# **Abstract**

The release notes for Fabric Engine 9.3 details platform-level enhancements across Extreme Networks' switching portfolio, including support for new hardware models such as the 5420M-24W-24S-4YE and 7830-32CE-8DE, with updated platform profiles and expanded transceiver compatibility for QSFP+/QSFP28, SFP+/SFP28, and 1000BASE-T modules. Software improvements include enhanced Auto-sense logic for dynamic port role assignment, routed Management VLAN support for Layer 3 segmentation on management interfaces, CLI and EDM refinements for improved operational visibility, and expanded MACsec cipher suite support including GCM-AES-256 and GCM-AES-XPN-256. Deployment features such as Zero Touch Deployment (ZTD) and guided Fabric Configuration workflows streamline provisioning and topology setup using DHCP automation and IS-IS/SPB templates. The release includes validated scaling metrics for Layer 2/3 routing tables, multicast groups, and VRF instances across the 4220-7830 Series platforms, with resource utilization benchmarks. Security updates cover MACsec keychain integration, NEAP fallback logic for resilient authentication, and RADIUS enhancements supporting vendor-specific attributes and granular accounting. Additional technical content includes hardware/software compatibility matrices, upgrade/downgrade pathing guidelines, indexed known issues and resolved defects, and extensive MIB updates detailing SNMPv2/v3 OID mappings and trap definitions, making this document a comprehensive reference for engineers managing Extreme Networks infrastructure.

# **Preface**

Conventions on page 7
Documentation and Training on page 10
Help and Support on page 10
Send Feedback on page 11

Read the following topics to learn about:

- · The meanings of text formats used in this document.
- · Where you can find additional information and help.
- · How to reach us with questions and comments.

# Purpose

This document describes important information about this release for platforms that support Extreme Networks Fabric Engine.

This document includes the following information:

- supported hardware and software
- scaling capabilities
- · known issues, including workarounds where appropriate
- known restrictions

# Conventions

To help you better understand the information presented in this guide, the following topics describe the formatting conventions used for notes, text, and other elements.

Text Conventions Preface

# **Text Conventions**

The following tables list text conventions that can be used throughout this document.

Table 1: Notes and warnings

Icon	Notice type	Alerts you to
-	Tip	Helpful tips and notices for using the product.
<b>600</b>	Note	Useful information or instructions.
-	Important	Important features or instructions.
1	Caution	Risk of personal injury, system damage, or loss of data.
<b>A</b>	Warning	Risk of severe personal injury.

# **Table 2: Text conventions**

Convention	Description
The words <i>enter</i> and <i>type</i>	When you see the word <i>enter</i> in this guide, you must type something, and then press the Return or Enter key. Do not press the Return or Enter key when an instruction simply says <i>type</i> .
Key names	Key names are written in boldface, for example <b>Ctrl</b> or <b>Esc</b> . If you must press two or more keys simultaneously, the key names are linked with a plus sign (+). Example: Press <b>Ctrl+Alt+Del</b>
NEW!	New information. In a PDF, this is searchable text.

# **Table 3: Command syntax**

Convention	Description
Angle brackets ( < > )	Angle brackets ( < > ) indicate that you choose the text to enter based on the description inside the brackets. Do not type the brackets when you enter the command.

Preface Text Conventions

**Table 3: Command syntax (continued)** 

Convention	Description
	If the command syntax is cfm maintenance-domain maintenance-level <0-7>, you can enter cfm maintenance-domain maintenance-level 4.
Bold text	Bold text indicates the GUI object name you must act upon. Examples:  • Select <b>OK</b> .  • On the <b>Tools</b> menu, choose <b>Options</b> .
Braces ({})	Braces ({}) indicate required elements in syntax descriptions. Do not type the braces when you enter the command. For example, if the command syntax is ip address {A.B.C.D}, you must enter the IP address in dotted, decimal notation.
Brackets ([])	Brackets ([]) indicate optional elements in syntax descriptions. Do not type the brackets when you enter the command.  For example, if the command syntax is show clock [detail], you can enter either show clock or show clock detail.
Ellipses ( )	An ellipsis () indicates that you repeat the last element of the command as needed.  For example, if the command syntax is ethernet/2/1 [ <parameter> <value> ], you enter ethernet/2/1 and as many parameter-value pairs as you need.</value></parameter>
Italic Text	Italics emphasize a point or denote new terms at the place where they are defined in the text. Italics are also used when referring to publication titles that are not active links.
Plain Courier Text	Plain Courier text indicates command names, options, and text that you must enter. Plain Courier text also indicates command syntax and system output, for example, prompts and system messages.  Examples:  • show ip route  • Error: Invalid command syntax [Failed] [2013-03-22 13:37:03.303 -04:00]

Table 3: Command syntax (continued)

Convention	Description
Separator ( > )	A greater than sign ( > ) shows separation in menu paths. For example, in the Navigation pane, expand <b>Configuration</b> > <b>Edit</b> .
Vertical Line ( )	A vertical line ( ) separates choices for command keywords and arguments. Enter only one choice. Do not type the vertical line when you enter the command.
	For example, if the command syntax is access-policy by-mac action { allow   deny }, you enter either access-policy by-mac action allow or access-policy by-mac action deny, but not both.

# Documentation and Training

Find Extreme Networks product information at the following locations:

**Current Product Documentation** 

Release Notes

Hardware and Software Compatibility for Extreme Networks products

**Extreme Optics Compatibility** 

Other Resources such as articles, white papers, and case studies

# Open Source Declarations

Some software files have been licensed under certain open source licenses. Information is available on the Open Source Declaration page.

# **Training**

Extreme Networks offers product training courses, both online and in person, as well as specialized certifications. For details, visit the Extreme Networks Training page.

# Help and Support

If you require assistance, contact Extreme Networks using one of the following methods:

#### Extreme Portal

Search the GTAC (Global Technical Assistance Center) knowledge base; manage support cases and service contracts; download software; and obtain product licensing, training, and certifications.

The Hub

A forum for Extreme Networks customers to connect with one another, answer questions, and share ideas and feedback. This community is monitored by Extreme Networks employees, but is not intended to replace specific guidance from GTAC.

#### Call GTAC

For immediate support: (800) 998 2408 (toll-free in U.S. and Canada) or 1 (408) 579 2800. For the support phone number in your country, visit www.extremenetworks.com/support/contact.

Before contacting Extreme Networks for technical support, have the following information ready:

- Your Extreme Networks service contract number, or serial numbers for all involved Extreme Networks products
- · A description of the failure
- · A description of any actions already taken to resolve the problem
- A description of your network environment (such as layout, cable type, other relevant environmental information)
- Network load at the time of trouble (if known)
- The device history (for example, if you have returned the device before, or if this is a recurring problem)
- · Any related RMA (Return Material Authorization) numbers

#### Subscribe to Product Announcements

You can subscribe to email notifications for product and software release announcements, Field Notices, and Vulnerability Notices.

- 1. Go to The Hub.
- 2. In the list of categories, expand the **Product Announcements** list.
- 3. Select a product for which you would like to receive notifications.
- 4. Select **Subscribe**.
- 5. To select additional products, return to the **Product Announcements** list and repeat steps 3 and 4.

You can modify your product selections or unsubscribe at any time.

# Send Feedback

The User Enablement team at Extreme Networks has made every effort to ensure that this document is accurate, complete, and easy to use. We strive to improve our documentation to help you in your work, so we want to hear from you. We welcome all feedback, but we especially want to know about:

- Content errors, or confusing or conflicting information.
- Improvements that would help you find relevant information.
- Broken links or usability issues.

To send feedback, email us at Product-Documentation@extremenetworks.com.

Send Feedback Preface

Provide as much detail as possible including the publication title, topic heading, and page number (if applicable), along with your comments and suggestions for improvement.

# **Document Revision Changes**

The following table identifies changes between revisions of the same release document.

Table 4: 9.3 Release Notes revision changes

Revision	Change	
AA	Initial revision for new release, see New in this Release on page 14	

# **New in this Release**

New Hardware on page 14 New Software Features or Enhancements on page 16 Other Changes on page 19 File Names for this Release on page 19

The following platforms support Fabric Engine 9.3:

- ExtremeSwitching 4220 Series
- · ExtremeSwitching 5320 Series
- ExtremeSwitching 5420 Series
- ExtremeSwitching 5520 Series
- ExtremeSwitching 5720 Series
- ExtremeSwitching 7520 Series
- ExtremeSwitching 7720 Series
- ExtremeSwitching 7830 Series

For MIB-related changes, see MIB Changes on page 147.

#### Note

ExtremeSwitching 5420 Series and 5520 Series: Upgrading from an earlier version of VOSS to Fabric Engine 8.6, or later, on these platforms will change the SNMP SysObjectID value. This change might affect SNMP-based management systems. For more information, see this Knowledge Article.

## **New Hardware**

#### 5420M-24W-24S-4YE Universal Ethernet Switch

5420 Series adds support for the following new model, 5420M-24W-24S-4YE. The 5420M-24W-24S-4YE provides the following ports:

- 24 x 10/100/1000BASE-T full/half duplex 802.3bt Type 4 PoE (90W)
- 24 x 100M/1 Gbps SFP
- 4 x 1/10/25 Gbps SFP28
- All ports support MACsec
- 2 x SFP-DD Universal Ethernet ports

In addition to the fixed ports, the 5420M-24W-24S-4YE model provides one RJ-45 OOB management port, one USB Type C console port, two Type A USB ports, and one RJ-45 serial console port.

For more information, see *5420 Series Installation Guide*. For optics compatibility, see the Extreme Optics website.

This model supports the same feature-based licensing mode as other 5420 Series models. For high-level feature support information, see *Fabric Engine and VOSS Feature Matrix*.

#### 7830 Series Universal Ethernet Switch

Extreme Networks 7830 Series is a two rack unit switch with the fixed ports in the lower half of the switch and Versatile Interface Modules (VIM) slots in the upper half of the switch. The 7830 Series provides high-density 100 Gbps and 400 Gbps ports, which enable scalable Fabric and traditional Enterprise deployments.

#### Note

7830 Series supports Fabric Engine operating system only.

Fabric Engine 9.3 supports the 7830-32CE-8DE:

- 32 x 100G QSFP28
- 8 x 400G QSFP56-DD
- 2 unpopulated Versatile Interface Modules (VIM) slots
- All ports support MACsec
- · Two unpopulated modular power supply slots
- · Four unpopulated fan slots

You can install the following VIMs in the dedicated slots in the upper half of the 7830 Series switch to provide dedicated high speed ports:

#### Note

VIMs are not hot-swappable in this release.

- 7830-VIM-16CE—16 x 100G QSFP28
- 7830-VIM-24YE—24 x 10/25G SFP28

7830 Series supports two removable, fully redundant power supply units. The switch can support AC, DC, or a combination of both AC and DC power supplies.

You can use the following 2400W power supplies:

- · Back-to-front airflow
  - XN-ACPWR-2400W-BF
  - XN-DCPWR-2400W-BF
- Front-to-back airflow:
  - XN-ACPWR-2400W-F

XN-DCPWR-2400W-F

The 7830 Series supports two fan module options, with front-to-back or back-to-front airflow:

- XN-FAN-007-FB—front-to-back airflow for switch cooling
- XN-FAN-007-BF—back-to-front airflow for switch cooling

In addition to the fixed ports, the 7830 Series provides one Type A USB interface port, one RJ-45 console port, and two management ports (SFP+ 1G/10G and 100M/1G/10G RJ-45) to provide management backup.

For more information, see *7830 Series Installation Guide*. For optics compatibility, see the Extreme Optics website.

For high-level feature support information, see Fabric Engine and VOSS Feature Matrix.

# New Transceivers and Components

This release introduces support for the following optical devices:

- 400G-AOC 5m (PN:400G-AOC-QSFPDD5M)
- 400G-AOC 10m (PN:400G-AOC-QSFPDD10M)
- 400G-AOC 20m (PN:400G-AOC-QSFPDD20M)
- 400G-DACP lm (PN:400G-DACP-QSFPDD1M)
- 400G-DACP 2m (PN:400G-DACP-QSFPDD2M)
- 400G-DACP 2.5m (PN:400G-DACP-QSFPDD2Z5M)
- 400G-DACP 3m (PN:400G-DACP-QSFPDD3M)
- 400G DR4 QSFPDD 500m MPO 12 SMF (PN:400G-DR4-QSFPDD500M)
- 400G DR4 QSFPDD 2km MPO 12 SMF (PN:400G-DR4X-QSFPDD2KM)
- 400G FR4 QSFPDD 2km LC SMF (PN:400G-FR4-QSFDDD2KM)
- 400G LR4-10 QSFPDD 10km LC SMF (PN:400G-LR4-QSFPDD10KM)
- 400G LR4P QSFPDD 10km MPO-12 SMF (PN:400G-LR4P-QSFPDD10KM)
- 400G-SR8 QSFPDD 100m (MPO-16) MMF (PN:400G-SR8-QSFPDD100M)

#### New Software Features or Enhancements

The following sections describe what is new in this release.

#### Fabric Enhancements

The software supports the following Fabric enhancements:

- Auto-sense: Auto-MLT on NNI ports—Enable this feature to automatically aggregate NNI links on Auto-sense ports into an MLT to form IS-IS adjacencies.
- Auto-sense: Mandatory Fabric Attach Authentication—To secure the FA connection, configure Auto-sense to force FA authentication for devices that attach to ports in the FA PROXY NOAUTH state.

- Auto-sense: Disable NNI—You can block an Auto-sense port from sending Fabric Connect LLDP TLVs and prevent the port from transitioning to the SD-WAN and NNI states.
- Auto-sense: SD-WAN BGP Autonomous System (AS) dynamic configuration enhancement—In this release, you can now connect an ExtremeCloud SD-WAN Appliance to an Auto-sense port to provide SD-WAN local breakout through Border Gateway Protocol (BGP) in the dynamic SD-WAN VRF and also apply static BGP configuration in the global routing table (GRT) or another static VRF in parallel.

If you apply a static configuration without a 4-byte AS number before you connect the SD-WAN appliance to an Auto-sense port, the Auto-sense port cannot complete the dynamic BGP configuration on the dynamic SD-WAN VRF and the Auto-sense ports transitions to SD-WAN-PENDING state. To resolve this situation, you must globally disable and then reenable BGP with a 4-byte AS number in the static configuration. The remaining static BGP configuration, including the AS number do not need to change.

#### Note

If you enable 4-byte AS numbering format, you can continue to use conventional 2-byte AS numbers.

• Auto-sense: Wait Interval—This release changes both the global- and port-configuration range from 10-120 to 2-120.

For more information, see *Fabric Engine User Guide* and *Fabric Engine Command References*.

#### Management VLAN in Router Mode

This release adds the ability to create a routed Management VLAN. You can use this VLAN to route incoming traffic and to manage the switch. You can also convert an existing non-routed Management VLAN to a routed Management VLAN.

For more information, see *Fabric Engine User Guide* and *Fabric Engine Command References*.

#### Operational Enhancements

The software supports the following operational enhancements:

- Ability to assign ExtremeCloud IQ Site Engine templates during ZTP+—You can now
  use port templates on the ExtremeCloud IQ Site Engine server to manage VLAN port
  memberships and to overwrite Auto-sense default configuration.
- CLI command to reset all port parameters to default Auto-sense values—You can
  now reset the port configuration to default values and enable Auto-sense on a port
  using the default all auto-sense command. In the previous release, you had to
  use the auto-sense enabled command separately after you issued the default
  all command to enable Auto-sense on the port.

Platform Enhancements New in this Release

- EDM changes—This release introduces the following changes:
  - Extended diagnostic fields are moved to Edit > Port > General > DDI/SFP > Extended DDM.
- MSTP-RSTP Interoperability—You can now configure an interface operating in Multiple Spanning Tree Protocol (MSTP) mode to also operate in Rapid Spanning Tree Protocol (RSTP) mode. When the interface receives an MSTP Bridge Protocol Data Unit (BPDU) from a neighboring device, it reverts automatically to MSTP mode.
- Open API—You can now use the Command Line Interface (CLI) to use OpenAPI for third-party management platforms and software tools.
- Storm Control—This feature monitors ingress port traffic and records the number
  of packets dropped because they exceed the configured rate limit. The switch CPU
  then takes the configured action on the port to enforce traffic control policies and
  ensure network stability.

#### Note

This feature does not apply to 7830 Series.

For more information, see *Fabric Engine User Guide* and *Fabric Engine Command References*.

#### Platform Enhancements

The software supports the following platform enhancements:

- 4220 Series- full CLI with no license requirement—This release removes restrictions that required a cloud-based subscription license to gain access to the Full CLI or EDM.
- Ability to set poe-pd-detect-type per port or a range of ports—This release extends
  this support to the remaining PoE-supporting 5420 Series and 5520 Series models.
  In a previous release, this port-level configuration was limited to specific models
  within these two product families. This release extends support to the following
  models:
  - 5420F-8W-16P-4XE
  - 5420F-16MW-32P-4XE
  - 5420F-16W-32P-4XE
  - 5420F-24P-4XE
  - 5420F-48P-4XE
  - 5420M-24W-4YE
  - 5520-12MW-36W

For more information, see *Fabric Engine User Guide* and *Fabric Engine Command References*.

# Security Enhancements

The software supports the following security enhancements:

 MACsec: Additional ciphers— This release adds support for GCM-AES-XPN-128 and GCM-AES-XPN-256 cipher suites on 7830 Series, 7520-48YE-8CE, and 5720-VIM-2CE, which eliminate the need for frequent SAK rekeying that can occur in high speed links. These cipher suites use 64-bit eXtended Packet Numbering (XPN) as part of the unique initial value for every packet transmitted with a given secure association key (SAK).

#### Note

GCM-AES-XPN-128 and GCM-AES-XPN-256 cipher suites are supported with MACsec Key Agreement (MKA) only.

- MACsec keychain—Keychains provide an alternative to configuring a single PSK on each MACsec interface. You can use MACsec Key Agreement (MKA) keychains to store and manage multiple pre-shared keys (PSK) used in MACsec encryption. Keychains provide hitless key rollover, which enables the system to switch to the next configured key in the keychain when the key lifetime expires without traffic loss.
- NEAP fallback if EAP authentication fails—In this release, a single client session can support both EAP and NEAP authentication methods. If a client fails to authenticate using EAP and NEAP authentication is already enabled on the port, the switch automatically attempts NEAP fallback to authenticate the client. In earlier releases, only one user could authenticate on an EAP-enabled port either as an EAP or as a NEAP client and if the RADIUS server could not authenticate the client, the client was denied access to the network.
- RADIUS Message-Authenticator Attribute for Management Authentication— The switch now supports the Message-Authenticator attribute with RADIUS authentication requests for management authentication in CLI and EDM.

For more information, see *Fabric Engine User Guide* and *Fabric Engine Command References*.

# Other Changes

# **Scaling Changes**

All tables are updated to reflect new platforms.

# File Names for this Release

#### **Important**

Do not use Google Chrome or Safari to download software files. Google Chrome can change the file sizes. Safari changes the .tgz extension to .tar.

After you download the software, calculate and verify the md5 checksum. For more information, see *Fabric Engine User Guide*.

When extracting the software image file, the extraction process appends the software version portion of the extracted file names to include the final full software version. (For example, extracting 5520.8.2.5.0.voss results in a software file named 5520.8.2.5.0.GA) Ensure that you specify the final full software version (in this case, 8.2.5.0.GA) when using CLI commands that include the software version, such as activating or removing the software.

The Open Source license text for the switch is included on the product. You can access it by entering the following command in the CLI:

more release/w.x.y.z.GA /release/oss-notice.txt

where w.x.y.z represents a specific release number.

The following tables provide the file names and sizes for this release.

Table 5: 4220 Series

Description	File	Size
Logs reference	4220.9.3.0.0_edoc.tar	39,946,240 bytes

# **Upgrade and Downgrade Considerations**

IS-IS Route Tagging on page 26

Validated Upgrade Paths on page 26

Switches That Will Not Use Zero Touch Deployment on page 27

Switches That Will Use Zero Touch Deployment on page 27

Compatible Fabric IPsec Gateway Versions on page 28

Downgrade Considerations on page 29

Post Upgrade Configuration for Zero Touch Fabric Configuration and Nickname Assignment on page 30

The topics in this section provide information on validated upgrade paths, migration considerations, and compatible software versions.

#### Note

If a 5420 Series or 5520 Series switch uses DHCP and you did not manually change the host name through the prompt or **sys name** command, applications that are hard-coded with the old host name can be impacted after upgrade from a VOSS release to Fabric Engine 8.6 or later. As a workaround, change the system name or prompt back to voss<mac-address>.

See the Fabric Engine User Guide for detailed image management procedures that includes information about the following specific upgrade considerations:

- DHCP Server vendor options configuration change
- · Considerations for digital certificates

Upgrade switches using one of the options in the following sections:

- Switches That Will Not Use Zero Touch Deployment on page 27
- Switches That Will Use Zero Touch Deployment on page 27

# IS-IS Route Tagging

#### Caution

To use IS-IS Route Tagging on GRT IS-IS routes, you must also configure the metric-type as external. If you want to use IS-IS tags on GRT as internal routes, all Fabric nodes must be above a minimum software version. Any switch in the SPB Fabric that runs earlier software versions triggers an exception if you use metric type internal. To ensure this does not occur, if you attempt to configure a tag and the metric-type is not external, the switch reminds you to upgrade the software on all devices. You must ensure all devices in the network run the minimum required software.

Table 13: Minimum software required

NOS	Minimum software versions
Fabric Engine	8.10.6.1 and later 9.0.5.1 and later 9.1 and later
VOSS	8.10.6.1 and later 9.0.5.1 and later 9.1 and later
VSP 8600 Series	8.1.7 and later

# Validated Upgrade Paths

This section identifies the software releases for which upgrades to this release have been validated.

#### Note

For any versions prior to 8.10.0.0, an intermediate upgrade is recommended because pre-8.10.0.0 versions are not validated.

For non-validated upgrade paths, perform the upgrade with one or two switches initially before doing a widespread upgrade.

**Table 14: Validated upgrade paths** 

Product	9.0.x to 9.2	9.1.x to 9.2	9.2.x to 9.3
4220 Series			Υ
5320 Series	Υ	Υ	Υ
5420 Series	Υ	Υ	Υ
5520 Series	Υ	Υ	Υ
5720 Series	Υ	Υ	Υ
7520 Series	Υ	Υ	Υ
7720 Series	Υ	Υ	Υ

# Switches That Will Not Use Zero Touch Deployment

Switches that will not use Zero Touch Deployment with ExtremeCloud™ IQ or ZTP+ with ExtremeCloud IQ Site Engine should upgrade to this release by performing these steps:

- 1. Upgrade to this release from one of the previously described releases, see Validated Upgrade Paths on page 26.
- 2. Continue to use the previous switch configuration.

# Switches That Will Use Zero Touch Deployment

Switches that will use Zero Touch Deployment with ExtremeCloud IQ or ZTP+ with ExtremeCloud IQ Site Engine should upgrade to this release by performing the following steps:

#### **Important**

When you perform these steps, any prior configuration for this switch is lost. You do not need to complete this procedure for switches that are already managed by ExtremeCloud IQ or ExtremeCloud IQ Site Engine; use the upgrade functionality available in ExtremeCloud IQ or ExtremeCloud IQ Site Engine.

- 1. Upgrade to this release from one of the previously described releases, see Validated Upgrade Paths on page 26.
- 2. Ensure the switch boots without a configuration file. To ensure the switch boots without a configuration file, perform one of the following actions:
  - Rename existing primary and secondary configuration files. Use the mv command to rename the existing configuration files. For example, mv config.cfg
     config.cfg.backup.

This is the preferred option because it ensures that the primary and secondary files are removed while making a backup of them at the same time. This option also ensures that the switch uses the default config.cfg file for the final configuration after it has successfully onboarded.

- Delete the existing primary and secondary configuration files. Create a backup of these files before you delete them.
- Boot from non-existent configuration files. Use the boot config choice command to configure the primary and backup configuration files to reference files that do not exist on the switch:

boot config choice primary config-file nonexistent1.cfg

boot config choice primary backup-config-file nonexistent2.cfg

This option also works, however, after the switch has successfully onboarded, it does not use the default config.cfg file but uses the alternative configuration file name provided instead, which might not be desired.

3. Reboot the switch.

Performing these steps results in a switch with a Zero Touch Deployment configuration with the following characteristics:

- The ssh and sshd boot configuration flags are enabled by default.
- All ports are Private VLAN isolated ports.
- VLAN 4048 is created as an *onboarding-vlan* for host-only connectivity for In Band management. All front panel ports are members of VLAN 4048.
- · In Band management is enabled.
- Dynamic Host Configuration Protocol (DHCP) client requests are cycled between In Band and Out of Band ports, except on the 5320 Series. With the exception of 5320-24T-4X-XT and 5320-24T-24S-4XE-XT, 5320 Series supports In Band management only.
- If the switch resets after the IP address is obtained from the DHCP Server, the
  entire DHCP process does not need to be repeated. Instead, the switch can directly
  send the DHCP Request to the DHCP Server for the IP stored in the /intflash/dhcp/
  dhclient.leases file.
- Out of Band management is enabled, except on the 5320 Series. With the
  exception of 5320-24T-4X-XT and 5320-24T-24S-4XE-XT, 5320 Series supports In Band
  management only.
- All ports are administratively enabled.
- IQAgent is enabled by default.
- Zero Touch Provisioning Plus (ZTP+) for ExtremeCloud IQ Site Engine onboarding is enabled by default.
- · Zero Touch Fabric Configuration is initiated.
- After the Zero Touch Fabric establishes successfully, the onboarding VLAN 4048 is automatically assigned to onboarding I-SID 15999999.

After the switch reboots in the Zero Touch Deployment configuration, the DHCP client and ExtremeCloud IQ Agent are enabled. The DHCP client obtains an IP address for the switch, DNS discovery is used to discover a Domain Name Server, and the switch attempts to connect to ExtremeCloud IQ and ExtremeCloud IQ Site Engine.

All switches also receive a Zero Touch Fabric Configuration. For more information, see *Fabric Engine User Guide*.

# Compatible Fabric IPsec Gateway Versions

#### Note

This section only applies to 5720-24MXW, 5720-48MXW, 7520 Series, and 7720 Series. For more information about feature support, see *Fabric Engine and VOSS Feature Matrix*.

The OVA image for the Fabric IPsec Gateway is posted with the image file for each network operating system (NOS) release.

For more information about image files in this release, see File Names for this Release on page 19. For virtual service upgrade instructions, see Fabric Engine User Guide.

Only use the Fabric IPsec Gateway image version that is posted with the NOS release image.

#### Note

Upgrade the switch software image before you upgrade the Fabric IPsec Gateway image.

# **Downgrade Considerations**

Save a backup copy of your switch configuration before upgrading to new release. New releases contain significant enhancements, which cannot be used in previous software versions. Downgrading to an earlier release will require a compatible configuration file.

#### Caution

If you need to downgrade the image on ExtremeCloud IQ Managed Switches to release 9.0.0.0, from 9.0.2.0, or later, you must remove the file .telegraf.csv from the /intflash directory if it exists. Failure to do so can cause the switch to crash and revert to 9.0.2.0. For more information, see Downgrade ExtremeCloud IQ Managed Switches to 9.0.0.0 on page 30.

# ExtremeCloud IQ Agent

For devices running VOSS 8.3, Fabric Engine 8.6, or later, that connect to ExtremeCloud IQ using ExtremeCloud IQ Agent versions 0.4.0 or higher, you cannot downgrade to VOSS 8.2.x and connect to the cloud automatically. After you downgrade to VOSS 8.2.x, you lose connectivity to ExtremeCloud IQ so you must install a VOSS 8.2.x compatible ExtremeCloud IQ Agent version to re-establish connectivity.

Contact support for assistance with installation of the VOSS 8.2.x compatible ExtremeCloud IQ Agent version. For the support phone number in your country, visit: www.extremenetworks.com/support/contact.

#### Note

Prior to Fabric Engine 8.6, 5520 Series and 5420 Series platforms ran VOSS. VOSS support ends for these platforms with VOSS 8.5.x.

For information about how to reinstall ExtremeCloud IQ Agent firmware, see *Fabric Engine User Guide*.

# Downgrade ExtremeCloud IQ Managed Switches to 9.0.0.0

Perform this procedure to downgrade switches that run GA version 9.0.2.0, or later, and are onboarded using ExtremeCloud IQ. This procedure does not apply to switches onboarded using ExtremeCloud IQ Site Engine.

#### Before You Begin

This procedure assumes the 9.0.0.0 GA image version is available on the switch. If not, you must upload it and extract the release distribution files to the /intflash/release/directory.

#### Procedure

- 1. Connect to the switch through the console, SSH, or Telnet.
- 2. Activate the 9.0.0.0 image:

enable

software activate 9.0.0.0 GA

3. Disable ExtremeCloud IQ Agent:

configure terminal

application

no igagent enable

4. Delete the following file from the switch:

```
delete /intflash/.telegraf.csv -y
```

5. (Optional) Retain a copy of the current configuration, if needed:

```
copy config.cfg config.backup
```

6. Ensure the boot configuration points to the saved configuration from 9.0.0.0:

```
copy config.9.0.0.0 config.cfg
```

boot config choice primary config-file config.cfg

7. Reboot the switch to initiate the downgrade:

```
reset -y
```

8. Reconnect to the switch and commit the software:

enable

software commit

# Post Upgrade Configuration for Zero Touch Fabric Configuration and Nickname Assignment

#### Note

In this section, a Zero Touch Fabric release refers to any of the following: VOSS 8.3, Fabric Engine 8.6, or later releases.

The switch initiates Zero Touch Fabric Configuration if you boot without a configuration file.

For Fabric Engine 8.9, or earlier, to add new Zero Touch Fabric Configuration devices or implement Zero Touch Fabric Configuration on existing devices, the network requires a nickname server and reachability to the DHCP server and, optionally, ExtremeCloud IQ servers or ExtremeCloud IQ Site Engine. How you implement Zero Touch Fabric Configuration depends on if the network is a new deployment, or an existing Fabric network that you upgrade. In a new deployment, you can meet the network requirements with one node, known as a seed node. In an existing network, functions can already exist on different nodes.

For devices running Fabric Engine 8.10 or later, the nickname automatically generates when you add new Zero Touch Fabric Configuration devices or implement Zero Touch Fabric Configuration on existing devices. You can configure a nickname server in your network with a dynamic nickname to replace the self-assigned nickname on your device.

For more details on Zero Touch Fabric Configuration, see Fabric Engine User Guide.

#### **Important**

Not all upgrade paths are validated by Extreme Networks for each new software release. To understand the validated upgrade paths, see Validated Upgrade Paths on page 26.

# **Network Requirements**

The following list identifies the network requirements before you add new Zero Touch Fabric Configuration devices or implement Zero Touch Fabric Configuration on existing devices:

- For devices running releases earlier than Fabric Engine 8.10, you must configure a node as the nickname server, if one does not already exist. This node can be anywhere in the SPB Fabric IS-IS area.
- The DHCP server must be reachable by the remote nodes:
  - In an existing network, the DHCP server can be anywhere in the network. If the DHCP server is on a different IP subnet from the onboarding I-SID, configure DHCP Relay functionality on the existing IP interface of VLAN 4048 with I-SID 15999999.
  - If the DHCP server is on the same subnet as the onboarding I-SID, configure the port facing the DHCP server as private-vlan promiscuous, using Private VLAN 4048, if the new DHCP snooping port feature does not have the promiscuous port configured automatically. This VLAN and the Auto-sense onboarding I-SID are created automatically on a newly deployed device.
- In this release, ports send Fabric Connect LLDP TLVs regardless of the Auto-sense configuration, which means these devices can establish adjacencies with other devices that run a Zero Touch Fabric release, and use either Auto-sense or static NNI configuration.

In an existing network that includes devices that run a version of VOSS earlier than 8.3, you must manually configure the NNI. Because the port running in the earlier

release does not send Fabric Connect LLDP TLVs, an adjacency with a Zero Touch Fabric release node does not form automatically.

For Zero Touch Fabric Configuration to work when a new switch that runs a Zero Touch Fabric release, connects to a switch on an existing Fabric, upgrade at least the existing Fabric switches to a Zero Touch Fabric release first.

Some SPB deployments use Ethertype 0x88a8 but many use 0x8100. Zero Touch
Fabric Configuration works with existing networks that use either value as long as
the existing switches that connect to the new switches run a Zero Touch Fabric
release.

# Zero Touch Fabric Configuration Switch

#### **Important**

If you deploy a Fabric-capable switch with Auto-sense enabled, the switch interacts with existing switches that support Fabric Attach (FA). If an existing FA Proxy switch does not have FA server connectivity established yet, it will form an FA connectivity to the newly connected VOSS (8.3 or later) or Fabric Engine, switch as it announces itself as an FA server. To avoid unintended FA connectivity, disable Auto-sense using the **no auto-sense enable** command on the relevant ports.

On switches (upgraded existing or newly deployed) where you want to initiate Zero Touch Fabric Configuration, perform the following tasks:

- 1. Upgrade to a Zero Touch Fabric release, if the device is not a new deployment already running a Zero Touch Fabric release. As a best practice, upgrade to a Fabric Engine release. For a new deployment of universal hardware, ensure the network operating system (NOS) is Fabric Engine.
- 2. On upgraded existing switches, ensure the switch boots without a configuration file. The switch joins the network as an end host. To ensure the switch boots without a configuration file, perform one of the following actions:
  - Rename existing primary and secondary configuration files. Use the mv command to rename the existing configuration files. For example, mv config.cfg
     config.cfg.backup.

This is the preferred option because it ensures that the primary and secondary files are removed while making a backup of them at the same time. This option also ensures that the switch uses the default config.cfg file for the final configuration after it has successfully onboarded.

- Delete the existing primary and secondary configuration files. Create a backup of these files before you delete them.
- Boot from non-existent configuration files. Use the **boot config choice** command to configure the primary and backup configuration files to reference files that do not exist on the switch:

boot config choice primary config-file nonexistent1.cfg

#### boot config choice primary backup-config-file nonexistent2.cfg

This option also works, however, after the switch has successfully onboarded, it does not use the default config.cfg file but uses the alternative configuration file name provided instead, which might not be desired.

3. The switch creates a Zero Touch Deployment configuration to onboard the switch, including the following Zero Touch Fabric Configuration items:

#### Note

For more details on Zero Touch Deployment, see Fabric Engine User Guide.

- Creates private VLAN 4048.
- Enables SPBM.
- Creates SPBM instance 1.
- · Creates default backbone VLANs (B-VLAN) (4051 and 4052).
- Creates manual area 00.1515.fee1.900d.1515.fee1.900d.

#### Note

The B-VLAN and manual area configuration values are not compulsory. This remote switch can attach to a Fabric core that does not match these values because the Auto-sense functionality dynamically learns the B-VLANs and manual area in use in the Fabric core from the connected seed node using LLDP.

- Creates the onboarding I-SID 15999999.
- Assigns the onboarding I-SID to private VLAN 4048 and also includes the management VLAN.

#### Note

As a best practice, use the onboarding I-SID for onboarding purposes and, whenever possible, configure a management VLAN or management CLIP on a different I-SID after the onboarding procedures have been successfully completed.

- · Enables Auto-sense on all ports.
- Configures Auto-sense access ports and Layer 2 trusted Auto-sense ports.
- Enables IS-IS globally.
- With Auto-sense, ports on a switch can detect whether they connect to an SPB device, a Fabric Attach (FA) client, FA Proxy, Voice IP devices, or an undefined host, and then make the necessary configuration.
- 4. If the seed node uses Auto-sense IS-IS Authentication, configure the remote switch to use the same authentication type and key as the seed node.

#### Note

This step only applies to devices running releases earlier than Fabric Engine 8.10.

5. The switch joins the Fabric.

- 6. For devices running releases earlier than Fabric Engine 8.10, the nickname server dynamically assigns an SPBM nickname. For devices running releases Fabric Engine 8.10, or later, the switch automatically assigns an SPBM nickname. The device searches the network for a nickname server and if one is found, the device replaces the automatic nickname with the dynamic nickname assigned by the server.
- 7. After the Zero Touch Fabric establishes successfully, the switch attempts to acquire an IP address on the onboarding VLAN and I-SID using DHCP. When the DHCP client obtains an IP address for the switch, the switch automatically attempts to connect to ExtremeCloud IQ and ExtremeCloud IQ Site Engine.

## 5520 Series Hardware

5520 Series is a universal hardware product that supports more than one Network Operating System (NOS) personality. For information about NOS personalities, see *Fabric Engine User Guide*.

#### Note

Prior to Fabric Engine 8.6, 5520 Series platforms ran VOSS. VOSS support ends for these platforms with VOSS 8.5.x.

**Table 18: Switch models** 

Model	Initial release	Supp	Supported new Fabric Engine feature release			
		9.0.2	9.0.3	9.1	9.2	9.3
5520-12MW-36W	VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ
5520-24T	AC: VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ
	ACDC: Fabric Engine 9.0					
5520-24W	VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ
5520-24X	AC: VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ
	ACDC: Fabric Engine 9.0					
5520-48SE	AC: VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ
	ACDC: Fabric Engine 9.0					

**Table 18: Switch models (continued)** 

Model	Initial release	Supported new Fabric Engine feature release			ise	
		9.0.2	9.0.3	9.1	9.2	9.3
5520-48T	AC: VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ
	ACDC: Fabric Engine 9.0					
5520-48W	VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ

#### Note

Ensure the switch runs, at a minimum, the noted initial software release before you install a VIM.

**Table 19: Versatile Interface Modules (VIMs)** 

Model	Initial	Supported new Fabric Engine feature release					
	release	9.0.2	9.0.3	9.1	9.2	9.3	
5520-VIM-4X	VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ	
5520-VIM-4XE	VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ	
5520-VIM-4YE	VOSS 8.2.5	Υ	Υ	Υ	Υ	Υ	

## **Operational Notes**

- The 5520-24T, 5520-24X, 5520-48SE, and 5520-48T models require a minimum of Fabric Engine 8.9 to support power supplies and fans with back-to-front airflow.
- The 5520-24T-ACDC, 5520-24X-ACDC, 5520-48SE-ACDC, and 5520-48T-ACDC models require a minimum of Fabric Engine 9.0 to support DC power supplies.

## Versatile Interface Module Operational Notes

The following table summarizes the operational capabilities of the various VIMs:

Table 20: 5520-VIM Matrix

	5520-VIM-4X	5520-VIM-4XE	5520-VIM-4YE
Operational speeds	1Gbps & 10Gbps	1Gbps & 10Gbps	10Gbps & 25Gbps
PHY present	No	Yes	Yes
1000BASE-T & 10GBASE- T	10GBASE-T only	Both	10GBASE-T only
Mixed speeds	1Gbps & 10Gbps	1Gbps & 10Gbps	Mixed speeds not supported
1G Auto-negotiation	Disabled	Disabled	Disabled
10G Auto-negotiation	Disabled	Disabled	Disabled

Table 20: 5520-VIM Matrix (continued)

	5520-VIM-4X	5520-VIM-4XE	5520-VIM-4YE
25G Auto-negotiation			Enabled for DAC Disabled for Fiber
FEC	Not supported	Not supported	Auto-FEC enabled for DAC and Fiber
MACsec	Not supported	128/256 bit	128/256 bit

## Operational Notes for VIM Transceivers

The IEEE 802.3by requirement for 25 Gb is that any transceiver or DAC 3 meters or longer, requires the use of forward error correction (FEC).

If you use an unsupported 25 Gb transceiver, you might experience CRC or link flap errors.

## 5720 Series Hardware

5720 Series is a universal hardware product that supports more than one Network Operating System (NOS) personality. For information about NOS personalities, see *Fabric Engine User Guide*.

Table 21: Switch models

Model	Initial					
	Fabric Engine release	9.0.2	9.0.3	9.1	9.2	9.3
5720-24MW	8.7	Υ	Υ	Υ	Υ	Υ
5720-24MXW	8.7	Υ	Υ	Υ	Υ	Υ
5720-48MW	8.7	Υ	Υ	Υ	Υ	Υ
5720-48MXW	8.7	Υ	Υ	Υ	Υ	Υ

#### Note

Ensure the switch runs, at a minimum, the noted initial software release before you install a VIM.

**Table 22: Versatile Interface Modules (VIMs)** 

Model		Supported new feature release				
	Engine release	9.0.2	9.0.3	9.1	9.2	9.3
5720-VIM-2CE	8.7	Υ	Υ	Υ	Υ	Υ
5720-VIM-6YE	8.7	Υ	Υ	Υ	Υ	Υ

## Versatile Interface Module Operational Notes

The following table summarizes the operational capabilities of the various VIMs:

Table 23: 5720-VIM Matrix

	5720-VIM-2CE	5720-VIM-6YE
Operational speeds	10/25/40/100Gbps	1/10/25Gbps
PHY present	Yes	Yes
1000BASE-T & 10GBASE-T	10GBASE-T only	Both
Mixed speeds	10/25/40Gbps	1/10/25Gbps
1G Auto-negotiation	Not supported	Not supported
10G Auto-negotiation	Not supported	Not supported
25G Auto-negotiation	Supported	Supported
FEC	Supports CL74/CL91	Supports CL74/CL91
MACsec	128/256 bit	128/256 bit

## 7520 Series Hardware

7520 Series is a universal hardware product that supports more than one Network Operating System (NOS) personality. For information about NOS personalities, see *Fabric Engine User Guide*.

**Table 24: Switch models** 

Model	Initial	Supported new Fabric Engine feature release				
	Fabric Engine release	9.0.2	9.0.3	9.1	9.2	9.3
7520-48Y-8C	8.10	Υ	Υ	Υ	Υ	Υ
7520-48YE-8CE	9.0	Υ	Υ	Υ	Υ	Υ
7520-48XT-6C	8.10	Υ	Υ	Υ	Υ	Υ

## 7520-48YE-8CE Operational Notes

7520-48YE-8CE does not support 1 Gbps speeds on SFP28 ports.

## 7720 Series Hardware

7720 Series is a universal hardware product that supports more than one Network Operating System (NOS) personality. For information about NOS personalities, see *Fabric Engine User Guide*.

Table 25: Switch models

Model	Initial	Supported new Fabric Engine feature release				
	Fabric Engine release	9.0.2	9.0.3	9.1	9.2	9.3
7720-32C	8.10	Υ	Υ	Υ	Υ	Υ

## 7830 Series Hardware

7830 Series is a universal hardware product that supports Fabric Engine software.

**Table 26: Switch models** 

Model part number	Initial Release
7830-32CE-8DE	9.3

## 7830 Series Operational Notes

On the port range 1/1-1/32, you can channelize only odd numbered ports. When you channelize an odd numbered port, the next even numbered port is not available for data traffic. For example, if ports 1/1 and 1/3 are channelized then ports 1/2 and 1/4 are unavailable for traffic.

In the port range 1/1-1/32, a group of four consecutive ports must operate at the same speed from either of the following groups:

- 10G or 40G or 4x10G
- 25G or 100G or 4x25G

For testing purposes only, you can mix transceivers with different capabilities in the same port group. When you install transceivers with different speeds in the same port group, group speed depends on the auto-speed configuration. For more information about auto-speed, see *Fabric Engine User Guide*.

**Table 27: Versatile Interface Modules** 

Model	Initial release
7830-VIM-16CE	9.3
7830-VIM-24YE	9.3

## Versatile Interface Module Operational Notes

The following table summarizes the operational capabilities of the various VIMs:

	7830-VIM-16CE	7830-VIM-24YE
Operational speeds	10/25/40/100Gbps	10/25Gbps
PHY present	Yes	Yes

	7830-VIM-16CE	7830-VIM-24YE
1000BASE-T & 10GBASET	10GBASE-T	10GBASE-T
Mixed speeds	Yes	Yes
10G Auto-negotiation	Not Supported	Not Supported
25G Auto-negotiation	Supported	Supported
40G Auto-negotiation	Supported	Not Supported
100G Auto-negotiation	Supported	Not Supported
FEC	Supports CL108/CL91	Supports CL108
MACsec	Yes	Yes

## Operational Notes for VIM Transceivers

7830-VIM-16CE and 7830-VIM-24YE are not hot-swappable in this release. Power off the 7830 Series to replace a VIM.

## **Transceivers**

The software allows the use of transceivers and direct attach cables from any vendor, which means that the switch will bring up the port operationally when using any transceiver. Extreme Networks does not provide support for operational issues related to the use of non-Extreme Networks branded transceivers and direct attached cables used in the switches.

To find product descriptions and compatibility information for optical transceivers and components, visit the Extreme Optics website.

## **Auto-Negotiation**

Use auto-negotiation to enable the device to automatically negotiate the best common data rate and duplex mode to use between two auto-negotiation-capable Ethernet devices.

When you use a 1 Gb SFP transceiver on a 10 Gb SFP+ port, ensure that autonegotiation is enabled.

For 1000BASE-T SFP transceivers, the best practice is to perform custom autonegotiation at the remote native copper port. This can prevent connections from failing if the speed or duplex negotiation changes.

## Forward Error Correction (FEC)

Forward Error Correction (FEC) is a method of obtaining error control in data transmission over an unreliable or noisy channel in which the source (transmitter) encodes the data in a redundant way by using an error correcting code (ECC). This redundancy enables a destination (receiver) to detect a limited number of errors and correct them without requiring a re-transmission.

For more information about FEC, see Fabric Engine User Guide.

Fabric Scaling on page 108

VRF Scaling on page 120

This section documents scaling capabilities of the universal hardware platforms.

#### Note

Feature support can differ within a product family. Scaling numbers for a product family do not always reflect when a feature is not supported on a specific model. For feature support information, see *Fabric Engine and VOSS Feature Matrix*.

The scaling and performance information shown in the following tables is provided for the purpose of assisting with network design. It is recommended that network architects and administrators design and manage networks with an appropriate level of network scaling "head room." The scaling and performance figures provided have been verified using specific network topologies using limited switch configurations. There is no guarantee that the scaling and performance figures shown are applicable to all network topologies and switch configurations and are provided as a realistic estimation only. If you experience scaling and performance characteristics that you feel

Scaling Layer 2

are sufficiently below what has been documented, contact Extreme Networks technical support for additional assistance.

#### Note

If your switch uses Advanced Feature Bandwidth Reservation in Full Feature mode, this affects scaling information that is based on the number of available ports. If you enable the boot configuration flag for this feature, remember to deduct the number of reserved ports from the documented scaling maximum. Not all hardware platforms require this feature to provide full feature support. For more information, see *Fabric Engine User Guide*.

## Layer 2

## **Table 28: Layer 2 Maximums**

Attribute	Product	Maximum number supported
MAC table size (without SPBM)	4220 Series	32,000

	7720 Series	200 See Maximum Number of Microsoft NLB Cluster IP Interfaces on page 53.
	7830 Series	n/a

The number of Private VLANs/Layer 2 E-Tree varies depending on the number of private VLAN trunk ports as members. The following table provides the maximum numbers.

Table 29: Private VLAN and Layer 2 E-Tree maximums

Platform	Total Private VLANs and Layer 2 E-Tree with 2 Private VLAN trunk ports	Total Private VLANs and Layer 2 E-Tree with 4 Private VLAN trunk ports
4220 Series	5	5
5320 16- and 24-port models	40	20
5320 48-port models	100	50
5420 Series	100	50
5520 Series	200	100
5720 Series	200	100
7520 Series	100	50
7720 Series	100	50
7830 Series	n/a	n/a

#### Maximum Number of Directed Broadcast Interfaces

The number of Directed Broadcast interfaces must be less than or equal to 200.

#### Note

This does not apply to 7830 Series.

However, if you configure VLANs with both NLB and Directed Broadcast, you can only scale up to 100 VLANs assuming there is only 1 NLB cluster IP interface per VLAN. Also, ensure that you configure NLB on a VLAN first, and then Directed Broadcast, so as to not exhaust the NLB and Directed Broadcast shared resources. The shared resources are NLB interfaces and VLANs with Directed Broadcast enabled. The permissible limit for the shared resources is 200.

#### Maximum Number of Microsoft NLB Cluster IP Interfaces

The number of NLB cluster IP interfaces multiplied by the number of configured clusters must be less than or equal to 200. The number of NLB cluster IP interfaces is the key, not the number of VLANs. You can configure 1 VLAN with up to 200 NLB cluster IP interfaces or configure up to 200 VLANs with 1 NLB cluster IP interface per VLAN.

For example: 1 virtual interface per cluster x 200 clusters = 200 or 2 virtual interfaces per cluster x 100 clusters = 200

However, if you configure VLANs with both NLB and Directed Broadcast, you can only scale up to 100 VLANs assuming there is only 1 NLB cluster IP interface per VLAN. Also, ensure that you configure NLB on a VLAN first, and then Directed Broadcast, so as to not exhaust the NLB and Directed Broadcast shared resources. The shared resources are NLB interfaces and VLANs with Directed Broadcast enabled. The permissible limit for the shared resources is 200.

#### Note

This does not apply to 7830 Series.

IP Unicast Scaling

## IP Unicast

**Table 30: IP Unicast Maximums**

#### IP Interface Maximums Clarification

In the following sections, the formulas refer to "#IP Interfaces" count and not the count of IP addresses, which can be greater if you use IP multinetting with either IPv4 or IPv6. To clarify, if you use multinetting or IPv4 and IPv6 dual stack on a VLAN, the consumption of routable MAC resources is as follows:

- IPv4 address (primary) consumes one entry of routable MACs
- IPv4 address (primary) + any number of secondary addresses (multinetting) consumes one entry of routable MACs
- IPv6 interface (link-local) consumes one entry of routable MACs
- IPv6 interface (link-local) + any number of global addresses consume one entry of routable MACs
- IPv4 address (in any combination) + IPv6 interface (in any combination) consumes one entry of routable MACs

## IP Interface Maximums for 4220 Series

The maximum number of IP interfaces for 4220 Series is based on the following formula:

# IP interfaces (max 128) + (# of VRRP IPv4 interfaces) + 2(if IP Shortcuts is enabled) + 3 + (#Anycast IP Gateway VLANs if Anycast IP Gateway router) = cannot exceed 128

For additional detail, see IP Interface Maximums Clarification on page 69.

#### IP Interface Maximums for 5320 Series

The maximum number of IP interfaces for 5320 Series is based on the following formulas:

```
5320-16P-2MXT-2X and 5320-24T-4X-XT
```

# IP interfaces (248 max) + (# of VRRP IPv4 interfaces) + (# of VRRP IPv6 interfaces) + 2(if IP Shortcuts is enabled) + 3x(# of VRFs) + (#Anycast IP Gateway VLANs if Anycast IP Gateway router) = cannot exceed 248

For additional detail, see IP Interface Maximums Clarification on page 69.

16- and Other 24-port models

# IP interfaces (max 248) + (# of VRRP IPv4 interfaces) + (# of VRRP IPv6 interfaces) + 2(if IP Shortcuts is enabled) + 3 + (#Anycast IP Gateway VLANs if Anycast IP Gateway router) = cannot exceed 248

For additional detail, see IP Interface Maximums Clarification on page 69.

#### 48-port models

- If you disable the VRF scaling boot configuration flag:
  - # IP interfaces (248 max) + (# of VRRP IPv4 interfaces) + (# of VRRP IPv6 interfaces) + 2(if IP Shortcuts is enabled) + 3x(# of VRFs) + (#Anycast IP Gateway VLANs if Anycast IP Gateway router) = cannot exceed 248
- If you enable the VRF scaling boot configuration flag:
  - # IP interfaces (max 248) + (# of VRRP IPv4 interfaces) + (# of VRRP IPv6 interfaces) + 2(if IP Shortcuts is enabled) + 3 + (#Anycast IP Gateway VLANs if Anycast IP Gateway router) = cannot exceed 248

For additional detail, see IP Interface Maximums Clarification on page 69.

#### IP Interface Maximums for 5420 Series

The maximum number of IP interfaces for 5420 Series is based on the following formulas:

- If you disable the VRF scaling boot configuration flag:
  - # IP interfaces (248 max) + (# of VRRP IPv4 interfaces) + (# of VRRP IPv6 interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3x(# of VRFs) + (#Anycast Gw VLANs if Anycast Gw router) = cannot exceed 248
- If you enable the VRF scaling boot configuration flag:
  - # IP interfaces (max 248) + (# of VRRP IPv4 interfaces) + (# of VRRP IPv6 interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3 + (#Anycast Gw VLANs if Anycast Gw router) = cannot exceed 248

For additional detail, see IP Interface Maximums Clarification on page 69.

#### IP Interface Maximums for 5520 Series

The maximum number of IP interfaces for 5520 Series is based on the following formulas:

- If you disable the VRF scaling boot configuration flag:
  - For interior node/non boundary node:
    - #NON DVR IP Interfaces + (# of VRRP interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3x(# of VRFs) + 1(if DVR node) + (#DVR VLANs if DVR controller) + (#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000
  - For boundary node:
    - #NON DVR IP Interfaces + 2x(# of VRRP interfaces) + 2x(# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + <math>7x(# of VRFs) + 1(if DVR node) + 2x(# DVR VLANs if DVR controller) + 2x(# Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000
- If you enable the VRF scaling boot configuration flag:
  - For interior node/non boundary node:

#NON DVR IP Interfaces + (# of VRRP interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3(if L3VSN is enabled) + 1(if DVR node) + (#DVR VLANs if DVR controller) + (#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

• For boundary node:

#NON DVR IP Interfaces + 2x(# of VRRP interfaces) + 2x(# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 7(if L3VSN is enabled) + 1(if DVR node) + 2x(<math>#DVR VLANs if DVR controller) + 2x(<math>#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For additional detail, see IP Interface Maximums Clarification on page 69.

#### IP Interface Maximums for 5720 Series

The maximum number of IP interfaces for 5720 Series is based on the following formulas:

- If you disable the VRF scaling boot configuration flag:
  - For interior node/non boundary node:

#NON DVR IP Interfaces + (# of VRRP interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3x(# of VRFs) + 1(if DVR node) + (#DVR VLANs if DVR controller) + (#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For boundary node:

#NON DVR IP Interfaces + 2x(# of VRRP interfaces) + 2x(# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 7x(# of VRFs) + 1(if DVR node) + 2x(#DVR VLANs if DVR controller) + 2x(#Anycast Gw VLANs if Anycast Gw router) cannot exceed

- · If you enable the VRF scaling boot configuration flag:
  - For interior node/non boundary node:

#NON DVR IP Interfaces + (# of VRRP interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3(if L3VSN is enabled) + 1(if DVR node) + (#DVR VLANs if DVR controller) + (#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For boundary node:

#NON DVR IP Interfaces + 2x(# of VRRP interfaces) + 2x(# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 7(if L3VSN is enabled) + 1(if DVR node) + 2x(#DVR VLANs if DVR controller) + 2x(#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For additional detail, see IP Interface Maximums Clarification on page 69.

#### IP Interface Maximums for 7520 Series

The maximum number of IP interfaces for 7520 Series is based on the following formulas:

- If you disable the VRF scaling boot configuration flag:
  - For interior node/non-boundary node:

#NON DVR IP Interfaces with unique mac offset + (# of VRRP interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3x(# of VRFs) + 1(if DVR node) + (#DVR VLANs if DVR controller) + (#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For boundary node:

#NON DVR IP Interfaces with unique mac offset + 2x(# of VRRP interfaces) + 2x(# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 7x(# of VRFs) + 1(if DVR node) + 2x(#DVR VLANs if DVR controller) + 2x(#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

- If you enable the VRF scaling boot configuration flag:
  - For interior node/non-boundary node:

#NON DVR IP Interfaces with unique mac offset + (# of VRRP interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3(if L3VSN is enabled) + 1(if DVR node) + (#DVR VLANs if DVR controller) + (#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For boundary node:

#NON DVR IP Interfaces with unique mac offset + 2x(# of VRRP interfaces) + 2x(# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 7(if L3VSN is enabled) + 1(if DVR node) + 2x(<math># DVR VLANs if DVR controller) + 2x(<math># Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For additional detail, see IP Interface Maximums Clarification on page 69.

#### IP Interface Maximums for 7720 Series

The maximum number of IP interfaces for 7720 Series is based on the following formulas:

- If you disable the VRF scaling boot configuration flag:
  - For interior node/non-boundary node:

#NON DVR IP Interfaces with unique mac offset + (# of VRRP interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3x(# of VRFs) + 1(if DVR node) + (#DVR VLANs if DVR controller) + (#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For boundary node:

#NON DVR IP Interfaces with unique mac offset + 2x(# of VRRP interfaces) + 2x(# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 7x(# of VRFs) + 1(if DVR node)

- + 2x(#DVR VLANs if DVR controller) + 2x(#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000
- If you enable the VRF scaling boot configuration flag:
  - For interior node/non-boundary node:

#NON DVR IP Interfaces with unique mac offset + (# of VRRP interfaces) + (# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 3(if L3VSN is enabled) + 1(if DVR node) + (#DVR VLANs if DVR controller) + (#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

• For boundary node:

#NON DVR IP Interfaces with unique mac offset + 2x(# of VRRP interfaces) + 2x(# of RSMLT interfaces) + 2(if IP Shortcuts is enabled) + 7(if L3VSN is enabled) + 1(if DVR node) + <math>2x(#DVR VLANs if DVR controller) + 2x(#Anycast Gw VLANs if Anycast Gw router) cannot exceed 1000

For additional detail, see IP Interface Maximums Clarification on page 69.

# Layer 3 Route Table Size

**Table 31: Layer 3 Route Table Size Maximums** 

Attribute	Maximum number supported
IPv4 RIP routes	See Route Scaling on page 73.
IPv4 OSPF routes	
IPv4 BGP routes	
IPv4 SPB shortcut routes	
IPv4 SPB Layer 3 VSN routes	
IPv6 OSPFv3 routes - GRT only	
IPv6 SPB shortcut routes - GRT only	
IPv6 RIPng routes	

### Route Scaling

The following table provides information on IPv4 and IPv6 route scaling. The route table is a shared hardware resource where IPv4 routes consume one entry and IPv6 routes with a prefix length less than 64 consume two entries.

The route scaling does not depend on the protocol itself, but rather the general system limitation in the following configuration modes:

- URPF check mode Enable this boot configuration flag to support Unicast Reverse Path Forwarding check mode.
- IPv6 mode Enable this boot configuration flag to support IPv6 routes with prefixlengths greater than 64 bits. When the IPv6-mode is enabled, the maximum number of IPv4 routing table entries decreases. This flag does not apply to all hardware platforms.

Route Scaling Scaling

### 4220 Series

The maximum IPv4 route table size for 4220 Series is 1,000. IPv6 and URPF mode do not apply to 4220 Series.

### 5320 Series

### Note

Only 5320-16P-2MXT-2X, 5320-24T-24S-4XE-XT, 5320-48P-8XE, and 5320-48T-8XE support URPF mode.

Model	URPF mode	IPv6 mode	IPv4	IPv6 (prefix less than 64)	IPv6 (prefix greater than 64)
48-port models	No	No	12K	6K	n/a
	No	Yes	6K	2K	1.5K
	Yes	Yes	3K	1K	750
	Yes	No	6K	2K	n/a
5320-24T-4X-XT	No	No	1K	1K	n/a
	No	Yes	500	500	250
5320-16P-4XE	No	No	8K	4K	n/a
Other 24-port models	No	Yes	4K	2K	1K
5320-16P-2MXT-2X	No	No	1,000	1,000	n/a
	No	Yes	500	500	250
	Yes	No	500	500	n/a
	Yes	Yes	250	250	125

### Note:

The total number of routes include local routes.

The stated numbers in the preceding rows are one-dimensional where the given number implies that only routes for that address family or type are present. For a given row in the table, the maximum scaling number is 'x' IPv4 routes OR 'y' ipv6 <= 64 routes (not a combination of both).

5420 Series

URPF mode	IPv6 mode	IPv4		IPv6 (prefix greater than 64)
No	No	12K	6K	n/a
No	Yes	6K	2K	1,500
Yes	No	6K	ЗК	n/a

Scaling Route Scaling

URPF mode	IPv6 mode	IPv4		IPv6 (prefix greater than 64)
Yes	Yes	3K	1K	750

### Note:

The total number of routes include local routes.

The stated numbers in the preceding rows are one-dimensional where the given number implies that only routes for that address family or type are present. For a given row in the table, the maximum scaling number is 'x' IPv4 routes OR 'y' ipv6 <= 64 routes (not a combination of both).

### 5520 Series

URPF mode	IPv6 mode	IPv4	IPv6 (prefix less than 64)	IPv6 (prefix greater than 64)
No	No	16K	8K	n/a
No	Yes	8K	4K	2K
Yes	No	8K	4K	n/a
Yes	Yes	4K	2K	1K

### Note:

The total number of routes include local routes.

The stated numbers in the preceding rows are one-dimensional where the given number implies that only routes for that address family or type are present. For a given row in the table, the maximum scaling number is 'x' IPv4 routes OR 'y' ipv6 <= 64 routes (not a combination of both).

### 5720 Series

URPF mode	IPv6 mode	IPv4	IPv6 (prefix less than 64)	IPv6 (prefix greater than 64)
No	No	5720MW Series models: 16K 5720MXW Series models: 24K	5720MW Series models: 8K 5720MXW Series models: 12K	n/a

# Distributed Virtual Routing (DvR)

### Note

Feature support differs across platforms. For more information, see *Fabric Engine and VOSS Feature Matrix*.

Local hosts use ARP entries and remote hosts use host entries. For information on IP ARP scaling, see IP Unicast on page 54.

4220 Series Filter Scaling Scaling Scaling

## 4220 Series Filter Scaling

This section provides more details on filter scaling numbers.

The switch supports the following maximum limits:

- 512 non-IPv6 ingress ACLs (inPort, inVSN, or inVlan):
  - 512 ACLs with 1 ACE each that can hold either Security/QoS/both action types or
  - a combination based on the following rule: ( (num ACLs + num ACEs) <= 1024)</li>

This maximum implies a VLAN member count of 1 for inVlan ACLs or a single I-SID for inVSN. The number of rules consumed by IPv4 inPort ACLs is not multiplied by the number of ports to which this ACL applies.

- Up to 1000 ACEs in a single ACL
- 512 IPv6 ingress ACLs (inPort):
  - 512 ACLs with 1 ACE each that can hold either Security/QoS/both action types or
  - a combination based on the following rule: (num ACLs + num ACEs) <= 1024</li>

This maximum also implies a port member count of 1 for the inPort ACL. The number of rules consumed by IPv6 inPort ACL is multiplied by the number of ports to which this ACL applies.

1024 ingress ACEs: All ACEs can hold either Security/QoS/both action types

This maximum also implies a VLAN member count of 1 for an inVlan ACL.

190 egress ACEs

This maximum also implies a port member count of 1 for the outPort ACL.

### 5320 Series Filter Scaling

This section provides more details on filter scaling numbers.

5320-16P-4XE and 24-Port Models

The 5320-16P-4XE and all 24-port models support the following maximum limits:

- 512 non-IPv6 ingress ACLs (inPort, inVSN, or inVlan):
  - 512 ACLs with 1 ACE each that can hold either Security/OoS/both action types or
  - a combination based on the following rule: ( (num ACLs + num ACEs) <= 1024)</li>

This maximum implies a VLAN member count of 1 for inVlan ACLs or a single I-SID for inVSN. The number of rules consumed by IPv4 inPort ACLs is not multiplied by the number of ports to which this ACL applies.

- Up to 1000 ACEs in a single ACL
- 512 IPv6 ingress ACLs (inPort):
  - 512 ACLs with 1 ACE each that can hold either Security/QoS/both action types or
  - a combination based on the following rule: (num ACLs + num ACEs) <= 1024</li>

This maximum also implies a port member count of 1 for the inPort ACL. The number of rules consumed by IPv6 inPort ACL is multiplied by the number of ports to which this ACL applies.

1024 ingress ACEs: All ACEs can hold either Security/QoS/both action types

This maximum also implies a VLAN member count of 1 for an inVlan ACL.

190 egress ACEs

This maximum also implies a port member count of 1 for the outPort ACL.

5320-16P-2MXT-2X and 48-Port Models

The 48-port models support the following maximum limits:

#### Note

5320-16P-2MXT-2X supports the same formulas but with different maximum values. See maximum values in Filters, QoS, and Security on page 86.

- 512 non-IPv6 ingress ACLs (inPort, inVSN, or inVlan):
  - 512 ACLs with 5 ACEs each that can hold either Security/QoS/both action types or
  - a combination based on the following rule: ( (num ACLs + num ACEs) <= 3072)</li>

This maximum implies a VLAN member count of 1 for inVlan ACLs or a single I-SID for inVSN. The number of rules consumed by IPv4 inPort ACLs is not multiplied by the number of ports to which this ACL applies.

- Up to 1000 ACEs in a single ACL
- 512 IPv6 ingress ACLs (inPort):
  - 512 ACLs with 5 ACEs each that can hold either Security/QoS/both action types or
  - a combination based on the following rule: (num ACLs + num ACEs) <= 3072</li>

This maximum also implies a port member count of 1 for the inPort ACL. The number of rules consumed by IPv6 inPort ACL is multiplied by the number of ports to which this ACL applies.

• 1024 ingress ACEs: All ACEs can hold either Security/QoS/both action types

This maximum also implies a VLAN member count of 1 for an inVlan ACL.

400 egress ACEs

This maximum also implies a port member count of 1 for the outPort ACL.

### 5420 Series Filter Scaling

This section provides more details on filter scaling numbers.

The switch supports the following maximum limits:

- 512 non-IPv6 ingress ACLs (inPort, inVSN, or inVlan):
  - 512 ACLs with 3 Primary Bank ACEs each OR
  - 512 ACLs with 1 Security Bank ACE each OR

5520 Series Filter Scaling Scaling

- a combination based on the following rule:
  - ((num ACLs + num Primary Bank ACEs) <= 2048) <= ((num ACLs + num Secondary Bank ACEs) <= 1024)</li>

This maximum implies a VLAN member count of 1 for inVlan ACLs or a single I-SID for inVSN. The number of rules consumed by IPv4 inPort ACLs is not multiplied by the number of ports to which this ACL applies.

- Up to 1000 ACEs in a single ACL
- 512 IPv6 ingress ACLs (inPort):
  - 512 ACLs with 1 ACE each OR
  - a combination based on the following rule:
    - (num ACLs + num IPv6 ACEs + num IPv4 Secondary Bank ACEs) <= 1024</li>

This maximum also implies a port member count of 1 for the inPort ACL. The number of rules consumed by IPv6 inPort ACLs is multiplied by the number of ports to which this ACL applies.

• 3072 ingress ACEs:

Theoretical maximum of 1024 implies 1 ingress ACL with 512 Primary Bank ACEs and 512 Secondary Bank ACEs

 Ingress ACEs supported: (2048 (Primary Bank) - # of ACLs) + (1024 (Secondary Bank) - # of ACLs)

This maximum also implies a VLAN member count of 1 for an inVlan ACL.

• 400 egress ACEs:

Theoretical maximum of 400 implies 1 egress ACL with 400 ACEs

• Egress ACEs supported: 400 - # of ACLs.

This maximum also implies a port member count of 1 for the outPort ACL.

### 5520 Series Filter Scaling

This section provides more details on filter scaling numbers.

The switch supports the following maximum limits:

- 512 non-IPv6 ingress ACLs (inPort, inVSN, or inVlan):
  - 512 ACLs with 1 Primary ACE each OR
  - 256 ACLs with 1 Secondary ACE each OR
  - a combination based on the following rule:
    - ((num ACLs + num Primary Bank ACEs) <= 1024) && ((num ACLs + num Secondary Bank ACEs) <= 512)</li>

This maximum implies a VLAN member count of 1 for inVlan ACLs or a single I-SID for inVSN. The number of rules consumed by IPv4 inPort ACLs is not multiplied by the number of ports to which this ACL applies.

- Up to 1000 ACEs in a single ACL
- 512 IPv6 ingress ACLs (inPort):
  - 512 ACLs with 1 ACE each OR
  - · a combination based on the following rule:
    - (num ACLs + num ACEs + num IPv4 Security Bank ACEs) <= 512</li>

The number of rules consumed by IPv6 ingress ACLs inPort ACLs is multiplied by the number of ports to which this ACL applies.

- 124 egress ACLs (outPort only):
  - ° 124 ACLs with 1 ACE each (one of these ACLs can have 2 ACEs) OR
  - a combination based on the following rule:
    - (num ACLs + num ACEs) <= 248

This maximum implies a port member count of 1 for outPort ACLs.

- 1536 ingress ACEs:
  - Ingress ACEs supported: (1024 (Primary Bank) # of ACLs) + (512 (Secondary Bank)
     # of ACLs)
- 247 egress ACEs:
  - Egress ACEs supported: 248 # of ACLs

This maximum also implies a port member count of 1 for the outPort ACL.

### 5720 Series Filter Scaling

This section provides more details on filter scaling numbers.

5720-24MW and 5720-48MW

The switch supports the following maximum limits:

- 512 non-IPv6 ingress ACLs (inPort, inVSN, or inVlan):
  - 512 ACLs with 5 Primary Bank ACEs each OR
  - 512 ACLs with 2 Secondary Bank ACEs each OR
  - a combination based on the following rule:
    - ( (num ACLs + num Primary Bank ACEs) <= 3072) && ((num ACLs + num Security Bank ACEs) <= 1536)</li>

This maximum implies a VLAN member count of 1 for inVlan ACLs or a single I-SID for inVSN.

The number of rules consumed by IPv4 inPort ACLs is not multiplied by the number of ports to which this ACL applies.

• You can configure up to 1000 ACEs in a single ACL.

5720 Series Filter Scaling Scaling

- 512 IPv6 ingress ACLs (inPort):
  - 512 ACLs with 2 ACEs each OR
  - · a combination based on the following rule:
    - (num ACLs + num ACEs + num of IPv4 Security Bank ACEs) <= 1536</li>

The number of rules consumed by IPv6 inPort ACLs is multiplied by the number of ports to which this ACL applies.

- 256 egress ACLs (outPort only):
  - 10R
  - · a combination based on the following rule:
    - (num ACLs + num ACES) <=2982
- 4608 ingress ACEs

Ingress ACEs supported: (3072 Primary Bank - num ACLs) + (1536 Secondary Bank - num ACEs)

· 2982 egress ACEs

Egress ACEs supported: 2982 - num ACLs

5720-24MXW and 5720-48MXW

The switch supports the following maximum limits:

- 512 non-IPv6 ingress ACLs (inPort, inVSN, or inVlan):
  - 512 ACLs with 7 Primary Bank ACEs each OR
  - 512 ACLs with 3 Secondary Bank ACEs each OR
  - a combination based on the following rule:
    - ((num ACLs + num Primary Bank ACEs) <= 4096) && ((num ACLs + num Security Bank ACEs) <= 2048)</li>

This maximum implies a VLAN member count of 1 for inVlan ACLs or a single I-SID for inVSN.

The number of rules consumed by IPv4 inPort ACLs is not multiplied by the number of ports to which this ACL applies.

- You can configure up to 1000 ACEs in a single ACL.
- 512 IPv6 ingress ACLs (inPort):
  - 512 ACLs with 3 ACEs each OR
  - a combination based on the following rule:
    - (num ACLs + num ACEs + num of IPv4 Security Bank ACEs) <= 2048</li>

The number of rules consumed by IPv6 inPort ACLs is multiplied by the number of ports to which this ACL applies.

- 256 egress ACLs (outPort only):
  - 10R

- a combination based on the following rule:
  - (num ACLs + num ACES) <=6000</li>
- 6144 ingress ACEs

Ingress ACEs supported: (4096 Primary Bank - num ACLs) + (2048 Secondary Bank - num ACEs)

6000 egress ACEs

Egress ACEs supported: 6000 - num ACLs

## 7520 Series Filter Scaling

This section provides more details on filter scaling numbers.

The switch supports the following maximum limits for ACL scaling:

- 512 non-IPv6 ingress ACLs (inVSN, inPort, or inVlan):
  - 256 ACLs with 1 Primary ACE each + 256 ACLs with 1 Secondary ACE each OR
  - 383 ACLs with 1 Primary ACE each and/or 1 Secondary ACE each OR
  - · a combination based on the following rule:
    - num ACLs <= 512 && (num ACLs + num Primary ACEs) <= 767 && (num ACLs + num Secondary ACEs) <= (767 X) where X = num IPv6 ACLs + num IPv6 ACEs</li>

For Primary bank, maximum implies a single port on inPort ACLs, a single I-SID for in VSN, and a single VLAN on inVlan ACLs.

For Secondary bank, inPort ACLs number of consumed rules is not multiplied by the number of ports attached to the ACL.

- 383 IPv6 ingress ACLs (inPort):
  - 383 IPv6 ACLs with 1 ACE each OR
  - A combination based on the following rule:
    - num IPv6 ACLs <= 383 && (num IPv6 ACLs + num ACEs) <= (767 X) where X = num non-IPv6 ACLs + num non-IPv6 Secondary ACEs</li>

This maximum implies a single port on inPort ACLs.

- 254 non-IPv6 egress ACLs (outPort):
  - 254 ACLS with 1 Security ACE each OR
    - A combination based on the following rule:
      - num ACLs <= 254 && (num ACLs + num Security ACEs) <= 508</li>

This maximum implies a single port on outPort ACLs.

- · 256 IPv6 Egress ACLs (outPort):
  - 256 ACLS with 1 Security ACE each OR
  - A combination based on the following rule:
    - num ACLs <= 256 && (num ACLs + num Security ACEs) <= 512</li>

7720 Series Filter Scaling Scaling Scaling

This maximum implies a single port on outPort ACLs.

The switch supports the following maximum limits for ACE scaling:

• 1,532 non-IPv6 ingress ACEs

This theoretical maximum implies

- 2 non-IPv6 ingress ACL with 383+384 Primary ACEs and 383+384 Secondary ACEs
- no IPv6 ACLs configured
- a single port on inPort ACLs, and a single VLAN on inVLAN ACLs
- 767 IPv6 ingress ACEs

This theoretical maximum implies

- 1 IPv6 ingress ACL with 767 Security ACEs
- no non-IPv6 ACLs configured
- · a port member count of 1 for inPort ACLs
- 783 non-IPv6 egress ACEs.

This theoretical maximum implies

- 1 egress ACL with 783 Security ACEs
- a port member count of 1 for outPort ACLs
- Non IPv6 egress ACEs supported: 783 num non-IPv6 egress ACLs
- 511 IPv6 egress ACEs

This theoretical maximum implies

- 1 egress ACL with 511 Security ACEs
- a port member count of 1 for outPort ACLs
- 511 num IPv6 egress ACLs

### 7720 Series Filter Scaling

This section provides more details on filter scaling numbers.

The switch supports the following maximum limits for ACL scaling:

- 512 non-IPv6 ingress ACLs (inVSN, inPort, or inVlan):
  - 256 ACLs with 1 Primary ACE each + 256 ACLs with 1 Secondary ACE each OR
  - 383 ACLs with 1 Primary ACE each and/or 1 Secondary ACE each OR
  - · a combination based on the following rule:
    - num ACLs <= 512 && (num ACLs + num Primary ACEs) <= 767 && (num ACLs + num Secondary ACEs) <= (767 X) where X = num IPv6 ACLs + num IPv6 ACEs</li>

For Primary bank, maximum implies a single port on inPort ACLs, a single I-SID for in VSN, and a single VLAN on inVlan ACLs.

For Secondary bank, inPort ACLs number of consumed rules is not multiplied by the number of ports attached to the ACL.

- 383 IPv6 ingress ACLs (inPort):
  - 383 IPv6 ACLs with 1 ACE each OR
  - A combination based on the following rule:
    - num IPv6 ACLs <= 383 && (num IPv6 ACLs + num ACEs) <= (767 X) where X = num non-IPv6 ACLs + num non-IPv6 Secondary ACEs</li>

This maximum implies a single port on inPort ACLs.

- 254 non-IPv6 egress ACLs (outPort):
  - 254 ACLS with 1 Security ACE each OR
    - A combination based on the following rule:
      - num ACLs <= 254 && (num ACLs + num Security ACEs) <= 508

This maximum implies a single port on outPort ACLs.

- 256 IPv6 Egress ACLs (outPort):
  - 256 ACLS with 1 Security ACE each OR
  - A combination based on the following rule:
    - num ACLs <= 256 && (num ACLs + num Security ACEs) <= 512</li>

This maximum implies a single port on outPort ACLs.

The switch supports the following maximum limits for ACE scaling:

• 1,532 non-IPv6 ingress ACEs

This theoretical maximum implies

- 2 non-IPv6 ingress ACL with 383+384 Primary ACEs and 383+384 Secondary ACEs
- no IPv6 ACLs configured
- a single port on inPort ACLs, and a single VLAN on inVLAN ACLs
- 767 IPv6 ingress ACEs

This theoretical maximum implies

- 1 IPv6 ingress ACL with 767 Security ACEs
- no non-IPv6 ACLs configured
- a port member count of 1 for inPort ACLs
- 783 non-IPv6 egress ACEs.

This theoretical maximum implies

- 1 egress ACL with 783 Security ACEs
- a port member count of 1 for outPort ACLs
- Non IPv6 egress ACEs supported: 783 num non-IPv6 egress ACLs
- 511 IPv6 egress ACEs

7830 Series Filter Scaling Scaling Scaling

This theoretical maximum implies

- 1 egress ACL with 511 Security ACEs
- a port member count of 1 for outPort ACLs
- 511 num IPv6 egress ACLs

## 7830 Series Filter Scaling

This section provides more details on filter scaling numbers.

The switch supports the following maximum limits for ACL scaling:

4092 ingress ACEs

((num ACLs + num Primary Bank ACEs) <= 2046) <= ((num ACLs + num Secondary Bank ACEs) <= 2046)

# Routed Private VLANs/E-TREEs Impact on Filter Scaling

The number of private VLANs that you configure with an IP address influences the IPv4 Egress ACE count.

The following table lists scaling limits for Routed Private VLANs/E-TREEs. Limits are not enforced; either number of private VLANs or number of private VLAN trunk ports can go beyond the recommended values.

Table 38: Routed Private VLANs/E-TREEs Maximums

	Private VLAN trunk ports	Routed PVLANs/E-TREEs	IPv4 Egress ACE rules available (No IPv6 egress filter bootflag enabled)	IPv4 Egress ACE rules available (With IPv6 egress filter bootflag enabled)
5320-24T-24S-4XE- XT 5320-48T-8XE 5320-48P-8XE	4	10	349	93
5320-16P-4XE 5320-16P-4XE-DC 5320-16P-2MXT-2X 5320-24P-8XE 5320-24T-8XE	4	10	139	11
5420 Series	4	10	349	93
5520 Series	4	10	285	29
5720-24MW 5720-48MW	4	100	2499	999
5720-24MXW 5720-48MXW	4	100	5499	2499

	Private VLAN trunk ports	Routed PVLANs/E- TREEs	IPv4 Egress ACE rules available (No IPv6 egress filter bootflag enabled)	IPv4 Egress ACE rules available (With IPv6 egress filter bootflag enabled)
7520 Series	4	50	783	271
7720 Series	4	50	783	271
7830 Series	N/A	N/A	N/A	N/A

Use the **show io resources filter** command to verify remaining resources. This command displays the following information:

- resources consumed by Routed Private VLANs
- free entries available for either IPv4 Egress ACEs or private VLANs

The following example output displays resource usage on a 5320 Series switch with one Routed Private VLAN and one outPort ACL.

# Routed Private VLANs/E-TREEs Impact on Filter Scaling

The number of private VLANs that you configure with an IP address influences the IPv4 Egress ACE count.

The following table lists scaling limits for Routed Private VLANs/E-TREEs. Limits are not enforced; either number of private VLANs or number of private VLAN trunk ports can go beyond the recommended values.

Table 40: Routed Private VLANs/E-TREEs Maximums

	Private VLAN trunk ports	Routed PVLANs/E- TREEs	IPv4 Egress ACE rules available (No IPv6 egress filter bootflag enabled)	IPv4 Egress ACE rules available (With IPv6 egress filter bootflag enabled)
5320-24T-24S-4XE- XT 5320-48T-8XE 5320-48P-8XE	4	10	349	93
5320-16P-4XE 5320-16P-4XE-DC 5320-16P-2MXT-2X 5320-24P-8XE 5320-24T-8XE	4	10	139	11
5420 Series	4	10	349	93
5520 Series	4	10	285	29
5720-24MW 5720-48MW	4	100	2499	999
5720-24MXW 5720-48MXW	4	100	5499	2499
7520 Series	4	50	783	271
7720 Series	4	50	783	271
7830 Series	N/A	N/A	N/A	N/A

Use the **show io resources filter** command to verify remaining resources. This command displays the following information:

- resources consumed by Routed Private VLANs
- free entries available for either IPv4 Egress ACEs or private VLANs

The following example output displays resource usage on a 5320 Series switch with one Routed Private VLAN and one outPort ACL.

```
Switch:1>show io resources filter

FILTER TABLE

ACL Filter Resource Manager stats

BCM CAP Group: | ICAP_SEC_QOS | ICAP_IPv6 | ECAP_SEC | ECAP_IPv6

Group Mode: | Double | Double | Double
```

```
Total Entries: | 1024 | 1024 | 247 | 128

7720 Series		500/1,000	2,000	12,000	4,000	6,000
7830 Series		2,000	2,000	3,000	N/A	N/A

- 1. Node scaling—refers to the enabled state of the **boot configuration flags spbm-node-scaling** command, if applicable. For 5320 Series and 5420 Series using Fabric Extend or vIST, it is a best practice to enable this command.
- 2. SPBM nodes—refers to the number of supported SPBM enabled nodes, both BEB and BCB. When different, the number is formatted as per area/total per device. For 5420 Series, this number is impacted by vIST.
- 3. Total unicast BMACs—refers to the total number, both virtual and physical, this node can share services with. This number includes Layer 2 VSNs, Layer 3 VSNs, E-TREE, Multicast, and Transparent Port UNI. For 5420 Series, this number is impacted by vIST.
- 4. Switched UNI endpoints—refers to the maximum local tagged and untagged endpoints, either manual, RADIUS, or FA-assigned. When different, the number is formatted based on the configuration of the **boot config flags macsec** command: enabled/disabled.
- 5. Multicast Data I-SIDs—refers to the maximum Layer 2 or Layer 3, dynamic and static originated data I-SIDs. The overall limits are across all locally configured Layer 2 VSNs

Multi-area SPB Maximums Scaling

The following table provides numbers for 5320 Series and 5420 Series only, to reflect the impact of the **boot configuration flags spbm-node-scaling** command, if supported.

Table 44: Maximum remote multicast sender nodes and local I-SIDs

Device	Node scaling <sup>1</sup>	Total remote multicast sender nodes <sup>2</sup>	Total local I-SIDs <sup>3</sup>
4220 Series	n/a	64	64
5320-24T-4X- XT	n/a	64	64
5320-16P-2MXT -2X	n/a	128	128
Other 5320 Series	Enabled	200	16- and 24-port models: 274 48-port models: 500
	Disabled	150	16- and 24-port models: 274 48-port models: 564
5420 Series	Enabled	200	500
	Disabled	150	564

- Node scaling—refers to the enabled state of the boot configuration flags spbm-nodescaling command. For 5320 Series and 5420 Series using Fabric Extend or vIST, it is a best practice to enable this command.
- 2. Total remote multicast sender nodes—refers to the total number of nodes that send IP multicast streams that the local BEB receives. This space is shared with unicast BMACs in the preceding table. Documented limits are individual in isolation; introducing vIST clusters or nodes that advertise IP multicast streams decreases the total number of physical nodes in an area.
- 3. Total local I-SIDs— refers to the total for Layer 2, Layer 3, and Multicast. On 48-port switches, which includes 5320-24T-24S-4XE-XT, with node-scaling enabled, a number of Layer 2 VSN entries equal to the number of ports is reserved for Switched UNI untagged endpoints.

#### Multi-area SPB Maximums

**Table 45: Multi-area SPB Maximums** 

Scaling	5520 Series	5720 Series	7520 Series	7720 Series	7830 Series
Number of nodes that can function as Multi-area SPB boundary nodes between two areas	2	2	4 in a non-vIST configuration, 2 in a vIST configuration	4 in a non-vIST configuration, 2 in a vIST configuration	N/A
SPBM enabled nodes per area	500	500	500	500	N/A
SPBM total nodes home + remote	650	650	1,000	1,000	N/A

Table 45: Multi-area SPB Maximums (continued)

Scaling	5520 Series	5720 Series	7520 Series	7720 Series	7830 Series
I-SIDs supported on boundary nodes (no local UNI present on device)	2,000	2,000	9,600	9,600	N/A
Maximum number of inter-area redistributed Layer 2 VSNs (no local UNI present on Boundary Node)	2,000	2,000	9,600	9,600	N/A
Maximum number of IP multicast S,Gs when operating as a boundary node (inter-area)	1,600	1,600	4,800	4,800	N/A
DvR host routes redistributed across area boundary	n/a	6,000	13,900	13,900	N/A
SPBM multicast-FIB entries	10,000	20,000	35,000	35,000	N/A

Number of I-SIDs Supported for the Number of Configured IS-IS Interfaces and Adjacencies

The number of I-SIDs supported depends on the number of IS-IS interfaces and adjacencies (NNIs) configured.

The following table shows the number of UNI I-SIDs supported per BEB. UNI I-SIDs are used for Layer 2 VSN, Layer 3 VSN, Transparent-UNI, E-Tree, Switched-UNI and S, G for Multicast.

Number of IS-IS interfaces (NNIs)	Product	I-SIDs with vIST configured on the platform	I-SIDs without vIST configured on the platform
4	4220 Series	n/a	64
	5320 Series	n/a	500 5320-16P-2MXT-2X supports a maximum of 128 5320-24T-4X-XT supports a maximum of 64

#### Interoperability Considerations for IS-IS External Metric

BEBs running VOSS 5.0 can advertise routes into IS-IS with the metric type as external. They can also correctly interpret route advertisements with metric type external received by means of IS-IS. In an SPB network with a mix of products running different versions of software releases, you must take care to ensure that turning on the ability to use metric-type external does not cause unintended loss of connectivity.

Note the following before turning on IS-IS external metric if the SPB network has switches running a release prior to VOSS 5.0:

- There are no special release or product type implications if the switch does not have IP Shortcuts or Layer 3 VSN enabled. For example, this applies to Layer 2 only BEBs and BCBs.
- There are no special release or product type implications if the Layer 3 VSN in which
  routes are being advertised with a metric-type of external is not configured on the
  switch.
- If a switch running a VOSS release that is prior to VOSS 5.0 but VOSS 4.2.1 or later, it will treat all IS-IS routes as having metric-type internal, regardless of the metric-type (internal or external) used by the advertising BEB in its route advertisement.
- Switches running VSP 9000 Series release 4.1.0.0 or later will treat all IS-IS routes as having metric-type internal, regardless of the metric-type (internal or external) used by the advertising BEB in its route advertisement.
- Switches running VOSS releases prior to 4.2.1.0 might not correctly install IS-IS routes in a Layer 3 VSN if any routes advertised with metric-type external are advertised in that Layer 3 VSN by other BEBs in the network. Layer 3 VSNs in which there are no routes with an external metric-type will not be impacted. Similar note applies to the GRT.
- Switches running VSP 9000 Series releases prior to 4.1.0.0 might not correctly install IS-IS routes in a Layer 3 VSN if any routes advertised with metric-type external are advertised in that Layer 3 VSN by other BEBs in the network. Layer 3 VSNs in which there are no routes with an external metric-type will not be impacted. Similar note applies to GRT.

Recommendations Scaling

#### Recommendations

This section provides recommendations that affect feature configuration.

Pay special attention to the expected scaling of routes in the network and the number of OSPF neighbors in a single VRF when you select configuration values for the isis 11-hellointerval and isis 11-hello-multiplier commands on IS-IS interfaces. The default values for these commands work well for most networks, including those using moderately-scaled routes.

The default values work well for 16,000 routes and 64 OSPF neighbors in a single VRF. However, in highly-scaled networks, you might need to configure higher values for these commands.

For example, if the total number of non IS-IS routes on a given BEB exceeds 16,000 in combination with approximately 128 OSPF neighbors in a single VRF, you should configure a value of 12 for **isis 11-hellomultiplier**, instead of using the default value of 3.

## **VRF** Scaling

By default, the system reserves VLAN IDs 4060 to 4094 for internal use. If you enable both the VRF scaling and the SPBM mode boot configuration flags, the system reserves additional VLAN IDs (3500 to 3998) for internal use.

By default, VRF scaling is disabled and SPBM mode is enabled. When VRF scaling is disabled, you can have a maximum of 24 VRFs, depending on platform maximums.

The boot config flag vrf-scaling command does not apply to 4220 Series.

For the 5320 Series, only the following models support more than one VRF with IP configuration:

- 5320-16P-2MXT-2X
- 5320-24T-4X-XT
- 5320-24T-24S-4XE-XT
- 5320-48P-8XE
- 5320-48T-8XE

Of the preceding 5320 Series models, the **boot config flag vrf-scaling** command does not apply to 5320-16P-2MXT-2X or 5320-24T-4X-XT.

# **Important Notices**

Platform Overview and Integration Updates on page 121 Licensing on page 122 Management CLIP Preferred for Management Client Applications on page 122 Memory Usage on page 123

Unless specifically stated otherwise, the notices in this section apply to all platforms.

## Platform Overview and Integration Updates

This section outlines the capabilities, integrations, and version-specific updates across the following Extreme Networks core platforms.

#### ExtremeCloud™ IQ

ExtremeCloud IQ is a cloud-managed networking solution that delivers unified, full-stack management for wireless access points, switches, and routers. It supports:

- Device onboarding and configuration
  - Real-time monitoring and troubleshooting
  - Advanced reporting and analytics

Leveraging machine learning and artificial intelligence, ExtremeCloud IQ processes millions of data points—from the network edge to the data center—to generate actionable insights and enable intelligent automation across the network.

Switches running Fabric Engine support zero touch connection to ExtremeCloud IQ. Zero touch deployment with ExtremeCloud IQ simplifies and accelerates device provisioning and configuration.

Fabric Engine 9.3 was successfully tested with ExtremeCloud IQ version 25.0.0.

The switch software integrates with ExtremeCloud IQ using IQAgent.

### ExtremeCloud IQ Site Engine

ExtremeCloud IQ Site Engine extends cloud management capabilities to the network infrastructure, offering enhanced visibility and control. ExtremeCloud IQ Site Engine version 22.3 or later is required to recognize devices running Fabric Engine. Earlier versions, including Extreme Management Center, do not recognize devices running Fabric Engine.

Zero Touch Provisioning Plus (ZTP+) enables you to deploy and configure switches in ExtremeCloud IQ Site Engine with minimal server configuration and intervention. In this release, Zero Touch Provisioning Plus was successfully tested with ExtremeCloud IQ Site Engine 25.8.10.50.

Fabric Engine 9.3 was successfully tested with ExtremeCloud IQ Site Engine version 25.8.10.

### Extreme Platform ONE Networking

Extreme Platform ONE Networking provides a unified foundation for integrating various Extreme applications, including ExtremeCloud IQ, Universal ZTNA, ExtremeCloud SD-WAN, and Extreme Intuitive Insights into a single, Al-powered platform that simplifies network deployment, management, and security.

Fabric Engine 9.3 was successfully tested with Extreme Platform ONE Networking version 25.5.0.

## Licensing

Because the hardware supports more than one Network Operating System (NOS) personality, it uses a licensing scheme that is NOS agnostic.

Table 46: Licensing model by platform

Platform	Model
4220 Series	The 4220 Series supports a subscription- licensing model. These switches do not support an on-switch licensing model.
5000 Series 7x20 Series 7830 Series	The switches support an on-switch licensing model that includes Base, Premier, and MACsec licenses. Premier and MACsec licenses enable use of advanced features not available in the Base License. To see which features a platform supports, see <i>Fabric Engine and VOSS Feature Matrix</i> .  These switches are also subscriptionlicense aware. Subscription licenses enable use of Premier features.

For more information about licensing including feature inclusion, order codes, and how to load a license file on the switch, see *Fabric Engine User Guide*.

## Management CLIP Preferred for Management Client Applications

If you configure both a Management VLAN in routing mode and a Management CLIP, the switch prefers the Management CLIP when it selects the source IP address and outgoing interface for traffic initiated by management client applications, for example RADIUS reachability. For management client traffic, ensure connectivity exists in the Management CLIP context.

Important Notices Memory Usage

## Memory Usage

These switches intentionally reboot when memory usage on the switch reaches 95%.

# **Known Issues and Restrictions**

Known Issues for this Release on page 124 Restrictions and Expected Behaviors on page 135

This section details the known issues and restrictions found in this release. Where appropriate, use the workarounds provided.

## Known Issues for this Release

This section identifies the known issues in this release.

Issue number	Description	Workaround
CFD-12633	In rare cases on 5420F-16MW-32P-4XE, Power over Ethernet (PoE) can stop working following a software upgrade from Release 8.8.x and earlier. This issue is caused by a firmware update or initialization error during the upgrade process.  POE ERROR POE Board Initialization failure (unable to download firmware POE is OUT OF SERVICE)	As a workaround to restore PoE functionality, you can either power cycle the switch or downgrade the software to Release 8.8.x.
CFD-13592	Multi-rate ports can stop working if frequent autonegotiation changes on that port. This is specific to Flex-UNI ports when the I-SID they are part of has no platform VLAN associated. This issue can affect the first 16 ports of 5420F-16MW-32P-4XE or 5420M-16MW-32P-4YE.	To avoid this issue, associate a platform VLAN to the I-SID. If the multi-rate ports have stopped working, reboot the switch to restore functionality.

Issue number	Description	Workaround
CFD-13825	In a scaled environment with a large number of OSPF routes, a race condition exists when you apply redistribution commands back-to-back for multiple source control protocols, which can result in an incorrect route reference counter. Subsequent loss of an impacted route results in traffic not rerouting properly.	To avoid this issue, wait several seconds between using the ip ospf apply redistribute <protocol> or ip ospf apply redistribute <protocol> vrf <vrf_name> commands. Alternatively, apply redistribution without specifying a source protocol using the ip ospf apply redistribute or ip ospf apply redistribute vrf <vrf_name>commands.</vrf_name></vrf_name></protocol></protocol>
CFD-14065	In environments using ECMP (Equal-Cost Multi-Path) routing for the default route (0.0.0.0/0), traffic can be incorrectly routed when a lower cost route replaces an existing one.	As a workaround, workaround, disable IP routing (no ip routing) and then issue the ip routing command to reenable IP routing.
	HTTPS connection fails for CA-signed certificate with certificate inadequate type error on FF.	Ensure End-Entity, Intermediate CA and Root CA certificates are all SHA256 based and RSA2048 key signed, and Extended key usage field is set to TLS webserver Auth only for subject and root. For intermediate, it must be set with other required bits to avoid this issue. Add the root, intermediate CAs in the trust store of the browser for accessing the EDM with HTTPS.
VOSS-1285	CAKs are not cleared after setting the device to factory-default.	None. Currently this is the default behavior and does not affect functionality of the MACsec feature.

Issue number	Description	Workaround
VOSS-1358	Traffic is forwarded to IGMP v2 SSM group, even after you delete the IGMP SSM-map entry for the group.	If you perform the delete action first, you can recreate the SSM-map record, and then disable the SSM-map record. The disabled SSM-map record causes the receiver to timeout because any subsequent membership reports that arrive and match the disabled SSM-map record are dropped. You can delete the SSM-map record after the receivers time out.
VOSS-2285	When on BEB, continuously pinging IPv6 neighbor address using CLI command ping -s, ping packets do not drop, but instead return no answer messages.	Restart the ping. Avoid intensive CPU processing.
VOSS-2333	Layer 2 ping to Virtual BMAC (VBMAC) fails, if the VBMAC is reachable using Layer 2 core.	None.
VOSS-7457	The switch can experience an intermittent traffic loss after you disable a Fabric Extend tunnel.	Bounce the tunnel between the devices.
VOSS-7472	EDM shows incorrect guidance for ACL TCP flag mask. EDM reports 063 as hexadecimal. CLI correctly shows <0-0x3F   0-63> Mask value <hex decimal=""  ="">. This is a display issue only with no functional impact.</hex>	Use CLI to see the correct unit values.
VOSS-10815	DvR over SMLT: Traffic is lost at failover on SMLT towards ExtremeXOS or Switch Engine switches. DvR hosts are directly connected to the DvR controllers vIST pair on SMLT LAG and switched-UNIs are dynamically added using Fabric Attach. Only occurs when the access SMLT is LACP MLT and all the ports in the MLT are down.  When all ports in the MLT down and an ARP request is received over an NNI link, there is no physical port that can be associated with the ARP request. The ARP entry is learned against NNI link, and MAC syncs from vIST peer or from a non-vIST peer when bouncing vIST.	None.
VOSS-11895	In a vIST SMLT environment where streams are both local and remote, if source and receiver port links are removed and reinserted several times, eventually traffic will not be forwarded to local single-homed receivers on one peer if the traffic is ingressing from the vIST peer over the NNI link. If the stream ingresses locally, it is received by the local UNI receivers.	Disable and re-enable Fabric Multicast (spbm <1-100> multicast enable) on the source VLAN to be able to delete the streams and come back in properly.

Issue number	Description	Workaround
VOSS-12330	When accessing the on-switch RESTCONF API documentation in a web browser, the page does not render correctly.	Ensure you include the trailing slash (/) in the URL: http(s):// <ip-address>:8080/apps/restconfdoc/. For more information, see Fabric Engine User Guide.</ip-address>
VOSS-13667	An intermittent issue in SMLT environments, where ARPs or IPv6 neighbors are resolved with delay can cause a transient traffic loss for the affected IPv6 neighbors. The situation auto-corrects.	None.
VOSS-15079	The Extreme Networks 10 meter SFP+ passive copper DAC (Model Number 10307) does not function on ports 2/3 and 2/4 of the VIM5-4X.	Use the Extreme Networks SFP+ active optical DAC (Model Number AA1403018-E6) with the VIM5-4X.
VOSS-15391	An SNMP walk on the rcIgmpSnoopTraceTable table will fail with an OID not increasing error. CLI and EDM are unaffected by this issue.	None.
VOSS-15541	You can experience temporary traffic loss when shutting down an LACP SMLT port (and therefore causing the local SMLT to go down), in a network with scaled Multicast traffic over an SPB cloud, while the datapath processes all dpm letter messages during LCAP recovery. This slow LACP recovery situation is only seen with scaled Multicast traffic over an SPB cloud.	Use static MLTs.

Issue number	Description	Workaround
VOSS-15812	Layer 3VSN IPv4 BGP (and static) routes having their next-hops resolved using IS-IS routes could result in traffic loss.	Choose the following workarounds, based on your deployment and needs:  Use static routes to reach the loopbacks used as BGP peers, (static routes having better preference than IS-IS); use static routes with next-hops reachable on the UNI side (L2VSN).  Use OSPF to reach the loopbacks used as BGP peers, but take care to ensure that the OSPF route towards the BGP peer is chosen as the "best route" (as IS-IS has a better preference than OSPF). There are several ways to accomplish this—either don't redistribute that route in IS-IS if it is not needed, or control the redistribution with a route-map, etc.  Have BGP peers reachable directly using a C-VLAN; do not use loopback interfaces as BGP peer addresses.  If none of the workaround scenarios are suitable for your deployment, do not use internal Border Gateway Protocol (iBGP) peering.
VOSS-15878	VSP 4900 Series and VSP 7400 Series do not boot with just the serial console cable connected and no terminating device, for example, a terminal server, PC, or Mac.	Either attach terminal equipment or disconnect the console cable.
VOSS-16971	On VSP4900-24S, VSP4900-24XE, and VSP4900-12MXU-12XE devices, and on the VIM5-4XE, if a copper SFP is plugged in with the cable inserted and the remote end is also plugged in, the peer box could see a link flap and take 6-8 seconds to link up.	First, plug in the SFP, and then insert the cable. The link up then happens in 3-4 seconds.

Issue number	Description	Workaround
VOSS-19260	Port mirroring does not work on port 1/s1 of VSP 7400-48Y if the connection type is OVS/SR-IOV.	Use a connection type of VT-d for port 1/s1.
VOSS-20455	As the switch starts, it can display the following log messages due to incomplete initialization of the management stack when trying to send the first RADIUS packet:  1 2021-02-17T23:32:16.810+01:00 DIST-H9-E3.1-01 CP1 - 0x000a45ae - 00000000 GlobalRouter RADIUS ERROR rad_sendRequest: unable to send a UDP packet. error 51,	None. This issue has no functional impact.
	S_errno_ENETUNREACH  • 1 2021-02-17T23:32:16.811+01:00 DIST-H9- E3.1-01 CP1 - 0x000a45ac - 00000000 GlobalRouter RADIUS ERROR rad_processPendingRequest: unable to send request	
VOSS-20456	Although the Management Router is not supported in the NOS, you can add a static route for VRF 512 using EDM. The route does not become active even if the next-hop address is reachable from the OOB management interface.	None. This issue has no functional impact.
VOSS-21097	In Multi-Area where vIST peers are boundary nodes, vIST can briefly flap during connection formation when IS-IS is disabled and then reenabled on both vIST peers.	None.
VOSS-21964	When using Windows SCP application on a switch to transfer a file, an error message displays even if a file transfers successfully.	
VOSS-22522	RESTCONF is delayed in a scaled setup with 2,000 VLANs.	None.
VOSS-22858	LLDP neighbor should not be discovered with mismatch in MKA MACsec on 5520 Series ports.	Disable MKA on both sides or shut down the port on both sides.
VOSS-23146	Multi-area DvR/SPBM configuration: Timeout: No response message is returned during snmpwalk on one of the DvR controllers.	Run the snmpwalk command with an increased timeout. You can also run snmpwalk for a specific object.
VOSS-23181	When you enable the <b>boot config flags macsec</b> command, the indiscard counter increments on SPBM-enabled ports.	None. There is no functional impact.
VOSS-23216	If you do not enable the DvR interface when you configure a dvr-one-ip interface, the dvr-one-ip interface does not display when you issue the <b>show dvr interfaces</b> command.	Enable the DvR interface.

Issue number	Description	Workaround
VOSS-24777	In the following port configurations on 5520 Series, 5420 Series, VSP 4900 Series, and VSP 7400 Series, inVSN ACL entries match ingressing packets that have the same VID as the VLAN associated with the ACL I-SID even if the ACL inVSN I-SID is different:  on an S-UNI port without a platform VLAN on a T-UNI port VLAN	None.
VOSS-24872	If the collector reachability path changes for Application Telemetry, it is not reflected properly in CLI. Packets remain mirrored towards the correct path but CLI does not reflect the next hop.	None. There is no functional impact.
VOSS-25023	5520 Series, 5420 Series, and 5320 Series platforms can reach 100% CPU utilization during inband transfer (FTP, SFTP, and SCP).	None.
VOSS-25162	RESTCONF ARP and MAC data: on 5x20 switches with 5K ARP entries and 5K MAC entries, it takes approximately 1 minute to retrieve data. The time increases based on the number of entries.  The same occurs on VSP 7400 Series with over 15K entries.	None.
VOSS-25288	Secure boot information for 5720 Series, 7520 Series, and 7720 Series does not display when you issue the <b>show sys-info</b> command.	None.
VOSS-25728	You cannot assign a second disk to the second virtual service on the following switches:  VSP 4900 Series  VSP 7400 Series  5720 Series	None.
VOSS-25874	Intermittent issue that causes inconsistency in show output.	None.
VOSS-25959	On the VSP 4900 Series, VSP 7400 Series, and 5720 Series, the virtual service does not operate properly when you configure e1000 Network Interface Card (NIC) type for SR-IOV and VT-d connect types.	None.
VOSS-26028	On the VSP 4900 Series, VSP 7400 Series, and 5720 Series, the virtual service does not operate properly when you configure more than 16 virtual ports per Extreme Integrated Application Hosting port.	None.
VOSS-26032	NNI port remains in STP blocking state in a very specific scenario and configuration.	Bounce the NNI port.
VOSS-26099	MACsec Key Agreement (MKA) MACsec does not operate properly when you enable and disable MKA MACsec on the port 15-20 times.	None.
VOSS-26122	Intermittently, some CLI commands related to sFlow functionality do not display in the CLI log.	None.

Issue number	Description	Workaround
VOSS-26151	MACsec Key Agreement (MKA) does not operate between Fabric Engine 5520 Series and 5720 Series switches and ExtremeXOS 5520 Series and 5720 Series switches when you use GCM-AES-256 MACsec encryption cipher suite on copper ports.	As a workaround, use GCM-AES-128 MACsec encryption cipher suite to connect Fabric Engine 5520 Series and 5720 Series switches and Switch Engine 5520 Series and 5720 Series switches.
VOSS-26526	After you format a USB drive and issue the <b>1s</b> command, the current date and time does not display.	None.
VOSS-26527	Intermittently, the <b>show sys-info</b> command does not display the correct part number or serial number for the 2000 W AC PoE power supply (Model XN-ACPWR-2000W with front-to-back ventilation airflow).	None.
VOSS-26692	The entry for VLAN used to send/receive VXLAN packets to/from FIGW (for IPSec encapsulation) is missing from my_station_tcam table. In this case, traffic over the corresponding FE tunnel is lost.	Shut/no shut of the used sideband port fixes the problem.
VOSS-26822	Configuration tab for Ports 53-54 (VSP 7400-48Y) cannot be accessed from the first attempt.	Select menu options on your Mozilla Firefox browser. Alternatively, use another browser: Google Chrome, Safari, or Microsoft Edge.
VOSS-27235	If you delete a VLAN IP interface, the switch does not delete the associated DvR gateway IP address.	Manually delete the DvR gateway IP address.
VOSS-27643	On 5320 Series, packet port statistics do not increment for multicast traffic ingressing Layer 3 Fabric Extend NNI.	As a workaround, calculate the number of packets from the total number of bytes received.
VOSS-27784	Layer 3 VSN traffic continues to flow after you delete IP addresses in dual stack scenarios.	None.
VOSS-27875	On 7520-48XT-6C copper ports(1/1-1/48) with SLPP enabled, the port LED state is off.	None.
VOSS-28437	Layer 3 routed traffic is discarded in a square topology with two pairs of vIST DVR controllers in different domains when traffic should reach the diagonal switch.	As a workaround, save the configuration file with the NNI-MSTP flag configured and reboot the system.
VOSS-28241	For a routed Gigabit Ethernet interface, traffic doubles on vIST peers if you issue the <b>action flushALL</b> command.	None.
VOSS-28525	DHCP clients fail to receive an IP address in scenarios with VRRP over SMLT when SMLT goes down and the DHCP interface is configured to broadcast.	As a workaround, disable broadcast on the DHCP relay.

Issue number	Description	Workaround
VOSS-28625	Boundary Nodes return VRRP packets into the originating area and cause warning messages to display. The issue occurs if you create the following ACL rule on a Multi-area SPB Boundary Node:	Remove the ACL used to mirror I-SID traffic on the boundary node. Use Fabric RSPAN (Mirror to I-SID) to achieve similar functionality. Alternatively, use matchtype "uniOnly" instead of "both".
	filter acl 1 type inVsn matchType both filter acl i-sid 1 12990020 filter acl ace 1 1 filter acl ace action 1 1 permit monitor-isid- offset 1 filter acl ace ethernet 1 1 ether-type eq ip filter acl ace 1 1 enable	
	The issue is caused by the interoperability of this specific ACL configured to mirror the I-SID traffic, and the Multiarea filters.	
VOSS-28672	IPFIX does not learn MCoSPB NNI-UNI flows on 7520 Series, 7720 Series, and VSP 7400 Series.	None.
VOSS-29711	If you enter a delayed reboot command for a device with at least one active RADIUS Accounting session, the switch does not send the RADIUS Accounting Stop or RADIUS Accounting Off packets, and console traces display on the screen.	None.
VOSS-30195	A potential LLDP flood issue can occur with certain third- party unmanaged devices on Auto-sense ports.	Eliminate the cause of flooding.
VOSS-30222	SSH connection is currently unavailable through Layer 2 FE Tunnel or Layer 3 FE Tunnel on the 5320 Series and 5420 Series.	Enable IPv6 Shortcuts.
VOSS-30287	An intermittent connectivity issue occurs over a Fabric Extend destination tunnel in a failover scenario when the IS-IS unicast FIB computation does not point to the shortest path.	This situation is temporary. You can perform an action, such as configuring any same I-SID on the Fabric Extend tunnel ends to trigger an IS-IS computation. Wait for the IS-IS computation to generate.
VOSS-30292	If IPv6 Shortcuts are explicitly disabled, SSH connections does not work on VSP 4900 Series.	Enable IPv6 Shortcuts.
VOSS-30576	WARNING: CPU: 0 PID: 1 at kernel/rcu/tree_plugin.h:297 rcu_note_context_switch+0x44/0x340 kernel message, which displays on the console during bootup has no functional impact on 4220 Series and 5320 SeriesXT	None.
VOSS-30980	After you enable an IP VPN instance on a VRF that you configure for the IS-IS logical interface and the adjacency establishes through the Fabric Extend tunnel with a nickname server, Dynamic Nickname Offers are discarded on the port with the Fabric Extend tunnel.	As a workaround, disable and then reenable IP VPN on the VRF or use the automatic nickname.

Issue number	Description	Workaround
VOSS-30990	When you change the advanced-fabric-bandwidth-reservation flag from low to high, you cannot enable Autosense on ports reserved as loopback ports after you reboot the switch.  An example of the message that displays is as follows:  Cleanup for auto-sense failed on port: 1/10, reason: VLAN cleanup failed!	As a workaround, disable Auto-sense on reserved loopback ports before you reboot the switch.
VOSS-31315	The following message displays when you upgrade to VOSS Release 9.1 on VSP 4900 Series:DMAR: [Firmware Bug]: No firmware reserved region can cover this RMRR [0x000000003e2e0000-0x000000003e2fffff], contact BIOS vendor for fixes.	None.
VOSS-31352	When you disconnect a Fabric Attach client from an Autosense port and reconnect a device that does not transmit LLDP packets, the device displays the wrong port default VLAN ID when the port transitions from the WAIT to UNI state.	As a workaround, bring the port down and then bring the port up to restart the Auto-sense state on the switch to display the correct default VLAN ID when the port transitions to the UNI state.
VOSS-31465	When an IPv6 RSMLT in the forwarding state cannot ping the IPv6 link-local address of the vIST peer in that particular RSMLT VLAN, local routes whose next-hop is the link-local address of the vIST peer can fail.	None.
VOSS-32147	ZTP+ fails to discover and connect to ExtremeCloud IQ Site Engine, in a scenario where two DNS servers are configured on the switch through DHCP but, although it is running, the primary DNS server cannot resolve the extremecontrol hostname.	In the DHCP server configuration, the primary DNS server must be able to resolve "extremecontrol". If one of the DNS servers cannot resolve the extremecontrol hostname, for example, in the case of a public DNS server, add that server in the DHCP configuration with a lower priority.
VOSS-32270	When ARP entries exceed the 8000 limit on VLANs without an assigned I-SID on 5520 Series, multiple error messages display and ARP entries fail to program correctly when you add additional ARP entries.	As a workaround, assign I-SIDs to VLANs that can manage more than 8000 ARP entries.
VOSS-32312	The following message displays on the console: unable to rotate the file '/intflash/shared/telegraf.log', rename /intflash/shared/telegraf.log /intflash/shared/telegraf. <timestamp>.log: no such file or directory.</timestamp>	None. You can safely ignore this message.

Issue number	Description	Workaround
VOSS-32476	In a scenario with multiple misconfigurations in single and multiple areas such as Multi-area SPB inter-area duplicate nickname/system-ID recovery, log messages can be mismatched.	None.
VOSS-32799	The 7830 Series does not display the hardware revision power supply units (PSUs).	To retrieve the hardware revision, remove the PSU and inspect the physical label.
VOSS-32873	In Release 8.10 and later, 5320 Series and 5420 Series do not support jumbo packet frames larger than 3748 bytes.	As a workaround, use jumbo frame packets smaller than 3748 bytes.
VOSS-33015	On the 7830 Series, if you configure the link speed at 10G on either the copper or SFP+ management port, the switch software detects the link speed as 1G.	None.
VOSS-33191	On the 7830 Series, traffic packets smaller than 64 bytes are drop but the TOO SHORT counter does not increment as expected.	None.
VOSS-33478	When you insert a 40G break-out cable but you do not channelize it, partner devices can still detect a valid signal and bring the links up. As a result, all 10G lanes on the break-out cable show link-up status, even though the 40G interface is not channelized.	As a workaround, channelize the 40G break-out cable.
VOSS-33685	In a scenario that uses AUTO-MLT with IS-IS backup adjacency, the MLT interface remains even after you disable all member ports. Although the IS-IS adjacency correctly goes down when all ports in the MLT are shut down, the MLT itself remains empty.	None.
VOSS-33615	In a scenario that involves inter-area system ID duplication, IP Shortcut traffic can fail to recover even after the duplicate system ID condition is resolved. ARP entries destined for an interior node can be incorrectly programmed on a tunnel pointing to a duplicate boundary node. These misprogrammed entries persist and prevent proper traffic forwarding, as they are not automatically corrected. This issue is caused by the RPF mechanism not functioning as expected for ARP packets, allowing entries to be programmed on incorrect tunnels.	As a workaround, issue an <b>ARP flush</b> command on the boundary node where the ARP entry was incorrectly programmed.
VOSS-33697	During early system startup, an IQ Agent core file can generate due to a race condition where the Redis context is not yet available when accessed by the IQ Agent. This crash is highly intermittent and harmless, as the system lifecycle management automatically restarts the IQ Agent, allowing normal operation to resume without any service impact.	None.
VOSS-33808	On the 7830 Series, the EDM LED for the fiber management port incorrectly displays green when operating at 1G speed, instead of the expected amber blinking to indicate activity.	None.

Issue number	Description	Workaround
VOSS-33809	On the 7830 Series, the EDM LED for the fiber management port operating at 10G should display solid green for link-up and blinking green to indicate activity.	None.
VOSS-33866	IP Anycast Gateway ONE-IP interfaces generate duplicate IP log reports when you enable router IS-IS. This occurs due to the IS-IS overload-on-startup flag, which acts as a hold-down timer for the Anycast Gateway. The default timer is 20 seconds. During this period, the ONE-IP interface cannot become operational. However, the VLAN IP interface becomes active and sends ARP requests using the VLAN chassis MAC address instead of the expected Anycast Gateway MAC.	None. Full recovery occurs automatically once the hold-down timer expires.
VOSS-33872	When querying statistics on a front panel port on the 7830 Series, the inDiscard counter reports a higher number of dropped packets than expected. This behavior occurs because the counter includes link-local packets (such as LLDP, ISIS, LLC, and BPDU), and can also count locally processed packets per port. These packets are copied to the CPU and then dropped to prevent VLAN flooding.	There is no workaround. You can validate the behavior by capturing traffic to confirm that packets meant to be flooded or routed are not discarded. To troubleshoot further, run the show khi cpp portstatistics command to observe how the CPU processes link-local packets. This confirms that the system drops these packets only after CPU processing.

## Restrictions and Expected Behaviors

This section lists known restrictions and expected behaviors that can first appear to be issues.

For Port Mirroring considerations and restrictions, see Fabric Engine User Guide.

## General Restrictions and Expected Behaviors

The following table provides a description of the restriction or behavior.

**Table 47: General restrictions** 

Issue number	Description	Workaround
	If you access the Extreme Integrated Application Hosting virtual machine using virtual- service tpvm console and use the Nano text editor inside the console access, the command ^o <cr> does not write the file to disk.</cr>	None.
VOSS-7	Even when you change the LLDP mode of an interface from CDP to LLDP, if the remote side sends CDP packets, the switch accepts them and refreshes the existing CDP neighbor entry.	Disable LLDP on the interface first, and then disable CDP and re-enable LLDP.
VOSS-687	EDM and CLI show different local preference values for a BGP IPv6 route.  EDM displays path attributes as received and stored in the BGP subsystem. If the attribute is from an eBGP peer, the local preference displays as zero.  CLI displays path attributes associated with the route entry, which can be modified by a policy. If a route policy is not configured, the local preference shows the default value of 100.	None.
VOSS-2166	The IPsec security association (SA) configuration has a NULL Encryption option under the <b>Encrpt-algo</b> parameter. Currently, you must fill the <b>encrptKey</b> and <b>keyLength</b> sub-parameters to set this option; however, these values are not used for actual IPsec processing as it is a NULL encryption option. The NULL option is required to interoperate with other vendors whose IPsec solution only supports that mode for encryption.	There is no functional impact due to this configuration and it only leads to an unnecessary configuration step. No workaround required.
VOSS-21946	When you create a vrf using the POSTMAN API platform, special characters, such as \\\\ and ### included in the URL are ignored.	None.

**Table 47: General restrictions (continued)** 

Issue number	Description	Workaround
VOSS-5197	A BGP peer-group is uniquely identified by its name and not by its index. It is possible that the index that is configured for a peer-group changes between system reboots; however this has no functional impact.	None.
VOSS-7553	Option to configure the default queue profile rate-limit and weight values are inconsistent between EDM and CLI. Option to configure default values is missing in EDM.	None.
VOSS-7640	The same route is learned via multiple IPv6 routing protocols (a combination of two of the following: RIPng, OSPFv3 and BGPv6).  In this specific case, an eBGP (current best – preference 45) route is replaced by and iBGP (preference 175) which in turn is replaced by and OSPFv3 (external 2) route (preference 125).	None.
VOSS-7647	With peer group configuration, you cannot configure Update Source interface with IPv6 loopback address in EDM.	Use CLI.
VOSS-9174	OVSDB remote VTEP and MAC details can take between 5 to 10 minutes to populate and display after a HW-VTEP reboots.	Known issue in VMware NSX 6.2.4. You can upgrade to NSX 6.4 to resolve this issue.
VOSS-9462	OVSDB VNID I-SID MAC bindings are not populated on HW-VTEPs after configuration changes.	Known issue in VMware NSX 6.2.4. You can upgrade to NSX 6.4 to resolve this issue.
VOSS-10168	The system CLI does not prevent you from using the same IP address for the VXLAN Gateway hardware VTEP replication remote peer IP and OOB Management IP.	Manually check the IP configured as the OOB Management IP. Do not use the OOB Management IP address as the replication remote peer IP address.

**Table 47: General restrictions (continued)** 

Issue number	Description	Workaround
VOSS-11817	The OVS connect-type for virtual service Vports is designed in such a way that it connects to any generic virtual machine (VM) guest OS version using readily available Ethernet device drivers. This design approach provides initial connectivity to the VM in a consistent manner.  A consequence of this approach is that Vports created with connect-type OVS will show up as 1 Gbps interfaces in the VM even though the underlying Ethernet connection supports 10 Gbps.	If additional performance is desired, upgrade the VM guest OS with an Ethernet device driver that supports 10 Gbps interfaces.
VOSS-11943	This release does not support perport configuration of Application Telemetry. Because the feature is enabled globally and VSP 7432CQ supports 32 100 Gbps ports, an undesirable condition could be encountered when an exceeded amount of Application Telemetry mirrored packets are sent to the collector.	None.
VOSS-12151	If logical switch has only hardware ports binding, and not VM behind software VTEP, Broadcast, Unknown Unicast, and Multicast (BUM) traffic does not flow between host behind two hardware VTEP.  The NSX replicator node handles the BUM traffic. NSX does not create the replicator node unless a VM is present. In an OVSDB topology, it is expected that at least one VM connects to the software VTEP. This issue is an NSX-imposed limitation.	After you connect the VM to the software VTEP, the issue is not seen.
VOSS-13794	You cannot use SFTP to transfer files larger than 2 GB to the switch.	Use SCP.
VOSS-17871	Starting with VOSS 8.1.5, internal system updates have resulted in a more accurate accounting of memory utilization. This can result in a higher baseline memory utilization reported although actual memory usage is not impacted.	Update any network management alarms that are triggered by value with the new baseline.

**Table 47: General restrictions (continued)** 

Issue number	Description	Workaround
VOSS-18238	When a management VLAN with DHCP is used to reach a RADIUS server, and the RADIUS server cannot be reached, the system waits for 15 minutes before attempting to reach the RADIUS server again. This is true even if the RADIUS server becomes reachable before the 15 minutes have elapsed.	None.
VOSS-18278	On the 5520 Series switch, when you make any change relating to port speed, the port statistics are cleared. This applies to all front panel fiber and copper ports as well as VIM ports.  The following are examples of changes relating to port speed:  Changing the auto-negotiation configuration settings on a copper port  Different negotiated speed on a copper port  Changing out an optical device for one having a different speed, for example changing from 1 Gb to 10 Gb	None.
VOSS-18523	When you configure a port using Zero Touch Provisioning Plus (ZTP+) with ExtremeCloud IQ Site Engine, the port cannot be part of both a tagged VLAN and an untagged VLAN.	n/a
VOSS-18851	Do not define a static route in which the NextHop definition uses an Inter-VRF redistributed route. Such a definition would require the system to perform a double lookup. When you attempt to define a static route in this way, an error message is generated.	Define the static route in such a way that it does not require Inter-VRF redistributed routing.

**Table 47: General restrictions (continued)** 

Issue number	Description	Workaround
VOSS-21620	When interior nodes are running software earlier than Release 8.4 and a Multi-area takeover occurs between the boundary nodes (when the non-designated boundary node transitions to designated) in the network, the interior nodes might detect a false duplicate case between the stale LSP of the old virtual node and the new virtual node. This has no functional impact in the network.	n/a
wi01068569	The system displays a warning message that routes will not inject until the apply command is issued after the enable command. The warning applies only after you enable redistribution, and not after you disable redistribution. For example: Switch:1(config) #isis apply redistribute direct vrf 2	n/a
wi01112491	IS-IS enabled ports cannot be added to an MLT. The current release does not support this configuration.	n/a
wi01122478	Stale SNMP server community entries for different VRFs appear after reboot with no VRFs. On a node with a valid configuration file saved with more than the default vrf0, SNMP community entries for that VRF are created and maintained in a separate text file, snmp_comm.txt, on every boot. The node reads this file and updates the SNMP communities available on the node. As a result, if you boot a configuration that has no VRFs, you can still see SNMP community entries for VRFs other than the globalRouter vrf0.	n/a

**Table 47: General restrictions (continued)** 

Issue number	Description	Workaround
wi01137195	A static multicast group cannot be configured on a Layer 2 VLAN before enabling IGMP snooping on the VLAN. After IGMP snooping is enabled on the Layer 2 VLAN for the first time, static multicast group configuration is allowed, even when IGMP snooping is disabled later on that Layer 2 VLAN.	n/a
wi01141638	When a VLAN with 1000 multicast senders is deleted, the console or Telnet session stops responding and SNMP requests time out for up to 2 minutes.	n/a
wi01142142	When a multicast sender moves from one port to another within the same BEB or from one vIST peer BEB to another, with the old port operationally up, the source port information in the output of the show ip igmp sender command is not updated with new sender port information.	<ul> <li>You can perform one of the following workarounds:         <ul> <li>On an IGMP snoopenabled interface, you can flush IGMP sender records.</li> </ul> </li> <li>Caution:             <ul> <li>Flushing sender records can cause a transient traffic loss.</li> </ul> </li> <li>On an IGMP-enabled Layer 3 interface, you can toggle the IGMP state.</li> </ul> <li>Caution:         <ul> <li>Expect traffic loss until IGMP records are built after toggling the IGMP state.</li> </ul> </li>
wi01171670	Telnet packets get encrypted on MACsec-enabled ports.	None.
wi01210217	The command show eapol auth-stats displays LAST-SRC-MAC for NEAP sessions incorrectly.	n/a
wi01212034	<ul> <li>When you disable EAPoL globally:</li> <li>Traffic is allowed for static MAC configured on EAPoL enabled port without authentication.</li> <li>Static MAC config added for authenticated NEAP client is lost.</li> </ul>	n/a

**Table 47: General restrictions (continued)** 

Issue number	Description	Workaround
wi01212247	BGP tends to have many routes. Frequent additions or deletions impact network connectivity. To prevent frequent additions or deletions, reflected routes are not withdrawn from client 2 even though they are withdrawn from client 1. Disabling route-reflection can create a black hole in the network.	Bounce the BGP protocol globally.
wi01212585	LED blinking in EDM is representative of, but not identical to, the actual LED blinking rates on the switch.	n/a
wi01213066 wi01213374	EAP and NEAP are not supported on brouter ports.	n/a
wi01213336	When you configure tx mode port mirroring on T-UNI and SPBM NNI ports, unknown unicast, broadcast and multicast traffic packets that ingress these ports appear on the mirror destination port, although they do not egress the mirror source port. This is because tx mode port mirroring happens on the mirror source port before the source port squelching logic drops the packets at the egress port.	n/a
wi01219658	The command show khi port- statistics does not display the count for NNI ingress control packets going to the CP.	n/a
wi01219295	SPBM QOS: Egress UNI port does not follow port QOS with ingress NNI port and Mac-in-Mac incoming packets.	n/a
wi01223526	ISIS logs duplicate system ID only when the device is a direct neighbor.	n/a
wi01223557	Multicast outage occurs on LACP MLT when simplified vIST peer is rebooted.	You can perform one of the following workarounds:  Enable PIM on the edge.  Ensure that IST peers are either RP or DR but not both.

**Table 47: General restrictions (continued)** 

Issue number	Description	Workaround
wi01224683 wi01224689	Additional link bounce can occur on 10 Gbps ports when toggling links or during cable re-insertion. Additional link bounce can occur with 40 Gbps optical cables and 40 Gbps break-out cables, when toggling links or during cable re-insertion.	n/a
wi01229417	Origination and termination of IPv6 6-in-4 tunnel is not supported on a node with vIST enabled.	None.
wi01232578	When SSH keyboard-interactive- auth mode is enabled, the server generates the password prompt to be displayed and sends it to the SSH client. The server always sends an expanded format of the IPv6 address. When SSH keyboard-interactive-auth mode is disabled and password-auth is enabled, the client itself generates the password prompt, and it displays the IPv6 address format used in the ssh command.	None.
VOSS-26218	In a scaled environment, running the <b>show io 12-tables</b> command reiteratively can cause the switch to reboot.	For scaled scenarios, do not run the <b>show io 12-tables</b> command in a loop.
VOSS-31214	With the upgrade to Mocana 7, RadSec Proxy certificates must conform to the following SP 800-132 specifications for PBKDFv2 parameters: • salt length of at least 128 bits • derived key length of at least 112 bits • iteration count of at least 1000 When you generate public or private key-pairs protected by a password with older versions of OpenSSL, the default PKCS5_SALT_LEN is 8 bytes, which results in TLS failures.	<ul> <li>You can perform one of the following workarounds:</li> <li>Recompile OpenSSL to use a PKCS5_SALT_LEN value of 16 bytes and generate new certificates.</li> <li>Use a newer version of OpenSSL that is FIPS approved.</li> <li>Generate the keys without password protection.</li> </ul>

## Filter Restrictions

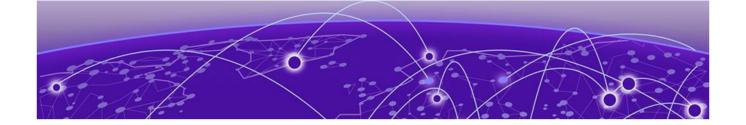

The following table identifies known restrictions.

#### **Table 48: ACL restrictions**

Applies To	Restriction
All platforms	Only port-based ACLs are supported on egress. VLAN-based ACLs are not supported.
All platforms	IPv6 ingress and IPv6 egress QoS ACL/filters are not supported.
	Note: IPv6 ACL DSCP Remarking is supported.
All platforms	Control packet action is not supported on InVSN Filter or IPv6 filters generally.
All platforms	IPv4/IPv6 VLAN based ACL filters will be applied on traffic received on all the ports if it matches VLAN ID associated with the ACL.
All platforms	Scaling numbers are reduced for IPv6 filters.
All platforms	The InVSN Filter does supports IP Shortcut traffic only on both UNI and NNI ports, but does not support IP Shortcut traffic on UNI ports only and NNI ports only.
All platforms	The InVSN Filter does not filter packets that arrive on NNI ingress ports but are bridged to other NNI ports or are for transit traffic.
All platforms	You can insert an InVSN ACL type for a Switched UNI only if the Switched UNI I-SID is associated with a platform VLAN.

#### **Table 49: ACE restrictions**

Applies To	Restriction
All platforms	When an ACE with action count is disabled, the statistics associated with the ACE are reset.
All platforms	Only security ACEs are supported on egress. QoS ACEs are not supported.
All platforms	ICMP type code qualifier is supported only on ingress filters.
All platforms	For port-based ACLs, you can configure VLAN qualifiers. Configuring port qualifiers are not permitted.
All platforms	For VLAN-based ACLs, you can configure port qualifiers. Configuring VLAN qualifiers are not permitted.
All platforms	Egress QoS filters are not supported for IPv6 filters.
All platforms	Source/Destination MAC addresses cannot be added as attributes for IPv6 filters ACEs.

## **Resolved Issues this Release**

This release incorporates all fixes from prior releases, up to and including the following releases:

- Fabric Engine 8.10.7
- Fabric Engine 9.1.2.0
- Fabric Engine 9.2.1.1

Issue number	Description
CFD-11778	VOSS/Fabric Engine–loop occurs for few seconds before LACP SMLT comes up.
CFD-12546	VOSS-SSH does not work when you configure the <i>none</i> parameter for the <b>ssh x509v3-auth revocation-check-method</b> command.
CFD-12836	VOSS/FE/Multi-area-A log message about duplicate nickname displays only one time.
CFD-13197	Port lock allows you to initiate a Time Domain Reflectometer (TDR) diagnostic test on the port.
CFD-13210	Fabric Engine 9.1–Customer reported issue VOSS-32171.
CFD-13260	VOSS 9.0.4.0-address over Fabric Extend becomes TX-NNI.
CFD-13322	IPv6 First Hop Security (FHS) DHCP snooping does not work in Fabric mode.
CFD-13329	5520-48SE (9.0.4)–Network communication issue when the I-SID is configured on more than one switch.
CFD-13916	Fabric Engine–Output to screen for the <b>show fulltech</b> command crashes the node with core file in 9.2.0 code.
CFD-13947	Avaya IP phones repeatedly restart during boot-up after an upgrade to 8.10.3.0.
CFD-13953	Switch temperature does not work as expected.
CFD-14048	VSP-7400-48Y-8C-Devices randomly reboot with a coredump.
CFD-14108	VOSS 9.0.5.0/9.1.1.0-ZTP LLDP SystemCapabilities entries are malformed.
CFD-14146	Auto-sense SD-WAN port stuck in SD-WAN-PENDING state and switch ignores Fabric Extend TLV.
CFD-14398	TCP port number for RESTCONF CLI and documentation issue.

Issue number	Description
CFD-14472	After you remove the remote IS-IS system ID, the default system-id value is still present in the config.
VOSS-30576	WARNING: CPU: 0 PID: 1 at kernel/rcu/ tree_plugin.h:297 rcu_note_context_switch+0x44/0x340 kernel message, which displays on the console during bootup has no functional impact on 4220 Series and 5320 SeriesXT.
VOSS-31916	In some cases, when the Anycast IP Gateway router is configured on a vIST node or on a boundary node with at least two peer boundary nodes, pinging the Anycast IP Gateway does not work. Routing functionality, including next hop ARP resolution, is not affected.
VOSS-32393	EDM displays an error when you configure the LLDP MED Tx TLV capabilities ( <b>TLVsTxEnable</b> ).
VOSS-33593	DHCP Snoop Bindings in EDM display only the HEX value of the IP addresses.
VOSS-33625	Crashes can be seen when you bounce IS-IS or you reset the switch with Node Alias enabled.
VOSS-33658	RemoteAddr and UpdateSourceInterface fields in EDM doe not display correctly in BGP peer tab.
