users to Factory defaults. All
custom Users
        will be deleted. Are you sure you want to proceed (y/n) ?y
```

Variable Definitions

The following table defines parameters for the **password hash** command.

Variable	Value
<code>sha1 sha2</code>	Specifies the password hash SHA value: <ul style="list-style-type: none">SHA1 - 160-bit password hashSHA2 - 512-bit password hash

Configure Directed Broadcast

About This Task

Configure directed broadcast on a VLAN to enable or disable directed broadcast traffic forwarding for an IP interface.

A directed broadcast is a frame sent to the subnet broadcast address on a remote IP subnet. When you disable (or suppress) directed broadcasts on an interface, all frames sent to the subnet broadcast address for a local router interface are dropped. Disabling directed broadcasts protects hosts from possible denial-of-service (DOS) attacks. By default, this feature is disabled on the device.

Note

Enabling this feature only applies to the primary IP address on the VLAN and not to Secondary IP Interfaces on the VLAN.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable

configure terminal

interface vlan <1-4059>
```
2. Configure the switch to forward directed broadcasts for a VLAN:

```
ip directed-broadcast enable
```
3. Verify the configuration:

```
show ip directed-broadcast vlan
```

Example

Enable directed broadcast on VLAN 2:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 2
Switch:1(config-if)#ip directed-broadcast enable
```

Display VLAN IDs with directed broadcast enabled:

```
Switch:1>show ip directed-broadcast vlan

                                Vlan Directed-Broadcast
-----
VLAN ID  DIRECTED-BROADCAST
-----
      2           true
```

Variable Definitions

The following table defines parameters for the **ip directed-broadcast** command.

Variable	Value
<i>enable</i>	Enables the device to forward directed broadcast frames to the specified VLAN. The default setting for this feature is disabled.

Prevent Certain Types of DOS Attacks

Protect the switch against IP packets with illegal IP addresses such as loopback addresses or a source IP address of ones, or Class D or Class E addresses from being routed. The switch supports high-secure configurable flag.

About This Task

Important

After you enable this flag, the desired behavior (not routing source packets with an IP address of 255.255.255.255) applies to all ports that belong to the same port.

Important

The setting to enable hsecure only takes effect for packets going to the CP; not to datapath traffic.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable high-secure mode:

```
high-secure [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]] enable
```

Example

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# interface GigabitEthernet 1/16
Switch:1(config-if)# high-secure enable
```

Variable Definitions

The following table defines parameters for the **high-secure** command.

Variable	Value
<code>port</code> <code>{slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}</code>	<p>Specifies the port on which you want to enable high-secure mode.</p> <p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none">• a single slot and port (slot/port)• a range of slots and ports (slot/port-slot/port)• a series of slots and ports (slot/port,slot/port,slot/port)• all ports on the same slot (slot/all)• all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>
<code>enable</code>	Enables the high-secure feature that blocks packets with illegal IP addresses. This flag is disabled by default.

Unicast Reverse Path Forwarding configuration using CLI

This section provides CLI procedures for Unicast Reverse Path Forwarding configuration.

Enable urpf-mode Boot Flag

To configure Unicast Reverse Path Forwarding on a port or VLAN, you are required to enable the urpf-mode boot flag. If you try to configure uRPF on an interface, that is, enable or change the urpf operating mode with the urpf-mode boot flag disabled, a consistency check error message is displayed: Unicast Reverse Path Forwarding configuration is not supported when urpf-mode boot flag is disabled.

Note

This procedure does not apply to 4220 Series.

About This Task

Use the following procedure to enable the urpf-mode boot flag. By default, urpf-mode is disabled.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable the urpf-mode boot flag:
`boot config flags urpf-mode`

3. Enter `y` to reboot:

The new setting requires a reboot to take effect!

The configuration will be saved and rebooted.

Are you sure you want to re-boot the switch (y/n)?

Note

If you enter `n`, the following message displays: Warning: Please save the configuration and reboot the switch for this configuration to take effect.

4. Check the status of the urpf-mode boot flag:

```
show boot config flags
```

Example

Enable the urpf-mode boot flag:

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# boot config flags urpf-mode
The new setting requires a reboot to take effect!
The configuration will be saved and rebooted.
Are you sure you want to re-boot the switch (y/n)? y
```

View the status of the urpf-boot flag:

```
Switch:1#show boot config flags
flags advanced-feature-bandwidth-reservation low
flags block-snmp false
flags debug-config false
flags debugmode false
flags dvr-leaf-mode false
flags enhancedsecure-mode false
flags factorydefaults false
flags flow-control-mode true
flags ftpd true
flags hsecure false
flags ipv6-egress-filter true
flags ipv6-mode false
flags logging true
flags macsec false
flags nni-mstp false
flags reboot true
flags spanning-tree-mode mstp
flags spbm-config-mode true
flags spbm-node-scaling true
flags sshd true
flags syslog-rfc5424-format true
flags telnetd true
flags tftpd true
flags trace-logging false
flags urpf-mode true
flags verify-config true
flags vrf-scaling true
flags vxlan-gw-full-interworking-mode false
```

Configure Unicast Reverse Path Forwarding on a Port

Before You Begin

- You must enable the urpf-mode boot flag. See [Enable urpf-mode Boot Flag](#) on page 3394.

Note

When you try to configure uRPF on an interface, that is, enable or change the urpf operating mode with the urpf-mode boot flag disabled, a consistency check error message is displayed: Unicast Reverse Path Forwarding configuration is not supported when urpf-mode boot flag is disabled.

- You must log on to the GigabitEthernet Interface Configuration mode in CLI.

About This Task

You can use the Unicast Reverse Path Forwarding (uRPF) feature to reduce the problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network. When you enable uRPF, the switch performs a check to determine if the source IP address of the packet is verifiable. If the address is not verifiable, the system drops the packet.

uRPF runs in two modes:

- strict mode
- loose mode (exist-only mode)

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Set or change the urpf operating mode on a port:

For IPv4, enter: `ip rvs-path-chk mode {strict|exist-only}`

For IPv6, enter: `ipv6 rvs-path-chk mode {strict|exist-only}`

3. To verify the configuration on the port, see [View the IPv4 and IPv6 Interface Configuration on a Port](#) on page 2125.

Example

Check whether the source IP address of the incoming packet exists in the FIB table.

Example for IPv4:

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# interface GigabitEthernet 1/10
Switch:1(config-if)# ip rvs-path-chk mode strict
```

Example for IPv6:

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# interface GigabitEthernet 1/16
Switch:1(config-if)# ipv6 rvs-path-chk mode strict
```

Variable Definitions

The following table defines parameters for the **ip rvs-path-chk mode** and **ipv6 rvs-path-chk mode** commands.

Variable	Value
mode{strict exist-only}	Specifies the mode for Unicast Reverse Path Forwarding (uRPF). In strict mode, uRPF checks whether the source IP address of the incoming packet exists in the FIB. If the incoming interface is not the best reverse path, the packet check fails and uRPF drops the packet. In exist-only mode, uRPF checks whether the source IP address of the incoming packet exists in the FIB. The packet is dropped only if the source address is not reachable via any interface on that router.

*Configure Unicast Reverse Path Forwarding on a VLAN***Before You Begin**

- You must enable the urpf-mode boot flag.

**Note**

When you try to configure uRPF on an interface, that is, enable or change the urpf operating mode with the urpf-mode boot flag disabled, a consistency check error message is displayed: Unicast Reverse Path Forwarding configuration is not supported when urpf-mode boot flag is disabled.

- You must log on to the VLAN Interface Configuration mode in CLI.

**Important**

You must assign a valid IP address to the selected port.

About This Task

Use the Unicast Reverse Path Forwarding (uRPF) feature to reduce the problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses

into a network. When you enable uRPF, the switch performs a check to determine if the source IP address of the packet is verifiable. If the address is not verifiable, the system drops the packet.

uRPF runs in two modes:

- strict mode
- loose mode (exist-only mode)

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```

2. Set or change the urpf operating mode on a VLAN:

For IPv4, enter: `ip rvs-path-chk mode {strict|exist-only}`

For IPv6, enter: `ipv6 rvs-path-chk mode {strict|exist-only}`

3. To verify the configuration on the VLAN, see [View the IPv4 and IPv6 Interface Configuration on a VLAN](#) on page 4016.

Example

Example for IPv4:

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# interface vlan 2
```

Check whether the source IP address of the incoming packet exists in the FIB table:

```
Switch:1(config-if)#ip rvs-path-chk mode exist-only
```

Example for IPv6:

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)# interface vlan 2
```

Check whether the source IP address of the incoming packet exists in the FIB table:

```
Switch:1(config-if)# ipv6 rvs-path-chk mode exist-only
```

Variable Definitions

The following table defines parameters for the **ip rvs-path-chk mode** and **ipv6 rvs-path-chk mode** commands.

Variable	Value
mode{strict exist-only}	Specifies the mode for Unicast Reverse Path Forwarding (uRPF). In strict mode, uRPF checks whether the source IP address of the incoming packet exists in the FIB. If the incoming interface is not the best reverse path, the packet check fails and uRPF drops the packet. In exist-only mode, uRPF checks whether the source IP address of the incoming packet exists in the FIB. The packet is dropped only if the source address is not reachable via an interface on that router.

Digital Certificate Configuration

The following section provides procedures to configure digital certificates using CLI.

For certificate configuration related to Syslog, see [Logs and Traps](#) on page 2535.

Configure Device Subject Parameters

About This Task

Use this procedure to configure the device subject parameters to identify the device, such as the name, Email ID, company, department, location, and subject name.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Configure the subject parameters of the device:

```
certificate subject {[common-name WORD<0-64>] [country WORD<2-2>] [e-mail WORD<0-254>] [locality WORD<0-128>] [organization WORD<0-64>] [province WORD<0-128>] [subject-name WORD<1-45>] [unit WORD<0-64>]}
```
3. Verify the subject names configured on the switch:

```
show certificate subject
```

Example

Configuring subject parameters:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)# certificate subject common-name 822-pki e-mail
client1@extemenetworks.com unit Engineering
```

```
organization ExtremeNetworks locality Salem province Massachusetts country US subject-
name 822
```

View the configuration.

```
Switch:1>show certificate subject
Subject Name      : 822
Common Name       : 822-pki
Email Address     : client1@extemenetworks.com
Organizational Unit : Engineering
Organization      : ExtremeNetworks
Locality          : Salem
Province          : Massachusetts
Country           : US

Subject Name      : 823
Common Name       : 823-pki
Email Address     : client1@extemenetworks.com
Organizational Unit : Engineering
Organization      : ExtremeNetworks
Locality          : Salem
Province          : Massachusetts
Country           : US

Subject Name      : Global
Common Name       : 821
Email Address     : client1@extemenetworks.com
Organizational Unit : Engineering
Organization      : ExtremeNetworks
Locality          : Salem
Province          : Massachusetts
Country           : US
```

Variable Definitions

The following table defines parameters for the **certificate subject** command.

Variable	Value
<i>common-name</i> <i>WORD<0-64></i>	Specifies the name of the subject sending the Certificate Signing Request to the Certificate Authority.
<i>country</i> <i>WORD<2-2></i>	Specifies the country of the subject sending the Certificate Signing Request to the Certificate Authority.
<i>e-mail</i> <i>WORD<0-254></i>	Specifies the Email address of the subject sending the Certificate Signing Request to the Certificate Authority.
<i>locality</i> <i>WORD<0-128></i>	Specifies the locality of the subject sending the Certificate Signing Request to the Certificate Authority.
<i>organization</i> <i>WORD<0-64></i>	Specifies the organization of the subject sending the Certificate Signing Request to the Certificate Authority.
<i>province</i> <i>WORD<0-128></i>	Specifies the state or province of the subject sending the Certificate Signing Request to the Certificate Authority.

Variable	Value
<i>subject-name</i> <i>WORD<1-45></i>	Specifies the Subject Identity Label to be used in local digital certificate request. You can configure up to 10 subject DN identities. If a subject name is not specified, the default subject name is Global.
<i>unit WORD<0-64></i>	Specifies the organizational unit of the subject sending the Certificate Signing Request to the Certificate Authority.

Configure Subject Alternative Names

About This Task

Use this procedure to protect additional host names with a single certificate.

Note

The switch supports 100 subject alternative names.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure a subject alternative name for the entity:

```
certificate subject-alternative-name {[dns WORD<1-255>] [e-mail  
WORD<1-255>] [ip> WORD<1-255>] [subject-name WORD<1-45>]}
```

Note

Note

You can configure up to 10 distinct subject names. The default subject name is Global.

3. View the subject alternative names configured on the switch:

```
show certificate subject-alternative-name
```

Examples

Configure a subject alternative name subject name 822:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#certificate subject-alternative-name subject-name 822 dns
822.extremenetworks.com
Switch:1(config)#certificate subject-alternative-name subject-name 822 e-mail
name@company.com
Switch:1(config)#certificate subject-alternative-name subject-name 822 ip 192.0.2.22
```

View the configuration:

```
Switch:1>show certificate subject-alternative-name
```

SAN Table		
TYPE	NAME	SUBJECT
E-MAIL	name@company.com	822
DNS	822.extremenetworks.com	822
IP	192.0.2.22	822

Configure a subject alternative name with the default subject name:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#certificate subject-alternative-name dns name@extrnetwk.com
Switch:1(config)#certificate subject-alternative-name e-mail j.smith@extremenetworks.com
Switch:1(config)#certificate subject-alternative-name ip 192.0.2.23
```

View the configuration:

```
Switch:1>show certificate subject-alternative-name
=====
SAN Table
=====
TYPE      NAME                                SUBJECT
-----
E-MAIL    j.smith@extremenetworks.com        Global
DNS       name@extrnetwk.com                 Global
IP        192.0.2.23                         Global
```

Variable Definitions

The following table defines parameters for the **certificate subject-alternative-name** command.

Variable	Value
<i>dns</i> WORD<1-255>	Specifies the DNS subject alternative name.
<i>e-mail</i> WORD<1-255>	Specifies the e-mail subject alternative name.
<i>ip</i> WORD<1-255>	Specifies the IP subject alternative name.
<i>subject-name</i> WORD<1-45>	Specifies the Subject Identity Label to be used in local digital certificate request. You can configure up to 10 subject DN identities. If the subject-name is not specified, the default subject name is Global.

Generate the Key Pair

About This Task

Use the following procedure to generate the private and public key pair for the specific cryptography type. By default, the switch generates a 2,048 RSA key when the system

starts. You can use this procedure to generate a new RSA key or to generate multiple RSA keys identified by a key-name. You can generate up to 10 RSA keys.

Procedure

1. Enter Global Configuration mode:

enable

```
configure terminal
```

2. Generate the key pair:

```
certificate generate-keypair {[type rsa size 2048] | [key-name WORD<1-45>1]}
```

Example

Generating the key pair identified by a key-name:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#certificate generate-keypair key-name pki_key
Switch:1(config)#1 2021-06-22T11:33:53.036Z 5520-24X-VOSS CP1 - 0x003a864c - 00000000
GlobalRouter DIGITALCERT INFO Digicert Key-pair generation is in progress
Switch:1(config):#1 2021-06-22T11:33:53.052Z 5520-24X-VOSS CP1 - 0x003a8604 - 00000000
GlobalRouter
DIGITALCERT INFO Generation of RSA key-pair for digital certificate is successful
1 2021-06-22T11:33:58.711Z Switch CP1 - 0x003a864d - 00000000 GlobalRouter DIGITALCERT
INFO Digicert Key-pair generation completed successfully for key-name: pki key
```

Display the configured key pairs:

```
Switch:1>show certificate key-name
Key Name: pki_key
Public Key Value:
00000000000000010000000102000000000301000100000100bdb1cf8382d66a2d2d0d24b4477908641c16423c

Variable Definition

The following table defines parameters for the **generate-keypair** command.

Variable	Value
<code>type rsa</code>	Specifies type of cryptography algorithm used to generate the key-pair. The switch uses only <code>rsa</code> as the cryptography algorithm type.
<code>size 2048</code>	Specifies the size or modulus of key-pair to be generated. The switch only supports 2048.
<code>key-name WORD<1-45></code>	Specifies the key label for RSA 2048 key to be generated. You can configure up to 10 RSA keys by specifying the key-name label. The default key-name label is <code>rsa_2048</code> .

Configure a Trustpoint CA

About This Task

Use this procedure to configure the certificate authority and perform related actions. You can configure up to eight CA trustpoints.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the trustpoint and associate it with the generated key pair:

```
certificate ca WORD<1-45> {[subject-name WORD<1-45>] [common-name WORD<0-64>] [key-name WORD<0-45>] [ca-url WORD<0-1000>] [use-post <true|false>]}
```

3. Configure an SHA-256 fingerprint to authenticate the received CA certificate:

```
certificate ca WORD<1-45> sha256-fingerprint WORD<64-64>
```

4. Configure the appropriate action:

- Configure trustpoint, authenticate the trustpoint CA by getting the certificate of the CA, and store the CA certificate locally:

```
certificate ca WORD<1-45> action caauth
```

- Generate certificate signing request to obtain identity certificate from configured trustpoint CA, get the digital certificate, and store it locally, associating with the trustpoint CA:

```
certificate ca WORD<1-45> action enroll [validity-days <7-1185>]
```

- Get the Certificate Revocation List from the CDP and store into a file:

```
certificate ca WORD<1-45> action get-crl
```

- Install the subject certificate obtained from the given trustpoint CA:

```
certificate ca WORD<1-45> action install
```

- Configure trustpoint and perform no other operation:

```
certificate ca WORD<1-45> action noop
```

- Release the locally stored certificate associated with the trustpoint CA post revocation:

```
certificate ca WORD<1-45> action remove
```

- Generate certificate renew request for given trustpoint CA, get the new digital certificate, and store it locally by replacing the old certificate with the new one:

```
certificate ca WORD<1-45> action renew [validity-days <7-1185>]
```

5. Install the Root Certificate Authority certificate obtained offline:

```
certificate ca WORD<1-45> install-file {root-ca-filename WORD<1-80>}
```

6. Set the HTTP request type to support the type of CA:

```
certificate ca WORD<1-45> use-post <false | true>
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#certificate ca ej common-name CaA2 key-name pki_key subject-name 822
Switch:1(config)#certificate ca ej action enroll

Variable Definitions

The following table defines parameters for the **certificate ca** command.

Variable	Value
<i>action caauth</i>	Authenticates the trustpoint CA by getting the certificate of the CA and stores the CA certificate locally.
<i>action enroll</i> <i>[validity-days <7-1185>]</i>	Generates certificate signing request to obtain identity certificate from configured trustpoint CA, gets the digital certificate, and stores it locally, associating with the trustpoint CA. The validity-days specifies the number of days for which the certificate will remain valid. The default value is 365 days.
<i>action get-crl</i>	Gets the Certificate Revocation List from the CDP and stores into a file.
<i>action install</i>	Installs the subject certificate obtained from the given trustpoint CA.
<i>action noop</i>	Specifies that no operation should be performed after configuring trustpoint.
<i>action remove</i>	Releases the locally stored certificate associated with the trustpoint CA post revocation.
<i>action renew</i> <i>[challenge-password</i> <i>WORD<0-128>]</i>	Specifies the password. This password is provided offline by the CA during the end entity registration.
<i>action renew</i> <i>[validity-days <7-1185>]</i>	Generates certificate renewal request for given trustpoint CA, gets the digital certificate, and stores it locally by replacing the old certificate with the new one. The validity-days specifies the number of days for which the certificate will remain valid. The default value is 365 days.
<i>ca WORD<1-45></i>	Specifies the name of the CA. You can configure up to 8 CA trustpoints by specifying the CA name. It should be alphanumeric and case-sensitive. The maximum length should be 45 characters.
<i>ca-url WORD<0-1000></i>	Specifies the trusted CA url.
<i>common-name</i> <i>WORD<0-64></i>	Specifies the name of the owner of the device or user.

Variable	Value
<code>key-name WORD<0-45></code>	Specifies the key pair generated by the command that was first associated with the CA trustpoint.
<code>install-file root-ca-filename WORD<1-80></code>	Installs the Root CA file obtained offline from the CA.
<code>sha256-fingerprint WORD<64-64></code>	Specifies an encrypted fingerprint of the expected certificate to match.
<code>subject-name WORD<1-45></code>	Specifies the configured Subject Identity label. The default is Global.
<code>use-post <false true></code>	Specify the HTTP request style. The default value is True. For example, True for EJBCA and False for Win2012 CA.

Install the Certificate

Before You Begin

To create a PKCS12 container with OpenSSL 3.0, use SHA-1. Certificate installation fails if you use SHA-256.

About This Task

Use this procedure to install the following:

- certificate authority (CA) certificate
- root CA certificates
- subject certificates
- Certificate Revocation List (CRL) file obtained offline from the CA

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Install the offline CA certificate:

```
certificate install-file offline-ca-filename WORD<1-80>
```
3. Install the CRL offline file:

```
certificate install-file offline-crl-filename WORD<1-80>
```
4. Install the root CA offline certificate:

```
certificate install-file offline-root-ca-filename WORD<1-80>
```

5. Install the subject offline certificate:

```
certificate install-file offline-subject-filename WORD<1-80> [relaxed]
[key-name WORD<1-45>] [subject-name WORD<1-45>]
```

**Note**

To obtain the offline subject certificate, you must first generate a certificate signing request (CSR).

6. (Optional) Install the subject offline certificate with PKCS12-format:

```
certificate install-file offline-subject-filename WORD<1-80> relaxed
pkcs12-password WORD<1-128>
```

Example

View the installed offline subject certificate:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1#certificate install-file offline-subject-filename 823pki.crt subject-name 823 key-
name pki
1 2021-02-02T14:19:01.587Z Switch CP1 - 0x003a864f - 00000000 GlobalRouter DIGITALCERT

Variable Definitions

The following table defines parameters for the **certificate install-file** command.

Variable	Definition
<code>offline-ca-filename WORD<1-80></code>	Specifies the certificate authority (CA) file name obtained from the CA.
<code>offline-crl-filename WORD<1-80></code>	Specifies the CRL file obtained from the CA.
<code>offline-root-ca-filename WORD<1-80></code>	Specifies the root CA file name obtained from the CA.
<code>offline-subject-filename WORD<1-80></code>	Specifies the subject certificate file name obtained from the CA.
<code>relaxed [pkcs12-password WORD<1-128>]</code>	Uses the relaxed mode for offline subject certificate installation for less restrictive consistency checks. You can also install a PKCS12 format certificate and secret key in relaxed mode. <code>WORD<1-128></code> is the password to extract the PKCS12 container. If you do not include this parameter, the supported format is Distinguished Encoding Rules (DER).
<code>key-name WORD<1-45></code>	Refers to the key name of the generated key-pair.
<code>subject-name WORD<1-45></code>	Refers to the subject identity name.

Generate the Certificate Signing Request

About This Task

Use this procedure to generate a certificate signing request (CSR) and store it into a file. This CSR is required to obtain the offline subject certificate. The generated file is located in the `/intflash/shared/certs` folder.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Generate certificate signing request:

```
certificate generate-csr [relaxed]
```
3. (Optional) Configure the subject-name and the key name:

```
certificate generate-csr subject-name WORD<1-45> key-name WORD<1-45>
```

Example

Display the generated CSR.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#certificate generate-crs subject-name 823 key-name pki
```

```
Switch:1(config)#1 2021-02-02T13:57:39.716z Switch CP1 - 0x003a8635 - 0000000
GlobalRouter DIGITALCERTIFICATE INFO Generate CSR for Digital Certificate successful!
```

Display Configured Key Pairs

About This Task

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Display the names and public keys of all the key-pairs:

```
show certificate key-name [WORD<1-64>]
```

Example

The following output example displays the names and public keys of all the key-pairs.

```
Switch:1(config)#show certificate key-name

Key Name: pki_key
Public Key Value:

View the Certificate Details

About This Task

Use this procedure for the following tasks:

- Displaying the digital certificate for given certificate type or list all the certificate details from the local store for given certificate type.
- Displaying the CA details for a given trustpoint CA name or listing all the CA details from the local store if the CA name is not specified.

```

Variable Definitions

The following table defines parameters for the **show certificate** command.

Variable	Value
<code>cert-type default-tls-certificate</code>	Displays the default TLS certificate (self-signed).
<code>cert-type online-ca-cert</code>	Specifies Certificate Authority's Certificate obtained online from Certificate Authority.
<code>cert-type online-subject-cert</code>	Specifies subject certificate obtained online from Certificate Authority.
<code>cert-type offline-ca-cert</code>	Specifies Certificate Authority's certificate obtained offline from Certificate Authority.
<code>cert-type offline-subject-cert</code>	Specifies subject certificate obtained offline from Certificate Authority.
<code>cert-type intermediate-ca-cert [WORD<1-80>]</code>	Specifies the intermediate certificate obtained offline from Certificate Authority.
<code>cert-type root-ca-cert [WORD<1-80>]</code>	Specifies root certificate obtained offline from Root Certificate Authority.
<code>ca [WORD<1-45>]</code>	Specifies name of the Certificate Authority. If the name is not specified, the command displays the CA details of all configured CA.

Configure a Web Server Certificate

About This Task

Use this task to configure a web server certificate.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure the Certificate Authority for the installed digital certificate:

```
web-server certificate ca-name <1-45>
```
3. Configure the subject identity label to be used

```
web-server certificate cert-subject-name <1-45>
```

Example

Display the web server certificate information:

```
Switch:1(config)#web-server certificate cert-subject-name 823
Switch:1(config)#1 2021--2--2T14:35:38.865z Switch CP1 - 0x003z8604 - 0000000
```

```
GlobalRouter DIGITALCERT INFO Digital Certificate Module: Configuration Saved
1 2021--2--2T14:35:38.865z Switch CP1 Switch CP1 - 0x00040601 - 0000000 Global Router
WEB INFO HTTPS: Using the CA Signed Server Cert
```

Variable Definitions

Use the data in the following table to use the **web-server certificate** command

Variable	Value
<i>ca-name</i> WORD<1-45>	Specifies the name of the Certificate Authority.
<i>ca-subject-label</i> WORD<1-45>	Specifies the name of the local certificate used.

Digital Certificate Configuration Examples

This section shows how to obtain an online CA signed certificate, remove the expired certificate, renew the certificate, and install an offline subject certificate.

Obtain an Online CA-signed Subject Certificate

Use the following procedure as an example to obtain an online CA signed subject certificate that the application can use.

About This Task

In the following commands, the variable *WORD<1-45>* refers to the name of the certificate authority and the variable *WORD<1-80>* refers to the certificate file name.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the subject:

```
certificate subject common-name 822-pki
certificate subject e-mail 822@extremenetworks.com
certificate subject unit Engineering
certificate subject organization ExtremeNetworks
certificate subject locality Salem
certificate subject country US
certificate subject province Massachusetts
certificate subject subject-name 822

certificate subject common-name 823-pki
certificate subject e-mail 823@extremenetworks.com
certificate subject unit Engineering
certificate subject organization ExtremeNetworks
certificate subject locality Salem
certificate subject country US
```

```
certificate subject province Massachusetts
certificate subject subject-name 823
```

**Note**

The values mentioned are for example only.

3. Generate the key pair:

```
certificate generate-keypair {[type rsa size 2048] | [key-name WORD<1-45>]}
```

4. Configure the certificate authority (CA):

```
certificate ca ej common-name subca5
certificate ca ej key-name rsa_2048
certificate ca ej ca-url http://192.51.100.9:8080/ejbca/publicweb/apply/scep/test/
pkiclient.exe
certificate ca ej use-post true
```

**Note**

The values mentioned are for example only.

5. Use SCP to upload the Root CA certificate to: /intflash/shared/certs.
6. Install the Root CA certificate:

```
certificate ca WORD<1-45> install-file root-ca-filename WORD<1-80>
```

7. Authenticate the CA:

```
certificate ca WORD<1-45> action caauth
```

8. Enroll the subject certificate by the CA:

```
certificate ca WORD<1-45> action enroll
```

9. Install the certificate:

```
certificate ca WORD<1-45> action install
```

10. (Optional) If the certificate expires, remove the enrolled subject certificate:

```
certificate ca WORD<1-45> action remove
```

11. (Optional) To obtain the new certificate before the old certificate expires, enter the following command to renew the certificate:

```
certificate ca WORD<1-45> action renew
```

The Certificate Authority generates a new certificate for the subject.

Install an Offline CA Certificate

Use the following procedure as an example to install an offline CA certificate.

About This Task

In the following commands, the variable *WORD<1-80>* refers to the certificate file name.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the subject:

```
certificate subject common-name 822-pki
certificate subject e-mail client1@extemenetworks.com
certificate subject unit Engineering
certificate subject organization ExtremeNetworks
certificate subject locality Salem
certificate subject province Massachusetts
certificate subject country US
certificate subject subject-name 822
```

Note

The values mentioned are for example only.

3. Generate the certificate signing request to support multiple subject identities on the switch:

```
certificate generate-csr subject-name WORD< 1-45> key-name WORD<1-64>
```

```
#certificate generate-csr subject-name 823 key-name mimi
Switch:1(config)#1 2021-02-02T13:57:39.716Z SwitchModel CP1 - 0x003a8635 - 00000000
GlobalRouter DIGITALCERT
INFO Generate CSR For Digital Certificate successful!
```

4. Use the generated CSR file to enroll the certificate on the server.

5. Use SCP to upload the enrolled certificate along with Root certificate and all intermediary certificates to:

```
/intflash/shared/certs/
```

6. Install the Root CA certificate:

```
certificate install-file offline-root-ca-filename WORD<1-80>
```

Note

If the subject certificate issuer is directly the Root, then Step 7 and 8 are optional. If the subject is issued by Intermediate CA, then Step 7 and 8 are mandatory, also in the certificate chain between Root and Subject, all the Intermediates must be installed using these steps.

7. Copy and paste the Intermediate CA certificate to:

```
/intflash/shared/certs/
```

8. Install the intermediate CA:

```
certificate install-file offline-ca-filename WORD<1-80>
```

9. Install the offline subject file name:

```
certificate install-file offline-subject-filename WORD<1-80>
```

```
#certificate install-file offline-subject-filename sd

Error: File Name Not Found in /intflash/shared/certs/ or /intflash/.cert/.offlineCert/
#certificate install-file offline-subject-filename 823mimi.crt subject-name 823 key-
name mimi

Configure X.509 V3 Certificates for SSH Two Factor Authentication

Use the following procedure as an example to configure the SSH server on the switch, and the SSH client Secure CRT for two factor authentication using X.509 V3 certificates.

Before You Begin

The following certificates must be loaded on the SSH server and SSH client:

- For the Secure CRT (SSH client):
 - subject certificate from the PIV card.
- For the switch (SSH server):
 - CAC-server.pem - the subject certificate
 - ca.cert.pem - the root CA certificate
 - Self-signedTrustAnchorCertificate.cer - the root CA certificate that signed the intermediate certificate
 - RSA2048IssuingCACertificate.cer - the intermediate certificate signed by the previous root CA that signed the subject certificate.

About This Task

Use the following steps as an example to configure the SSH server on the switch, the RADIUS Windows server, and the SSH client Secure CRT.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Ensure the switch is running in Enhanced Secure Mode:

```
Switch:1(config)#show boot config flags
flags enhancedsecure-mode true
```

Note

This shows a partial output of only the relevant entry.

3. Ensure the switch clock is synchronized:

```
Switch:1#show clock
System Clock time : Fri Oct 12 19:36:36 2018 UTC
```

4. Provision PKI with certificates.

For information about provisioning PKI with certificates, see the following sections:

- [Obtain an Online CA-signed Subject Certificate](#) on page 3419
- [Install an Offline CA Certificate](#) on page 3420

X.509 Authentication User Name Option Example

Use the following procedure as an example to configure user name authentication options using X.509 V3 certificates.

Procedure

1. Enable X.509 V3 authentication user name override:

```
Switch:1(config)# ssh x509v3-auth username overwrite
```

The switch disregards the user name sent by the SSH client and uses the principal name from the client's certificate for authentication. If RADIUS authentication is configured, the user name is sent after you type the RADIUS password. For example, if you configure the SSH client with the user name "John" and enable x509v3-auth user name overwrite on the device, the switch sends the principal name 1403824387@mil to the RADIUS server for authorization.

```

64 5c 85 78 10 93 ee
Cert: 8066aec3484d3740d7d99ec2f5ed1983365bb1
```

2. Enable X.509 V3 authentication user name strip:

```
Switch:1(config)#ssh x509v3-auth username strip-domain
```

If x509v3-auth user name strip-domain is configured, the switch sends the principal name without the domain to the RADIUS for authorization. The user name is sent after you type the RADIUS password. For example: If you select principal name 1403824387@mil, the switch sends the principal name 1403824387 without the domain to the RADIUS server for authorization.

```

64 5c 85 78 10 93 ee
Cert: 8066aec3484d3740d7d99ec2f5ed1983365bb129
```

3. Enable X.509 V3 authentication user name use-domain:

```
Switch:1(config)ssh x509v3-auth username use-domain extreme.com
```

If you select the user name as the principal name, the switch sends the principal name from the certificate with the domain configured on the switch to the RADIUS for authorization. The user name is sent after typing the RADIUS password. For example: If you configure use-domain "extreme.com" on the switch and you configure the user name to be the principal name 1403824387@mil, the

switch sends the user name 1403824387@extreme.com to the RADIUS server for authorization.

64 5c 85 78 10 93 ee
Cert: 8066aec3484d3740d7d99ec2f5ed1983365bb129
```

4. RADIUS server is not configured:

If the RADIUS server is not configured, the authorization falls back locally on the switch, for the user name. You must configure the user names on the switch. You are prompted for the password. For example: If you select the principal name 1403824387@mil, the switch authorizes locally the user name as 1403824387@mil or 1403824387 if strip domain is enabled. You are prompted for the password.

Configure TCP Keepalive and TCP Timestamp

About This Task

TCP Keepalive configures the system TCP keepalive interval, probes, and time.

TCP Timestamp option (RFC 1323) allows TCP to determine the order in which the packets are sent. The TCP Timestamp provides protection against Wrapped Sequence numbers. However, it is possible to calculate the system uptime when the Timestamp option is enabled. The analysis of timestamp behaviour can provide information on the system identity, which poses security threats and can cause a potential attack.

The TCP Timestamp option is enabled by default. You can disable the timestamp to avoid any security risks.

Note

The configuration will be applied only to the new TCP connections and the existing connections are not affected. You must perform a **config save** and **reboot** to apply the new configuration to all TCP connections.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the TCP keepalive interval:
`sys control tcp-keepalive-interval <1-3600>`
3. Configure the TCP keepalive probes:
`sys control tcp-keepalive-probes <1-50>`
4. Configure the TCP keepalive time:
`sys control tcp-keepalive-time <5-65535>`
5. Enable the TCP Timestamp:
`sys control tcp-timestamp`
6. Disable the TCP Timestamp:
`no sys control tcp-timestamp`
7. View the status of TCP Timestamp:
`show sys control`

Examples

Configure the TCP keepalive to interval 60 seconds, with 15 probes, and 120 seconds time:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#sys control tcp-keepalive-interval 60
Switch:1(config)#sys control tcp-keepalive-probes 15
Switch:1(config)#sys control tcp-keepalive-time 120
```

Disable TCP Timestamp:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#no sys control tcp-timestamp
```

Warning: Existing TCP connections won't be affected.

A config save and reboot is required to apply this configuration for all TCP connections

Display the status of the TCP Timestamp:

```
Switch:1>show sys control
=====
                        System Control Settings
=====
      tcp-timestamp : enable
      tcp-keepalive-time : 60
tcp-keepalive-interval : 10
      tcp-keepalive-probes : 5
      tcp-mtu-probing : disabled
      tcp-base-mss : 1024
      mac-move-protection : on
```

Variable Definitions

The following table defines parameters for the **sys control** command.

Variable	Value
<i>tcp-keepalive-interval</i> <1-3600>	Configure the TCP keepalive interval in seconds. The default is 10.
<i>tcp-keepalive-probes</i> <1-50>	Configure the TCP keepalive probes. The default is 5.
<i>tcp-keepalive-time</i> <5-65535>	Configure the TCP keepalive time in seconds. The default is 60.
<i>tcp-timestamp</i>	<p>Enable or disable tcp-timestamp.</p> <p>Note: The timestamp is enabled by default. The system displays the following warning message when a new configuration is applied: Warning: Existing TCP connections won't be affected. A config save and reboot is required to apply this configuration for all TCP connections.</p>

Enable Authentication for Privileged EXEC Command Mode

With authentication enabled, you must enter a user name and password to access Privileged EXEC command mode from User-EXEC command mode. The user name and password is the same user name and password you used to Telnet or SSH to the switch.

Note

When you enable authentication for the Privileged EXEC CLI command mode, the changes do not affect existing CLI sessions. For the changes to take effect, you must first log out from your current CLI session and log back in on a new session.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable authentication for Privileged EXEC CLI command mode:

```
sys priv-exec-password
```
3. Verify the configuration:

```
show sys priv-exec-password
```

Enable MAC Move Protection on vIST

About This Task

Perform this procedure to enable MAC move protection on virtual interswitch trunk (vIST).

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable MAC move protection:

```
sys control virtual-ist mac-move-protection
```
3. Confirm the configuration:

```
show sys control
```

Examples

Enable MAC move protection on vIST:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#sys control virtual-ist mac-move-protection
Switch:1>show sys control
=====
                        System Control Settings
=====
                        tcp-timestamp : enable
                        tcp-keepalive-time : 60
                        tcp-keepalive-interval : 10
                        tcp-keepalive-probes : 5
                        tcp-mtu-probing : disabled
                        tcp-base-mss : 1024
                        mac-move-protection : on
```

Variable Definitions

The following table defines parameters for the **sys control virtual-ist** command.

Variable	Value
<i>mac-move-protection</i>	Enable MAC move protection on vIST. The default value is disabled.

Security Configuration using EDM

Configure security information used on the control and data paths to protect the network from uncontrolled access to network resources.

For more information about how to configure passwords and access policies, see [System Access Configuration Using EDM](#) on page 309.

Change Passwords

About This Task

Configure new passwords for each access level, or change the logon or password for the different access levels of the system to prevent unauthorized access. After you receive the switch, use default passwords to initially access CLI. If you use Simple Network Management Protocol version 3 (SNMPv3), you can change passwords in encrypted format.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **General**.
3. Select the **CLI** tab.
4. Specify the user name and password for the appropriate access level.
5. Select **Apply**.

CLI Field Descriptions

The following table defines parameters for the **CLI** tab.

Name	Description
RWAUserName	Specifies the user name for the read-write-all CLI account.
RWAPassword	Specifies the password for the read-write-all CLI account.
RWEnable	Activates the read-write access. The default is enabled.
RWUserName	Specifies the user name for the read-write CLI account.
RWPassword	Specifies the password for the read-write CLI account.
RWL3Enable	Activates the read-write Layer 3 access. The default is enabled.
RWL3UserName	Specifies the user name for the Layer 3 read-write CLI account.
RWL3Password	Specifies the password for the Layer 3 read-write CLI account.
RWL2Enable	Activates the read-write Layer 2 access. The default is enabled.
RWL2UserName	Specifies the user name for the Layer 2 read-write CLI account.
RWL2Password	Specifies the password for the Layer 2 read-write CLI account.
RWL1Enable	Activates the read-write Layer 1 access. The default is enabled.

Name	Description
RWLUserName	Specifies the user name for the Layer 1 read-write CLI account.
RWLPassword	Specifies the password for the Layer 1 read-write CLI account.
ROEnable	Activates the read-only CLI account. The default is enabled.
ROUserName	Specifies the user name for the read-only CLI account.
ROPassword	Specifies the password for the read-only CLI account.
MaxTelnetSessions	Specifies the maximum number of concurrent Telnet sessions in a range from 0–8. The default is 8.
Timeout	Specifies the number of seconds of inactivity for a Telnet before the system initiates automatic timeout and disconnect, expressed in a range from 30–65535. The default is 900 seconds.
NumAccessViolations	Indicates the number of CLI access violations detected by the system. This variable is a read-only field.
CustomBannerText	Specifies the text message that is displayed to users on the CLI before authentication. The message can be company information, such as company name and contact, or a warning message for the users of CLI. With character limitation from 1-1800, the text box displays 79 characters per line.
CustomBannerEnable	Specifies whether custom logon banner is enabled or disabled. The default is enabled.

Configure Directed Broadcast on a VLAN

About This Task

Configure directed broadcast on a VLAN to enable or disable directed broadcast traffic forwarding for an IP interface.

A directed broadcast is a frame sent to the subnet broadcast address on a remote IP subnet. When you disable (or suppress) directed broadcasts on an interface, all frames sent to the subnet broadcast address for a local router interface are dropped. Disabling directed broadcasts protects hosts from possible denial-of-service (DOS) attacks. By default, this feature is disabled on the device.

Note

Enabling this feature only applies to the primary IP address on the VLAN and not to Secondary IP Interfaces on the VLAN.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select a VLAN.
5. Select **IP**.
6. Select the **Direct Broadcast** tab.
7. Select **DirectBroadcastEnable**.

Important

Configure multiple VLANs or IPs in the same subnet but in different systems simultaneously.

8. Select **Apply**.

Direct Broadcast Field Descriptions

Use the data in the following table to use the **Direct Broadcast** tab.

Name	Description
DirectBroadcastEnable	<p>Specifies that an Isolated Routing Port (IRP) can forward directed broadcast traffic. A directed broadcast is a frame sent to the subnet broadcast address on a remote IP subnet. By disabling or suppressing directed broadcast on an interface, all frames sent to the subnet broadcast address for a local router interface are dropped. Disabling this function protects a host from possible denial of service (DoS) attacks.</p> <p>With the feature enabled, the Control Processor (CP) does not receive a copy of the directed broadcast. As a result, the system does not respond to a subnet broadcast ping sent from a remote subnet.</p> <p>The default is disabled.</p>

Configure TCP Keepalive and TCP Timestamp

About This Task

TCP Keepalive configures the system TCP keepalive interval, probes, and time.

TCP Timestamp option (RFC 1323) allows TCP to determine the order in which the packets are sent. The TCP Timestamp provides protection against Wrapped Sequence numbers. However, it is possible to calculate the system uptime when the Timestamp option is enabled. The analysis of timestamp behaviour can provide information on the system identity, which poses security threats and can cause a potential attack.

The TCP Timestamp option is enabled by default. You can disable the timestamp to avoid any security risks.

**Note**

The configuration will be applied only to the new TCP connections and the existing connections are not affected. You must save the configuration and reboot the switch to apply the new configuration to all TCP connections.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **System Control** tab.
4. Configure the TCP timestamp by performing one of the following actions:
 - a. Select **TcpTimestamp** to enable the TCP timestamp.
 - b. Clear **TcpTimestamp** to disable the TCP timestamp.
5. In **KeepaliveTime**, enter a number in seconds.
6. In **KeepaliveInterval**, enter a number in seconds.
7. In **KeepaliveProbes**, enter a number of probes.
8. Select **Apply**.

System Control *Field Descriptions*

Use the data in the following table to use the **System Control** tab.

Name	Description
TcpTimestampEnable	Enables or disables the TCP timestamp. The timestamp is enabled by default. The system displays the following warning message after you apply a new configuration: Warning: Existing TCP connections won't be affected. A config save and reboot is required to apply this configuration for all TCP connections.
KeepaliveTime	Specify the TCP keepalive time in seconds. The default is 60.
KeepaliveInterval	Specify the TCP keepalive interval in seconds. The default is 10.
KeepaliveProbes	Specify the TCP keepalive probes. The default is 5.

Name	Description
PrivExecPasswordEnable	Enables authentication to access Privileged EXEC CLI command mode. Authentication is disabled by default.
RateLimitActionPollInterval	Specifies the interval, in seconds, at which this feature checks the hardware counters for packets dropped because they exceeded the configured port rate limit. The default is 3 seconds.

Enable Authentication for Privileged EXEC Command Mode

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **System Control** tab.
4. Select **PrivExecPasswordEnable**.

Unicast Reverse Path Forwarding configuration using EDM

This section provides EDM procedures for Unicast Reverse Path Forwarding configuration.

Configure Reverse Path Checking on a Port

Before You Begin

- The system supports reverse path checking only on ports that have a valid IP address.

About This Task

Configure reverse path checking on a port to determine if a packet IP address is verifiable. Use reverse path checking to reduce the problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network. After you enable reverse path checking, the switch performs a reverse path check to determine if the packet IP address is verifiable. If the address is not verifiable, the system discards the packet.

Reverse path checking operates in one of two modes:

- exist-only mode
- strict mode

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **IP**.

4. Select the **Reverse Path Checking** tab.
5. Select **Enable** to enable reverse path checking.
6. Select **exist-only** or **strict**.
7. Select **Apply**.

Reverse Path Checking Field Descriptions

Use the data in the following table to use the **Reverse Path Checking** tab.

Name	Description
Enable	Enables reverse path checking on the selected port. The default is disabled.
Mode	<p>Specifies the mode for reverse path checking. The modes are</p> <ul style="list-style-type: none">• exist-only—reverse path checking checks whether the incoming packet source IP address exists in the routing table. If reverse path checking finds the source IP entry, the packet is forwarded; otherwise the packet is discarded.• strict—reverse path checking checks whether the incoming packet source IP address exists in routing table. If reverse path checking does not find the source IP entry, the packet is dropped; otherwise, reverse path checking further checks if the source IP interface matches the incoming interface of the packet. If they match, the packet is forwarded; otherwise the packet is discarded. <p>The default is exist-only.</p>

Configure Reverse Path Checking on an IPv6 Port

Before You Begin

- The system supports reverse path checking only on ports that have a valid IP address.

About This Task

Configure reverse path checking on a port to determine if a packet IP address is verifiable. Use reverse path checking to reduce the problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network. After you enable reverse path checking, the switch performs a reverse path check to determine if the packet IP address is verifiable. If the address is not verifiable, the system discards the packet.

Reverse path checking operates in one of two modes:

- exist-only mode
- strict mode

Procedure

1. In the Device Physical View tab, select a port.

2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **IPv6**.
4. Select the **Reverse Path Checking** tab.
5. Select **ReversePathCheckEnable** to enable reverse path checking.
6. Select **exist-only** or **strict**.
7. Select **Apply**.

Reverse Path Checking Field Descriptions

Use the data in the following table to use the **Reverse Path Checking** tab.

Name	Description
ReversePathCheckEnable	Enables reverse path checking on the selected port. The default is disabled.
ReversePathCheckMode	<p>Specifies the mode for reverse path checking. The modes are</p> <ul style="list-style-type: none">• exist-only—reverse path checking checks whether the incoming packet source IP address exists in the routing table. If reverse path checking finds the source IP entry, the packet is forwarded; otherwise the packet is discarded.• strict—reverse path checking checks whether the incoming packet source IP address exists in routing table. If reverse path checking does not find the source IP entry, the packet is dropped; otherwise, reverse path checking further checks if the source IP interface matches the incoming interface of the packet. If they match, the packet is forwarded; otherwise the packet is discarded. <p>The default is exist-only.</p>

Configure Reverse Path Checking on a VLAN

Before You Begin

- Before you can configure reverse path checking on a VLAN, you must assign a valid IP address to the selected VLAN.

About This Task

Configure reverse path checking on a VLAN to determine if a packet IP address is verifiable. Use reverse path checking to reduce the problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network. After you enable reverse path checking, the switch performs a reverse path check to determine if the packet IP address is verifiable. If the address is not verifiable, the system discards the packet.

Reverse path checking operates in one of two modes:

- exist-only mode
- strict mode

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select the VLAN on which you want to configure reverse path checking.
5. Select **IP**.
6. Select the **Reverse Path Checking** tab.
7. Select **Enable** to enable reverse path checking.
8. Select **exist-only** or **strict**.
9. Select **Apply**.

Reverse Path Checking Field Descriptions

Use the data in the following table to use the **Reverse Path Checking** tab.

Name	Description
Enable	Enables reverse path checking on the selected VLAN.
Mode	<p>Specifies the mode for reverse path checking. The modes are</p> <ul style="list-style-type: none">• exist-only—reverse path checking checks whether the incoming packet source IP address exists in the routing table. If reverse path checking finds the source IP entry, the packet is forwarded; otherwise, the packet is discarded.• strict—reverse path checking checks whether the incoming packet source IP address exists in routing table. If reverse path checking does not find the source IP entry, then the packet is dropped. Otherwise, reverse path checking further checks if the source IP interface matches the incoming interface of the packet. If they match, then the packet is forwarded. Otherwise, the packet is discarded. <p>The default is exist-only.</p>

Configure Reverse Path Checking on an IPv6 VLAN

Before You Begin

- Before you can configure reverse path checking on a VLAN, you must assign a valid IP address to the selected VLAN.

About This Task

Configure reverse path checking on a VLAN to determine if a packet IP address is verifiable. Use reverse path checking to reduce the problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network. After you enable reverse path checking, the switch performs a reverse path check to determine if the packet IP address is verifiable. If the address is not verifiable, the system discards the packet.

Reverse path checking operates in one of two modes:

- exist-only mode
- strict mode

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select the VLAN on which you want to configure reverse path checking.
5. Select **IPv6**.
6. Select the **Reverse Path Checking** tab.
7. Select **ReversePathCheckEnable** to enable reverse path checking.
8. Select **exist-only** or **strict**.
9. Select **Apply**.

Reverse Path Checking Field Descriptions

Use the data in the following table to use the **Reverse Path Checking** tab.

Name	Description
ReversePathCheckEnable	Enables reverse path checking on the selected VLAN.
ReversePathCheckMode	<p>Specifies the mode for reverse path checking. The modes are</p> <ul style="list-style-type: none"> • exist-only—reverse path checking checks whether the incoming packet source IP address exists in the routing table. If reverse path checking finds the source IP entry, the packet is forwarded; otherwise, the packet is discarded. • strict—reverse path checking checks whether the incoming packet source IP address exists in routing table. If reverse path checking does not find the source IP entry, then the packet is dropped. Otherwise, reverse path checking further checks if the source IP interface matches the incoming interface of the packet. If they match, then the packet is forwarded. Otherwise, the packet is discarded. <p>The default is exist-only.</p>

Digital Certificate Configuration Using EDM

The following section provides procedures to configure digital certificates using EDM.

*Configure Device Subject Parameters***About This Task**

Use this procedure to configure the device subject parameters to identify the device. The parameters include name, Email ID, company, department, and location of the subject.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **Certificate**.
3. Select the **Global Subject** tab.
4. In **CommonName**, type the name of the subject.
5. Complete the remaining optional configuration to customize the policy.
6. Select **Apply**.

Subject Field Descriptions

Use the data in the following table to use the **Subject** tab.

Name	Description
CommonName	Specifies the name of the subject sending the Certificate Signing Request to the Certificate Authority.
EmailAddress	Specifies the Email address of the subject sending the Certificate Signing Request to the Certificate Authority.
OrganizationalUnit	Specifies the organizational unit of the subject sending the Certificate Signing Request to the Certificate Authority.
Organization	Specifies the organization of the subject sending the Certificate Signing Request to the Certificate Authority.
Locality	Specifies the locality of the subject sending the Certificate Signing Request to the Certificate Authority.
Province	Specifies the province of the subject sending the Certificate Signing Request to the Certificate Authority.
Country	Specifies the country of the subject sending the Certificate Signing Request to the Certificate Authority.
InstallFile	Installs the specific certificate file type obtained offline from the Certificate Authority.
InstallFileName	Specifies the certificate file name to install.
UninstallFile	Uninstalls the specific certificate file type obtained offline from the Certificate Authority.

Name	Description
UninstallFileName	Specifies the certificate file name to uninstall.
GenerateCsr	Generates the certificate signing request to obtain the offline subject certificate.

Configure Device Subject Entries Parameters

Use this procedure to configure the device subject parameters to identify the device. The parameters include name, Email ID, company, department, and location of the subject.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **Certificate**.
3. Select the **Subject Entries** tab.
4. Select **Insert**.
5. In **Name**, type the name of the subject.
6. Complete the remaining optional configuration to customize the policy.
7. Select **Insert**.

Subject Entries Field Descriptions

Use the data in the following table to use the **Subject Entries** tab.

Name	Description
Name	Specifies the user defined name referring to the subject.
CommonName	Specifies the name of the subject sending the Certificate Signing Request to the Certificate Authority.
EmailAddress	Specifies the Email address of the subject sending the Certificate Signing Request to the Certificate Authority.
OrganizationalUnit	Specifies the organizational unit of the subject sending the Certificate Signing Request to the Certificate Authority.
Organization	Specifies the organization of the subject sending the Certificate Signing Request to the Certificate Authority.
Locality	Specifies the locality of the subject sending the Certificate Signing Request to the Certificate Authority.
Province	Specifies the province of the subject sending the Certificate Signing Request to the Certificate Authority.

Name	Description
Country	Specifies the country of the subject sending the Certificate Signing Request to the Certificate Authority.
InstallFile	Installs the specific certificate file type obtained offline from the Certificate Authority.
InstallFileName	Specifies the certificate file name to install.
UninstallFile	Uninstalls the specific certificate file type obtained offline from the Certificate Authority.
UninstallFileName	Specifies the certificate file name to uninstall.
GenerateCsr	Generates the certificate signing request to obtain the offline subject certificate.
RelaxedMode	Specifies relaxed mode for offline subject certificate installation for less restrictive consistency checks.
Pkcs1Password	Specifies the password to extract the PKCS12 container when in relaxed mode.
KeyName	Specifies the key name of the generated key-pair.

Generate the Key Pair

About This Task

Use the following procedure to generate the private and public key pair for the specific cryptography type.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **Certificate**.
3. Select the **Key-Pair** tab.
4. Select **Insert**.
5. In **Type**, select the cryptography type.
6. In **Size**, type the size of the key.
7. Select **Insert**.

Key-Pair Field Description

Use the data in the following table to use the **Key-Pair** tab.

Name	Description
Type	Specifies the cryptography algorithm used to generate the key-pair. Only RSA is supported.
Size	Specifies the size of the key-pair to be generated. Only 2048 is supported.
Name	Specifies the name of the key-pair generated for the subject. This name is auto-generated as the combination of key-type and key-size.

Configure the Certificate Authority

Use this procedure to configure the certificate authority (CA) and perform related actions. You can configure only one CA in a device at a time.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **Certificate**.
3. Select the **CA** tab.
4. Select **Insert**.
5. In **Name**, type a user-defined name of the CA.
6. In **CommonName**, type the common name of the CA.
7. In **KeyName**, type the name of the associated key pair.
8. Complete the remaining optional configuration to customize the policy.
9. Select **Insert**.
10. (Optional) Select **Retry Action** if the trustpoint CA certificate authentication fails or takes time for authentication. This can be done only when the selected Action is **caauth**.

CA Field Descriptions

Use the data in the following table to use the **CA** tab.

Name	Description
Name	Specifies the user-defined name referring to the Certificate Authority issuing the Digital Certificate.
CommonName	Specifies the Common Name of the Certificate Authority issuing the Digital Certificate.
KeyName	Specifies the name of the associated key pair.

Name	Description
CaUrl	Specifies the URL of the Certificate Authority issuing the Digital Certificate.
Action	Specifies the action the Certificate Authority can take: <ul style="list-style-type: none"> • noop — no operation • caauth — CA authentication • enroll — certificate enrolment request • renew — certificate renew request • remove — remove the subject certificate obtained online from the CA • install — install the subject certificate obtained online from the CA • getCrl — retrieve the Certificate Revocation List (CRL) from the CRL Distribution Point (CDP).
ActionChallengePassword	Specifies the challenge password required to perform the SCEP operation.
LastActionStatus	Specifies the status of the last action: <ul style="list-style-type: none"> • none - No action is performed yet • success - Execution of the action triggered is completed successfully • failed - Execution of the action triggered has failed • inProgress - Execution of the action triggered is in progress
LastActionFailureReason	Specifies the reason of failure for the last action performed by the Certificate Authority.
InstallRootCaFileName	Specifies the certificate file obtained offline from the Root Certificate Authority.
SubjectCertificateValidityDays	Specifies the number of days for which subject certificate will remain valid. The default value is 365 days.
UsePost	Specifies the HTTP request type: URL or POST. TRUE for EJBCA and FALSE for Win2012 CA
Sha256Fingerprint	Specifies an encrypted fingerprint of the expected certificate to match.
SubjectName	Specifies the Subject Name of the subject sending the Certificate Signing Request to the Certificate Authority.
UsedFor	Specifies the name of the application the certificate uses. The default is enabled if there is only 1 CA trustpoint configured.

View the Certificate Details

Use this procedure to:

- display the configured key details for given key name.
- display the digital certificate for the given certificate index or list all the certificate details from the local store if the certificate index is not specified.
- display the CA details for given trustpoint CA name or list all the CA details from the local store if the CA name is not specified.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **Certificate**.
3. Select the **Certificate** tab.

Certificate Field Descriptions

Use the data in the following table to use the **Certificate** tab.

Name	Description
Type	Specifies the certificate type.
VersionNumber	Specifies the version number of the certificate for the subject as issued by the Certificate Authority.
SerialNumber	Specifies the serial number of the certificate for the subject as issued by the Certificate Authority.
IssuerName	Specifies the name of the issuer of the certificate for the subject as issued by the Certificate Authority.
ValidStartPeriod	Specifies the start date of the validation period of the certificate for the subject as issued by the Certificate Authority.
ValidEndPeriod	Specifies the last date of the validation period of the certificate for the subject as issued by the Certificate Authority.
CertificateSignatureAlgorithm	Specifies the algorithm used for the signature of the issuer on the certificate for the subject as issued by the Certificate Authority.
CertificateSignature	Specifies the signature of the issuer on the certificate for the subject as issued by the Certificate Authority.
Subject	Specifies the details of the subject on its certificate as issued by Certificate Authority.
SubjectPublicKeyAlgorithm	Specifies the algorithm used to generate the public key of the subject for the certificate issued by the Certificate Authority.

Name	Description
SubjectPublicKey	Specifies the public key of the subject used for the Certificate Signing Request.
HasBasicConstraint	Specifies whether the certificate contains any basic certificate constraint or not.
HasKeyUsage	Specifies whether the certificate contains basic key usage constraint or not.
IsCa	Specifies whether the certificate is a ca certificate or not.
KeyUsage	Specifies the purpose of the key used in the certificate. It is represented in the form of bits as follows: <ul style="list-style-type: none"> • bit 0 - digitalSignature • bit 1 - nonRepudiation • bit 2 - keyEncipherment • bit 3 - dataEncipherment • bit 4 - keyAgreement • bit 5 - keyCertSign • bit 6 - cRLSign • bit 7 - encipherOnly • bit 8 - decipherOnly
Status	Specifies the status of the certificate.
Installed	Specifies whether the certificate is installed or not.
CdpUrl	Specifies the CDP URL present in the Digital Certificate Extensions field.
OcspUrl	Specifies the OCSP URL present in the Digital Certificate AIA field.
ExtendedKeyUsage	Indicates the purpose for which the key is used in addition to or in place of the basic purposes indicated in the key-usage field of the certificate.
RevocationStatus	Specifies the revocation status of the certificate.

View the Certificate Store

About This Task

Use the following procedure to view the online, offline and root certificates in the local store.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **Certificate**.
3. Select the **Certificate Store** tab.

Certificate Store Field Descriptions

Use the data in the following table to use the **Certificate Store** tab.

Name	Description
CommonName	Specifies the Common Name of the Certificate Authority issuing the Digital Certificate.
Type	Specifies the certificate type.
VersionNumber	Specifies the version number of the certificate for the subject as issued by the Certificate Authority.
SerialNumber	Specifies the serial number of the certificate for the subject as issued by the Certificate Authority.
IssuerName	Specifies the name of the issuer of the certificate for the subject as issued by the Certificate Authority.
ValidStartPeriod	Specifies the start date of the validation period of the certificate for the subject as issued by the Certificate Authority.
ValidEndPeriod	Specifies the last date of the validation period of the certificate for the subject as issued by the Certificate Authority.
CertificateSignatureAlgorithm	Specifies the algorithm used for the signature of the issuer on the certificate for the subject as issued by the Certificate Authority.
CertificateSignature	Specifies the signature of the issuer on the certificate for the subject as issued by the Certificate Authority.
Subject	Specifies the details of the subject on its certificate as issued by Certificate Authority.
SubjectPublicKeyAlgorithm	Specifies the algorithm used to generate the subject's public key for the certificate issued by the Certificate Authority.
SubjectPublicKey	Specifies the public key of the subject used for Certificate Signing Request.
HasBasicConstraint	Specifies whether certificate contains basic certificate constraint.
HasKeyUsage	Specifies whether certificate contains basic key usage constraint.
IsCa	Specifies if the certificate is a CA certificate or not.

Name	Description
KeyUsage	Specifies the purpose of the key used in the certificate. It is represented in the form of bits as follows: <ul style="list-style-type: none">• bit 0 - digitalSignature• bit 1 - nonRepudiation• bit 2 - keyEncipherment• bit 3 - dataEncipherment• bit 4 - keyAgreement• bit 5 - keyCertSign• bit 6 - cRLSign• bit 7 - encipherOnly• bit 8 - decipherOnly
Status	Specifies the status of the certificate.
Installed	Specifies whether the certificate is installed or not.
CdpUrl	Specifies the CDP URL present in the Digital Certificate Extensions field.
OscpUrl	Specifies the OCSP URL present in the Digital Certificate AIA field.
ExtendedKeyUsage	Indicates the purpose for which the key is used in addition to or in place of the basic purposes indicated in the key-usage field of the certificate.
CaFileName	Specifies the certificate file obtained offline from the Root Certificate Authority.

NEW! Segmented VRF

[Segmented VRF CLI Configuration](#) on page 3453

[Segmented VRF EDM Configuration](#) on page 3462

Table 296: Segmented VRF product support

Feature	Product	Release introduced
Segmented VRF Note: Only platforms that support multiple VRFs support this feature.	4220 Series	Not Supported The 4220 Series switches support only a single active VRF with IP configuration.
	5320 Series	Fabric Engine 9.4 For the 5320 Series, only the following models support more than one VRF with IP configuration: <ul style="list-style-type: none"> • 5320-16P-2MXT-2X • 5320-24T-4X-XT • 5320-24T-24S-4XE-XT • 5320-48P-8XE • 5320-48T-8XE
	5420 Series	Fabric Engine 9.4
	5520 Series	Fabric Engine 9.4
	5720 Series	Fabric Engine 9.4
	7520 Series	Fabric Engine 9.4
	7720 Series	Fabric Engine 9.4
	7830 Series	Not Supported
	VSP 4900 Series	VOSS 9.4
	VSP 7400 Series	VOSS 9.4

Use a Segmented VRF (or Segmented Layer 3 VSN) to control, isolate, and secure traffic flows across the network by creating isolated routing domains within a single, traditional VRF or Layer 3 VSN. You can use a Segmented VRF to segment customers, internal services, functions, or security zones. You determine how, or if, the segments interconnect. Assign I-SIDs to each routing domain to advertise routes between the domains.

After you enable Segmented VRF on a traditional VRF, the switch separates the VRF into three access areas, or trust levels, called segments:

- Trusted segment—connects to secure and controlled networks
- Unrestricted segment—permits open communication without trust-based restrictions
- Untrusted segment—connects to potentially unsafe, or public networks

Assign VLAN routing interfaces to the three segments. The switch makes routing decisions based on the VRF context and access type. For more information, see [Routing Interface Types for Segmented VRF](#) on page 3448 and [Route Classification for Segmented VRF](#) on page 3449.

At a high-level, take the following actions to use Segmented VRF:

1. Enable Segmented VRF on a traditional VRF to create three segments within the VRF. The traditional VRF configuration becomes the trusted segment.
2. Associate an I-SID with the trusted segment to advertise trusted routes to the other segments.
3. (Optional) Associate I-SIDs with the unrestricted and untrusted segments. If you do not assign an I-SID to the unrestricted and untrusted segments, the switch automatically derives a value based on the trusted I-SID.
4. (Optional) Specify BGP neighbors in the unrestricted segment. By default, BGP neighbors are configured in the trusted segment.
5. (Optional) Create a CLIP interface in the unrestricted or trusted segment.
6. (Optional) Enable IP VPN on the trusted segmented.
7. Associate a VLAN routing interface with each segment.

For detailed configuration steps, see the following tasks:

- [Segmented VRF CLI Configuration](#) on page 3453
- [Segmented VRF EDM Configuration](#) on page 3462

The sections that follow provide conceptual information about this feature.

Routing Interface Types for Segmented VRF

Assign VLAN routing interfaces to the different segments. The following table defines how the switch handles traffic for the different routing interface types.

Note

If you enable Segmented VRF on an existing configured VRF, the existing routing interfaces associated with the VRF automatically become trusted interfaces.

Table 297: Routing interfaces by access segment

Interface Type	Trust level	Traffic handling	Use case	Example
Trusted	High	Access to all trusted segments	Internal communication between known and authenticated devices	An interface on a corporate LAN that connects to internal servers and employee devices
Unrestricted	Full	Open access	Development, testing, or public-facing services with broad access requirements	A network interface on a public web server that accepts connections from any IP address
Untrusted	Low	Limited access	Isolate external or unknown traffic from internal systems	A WAN interface on a firewall that connects to the public Internet

Route Classification for Segmented VRF

The following table defines the behavior of routes associated with the three access segments.

Table 298: Route behavior by type

Route Type	Trust level	Behavior	Use case	Example
Trusted	High	Allowed, prioritized, monitored lightly	Internal corporate network, VPN, known secure endpoints	Routing traffic to a known internal subnet using a secure gateway
Unrestricted	Full	Open access, no filtering or inspection	Open networks, default routes in less secure environments	A default route that forwards all traffic to the Internet without firewall rules
Untrusted	Low	Restricted, monitored, or blocked	Public Internet, guest network, unknown external source	Routing traffic from an external IP range through a firewall with strict inspection rules

You do not need to configure communication between the segments of the VRF. Communication between segments is based on rules, such as the following list:

- route availability algorithm, see [Figure 220](#) for an illustration of this concept
- unicast protocol configuration
- global configuration, for example, ECMP

The following figure illustrates route accessibility across segments.

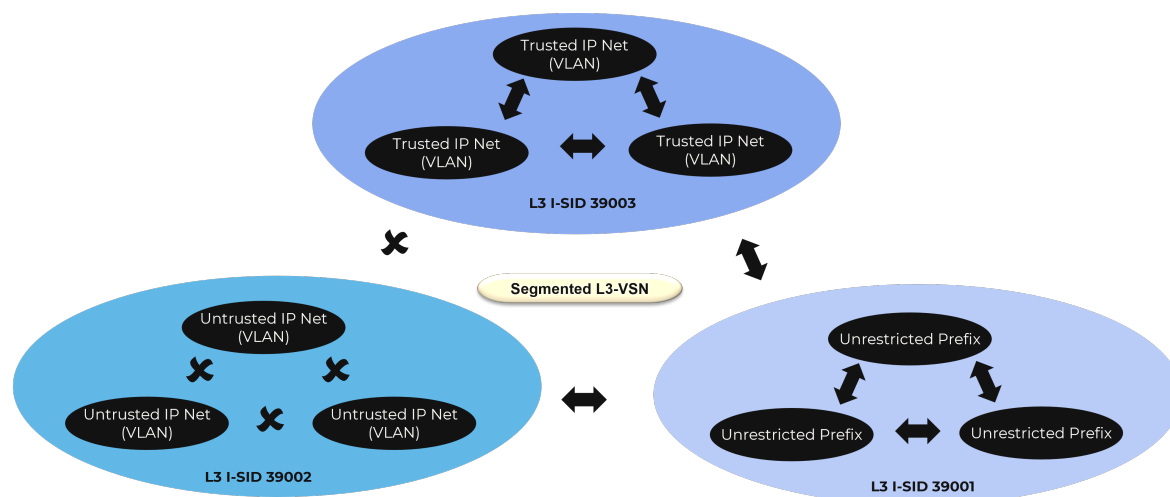

Figure 220: Segmented VRF behavior

Operations and Restrictions

The following list identifies supported operations and restrictions for Segmented VRF:

- You cannot directly configure the untrusted or unrestricted segments, nor use their IDs or names in command syntax. The switch replicates the trusted configuration to the other segments, with some exceptions as documented in this section and in [Table 299](#) on page 3451. Feature configurations that replicate across all segments are not listed.
- After you configure Segmented VRF on a switch, several CLI **show** commands, especially those that display route information or IP statistics, display the output separated by applicable segment, with the trusted segment first, followed by the unrestricted segment, and finally, the untrusted segment. For an example of this output, see the **show ip route verbose vrf** output in [Segmented VRF CLI Example](#) on page 3460.

Several **IP** folder tabs in EDM can also separate information based on applicable segment, such as the **IP > IP > ARP** and **IP > BGP > Peer Groups** tabs. You must launch the VRF context view for the Segmented VRF to see this information.

- Some CLI **show** command outputs and EDM tabs include an ACCESS or L3 ACCESS column to specify the associated Segmented VRF access type for each entry in the output.
- BGP and OSPF:
 - You can only enable OSPF on a VLAN associated with a trusted or unrestricted segment. OSPF adjacencies form only in trusted and unrestricted segments.
 - You cannot configure OSPF static neighbors on interfaces associated with an untrusted segment.
 - You can configure BGP peers or peer groups for trusted or unrestricted segments.
 - OSPF adjacencies and BGP peers redistribute routes based on owner and not route-access level. The trust level is lost during redistribution.
 - If the source VRF for BGP or OSPF inter-VRF routing is a Segmented VRF, only trusted routes are redistributed. If the destination VRF is a Segmented VRF, routes are installed only for the trusted segment and are available in the unrestricted routing table.
- After you segment an existing VRF configured for DHCP Relay, the configuration becomes part of the trusted segment. The switch associates new configurations with a segment based on the interface on which the agent IP address resides. All trust-level interfaces can use the agent IP address.
- After you segment an existing VRF configured for VRRP or Anycast IP Gateway, the configuration becomes part of the trusted segment. The switch associates new configurations with a segment based on the VLAN access level.
- To enable both Segmented VRF and IP VPN on the same VRF, you must enable Segmented VRF on the VRF before you enable IP VPN.
- Ensure the I-SIDs you configure for Segmented VRF, or that the switch automatically derives, do not conflict with I-SIDs used for other purposes in the network.

- The Layer 3 VSN I-SID you associate with an access segment must be used with the same access segment across the Fabric network. For example, do not configure I-SID 1011 for a trusted segment on BEB A and for an untrusted segment on BEB B.
- To use Segmented VRF in a Multi-area SPB deployment, you must create the Segmented VRFs, with IP VPN enabled and IP VPN I-SIDs, on all boundary nodes.
- VLANs:
 - The Segmented Management Instance VLAN cannot use an untrusted or unrestricted segment VLAN.
 - The Layer 2 VSN must have the same access type on all routers.
 - To change the VLAN ownership, you must remove the original configuration first.
 - The VLAN associated with a segment can be a VLAN with Secondary IP Interfaces.

The following table identifies feature replication exceptions across the three segments.

Table 299: Feature exceptions across segments

Feature	Trusted	Unrestricted	Untrusted	Notes
<ul style="list-style-type: none"> • BFD • Brouter interfaces • DvR, including redistribution • IPv6 • Multicast, including IP Multicast config-lite for Fabric Connect • OSPF tags in IS-IS • RIP 	Y	N	N	Configuration not replicated to unrestricted or untrusted RIP routes learned on trusted segments are synchronized to unrestricted
IS-IS Accept Policies	Y	N	N	Accepted I-SID can only be a trusted I-SID Configuration not replicated, with the following exceptions: <ul style="list-style-type: none"> • default and adv-rtr policy configuration replicated to all segments • I-SID and I-SID list configuration replicated to unrestricted
I-SID Lists	Y	Y	N	Configuration not replicated to untrusted

Table 299: Feature exceptions across segments (continued)

Feature	Trusted	Unrestricted	Untrusted	Notes
CLIP interfaces	Y	Y	N	Can add in either trusted or unrestricted Accessible from trusted and unrestricted if added in trusted Accessible from all segments if added in unrestricted
Inter-VRF Routing	Y	Y	N	Configuration not replicated to untrusted

Use Case Examples

Typically, position a firewall on an unrestricted VLAN, which means it can respond to untrusted as well as trusted VLANs. Position unsecure IoT devices on untrusted VLANs, which means they are restricted to only reach a subset (unrestricted) of destinations.

Use untrusted segments to build a larger number of segmented communication groups, using VLAN and I-SID, with devices that can only communicate with each other, and route to the unrestricted segment or firewall. For example, a multi-device, third-party IoT infrastructure with remote access for management.

Use untrusted segments to build many isolated IP subnets, using Private VLAN and E-Tree I-SID, that can only communicate with, and route to, the unrestricted segment or firewall. For example, a single-device, third-party IoT infrastructure with remote access for management.

The following image illustrates that you can combine Segmented VRF untrusted segments with VLANs, and E-Tree/Private VLANs, for full Layer 2 isolation.

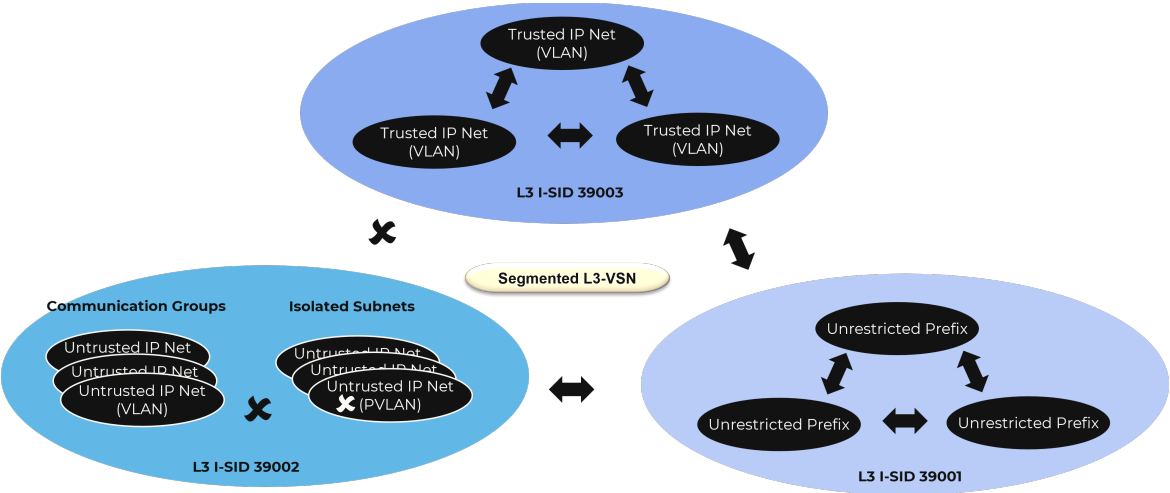

Figure 221: Communication groups and isolated networks

NEW! Segmented VRF CLI Configuration

Because the switch replicates most of the trusted configuration to the other segments, this task flow focuses on the steps that are specific to Segmented VRF. This task flow does not include traditional VLAN, CLIP, or VRF configuration.

For an example configuration, see [Segmented VRF CLI Example](#) on page 3460.

Note

After you configure Segmented VRF on a switch, several CLI **show** commands, especially those that display route information or IP statistics, display the output separated by applicable segment, with the trusted segment first, followed by the unrestricted segment, and finally, the untrusted segment. For an example of this output, see the **show ip route verbose vrf** output in the example mentioned in the preceding paragraph.

Table 300: Segmented VRF CLI Task Flow

Steps	Procedure	Description
1	Enable Segmented VRF on page 3454	Enable Segmented VRF on the traditional VRF.
2	Associate I-SIDs With VRF Segments on page 3455	Associate I-SIDs with the VRF segments to advertise routes between segments. The trusted I-SID is a mandatory configuration. If you do not assign an I-SID to the unrestricted or untrusted segment, the switch automatically derives a value based on the trusted I-SID.
3	Configure a BGP Neighbor in an Unrestricted Segment on page 3456	Optional. Configure a BGP neighbour in the unrestricted segment. By default, BGP neighbors configured on the Segmented VRF are part of the trusted segment.
4	Create a CLIP Interface in an Unrestricted Segment on page 3457	Optional. Create a CLIP interface in the unrestricted segment if it needs to be accessible from hosts in all three segments. If you do not specify the interface as unrestricted, a CLIP interface associated with a Segmented VRF is part of the trusted segment and is only accessible from hosts in the trusted and unrestricted segments.
5	Associate a VLAN Routing Interface With a VRF Segment on page 3458	Associate VLANs with each of the three segments.

Table 300: Segmented VRF CLI Task Flow (continued)

Steps	Procedure	Description
6	Create an IP VPN Instance on a VRF on page 4086	Optional. Create an IP VPN instance to advertise IP routes from the Segmented VRF.
7	Verify the Segmented VRF Configuration on page 3459	Verify the configuration.

NEW Enable Segmented VRF

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Create and configure the VRF.
- Confirm IP VPN is disabled on the VRF. You can enable IP VPN after you enable Segmented VRF.

About This Task

The traditional VRF configuration becomes the trusted segment for trusted access and the switch creates segments for unrestricted and untrusted access. The new segments use the name of the traditional VRF and append either -unr for unrestricted or -unt for untrusted. For non-trusted segments, the switch truncates the traditional VRF name to accommodate the suffix and remain within allowed character limits.

If you enable Segmented VRF on an existing configured VRF, the existing routing interfaces associated with the VRF automatically become trusted interfaces.

Note

Segmented VRFs use more system resources than traditional VRFs (Layer 3 VSNs). For scaling information, see *Fabric Engine Release Notes*.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

Note

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Enable Segmented VRF on the traditional VRF:

```
segmented
```

NEW! Associate I-SIDs With VRF Segments

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Enable Segmented VRF on the traditional VRF. This task assumes an I-SID was not previously assigned to the VRF. If the VRF has an I-SID, it becomes the trusted I-SID after you segment the VRF.
- Create three I-SIDs to use for the segmented access levels.

About This Task

Important

Ensure the I-SIDs you configure for Segmented VRF, or that the switch automatically derives, do not conflict with I-SIDs used for other purposes in the network.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

Note

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Associate an I-SID with the trusted segment to advertise routes learned on that routing interface type. The trusted I-SID configuration is mandatory:

```
i-sid <0-16777215> [trusted]
```
3. (Optional) Associate I-SIDs with the unrestricted or untrusted segment to advertise routes learned on that routing interface type:

```
i-sid <0-16777215> <unrestricted | untrusted>
```

Important

If you do not assign an I-SID to the unrestricted and untrusted segments, the switch automatically derives a value based on the trusted I-SID.

NEW! Variable Definitions

The following table defines parameters for the **i-sid <0-16777215>** command.

Variable	Value
<0-16777215>	Specifies the service instance identifier (I-SID).
trusted	Assigns an I-SID to advertise trusted routes to trusted and unrestricted segments.
unrestricted	Assigns an I-SID to advertise unrestricted routes to all segments. If you do not assign an I-SID to the unrestricted segment, the switch automatically derives a value based on the trusted I-SID, (trusted I-SID + 1).
untrusted	Assigns an I-SID to advertise untrusted routes to restricted segments. If you do not assign an I-SID to the untrusted segment, the switch automatically derives a value based on the trusted I-SID, (trusted I-SID + 2).

NEW! Configure a BGP Neighbor in an Unrestricted Segment**Note**

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Enable Segmented VRF on the traditional VRF.

About This Task**Note**

If you do not enter this command with the *unrestricted* parameter, BGP neighbors configured on the Segmented VRF are part of the trusted segment.

The switch adds existing BGP neighbors in the VRF context to the trusted segment automatically.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

Note

You cannot use the derived name for the untrusted (*-unt) or unrestricted (*-unr) segments of a Segmented VRF to enter this mode.

2. Configure a BGP neighbor in the unrestricted segment:

```
ip bgp neighbor WORD<0-1536> unrestricted
```

NEW! Variable Definitions

The following table defines parameters for the **ip bgp neighbor WORD<0-1536>** command.

Variable	Value
unrestricted	Configures a BGP neighbor as part of the unrestricted segment. If you do not enter this parameter, new BGP neighbors that you configure in the VRF context are part of the trusted segment.
WORD<0-1536>	Specifies the peer IP address or the peer group name.

NEW! Create a CLIP Interface in an Unrestricted Segment

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Enable Segmented VRF on the traditional VRF.

About This Task

If you create the interface in the trusted segment, it is only accessible from hosts in the trusted and unrestricted segments. Create a CLIP interface in the unrestricted segment if it needs to be accessible from hosts in all three segments.

Procedure

1. Enter Loopback Interface Configuration mode

```
enable
```

```
configure terminal
```

```
interface Loopback <1-256>
```

2. Create a CLIP interface in the unrestricted segment:

```
ip address {<A.B.C.D/X> | <A.B.C.D> <A.B.C.D>} vrf WORD<1-16>  
unrestricted
```

NEW! Variable Definitions

The following table defines parameters for the **ip address** command.

Variable	Value
<A.B.C.D/X> <A.B.C.D> <A.B.C.D>	Specifies the IP address and subnet mask for the CLIP interface in either of the following notation formats: A.B.C.D/X or A.B.C.D A.B.C.D.
unrestricted	Specifies that the interface belongs to the unrestricted segment of a Segmented VRF. If you omit this parameter, the interface is part of the trusted segment and is only accessible from hosts in the trusted and unrestricted segments. Use the <i>unrestricted</i> parameter to make the interface accessible from hosts in all three segments. The default is trusted.
vrf WORD<1-16>	Specifies the Segmented VRF by name.

NEW! Associate a VLAN Routing Interface With a VRF Segment

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Enable Segmented VRF on the traditional VRF.
- Create and configure a VLAN routing interface to associate with each segment.

About This Task

If you enable Segmented VRF on an existing configured VRF, the existing routing interfaces associated with the traditional VRF automatically become trusted interfaces.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```

2. Associate the VLAN with the appropriate segment:

```
vrf WORD<1-16> <trusted | unrestricted | untrusted>
```

NEW! Variable Definitions

The following table defines parameters for the **vrf WORD<1-16>** command.

Variable	Value
trusted	Associates the VLAN with the trusted segment. If you do not use this parameter, the VLAN is associated with the trusted segment by default.
untrusted	Associates the VLAN with the untrusted segment. If you do not use this parameter, the VLAN is associated with the trusted segment by default.
unrestricted	Associates the VLAN with the unrestricted segment. If you do not use this parameter, the VLAN is associated with the trusted segment by default.
WORD<1-16>	Specifies the name of the traditional VRF. You cannot use untrusted or unrestricted segment names in command syntax.

NEW! Verify the Segmented VRF Configuration

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Confirm the traditional VRF is now a Segmented VRF:

```
show ip vrf [detail]
```

3. Verify the I-SID configuration for each segment:

```
show ip ipvpn
```

4. View route information for each segment:

```
show ip route [verbose] vrf WORD<1-16>
```

```
show ip route unrestricted-segment {vrf WORD<1-16> | vrfids  
WORD<0-512>}
```

```
show ip route untrusted-segment {vrf WORD<1-16> | vrfids WORD<0-512>}
```

```
show ip route trusted-segment {vrf WORD<1-16> | vrfids WORD<0-512>}
```

NEW Segmented VRF CLI Example

Create a VRF named sales, and enable Segmented VRF. Configure a Layer 3 I-SID for the VRF, which becomes the trusted I-SID, but permit the switch to derive the untrusted and unrestricted I-SIDs automatically. Identify BGP neighbors for both the trusted segment and the unrestricted segment. Associate VLAN 100 with the trusted segment, VLAN 200 with the unrestricted segment, and VLAN 300 with the untrusted segment.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#ip vrf sales
Switch:1(config)#router vrf sales
Switch:1(router-vrf)#segmented
Switch:1(router-vrf)#i-sid 1010
Switch:1(router-vrf)#ipvpn
Switch:1(router-vrf)#ipvpn enable
Switch:1(router-vrf)#ip bgp neighbor 192.0.2.1
Switch:1(router-vrf)#ip bgp neighbor trPeerGroup
Switch:1(router-vrf)#ip bgp neighbor 198.51.100.1 unrestricted
Switch:1(router-vrf)#ip bgp neighbor unresPeerGroup unrestricted
Switch:1(router-vrf)#interface vlan 100
Switch:1(config-if)#vrf sales
Switch:1(router-vrf)#interface vlan 200
Switch:1(config-if)#vrf sales unrestricted
Switch:1(config-if)#interface vlan 300
Switch:1(config-if)#vrf sales untrusted
### VRF and VLAN configuration not shown###
```

Verify the configuration.

Notice that the **show ip vrf** output indicates there are 3 VRFs on the switch but 5 IDs are allocated. After you segment the sales VRF, the switch uses the existing VRF ID for the trusted segment and automatically allocates VRF IDs to the new untrusted and unrestricted segments, starting with the highest available VRF ID. You can see the IDs assigned to each segment in the **show ip vrf detail** output.

Also notice the different origins between the segment types.

```
Switch:1#show ip vrf
```

NEW! Segmented VRF EDM Configuration

Because the switch replicates most of the trusted configuration to the other segments, this task flow focuses on the steps that are specific to Segmented VRF. This task flow does not include traditional VLAN, CLIP, or VRF configuration.

Note

After you configure Segmented VRF on a switch, several **IP** folder tabs in EDM can separate information based on applicable segment, such as the **IP > IP > ARP** and **IP > BGP > Peer Groups** tabs. You must launch the VRF context view for the Segmented VRF to see this information.

Table 301: Segmented VRF EDM Task Flow

Steps	Procedure	Description
1	Enable Segmented VRF on page 3463	Enable Segmented VRF on the traditional VRF.
2	Associate I-SIDs With VRF Segments on page 3463	Associate I-SIDs with the VRF segments to advertise routes between segments. The trusted I-SID is a mandatory configuration. If you do not assign an I-SID to the unrestricted or untrusted segment, the switch automatically derives a value based on the trusted I-SID.
3	Configure a BGP Neighbor in an Unrestricted Segment on page 3464	Optional. Configure a BGP neighbour in the unrestricted segment. By default, BGP neighbors configured on the Segmented VRF are part of the trusted segment.
4	Create a CLIP Interface in a VRF Segment on page 3465	Optional. Create a CLIP interface in the unrestricted segment if it needs to be accessible from hosts in all three segments. If you do not specify the interface as unrestricted, a CLIP interface associated with a Segmented VRF is part of the trusted segment and is only accessible from hosts in the trusted and unrestricted segments.
5	Create an IP VPN Instance on a VRF on page 4101	Optional. Create an IP VPN instance to advertise IP routes from the Segmented VRF.
6	Associate a VLAN Routing Interface With a VRF Segment on page 3466	Associate VLANs with each of the three segments.

NEW Enable Segmented VRF

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Create and configure the VRF.
- Confirm IP VPN is disabled on the VRF. You can enable IP VPN after you enable Segmented VRF.

About This Task

The traditional VRF configuration becomes the trusted segment for trusted access and the switch creates segments for unrestricted and untrusted access. The new segments use the name of the traditional VRF and append either -unr for unrestricted or -unt for untrusted. For non-trusted segments, the switch truncates the traditional VRF name to accommodate the suffix and remain within allowed character limits.

If you enable Segmented VRF on an existing configured VRF, the existing routing interfaces associated with the VRF automatically become trusted interfaces.

Note

Segmented VRFs use more system resources than traditional VRFs (Layer 3 VSNs). For scaling information, see *Fabric Engine Release Notes*.

Procedure

1. In the navigation pane, expand **Configuration > VRF**.
2. Select **VRF**.
3. Select the **VRF** tab.
4. In **Segmented**, select **true** in the row for the traditional VRF you want to segment.
5. Select **Apply**.

Note

After you segment the VRF, the switch uses the existing VRF ID for the trusted segment and automatically allocates VRF IDs to the new untrusted and unrestricted segments, starting with the highest available VRF ID.

NEW Associate I-SIDs With VRF Segments

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Enable Segmented VRF on the traditional VRF. This task assumes an I-SID was not previously assigned to the VRF. If the VRF has an I-SID, it becomes the trusted I-SID after you segment the VRF.
- Create three I-SIDs to use for the segmented access levels.

About This Task

Important

Ensure the I-SIDs you configure for Segmented VRF, or that the switch automatically derives, do not conflict with I-SIDs used for other purposes in the network.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **IP-VPN**.
3. Select the **VPN** tab.
4. In **Trusted Isid** in the row for the VRF ID for the trusted segment, type the I-SID.
5. (Optional) In **Unrestricted Isid** or **Untrusted Isid** in the row for the VRF ID of the trusted segment, type the I-SID.

Important

If you do not assign an I-SID to the unrestricted and untrusted segments, the switch automatically derives a value based on the trusted I-SID.

6. Select **Apply**.

NEW! Configure a BGP Neighbor in an Unrestricted Segment

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Enable Segmented VRF on the traditional VRF.
- Select and launch the VRF instance associated with the Segmented VRF. For more information about how to use EDM to configure a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100.

About This Task

By default, BGP neighbors configured on the Segmented VRF are part of the trusted segment.

The switch adds existing BGP neighbors in the VRF context to the trusted segment automatically.

Procedure

1. In the navigation pane of the VRF context tab, expand **Configuration > IP**.
2. Select **BGP**.
3. Select the **Peers** tab or the **Peer Groups** tab.
4. Select **Insert**.
5. Configure the necessary parameters for the peer or peer group.
6. In **AccessType**, select **unrestricted**.
7. Select **Insert**.
8. Select **Apply**.

NEW Create a CLIP Interface in a VRF Segment

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Enable Segmented VRF on the traditional VRF.
- Select and launch the VRF instance associated with the Segmented VRF. For more information about how to use EDM to configure a non-default VRF, see [Select and Launch a VRF Context View](#) on page 4100.

About This Task

If you create the interface in the trusted segment, it is only accessible from hosts in the trusted and unrestricted segments. Create a CLIP interface in the unrestricted segment if it needs to be accessible from hosts in all three segments.

Procedure

1. In the navigation pane of the VRF context tab, expand **Configuration > IP**.
2. Select **IP**.
3. Select the **Circuitless IP** tab.
4. Select **Insert**.
5. In **Interface**, assign a CLIP interface number.
6. Type the IP address.
7. Type the network mask.
8. In **AccessType**, select **unrestricted** or **trusted** to specify the segment.
9. Select **Insert**.
10. Select **Apply**.

NEW! Associate a VLAN Routing Interface With a VRF Segment

Note

This procedure does not apply to 7830 Series or to switch models that support a single active VRF. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Before You Begin

- Enable Segmented VRF on the traditional VRF.
- Create and configure a VLAN routing interface to associate with each segmented access level.

About This Task

If you enable Segmented VRF on an existing configured VRF, the existing routing interfaces associated with the VRF automatically become trusted interfaces.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**
2. Select **VLANs**.
3. Select the **Basic** tab.
4. In **Vrfid** in the row for the VLAN, double-click to display the **Vrfid** dialog box.
5. Select the VRF ID for the appropriate segment to associate with the VLAN.
6. Select **Ok**.
7. Select **Apply**.

	VSP 7400 Series	VOSS 8.0

You can use the Simple Network Management Protocol (SNMP) to remotely collect management data and configure devices.

An SNMP agent is a software process that monitors the UDP port 161 for SNMP messages. Each SNMP message sent to the agent contains a list of management objects to retrieve or modify.

SNMPv3

The SNMP version 3 (v3) is the third version of the Internet Standard Management Framework and is derived from and builds upon both the original Internet Standard Management Framework SNMP version 1 (v1) and the second Internet Standard Management Framework SNMP version 2 (v2).

The SNMPv3 is not a stand-alone replacement for SNMPv1 or SNMPv2. The SNMPv3 defines security capabilities you must use in conjunction with SNMPv2 (preferred) or SNMPv1. The following figure shows how SNMPv3 specifies a user-based security model (USM) that uses a payload of either an SNMPv1 or an SNMPv2 Protocol Data Unit (PDU).

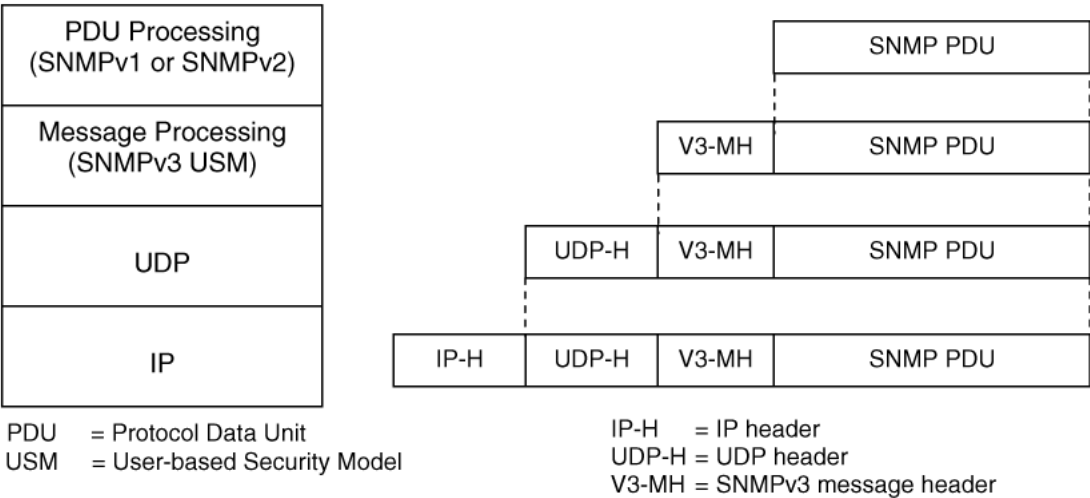

Figure 222: SNMPv3 USM

SNMPv3 is an SNMP framework that supplements SNMPv2 by supporting the following:

- New SNMP message formats
- Security for messages
- Access control
- Remote configuration of SNMP parameters

The recipient of a message can use authentication within the USM to verify the message sender and to detect if the message is altered. According to RFC2574, if you use authentication, the USM checks the entire message for integrity.

An SNMP entity is an implementation of this architecture. Each SNMP entity consists of an SNMP engine and one or more associated applications.

SNMP Engine

An SNMP engine provides services for sending and receiving messages, authenticating and encrypting messages, and controlling access to managed objects. A one-to-one association exists between an SNMP engine and the SNMP entity, which contains the SNMP engine.

EngineID

Within an administrative domain, an EngineID is the unique identifier of an SNMP engine. Because there is a one-to-one association between SNMP engines and SNMP entities, the ID also uniquely and unambiguously identifies the SNMP entity within that

administrative domain. The system generates an EngineID during the startup process. The SNMP engine contains a:

- [Dispatcher](#) on page 3470.
- [Message Processing Subsystem](#) on page 3470.
- [Security Subsystem](#) on page 3470.
- [Access Control Subsystem](#) on page 3471.

Automatic discovery of a Remote EngineID is performed so that Inform messages are populated properly and not rejected by the SNMP Manager. This automatic discovery is performed by the switch using a request to the Manager for a response that contains the EngineID. The switch then uses this Remote EngineID value to populate all subsequent Inform messages.

Dispatcher

The dispatcher is part of an SNMP engine. You can use the dispatcher for concurrent support of multiple versions of SNMP messages in the SNMP engine through the following ways:

- To send and receive SNMP messages to and from the network.
- To determine the SNMP message version and interact with the corresponding message processing model.
- To provide an abstract interface to SNMP applications for delivery of a PDU to an application.
- To provide an abstract interface for SNMP applications to send a PDU to a remote SNMP entity.

Message Processing Subsystem

The message processing subsystem prepares messages for sending and extracts data from received messages. The subsystem can contain multiple message processing models.

Security Subsystem

The security subsystem provides the following features:

- Authentication
- Privacy
- Security

Authentication

You can use authentication within the SNMPv3 to verify the message sender and whether the message is altered. If you use authentication, the integrity of the message is verified. The supported SNMPv3 authentication protocols are HMAC-MD5 and HMAC-SHA-96. By default, the switch uses HMAC-SHA1-96 with 160-bit key length.

Privacy

SNMPv3 is an encryption protocol for privacy. Only the data portion of a message is encrypted; the header and the security parameters are not. The privacy protocol that SNMPv3 supports is CBC-DES Symmetric Encryption Protocol and Advanced Encryption Standard (AES).

Security

The SNMPv3 security protects against:

- Modification of information—protects against altering information in transit.
- Masquerade—protects against an unauthorized entity assuming the identity of an authorized entity.
- Message stream modification—protects against delaying or replaying messages.
- Disclosure—protects against eavesdropping.

The SNMPv3 security also offers:

- Discovery procedure—finds the EngineID of an SNMP entity for a given transport address or transport endpoint address.
- Time synchronization procedure—facilitates authenticated communication between entities

The SNMPv3 does not protect against the following:

- Denial-of-service—prevention of exchanges between manager and agent.
- Traffic analysis—general pattern of traffic between managers and agents.

Access Control Subsystem

SNMPv3 provides a group option for access policies.

The access policy feature in the switch determines the access level for the users connecting to the device with different services like File Transfer Protocol (FTP), Trivial FTP (TFTP), and Telnet. The system access policy feature is based on the user access levels and network address. This feature covers services, such as TFTP, HTTP, SSH, and SNMP. However, with the SNMPv3 engine, the community names do not map to an access level. The View-based Access Control Model (VACM) determines the access privileges.

Use the configuration feature to specify groups for the SNMP access policy. You can use the access policy services to cover SNMP. Because the access restriction is based on groups defined through the VACM, the synchronization is made using the SNMPv3 VACM configuration. The administrator uses this feature to create SNMP users (USM community) and associate them to groups. You can configure the access policy for each group and network.

The following are feature specifications for the group options:

- After you enable SNMP service, this policy covers all users associated with the groups configured under the access policy. The access privileges are based on access allow

or deny. If you select allow, the VACM configuration determines the management information base (MIB)-views for access.

- The SNMP service is disabled by default for all access policies.
- The access level configured under **access-policy policy <id>** does not affect SNMP service. The VACM configuration determines the SNMP access rights.

User-Based Security Model

In a USM system, the security model uses a defined set of user identities for any authorized user on a particular SNMP engine. A user with authority on one SNMP engine must also have authorization on all SNMP engines with which the original SNMP engine communicates.

The USM provides the following levels of communication:

- NoAuthNoPriv—communication without authentication and privacy.
- AuthNoPriv—communication with authentication and without privacy.
- AuthPriv—communication with authentication and privacy.

The following figure shows the relationship between USM and VACM.

Figure 223: USM association with VACM

View-Based Access Control

View-based Access Control Model (VACM) provides group access, group security levels, and context based on a predefined subset of MIB objects. These MIB objects define a set of managed objects and instances.

VACM is the standard access control mechanism for SNMPv3, and it provides:

- Authorization service to control access to MIB objects at the PDU level.
- Alternative access control subsystems.

The access is based on principal, security level, MIB context, object instance, and type of access requested (read or write). You can use the VACM MIB to define the policy and control remote management.

SNMPv3 Encryption

A user-based security port for SNMPv3 is defined as a security subsystem within an SNMP engine. The switch USM uses HMAC-MD5-96 and HMAC-SHA-96 as the authentication protocols, and CBC-DES as the privacy protocol. Use USM to use other protocols instead of, or concurrently with, these protocols. CFB128-AES-128, an AES-based Symmetric Encryption Protocol, is an alternative privacy protocol for the USM.

The AES standard is the current encryption standard, Federal Information Processing Standard 140-2 (FIPS 140-2), intended to be used by the U.S. Government organizations to protect sensitive information. The AES standard is also becoming a global standard for commercial software and hardware that uses encryption or other security features.

The AES-Based Symmetric Encryption Protocol

This symmetric encryption protocol provides support for data confidentiality. The system encrypts the designated portion of the SNMP message and includes it as part of the transmitted message.

The USM specifies that the scoped PDU is the portion of the message that requires encryption. An SNMP engine that can legitimately originate messages on behalf of the appropriate user shares a secret value, in combination with a timeliness value and a 64-bit integer, used to create the (localized) encryption/decryption key and the initialization vector.

The AES Encryption Key and Initialization Vector

The AES encryption key uses the first 128 bits of the localized key. The 128-bit Initialization Vector (IV) is the combination of the authoritative SNMP engine 32-bit `snmpEngineBoot`, the SNMP engine 32-bit `snmpEngineTime`, and a local 64-bit integer. The system initializes the 64-bit integer to a pseudo-random value at startup time.

Data Encryption

The switch handles data encryption in the following manner:

1. The system treats data as a sequence of octets.
2. The system divides the plaintext into 128-bit blocks.

The first input block is the IV, and the forward cipher operation is applied to the IV to produce the first output block.

3. The system produces the first cipher text block by executing an exclusive-OR function on the first plaintext block with the first output block.
4. The system uses the cipher text block as the input block for the subsequent forward cipher operation.
5. The system repeats the forward cipher operation with the successive input blocks until it produces a cipher text segment from every plaintext segment.
6. The system produces the last cipher text block by executing an exclusive-OR function on the last plaintext segment of r bits (r is less than or equal to 128) with the segment of the r most significant bits of the last output block.

Data Decryption

The switch handles data decryption in the following manner:

1. In CFB decryption, the IV is the first input block, the system uses the first cipher text for the second input block, the second cipher text for the third input block, and this continues until the system runs out of blocks to decrypt.
2. The system applies the forward cipher function to each input block to produce the output blocks.
3. The system passes the output blocks through an exclusive-OR function with the corresponding cipher text blocks to recover the plaintext blocks.
4. The system sends the last cipher text block (whose size r is less than or equal to 128) through an exclusive-OR function with the segment of the r most significant bits of the last output block to recover the last plaintext block of r bits.

Trap Notifications

You configure traps by creating SNMP trap notifications, creating a target address to which you want to send the notifications, and specifying target parameters. For more information about how to configure trap notifications, see [Logs and Traps](#) on page 2535.

SNMP Community Strings

For security reasons for SNMPv1 and SNMPv2, the SNMP agent validates each request from an SNMP manager before responding to the request by verifying that the manager belongs to a valid SNMP community. An SNMP community is a logical relationship between an SNMP agent and one or more SNMP managers (the manager software implements the protocols used to exchange data with SNMP agents). You define communities locally at the agent level.

The agent establishes one community for each combination of authentication and access control characteristics that you choose. You assign each community a unique name (community string), and all members of a community have the same access privileges, either read-only or read-write:

- Read-only: members can view configuration and performance information.
- Read-write: members can view configuration and performance information, and change the configuration.

By defining a community, an agent limits access to its MIB to a selected set of management stations. By using more than one community, the agent can provide different levels of MIB access to different management stations.

SNMP community strings are used when a user logs on to the device over SNMP, for example, using an SNMP-based management software. You set the SNMP community strings using CLI . If you have read/write/all access authority, you can modify the SNMP community strings for access to the device through Enterprise Device Manager (EDM).

You are provided with community strings for SNMPv1 and SNMPv2. If you want to use SNMPv3 only, you must disable SNMPv1 and SNMPv2 access by deleting the default community string entries and create the SNMPv3 user and group.[SNMPv3](#).

**Note**

If you enable enhanced secure mode, the switch does not support the default SNMPv1 and default SNMPv2 community strings, and default SNMPv3 user name. The individual in the administrator access level role can configure a non-default value for the community strings, and the switch can continue to support SNMPv1 and SNMPv2. The individual in the administrator access level role can also configure a non-default value for the SNMPv3 user name and the switch can continue to support SNMPv3.

If you disable enhanced secure mode, the SNMPv1 and SNMPv2 support for community strings remains the same, and the default SNMPv3 user name remains the same. Enhanced secure mode is disabled by default.

For more information on enhanced secure mode, see [Enhanced Secure Mode](#) on page 266.

The following table lists the default community strings for SNMPv1 and SNMPv2.

VRF	Default community string	Access
GlobalRouter VRF	public	Read access
	private	Write access
ManagementRouter VRF	public:512	Read access
	private:512	Write access

Community strings are encrypted using the AES encryption algorithm. The system does not display community strings on the device and are not stored in the configuration file.

**Caution**

Security risk

For security reasons, as a best practice, set the community strings to values other than the factory defaults.

The switch handles community string encryption in the following manner:

- When the device starts up, community strings are restored from the hidden file.

- When the SNMP community strings are modified, the modifications are updated to the hidden file.
- Stale snmp-server community entries for different VRFs that the system displays it after reboot with no VRFs . On an node with any valid config file saved with more than the default vrf0 , snmp_community entries for that VRF are created and maintained in a separate txt file, snmp_comm.txt, on every boot. The node reads this file and updates the snmp communities available on the node. As a result for a boot with config having no VRFs, you can still see snmp_community entries for VRFs other than the globalRouter vrf0.

Hsecure with SNMP

If you enable hsecure, the system disables SNMPv1, SNMPv2 and SNMPv3. If you want to use SNMP, you must use the command **no boot config flag block-snmp** to re-enable SNMP.

SNMPv3 support for VRF

Use Virtual Router Forwarding (VRF) to offer networking capabilities and traffic isolation to customers that operate over the same node (switch). Each virtual router emulates the behavior of a dedicated hardware router and is treated by the network as a separate physical router. You can use VRF Lite to perform the functions of many routers using a single router running VRF Lite. This substantially reduces the cost associated with providing routing and traffic isolation for multiple clients.

SNMPv3 Remote Engine ID Discovery

The following sections contain information about SNMPv3 remote engine ID discovery.

Traps and Informs

SNMPv3 supports two types of notifications, traps and informs.

Traps are unacknowledged notifications sent by agents to managers. Traps are generated by the agent, and the authoritative SNMP engine for a trap packet is the sending SNMP agent. Because the generator of the message and the authoritative engine are the same, there is no need for the SNMPv3 discovery process.

Informs are acknowledged notifications. An agent sends an inform notification and waits for acknowledgement. If the agent does not receive the acknowledgement within the configured timeout period, it resends the inform notification. The agent continues to resend the inform notification until a reply is received or until the maximum retry value is reached. For information about configuring an inform timeout period or configuring a maximum retry value, see [Configure SNMP settings](#) on page 3477.

Remote Engine ID Discovery

Inform packets must contain the management (remote) SNMP engine ID. The agent generates informs, but the authoritative SNMP engine is the manager. To generate valid inform packets and avoid manual configuration of the manager SNMP engine ID, the agent must discover the SNMP engine ID of the manager.

The agent discovers the management SNMP Engine ID by sending a probe message to the manager. The manager response to the probe message is a report message that contains the SNMP engine ID of the authoritative SNMP engine. The agent stores the SNMP engine ID received from the manager in the engine table, and sends inform packets using the manager SNMP engine ID. If the manager SNMP engine ID changes, the discovery process updates the manager SNMP engine ID value in the engine table.

Note

Config files including local user with specified security level (noAuthNoPriv or authNoPriv or authPriv) must be saved to be compatible with remote engine ID discovery.

SNMP Configuration Using CLI

Configure the SNMP engine to provide services to send and receive messages, authenticate and encrypt messages, and control access to managed objects. A one-to-one association exists between an SNMP engine and the SNMP entity.

Configure SNMP settings

Configure Simple Network Management Protocol (SNMP) to define or modify the SNMP settings, and specify the security level for SNMP communications.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable the generation of authentication traps:
`snmp-server authentication-trap enable`
3. Configure the contact information for the system:
`snmp-server contact WORD<0-255>`
4. Create an SNMPv1 server host:
`snmp-server host WORD<1-256> [port <1-65535>] v1 WORD<1-32> [filter WORD<1-32>]`
5. Create an SNMPv2 server host:
`snmp-server host WORD<1-256> [port <1-65535>] v2c WORD<1-32> [inform] [timeout <1-2147483647>] [retries <0-255>] [mms <0-2147483647>] [filter WORD<1-32>]`

6. Create an SNMPv3 server host:

```
snmp-server host WORD<1-256> [port <1-65535>] v3 {noAuthNoPriv|
authNoPriv|authPriv WORD<1-32> [inform] [timeout <1-2147483647>]
[retries <0-255>]] [filter WORD<1-32>]
```

7. Configure the system location:

```
snmp-server location WORD<0-255>
```

8. Enable login-success traps:

```
snmp-server login-success-trap enable
```

9. Configure the SNMP system name:

```
snmp-server name WORD<0-255>
```

10. Create a new entry in the notify filter table:

```
snmp-server notify-filter WORD<1-32> WORD<1-32>
```

Example

Enable the generation of SNMP traps. Configure the contact information for the system. Configure hosts to receive SNMP notifications:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmp-server authentication-trap enable
Switch:1(config)#snmp-server contact xxxx@company.com
Switch:1(config)#snmp-server host 192.0.2.16 port 1 v1 SNMPv1 filter SNMPfilterv1
```

Variable Definitions

The following table defines parameters for the `snmp-server` command.

Variable	Value
<code>authentication-trap {enable}</code>	Enables generation of SNMP server authentication traps.
<code>contact WORD<0-255></code>	Changes the sysContact information for the switch. WORD<0-255> is an ASCII string from 0–255 characters (for example, a phone extension or email address).

Variable	Value
<pre>host WORD<1-256> [port <1-65535>] {v1 WORD<1-32> v2c WORD<1-32> [inform] [timeout <1-2147483647>] [retries <0-255>] [mms <0-2147483647>]] v3 {noAuthPriv authNoPriv authPriv} WORD<1-32> [inform [timeout <1-2147483647>] [retries <0-255>]]} [filter WORD<1-32>]</pre>	<p>Configures hosts to receive SNMP notifications.</p> <ul style="list-style-type: none"> <code>host WORD<1-256></code> specifies the IPv4 or IPv6 host address <code>port <1-65535></code> specifies the port number <code>v1 WORD<1-32></code> specifies the SNMPv1 security name <code>v2c WORD<1-32></code> specifies the SNMPv2 security name <code>inform</code> specifies the notify type <code>timeout <1-2147483647></code> specifies the timeout value <code>retries <0-255></code> specifies the number of retries <code>mms < 1-2147483647></code> specifies the maximum message size <code>v3</code> specifies SNMPv3 <code>noAuthPriv authNoPriv authPriv</code> specifies the security level <code>WORD<1-32></code> specifies the user name <code>filter</code> specifies a filter profile name
<pre>location WORD<0-255></pre>	Configures the sysLocation information for the system. <WORD 0-255> is an ASCII string from 0–255 characters.
<pre>login-success-trap {enable}</pre>	Enables generation of SNMP server login-success traps.
<pre>name WORD<0-255></pre>	Configures the sysName information for the system. <WORD 0-255> is an ASCII string from 0–255 characters. SNMP system name is derived from the global system name that is synchronized with SNMP system name, until the SNMP system name is manually configured.
<pre>notify-filter WORD<1-32> WORD<1-32></pre>	Creates a new entry in the notify filter table. The first WORD<1-32> specifies the filter profile name, and the second WORD<1-32> specifies the subtree object identifier (OID).

Creating a user

Create a new user in the USM table to authorize a user on a particular SNMP engine.

Procedure

- Enter Global Configuration mode:

```
enable

configure terminal
```
- Create a user on a remote system:

```
snmp-server user engine-id WORD<16-97> WORD<1-32> {md5 | sha }[aes |
des ]
```
- Enter and confirm your password.

4. Create a user on the local system:

```
snmp-server user WORD<1-32> [notify-view WORD<0-32>] [read-view WORD<0-32>] [write-view WORD<0-32>] {md5 | sha} [aes | des ]
```

5. Enter and confirm your password.

6. Add the user to a group:

```
snmp-server user WORD<1-32> group WORD<1-32> {md5 | sha} [aes | des ]
```

7. Enter and confirm your password.

8. Verify the configuration:

```
show snmp-server user
```

Example

Create a user named test1 on a remote system with MD5:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmp-server user engine-id 0x80:00:08:E0:03:10:CD:AE:6B:D0:00 test1 md5
aes
Enter the authentication protocol password : *****
Re-enter the authentication protocol password : *****
Enter the privacy protocol password : *****
Re-enter the privacy protocol password : *****

WARNING: For best security practices avoid the use
         of repeated patterns in passwords.

Switch:1(config)#show snmp-server user
*****
Engine ID = 0x80:00:08:E0:03:10:CD:AE:6B:D0:00

=====
                        USM Configuration

-----
User2                   0x80:00:08:E0:03:10:CD:AE:6B:D0:00 HMAC_MD5, AES PRIVACY,
test1                   0x80:00:08:E0:03:10:CD:AE:6B:D0:00 HMAC_MD5, AES PRIVACY,

2 out of 2 Total entries displayed
=====
```

Variable Definitions

The following table defines parameters for the `snmp-server user` command.

Variable	Value
<code>{aes des}</code>	Specifies a privacy protocol. If no value is entered, no authentication capability exists. The choices are aes or des. Important: You must set authentication before you can set the privacy option.
<code>engine-id WORD<16-97></code>	Assigns an SNMPv3 engine ID.

Variable	Value
<code>group WORD<1-32></code>	Specifies the group access name.
<code>{md5 sha}</code>	Specifies an authentication protocol. If no value is entered, no authentication capability exists. The protocol choices are: MD5 and SHA.
<code>notify-view WORD<0-32></code>	Specifies the view name. The first instance is a noAuth view. The second instance is an auth view and the last instance is an authPriv view.
<code>read-view WORD<0-32></code>	Specifies the view name. The first instance is a noAuth view. The second instance is an auth view and the last instance is an authPriv view.
<code>write-view WORD<0-32></code>	Specifies the view name. The first instance is a noAuth view. The second instance is an auth view and the last instance is an authPriv view.
<code>user WORD<1-32></code>	Creates the new entry with this security name. The name is used as an index to the table.

Create a New User Group

Create a new user group to logically group users who require the same level of access. Create new access for a group in the View-based Access Control Model (VACM) table to provide access to managed objects.

Note

There are several default groups (public and private) created that you can use. To see the list of default groups and their associated security names (secnames), enter **show snmp-server group**. If you use one of these groups, there is no need to create a new group.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create a new user group:

```
snmp-server group WORD <1-32> WORD<1-32> {auth-no-priv|auth-priv|no-  
auth-no-priv} [notify-view WORD<1-32>] [read-view WORD<1-32>] [write-  
view WORD<1-32>]
```

Examples

The following example uses the following variable names:

- The new group name is `lan6grp`.
- The context of the group is `"`, which represents the Global Router (VRF 0).

- The security level is *no-auth-no-priv*.
- The access view name is *v1v2only* for all three views: **notify-view**, **read-view**, and **write-view**.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmp-server group lan6grp "" no-auth-no-priv notify-view v1v2only read-view v1v2only write-view v1v2only
```

Variable Definitions

The following table defines parameters for the `snmp-server group` command.

Variable	Value
<i>auth-no-priv</i>	Assigns the minimum level of security required to gain the access rights allowed by this conceptual row. If the <i>auth-no-priv</i> parameter is included, it creates one entry for SNMPv3 access.
<i>auth-priv</i>	Assigns the minimum level of security required to gain the access rights allowed by this conceptual row. If the <i>auth-priv</i> parameter is included, it creates one entry for SNMPv3 access.
<i>group</i> WORD<1-32> WORD<1-32>	The first WORD<1-32> specifies the group name for data access. The range is 1-32 characters. The second WORD<1-32> specifies the context name. The range is 1-32 characters. If you use a particular group name value but with different context names, you create multiple entries for different contexts for the same group. You can omit the context name and use the default. If the context name value ends in the wildcard character (*), the resulting entries match a context name that begins with that context. For example, a context name value of foo* matches contexts starting with foo, such as foo6 and foofofum.
<i>no-auth-no-priv</i>	Assigns the minimum level of security required to gain the access rights allowed by this conceptual row. If the <i>no-auth-no-priv</i> parameter is included, it creates 3 entries, one for SNMPv1 access, one for SNMPv2c access, and one for SNMPv3 access.
<i>notify-view</i> WORD<1-32>	Specifies the view name.
<i>read-view</i> WORD<1-32>	Specifies the view name.
<i>write-view</i> WORD<1-32>	Specifies the view name.

Creating a new entry for the MIB in the view table

Create a new entry in the MIB view table. The default Layer 2 MIB view cannot modify SNMP settings. However, a new MIB view created with Layer 2 permission can modify SNMP settings.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Create a new entry:
`snmp-server view WORD<1-32> WORD<1-32>`

Example

```
Switch:1>enable
Switch:1#configure terminal
```

Create MIB views:

```
Switch:1(config)#snmp-server view 2 1.3.8.7.1.4
```

Variable Definitions

The following table defines parameters for the `snmp-server view` command.

Variable	Value
The first <i>WORD<1-32></i>	Specifies the prefix that defines the set of MIB objects accessible by this SNMP entity. The range is 1–32 characters.
The second <i>WORD<1-32></i>	Specifies a new entry with this group name. The range is 1–32 characters.

Creating a community

Create a community to use in forming a relationship between an SNMP agent and one or more SNMP managers. You require SNMP community strings to access the system using an SNMP-based management software.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`

2. Create a community:

```
snmp-server community WORD<1-32> [group WORD<1-32>] [index WORD<1-32>]
[secname WORD<1-32>]
```

**Important**

- The **group** parameter is only required if you created a new user group using the procedure in [Creating a new user group](#). If you use any of the default groups, the **secname** automatically links the community to its associated group so there is no need specify the group in this command.
- If you do create a new group, use the **snmp-server community** command to create an SNMP community with a new security name and link it to the new group you created. There is no separate command to create a security name (secname). You use the **snmp-server community** command. The security name is the key to link the community name to a group.
- You cannot use the @ character or the string :: when you create community strings.

Example

In the following example, the community name is *anewcommunity*, the index is *third*, and the secname is *readview*. There is no group specified because this is a default public/read only group.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmp-server community anewcommunity index third secname readview
```

Variable Definitions

The following table defines parameters for the `snmp-server community` command.

Variable	Value
<i>community</i> <i>WORD<1-32></i>	Specifies a community string. The range is 1–32 characters.
<i>group</i> <i>WORD<1-32></i>	Specifies the group name. The range is 1–32 characters.
<i>index</i> <i>WORD<1-32></i>	Specifies the unique index value of a row in this table. The range is 1–32 characters.
<i>secname</i> <i>WORD<1-32></i>	Maps the community string to the security name in the VACM Group Member Table. The range is 1–32 characters.

Add a User to a Group

Add a user to a group to logically group users who require the same level of access.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Create a new user group:
snmp-server user *WORD*<1-32> group *WORD*<1-32> {md5 | sha} [aes | des]
3. Enter and confirm your password.
4. Verify the configuration:
show snmp-server group

Example

Add a user to a group to logically group users who require the same level of access:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmp-server user test4 group grouptest4 md5 aes
Enter the authentication protocol password : *****
Re-enter the authentication protocol password : *****
Enter the privacy protocol password : *****
Re-enter the privacy protocol password : *****
```

```
WARNING: For best security practices avoid the use
         of repeated patterns in passwords.
```

```
Switch:1(config)#show snmp-server group
```

```
*****
```

VACM Group Membership Configuration

Sec Model	Security Name	Group Name
snmpv1	readview	readgrp
snmpv1	initialview	vlv2grp
snmpv2c	readview	readgrp
snmpv2c	initialview	vlv2grp
usm	test1	Grouptest1
usm	test2	geet1
usm	test4	grouptest4

```
7 out of 7 Total entries displayed

Variable Definitions

The following table defines parameters for the `snmp-server user` command.

Variable	Value
<code>{aes des}</code>	Specifies a privacy protocol. If no value is entered, no authentication capability exists. The choices are aes or des. Important: You must set authentication before you can set the privacy option.
<code>engine-id WORD<16-97></code>	Assigns an SNMPv3 engine ID.
<code>group WORD<1-32></code>	Specifies the group access name.
<code>{md5 sha}</code>	Specifies an authentication protocol. If no value is entered, no authentication capability exists. The protocol choices are: MD5 and SHA.
<code>notify-view WORD<0-32></code>	Specifies the view name. The first instance is a noAuth view. The second instance is an auth view and the last instance is an authPriv view.
<code>read-view WORD<0-32></code>	Specifies the view name. The first instance is a noAuth view. The second instance is an auth view and the last instance is an authPriv view.
<code>write-view WORD<0-32></code>	Specifies the view name. The first instance is a noAuth view. The second instance is an auth view and the last instance is an authPriv view.
<code>user WORD<1-32></code>	Creates the new entry with this security name. The name is used as an index to the table.

Block SNMP Access

Disable SNMP by using the SNMP block flag. By default, SNMP access is enabled.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Disable SNMP access:

```
boot config flags block-snmp
```

Variable Definitions

The following table defines parameters for the `boot config flags` command.

Variable	Value
<i>block-snmp</i>	Configures the block SNMP flag as active. The default is off.

View SNMP System Information

View SNMP system information to view trap and authentication profiles.

For a comprehensive set of SNMP-related **show** commands, see *Fabric Engine Command References*.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View SNMP system information:

```
show snmp-server
```

Example

```
Switch:1>show snmp-server

      contact : http://www.extremenetworks.com/contact/
      location :
        name : Switch-BEB
AuthenticationTrap : false
LoginSuccessTrap : false
```

SNMP Configuration Using EDM

Configure SNMP to provide services to send and receive messages, authenticate and encrypt messages, and control access to managed objects with EDM.

Create a User

About This Task

Create a new user in the USM table to authorize a user on a particular SNMP engine.

Note

In EDM, to create new SNMPv3 users you must use the **CloneFromUser** option. However, you cannot clone the default user, named initial. As a result, you must first use CLI to configure at least one user, and then you can use EDM to create subsequent users with the **CloneFromUser** option.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **USM Table**.
3. Select **Insert**.
4. In **EngineID**, use the default Engine ID provided or type an administratively-unique identifier to an SNMP engine.
5. In **User Name**, type a name.
6. From **CloneFromUser**, select a security name from which the new entry copies authentication data and private data, if required.
7. From **Auth Protocol**, select an authentication protocol.
8. In **Cloned User's Auth Password**, type the authentication password of the cloned user.
9. In **New User's Auth Password**, type an authentication password for the new user.
10. From **Priv Protocol**, select a privacy protocol.
11. In **Cloned User's Priv Password**, type the privacy password of the cloned user.
12. In **New User's Priv Password**, type a privacy password for the new user.
13. Select **Insert**.

Caution

To ensure security, change the GroupAccess table default view after you set up a new user in the USM table. This prevents unauthorized people from accessing the system using the default user logon. Also, change the Community table defaults, because the community name is used as a community string in SNMPv1/v2 PDU.

USM Table Field Descriptions

Use the data in the following table to use the **USM Table** tab and the **Insert USM Table** dialog box. The system displays some fields only on the Insert USM Table dialog box.

Name	Description
EngineID	Specifies an administratively-unique identifier to an SNMP engine.
UserName	Creates the new entry with this security name. The name is used as an index to the table. The range is 1–32 characters.

Name	Description
SecurityName	Identifies the name on whose behalf SNMP messages are generated.
Clone From User	Specifies the security name from which the new entry must copy privacy and authentication parameters. The range is 1–32 characters. The system displays this option only in the Insert USM Table dialog box.
Auth Protocol (Optional)	Assigns an authentication protocol (or no authentication) from a list. If you select an authentication protocol, you must enter an old AuthPass and a new AuthPass.
Cloned User's Auth Password	Specifies the current authentication password of the cloned user. The system displays this option only in the Insert USM Table dialog box.
New User's Auth Password	Specifies the authentication password of the new user. The system displays this option only in the Insert USM Table dialog box.
Priv Protocol (Optional)	Assigns a privacy protocol (or no privacy) from a list. If you select a privacy protocol, you must enter an old PrivPass and a new PrivPass.
Cloned User's Priv Password	Specifies the current privacy password of the cloned user. The system displays this option only in the Insert USM Table dialog box.
New User's Priv Password	Specifies the privacy password of the new user. The system displays this option only in the Insert USM Table dialog box.

Create a New Group Membership

About This Task

Create a new group membership to logically group users who require the same level of access.

Note

There are several default groups (public and private) created that you can use. To see the list of default groups and their associated security names (secnames), enter **show snmp-server group**. If you use one of these groups, there is no need to create a new group.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **VACM Table**.
3. Select the **Group Membership** tab.
4. Select **Insert**.
5. From the **SecurityModel** options, select a security model.
6. In **SecurityName**, type a security name.
7. In **GroupName**, type a group name.

8. Select **Insert**.

Group Membership *Field Descriptions*

Use the data in the following table to use the **Group Membership** tab.

Name	Description
SecurityModel	Specifies the security model to use with this group membership.
SecurityName	Specifies the security name assigned to this entry in the View-based Access Control Model (VACM) table. The range is 1–32 characters.
GroupName	Specifies the name assigned to this group in the VACM table. The range is 1–32 characters.

Create Access for a Group

About This Task

Create access for a group in the View-based Access Control Model (VACM) table to provide access to managed objects.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **VACM Table**.
3. Select the **Group Access Right** tab.
4. Select **Insert**.
5. In **GroupName**, type a VACM group name.
6. (Optional) In **ContextPrefix**, select a VRF instance.
7. From the **SecurityModel** options, select a model.
8. From the **SecurityLevel** options, select a security level.
9. In **ContextMatch**, select a value to match the context name.
10. (Optional) In **ReadViewName**, type the name of the MIB view that forms the basis of authorization when reading objects.
11. (Optional) In **WriteViewName**, type the name of the MIB view that forms the basis of authorization when writing objects.
12. (Optional) In **NotifyViewName**, type MIB view that forms the basis of authorization for notifications.
13. Select **Insert**.

Group Access Right *Field Descriptions*

Use the data in the following table to use the **Group Access Right** tab.

Name	Description
GroupName	Specifies the name of the new group in the VACM table. The range is 1–32 characters.
ContextPrefix	Specifies if the contextName must match the value of the instance of this object exactly or partially. The range is an SnmpAdminString, 1–32 characters.
SecurityModel	Specifies the authentication checking to communicate to the switch. The security models are: <ul style="list-style-type: none"> • SNMPv1 • SNMPv2 • USM
SecurityLevel	Specifies the minimum level of security required to gain the access rights allowed. The security levels are: <ul style="list-style-type: none"> • noAuthNoPriv • authNoPriv • authpriv
ContextMatch	Specifies if the prefix and the context name must match. If the value is exact, all rows where the contextName exactly matches vacmAccessContextPrefix are selected. If you do not select exact, all rows where the contextName with starting octets that exactly match vacmAccessContextPrefix are selected. This default is exact .
ReadViewName	Identifies the MIB view of the SNMP context to which this conceptual row authorizes read access. The default is the empty string.
WriteViewName	Identifies the MIB view of the SNMP context to which this conceptual row authorizes write access. The default is the empty string.
NotifyViewName	Identifies the MIB view of the SNMP context to which this conceptual row authorizes access for notifications. The default is the empty string.

Create Access Policies for SNMP Groups

Create an access policy to determine the access level for the users who connect to the switch with different services like File Transfer Protocol (FTP), Trivial FTP (TFTP), and Telnet.

About This Task

You only need to create access policies for SNMP groups if you have the access policy feature enabled.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **Access Policies**.
3. Select the **Access Policies-SNMP Groups** tab.
4. Select **Insert**.
5. Enter an **ID**.
6. In the **Name** box, type a name.
7. From the **Model** options, select a security model.
8. Select **Insert**.

Access Policies — SNMP Groups *Field Descriptions*

The following table defines parameters for the **Access Policies-SNMP Groups** tab.

Name	Description
Id	Specifies the ID of the group policy.
Name	Specifies the name assigned to the group policy. The range is 1–32 characters.
Model	Specifies the security model {SNMPv1 SNMPv2c USM}.

Assign MIB View Access for an Object

About This Task

Create a new entry in the MIB View table.

You cannot modify SNMP settings with the default Layer 2 MIB view. However, you can modify SNMP settings with a new MIB view created with Layer 2 permissions.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **VACM Table**.
3. Select the **MIB View** tab.
4. Select **Insert**.
5. In **ViewName**, type a view name.
6. In **Subtree**, type a subtree.
7. In **Mask**, type a mask.
8. From the **Type** options, select whether access to the MIB object is granted.
9. Select **Insert**.

MIB View *Field Descriptions*

Use the data in the following table to use the **MIB View** tab.

Name	Description
ViewName	Creates a new entry with this group name. The range is 1–32 characters.
Subtree	Specifies a valid object identifier that defines the set of MIB objects accessible by this SNMP entity, for example, 1.3.6.1.1.5.
Mask (optional)	Specifies a bit mask with vacmViewTreeFamilySubtree to determine whether an OID falls under a view subtree.
Type	Determines whether access to a MIB object is granted (included) or denied (excluded). The default is included.

Create a Community

About This Task

Create a community to use in forming a relationship between an SNMP agent and one or more SNMP managers. You require SNMP community strings for access to the switch using an SNMP-based management software.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **Community Table**.
3. Select **Insert**.
4. In **Index**, type an index.
5. In **Name**, type a name that is a community string.
6. In **SecurityName**, type a security name.
7. In **ContextName**, type the context name.
8. Select **Insert**.

Community Table *Field Descriptions*

Use the data in the following table to use the **Community Table** tab.

Name	Description
Index	Specifies the unique index value of a row in this table. The range is 1–32 characters.
Name	Specifies the community string for which a row in this table represents a configuration.
SecurityName	Specifies the security name in the VACM group member table to which the community string is mapped. The range is 1–32 characters.

Name	Description
ContextEngineID	Indicates the location of the context in which management information is accessed when using the community string specified in Name .
ContextName	Specifies the context in which management information is accessed when you use the specified community string.

View All Contexts for an SNMP Entity

About This Task

View contexts to see the contents of the context table in the View-based Access Control Model (VACM). This table provides information to SNMP command generator applications so that they can properly configure the VACM access table to control access to all contexts at the SNMP entity.

Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Select **VACM Table**.
3. Select the **Contexts** tab.

Contexts Field Descriptions

Use the data in the following table to use the **Contexts** tab.

Variable	Value
ContextName	Shows the name identifying a particular context at a particular SNMP entity. The empty contextName (zero length) represents the default context.

Show SNMP Statistics

About This Task

Display SNMP statistics to monitor the number of specific error messages, such as the number of messages that were delivered to SNMP but were not allowed.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **General**.
3. Select the **SNMP** tab.

SNMP Field Descriptions

Use the data in the following table to display **SNMP** statistics.

Name	Description
OutTooBigs	Shows the number of SNMP PDUs that the SNMP protocol entity generated and for which the value of the error-status field is tooBig.
OutNoSuchNames	Shows the number of SNMP PDUs that the SNMP protocol entity generated and for which the value of the error-status is noSuchName.
OutBadValues	Shows the number of SNMP PDUs that SNMP protocol entity generated and for which the value of the error-status field is badValue.
OutGenErrors	Shows the number of SNMP PDUs that the SNMP protocol entity generated and for which the value of the error-status field is genErr.
InBadVersions	Shows the number of SNMP messages that were delivered to the SNMP protocol entity and were for an unsupported SNMP version.
InBadCommunityNames	Shows the number of SNMP messages delivered to the SNMP protocol entity that used an SNMP community name not known to the entity.
InBadCommunityUsers	Shows the number of SNMP messages delivered to the SNMP protocol entity that represented an SNMP operation not allowed by the SNMP community named in the message.
InASNParseErrs	Shows the number of ASN.1 or BER errors encountered by the SNMP protocol entity when decoding received SNMP messages.
InTooBigs	Shows the number of SNMP PDUs that were delivered to the SNMP protocol entity and for which the value of the error-status field is tooBig.
InNoSuchNames	Shows the number of SNMP PDUs that were delivered to the SNMP protocol entity and for which the value of the error-status field is noSuchName.
InBadValues	Shows the number of SNMP PDUs that were delivered to the SNMP protocol entity and for which the value of the error-status field is badValue.
InReadOnlys	Shows the number of valid SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is "read-only". It is a protocol error to generate an SNMP PDU that contains the value "read-only" in the error-status field; this object is provided as a means of detecting incorrect implementations of the SNMP.
InGenErrors	Shows the number of SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is "genErr."

Spanning Tree Configuration

[Spanning Tree Fundamentals](#) on page 3496

[Spanning Tree Configuration Using CLI](#) on page 3506

[Spanning Tree Configuration Using EDM](#) on page 3532

This section provides conceptual and procedural information about Spanning Tree.

Spanning Tree Fundamentals

Table 303: Spanning Tree Protocol product support

Feature	Product	Release introduced
Spanning Tree Protocol (STP): <ul style="list-style-type: none">• Multiple STP (MSTP)• Rapid STP (RSTP)	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.3 Note: 7830 Series does not support RSTP.
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

Table 303: Spanning Tree Protocol product support (continued)

Feature	Product	Release introduced
Multiple Spanning Tree Protocol (MSTP) Restricted Role (Root Guard) and Restricted Topology Change Notification (TCN)	4220 Series	Fabric Engine 9.4
	5320 Series	Fabric Engine 9.4
	5420 Series	Fabric Engine 9.4
	5520 Series	Fabric Engine 9.4
	5720 Series	Fabric Engine 9.4
	7520 Series	Fabric Engine 9.4
	7720 Series	Fabric Engine 9.4
	7830 Series	Fabric Engine 9.4
	VSP 4900	VOSS 9.4
	VSP 7400	VOSS 9.4

The switch supports Rapid Spanning Tree Protocol (RSTP) and Multiple Spanning Tree Protocol (MSTP).

Spanning Tree

Spanning Tree protocols detect and eliminate logical loops in a bridged or switched network. If multiple paths exist, the spanning Tree algorithm configures the network so that a bridge or device uses the root bridge path based on hop counts. Although link speed is taken into account, the path is based on the root bridge rather than on an optimized path. If that path fails, the protocol automatically reconfigures the network and makes another path active, thereby sustaining network operations.

The switch supports RSTP and MSTP but can downgrade a port automatically if it receives an STP Bridge Protocol Data Unit (BPDU) from a switch that runs STP. While in MSTP mode, you can configure the switch to temporarily operate in RSTP mode and send RSTP BPDUs on a specific port. This RSTP mode remains active until the port receives an MSTP BPDU, at which point it reverts automatically to MSTP mode.

Note

Spanning Tree is disabled on all Switched UNI (S-UNI) ports. The ports move into forwarding state as soon as the physical port or VLACP or LACP comes up on the port. If the platform VLAN is associated to the S-UNI Service Instance Identifier (I-SID), then the S-UNI ports added to the platform VLAN become the member of MSTP instances associated with the platform VLAN. To enable SLPP on the S-UNI ports, the platform VLAN must be associated with the S-UNI I-SID.

Spanning Tree Groups

Spanning Tree Groups (STGs) represent logical topologies. A topology is created based on bridge configuration values such as root bridge priority. In the case of multiple STGs, you can map a VLAN to the most appropriate logical topology in the physical network.

The switch supports Spanning Tree modes RSTP and MSTP. The default Spanning Tree mode is MSTP. The default STG is 0. In RSTP mode, all VLANs run in the default STG. In MSTP mode, you can create additional STGs by using the VLAN create command. The switch supports up to 64 STGs.

Although STP and MSTP are variations of the same Spanning Tree protocol, they communicate information differently. A switch in MSTP mode cannot recognize the Spanning Tree groups running on a chassis configured with STP. MSTP Spanning Tree groups are not the same as STP Spanning Tree groups. Using a switch in MSTP mode with a chassis in STP mode can create a loop in the network.

The root bridge for Rapid Spanning Tree Protocol (RSTP) and Multiple Spanning Tree Protocol (MSTP) is determined by comparing attributes of each bridge in the network.

The protocol considers bridge priority first. If more than one bridge has the same priority, then the protocol must consider the bridge ID. The bridge with the lowest ID becomes the root bridge. For MSTP, this bridge is called the Common and Internal Spanning Tree (CIST) Root because it is the root of the entire physical network.

In MSTP mode, you can create additional Spanning Tree instances, by using the VLAN command. These instances, known as Multiple Spanning Tree Instances (MSTIs), can assign different priorities to switches. The MSTIs have different link costs or port priorities and as a result create separate logical topologies.

MSTP also allows the creation of MSTP regions. A region is a collection of switches sharing the same view of physical and logical topologies. For switches to belong to the same region, the following attributes must match:

- MSTP configuration ID selector
- MSTP configuration name
- MSTP configuration revision number
- VLAN instance mapping

Links connecting sections are called boundary ports. In a region, the boundary switch that contains the boundary port providing the shortest external path cost to the CIST Root is the CIST Regional Root.

STGs and VLANs

When you map VLANs to STGs, be aware that all links on the bridge belong to all STGs. Because each Spanning Tree group can differ in its decision to make a link forwarding or blocking, you must ensure that the ports you add to a VLAN are in the expected state.

Untagged ports can only belong to one VLAN and therefore can only belong to one STG. Tagged ports can belong to multiple VLANs and therefore to multiple STGs.

BPDU handling on S-UNI port/MLT

The switch handles Bridge Protocol Data Units (BPDUs) according to whether or not you configure a platform VLAN.

- When you configure a platform VLAN:
 - BPDUs are forwarded to the CPU by default.
 - For both the ingress and egress ports, BPDUs are not flooded in the S-UNI I-SID associated with the platform VLAN.

Note

If the platform VLAN is configured for the S-UNI port, you cannot enable BPDU forwarding.

- When you DO NOT configure a platform VLAN:
 - BPDUs received on untagged-traffic ports are dropped by default.
 - To flood BPDUs in its I-SID, enable BPDU forwarding under S-UNI I-SID using the command **untagged-traffic port <port no> bpdu enable**.

BPDU Guard

Table 304: Bridge Protocol Data Unit (BPDU) Guard product support

Feature	Product	Release introduced
Bridge Protocol Data Unit (BPDU) Guard	4220 Series	Fabric Engine 9.2
	5320 Series	Fabric Engine 8.6
	5420 Series	VOSS 8.4
	5520 Series	VOSS 8.2.5
	5720 Series	Fabric Engine 8.7
	7520 Series	Fabric Engine 8.10
	7720 Series	Fabric Engine 8.10
	7830 Series	Fabric Engine 9.4
	VSP 4900 Series	VOSS 8.1
	VSP 7400 Series	VOSS 8.0

The switch supports Bridge Protocol Data Unit (BPDU) Guard for STGs, RSTP, and MSTP.

Overview

Spanning Tree eliminates loops in a network. A bridge that participates in spanning tree uses BPDUs to exchange information with other bridges. The bridges select a single bridge as the root bridge based on the BPDU information exchange. The bridge with the lowest priority becomes the root bridge. If all bridges share the same priority,

the bridge with the lowest bridge ID becomes the root bridge. This process is the root selection process.

After you add a new bridge to the network, or remove an existing bridge, the bridges repeat the root selection process, and then select a new root bridge.

To ensure the correct operation of Spanning Tree in the network, BPDU Guard protects the stability of the Root Bridge by dropping stray, unexpected, or unwanted BPDU packets entering a port, and immediately shutting down those ports for a specified time period. BPDU Guard is normally enabled on access ports connecting to end user devices such as servers that are not expected to operate Spanning Tree.

Use BPDU Guard to achieve the following results:

- Block the root selection process after an edge device, such as a laptop that uses Linux with STP enabled, is added to the network. Blocking the root selection process prevents unknown devices from influencing the spanning tree topology.
- Block BPDU flooding of the switch from an unknown device.

Operation

You can enable or disable BPDU Guard on an individual port basis, regardless of the spanning tree state. Each port uses a timer to determine port-state recovery.

After you enable BPDU Guard on a port and the port receives a BPDU, the following actions occur:

1. The guard disables the port.
2. The switch generates an SNMP trap and alarm, and the following log message:

```
BPDU Guard - Port <slot/port> is being shutdown by BPDU Guard, timeout  
<time_seconds>
```

3. The port timer begins.
4. The port remains in the disabled state until the timer expires.

If you disable BPDU Guard before the timer expires, the timer stops and the port remains in the disabled state. You must manually enable the port.

BPDU Guard is enabled at the interface level. You can configure the BPDU Guard timer for each port. If you set the port timer to zero, it does not expire.

Rapid Spanning Tree Protocol and Multiple Spanning Tree Protocol

The Rapid Spanning Tree Protocol (RSTP or IEEE 802.1w) reduces the recovery time after a network breakdown. It also maintains backward compatibility with IEEE 802.1d (the spanning tree implementation prior to RSTP). In certain configurations, the recovery time of RSTP can be reduced to less than 1 second. RSTP also reduces the amount of flooding in the network by enhancing the way Topology Change Notification (TCN) packets are generated.

With Multiple Spanning Tree Protocol (MSTP or IEEE 802.1s), you can configure multiple instances or Spanning Tree groups on the same device. Each instance or Spanning Tree group can include one or more VLANs.

By using RSTP and MSTP, the switch achieves the following:

- reduces convergence time after a topology change (from 30 seconds to less than 1 or 2 seconds)
- eliminates unnecessary flushing of the MAC database and the flooding of traffic to the network
- creates backward compatibility with classic 802.1d switches
- creates support for 64 instances of spanning tree in MSTP mode

RSTP interoperability with STP

RSTP provides a parameter called ForceVersion to provide backward compatibility with standard STP. A user can configure a port in either STP-compatible mode or RSTP mode:

- An STP-compatible port transmits and receives only STP Bridge Protocol Data Units (BPDUs). An RSTP BPDU that the port receives in this mode is discarded.
- An RSTP-compatible port transmits and receives only RSTP BPDUs. If an RSTP port receives an STP BPDU, it becomes an STP port. User intervention is required to change this port back to RSTP mode. This process is called Port Protocol Migration.

Note

You must configure protocol migration to true on all spanning-tree enabled interfaces when you change the spanning tree version from STP-compatible to MSTP for those interfaces to work in the proper mode.

Before implement MSTP or RSTP you must be aware of the following:

- The default mode is MSTP. A special boot configuration flag identifies the mode.
- You can lose your configuration if you change the spanning tree mode from MSTP to RSTP and the configuration file contains VLANs configured with MSTI greater than 0. RSTP only supports VLANs configured with the default instance 0.
- For best interoperability results, contact your vendor representative.

Differences in port roles for STP and RSTP

RSTP is an enhanced version of STP. These two protocols have almost the same parameters.

The following table lists the differences in port roles for STP and RSTP. STP supports two port roles, while RSTP supports four port roles.

Table 305: Differences in port roles for STP and RSTP

Port Role	STP	RSTP	Description
Root	Yes	Yes	This port receives a better BPDU than its own and has the best path to reach the Root. The root port is in Forwarding state. The root port and designated ports can be in the Discarding state before they go to root forwarding.
Designated	Yes	Yes	This port has the best BPDU on the segment. The designated port is in the Forwarding state.
Alternate	No	Yes	This port receives a better BPDU than its own BPDU, and a root port exists within the same device. The alternate port is in the Discarding state.
Backup	No	Yes	This port receives a better BPDU than its own BPDU, and this BPDU is from another port within the same device. The backup port is in the Discarding state.

Port roles: root forwarding role

MSTP and RSTP root forwarding roles are as follows:

- The port that receives the best path BPDU on a device is the root port, and is referred to as a Root Forwarding (RF) port. This is the port that is the closest to the root bridge in terms of path cost.
- The spanning tree algorithm elects a single root bridge in a bridged network. With MSTP, a root bridge is selected for the Common and Internal Spanning Tree (CIST). A root bridge is selected for the region, and a root bridge is selected for each spanning tree instance.
- The root bridge is the only bridge in a network that does not have root ports; all ports on a root bridge are Designated Forwarding (DF).
- Only one path towards a root bridge can exist on a given segment; otherwise, loops can occur.

Port roles: designated forwarding role

MSTP and RSTP designated forwarding roles are as follows:

- All bridges connected on a segment monitor the BPDUs of all other bridges. The bridge that sends the best BPDU is the root bridge for the segment.
- The corresponding port on the bridge is referred to as a Designated Forwarding Port.

Port roles: alternate blocking role

MSTP and RSTP alternate blocking roles are as follows:

- A blocked port is defined as not being the designated or root port. An alternate port provides an alternate path to the root and can replace the root port if it fails.
- An alternate blocked port is a port that is blocked because it received better path cost BPDUs from another bridge.

Port roles: backup blocking role

MSTP and RSTP backup blocking roles are as follows:

- A backup port receives the more useful BPDUs from the bridge on which the port exists.

Edge port

RSTP uses a parameter called the edge port. After a port connects to a nonswitch device, such as a PC or a workstation, it must be configured as an edge port. An active edge port enters the forwarding state without delay. An edge port becomes a nonedge port if it receives a BPDU.

Path cost values

RSTP and MSTP path cost values support a wide range of link speeds. The following table lists the path cost values.

Table 306: Path cost values

Link speed	Value
Less than or equal to 100 Kbps	200 000 000
1 Mbps	20 000 000
10 Mbps	2 000 000
100 Mbps	200 000

100 Gbps	200
1 Tbps	20
10 Tbps	2

RSTP negotiation process

The following section describes the negotiation process between switches that takes place before PCs can exchange data (see the following figure).

Figure 224: RSTP negotiation process

After turning on, all ports assume the role of designated ports. All ports are in the discarding state except edge ports. Edge ports go directly into the forwarding state without delay.

Unit A port 1 and Unit B port 1 exchange BPDUs. Unit A knows that it is the root and that Unit A port 1 is the designated port. Unit B learns that Unit A has higher priority. Unit B port 1 becomes the root port. Both Unit A port 1 and Unit B port 1 are still in the discarding state.

Unit A starts the negotiation process by sending a BPDU with the proposal bit set.

Unit B receives the proposal BPDU and configures its nonedge ports to discarding state. This operation occurs during the synchronization process.

Unit B sends a BPDU to Unit A with the agreement bit set.

Unit A configures port 1 to the forwarding state, and Unit B configures port 1 to the forwarding state. PC 1 and PC 2 can now communicate. The negotiation process now moves on to Unit B port 3 and its partner port. PC 3 cannot exchange data with either PC 1 or PC 2 until the negotiation process between Unit B and Unit C finishes.

The RSTP convergence time depends on how quickly the switch can exchange BPDUs during the negotiation process, and on the number of switches in the network.

NEW Multiple Spanning Tree Protocol Restricted Role and Restricted TCN

Multiple Spanning Tree Protocol (MSTP) Restricted Role (Root Guard) prevents a port from accepting superior BPDUs from non-root bridges. When triggered, it puts the port in a root-inconsistent state. Restricted Topology Change Notification (TCN) prevents a switch port from propagating topology-change messages to other ports. When enabled, the port blocks and ignores all received TCNs.

NEW! Examples

The following examples use a simplified topology with two Backbone Edge Bridges (BEB-1 and BEB-2) and, where noted, a remote BEB-3 to describe how MSTP Restricted Role (Root Guard) and Restricted Topology Change Notification (TCN) operate in common deployment scenarios.

MSTP Restricted Role (Root Guard)

BEB-1 and BEB-2 provide an uplink toward the core and run MSTP Restricted Role on those uplink ports. With Restricted Role active, each BEB refuses any superior BPDU that attempts to advertise a better path to the root bridge. Each BEB treats itself as the root bridge and ignores the other device in spanning tree processing, which causes one uplink to block. This behavior removes the need for vIST between the BEBs and avoids the requirement for SPB STP-Multihoming when the VLAN operates as a routed Layer 2 VSN at the access layer. Restricted Role therefore delivers a straightforward method to maintain predictable spanning tree behavior when dual edge devices connect to a shared Layer 2 segment.

MSTP Restricted Role (Root Guard) Protection Against External Bridges

When an external bridge tries to become the root bridge—for example, by advertising a bridge priority of zero—BEB-1 and BEB-2 immediately trigger Restricted Role on the ports connected to that device. Restricted Role rejects the superior BPDUs that the external bridge sends, which prevents that device from influencing the spanning tree topology and helps the BEBs maintain a stable network. This behavior highlights the security advantage of running Restricted Role on ports that connect to untrusted or unmanaged Layer 2 equipment, because it stops external devices from overriding the intended root bridge position within the BEB network.

MSTP Restricted TCN Behavior

When BEB-1 and BEB-2 run Restricted TCN on the ports that connect to an external spanning tree network, they block any topology change events that originate from that external network. The BEBs drop incoming TCNs from the external bridges, which stops unnecessary MAC address table flushes and avoids unwanted reconvergence events within the BEBs and the rest of the SPB fabric when STP-Multihoming is in use. By enabling Restricted Role and Restricted TCN on the same ports, the BEBs isolate the core network and prevent both root bridge manipulation attempts and disruptive topology change signals from the external Layer 2 domain.

Uplink A and Uplink B Switchover with Remote BEB-3

In this scenario, BEB-1 and BEB-2 provide dual uplinks—uplink A (active) and uplink B (standby)—toward the core, and BEB-3 extends the same access VLANs across a Layer 2 VSN with STP-Multihoming. When uplink A on BEB-1 fails and uplink B unlocks, the fabric does not propagate that STP uplink change to BEB-3. BEB-3 continues to use the existing I-SID destination MAC for host H1—the B-MAC of BEB-1—so if H1 remains silent, BEB-3 cannot reach H1 during this interval. After BEB-3 ages out the MAC entry for H1, the fabric updates the destination MAC to reflect the new path, and H1 becomes reachable again. This behavior highlights the MAC-aging dependency during uplink

transitions when you extend access VLANs across a Layer 2 VSN to a remote BEB that uses STP-Multihoming.

Spanning Tree Configuration Using CLI

Important

The switch supports up to 64 STGs on a device, however, SPBM uses STG 63 and MSTI 62 for internal use. STG 63 or MSTI 62 cannot be used by other VLANs or MSTIs.

Configure the Spanning Tree Mode

About This Task

Specifies the Multiple Spanning Tree Protocol (MSTP) or Rapid Spanning Tree Protocol (RSTP) mode. If you do not specify a protocol, the switch uses the default mode, which is mstp. If you change the spanning tree mode, you must save the current configuration and restart the switch.

Important

Only MSTP mode is compatible with Fabric SPBM. If you configure RSTP mode, the switch cannot participate in an SPBM network.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the STP mode:
`boot config flags spanning-tree-mode {mstp | rstp}`

Example

Configure the STP mode:

```
Switch:1(config)#boot config flags spanning-tree-mode rstp
Warning: RSTP Spanning Tree mode is incompatible with Fabric SPBM
         and will result in the switch no longer being able to
         participate in an SPBM network.
Warning: Please save the configuration and reboot the switch
         for this to take effect.
Warning: Please carefully save your configuration files before
         starting configuring the switch in RSTP or MSTP mode.
```

Configure BPDU Guard

Configure BPDU Guard to block the root selection process or to prevent BPDU flooding from unknown devices.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable BPDU Guard for the port:

```
spanning-tree bpduguard enable
```

3. (Optional) Configure the timer for port-state recovery:

```
spanning-tree bpduguard timeout <0, 10-65535>
```

4. (Optional) Enable BPDU Guard on an additional port or group of ports:

```
spanning-tree bpduguard port {slot/port[-slot/port] [,...][slot/all]
[all]} enable
```

5. (Optional) Configure the timer for port-state recovery for an additional port or group of ports:

```
spanning-tree bpduguard port {slot/port[-slot/port] [,...][slot/all]
[all]} timeout <0-65535>
```

6. Verify the configuration:

```
show spanning-tree bpduguard [GigabitEthernet {slot/port[-slot/port]
[,...][slot/all][all]}] [{slot/port[-slot/port] [,...][slot/all][all]}]
```

Example

Enable BPDU Guard on port 1/8, and specify a timer value of 200 seconds. Verify the configuration.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/8
Switch:1(config-if)#spanning-tree bpduguard enable
Switch:1(config-if)#spanning-tree bpduguard timeout 200
Switch:1(config-if)#show spanning-tree bpduguard 1/8
```

Bpdu Guard							
Port	PORT	PORT		TIMER	BPDUGUARD	BPDUGUARD	
NUM	MLTID	ADMIN_STATE	OPER_STATE	TIMEOUT	COUNT	ADMIN_STATE	ORIGIN
1/8	Up	Up	200	0	Enabled	CONFIG	

Variable Definitions

Use the data in the following table to use the **spanning-tree bpduguard** commands.

Variable	Value
<code>enable</code>	Enables BPDU Guard on the port. The default is disabled.
<code>port {slot/ port[-slot/port] [,...][slot/all] [all]}</code>	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all)
<code>timeout <0, 10-65535></code>	Specifies the value to use for port-state recovery. After a BPDU guard disables a port, the port remains in the disabled state until this timer expires. You can configure a value from 10 to 65535. The default is 120 seconds. If you configure the value to 0, the expiry is infinity.

Use the data in the following table to use the **show spanning-tree bpduguard** command.

Variable	Value
<code>{slot/port[/ sub-port]}[- slot/port[/sub- port]][,...] [slot/all] [all]}</code>	Identifies the slot and port in one of the following formats: <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Troubleshoot No BPDU Packets Received on the Port

For BPDU Guard to work on a port, the port must receive BPDU packets. Perform the following procedure to troubleshoot cases when the port does not receive packets.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Show the BPDU Guard status for the port:

```
show spanning-tree bpduguard {slot/port[-slot/port]][,...][slot/all]  
[all]}
```

3. Use the following command to verify that the port receives packets:

```
show interfaces gigabitEthernet statistics verbose {slot/port[-slot/  
port]][,...][slot/all][all]}
```

4. Verify that the remote port is sending packets:

```
show spanning-tree {mstp|rstp} port role [{slot/port[-slot/port]}[,...]  
[slot/all][all]]
```

```
show spanning-tree {mstp|rstp} port statistics [{slot/port[-slot/port]}  
[,...][slot/all][all]]
```

Example

Port 1/8 receives packets. The remote port is disabled and does not send BPDU packets.

The following example shows that BPDU Guard is enabled for port 1/8. The BPDU Guard administrative state for the port is enabled but the timer counter is 0.

```
Switch:1>enable
Switch:1#show spanning-tree bpduguard 1/8

Configure Rapid Spanning Tree Protocol

Configure Rapid Spanning Tree Protocol (RSTP) to reduce the recovery time after a network breakdown.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure RSTP:

```
spanning-tree rstp [forward-time <400-3000>] [group-stp enable]
[hello-time <100-1000>] [max-age <600-4000>] [pathcost-type <bits16|
bits32>] [priority <0-61440>] [tx-holdcount <1-10>] [version <rstp|
stp-compatible>]
```

Example

Configure RSTP:

```
Switch:1(config)# spanning-tree rstp forward-time 1000 hello-time 200 max-age 4000
pathcost-type bits16 priority 4096 tx-holdcount 10 version rstp group-stp enable
```

Variable Definitions

Use the data in the following table to use the **spanning-tree rstp** command.

Variable	Value
<i>forward-time <400-3000></i>	Configures the RSTP forward delay for the bridge in hundredths of a second.
<i>group-stp enable</i>	Enables RSTP for a specific STG.
<i>hello-time <100-1000></i>	Assigns the RSTP hello time delay for the bridge in hundredths of a second.
<i>max-age <600-4000></i>	Assigns the RSTP maximum age time for the bridge in hundredths of a second.
<i>pathcost-type {bits16 bits32}</i>	Assigns the RSTP default pathcost version. The default is 32 bits.
<i>priority <0-61440></i>	Assigns the RSTP bridge priority.
<i>tx-holdcount <1-10></i>	Assigns the RSTP transmit hold count. The default value is 6.
<i>version {rstp/stp-compatible}</i>	Sets the version to RSTP or STP compatible.

Configure Rapid Spanning Tree Protocol for a Port

Configure RSTP to reduce the recovery time after a network breakdown.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...][slot/all][all]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure RSTP:

```
spanning-tree rstp cost <1-200000000> edge-port <false|true> p2p  
<auto|force-false|force-true> priority <0-240> protocol-migration  
<false|true> stp enable
```

Example

Configure RSTP:

```
Switch:1(config-if)#spanning-tree rstp cost 100 edge-port true p2p auto priority 32  
protocol-migration true stp enable
```

Variable Definitions

Use the data in the following table to use the **spanning-tree rstp** command.

Variable	Value
<i>cost</i> <1-200000000>	Specifies the contribution of this port to the path cost.
<i>edge-port</i> <false true>	Configures the edge-port value for the port. A value of true indicates that this port is an edge-port, and a value of false indicates that this port is a nonedge-port.
<i>p2p</i> <auto force-false force-true>	Specifies the point-to-point status of the LAN segment attached to this port. A value of force-true indicates that this port is treated as if it connects to a point-to-point link. A value of force-false indicates that this port is treated as having a shared media connection. A value of auto indicates that this port is considered to have a point-to-point link if it is an aggregator and all of its members are aggregatable, or if the MAC entity is configured for full-duplex operation, either through autonegotiation or by management means.

Variable	Value
<code>priority <0-240></code>	Assigns the RSTP bridge priority in a range of 0–240. The value has to increment in steps of 16.
<code>protocol-migration <false true></code>	<p>If you chose true, the option initiates protocol migration for a port. If you chose false, the option terminates protocol migration for a port.</p> <p>An RSTP-compatible port transmits and receives only RSTP BPDUs. If an RSTP port receives an STP BPDU, it becomes an STP port. User intervention is required to change this port back to RSTP mode. This process is called Port Protocol Migration.</p>
<code>stp enable</code>	Configures STP for the port.

Configure the Rapid Spanning Tree Protocol Version

Perform this procedure to specify the RSTP mode.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure Rapid Spanning Tree Protocol version:

```
spanning-tree rstp version {rstp|stp-compatible}
```

Example

Configure Rapid Spanning Tree Protocol version:

```
Switch:1(config)#spanning-tree rstp version rstp
```

Variable Definitions

Use the data in the following table to use the **spanning-tree rstp version** command.

Variable	Value
<code>rstp version {rstp stp-compatible}</code>	<p>Sets the version to RSTP or to STP compatible.</p> <p>The default is RSTP.</p>

Display Global RSTP Configuration Information

Procedure

1. To enter User EXEC mode, log on to the switch.

2. Display global RSTP configuration information:

```
show spanning-tree rstp config
```

Example

Display global RSTP configuration information:

```
Switch:1>show spanning-tree rstp config
=====
                        RSTP Configuration
=====
Rstp Module Status      : Enabled
Priority                 : 32768 (0x8000)
Stp Version              : rstp Mode
Bridge Max Age           : 20 seconds
Bridge Hello Time        : 2 seconds
Bridge Forward Delay Time : 15 seconds
Tx Hold Count            : 6
PathCost Default Type    : 32-bit
```

Display RSTP statistics

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display RSTP statistics:

```
show spanning-tree rstp statistics
```

Example

View RSTP statistics:

```
Switch:1>show spanning-tree rstp statistics
=====
                        RSTP Statistics
=====
Rstp UP Count            : 1
Rstp Down Count          : 0
Count of Root Bridge Changes : 0
Stp Time since Topology change: 0 day(s), 00H:00M:00S
Total No. of topology changes : 0
```

Display the RSTP Status

Perform the following procedure to display the RSTP related status information for the selected bridge.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the RSTP status:

```
show spanning-tree rstp status
```

Example

View the RSTP status:

```
Switch:1>show spanning-tree rstp status
=====
                        RSTP Status Information
=====
Designated Root          : 80:00:00:24:7f:9f:60:00
Stp Root Cost            : 0
Stp Root Port            : cpp
Stp Max Age              : 20 seconds
Stp Hello Time           : 2 seconds
Stp Forward Delay Time   : 15 seconds
```

Display the RSTP Configuration Information

Perform the following procedure to display the RSTP-related port level configuration details.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display RSTP configuration information:

```
show spanning-tree rstp port config {slot/port[/sub-port]}[-slot/port[/sub-port]][,...][slot/all][all]}
```

Note

If your platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Example

Display RSTP configuration information:

```
Switch:1>show spanning-tree rstp port config 1/1
=====
                        RSTP Port Configurations
=====
Port Number              : 1/1
Port Priority             : 128 (0x80)
Port PathCost            : 200000000
Port Protocol Migration  : False
Port Admin Edge Status   : False
Port Oper Edge Status    : False
Port Admin P2P Status    : Auto
Port Oper P2P Status     : False
Port Oper Protocol Version : Rstp
```

Variable Definitions

Use the data in the following table to use optional parameters with the **show spanning-tree rstp port config** command.

Variable	Value
<code>{slot/port[/sub-port][-slot/port[/sub-port]][,...][slot/all][all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Display the RSTP Status for a Port

Perform the following procedure to display the RSTP-related status information for a selected port.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the RSTP status for a port:

```
show spanning-tree rstp port status {slot/port[-slot/port][,...][slot/all][all]}
```

Note

If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Example

View the RSTP status for a port:

```
Switch:1>show spanning-tree rstp port status 1/2
```

```

=====
                        RSTP Port Status
                      (Port Priority Vector)
=====
Port Number           : 1/2
Port Designated Root   : 80:00:00:24:7f:9f:60:00
Port Designated Cost   : 0

Port Designated Port   : 80:c1

```

Variable Definitions

Use the data in the following table to use optional parameters with the **show spanning-tree rstp port status** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]][, ...] [slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Display RSTP Information for a Port

Perform the following procedure to display the RSTP-related configuration information for the selected port.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display the RSTP information for a selected port:
show spanning-tree rstp port statistics [{slot/port[/sub-port] [-slot/port[/sub-port]][, ...] [slot/all] [all]]

Example

Display the RSTP information for a selected port:

```
Switch:1# show spanning-tree rstp port statistics 1/4
```

```
=====
                        RSTP Port Statistics
=====

Number of Fwd Transitions  : 0
Rx RST BPDUs Count        : 0
Rx Config BPDU Count       : 0
Rx TCN BPDU Count         : 0
Tx RST BPDUs Count        : 9
Tx Config BPDU Count       : 0
Tx TCN BPDU Count         : 0
Invalid RST BPDUs Rx Count : 0
Invalid Config BPDU Rx Count : 0
Invalid TCN BPDU Rx Count  : 0
Protocol Migration Count   : 0
```

Variable definitions

Use the data in the following table to use optional parameters with the `show spanning-tree rstp port statistics` command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Display the RSTP Role

Perform the following procedure to display the RSTP information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the RSTP role:

```
show spanning-tree rstp port role [{slot/port[/sub-port] [-slot/port[/sub-port]] [, ...] [slot/all] [all]}
```

Example

Display the RSTP role:

```
Switch:1> show spanning-tree rstp port role 1/3
```

```
=====
                        RSTP Port Roles and States
=====
```

Port-Index	Port-Role	Port-State	PortSTPStatus	PortOperStatus
1/3	Designated	Forwarding	Enabled	Enabled

```
=====
```

Variable definitions

Use the data in the following table to use optional parameters with the **show spanning-tree rstp port role** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]][, ...] [slot/all] [all]}</code>	<p>Identifies the slot and port in one of the following formats:</p> <ul style="list-style-type: none"> • a single slot and port (slot/port) • a range of slots and ports (slot/port-slot/port) • a series of slots and ports (slot/port,slot/port,slot/port) • all ports on the same slot (slot/all) • all ports on the switch (all) <p>If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p>

Display Spanning Tree Configuration

Perform this procedure to view configuration and status information for spanning tree in your network.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display spanning tree configuration information:

```
show spanning-tree config
```
3. Display spanning tree status information:

```
show spanning-tree status
```

Example

Display spanning tree configuration information:

```
Switch:1> show spanning-tree config
```

```

Configure Multiple Spanning Tree Protocol

Use the following procedure to configure the Multiple Spanning Tree Protocol.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Configure the MSTP forward delay for the bridge:
spanning-tree mstp forward-time <400-3000>
3. Configure the maximum age time for the bridge:
spanning-tree mstp max-age <600-4000>
4. Configure the maximum hop count for the bridge:
spanning-tree mstp max-hop <100-4000>
5. Configure the MSTP MSTI:
spanning-tree mstp msti <1-63> priority <0-65535>
6. Configure the default pathcost version:
spanning-tree mstp mstp pathcost-type <bits16 | bits32>
7. Configure the bridge priority:
spanning-tree mstp priority <0-61440>
8. Configure the region:
spanning-tree mstp region {config-id-sel <0-255> | region-name WORD<1-32> | region-version <0-65535>}
9. Configure the transmit hold count:
spanning-tree mstp tx-holdcount <1-10>
10. Configure the bridge version:
spanning-tree mstp version <mstp | rstp | stp-compatible>

Example

Configure Multiple Spanning Tree Protocol to configure the MSTP configuration version.

```
Switch>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#spanning-tree mstp forward-time 500 max-age 3000 max-hop 200 pathcost-
type bits32 priority 8192 tx-holdcount 10 version mstp
```

Variable Definitions

Use the data in the following table to use the **spanning-tree mstp** command.

Variable	Value
<i>forward-time</i> <400-3000>	Configures the MSTP forward delay for the bridge in hundredths of a second.
<i>max-age</i> <600-4000>	Assigns the MSTP maximum age time for the bridge from 600 to 4000 one hundredths of a second.
<i>max-hop</i> <100-4000>	Assigns the MSTP bridge maximum hop count. The range is 100 to 4000 one hundredths of a second. The original MIB erroneously designated the value in hundredths of a second, when it should have been in hops. The replacement MIB kept the range at 100-4000 to remain backwards compatible. To convert this value to hops, divide by 100 so 100-4000 equals 1-40 hops.
<i>msti</i> <1-63> <i>priority</i> <0-65535>	Assigns the MSTP MSTI instance parameter.
<i>pathcost-type</i> {bits16 bits32}	Assigns the MSTP default pathcost type to either 16 bits or 32 bits. The default is 32 bits.
<i>priority</i> <0-61440>	Assigns the MSTP bridge priority in a range of 0 to 61440 in steps of 4096.
<i>region</i> [<i>config-id-sel</i> <0-255>] [<i>region-name</i> <WORD 1-32>] [<i>region-version</i> <0-65535>]	Assigns the MSTP region commands: <ul style="list-style-type: none"> <i>config-id-sel</i>—Assigns the MSTP region configuration ID number. The range is 0 to 255. <i>region-name</i>—Assigns the MSTP region name. The character string can be a range of 1 to 32 characters <i>region-version</i>—Assigns the MSTP region version. The range is 0 to 65535.

Variable	Value
<code>tx-holdcount <1-10></code>	Assigns the MSTP transmit hold count. The range is 1 to 10. The default value is 3.
<code>version {mstp rstp stp-compatible}</code>	<p>Assigns the bridge version.</p> <p>Although STP and MSTP are variations of the same spanning tree protocol, they communicate information differently. A switch in MSTP mode cannot recognize the spanning tree groups running on a chassis configured with STP. MSTP spanning tree groups are not the same as STP spanning tree groups. Using a switch in MSTP mode with another chassis in STP mode can create a loop in the network.</p> <p>You must configure protocol migration to true on all spanning-tree enabled interfaces when you change the spanning tree version from STP-compatible to MSTP for those interfaces to work in the proper mode.</p> <p>Note: You cannot configure the MSTP version when MSTP-Fabric Connect Multi Homing is enabled on the switch.</p>

NEW! Configure MSTP Restricted Role
