Configure the IP router interface so that you can use routing protocols and features on the interface. This section contains instructions for both the Global Router and Virtual Router Forwarding (VRF) instances.

Enabling routing for a router or a VRF instance

About This Task

Enable IP forwarding (routing) on a router or a Virtual Router Forwarding (VRF) instance so that they support routing. You can use the IP address of any physical or virtual router interface for an IP-based network management.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Globals** tab.
4. To enable routing, select **Forwarding**.
5. Click **Apply**.

Deleting a dynamically-learned route

About This Task

Use the Routes tab to view and manage the contents of the system routing table. You can also delete a dynamically learned route using this table. Exercise caution if you delete entries from the route table.

To delete a static route, use the **StaticRoute** tab.

To delete dynamic routes from the table for a VRF instance, first select the appropriate instance.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Routes** tab.
4. To delete a route, select the route and click **Delete**.

Routes field descriptions

Use the data in the following table to use the **Routes** tab.

| Name | Description |
|--------------------|--|
| Dest | Specifies the destination IP network of this route. An entry with a value of 0.0.0.0 is a default route. Multiple routes to a single destination can appear in the table, but access to multiple entries depends on the table access mechanisms defined by the network management protocol in use. |
| Mask | Indicates the network mask to logically add with the destination address before comparison to the destination IP network. |
| NextHop | Specifies the IP address of the next hop of this route. |
| AltSequence | Indicates the alternative route sequence. The value of 0 denotes the best route. |
| NextHopId | Specifies the identifier of the next-hop, hostname or MAC address. |
| HopOrMetric | Specifies the primary routing metric for this route. The semantics of this metric are specific to various routing protocols. |
| Interface | Specifies the router interface for this route. <ul style="list-style-type: none"> • Virtual router interfaces are identified by the VLAN number of the VLAN followed by the (VLAN) designation. • Brouter interfaces are identified by the slot and port number of the brouter port. |
| Proto | Specifies the routing mechanism through which this route was learned: <ul style="list-style-type: none"> • local—nonprotocol information, for example, manually configured entries • static • isis • inter-vrf redistributed route |

| Name | Description |
|----------------------|---|
| Age | Specifies the number of seconds since this route was last updated or otherwise determined correct. |
| PathType | <p>Indicates the route type, which is a combination of direct, indirect, best, alternative, and ECMP paths.</p> <ul style="list-style-type: none"> • iA indicates Indirect Alternative route without an ECMP path • iAE indicates Indirect Alternative ECMP path • iB indicates Indirect Best route without ECMP path • iBE indicates Indirect Best ECMP path • dB indicates Direct Best route • iAN indicates Indirect Alternative route not in hardware • iAEN indicates Indirect Alternative ECMP route not in hardware • iBN indicates Indirect Best route not in hardware • iBEN indicates Indirect Best ECMP route not in hardware • dBN indicates Direct Best route not in hardware • iAU indicates Indirect Alternative Route Unresolved • iAEU indicates Indirect Alternative ECMP Unresolved • iBU indicates Indirect Best Route Unresolved • iBEU indicates Indirect Best ECMP Unresolved • dBU indicates Direct Best Route Unresolved • iBF indicates Indirect Best route replaced by FTN • iBEF indicates Indirect Best ECMP route replaced by FTN • iBV indicates Indirect best IPVPN route • iBEV indicates Indirect best ECMP IP VPN route • iBVN indicates Indirect best IP VPN route not in hardware • iBEVN indicates Indirect best ECMP IP VPN route not in hardware |
| Pref | Specifies the preference. |
| NextHopVrflid | Specifies the VRF ID of the next-hop address. |

Configuring IP route preferences

Before You Begin

- Disable ECMP before you configure route preferences.

About This Task

Change IP route preferences to force the routing protocols to prefer a route over another. Configure IP route preferences to override default route preferences and give preference to routes learned for a specific protocol.

Important

Changing route preferences is a process-oriented operation that can affect system performance and network reachability while you perform the procedures. Therefore, if you want to change default preferences for routing protocols, you do so before you enable the protocols.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **RoutePref** tab.
4. In the **ConfiguredValue** column, change the preference for the given protocol.
5. Click **Apply**.

RoutePref field descriptions

Use the data in the following table to use the **RoutePref** tab.

| Name | Description |
|------------------------|--|
| DefaultValue | Specifies the default preference value for the specified protocol. |
| Protocol | Specifies the protocol name. |
| ConfiguredValue | Configures the preference value for the specified protocol. |

Flushing routing tables by VLAN

About This Task

For administrative and troubleshooting purposes, sometimes you must flush the routing tables. You can use Enterprise Device Manager (EDM) to flush the routing tables by VLAN or by port. Use this procedure to flush the IP routing table for a VLAN.

To flush routing tables by VLAN for a VRF instance, first select the appropriate instance.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > VLAN**.
2. Click **VLANS**.
3. Click the **Advanced** tab.
4. In the **Vlan Operation Action** column, select a flush option.

In a VLAN context, all entries associated with the VLAN are flushed. You can flush the ARP entries and IP routes for the VLAN.
5. Click **Apply**.

Flushing routing tables by port

For administrative and troubleshooting purposes, sometimes you must flush the routing tables. You can use EDM to flush the routing tables by VLAN or flush them by port. Use this procedure to flush the IP routing table for a port.

About This Task

To flush routing tables by port for a VRF instance, first select the appropriate instance.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation tree, expand the following folders: **Configuration > Edit > Port**.
3. Click **General**.
4. Click the **Interface** tab.
5. In the **Action** section, select **flushAll**.

In a port context, all entries associated with the port are flushed. You can flush the ARP entries and IP routes for a port.

After you flush a routing table, it is not automatically repopulated. The repopulation time delay depends on the routing protocols in use.

6. Click **Apply**.

Assigning an IP address to a port

Assign an IP address to a port so that it acts as a routable VLAN (a brouter port) and supports IP routing.

To configure a brouter port, assign an IP address to an IP policy-based single-port VLAN.

Before You Begin

- Ensure routing (forwarding) is globally enabled.
- Ensure the VLAN is configured.
- If required, ensure the VRF instance exists.

About This Task

Important

After you configure the IP address, you cannot edit the IP address, and you can assign only one IP address to any router interface (brouter or virtual).

You cannot assign an IP address to a brouter port that is a member of a routed VLAN. To assign an IP address to the brouter port, you must first remove the port from the routed VLAN.

If you want to assign a new IP address to a VLAN or brouter port that already has an IP address, first delete the existing IP address and then insert the new IP address.

Procedure

1. In Device Physical View, select the port.
2. In the navigation tree, expand the **Configuration > Edit > Port** folders.
3. Click **IP**.
4. Click the **IP Address** tab.
5. Click **Insert**.
6. In the **Insert IP Address** dialog box, type the IP address, network mask, and VLAN ID.
7. Click **Insert**.

IP Address Field Descriptions

Use the data in the following table to help use the **IP Address** tab.

| Name | Description |
|------------------------|--|
| Interface | Specifies the router interface. <ul style="list-style-type: none"> The name of the VLAN followed by the VLAN designation identifies virtual router interfaces. The slot and port number of the brouter port identifies brouter interfaces. |
| Ip Address | Specifies the IP address of the brouter interface on this port. You can define only one IP address on a given port interface. |
| Net Mask | Specifies the subnet mask of the brouter interface on this port. The mask is an IP address with all the network bits set to 1 and all the hosts bits set to 0. |
| Name | Specifies the name of the brouter interface. The value ranges from 0 to 64 characters. |
| BcastAddrFormat | Specifies the IP broadcast address format used on this interface. |
| ReasmMaxSize | Specifies the size of the largest IP packet which the interface can reassemble from fragmented incoming IP packets. |
| VlanId | Specifies the ID of the VLAN associated with the brouter port. This parameter is used to tag ports. |
| BrouterPort | Indicates whether this is a brouter port. |
| MacOffset | Specifies a number by which to offset the MAC address of the VLAN from the chassis MAC address. This ensures that each IP address has a different MAC address. |
| VrfId | Specifies the associated VRF interface. The VrfId associates VLANs or brouter ports to a VRF after the creation of VLANs or brouter ports. VRF ID 0 is reserved for the Global Router. |

Assigning an IP Address to a VLAN

Before You Begin

- Ensure routing (forwarding) is globally enabled.
- Ensure VLAN is configured.
- Change the VRF instance as required. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 3909.

About This Task

Specify an IP address for a VLAN so that the VLAN can perform IP routing.

**Important**

You can assign only one IP address to any router interface (brouter or VLAN).

You cannot assign an IP address to a VLAN if a brouter port is a member of the VLAN. To assign an IP address to the VLAN, you must first remove the brouter port member.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > VLAN**.
2. Click **VLANs > Basic**.
3. Select a VLAN.
4. Click **IP**.
5. Click **Insert**.
6. In the **Insert IP Address** dialog box, type the IP address and network mask.
7. Click **Insert**.

Viewing IP addresses for all router interfaces

About This Task

Use the Addresses tab to view IP addresses (and their associated router interfaces) from one central location.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Addresses** tab.

Addresses field descriptions

Use the data in the following table to use the **Addresses** tab.

| Name | Description |
|------------------------|--|
| Interface | Specifies the router interface. <ul style="list-style-type: none"> • The name of the VLAN followed by the VLAN designation identifies virtual router interfaces. • The slot and port number of the brouter port identifies brouter interfaces. |
| Ip Address | Specifies the IP address of the router interface. |
| Net Mask | Specifies the subnet mask of the router interface. |
| BcastAddrFormat | Specifies the IP broadcast address format used on this interface; that is, whether 0 (zero) or one is used for the broadcast address. The switch uses 1. |
| ReasmMaxSize | Specifies the size of the largest IP packet that this interface can reassemble from incoming fragmented IP packets. |
| VlanId | Identifies the VLAN associated with this entry. This value corresponds to the lower 12 bits in the IEEE 802.1Q VLAN tag. |
| BrouterPort | Indicates whether this is a brouter port (as opposed to a routable VLAN). |
| MacOffset | Specifies a number by which to offset the MAC address of the VLAN from the chassis MAC address. This ensures that each IP address has a different MAC address. |

Configuring IP routing features globally

About This Task

Configure the IP routing protocol stack to determine which routing features the switch can use.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Globals** tab.
4. To globally enable routing, select **Forwarding**.
5. To globally configure the default TTL parameter type a value in the **DefaultTTL** field.
This value is placed into routed packets that have no TTL specified.
6. To globally enable IPv4 ICMP broadcast, select **IcmpEchoBroadcastRequestEnable**.
7. To globally enable the Alternative Route feature, select **AlternativeEnable**.
8. To globally enable ICMP Router Discovery, select **RouteDiscoveryEnable**.
9. To globally enable IP Source Routing, select **SourceRouteEnable**.
10. To globally enable ECMP, select **EcmpEnable**.
11. Configure the remaining parameters as required.
12. Click **Apply**.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

| Name | Description |
|---------------------|--|
| Forwarding | Configures the system for forwarding (routing) or nonforwarding. The default value is forwarding. |
| DefaultTTL | Configures the default time-to-live (TTL) value for a routed packet. TTL indicates the maximum number of seconds elapsed before a packet is discarded. Enter an integer from 1 to 255. The default value of 255 is used if a value is not supplied in the datagram header. |
| ReasmTimeout | Specifies the maximum number of seconds that received fragments are held while they wait for reassembly. The default value is 30 seconds. |

| Name | Description |
|---|---|
| ICMPUnreachableMsgEnable | <p>Enables the generation of Internet Control Message Protocol (ICMP) network unreachable messages if the destination network is not reachable from this system. These messages help determine if the system is reachable over the network. The default is disabled.</p> <p>Important:
As a best practice, enable icmp-unreach-msg only if it is absolutely required. If icmp-unreach-msg is enabled and a packet is received for which there is no route in the routing table, CPU utilization can dramatically increase.</p> |
| ICMPRedirectMsgEnable | Enables or disables the system sending ICMP destination redirect messages. |
| IcmpEchoBroadcastRequestEnable | Enables or disables IP ICMP echo broadcast request feature. The default is enabled. |
| AlternativeEnable | <p>Globally enables or disables the Alternative Route feature.</p> <p>If the alternative-route parameter is disabled, all existing alternative routes are removed. After the parameter is enabled, all alternative routes are re-added. The default is enabled.</p> |
| RouteDiscoveryEnable | Enables the ICMP Router Discovery feature. The default is disabled (not selected). Use ICMP Router Discovery to enable hosts attached to multicast or broadcast networks to discover the IP addresses of neighboring routers. |
| AllowMoreSpecificNonLocalRouteEnable | Enables or disables a more-specific nonlocal route. If enabled, the system can enter a more-specific nonlocal route into the routing table. The default is disabled. |
| SuperNetEnable | Enables or disables supernetting. If supernetting is globally enabled, the system can learn routes with a route mask less than 8 bits. Routes with a mask length less than 8 bits cannot have ECMP paths, even if you globally enable the ECMP feature. The default is disabled. |
| UdpChecksumEnable | Enables or disables the UDP checksum calculation. The default is enable. |
| SourceRouteEnable | Enables or disables IP Source Routing globally. It is disabled by default. |
| ARPLifeTime | Specifies the lifetime of an ARP entry within the system, global to the switch. The default value is 360 minutes. |

| Name | Description |
|--------------------------|--|
| EcmpEnable | Globally enables or disables the Equal Cost Multipath (ECMP) feature. The default is disabled.
After ECMP is disabled, the EcmpMaxPath is reset to the default value of 1. |
| EcmpMaxPath | Globally configures the maximum number of ECMP paths.
You cannot configure this feature unless ECMP is enabled globally.
Different hardware platforms can support a different number of ECMP paths. For more information, see Release Notes for VOSS . |
| Ecmp1PathList | Selects a preconfigured ECMP path. |
| Ecmp2PathList | Selects a preconfigured ECMP path. |
| Ecmp3PathList | Selects a preconfigured ECMP path. |
| Ecmp4PathList | Selects a preconfigured ECMP path. |
| Ecmp5PathList | Selects a preconfigured ECMP path. |
| Ecmp6PathList | Selects a preconfigured ECMP path. |
| Ecmp7PathList | Selects a preconfigured ECMP path. |
| Ecmp8PathList | Selects a preconfigured ECMP path. |
| EcmpPathListApply | Applies changes in the ECMP pathlist configuration, or in the prefix lists configured as the pathlists. |

Configure ECMP

Enable Equal Cost MultiPath (ECMP) to permit routers to determine up to eight equal-cost paths to the same destination prefix. You can use the multiple paths for load-sharing of traffic, which allows fast convergence to alternative paths. By maximizing load sharing among equal-cost paths, you can maximize the efficiency of links between routers.

Before You Begin

- Change the VRF instance as required. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 3909.
- To configure an ECMP pathlist, you must first configure a prefix list that you reference in the pathlist configuration.

About This Task

Different hardware platforms can support a different number of ECMP paths. For more information, see [Release Notes for VOSS](#).

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **IP**.

3. Select the **Globals** tab.
4. Select **EcmpEnable**.
5. (Optional) In **EcmpMaxPath**, type the preferred maximum number of equal-cost paths.
6. (Optional) Configure an ECMP pathlist to specify routes with the required number of paths.
7. (Optional) If you modified the ECMP pathlist configuration, select **EcmpPathListApply**.
8. Select **Apply**.

Configure Static Routes using EDM

About This Task

Use static routes to force the router to make certain forwarding decisions. Create IP static routes to manually provide a path to destination IP address prefixes.

Note

Do not configure static routes on a DVR Leaf node unless the configuration is for reachability to a management network using a brouter port.

Also, configuring the preference of static routes is not supported on a Leaf node.

For route scaling information, see [Release Notes for VOSS](#).

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Static Routes** tab.
4. Click **Insert**.
5. If required, in the **OwnerVrfId** check box, select the appropriate VRF ID. By default, the VRF is the GlobalRouter VRF 0.
6. In the **Dest** field, type the IP address.
7. In the **Mask** field, type the subnet mask.
8. In the **NextHop** field, type the IP address of the router through which the specified route is accessible.
9. (Optional) In the **NextHopVrfId** field, select the appropriate value.
10. (Optional) To enable the static route, select the **Enable** check box.
11. (Optional) In the **Metric** field, type the metric.
12. (Optional) In the **Preference** field, type the route preference.
13. (Optional) If required, select the **LocalNextHop** check box.

Use this option to create Layer 3 static routes.

14. Click **Insert**.

The new route appears in the **IP** dialog box, **Static Routes** tab.

Static Routes Field Descriptions

Use the data in the following table to use the **Static Routes** tab.

| Name | Description |
|---|---|
| OwnerVrflid | Specifies the VRF ID for the static route. |
| Dest | Specifies the destination IP address of this route. A value of 0.0.0.0 is a default route. Multiple routes to a single destination can appear in the table, but access to such multiple entries is dependent on the table-access mechanisms defined by the network management protocol in use. |
| Mask | Indicates the mask that the system operates a logically AND function on, with the destination address, to compare the result to the Route Destination. For systems that do not support arbitrary subnet masks, an agent constructs the Route Mask by determining whether it belongs to a class A, B, or C network, and then uses one of:
255.0.0.0—Class A
255.255.0.0—Class B
255.255.255.0—Class C
If the Route Destination is 0.0.0.0 (a default route) then the mask value is also 0.0.0.0. |
| NextHop | Specifies the IP address of the next hop of this route. In the case of a route bound to an interface which is realized through a broadcast media, the Next Hop is the IP address of the agent on that interface.
When you create a black hole static route, configure this parameter to 255.255.255.255. |
| NextHopVrflid | Specifies the next-hop VRF ID in interVRF static route configurations. Identifies the VRF in which the ARP entry resides. |
| Name

Note:
This field does not apply to all hardware platforms. | Specifies the name for the static route. |
| Enable | Determines whether the static route is available on the port. The default is enable.
If a static route is disabled, it must be enabled before it can be added to the system routing table. |
| Status | Specifies the status of the route. The default is enabled. |
| Metric | Specifies the primary routing metric for this route. The semantics of this metric are determined by the routing protocol specified in the route RouteProto value. If this metric is not used, configure the value to 1. The default is 1.

Note:
Do not configure a static interface subnet route with a metric of 1. |
| Ifindex | Specifies the route index of the Next Hop. The interface index identifies the local interface through which the next hop of this route is reached. |

| Name | Description |
|---------------------|--|
| Preference | Specifies the routing preference of the destination IP address. If more than one route can be used to forward IP traffic, the route that has the highest preference is used. The higher the number, the higher the preference. |
| LocalNextHop | Enables and disables LocalNextHop. If enabled, the static route becomes active only if the system has a local route to the network. If disabled, the static route becomes active if the system has a local route or a dynamic route. |

Deleting a static route

About This Task

Delete static routes that are no longer needed to prevent routing errors.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Static Routes** tab.
4. Select the static route you want to delete.
5. Click **Delete**.

Configuring a Default Static Route

Before You Begin

- Change the VRF instance as required. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 3909.

About This Task

The default route specifies a route to all networks for which there no explicit routes exist in the Forwarding Information Base or in the routing table. This route has a prefix length of zero (RFC 1812). You can configure the switch with a static default route, or they can learn it through a dynamic routing protocol.

To create a default static route, you configure the destination address and subnet mask to 0.0.0.0.

Note

It is recommended that you do not configure static routes on a DvR Leaf node unless the configuration is for reachability to a management network using a Brouter port.

Also, configuring the preference of static routes is not supported on a Leaf node.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Static Routes** tab.

4. Click **Insert**.
5. In the **OwnerVrfId** check box, select the appropriate VRF ID.
6. In the **Dest** field, type 0.0.0.0.
7. In the **Mask** field, type 0.0.0.0.
8. In the **NextHop** field, type the IP address of the router through which the specified route is accessible.
9. In the **Metric** field, type the HopOrMetric value.
10. Click **Insert**.

Configure a Black Hole Static Route

Before You Begin

- Change the VRF instance as required. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 3909.

About This Task

Create a black hole static route to the destination that a router advertises to avoid routing loops when aggregating or injecting routes to other routers.

If an existing black hole route is enabled, you must first delete or disable it before you can add a regular static route to that destination.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Static Routes** tab.
4. Click **Insert**.
5. In the **OwnerVrfId** check box, select the appropriate VRF ID.
6. In the **Dest** field, enter the IP address.
7. In the **Mask** field, enter the network mask.
8. In the **NextHop** field, type 255.255.255.255.

To create a black hole static route, you must configure the NextHop address to 255.255.255.255.

9. Select the **enable** option.
10. In the **Metric** box, type the HopOrMetric value.
11. In the **Preference** check box, select the route preference.

When you specify a route preference, be sure to appropriately configure the preference so that when the black hole route is used, it is elected as the best route.

12. Click **Insert**.

Viewing IP routes

View IP routes learned on the device.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > IP**.

2. Click **IP**.
3. Click the **Routes** tab to view IP routes learned on the device.
4. If you want to limit the routes displayed, click **Filter** to show a smaller subset of the learned routes.
5. In the Filter dialog box, select an option, or options, and enter information to limit the routes to display in the Routes table.
6. Click **Filter** and the Routes table displays only the routes that match the options and information that you enter.

Routes field descriptions

Use the data in the following table to use the **Routes** tab.

| Name | Description |
|--------------------|--|
| Dest | Specifies the destination IP network of this route. An entry with a value of 0.0.0.0 is a default route. Multiple routes to a single destination can appear in the table, but access to multiple entries depends on the table access mechanisms defined by the network management protocol in use. |
| Mask | Indicates the network mask to logically add with the destination address before comparison to the destination IP network. |
| NextHop | Specifies the IP address of the next hop of this route. |
| AltSequence | Indicates the alternative route sequence. The value of 0 denotes the best route. |
| NextHopId | Displays the MAC address or hostname of the next hop. |
| HopOrMetric | Displays the primary routing metric for this route. The semantics of this metric are specific to different routing protocols. |
| Interface | Specifies the router interface for this route. <ul style="list-style-type: none"> • Virtual router interfaces are identified by the VLAN number of the VLAN followed by the (VLAN) designation. • Brouter interfaces are identified by the slot and port number of the brouter port. |

| Name | Description |
|----------------------|--|
| Proto | Specifies the routing mechanism through which this route was learned: <ul style="list-style-type: none"> • other—none of the following • local—nonprotocol information, for example, manually configured entries • static • ICMP • EGP • GGP • Hello • RIP • IS-IS • ES-IS • Cisco IGRP • bbnSpfIgp • OSPF • BGP • Inter-VRF Redistributed Route |
| Age | Displays the number of seconds since this route was last updated or otherwise determined to be correct. |
| PathType | Indicates the route type, which is a combination of direct, indirect, best, alternative, and ECMP paths. <ul style="list-style-type: none"> • iA indicates Indirect Alternative route without an ECMP path • iAE indicates Indirect Alternative ECMP path • iB indicates Indirect Best route without ECMP path • iBE indicates Indirect Best ECMP path • dB indicates Direct Best route • iAN indicates Indirect Alternative route not in hardware • iAEN indicates Indirect Alternative ECMP route not in hardware • iBN indicates Indirect Best route not in hardware • iBEN indicates Indirect Best ECMP route not in hardware • dBN indicates Direct Best route not in hardware • iAU indicates Indirect Alternative Route Unresolved • iAEU indicates Indirect Alternative ECMP Unresolved • iBU indicates Indirect Best Route Unresolved • iBEU indicates Indirect Best ECMP Unresolved • dBU indicates Direct Best Route Unresolved • iBF indicates Indirect Best route replaced by FTN • iBEF indicates Indirect Best ECMP route replaced by FTN • iBV indicates Indirect best IPVPN route • iBEV indicates Indirect best ECMP IP VPN route • iBVN indicates Indirect best IP VPN route not in hardware • iBEVN indicates Indirect best ECMP IP VPN route not in hardware |
| Pref | Displays the preference. |
| NextHopVrflid | Specifies the VRF ID of the next-hop address. |

Configuring ICMP Router Discovery globally

About This Task

Enable ICMP Router Discovery so that it can operate on the system.

Procedure

1. In the navigation tree, expand the following folders: **Configuration** > **IP**.
2. Click **IP**.
3. Click the **Globals** tab.
4. Select **RouteDiscoveryEnable**.
5. To select a preconfigured ECMP path, click the **EcmpPathList** ellipsis button.
6. Click **OK**.
7. Click **Apply**.

Configure the ICMP Router Discovery Table

Before You Begin

- ICMP Router Discovery must be globally enabled.
- Change the VRF instance as required. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 3909.

About This Task

Configure the ICMP Router Discovery table to ensure correct ICMP operation for all interfaces that use Router Discovery.

Procedure

1. In the navigation tree, expand the following folders: **Configuration** > **IP**.
2. Click **IP**.
3. Click the **Router Discovery** tab.
4. Configure the Router Discovery parameters to suit your network.
5. Click **Apply**.

Router Discovery field descriptions

Use the data in the following table to use the **Router Discovery** tab.

| Name | Description |
|-------------------|---|
| Interface | Indicates the VLAN ID or the port. |
| AdvAddress | Specifies the IP destination address used for broadcast or multicast router advertisements sent from the interface. The address is the all-systems multicast address 224.0.0.1, or the limited-broadcast address 255.255.255.255. The default value is 255.255.255.255. |
| AdvFlag | Indicates whether (true) or not (false) the address is advertised on the interface. The default value is true (advertise address). |

| Name | Description |
|------------------------|--|
| AdvLifetime | Specifies the time to-live-value (TTL) of router advertisements (in seconds) sent from the interface. The range is MaxAdvInterval to 9000 seconds.
The default value is 1800 seconds. |
| MaxAdvInterval | Specifies the maximum time (in seconds) that elapses between unsolicited broadcast or multicast router advertisement transmissions from the interface. The range is 4 to 1800 seconds.
The default value is 600 seconds. |
| MinAdvInterval | Specifies the minimum time (in seconds) that elapses between unsolicited broadcast or multicast router advertisement transmissions from the interface. The range is 3 seconds to MaxAdvInterval.
The default value is 450 seconds. |
| PreferenceLevel | Specifies the preference value (a higher number indicates more preferred) of the address as a default router address relative to other router addresses on the same subnet. The range is -2147483648 to 2147483647.
The default value is 0. |

Configuring ICMP Router Discovery for a Port

Before You Begin

- You must globally enable ICMP Router Discovery.
- Change the VRF instance as required. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 3909.

About This Task

Use this procedure to configure Router Discovery on a port. When enabled, the port sends Router Discovery advertisement packets.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation tree, expand the following folders: **Configuration > Edit > Port**.
3. Click **IP**.
4. Click the **Router Discovery** tab.
5. To enable Router Discovery, select **AdvFlag**.
6. Configure other parameters as required for proper operation.
7. Click **Apply**.

Router Discovery field descriptions

Use the data in the following table to use the **Router Discovery** tab.

| Name | Description |
|------------------------|--|
| AdvAddress | Specifies the destination IP address used for broadcast or multicast router advertisements sent from the interface. The accepted values are the all-systems multicast address 224.0.0.1, or the limited-broadcast address 255.255.255.255. The default value is 255.255.255.255. |
| AdvFlag | Indicates whether (true) or not (false) the address is advertised on the interface. The default value is True (advertise address). |
| AdvLifetime | Specifies the time to live value (TTL) of router advertisements (in seconds) sent from the interface. The range is MaxAdvInterval to 9000 seconds. The default value is 1800 seconds. |
| MaxAdvInterval | Specifies the maximum time (in seconds) that elapses between unsolicited broadcast or multicast router advertisement transmissions from the interface. The range is 4 seconds to 1800 seconds. The default value is 600 seconds. |
| MinAdvInterval | Specifies the minimum time (in seconds) that elapses between unsolicited broadcast or multicast router advertisement transmissions from the interface. The range is 3 seconds to MaxAdvInterval. The default value is 450 seconds. |
| PreferenceLevel | Specifies the preference value (a higher number indicates more preferred) of the address as a default router address relative to other router addresses on the same subnet. The accepted values are -2147483648 to 2147483647. The default value is 0. |

Configure ICMP Router Discovery on a VLAN

Before You Begin

- You must globally enable ICMP Router Discovery.
- Change the VRF instance as required. For information about how to use EDM for a non-default VRF, see [Select and Launch a VRF Context View](#) on page 3909.

About This Task

Configure Router Discovery on a VLAN so that the ICMP Router Discovery feature can run over the VLAN. When enabled, the system sends Router Discovery advertisement packets to the VLAN.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > VLAN**.
2. Click **VLANs**.
3. Select the VLAN ID that you want to configure to participate in Router Discovery.
4. Click **IP**.

5. Click the **Router Discovery** tab.
6. To enable Router Discovery for the VLAN, select **AdvFlag**.
7. Configure other parameters as required for proper operation.
8. Click **Apply**.

Router Discovery field descriptions

Use the data in the following table to use the **Router Discovery** tab.

| Name | Description |
|------------------------|---|
| AdvAddress | Specifies the destination IP address used for broadcast or multicast router advertisements sent from the interface. The address is the all-systems multicast address, 224.0.0.1, or the limited-broadcast address, 255.255.255.255. The default value is 255.255.255.255. |
| AdvFlag | Indicates whether (true) or not (false) the address is advertised on the interface. The default value is true (advertise address). |
| AdvLifetime | Specifies the time to-live-value (TTL) of router advertisements (in seconds) sent from the interface. The range is MaxAdvInterval to 9000 seconds. The default value is 1800 seconds. |
| MaxAdvInterval | Specifies the maximum time (in seconds) allowed between sending unsolicited broadcast or multicast router advertisements from the interface. The range is 4 seconds to 1800 seconds. The default value is 600 seconds. |
| MinAdvInterval | The minimum time (in seconds) allowed between unsolicited broadcast or multicast router advertisements sent from the interface. The range is 3 seconds to MaxAdvInterval. The default value is 450 seconds. |
| PreferenceLevel | Specifies the preference value (a higher number indicates more preferred) of the address as a default router address, relative to other router addresses on the same subnet. The range is -2147483648 to 2147483647. The default value is 0. |

Configure a Circuitless IPv4 Interface

About This Task

You can use a circuitless IPv4 (CLIPv4) interface to provide uninterrupted connectivity to your system.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **IP**.
3. Select the **Circuitless IP** tab.
4. Select **Insert**.
5. In the **Interface** field, assign a CLIP interface number.
6. Enter the IP address.

7. Enter the network mask.
8. Select **Insert**.
9. To delete a CLIP interface, select the interface and select **Delete**.

Circuitless IP Field Descriptions

Use the data in the following table to use the **Circuitless IP** tab.

| Name | Description |
|-------------------|---|
| Interface | Specifies the number assigned to the interface. |
| Ip Address | Specifies the IP address of the CLIP. |
| Net Mask | Specifies the network mask. |
| Name | Specifies the name assigned to the IPv4 CLIP address. |

Enabling OSPF on a CLIP interface

Before You Begin

- You must globally enable OSPF.
- The OSPF area must already exist.

About This Task

Enable Open Shortest Path First (OSPF) on a CLIP interface so that it can participate in OSPF routing.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IP**.
2. Click **IP**.
3. Click the **Circuitless IP** tab.
4. Select the required CLIP interface.
5. Click **OSPF**.
6. Select the **Enable** check box.
You must enable OSPF on the CLIP interface for CLIP to function.
7. In the current **AreaID** field, enter the IP address of the OSPF backbone area.
8. Click **Apply**.

Circuitless OSPF field descriptions

Use the data in the following table to use the **Circuitless OSPF** tab.

| Name | Description |
|---------------|-------------------------------------|
| Enable | Enables OSPF on the CLIP interface. |
| AreaID | Specifies the OSPF area ID. |

Enabling PIM on a CLIP interface

Enable Protocol Independent Multicasting (PIM) on a CLIP interface so that it can participate in PIM routing.

Before You Begin

- You must globally enable PIM.

About This Task

Note

The PIM button does not appear for all hardware platforms.

Procedure

- In the navigation tree, expand the following folders: **Configuration > IP**.
- Click **IP**.
- Click the **Circuitless IP** tab.
- Select the required CLIP interface.
- Click **PIM**.
- Select the **Enable** check box.
You must enable PIM on the CLIP interface for PIM to function. The mode is indicated on this tab.
- Click **Apply**.

Circuitless PIM field descriptions

Use the data in the following table to use the **Circuitless PIM** tab.

| Name | Description |
|---------------|------------------------------------|
| Enable | Enables PIM on the CLIP interface. |
| Mode | Specifies the PIM mode. |

Enable BFD on a CLIP interface

Before You Begin

- The CLIP Interface must already exist.

About This Task

Enable Bidirectional Forwarding Detection (BFD) over Fabric Extend tunnels on a CLIP interface.

Note

The BFD button does not appear for all hardware platforms.

Procedure

- In the navigation pane, expand the **Configuration > IP** folders.
- Click **IP**.
- Click the **Circuitless IP** tab.

4. Select the required CLIP interface.
5. Click **BFD**.
6. Select the **Enable** check box.
7. (Optional) In the **MinRxInterval** field, specify the minimum receive interval.
8. (Optional) In the **TxInterval** field, specify the transmit interval.
9. (Optional) In the **Multiplier** field, specify the multiplier used to calculate a receive timeout.

BFD Field Descriptions

Use the data in the following table to use the **BFD** tab.

| Name | Description |
|----------------------|---|
| Enable | Enable BFD on the CLIP interface. |
| MinRxInterval | <p>Specifies the minimum interval, in milliseconds, between received BFD control packets that the local system is capable of supporting. The default is 200 ms.</p> <p>Note: For XA1400 Series, the default is 1000 ms.</p> <p>Note:
The minimum value you can configure for the receive interval is 100 ms. You can configure a maximum of 4 BFD sessions with the minimum value for the receive interval. You can configure any remaining BFD sessions with a receive interval that is greater than or equal to the 200 ms default value.</p> |
| TxInterval | <p>Specifies the transmit interval in milliseconds. The default is 200 ms.</p> <p>Note: For XA1400 Series, the default is 1000 ms.</p> <p>Note:
The minimum value you can configure for the transmit interval is 100 ms. You can configure a maximum of 4 BFD sessions with the minimum value for the transmit interval. You can configure any remaining BFD sessions with a transmit interval that is greater than or equal to the 200 ms default value.</p> |
| Multiplier | <p>Specifies a value for the multiplier used to calculate a receive timeout. The default is 3.</p> <p>Note:
If you configure the transmit interval or the receive interval as 100 ms, you must configure a value of 4 or greater for the multiplier.</p> |

Viewing TCP global information

View TCP and UDP information to view the current configuration.

About This Task

The fields on the TCP global tab provide information about the handshake (SYN) configuration and the maximum number of TCP connections you can create on your system.

When you initiate a TCP connection, both end points send handshake information to create the channel.

The retransmission algorithm and fields display the configured timeout value and minimum and maximum retransmission times that your system uses to terminate a connection attempt that falls outside your specified parameters.

Procedure

1. In the navigation pane, expand the **Configuration > IP** folders.
2. Click **TCP/UDP**.
3. Click the **TCP Globals** tab.

TCP Global field descriptions

Use the data in the following table to use the **TCP Globals** tab.

| Name | Description |
|---------------------|---|
| RtoAlgorithm | Determines the timeout value used for retransmitting unacknowledged octets. |
| RtoMin | Displays the minimum time (in milliseconds) permitted by a TCP implementation for the retransmission timeout. |
| RtoMax | Displays the maximum time (in milliseconds) permitted by a TCP implementation for the retransmission timeout. |
| MaxConn | Displays the maximum connections for the device. |

Viewing TCP connections information

View information about TCP connections.

About This Task

Among other things, the fields on the TCP connections tab provide important information about the health of connections that traverse your switch.

In particular, the state column lets you know the state of each TCP connection. Of these, synSent, synReceived, and established indicate whether or not a channel is established and listen indicates when an end system is waiting for a returning handshake (SYN).

Procedure

1. In the navigation pane, expand the : **Configuration > IP** folders.
2. Click **TCP/UDP**.
3. Click the **TCP Connections** tab.

TCP Connections field descriptions

Use the data in the following table to use the **TCP Connections** tab.

| Name | Description |
|-------------------------|--|
| LocalAddressType | Displays the type (IPv6 or IPv4) for the address in the LocalAddress field. |
| LocalAddress | Displays the IPv6 address for the TCP connection. |
| LocalPort | Displays the local port number for the TCP connection. |
| RemAddressType | Displays the type (IPv6 or IPv4) for the remote address of the TCP connection. |
| RemAddress | Displays the IPv6 address for the remote TCP connection. |
| RemPort | Displays the remote port number for the TCP connection. |
| State | Displays an integer that represents the state for the connection: <ul style="list-style-type: none"> • closed • listen • synSent • synReceived • established • finWait1 • finWait2 • closeWait • lastAck(9) • closing • timeWait • deleteTCB |
| Process | Displays the process ID for the system process associated with the TCP connection. |

Viewing TCP listeners information

View TCP listener information.

About This Task

The TCP listeners table provides a detailed list of systems that are in the listening state.

When a connection is in the listen state an end point system is waiting for a returning handshake (SYN).The normal listening state should be very transient, changing all of the time.

Two or more systems going to a common system in an extended listening state indicates the need for further investigation.

End systems in an extended listening state can indicate a broken TCP connection or a DOS attack on a resource.

This type of DOS attack, known as a SYN attack, results from the transmission of SYNs with no response to return replies.

While many systems can detect a SYN attack, the TCP listener statistics can provide additional forensic information.

Procedure

1. In the navigation pane, expand the **Configuration > IP** folders.
2. Click **TCP/UDP**.
3. Click the **TCP Listeners** tab.

TCP Listeners field descriptions

Use the data in the following table to use the **TCP Listeners** tab.

| Name | Description |
|-------------------------|--|
| LocalAddressType | Displays the type (IPv6 or IPv4) for the address in the LocalAddress field. |
| LocalAddress | Displays the IPv6 address for the TCP connection. |
| LocalPort | Displays the local port number for the TCP connection. |
| Process | Displays the process ID for the system process associated with the TCP connection. |

- [IPv6 Basic Configuration using EDM](#) on page 1856
- [Viewing IPv6 Connections using EDM](#) on page 1878
- [IPv6 alternative routes configuration example](#) on page 1882

The following sections provide concepts and procedures to complete basic IPv6 configuration, for example, IPv6 forwarding and static routes.

Origins of IPv6

The growth of IP address use is exponential.

Predictions indicated that the IPv4 address pool could be exhausted as early as 1994.

So, in July 1991, the Internet Engineering Task Force (IETF) began researching a replacement for IPv4.

That replacement is IPv6.

The Internet Assigned Numbers Authority (IANA) free pool of IPv4 addresses reached 0% in February 2011, according to the American Registry for Internet Numbers (ARIN).

While IPv4 addresses may remain available for some time within reserved pools, no further IPv4 addresses are available for reservation.

Although IPv6 is designed to replace IPv4, IPv6 is not backward-compatible and IPv4 and IPv6 need to coexist within your network during and after the transition to IPv6.

Advantages of IPv6

IPv6 can provide more addresses and support more networks than IPv4. For example, IPv6 offers enough addresses for every person on Earth to have 1 million addresses.

Because IPv6 offers a larger address space it offers improved scalability.

Following are additional advantages of IPv6 over IPv4:

- With 128 bit addresses, the larger IPv6 address space offers global access and scalability and solves the pending exhaustion of IP addresses.
- Network Address Translation (NAT) is no longer required.

Flat address space and transparency are restored by IPv6 because NAT is eliminated.

- Routing efficiency is improved due to the hierarchical network architecture.

IPv6 allows for hierarchical routing and effective route summarization.

- IPv6 supports Auto-configuration.
- IPv6 supports plug-and-play.
- Enhanced support is included for mobile IP and mobile computing devices.

Addresses can be permanently assigned to end devices such as DSL, PDAs, mobile terminals and PCs.

- Neighbor discovery (ND) replaces ARP in IPv6.

ND combines the IPv4 services for IPv4 Address Resolution Protocol (ARP) and router discovery.

Comparison of IPv4 and IPv6

The following table compares the key differences between IPv4 and IPv6.

Note

This information may not reflect IPv6 support in the current release.

Table 219: IPv4 and IPv6 key differences compared

| Feature | IPv4 | IPv6 |
|-------------------------------|-------------------|---------------------------------------|
| Address length | 32 bits | 128 bits |
| IPsec support | Optional | Required |
| QoS support | Limited | Improved |
| Fragmentation | Hosts and routers | Hosts only |
| Minimum MTU packet size | 576 bytes | 1280 bytes |
| Checksum in header | Yes | No |
| Options in header | Yes | Yes |
| Link-layer address resolution | ARP (broadcast) | Multicast neighbor discovery messages |
| Multicast membership | IGMP | Multicast Listener Discovery |
| Router discovery | Optional | Optional |
| Uses broadcasts | Yes | No |
| Address configuration | Manual, DHCP | Automatic, DHCP |

IPv6 packet

Each IPv6 packet can include mandatory and non-mandatory components.

An IPv6 packet includes:

- The basic header, which has a fixed length and is mandatory
- Extension header(s) , which has a variable length and is not mandatory
- Payload, which has a variable length and is not mandatory

The following figure illustrates the components of an IPv6 packet.

Figure 161: IPv6 packet components

Note

Nodes must be able to handle packets up to 1,280 octets in length.

IPv6 header

The IPv6 header basic length is fixed at 40 octets (bytes) and it contains the following fields:

Table 220: Fields in the IPv6 header

| Field | Size in bits |
|--|--------------|
| Ver—Internet Protocol version number, with a value of 6 | 4 |
| DS byte—Traffic class field, similar to Type of Service in IPv4 | 8 |
| Flow label—identifies traffic flow for additional Quality of Service (QoS) | 20 |
| Payload Length—Unsigned integer, the length of the IPv6 payload | 16 |
| Next header selector—identifies the next header | 8 |
| Hop limit unsigned integer—decrements by 1 each time a node forwards the packet (nodes discard packets with hop limit values of 0) | 8 |
| Source address | 128 |
| Destination address | 128 |

The following figure illustrates the basic IPv6 header, without extension headers.

Figure 162: IPv6 header

IPv6 extension headers

IPv6 extension headers describe processing options.

Each extension header contains a separate category of options and is identified by a number, similar to protocol identification numbers.

An IPv6 packet can include extension headers, but they are not mandatory.

The following figure illustrates the IPv6 header with extension headers.

Figure 163: IPv6 header with extension headers

IPv6 examines the destination address in the main header of each packet it receives.

This examination determines whether the router is

- the packet destination - if the router is the packet destination, IPv6 examines the header extensions that contain options for destination processing.
- an intermediate node in the packet data path - if the router is an intermediate node, IPv6 examines the header extensions that contain forwarding options.

By examining only the extension headers that apply to the operations it performs, IPv6 reduces the amount of time and resources required to process a packet.

IPv6 defines the following extension headers as described in the following table:

Table 221: IPv6 extension headers

| Extension header name | Description |
|--|---|
| hop-by-hop | Contains optional information, and sub-options for Router Alert and Jumbo Payload, that all intermediate IPv6 routers examine between the source and the destination. |
| destinations-options | Contains optional information for the destination node. This option can appear twice, once for way points and once for final destination. |
| source-routing | Contains a list of one or more intermediate nodes that define a path for the packet to follow through the network to the destination. The packet source creates this list. The source-routing function is similar to the IPv6 source routing options. |
| fragmentation | Uses an IPv6 source to send packets larger than the size specified for the path maximum transmission unit (MTU). |
| authentication | provides security for IPv6 datagrams |
| encapsulated security payload (ESP) | provides security for IPv6 datagrams |
| The authentication extension header and the encapsulated security payload extension header can be used together to provide security services for IPv6 datagrams. | |

The following extension header order is:

- Hop-by-hop
- Destination option 1
- Routing
- Fragmentation
- Authentication/ESP
- Destination Option 2

The presence of particular extension headers within a packet can cause slower packet processing if the IPv6 implementation handles only certain headers and diverts others to a slow path. For example, many IPv6 implementations usually process Hop-by-Hop extension headers on the control plane.

IPv6 address component summary

The IPv6 Internet is divided into addressing zones and IPv6 addresses can be categorized by type and scope.

IPv6 addressing is represented in RFC 4291.

Address types

IPv6 addresses are divided into the following types:

- Unicast

Unicast addresses provide one-to-one communication.

- Multicast

Multicast addresses are similar in operation to IPv4 and provide one-to-many communication.

- Anycast

An Anycast address is a Unicast address used for several devices to allow them to communicate with the device closest to the source; one-to-nearest communication.

- Broadcast

In IPv6, broadcast addresses have been superseded by multicast addresses per RFC 4291.

For more information about address types and scopes, see [IPv6 Address Types](#).

Address scopes

Following are IPv6 address scopes:

- node-local
- link-local
- global

The switch does not support site-local addresses and, according to RFC 4193, site-local addresses will be replaced by unique-local addresses.

For more information about address types and scopes, see [IPv6 address formats](#).

Address zones

The IPv6 Internet is divided into zones.

For example:

- Each node is a separate zone of the node-local scope.
- Each link is a separate zone of the link-local scope.
- The entire Internet is a single zone of global scope.

Zones of the same scope do not overlap.

IPv6 address formats

IPv6 addresses are 128 bits long. In comparison, IPv4 addresses are 32 bits in length.

The IPv6 address contains an

- address type
- address prefix
- interface ID

The following figure illustrates the IPv6 address format.

| | | |
|------|----------------|--------------|
| Type | Address prefix | Interface ID |
|------|----------------|--------------|

Figure 164: IPv6 address format

Address types

IPv6 uses three main address types to help route packets.

Address types are:

- Unicast: global, link—local, special unspecified, special loopback
- Multicast
- Anycast

Difference between multicast and anycast

Anycast address delivery is from one to one-of-many, whereas multicast address delivery is from one to many.

Unicast addresses

Unicast addresses provide one-to-one communication

Unicast addresses provide one-to-one communication.

Global

A Unicast global address identifies a single interface and is similar to an IPv4 public address.

Unicast global addresses are globally routable in the same manner as IPv4 addresses.

The following figure illustrates the Unicast global address parts.

Figure 165: Unicast global address parts

An IPv6 Unicast global address is composed of the following 3 levels:

- public topology (48 bit Global Routing Prefix)
 - 001, specifies an IPv6 Unicast global address
 - Top Level Aggregation Identifier (TLA ID), the highest level in routing hierarchy
 - Res, reserved for future use
 - Next Level Aggregation Identifier (NLA ID), specifies a customer site
- site topology (16 bit Subnet ID)
 - Site Level Aggregation Identifier (SLA ID); assigned within the site, an ISP cannot affect the SLA ID, enables up to 65,536 subnets within a site
- interface ID (64 bits)
 - specifies the interface for a node on a subnet

The system uses the 48 bit global routing prefix for the route prefix exchange.

The IPv6 Prefix for Unicast global is 2000::/3 (RFC3513).

Link-local

Hosts on the same link/subnet use automatically configured IPv6 Unicast link-local addresses to communicate with each other.

Link-local addresses are automatically configured on all interfaces.

Routers do not forward packets containing a destination or source address with a link-local address.

IPv6 uses neighbor discovery (ND) for address resolution.

The IPv6 prefix for link-local Unicast addresses is FE80::/10 (RFC3513).

The following figure illustrates the parts of a Unicast Link-local address.

Figure 166: Unicast Link-local address

Special addresses

The Unicast/special/unspecified address indicates the absence of an address and is the only valid SRC address for IPv6 Duplicate Address Detection (DAD).

Equivalent to the IPv4 unspecified address 0.0.0.0, represented as 0:0:0:0:0:0:0:0 or ::; an IPv6 host that does not have a valid address uses the unspecified address as its source address when it sends a packet to discover whether an address is used by another node (during the boot process when the host requests address configuration information).

Note

Do not assign an unspecified address, either statically or dynamically, to an interface.

The Unicast/special/loopback address is a special case Unicast address only found inside a single node.

The switch does not support the loopback address.

Equivalent to the IPv4 loopback address 127.0.0.1, represented as 0:0:0:0:0:0:0:1 or ::1; a node uses a loopback address to send a packet to itself.

The loopback address is beneficial in troubleshooting and testing the IP stack because you can use it to send a packet to the protocol stack without sending it onto the subnet.

Note

Do not assign a loopback address, either statically or dynamically, to an interface.

Both Loopback and Unspecified addresses are not valid destination addresses.

An example of a unicast IPv6 address is 1080:0:0:0:8:8000:200C:417A

An example of a link-local Unicast IPv6 address is FE80::4445:4eff:fe54:1212

Multicast addresses

Multicast addresses provide one-to-many communication

Multicast addresses provide one-to-many communication.

An IPv6 multicast address identifies a group of nodes.

The scope is built into the multicast address structure.

The system uses a multicast address to send traffic to multiple destinations. In this situation traffic experiences less delay with a multicast address than it would with Unicast address.

The following figure shows the format of an IPv6 multicast address.

| | | | |
|--------------------|-----------------|-----------------|----------------------|
| 8 bits
11111111 | 4 bits
flags | 4 bits
scope | 112 bits
group ID |
|--------------------|-----------------|-----------------|----------------------|

Figure 167: IPv6 multicast address format

A value of FF (11111111) in the 8 high-order bits of an IPv6 address indicates that the address is an IP multicast address.

The Multicast IPv6 Prefix is FF00::/8 (RFC3513).

Flags

The 4-bit flags field indicates whether the group is permanent or transient. The first 3 bits are reserved and the 4th bit represents the Transient flag. Currently only the Transient (T) flag is defined. A T flag set to 0 specifies a permanently assigned multicast address. A T flag set to 1 specifies a transient address.

Group ID

The 112 bit group ID identifies the multicast group.

An example of a multicast address is FF01:0:0:0:0:0:0:101

Scope field

The 4-bit scope field within the group ID specifies the multicast traffic scope.

Following is a list of the scope options that limit the scope of the multicast address:

- 1 - node-local
- 2 - link-local
- 3 - subnet local
- 4 - admin local
- 5 - site-local – not supported
- 8 - organization-local
- B - community-local
- E - global

Examples of multicast addresses

All-nodes addresses look like this:

FF01::1 (Node Local), FF02::1 (Link Local)

All-routers addresses look like this:

FF01::2 (Node Local), FF02::2 (Link Local)

A solicited node or host address looks like this:

FF02::1:FF1E:8329.

In this case the MAC is 00-02-B3-1E-83-29 and the IPv6 address is fe80::202:B3FF:FE1E:8329.

The following table lists some well-known multicast IPv6 addresses

Table 222: Well-known multicast IPv6 addresses

| Name | Address |
|---------------------------|-----------------------|
| All Nodes | FF02:0:0:0:0:0:0:1 |
| All Routers | FF02:0:0:0:0:0:0:2 |
| OSPFv2 | FF02:0:0:0:0:0:0:5 |
| OSPFv2 Designated Routers | FF02:0:0:0:0:0:0:6 |
| All PIM Routers | FF02:0:0:0:0:0:0:D |
| VRRP | FF02:0:0:0:0:0:0:12 |
| All MLDv2-capable routers | FF02:0:0:0:0:0:0:16 |
| All DHCP agents | FF02:0:0:0:0:0:0:2 |
| Solicited Node address | FF02::1:FF00:0000/104 |

Anycast

Anycast addresses provide one-to-nearest (one to one-of-many) communication.

Anycast addresses provide one-to-nearest (one to one-of-many) communication.

An anycast address designates a set of interfaces that share an address.

A packet sent to an anycast address goes only to the nearest member of the group. Considering routing distance, the system delivers packets with anycast addresses only to the nearest member of a group of multiple interfaces.

Restrictions

An anycast address must not be:

- used as the source address in an IPv6 packet
- assigned to an IPv6 host (you can assign an anycast address to an IPv6 router)

Anycast address scopes

Anycast addresses have the following scopes:

- Link-local—the local link; nodes on the same subnet
- Global—IPv6 Internet addresses

Similar to anycast IPv4 addresses, IPv6 anycast addresses are more efficient. They use the unicast address space but identify multiple interfaces.

IPv6 delivers a packet bearing an anycast address to the nearest interface identified by the address.

Currently anycast addresses are assigned to routers and are used as destination addresses. Because packets bearing anycast addresses are delivered to the closest router, you can also access the closest name server or time server with an anycast address.

Visually there is no distinction between an anycast address and a unicast address.

**Note**

The switch supports only the subnet-router anycast address.

You cannot configure any specific anycast addresses beyond the automatic, generic subnet-router anycast address.

IP address prefix

Address prefixes represent one of the following:

- network identifier
- fixed address part

Examples of IP address prefixes

2001:10F2::/48 represents a summarized route prefix

2001:10F2:0:102F::/64 represents a subnet or link prefix

FF00::/8 represents Multicast IPv6

Interface ID

Interface identifiers identify interfaces on a link.

As long as the interfaces are attached to different subnets, you can use the same identifier on more than one interface on a single node.

The IPv6 interface ID is as unique as the MAC address.

The interface ID is derived by a formula that uses the link layer 48-bit MAC address. In most cases, the interface ID is a 64-bit interface ID that contains the 48-bit MAC address. If you enter less than 64 bits, the system adds leading zeroes to extend the interface ID length to 64 bits.

You can configure the interface ID in the following ways:

- Manual configuration
- DHCPv6 (can configure the whole address)
- Automatic derivation from EUI-64 (MAC address or other HW serial)—enables serverless or stateless auto-configuration when combined with high order part of address learned from router advertisements
- Pseudo-random generation (client privacy)—enables serverless or stateless auto-configuration when combined with high order part of address learned from router advertisements

The switch supports manual interface ID configuration or automatic derivation from EUI-64.

**Note**

You must manually specify the network prefix, regardless of the interface ID formation method.

For stateless autoconfiguration, the ID is 64 bits in length.

For more information about stateless autoconfiguration, see [Host autoconfiguration](#) on page 1899.

How to write an IPv6 address

The appearance of IPv6 addresses differs from IPv4 addresses and you express them differently.

Hexadecimal IPv6 address representations

The 128 bits in an IPv6 address are divided into 8 blocks of 16 bits each.

Following is the preferred IPv6 address format:

```
XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX
```

Each 16 bit block in an IPv6 address is converted into a 1 to 4 digit hexadecimal number separated by colons (:).

The format to represent an IPv6 address is n:n:n:n:n:n:n, where n is the hexadecimal representation of 16 bits in the address; for example, 2001:0:0:0:0:0:0:43.

Each nonzero field must contain at least one numeral.

Within a hexadecimal field, you do not need leading zeros.

Certain classes of IPv6 addresses commonly include multiple adjacent fields that contain hexadecimal 0.

The sample address—2001::43—includes six adjacent fields that contain zeroes represented by a double colon (::) .

You can use a double colon to compress the leading zero fields in a hexadecimal address.

A double colon can appear only once in an address.

Four more ways to write an IPv6 address

```
2001:DB8:0000:0000:25AB:0000:0000:0001
2001:DB8:0:0:25AB:0:0:1
2001:DB8:0:0:25AB::1
2001:DB8::25AB:0:0:1
```

ICMPv6

Internet Control Message Protocol version 6 (ICMPv6) maintains and improves on features from ICMP for IPv4.

ICMPv6 reports the delivery of forwarding errors.

For example:

- Destination unreachable
- Packet too big (path MTU)
- Time exceeded (fragmentation)
- Parameter problem

ICMPv6 also delivers information messages such as ping, otherwise known as

- Echo request
- Echo reply

Important

By providing a framework for informational messages, ICMPv6 plays an important role in IPv6 features such as

- Neighbor discovery (ND)
- Path MTU discovery
- Multicast Listener Discovery (MLD)

You can identify an IPv6 ICMP packet because the Next Header field in the IPv6 packet header is 58.

Internet Protocol Security (IPsec) with ICMPv6

You can configure IPsec with ICMPv6. For a configuration example of IPsec with ICMPv6, see [IPsec with ICMPv6 configuration example](#) on page 1726.

Path MTU discovery

IPv6 routers do not fragment packets.

The source node may send packets less than or equal to the maximum transmission unit (MTU) of the link layer.

As the packet travels through the network to the source it may encounter a link with a smaller MTU. If so, the router sends the source node an ICMP error message that contains the MTU size of the next link. The source IPv6 node then resends a packet equal to the size of the MTU included in the ICMP message.

The default Layer 3 IPv6 MTU value is 1500 where the system MTU default value is 1950.

The default IPv6 MTU value is always less than the default System MTU value.

You can configure the MTU for each IPv6 interface.

Note

To configure separate Layer 3 MTU values for IPv4 and IPv6 packets on the same VLAN interface, you must disable Unicast Reverse Path Forwarding (uRPF) mode. If you enable the uRPF mode using the command **boot config flags urpf-mode**, the MTU values for both IPv4 and IPv6 packets on the same VLAN are matched. Different Layer 3 MTU sizes on the same VLAN are not allowed in uRPF mode.

Routing

A routing table is present on all nodes.

The routing table stores information about IPv6 network prefixes and how to reach them.

Note

The switch requires routing protocols, such as OSPFv3 to exchange IPv6 routing prefixes.

For each incoming packet, the switch checks the destination neighbor cache first. If the destination is not in the destination neighbor cache, the routing table determines:

- the next-hop interface (the interface used for forwarding)
- the next-hop address

Note

The system uses the IPv6 Neighbor Cache for on-link, directly-connected destinations only. Off-link destinations go through a next-hop router, as determined by the next-hop address lookup.

IPv6 routes in a routing table can be:

- directly attached network routes using a 64-bit prefix
- remote network routes using a 64-bit or lower prefix
- host routes using a 128-bit prefix length
- the default route using a prefix of `::/0`

The switch supports the following IPv6 routing protocols:

- RIPng
- OSPFv3
- BGP+ (over 6in4 tunnels)
- IPv6 Shortcuts (over Fabric Connect)

You can redistribute IPv6 routes between any of these routing protocols.

To configure IPv6 routing on a VLAN, an IP address is assigned to the VLAN. This IP address is not associated with any particular physical port, but is used on all ports where this VLAN is a member.

On a brouter port, a single port VLAN is used to route the traffic. IPv4 and IPv6 traffic is routed in the single-port brouter VLAN.

Other VLANs (which are multiple port VLANs) can bridge and route the traffic.

Virtual routing between IPv6 subnets

The switch supports IPv6 routing between subnets.

When you add an IP address to the VLAN, the system maps an IP subnet to the VLAN.

As shown in the following figure, although VLAN 1 and VLAN 2 reside on the same switch, for traffic to flow from VLAN 1 to VLAN 2, you must route the traffic.

You must enable IPv6 forwarding to route IPv6 traffic between VLANs. And you must enable IPv6 both globally and on a specific VLAN basis in order for forwarding to function. You can enable or disable IPv6, either globally or on a specific VLAN basis.

IPv6 forwarding is enabled by default.

Figure 168: IPv6 routing between VLANs

When you configure routing on a VLAN, an IPv6 address assigned to the VLAN is the VLAN IP interface.

The VLAN IPv6 address can be reached through any VLAN port, and frames route from the VLAN through the gateway IPv6 address.

You can forward traffic to any IPv6 subnet in the switch. A VLAN can be reached only if it has an IPv6 interface configured on it.

Because a port can belong to multiple VLANs, a one-to-one correspondence no longer exists between the physical port and the router interface when VLAN tagging is enabled.

If you do not enable VLAN tagging a single port can belong only to one port-based VLAN, but that same single port can belong to multiple policy-based VLANs.

As with any IPv6 address, you can use any VLAN IP interface for device management.

For the Simple Network Management Protocol (SNMP) or Telnet management, you can use any VLAN IP interface to access the switch while routing is enabled on the VLAN.

Router ports

A router port is a single-port VLAN that can route IP packets and bridge all nonroutable traffic.

The difference between a brouter port and a standard protocol-based VLAN configured for routing is that the routing interface of the brouter port is not subject to the spanning tree state of the port. A brouter port can be in the blocking state for nonroutable traffic while it routes IP traffic.

**Note**

Because a brouter port is a one-port VLAN, each brouter port decreases the number of available VLANs by one and uses one VLAN ID.

Static routes

Static routes provide an alternative method for establishing route reachability.

Static routes, with dynamic routes, provide routing information from the forwarding database.

Only enabled static routes whose nexthop address is reachable are submitted to the Route Table Manager (RTM), which determines the best route based on reachability, route preference, and cost.

The RTM communicates all updates to best routes.

If the nexthop is not reachable you can use the **show ipv6 route static** command to display the status. If the nexthop is not reachable, the status is `TryToResolve` and the route does not appear in the RTM until the nexthop address is resolved.

For directly-connected IPv6 Subnets you do not need to specify a nexthop address; you can specify outgoing Tunnel-ID, VLAN, or port. If you use outgoing Tunnel-ID, VLAN, or port, the implied nexthop value is `0::0`.

When you configure IPv6 static routes only by interface (VLAN or brouter), it lets the traffic to reach IPv6 prefixes configured on the link that is directly connected to the interface provided in the static route configuration. For example: `ipv6 route 180:0:0:0:0:0:0/64 cost 1 vlan 631`.

When you configure static routes with a link-local nexthop, you must also specify the outgoing Tunnel-ID, VLAN, or port because link-local addresses are ambiguous unless the proper interface binding is attached. For example: `ipv6 route 1234::/64 cost 1 next-hop fe80::1 vlan 1900`.

You must provide the following options to configure a static route:

- local or nonlocal hop option

Configure a static route either with a next hop that exists on a locally attached network or a next hop that is reachable through a dynamic route. The static route is available as long as the next hop is reachable.

- route preference

You can specify the route preference for the static routes as follows:

- Global value for all static routes: the preference is either static or dynamic routes.
 - Preference for each static route entry: if specified, this value overrides the global value for the entry which provides flexibility to change the general behavior of a specific static route.
- Administrative status

Controls when the static route is considered for forwarding. Administrative status differs from the operational status. An admin-enabled static route can still be unreachable and not used for forwarding. An admin-disabled static route is operationally a nonexistent route.

- Multiple static routes

Specify alternative paths to the same destination. Multiple static routes provide stability and load balancing.

To configure a default static route, supply a value of 0 for the prefix and the prefix length.

The following table describes events that affect static route operation.

Table 223: Events and their affects on static route operation

| Action | Result |
|--|---|
| Change the administrative status of the static route | Makes the static route unavailable for forwarding
You can use one CLI command to administratively enable or disable all static routes as follows <code>ipv6 route static enable</code> .
You can administratively disable all routes but preserve the static route configuration when you use the CLI command: <code>no ipv6 static route enable</code> . |
| Delete the IPv6 addresses of a VLAN or brouter port | Permanently deletes the static routes with the corresponding local neighbors from the RTM, the forwarding database, and the configuration database |
| Delete a VLAN | Removes static routes with a local next-hop option from the configuration database. Static routes with a nonlocal next-hop option become inactive (they are removed from the forwarding database). |
| Disable forwarding on a VLAN or brouter port | Static routes reachable through the locally attached network become inactive |
| Disable a VLAN or brouter port | Makes the static route inactive |
| Disable IPv6 forwarding globally | Stops forwarding all IPv6 traffic |
| Learn changes about a dynamically learned neighbor | After a neighbor becomes unreachable or is deleted, the static route with the neighbor becomes inactive, and the configuration is not affected. The static route with the neighbor becomes active in the configuration and is added to the RTM and forwarding database when the neighbor becomes reachable. |
| Enable a static route | Adds the route to the RTM to change certain static routes to active. |
| Delete a static route | Permanently deletes a static route from the configuration. |
| Disable a static route | Stops traffic on the static route but does not remove the route from the configuration. |
| Change a route preference | After the static route preference changes, the best routes for the entries use both static and dynamic paths. |
| Delete or disable a tunnel | Removes the tunnel entry from the forwarding table |
| Enable a tunnel | Activates the tunnel static routes and adds an entry to the forwarding table. |

The local-nexthop flag is not required for IPv6.

An IPv4 device cannot learn a neighbor ARP entry unless the device uses a local route entry.

In IPv6, a host can learn a neighbor entry if the device is physically connected to the neighbor (one hop).

The static route becomes active when the next hop is reachable by a dynamic route neighbor resolution. The static route takes the forwarding information from the dynamic route. If the next hop is reachable using a local route, the neighbor resolution is required.

Static route table

The static route table is separate from the system routing table that the router uses to make forwarding decisions.

You can use the static route table to directly change static routes.

Although the tables are separate, the system routing table automatically reflects the static routing table manager entries if the next-hop address in the static route is reachable and if the static route is enabled.

The static route table is indexed by four attributes:

- destination network
- destination mask
- next hop
- interface

You can insert static routes by using the static route table, and you can delete static routes by using either the static route table or the system routing table. For information on route scaling, see [Release Notes for VOSS](#).

Important

The system routing table stores only active static routes with the best route preference. A static route is active only if the route is enabled and if the next-hop address is reachable; for example, if a valid IPv6 neighbor cache entry exists for the next hop.

You can enter multiple routes (for example, multiple default routes) that use different costs and the lowest cost route that is reachable appears in the routing table.

If you enter multiple next hops for the same route with the same cost, the switch does not replace the existing route.

If you enter the same route with the same cost and a different next hop, the switch uses the first route. If that first route becomes unreachable, the system activates the second route, with a different next-hop, with no connectivity loss.

Route scaling

IPv4 and IPv6 route scaling depends on the combination of the `ipv6-mode` and `urpf-mode` boot config flags. For more information, see [Release Notes for VOSS](#).

IPv6 Circuitless IP

IPv6 Circuitless IP (CLIP) is a virtual interface that is not associated with any physical port. You can use an IPv6 CLIP interface to provide uninterrupted connectivity to your switch as long as an actual path exists to reach the device. The system treats the IPv6 CLIP interface like an IPv6 interface and treats the network associated with the IPv6 CLIP as a local network attached to the device. This route always exists and the circuit is always up because no physical attachment exists.

You can use an IPv6 CLIP address as a logical IPv6 address for network management, as well as for other purposes. The IPv6 CLIP is typically a host address with any prefix length. You can redistribute this address as part of any other routing protocol update, so that the CLIP address is known to neighbors and available for use in routing or other types of connectivity. You can use IPv6 CLIP for many kinds of management connectivity such as telnet or SSH. You can also use IPv6 CLIP as a source IP address for sending Syslog messages.

For scaling information on IPv6 CLIP, see [Release Notes for VOSS](#).

IPv6 CLIP restrictions and limitations

This section describes the restrictions and limitations associated with IPv6 CLIP.

- Stateless address autoconfiguration (SLAAC) is not supported on IPv6 CLIP interfaces.
- IPv6 CLIP does not support link-local address configuration.
- To configure an IPv6 address with a prefix length from 65 to 127 on a CLIP interface, you must enable the IPv6 mode flag.

Note

This flag does not apply to all hardware platforms. For more information, see [Release Notes for VOSS](#).

- Neighbor discovery (ND) does not run on an IPv6 CLIP interface. Therefore, the system does not detect duplicate IPv6 address assignment to this interface.
- Multiple IPv6 address configuration on an IPv6 CLIP interface is not supported.
- IPv6 CLIP interface is enabled by default and it cannot be disabled.
- You cannot configure an IPv6 CLIP interface as the source or destination endpoint of an IPv6-in-IPv4 tunnel.

Equal Cost Multipath

Table 224: Equal Cost Multiple Path for IPv6 product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| ECMP for IPv6 | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VOSS 5.1 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 5.1 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VOSS 5.1 |
| | VSP 8400 Series | VOSS 5.1 |
| | VSP 8600 Series | VSP 8600 6.2 |
| | XA1400 Series | Not Supported |

With Equal Cost Multipath (ECMP), the switch can determine equal-cost paths to the same destination prefix. You can use multiple paths for load sharing of traffic. These multiple paths allow faster convergence to other active paths in case of network failure. By maximizing load sharing among equal-cost paths, you can use your links between routers more efficiently when sending IP traffic. ECMP is formed using routes from the same source or protocol, and the ECMP routes are evaluated within each routing protocol.

The ECMP feature supports and complements the following protocols and route types:

- OSPFv3
- Static routes
- BGP+
- RIPng
- IPv6 Shortcuts

ECMP with static routes

ECMP supports and complements static routes.

The following points need to be considered while configuring ECMP with static routes:

- When ECMP is globally enabled, the equal cost static routes are added in the Routing Table Manager (RTM).
- Static routes that are configured only using an interface, such as VLAN or port, do not support ECMP as these routes have a preference value of 0 and are treated like local routes.
- If your switch supports a management interface, then static routes configured on the management interface do not support ECMP.
- Static routes configured by next-hop are not considered equal cost with routes that are configured by tunnel even if the routes have the same cost and preference.

- A static route configured by tunnel is the least preferred and is programmed only when a next-hop or an interface does not configure a static route.
- Static routes configured by next-hop that resolves their next-hop using another static route will be in the `notReachable` state even if the next-hop can be pinged.
- If there are two static routes configured by next-hop, and both next-hops are resolved via a dynamic protocol to the same value, then only one route will be in the `reachableInRtm` state. The state of the other route will be `reachableNotInRtm`.

Disable IPv6 ICMP multicast

On IPv6 networks, a packet can be directed to an individual machine or multicasted to a set of hosts. When a packet is sent to an IPv6 multicast address from a machine on the local network, that packet is delivered to a subset or all machines on that network.

If the packet that is sent to the multicast address is an ICMP Echo Request packet, the machines on the network will receive this ICMPv6 echo request packet and send an ICMP echo reply packet back. When all the machines on a network respond to this ICMPv6 echo request, the result can be severe network congestion or outages.

Network devices always respond to the IPv6 ICMP packets sent to a multicast address. However, you can disable the processing of IPv6 ICMP packets sent to a multicast address on the device. On disabling the ICMP multicast processing, all the packets containing ICMP sent to multicast addresses are dropped when the packets reach the control plane.

Viewing IPv6 Connections

You can establish network connectivity with the following protocols:

- Transmission Control Protocol (TCP), for connection-oriented sessions
- User Datagram Protocol (UDP), for connectionless sessions

When you view TCP information you can:

- check the health of the connections, from the switch perspective, as they traverse the network
- detect intermittent connectivity
- detect attacks on resources
- determine which applications are active by checking the port numbers

UDP endpoint information tells you about local and remote UDP activity.

When you view UDP information you can:

- determine which applications are active by checking the local and remote port numbers
- identify processes within a UDP session to enable multiplexing of a port mapping for UDP

IPv6 Basic Configuration using CLI

Use the procedures in this section to configure IPv6 basics using CLI.

Enabling the IPv6-mode boot config flag

Enable this flag to support IPv6 routes with prefix-lengths greater than 64 bits.

This flag is disabled by default. Use this procedure to enable (set to true) the IPv6-mode boot config flag.

When the IPv6-mode boot config flag is enabled, the maximum number of IPv4 routing table entries decreases. For scaling information, see [Release Notes for VOSS](#).

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enable the IPv6-mode boot config flag:
`boot config flags ipv6-mode`
3. Save the configuration, and then reboot the switch for the change to the IPv6-mode boot config flag to take effect.
4. After you reboot the switch, verify that the IPv6-mode boot config flag is set to true:
`show boot config flags`

Configuring an IPv6 static neighbor address

You can use static IPv6 neighbors to manually specify the link-layer address for a given IPv6 endpoint.

About This Task

Under normal operation you do not need to configure static IPv6 neighbors.

However, IPv6 static neighbors can be used to:

- avoid the overhead associated with dynamic neighbor discovery protocol traffic
- help troubleshoot specific network scenarios

Note

- IPv6 static neighbors are not supported on SMLT.
- When you add or remove IPv6 static neighbors that point to a nexthop router, make sure that you have disabled the IPv6 interface.

Not all parameters are available in non-default VRFs.

Procedure

1. Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:
`enable`

`configure terminal`

Optional: `router vrf WORD<1-16>`

2. Configure an IPv6 neighbor address:

```
ipv6 neighbor WORD<0-128> port {slot/port[sub-port]} mac  
<0x00:0x00:0x00:0x00:0x00:0x00> [vlan <1-4059>
```

3. Configure optional parameters if the default values do not meet your requirements:

- a. Configure the hop limit:

```
ipv6 hop-limit <0-255>
```

The default is 64.

- b. Configure ICMP network address unreachable messages:

```
ipv6 icmp addr-unreach
```

- c. Configure the ICMP error interval:

```
ipv6 icmp error-interval <1-2147483647>
```

The interval is in milliseconds. An interval of 0 results in no error messages. The default is 1000.

- d. Configure the ICMP error quota:

```
ipv6 icmp error-quota <0-2000000>
```

The default is 50.

- e. Configure ICMP port unreachable messages:

```
ipv6 icmp port-unreach
```

- f. Enable response to icmp echo multicast packets:

```
ipv6 icmp echo-multicast-request
```

The default is disabled.

- g. Enable ICMP network unreachable messages:

```
ipv6 icmp unreach-msg
```

The default is disabled.

Example

Add an IPv6 neighbor for a brouter port:

```
Switch:1(config)#ipv6 neighbor 3000:0:0:0:0:0:0:2 port 1/11 mac  
00:0c:42:07:35:90
```

Add an IPv6 neighbor for a VLAN:

```
Switch:1(config)#ipv6 neighbor 3000::3 port 1/12 mac 01:02:03:04:05:06  
vlan 20
```

Variable definitions

Use the data in the following table to use the **ipv6** commands in this procedure.

| Variable | Value |
|---|--|
| <i>forwarding</i> | Configures whether this entity is an IPv6 router with respect to the forwarding of datagrams received by, but not addressed to, this entity. Enable forwarding to act as a router. The default is enabled. |
| <i>hop-limit</i> <0-255> | Configures the hop limit. The default is 64. |
| <i>icmp addr-unreach</i> | Enables ICMP address unreachable messages. The default is enabled. |
| <i>icmp echo-multicast-request</i> | Enable response to icmp echo multicast packets. The default is enable. |
| <i>icmp error interval</i> <1-2147483647> | Configures the interval (in milliseconds) for sending ICMPv6 error messages. The default is 1000. |
| <i>icmp error-quota</i> <0-2000000> | Configures the number of ICMP error messages that can be sent during the ICMP error interval. A value of zero instructs the system not to send an ICMP error messages. The default value is 50. |
| <i>icmp port-unreach</i> | Enables ICMP port unreachable messages. The default is enabled. |

| Variable | Value |
|--|---|
| <code>icmp unreachable-msg</code> | Enables ICMP network unreachable messages. The default is disabled. |
| <code>neighbor WORD<0-128> port {slot/port [sub-port]} mac <0x00:0x00:0x00:0x00:0x00:0x00> [vlan <1-4059>]</code> | <p>Creates a static IPv6 neighbor with the following variables:</p> <ul style="list-style-type: none"> <code>WORD<0-128></code> specifies the IPv6 address of the neighbor in hexadecimal colon format. <code>{slot/port [/sub-port]}</code> specifies the brouter port to use for the neighbor. <p>Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.</p> <ul style="list-style-type: none"> <code>mac <0x00:0x00:0x00:0x00:0x00:0x00></code> specifies the MAC address of the neighbor. <code>vlan <1-4059></code> specifies the VLAN ID to use for the neighbor. <p>Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <code>vrf-scaling</code> and <code>spbm-config-mode</code> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.</p> <p>Static IPv6 neighbors do not maintain any state machine and the system assumes that they are always reachable.</p> |

Configure an IPv6 Interface

The information in this section can help you configure an IPv6 interface to make IPv6 active on the interface and fine-tune IPv6 neighbor discovery to control the frequency of protocol traffic.

By default, IPv6 forwarding is enabled on an interface.

Compared to IPv4/ARP, the IPv6 neighbor discovery mechanism maintains more protocol state, timers, and protocol traffic overhead.

There are two important tunable parameters for IPv6 ND that can control the frequency of protocol traffic:

- `ipv6 interface reachable-time`
- `ipv6 interface retransmit-timer`

Before You Begin

- Before you can assign an IPv6 address to the interface, you must configure an IPv6 interface for a VLAN or brouter port.

You must configure a VLAN before you can give the VLAN an interface identifier or an IPv6 address.

The switch supports port-based and IPv6 protocol-based VLANs.

For information about how to configure VLANs, see the followings:

- [VLAN configuration using CLI](#) on page 3826
- [MultiLink Trunking and Split MultiLink Trunking](#) on page 2254

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create IPv6 interface:

```
ipv6 interface
```

3. Configure optional parameters to meet your requirements:

- a. Enable IPv6 router advertisement on the interface:

```
ipv6 nd send-ra
```

- b. Configure the maximum number of hops before packets drop:

```
ipv6 interface hop-limit <1-255>
```

- c. Configure the link-local address:

```
ipv6 interface link-local WORD<0-19>
```

- d. Configure the mac offset:

```
ipv6 interface mac-offset <MAC-offset>
```

- e. Configure the maximum transmission unit (MTU):

```
ipv6 interface mtu <1280-9500>
```

- f. Configure an interface description:

```
ipv6 interface name WORD<0-255>
```

- g. Configure the time a neighbor is considered reachable after receiving a reachability confirmation:

```
ipv6 interface reachable-time <1-3600000>
```

- h. Configure the time between retransmissions of neighbor solicitation messages to a neighbor when resolving the address or when probing the reachability of a neighbor:

```
ipv6 interface retransmit-timer <1-4294967295>
```

- i. Configure a brouter port as part of an IPv6 VLAN:

```
ipv6 interface vlan <1-4059>
```
- j. Configure the interface to perform IPv6 unicast reverse path forwarding:
 - To enable urpf-mode boot flag, enter:

```
boot config flags urpf-mode
```
 - To configure unicast reverse path forwarding, enter:

```
ipv6 rvs-path-chk mode {strict|exist-only}
```

Example

Create and administratively enable the interface:

```
Switch:1(config-if)#ipv6 interface enable
```

Note

In contrast to IPv6 interface creation and address assignment in EDM, you use the **ipv6 interface** CLI command to create an interface and specify a single global address in one step.

Variable definitions

Use the data in the following table to use the **ipv6 interface** command.

| Variable | Value |
|--------------------------------|--|
| <i>hop-limit</i> <1-255> | Configures the maximum hops. The default is 64. |
| <i>link-local WORD</i> <0-19> | Specifies the 64-bit interface ID used to calculate the actual link-local address as a name up to 19 characters long. |
| <i>mac-offset</i> <MAC-offset> | Use <i>mac-offset</i> to request a particular MAC for an IPv6 VLAN.

Note:
This parameter applies only to VLANs.

You can specify a MAC offset when you configure IPv6 on a VLAN, or the system can assign a MAC address from within the available range. Specifies a number by which to offset the MAC address from the chassis MAC address. This ensures that each IP address has a different MAC address. If you omit this variable, a unique MAC offset is automatically generated. Different hardware platforms support different ranges. To see which range is available on the switch, use the CLI command completion Help. |
| <i>mtu</i> <1280-9500> | Configures the maximum transmission unit for the interface: 1280-1500, 1850, or 9500. This value must be the same for all addresses defined on this interface. The default is 1500.
Different hardware platforms support different MTU values. To see what values your switch supports, use the CLI command completion help. |
| <i>name WORD</i> <0-255> | Assigns a descriptive name. The network management system also configures this string. |

| Variable | Value |
|--|---|
| <code>reachable-time</code>
<code><0-3600000></code> | <p>Controls how long IPv6 neighbor entries learned on an interface remain in the REACHABLE state (as described in RFC 4861). The system randomizes the value you configure, per RFC specifications, to be 50%-150% of the configured value. By default the reachable-time base value is 30 seconds, with an actual 15-45 second range when you consider the randomization factor. The default is 3000 milliseconds</p> |
| <code>retransmit-timer</code>
<code><0-4294967295></code> | <p>Controls the time, in milliseconds, between retransmission of Neighbor Solicitation messages when the system attempts to resolve or reconfirm the reachability of an IPv6 neighbor. By default, the system sends three Neighbor Solicitation messages with a one second interval between each message. If the system does not receive a corresponding Neighbor Advertisement within an interval equal to 3 X retransmit-timer milliseconds, the system declares the IPv6 neighbor unreachable.</p> <p>Tip:
You can increase the retransmit-timer to extend the interval that the switch waits until it declares the neighbor unreachable. For example: a retransmit-timer value of 5000 means the switch waits 3 X 5000 milliseconds which equals 15000 milliseconds or 15 seconds.</p> <p>The default is 1000 milliseconds</p> |
| <code>vlan</code> <code><1-4059></code> | <p>Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <code>vrf-scaling</code> and <code>spbm-config-mode</code> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This value corresponds to the lower 12 bits of the IEEE 802.1Q VLAN tag.</p> |

Use the data in the following table to use the `ipv6 rvs-path-chk` command.

| Variable | Value |
|--|---|
| <code>mode</code>
<code>{strict </code>
<code>exist-only}</code> | <p>Specifies the mode for Unicast Reverse Path Forwarding (uRPF). In strict mode, uRPF checks whether the source IP address of the incoming packet exists in the FIB. If the incoming interface is not the best reverse path, the packet check fails and uRPF drops the packet. In exist-only mode, uRPF checks whether the source IP address of the incoming packet exists in the FIB. The packet is dropped only if the source address is not reachable via any interface on that router.</p> |

Use the data in the following table to use the **interface** command.

| Variable | Value |
|---|--|
| <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]} | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Assigning IPv6 addresses to a brouter port or VLAN

Assign IPv6 addresses to interfaces to configure IPv6 routing for the interface.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Assign an IPv6 address:

```
ipv6 interface address WORD<0-255>
```

Example

Assign an IPv6 address specifying the full 128 bits of the address:

```
Switch:1(config-if)#ipv6 interface address 30:0:0:0:0:0:0:ffff/64
```

Assign an IPv6 address specifying only the upper 64 bits of the address:

```
Switch:1(config-if)#ipv6 nd prefix-interface <prefix> eui <1-3>
```

In this example you specify only the upper 64 bits of the address and allow the system to auto-generate the lower 64 bits from the MAC address.

Variable Definitions

The following table defines parameters for the **ipv6 interface address** command.

| Variable | Value |
|---------------------|--|
| <i>WORD</i> <0–255> | Specifies the IPv6 address for the port or VLAN. |

The following table defines parameters for the **interface** command.

| Variable | Value |
|---|--|
| <1–4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| { <i>slot/port</i> [/ <i>sub-port</i>][/ <i>slot/port</i> [/ <i>sub-port</i>]]
[,...]} | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Configuring IPv6 route preferences

Before You Begin

Important

Changing route preferences can affect system performance and network accessibility while you perform the procedure. Change a prefix list or a routing protocol before you activate the protocols.

About This Task

Configure IPv6 route preferences to give preference to routes learned for a specific protocol.

Procedure

- Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:

```
enable

configure terminal

Optional: router vrf WORD<1–16>
```
- Configure the route preference:

```
ipv6 route preference protocol <static|ebgp|ibgp|ospfv3-intra|ospfv3-
inter|ospfv3-extern1|ospfv3-extern2|ripng|spbm-level1> <0–255>
```
- Confirm that the configuration is correct:

```
show ipv6 route preference [vrf WORD<1–16> | vrfids WORD<0–512>]
```

Example

Configure the route preference to RIPng and confirm the configuration is correct.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#ipv6 route preference protocol ripng 10
Switch:1(config)#show ipv6 route preference
```

```
=====
IPv6 Route Preference - GlobalRouter
=====
=====
PROTOCOL          DEFAULT    CONFIG
-----
LOCAL             0          0
STATIC            5          5
SPBM_L1           7          7
OSPFv3_INTRA     20         20
OSPFv3_INTER     25         25
EBGP              45         45
RIPNG             100        100
OSPFv3_E1        120        120
OSPFv3_E2        125        125
IBGP              175        175
```

Variable definitions

Use the data in the following table to use the **ipv6 route preference** and the **show ipv6 route preference** commands.

| Variable | Value |
|-----------------------|---|
| <0-255> | Assigns a route preference value. |
| <i>ebgp</i> | Configures the preference for protocol type EBGP. |
| <i>ibgp</i> | Configures the preference for protocol type IBGP. |
| <i>ospfv3-extern1</i> | Configures the preference for protocol type OSPFv3 external type 1. |
| <i>ospfv3-extern2</i> | Configures the preference for protocol type OSPFv3 external type 2. |
| <i>ospfv3-intra</i> | Configures the preference for protocol type OSPFv3 intra-area. |
| <i>ospfv3-inter</i> | Configures the preference for protocol type OSPFv3 inter-area. |
| <i>ripng</i> | Configures the preference for protocol type RIPng. |
| <i>spbm-level1</i> | Configures the preference for protocol type spbm-level1. |
| <i>static</i> | Configures the preference for protocol type static. |

View Global IPv6 Information

View and manage general IPv6 information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display IPv6 information for an interface:

```
show ipv6 interface [gigabitethernet {slot/port[/sub-port] [-slot/
port[/sub-port]] [,...]] [loopback <1-256>] [mgmtEthernet {slot/port[/
sub-port] [-slot/port[/sub-port]] [,...]] [tunnel <1-2000>] [vlan
<1-4059>] [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Note

The *mgmtEthernet* parameter is only supported on VSP 8600 Series.

3. Display IPv6 tunnel information:

```
show ipv6 interface tunnel <1-2000>
```

4. Display IPv6 address information for the specified slot and port:

```
show ipv6 address interface gigabitethernet {slot/port[/sub-port] [-
slot/port[/sub-port]] [,...]} [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

5. Display IPv6 address information for the specified IPv6 address:

```
show ipv6 address interface ip WORD<0-46> [vrf WORD<1-16>] [vrfids
WORD<0-512>]
```

6. Display IPv6 address information for the specified tunnel:

```
show ipv6 address interface tunnel <1-2000>
```

7. Display IPv6 address information for the specified VLAN:

```
show ipv6 address interface vlan <1-4059>
```

8. Display the current state of IPv6 forwarding:

```
show ipv6 forwarding [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

9. Display information on the current state of IPv6 functionality:

```
show ipv6 global [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

10. Display IPv6 Gigabit Ethernet (GbE) router advertisement information:

```
show ipv6 nd interface gigabitethernet [{slot/port[/sub-port] [-slot/
port[/sub-port]] [,...]]
```

11. Display IPv6 router advertisement information for the management port:

```
show ipv6 nd interface mgmtEthernet mgmt
```

Note

This step applies to VSP 8600 Series only.

12. Display IPv6 VLAN router advertisement information:

```
show ipv6 nd interface vlan [<1-4059>]
```

13. Display detailed information in IPv6 router advertisements:

```
show ipv6 nd-prefix detail [vrf WORD<1-16> | vrfids WORD<0-512>]
```

14. Display GbE interface information in IPv6 router advertisements:

```
show ipv6 nd-prefix interface gigabitethernet [{slot/port[/sub-port]
[-slot/port[/sub-port]] [,...]]
```

15. Display VLAN interface information in IPv6 router advertisements:

```
show ipv6 nd-prefix interface vlan [<1-4059>]
```

16. Display VLAN information in IPv6 router advertisements:

```
show ipv6 nd-prefix vlan <1-4059>
```

17. Display IPv6 neighbor entries with specific brouter port numbers:

```
show ipv6 neighbor interface gigabitethernet {slot/port[/sub-port]}
```

18. Display IPv6 neighbor information for neighbors of the specified type:

```
show ipv6 neighbor type <1-4>
```

19. Display IPv6 neighbor information:

```
show ipv6 neighbor [WORD<0-46>]
```

Example

```
Switch:1(config)#show ipv6 interface vlan

```

Variable definitions

Use the data in the following table to use the **show ipv6** commands.

| Variable | Value |
|--|--|
| <i>address interface ip</i>
<i>WORD</i> <0-46> | Specifies the IPv6 address. |
| <i>neighbor</i> [<i>WORD</i> <0-46>] | Specifies the IPv6 address of the neighbor. |
| <i>loopback</i> <1-256> | Specifies the loopback interface ID value. If you do not specify a value, the output includes all IPv6 loopback interfaces. |
| { <i>slot/port</i> [/ <i>sub-port</i>]
[- <i>slot/port</i> [/ <i>sub-port</i>]]
[,...] | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <i>type</i> <1-4> | Specifies the neighbor type as one of the following: <ul style="list-style-type: none"> • 1 - other • 2 - dynamic • 3 - static • 4 - local |
| <i>tunnel</i> <1-2000> | Specifies the tunnel ID. |
| <i>vlan</i> <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| <i>vrf</i> <i>WORD</i> <1-16> | Specifies the VRF name. |
| <i>vrfids</i> <i>WORD</i> <1-256> | Specifies the VRF ID. |

Creating IPv6 static routes

Use static routes to manually configure routes to destination IPv6 address prefixes.

About This Task

Not all parameters are available in non-default VRFs.

Procedure

1. Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

Optional: `router vrf WORD<1-16>`

2. Enable IPv6 static routes globally:

```
ipv6 route static enable
```

If you disable static routes globally, the system removes all enabled static routes from the RTM and does not add new static routes to the RTM.

3. Configure a static route:

```
ipv6 route WORD<0-46> [enable] [cost <1-65535>] [next-hop WORD<0-46>]  
[preference <1-255>] [tunnel <1-2000>] [port {slot/port[sub-port]}]  
[vlan <1-4059>]
```

4. (Optional) Disable all IPv6 static routes:

```
no ipv6 route static enable
```

5. (Optional) Permanently delete the IPv6 static route configuration:

```
clear ipv6 route static [vrf WORD<1-16> | vrfids WORD<0-512>]
```

Example

Enable IPv6 static routes globally:

```
Switch:1(config)#ipv6 route static enable
```

Create and enable a static route through a global nexthop:

```
Switch:1(config)#ipv6 route 4000::/64 cost 1 next-hop 3000::2 enable
```

Create and enable a static route through an outgoing interface (VLAN or brouter port):

```
Switch:1(config)# ipv6 route 4000::/64 cost 1 vlan 1900 enable
```

Create and enable a static route through a link local nexthop and an outgoing interface:

```
Switch:1(config)# ipv6 route 4000::/64 cost 1 next-hop fe80::1 vlan 1900  
enable
```

In the preceding example, you must specify the outgoing interface so that the system can apply the correct context to the link-local address.

Variable definitions

Use the data in the following table to use the **ipv6 route** command.

| Variable | Value |
|--|--|
| <i>WORD</i> <0-46> | Specifies the IPv6 destination address and prefix. |
| <i>enable</i> | Enables the static route. The default is enabled. |
| <i>cost</i> <1-65535> | Specifies the cost or distance ratio to reach the destination for this static route. The default is 1. |
| <i>next-hop Word</i> <0-46> | Specifies the IPv6 address of the next hop on this route. You do not need to specify the next hop if the devices directly connect to one another. Configure the next hop if the two nodes do not share the same network prefix but reside on the same link. |
| <i>preference</i> <1-255> | Specifies the routing preference of the destination IPv6 address. The default is 5. |
| { <i>slot/port</i> [/ <i>sub-port</i>]} | Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <i>tunnel</i> <1-2000> | Specifies the tunnel ID. |
| <i>vlan</i> <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |

View Routes Information

View routes information to view the current configuration.

About This Task

Not all parameters are available in non-default VRFs.

IPv6 host routes created for the IPv6 local interfaces do not display in the routing table.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show route information for alternative routes:

```
show ipv6 route alternative [vrf WORD<1-16> | vrfids WORD<1-256>]
```
3. Show the number of OSPF, RIP, static, and local routes:

```
show ipv6 route count-summary [vrf WORD<1-16> | vrfids WORD<1-256>]
```
4. Show route information for a destination:

```
show ipv6 route dest WORD<0-46> [vrf WORD<1-16> | vrfids WORD<1-256>]
```
5. Show route information for a port:

```
show ipv6 route gigabitethernet {slot/port[sub-port]}
```

6. Show route information for a next-hop address:

```
show ipv6 route next-hop WORD<0-46> [vrf WORD<1-16> | vrfids WORD<1-256>]
```
7. Show route information for an SPBM IPv6 route:

```
show ipv6 route spbm-nh-as-mac
```
8. Show route information for a static route:

```
show ipv6 route static [vrf WORD<1-16> | vrfids WORD<1-256>]
```
9. Show route information for a tunnel:

```
show ipv6 route tunnel <1-2000>
```
10. Show route information for a VLAN:

```
show ipv6 route vlan <1-4059>
```

Example

```
Switch:1(config-if)#show ipv6 route
```

```

Variable definitions

Use the data in the following table to use the **show ipv6 route** command.

| Variable | Value |
|----------------------------------|--|
| <i>count-summary</i> | Shows the total number of OSPF, static, and local routes. |
| <i>dest WORD<0-46></i> | Specifies the IPv6 destination network address. The prefix value must match the prefix length. |
| <i>next-hop WORD<0-46></i> | Specifies the IPv6 address of the next hop on this route. |
| <i>spbm-nh-as-mac</i> | Shows the B-MAC address as the next hop rather than the host name. |
| <i>{slot/port[/sub-port]}</i> | Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <i>static</i> | Shows static IPv6 routes. |
| <i>tunnel <1-2000></i> | Shows route entries for a specific tunnel ID. |
| <i>vlan<1-4059></i> | Shows route entries for a specific VLAN ID. |
| <i>vrfWORD<1-16></i> | Shows the VRF name. |
| <i>vrfidsWORD<1-256></i> | Shows the VRF ID. |

Creating an IPv6 CLIP interface

About This Task

Perform this procedure to create an IPv6 CLIP interface and associate it with a specific VRF.

Procedure

1. Enter Loopback Interface Configuration mode

```
enable
```

```
configure terminal
```

```
interface Loopback <1-256>
```
2. Create an IPv6 loopback interface address:

```
ipv6 interface address WORD <0-255> vrf WORD <1-16>
```
3. (Optional) Enter a name for the IPv6 address:

```
ipv6 interface name WORD <0-64>
```

4. Ensure the configuration is correct:

```
show ipv6 interface loopback <1-256>
```

Example

```
Switch:1#show ipv6 interface loopback
=====
                        Loopback IPv6 Interfaces
=====
IF   VRF          Descr          VLAN PHYSICAL      ADMIN  OPER  TYPE  MTU  HOP REACHABLE  RETRANSMIT  IPSEC

Legend: NA - Information not available

1 out of 1 Total Num of Interface Entries displayed.
1 out of 1 Total Num of Address Entries displayed.
```

Variable definitions

Use the data in the following table to use the **ipv6** commands.

| Variable | Value |
|------------------------|--|
| <i>WORD</i> <1-256> | Specifies the CLIP interface ID. |
| <i>WORD</i> <0-255> | Specifies the IPv6 address. |
| <i>vrf WORD</i> <1-16> | Specifies the VRF name. |
| <i>WORD</i> <0-64> | Specifies the I-SID name associated with the IPv6 address. |

Enabling IPv6 ECMP

About This Task

Use the following procedure to enable IPv6 ECMP globally or on a specific VRF. IPv6 ECMP is disabled by default.

Procedure

1. Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:

```
enable

configure terminal

Optional: router vrf WORD<1-16>
```
2. Enter the following command to enable IPv6 ECMP:

```
ipv6 ecmp enable
```

3. Set the default value, IPv6 ECMP is disabled by default.

```
default ipv6 ecmp enable
```

4. Disable IPv6 ECMP globally:

```
no ipv6 ecmp enable
```

Variable definitions

Use the data in the following table to use the **ipv6 ecmp** command.

| Variable | Value |
|---------------------|---|
| <code>enable</code> | <p>Enables IPv6 ECMP globally.</p> <p>Note:</p> <ul style="list-style-type: none"> • Enabling IPv6 ECMP sets the maximum number of paths configured to its default value. This value is either 4 or 8 depending on your hardware platform. • Disabling IPv6 ECMP sets the maximum number of paths configured to 1. |

Configuring maximum number of ECMP paths

Before You Begin

Enable ECMP on the switch before configuring the max-path value. For more information, see [Enabling IPv6 ECMP](#) on page 1847.

About This Task

Use the following procedure to configure the maximum number of ECMP paths.

Procedure

1. Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

Optional: `router vrf WORD<1-16>`

2. Configure the maximum number of ECMP paths.

```
ipv6 ecmp max-path <ECMP-Paths>
```

3. Set the configured maximum number of ECMP paths to its default value:

```
default ipv6 ecmp max-path
```

Note

The default value for max-path is the maximum value, which varies depending on your hardware platform.

Example

```
Switch:1>enable
Switch:1#configure terminal
```

Enable ECMP on the switch:

```
Switch:1(config)#ipv6 ecmp enable
```

Configure the maximum number of ECMP paths to 4:

```
Switch:1(config)#ipv6 ecmp max-path 4
```

Variable definitions

Use the data in the following table to use the **ipv6 ecmp max-path** command.

| Variable | Value |
|--------------|---|
| <ECMP-Paths> | Specifies the maximum number of ECMP paths. Different hardware platforms can support a different number of ECMP paths. For more information on the maximum number of ECMP paths supported on the switch, see the scaling information in Release Notes for VOSS .
When ECMP is enabled, the default value is either 4 or 8 depending on your hardware platform. |

Enabling or disabling IPv6 ICMP multicast

On disabling the ICMP multicast processing, ICMPv6 Echo Request packets sent to IPv6 multicast addresses are dropped when they reach the control plane.

About This Task

Use this procedure to enable or disable the IPv6 ICMP multicast on the global router.

Procedure

1. Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:

```
enable

configure terminal

Optional: router vrf WORD<1-16>
```
2. Enable IPv6 ICMP multicast, enter:

```
ipv6 icmp echo-multicast-request
```
3. Disable IPv6 ICMP multicast, enter:

```
no ipv6 icmp echo-multicast-request
```
4. Set IPv6 ICMP multicast to default state, enter:

```
default ipv6 icmp echo-multicast-request
```

**Note**

By default, the IPv6 ICMP multicast feature is enabled.

5. View the IPv6 ICMP multicast state:

```
show ipv6 global [vrf WORD<1-16> | vrfids WORD<0-512>]
```

Enabling Stateless Address Autoconfiguration

Enable IPv6 Stateless Address Autoconfiguration to generate addresses using a combination of locally available information and information advertised by routers.

The default is disabled.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable IPv6 autoconfiguration:

```
ipv6 autoconfig
```

Example

```
Switch:1(config)#ipv6 autoconfig
```

The following example shows a sample output for the **show ipv6 global** command.

```
Switch:1#show ipv6 global
  forwarding                : disable
  default-hop-cnt           : 64
  number-of-interfaces      : 2
  icmp-error-interval       : 1000
  icmp-error-quota          : 50
  icmp-unreach-msg          : disable
  icmp-addr-unreach-msg     : enable
  icmp-port-unreach-msg     : enable
  icmp-echo-multicast-request : enable
  static-route-admin-status : enable
  alternative-route         : enable
  ecmp                      : disable
  ecmp-max-path             : 1
  source-route              : disable
  host-autoconfig           : enable
```

Configure Route Advertisement on the Management Port

Configure route advertisement in IPv6 on the management port for neighbor discovery (ND).

Note

This procedure supports Layer 2 or Layer 3 route advertisement on VSP 8600 Series only.

Procedure

1. Enter mgmtEthernet Interface Configuration mode:

```
enable

configure terminal

interface mgmtEthernet <mgmt | mgmt2>
```
2. Configure the number of neighbor solicitation messages from duplicate address detection:

```
ipv6 nd dad-ns <0-600>
```
3. Configure the hop limit sent in router advertisements:

```
ipv6 nd hop-limit <0-255>
```

Example

```
Switch:1(config-if)#ipv6 nd dad-ns 2
Switch:1(config-if)#ipv6 nd hop-limit 2
Switch:1(config-if)#show ipv6 nd interface mgmtethernet mgmt

-----
Mgmt Ipv6 Nd
-----
IFID  MGMT-IF  RTR-ADV  MAX-INT  MIN-INT  LIFETIME  MANAG  OTHER  DAD-NS  MTU      HOP    REACHABLE  RETRANSMIT
                FLAG   CONF
-----
64   mgmt     False    600     200     0         False  False  2       0 (d)   2 (s)   0 (d)     0 (d)

Note:  (s) = Set, (d) = Default, (i) = inherit.

1 out of 5 Total Num of Ipv6 ND Entries displayed.
```

Variable definitions

Use the data in the following table to use the **ipv6 nd** command.

| Variable | Value |
|--------------------------------------|---|
| <code>dad-ns <0-600></code> | Specifies the number of neighbor solicitation messages for duplicate address detection (DAD).
A value of 0 disables the DAD process on this interface.
A value of 1 sends one advertisement without retransmissions.
The default is 1. |
| <code>hop-limit <0-255></code> | Specifies the current hop limit field sent in router advertisements from this interface.
The value must be the current diameter of the Internet.
A value of zero indicates that the advertisement does not specify a hop-limit value.
The default is 64. |

Configure Process-redirect for the Management Port

Configure process-redirect messages to honor or ignore redirect messages for the management port. Redirect messages are visible only when Stateless Address Autoconfiguration is configured on switches capable of routing IPv6 traffic.

The default is disabled.

Note

This procedure supports Layer 2 or Layer 3 process-redirect on VSP 8600 Series only.

Before You Begin

- Disable IPv6 forwarding.
- Enable Stateless Address Autoconfiguration
- Create an IPv6 interface.
- Configure an IPv6 address.

Procedure

1. Enter mgmtEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface mgmtEthernet <mgmt | mgmt2>
```

2. Configure process-redirect messages:

```
ipv6 interface process-redirect
```

3. Verify that process-redirect messages are configured on the management port.

```
Switch:1(config-if)#ipv6 interface process-redirect
```

Example

The following examples shows a sample output of the **show ipv6 interface process-redirect** command.

```
Switch:1#show ipv6 interface process-redirect
=====
                Process ICMP redirect status
=====
IFINDX          DESCR          VLAN          STATUS
-----
64              PORT-mgmt          4092          Enabled
192             VLAN-5             5             Disabled
2050            VLAN-2             2             Disabled
```

Viewing IPv6 default routers

View the table of default routers learned from router advertisement messages.

A maximum of four routers are visible in the default routers list.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show IPv6 default routers:

```
show ipv6 default-routers
```

Example

```
Switch:1#show ipv6 default-routers
=====
                        Default Routers
NET ADDRESS                VLAN    LIFETIME    IS ACTIVE
-----
fe80::211:58ff:fe2b:fc00    mgmt     1778        YES
fe80::215:e8ff:fe6e:2800    mgmt     1657        NO
```

Job aid

The following table describes the fields in the output for the **show ipv6 default-routers** command.

| Parameter | Description |
|----------------------------|--|
| <i>net address</i> | Shows the IPv6 router address received from a valid router advertisement. |
| <i>VLAN <1-4059></i> | Shows the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. If you enable VRF scaling and SPBM mode, the system also reserves VLAN IDs 3500 to 3999. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| <i>LIFETIME</i> | Shows the value placed in the router lifetime field of router advertisements. This value must be either 0 or between 4 and 9000. A value of zero indicates that the system is not a default router. The default is 1800. |
| <i>IS ACTIVE</i> | Shows if the default router is active or inactive. |

Configuring an IPv6 prefix list

Use IPv6 prefix lists to allow or deny specific IPv6 route updates. A prefix list policy specifies route prefixes to match. When there is a match, the route is used.

About This Task

You configure prefix lists on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create an IPv6 prefix list:

```
ipv6 prefix-list <WORD 1-64> <WORD 1-256> [ge <0-128>] [le <0-128>]
[id <1-2147483647>]
```

Use the same command to add additional prefixes to the list.

3. To rename the list:

```
ipv6 prefix-list <WORD 1-64> name <WORD 1-64>
```

4. Display the prefix list:

```
show ipv6 prefix-list <WORD 1-256> [vrf WORD<1-16>] [vrfids
WORD<1-512>] [WORD <1-64>]
```

Example

Create an IPv6 prefix list:

```
Switch:1<config>#ipv6 prefix-list list4 2001:DB8::/32 ge 32 le 32
```

To rename the list:

```
Switch:1<config>#ipv6 prefix-list list4 name list5
```

Variable Definitions

Use the data in the following table to use the **ipv6 prefix-list** command.

| Variable | Value |
|-------------------|---|
| <WORD 1-64> | Specifies the IPv6 prefix-list name. |
| <WORD 1-256> | Specifies the IPv6 prefix and length. |
| ge <0-128> | Specifies the minimum length to match. Lower bound and higher bound mask lengths together can define a range of networks. |
| id <1-2147483647> | Specifies the Prefix list ID. |
| le <0-128> | Specifies the maximum length to match. Lower bound and higher bound mask lengths together can define a range of networks. |
| name <WORD 1-64> | Names the prefix list. The default value is none. |

Use the data in the following table to use the **show ipv6 prefix-list** command.

| Variable | Value |
|--------------------|--|
| <WORD 1-256> | Specifies the IPv6 prefix and length. |
| vrf WORD<1-16> | Specifies the name of the VRF. |
| vrfids WORD<0-512> | Specifies the ID of the VRF and is an integer in the range of 0-512. |
| WORD<1-64> | Specifies a prefix list, by name, to use for the command output. |

Viewing IPv6 Connections using CLI

Use the procedures in this section to view IPv6 connections using CLI.

Viewing TCP and UDP information

Perform this procedure to view the TCP and UDP configuration information for IPv6.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display IPv6 TCP connection information:
show ipv6 tcp connections [vrf WORD<1-16> | vrfids WORD<0-512>]
3. Display IPv6 TCP listener information for the specified IPv6 address:
show ipv6 tcp listener [vrf WORD<1-16> | vrfids WORD<0-512>]
4. Display IPv6 TCP properties
show ipv6 tcp properties [vrf WORD<1-16> | vrfids WORD<0-512>]
5. Display IPv6 TCP statistics
show ipv6 tcp statistics [vrf WORD<1-16> | vrfids WORD<0-512>]
6. Display IPv6 UDP information:
show ipv6 udp endpoints [vrf WORD<1-16> | vrfids WORD<0-512>]

Example

```
Switch:1>show ipv6 tcp connections
```

```
=====
                        TCP connection table info - GlobalRouter
=====
LOCALPORT   LOCALADDR           REMOTEPORT   REMOTEADDR       STATE
-----
21          0:0:0:0:0:0:0:0    0            0:0:0:0:0:0:0:0  listen
23          0:0:0:0:0:0:0:0    0            0:0:0:0:0:0:0:0  listen
```

```
Switch:1>show ipv6 tcp listener
```

```
=====
                        TCP listener table info - GlobalRouter
=====

```

IPv6 Basic Configuration using EDM

Use the procedures in this section to configure IPv6 basics using EDM.

Enabling the IPv6-mode boot config flag

Enable this flag to support IPv6 routes with prefix-lengths greater than 64 bits.

This flag is disabled by default. Use this procedure to enable (set to true) the IPv6-mode boot config flag.

When the IPv6-mode boot config flag is enabled, the maximum number of IPv4 routing table entries decreases. For scaling information, see [Release Notes for VOSS](#).

Procedure

1. In the navigation pane, expand the following folders: **Configuration > Edit**,
2. Click **Chassis**.
3. Click the **Boot Config** tab.
4. Select the **EnableIpv6Mode** check box.
5. Click **Apply**.
6. Save the configuration, and then reboot the switch for the change to the IPv6-mode boot config flag to take effect.

Configuring IPv6 globally

Global configuration includes the following:

- IPv6 alternative routes: To avoid traffic interruption, enable alternative routes globally on the switch, to replace the best route with the next-best route if the best route becomes unavailable. By default, this feature is enabled.

Before You Begin

Change the VRF instance as required to configure IPv6 globally on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation tree, expand the **Configuration > IPv6** folders.
2. Click **IPv6**.
3. Click the **Globals** tab.
4. In the **DefaultHopLimit** box, enter the preferred number of hops before packets drop.
5. To enable ICMP network unreachable messages, click **IcmpNetUnreach**.
6. In the **IcmpErrorInterval** box, enter the preferred interval for sending ICMPv6 error messages.
7. In the **IcmpErrorQuota** box, enter the preferred number of ICMP error messages that the system can send during the ICMP error interval.
8. To enable IPv6 multicast, click **IcmpMulticastRequestEnable**.
9. To enable IPv6 ICMP address unreachable messages, click **IcmpAddrUnreach**.
10. To enable IPv6 ICMP port unreachable messages, click **IcmpPortUnreach**.
11. To enable IPv6 autoconfiguration, click **Autoconfig**.
12. To enable IPv6 static routes globally, click **StaticRouteGlobalAdminEnabled**.
13. To enable IPv6 Source Routing, click **SourceRouteEnable**.
14. To clear all IPv6 static routes, click **RouteStaticClear**.
15. To enable IPv6 alternative routes, click **AlternativeRouteEnable**.
16. To configure IPv6 ECMP globally, select **enable** or **disable**, in the **EcmpEnable** option box.
17. In the **EcmpMaxPath** box, enter the preferred number of equal-cost paths.
18. Click **Apply**.

Globals field descriptions

Use the data in the following table to use the **Globals** tab.

| Name | Description |
|--------------------------|--|
| Forwarding | Configures whether this switch is an IPv6 router with respect to the forwarding of datagrams received by, but not addressed to, the switch. Select forwarding for the switch to act as a router for IPv6 traffic. Select notForwarding to not act as a router for IPv6 traffic. The default is forwarding . You must enable forwarding to use Telnet or Ping with IPv6. |
| DefaultHopLimit | Configures the hop limit. The default is 64. |
| Interfaces | Shows the number of interfaces. |
| IfTableLastChange | Shows the date of the last interface table change. |
| IcmpNetUnreach | Enables ICMP network unreachable messages. The default is disabled. |

| Name | Description |
|--------------------------------------|--|
| IcmpErrorInterval | Configures the interval (in milliseconds) for sending ICMPv6 error messages. The default is 1000. An entry of 1 seconds results in no sent ICMPv6 error messages. |
| IcmpErrorQuota | Configures the number of ICMP error messages that the system can send during the ICMP error interval. A value of zero specifies not to send any. The default value is 50. |
| IcmpMulticastRequestEnable | Globally enables or disables the IPv6 ICMP echo multicast request feature. This is enabled by default. |
| IcmpAddrUnreach | Enables or disabled ICMP address unreachable messages.
This is enabled by default. |
| IcmpPortUnreach | Enables or disables ICMP port unreachable messages.
This is enabled by default. |
| Autoconfig | Enables or disables stateless address autoconfiguration.
This is disabled by default. |
| StaticRouteGlobalAdminEnabled | Enables IPv6 static routes globally. If you disable static routes globally, the system removes all enabled static routes from the RTM and does not add new static routes to the RTM.
The default is enabled. |
| RouteStaticClear | Clears all IPv6 static routes. |
| SourceRouteEnable | Globally enables or disables the IPv6 Source Routing feature. It is disabled by default. |
| PrefixListTableSize | Displays the prefix list table size. |
| RoutePrefTableSize | Displays the route preference table size. |
| AlternativeRouteEnable | Globally enables or disables the IPv6 alternative route feature. By default, this feature is enabled. |
| EcmpEnable | Enables or disables the IPv6 ECMP globally. By default, it is disabled. |
| EcmpMaxPath | Globally configures the maximum number of ECMP paths.
The number of paths supported is either 1 to 4 or 1 to 8, depending on your hardware platform.
When ECMP is enabled, the default value is either 4 or 8 depending on your hardware platform.
You cannot configure this feature unless ECMP is enabled globally. |

Configure an IPv6 Interface

You must configure an IPv6 interface for a VLAN or brouter port before you can assign an IPv6 address to the interface.

Before You Begin

- You must configure a VLAN before you can give the VLAN an interface identifier or an IPv6 address. The switch supports port-based, protocol-based, and MAC-source-based VLANs.

For information about how to configure VLANs, see [VLAN Configuration using EDM](#) on page 3858.

- Change the VRF instance as required to configure an IPv6 interface on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

You can also configure an IPv6 interface for a brouter port through the **Edit > Port > IPv6** navigation path, and for a VLAN through the **VLAN > VLANs > Basic > IPv6** navigation path. This procedure uses the main IPv6 navigation path where you can create both types of interfaces.

Procedure

- In the navigation pane, expand the **Configuration > IPv6** folders.
- Select **IPv6**.
- Select the **Interfaces** tab.
- Select **Insert**.
- In the **Interface** field, select **Port** or **VLAN**.
- Select a port or VLAN.
- Select **OK**.
- Select the **AdminStatus** field to activate the interface.
- Configure the remaining parameters as required.
- Select **Insert**.
- Select **Apply**.

Interfaces field descriptions

Use the data in the following table to use the **Interfaces** tab.

| Name | Description |
|-------------------------|---|
| Interface | Specifies the port or VLAN. |
| Identifier | Shows the IPv6 address interface identifiers. This value is a binary string of up to 8 octets in network byte-order. |
| IdentifierLength | Shows the length of the identifier, in bits. |
| Descr | Specifies a description of the interface. The network management system also configures this string. |
| VlanId | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This value corresponds to the lower 12 bits of the IEEE 802.1Q VLAN tag. |
| Type | Shows the interface type. |

| Name | Description |
|-----------------------------|--|
| ReasmMaxSize(MTU) | Specifies the maximum size of the MTU of this IPv6 interface. This value must be the same for all the IP addresses defined on this interface. The default value is 1500.
Different hardware platforms support different MTU values. |
| PhysAddress | Specifies the media-dependent physical address. For Ethernet, this is a MAC address. |
| AdminStatus | Specifies if IPv6 is active on this interface. The default is false (disabled). |
| OperStatus | Specifies the current operational status of the interface. |
| ReachableTime | Specifies the time, in milliseconds, that a neighbor is considered reachable after receiving a reachability confirmation. The default is 30000. |
| RetransmitTimer | Specifies the time, in milliseconds, between retransmissions of neighbor solicitation messages to a neighbor when resolving the address, or when probing the reachability of a neighbor. The default is 1000. |
| CurHopLimit | Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet. A value of zero indicates that the advertisement does not specify a value for CurHopLimit. The default is 64. |
| MulticastAdminStatus | The option to select MulticastAdminStatus is disabled. You cannot configure the administrative status for multicast in this context. |
| MacOffset | Requests a particular MAC for an IPv6 VLAN.
You can specify a MAC offset when you configure IPv6 on a VLAN, or the system can assign a MAC address from within the available range.
Different hardware platforms support different MAC offset ranges. |
| RSMLTEnable | Shows whether RSMLT is enabled on the interface.
The default value is disabled (false). |
| ProcessRedirect | Shows whether ND Redirect messages processing is enabled or disabled on this interface.
The default value is disabled (false). |

Configuring an IPv6 router port interface

You must configure an IPv6 interface for a router port before you can assign an IPv6 address to the interface.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand the **Configuration > Edit > Port** folders.
3. Click **IPv6**.
4. Click the **IPv6 Interface** tab.
5. Click **Insert**.
6. Enter the interface identifier.
7. Select the **AdminStatus** field to activate the interface.
8. Configure the remaining parameters as required.
9. Click **Insert**.

10. Click **Apply**.

Interfaces field descriptions

Use the data in the following table to use the **Interfaces** tab.

| Name | Description |
|-----------------------------|---|
| Interface | Specifies the port or VLAN. |
| Identifier | Shows the IPv6 address interface identifiers. This value is a binary string of up to 8 octets in network byte-order. |
| IdentifierLength | Shows the length of the identifier, in bits. |
| Descr | Specifies a description of the interface. The network management system also configures this string. |
| VlanId | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This value corresponds to the lower 12 bits of the IEEE 802.1Q VLAN tag. |
| Type | Shows the interface type. |
| ReasmMaxSize(MTU) | Specifies the maximum size of the MTU of this IPv6 interface. This value must be the same for all the IP addresses defined on this interface. The default value is 1500. Different hardware platforms support different MTU values. |
| PhysAddress | Specifies the media-dependent physical address. For Ethernet, this is a MAC address. |
| AdminStatus | Specifies if IPv6 is active on this interface. The default is false (disabled). |
| OperStatus | Specifies the current operational status of the interface. |
| ReachableTime | Specifies the time, in milliseconds, that a neighbor is considered reachable after receiving a reachability confirmation. The default is 30000. |
| RetransmitTimer | Specifies the time, in milliseconds, between retransmissions of neighbor solicitation messages to a neighbor when resolving the address, or when probing the reachability of a neighbor. The default is 1000. |
| CurHopLimit | Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet. A value of zero indicates that the advertisement does not specify a value for CurHopLimit. The default is 64. |
| MulticastAdminStatus | The option to select MulticastAdminStatus is disabled. You cannot configure the administrative status for multicast in this context. |
| MacOffset | Requests a particular MAC for an IPv6 VLAN. You can specify a MAC offset when you configure IPv6 on a VLAN, or the system can assign a MAC address from within the available range. Different hardware platforms support different MAC offset ranges. |

| Name | Description |
|------------------------|--|
| RSMLTEnable | Shows whether RSMLT is enabled on the interface. The default value is disabled (false). |
| ProcessRedirect | Shows whether ND Redirect messages processing is enabled or disabled on this interface. The default value is disabled (false). |

Configure an IPv6 VLAN Interface

You must configure an IPv6 interface for a VLAN before you can assign an IPv6 address to the interface.

Before You Begin

- You must configure a VLAN before you can give the VLAN an interface identifier or an IPv6 address. The switch supports port-based, protocol-based, and MAC-source-based VLANs.

For information about how to configure VLANs, see [VLAN Configuration using EDM](#) on page 3858.

Procedure

- In the navigation pane, expand the **Configuration > VLAN** folders.
- Select **VLANs**.
- Select the **Basic** tab.
- Select a VLAN.
- Select **IPv6**.
- Select the **IPv6 Interface** tab.
- Select **Insert**.
- Enter the interface identifier.
- Select the **AdminStatus** field to activate the interface.
- Configure the remaining parameters as required.
- Select **Insert**.
- Select **Apply**.

IPv6 Interfaces field descriptions

Use the data in the following table to use the **IPv6 Interfaces** tab.

| Name | Description |
|-------------------------|--|
| Interface | Specifies the port or VLAN. |
| Identifier | Shows the IPv6 address interface identifiers. This value is a binary string of up to 8 octets in network byte-order. |
| IdentifierLength | Shows the length of the identifier, in bits. |
| Descr | Specifies a description of the interface. The network management system also configures this string. |

| Name | Description |
|-----------------------------|---|
| VlanId | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This value corresponds to the lower 12 bits of the IEEE 802.1Q VLAN tag. |
| Type | Shows the interface type. |
| ReasmMaxSize(MTU) | Specifies the maximum size of the MTU of this IPv6 interface. This value must be the same for all the IP addresses defined on this interface. The default value is 1500. |
| PhysAddress | Specifies the media-dependent physical address. For Ethernet, this is a MAC address. |
| AdminStatus | Specifies if IPv6 is active on this interface. The default is false (disabled). |
| OperStatus | Specifies the current operational status of the interface. |
| ReachableTime | Specifies the time, in milliseconds, that a neighbor is considered reachable after receiving a reachability confirmation. The default is 30000. |
| RetransmitTimer | Specifies the time, in milliseconds, between retransmissions of neighbor solicitation messages to a neighbor when resolving the address, or when probing the reachability of a neighbor. The default is 1000. |
| CurHopLimit | Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet. A value of zero indicates that the advertisement does not specify a value for CurHopLimit. The default is 64. |
| MulticastAdminStatus | The option to select MulticastAdminStatus is disabled. You cannot configure the administrative status for multicast in this context. |
| MacOffset | Requests a particular MAC for an IPv6 VLAN. You can specify a MAC offset when you configure IPv6 on a VLAN, or the system can assign a MAC address from within the available range. Different hardware platforms support different MAC offset ranges. |
| RSMLTEnable | Shows whether RSMLT is enabled on the interface. The default value is disabled (false). |
| ProcessRedirect | Shows whether ND Redirect messages processing is enabled or disabled on this interface. The default value is disabled (false). |

Assigning IPv6 addresses to interfaces

Assign IPv6 addresses to interfaces to configure IPv6 routing for the interface.

You can assign an IPv6 address to a VLAN or brouter port.

Before You Begin

Change the VRF instance as required to assign IPv6 addresses to interfaces on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

To create MLT and LAG interfaces with IPv6, you must configure VLAN-based connections and you cannot use brouter ports.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6**.
3. Click the **Addresses** tab.
4. Click **Insert**.
5. In the **Interface** field, click **Port** or **VLAN**.
6. Select the interface.
7. Click **OK**.
8. Type the IPv6 address and prefix length.
9. Click **Insert**.
10. Click **Apply**.

Addresses field descriptions

Use the data in the following table to use the **Addresses** tab.

| Name | Description |
|------------------|---|
| Interface | Specifies the interface to which this entry applies. |
| Addr | Specifies the IPv6 address to which this entry applies.

Important:
If the IPv6 address exceeds 116 octets, the object identifiers (OIDs) of instances of columns in this row are more than 128 subidentifiers and you cannot use SNMP-v1, SNMPv2c, or SNMPv3 to access them. |
| AddrLen | Specifies the prefix length value for this address. You cannot change the address length after you create it. You must provide this value to create an entry in this table. |
| Type | Specifies the type of address. The default is unicast. |
| Origin | Specifies the origin of the address. The following list shows the possible origins: <ul style="list-style-type: none"> • other • manual • dhcp • linklayer • random |

| Name | Description |
|----------------------|--|
| Status | Specifies the status of the address, describing whether the address is used for communication. The following list shows the possible statuses: <ul style="list-style-type: none"> • preferred (default) • deprecated • invalid • inaccessible • unknown • tentative • duplicate |
| Created | Specifies the sysUpTime of the creation of this entry. If the entry was created prior to the last reinitialization of the local management subsystem, the object contains a zero value. |
| LastChanged | Specifies the value of sysUpTime of the last modification to this entry. If the entry was created prior to the last reinitialization of the local management subsystem, the object contains a zero value. |
| ValidLifetime | Shows how long, in seconds, the address is valid. |
| PrefLifetime | Shows how long, in seconds, the address is in use. |

Assigning IPv6 addresses to a brouter port interface

Assign IPv6 addresses to interfaces to configure IPv6 routing for the interface.

You can assign an IPv6 address to a VLAN or brouter port.

Before You Begin

Change the VRF instance as required to assign IPv6 addresses to a brouter port interface on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

To create MLT and LAG interfaces with IPv6, you must configure VLAN-based connections and you cannot use brouter ports.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > Edit > Port**.
2. Click **IPv6**.
3. Click the **IPv6 Addresses** tab.
4. Click **Insert**.
5. Click **Insert**.
6. Click **Apply**.

IPv6 Addresses field descriptions

Use the data in the following table to use the **IPv6 Addresses** tab.

| Name | Description |
|--------------------|--|
| Interface | Specifies the port. |
| Addr | Specifies the IPv6 address to which this entry applies.

Note:
If the IPv6 address exceeds 116 octets, the object identifiers (OIDs) of instances of columns in this row are more than 128 subidentifiers and you cannot use SNMP-v1, SNMPv2c, or SNMPv3 to access them. |
| AddrLen | Specifies the prefix length value for this address. You cannot change the address length after you create it. You must provide this value to create an entry in this table. |
| Type | Specifies the type of address. The default is unicast. |
| Origin | Specifies the origin of the address. |
| Status | Specifies the status of the address, describing whether the address is used for communication. |
| Created | Specifies the sysUpTime of the creation of this entry. If the entry was created prior to the last reinitialization of the local management subsystem, the object contains a zero value. |
| LastChanged | Specifies the value of sysUpTime of the last modification to this entry. If the entry was created prior to the last reinitialization of the local management subsystem, the object contains a zero value. |

Assigning an IPv6 address to a VLAN

Assign an IPv6 address to a VLAN.

Procedure

1. In the navigation pane, expand the **Configuration > VLAN** folders.
2. Click **VLANs**.
3. Click the **Basic** tab.
4. Select a VLAN interface.
5. Click **IPv6**.
6. Click the **IPv6 Addresses** tab.
7. Click **Insert**.
8. Type the IPv6 address and length in the fields.

9. Click **Insert**.
10. Click **Apply**.

IPv6 Addresses field descriptions

Use the data in the following table to use the **IPv6 Addresses** tab.

| Name | Description |
|--------------------|---|
| Interface | Identifies the address to which the address is assigned. |
| Addr | Specifies an IP address that is associated with a VLAN. |
| AddrLen | Specifies the prefix address length value for this address. |
| Type | Specifies the type of address: either unicast or anycast. |
| Origin | Specifies the origin of the address as one of the following: <ul style="list-style-type: none"> • other • manual • dhcp • linklayer • random |
| Status | Shows the status of the address and if it can be used for communication. |
| Created | Shows the time this address entry was created. |
| LastChanged | Shows the time this address entry was last updated. |

Create IPv6 Static Routes

Use static routes to manually configure routes to destination IPv6 address prefixes.

Before You Begin

- Enable IPv6 forwarding.
- Change the VRF instance as required to create IPv6 static routes on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6**.
3. Click the **Globals** tab.
4. Select the **StaticRouteGlobalAdminEnabled** check box.

If you disable static routes globally, the system removes all enabled static routes from the RTM and does not add new static routes to the RTM. The default is enabled.

5. Click **Apply**.

6. Click the **Static Routes** tab.
7. Click **Insert**.
8. In the **Dest** field, type the IPv6 address.
9. In the **PrefixLength** field, type the length of the prefix for the IPv6 address.
10. In the **NextHop** field, type the IPv6 address of the router through which the specified route is accessible.
11. Beside the **Interface** field, click **Port** or **Vlan** or **Tunnel**.
12. Select the interface, and then click **OK**.
13. In the **Cost** field, type a number for the distance.
14. Select the **Enable** check box.
15. Click **Insert**.

Static Routes Field Descriptions

Use the data in the following table to use the **Static Routes** tab.

| Name | Description |
|---|---|
| Dest | Specifies the IPv6 destination network address. The prefix value must match the PrefixLength. |
| PrefixLength | Specifies the number bits you want to advertise from the prefix. The prefix value must match the value in the Dest field. The range is 0 to 128. |
| NextHop | Specifies the IPv6 address of the next hop on this route. You do not need to specify the next hop if the devices directly connect to one another. Configure the next hop if the two nodes do not share the same network prefix but reside on the same link. |
| Interface | Specifies the interface to which this entry applies. You must specify the port or VLAN if the next hop is a link-local address. |
| Cost | Specifies the cost or distance ratio to reach the destination for this node. The range is 1-65535. The default value is 1. |
| Name

Note:
This field is not supported on all hardware platforms. | Specifies the name for the static route. |
| Enable | Enables the static route on the port. The default value is enable. |

| Name | Description |
|-------------------|--|
| Status | Shows the status of the static route as one of the following: <ul style="list-style-type: none"> • notReachable: The route is not reachable and no neighbor request entry is built to resolved the next-hop. This status appears if no route or neighbor exists to reach the next-hop of the static route. • tryToResolve: The route is not reachable but a neighbor request entry is built to resolve the next-hop. This status appears if a local equivalent route exists in the system to reach the next-hop but the neighbor is not learned. • reachableNotInRtm: The static route is reachable but it is not in RTM. This status appears if the static route is reachable, but it is not the best among alternative static routes. • reachableInRtm: The static route is reachable and it is in RTM. This status appears if the static route is reachable, and it is the best among alternative static routes to be added into RTM. |
| Preference | Specifies the routing preference of the destination IPv6 address. The range is 1-255. The default value is 5. |

Configuring IPv6 route preferences

Change IPv6 route preferences to force the routing protocols to prefer one route over another. Configure route preferences to override default route preferences and give preference to routes learned for a specific protocol.

Before You Begin

Change the VRF instance as required to configure IPv6 route preferences on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

Important

Changing route preferences is a process-oriented operation that can affect system performance and network reachability while you perform the procedures. If you want to change default preferences for routing protocols, do so before you enable the protocols.

Procedure

1. In the navigation pane, expand the following folders: **Configuration** > **IPv6**.
2. Click **IPv6**.
3. Click the **RoutePref** tab.
4. In the **ConfiguredValue** column, double-click a parameter to change the preference for the given protocol.

5. Click **Apply**.

RoutePref field descriptions

Use the data in the following table to use the **RoutePref** tab.

| Name | Description |
|------------------------|--|
| DefaultValue | Specifies the default preference value for the specified protocol. |
| Protocol | Specifies the protocol name. |
| ConfiguredValue | Configures the preference value for the specified protocol. |

View Route Information

View routes information to view the current configuration.

About This Task

IPv6 host routes created for the IPv6 local interfaces do not display in the routing table.

Before You Begin

Change the VRF instance as required to view route information on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Select **IPv6**.
3. Select the **Routes** tab.

Routes Field Descriptions

Use the data in the following table to use the **Routes** tab.

| Name | Description |
|------------------|---|
| Dest | Specifies the IPv6 destination network address. The prefix value must match the PrefixLength. |
| PfxLength | Specifies the number bits you want to advertise from the prefix. The prefix value must match the value in the Dest field. |
| Index | Specifies the unique value that identifies the route among the routes to the same network layer destination. |
| Interface | Specifies the interface to which this entry applies. |
| NextHop | Specifies the IPv6 address of the next hop on this route. |
| Protocol | Specifies the routing protocol, such as OSPF. |

| Name | Description |
|------------------|---|
| Metric | Specifies the metric assigned to this interface. The default value of the metric is the reference bandwidth or ifSpeed. The value of the reference bandwidth is configured by the rcOspfV3ReferenceBandwidth object. For more information about reference bandwidth, see Globals field descriptions on page 2454. |
| NextHopId | Identifier of the next-hop, hostname, or mac address. |
| Age | Specifies the number of seconds since the route was last updated or is last active. |
| Type | Specifies the type of route. |
| PathType | Specifies the type of path. |
| SrcVrfId | Specifies the source VRF instance. |
| Pref | Specifies the preference. |

Viewing IPv6 Default Routers

View the table of default routers learned from router advertisement messages.

A maximum of four routers are visible in the default routers list.

Note

Not all hardware platforms include a dedicated, physical management interface. For more information about supported interfaces, see your hardware documentation.

Procedure

1. In the navigation tree, expand the **Configuration > IPv6** folders.
2. Click **IPv6**.
3. Click the **Default Routers** tab.

Default Routers field descriptions

Use the data in the following table to use the **Default Routers** tab.

| Name | Description |
|-----------------|--|
| Address | Specifies the learned router address for an IPv6 default routers entry. |
| IfIndex | Specifies the interface number for an IPv6 default routers entry. |
| Lifetime | Specifies the remaining router lifetime. |
| Active | Specifies if the default router is active for an IPv6 default routers entry. |

Configure a Circuitless IPv6 Interface

Before You Begin

Change the VRF instance as required to configure a Circuitless IPv6 interface on a specific VRF instance.

About This Task

You can use a circuitless IPv6 (CLIPv6) interface to provide uninterrupted connectivity to your system.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **IPv6**.
3. Click the **Circuitless IP** tab.
4. Click **Insert**.
5. In the **Interface** field, assign a CLIP interface number.
6. Type the IPv6 address and prefix length.

Circuitless IPv6 Field Descriptions

Use the data in the following table to use the **Circuitless IPv6** tab.

| Name | Description |
|---|---|
| Interface | Specifies the interface to which this entry applies. |
| Addr | Specifies the IPv6 address to which this entry applies. |
| AddrLen | Specifies the prefix length value for this address. You cannot change the address length after you create it. You must provide this value to create an entry in this table. |
| Name
Note:
This field does not apply to all hardware platforms. | Specifies the name assigned to the IPv6 CLIP address. |

Configuring IPv6 Prefix List

Use IPv6 prefix lists to allow or deny specific route updates. A prefix list policy specifies route prefixes to match. When there is a match, the route is used.

Before You Begin

- Change the VRF instance as required to configure a prefix list on a specific VRF instance.

Procedure

1. In the navigation pane, open the following folders: **Configuration > IPv6**.
2. Click **Policy**.
3. In the **Ipv6-Prefix List** tab, click **Insert**.
4. Edit the parameters as required.

- Click **Insert**.

IPv6-Prefix list field descriptions

Use the data in the following table to use the **IPv6-Prefix List** tab.

| Name | Description |
|----------------------|---|
| Id | Specifies the list identifier. The range is 1 to 2147483647. |
| Prefix | Specifies the prefix IPv6 address. |
| PrefixMaskLen | Specifies the length of the prefix mask. You must enter the full 128-bit mask to exact a full match of a specific IPv6 address (for example, when creating a policy to match the next-hop). |
| Name | Names a specified prefix list during the creation process or renames the specified prefix list. The name can be from 1 to 64 characters in length. |
| MaskLenFrom | Specifies the lower bound on the mask length. The default is the mask length. Lower bound and higher bound mask lengths together can define a range of networks. |
| MaskLenUpto | Specifies the higher bound mask length. The default is the mask length. Lower bound and higher bound mask lengths together can define a range of networks. |

Configuring an IPv6 Route Policy

Procedure

- In the navigation pane, expand the following folders: **Configuration > IPv6**.
- Click **Policy**.
- Click the **Route Policy** tab.
- Click **Insert**.
- Enter the appropriate information for your configuration in the Insert Route Policy dialog box.
- Click **Insert**.

Route Policy Field Descriptions

Use the data in the following table to use the **Route Policy** tab.

| Name | Description |
|-----------------------|--|
| Id | Specifies the ID of an entry in the Prefix list table. |
| SequenceNumber | Specifies a policy within a route policy group. |
| Name | Specifies the name of the policy. This command changes the name field for all sequence numbers under the given policy. |

| Name | Description |
|----------------------------|---|
| Enable | Indicates whether this policy sequence number is enabled or disabled. If disabled, the policy sequence number is ignored. The default is disabled. |
| Mode | Specifies the action to take when a policy is selected for a specific route. Select permit (allow the route) or deny (ignore the route). The default is permit. |
| MatchProtocol | Selects the appropriate protocol. If configured, matches the protocol through which the route is learned. This field is used only for RIP Announce purposes. The default is to enable all match protocols. |
| MatchNetwork | Specifies if the system matches the destination network against the contents of the specified prefix list. |
| MatchIpRouteSource | Specifies if the system matches the next-hop IP address for RIP routes and advertising router IDs for OSPF routes against the contents of the specified prefix list. This option is ignored for all other route types.
Select the ellipsis and choose from the list in the Match Route Source dialog box. You can select up to four entries. To clear an entry, use the ALT key.
You can also change this field in the Route Policy tab of the Policy dialog box. |
| MatchIpRouteDest | Specifies if the system matches the next-hop IP address for RIP routes and advertising router IDs for OSPF routes against the contents of the specified prefix list. This option is ignored for all other route types. |
| MatchNextHop | Specifies if the system matches the next-hop IP address of the route against the contents of the specified prefix list. This field applies only to nonlocal routes.
Select the ellipsis and choose from the list in the Match Next Hop dialog box. You can select up to four entries. To clear an entry, use the ALT key. |
| MatchInterface | Specifies if the system matches the IP address of the interface by which the RIP route was learned against the contents of the specified prefix list. This field is used only for RIP routes and ignored for all other type of route.
Select the ellipsis and choose from the list in the Match Interface dialog box. You can select up to four entries. To clear an entry, use the ALT key. |
| MatchRouteType | Configures a specific route type to match (applies only to OSPF routes).
Externaltype1 and Externaltype2 specify the OSPF routes of the specified type only. OSPF internal refers to intra- and inter-area routes. The default is any. |
| MatchMetric | Specifies if the system matches the metric of the incoming advertisement or existing route against the specified value (1 to 65535). If 0, this field is ignored. The default is 0. |
| MatchMetricTypelsis | Specifies the match metric type field in the incoming ISIS routes in accept policy. |

| Name | Description |
|------------------------------|--|
| MatchAsPath | Configures if the system matches the BGP autonomous system path. Applicable to BGP only. This overrides the BGP neighbor filter list information. |
| MatchCommunity | Filters incoming and outgoing updates based on a Community List. Applicable to BGP only. The default is disable. |
| MatchCommunityExact | Indicates if the match must be exact (that is, all of the communities specified in the path must match). Applicable to BGP only. The default is disabled. |
| MatchTag | Specifies a list of tags used during the match criteria process. Applicable to BGP only. It contains one or more tag values. |
| MatchVrf | Identifies the source VRFs that leaks routes to the local VRF (applies only to RIP routes). |
| MatchLocalPref | Specifies the local preference value to be matched. |
| NssaPbit | Configures or resets the P bit in specified type 7 link state advertisements (LSA). By default, the Pbit is always configured in case the user configures the Pbit to a disable state for a particular route policy other than all type 7. LSAs associated with that route policy have the Pbit cleared. With this intact, not so stubby area (NSSA) area border router (ABR) does not perform translation of these LSAs to type 5. The default is enable. |
| SetRoutePreference | Configures a value from 0 to 255. The default value is 0. If the default is configured, the global preference value is used. When configured to a value greater than zero, specifies the route preference value assigned to the routes that matches the policy. This feature applies to accept policies only. |
| SetMetricTypeInternal | Identifies the MED value for routes advertised to BGP numbers to the Interior Gateway Protocol (IGP) metric value. The value must be 0 or 1. The default is 0. |
| SetMetricTypeIisis | Sets the metric type IS-IS. |
| SetMetric | Configures the system to use the metric value for the route while announcing or redistributing. The default-import-metric is 0. If the default is configured, the original cost of the route is advertised into OSPF; for RIP, the original cost of the route or the default value is used (applies to IS-IS routes also). The default is 0. |
| SetMetricType | Configures the metric type for the routes to announce into the OSPF routing protocol that matches this policy. Applicable to OSPF protocol only. The default is type 2. This field is applicable only for OSPF announce policies. The default is type2. |
| SetNextHop | Configures the IP address of the next-hop router. Applicable to BGP only. The default is 0.0.0.0. |

| Name | Description |
|----------------------------|---|
| SetInjectNetList | Configures the destination network of the route that matches this policy with the contents of the specified prefix list. Select the ellipsis and choose from the list in the Set Inject NetList dialog box. |
| SetMask | Configures the mask of the route that matches this policy. This applies only to RIP accept policies. |
| SetAsPath | Indicates the AS path value to use whether the SetAsPathMode field is Tag or Prepend. Applicable to BGP only.

Note:
Prepend is not applicable to an internal BGP (iBGP) peer with outbound route policy. |
| SetAsPathMode | Configures if the system converts the tag of a route into an AS path. Applicable to BGP protocol only. The mode is either Tag or Prepend tag. The value is applicable only while redistributing routes to BGP. The default is prepend.

Note:
Prepend is not applicable to an iBGP peer with outbound route policy. |
| SetAutomaticTag | Enables the automatic tag feature. Applicable to BGP protocol only. The default is disable. |
| SetCommunityNumber | Configures the community number for BGP advertisements. This value can be a number (1 to 42949672000) or no-export or no-advertise. |
| SetCommunityMode | Configures the community mode for the BGP protocol. This value can be either append, none, or unchanged. The default is unchanged. <ul style="list-style-type: none"> • Unchanged—keeps the community attribute in the route path as it is. • None—removes the community in the route path additive. • Append—adds the community number specified in SetCommunityNumber to the community list attribute. |
| SetExtCommunity | Configures a BGP community. The values are 0 to 256. |
| SetExtCommunityMode | Configures the extended-community mode. The value can be append, unchanged, or overwrite. The default value is unchanged. <ul style="list-style-type: none"> • append — creates another community string. • unchanged — keeps the community attribute as it is. • overwrite — changes the current value. |
| SetOrigin | Configures the origin for the BGP protocol to IGP, EGP, incomplete, or unchanged. If not configured, the system uses the route origin from the IP routing table (protocol). The default is unchanged. |

| Name | Description |
|-----------------------|---|
| SetLocalPref | Configures the local preference for the BGP protocol only. The system uses this value during the route decision process for the BGP protocol. The default is 0. |
| SetOriginEgpAs | Indicates the remote autonomous system number for the BGP protocol. The default is 0. |
| SetWeight | Configures the weight value for the routing table for the BGP protocol. This field must be used with the match as-path condition. For BGP, this value overrides the weight configured through the NetworkTableEntry, FilterListWeight, or NeighborWeight. The default is 0. |
| SetTag | Configures the list of tags used during the match criteria process for the BGP protocol. The default is 0. |
| Ipv6SetNextHop | Specifies the address of the IPv6 next hop router. |

Configuring IPv6 Route Redistribution Policies

About This Task

Configure route redistribution so that a VRF interface can announce routes that other protocols learn, for example, OSPF or BGP. Use a route policy to control the redistribution of routes. You can redistribute routes for the Global router (VRF 0) and within a user-defined VRF but not between different VRFs.

Before You Begin

- Ensure VRF instances exist.
- Configure route policies, if required.
- Change the VRF instance as required.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **Policy**.
3. Click the **Route Redistribution** tab.
4. Click **Insert**.
5. Choose the protocol and route source.
6. Select **Enable**.
7. Choose the route policy to apply to the redistributed routes.
8. Configure other parameters as required.
9. Click **Insert**.

Route Redistribution Field Descriptions

Use the data in the following table to use the **Route Redistribution** tab.

| Name | Description |
|--------------------|--|
| DstVrflid | Specifies the destination VRF ID. |
| Protocol | Specifies the protocols for which you want to receive external routing information. |
| SrcVrflid | Specifies the source VRF ID. |
| RouteSource | Indicates if the protocol receives notification about the routes this source learns. The route source is equivalent to the owner in the routing table. |
| Enable | Enables or disables route redistribution. The default is disabled. |
| RoutePolicy | Specifies the route policies to apply to the redistributed routes from the source VRF. Use the route policy to determine whether the system advertises a specific route to the specified protocol. |
| Metric | Specifies the metric announced in advertisements. The default is 0. |
| MetricType | Specifies the metric type (applies to OSPF and BGP only). Specifies a type 1 or a type 2 metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone. The default is type2. |

Viewing IPv6 Connections using EDM

Use the procedures in this section to view IPv6 connections using EDM.

Viewing TCP global information

View TCP and UDP information to view the current configuration.

Before You Begin

Change the VRF instance as required to view TCP global information on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

The fields on the TCP global tab provide information about the handshake (SYN) configuration and the maximum number of TCP connections you can create on your system.

When you initiate a TCP connection, both end points send handshake information to create the channel.

The retransmission algorithm and fields display the configured timeout value and minimum and maximum retransmission times that your system uses to terminate a connection attempt that falls outside your specified parameters.

Procedure

1. In the navigation pane, expand the **Configuration > IPv6** folders

2. Click **TCP/UDP**.
3. Click the **TCP Globals** tab.

TCP Global field descriptions

Use the data in the following table to use the **TCP Globals** tab.

| Name | Description |
|---------------------|---|
| RtoAlgorithm | Determines the timeout value used for retransmitting unacknowledged octets. |
| RtoMin | Displays the minimum time (in milliseconds) permitted by a TCP implementation for the retransmission timeout. |
| RtoMax | Displays the maximum time (in milliseconds) permitted by a TCP implementation for the retransmission timeout. |
| MaxConn | Displays the maximum connections for the device. |

Viewing TCP connections information

View information about TCP connections.

Before You Begin

Change the VRF instance as required to view TCP connections information on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

Among other things, the fields on the TCP connections tab provide important information about the health of connections that traverse your switch.

In particular, the state column lets you know the state of each TCP connection. Of these, synSent, synReceived, and established indicate whether or not a channel is established and listen indicates when an end system is waiting for a returning handshake (SYN).

Procedure

1. In the navigation pane, expand the **Configuration > IPv6** folders.
2. Click **TCP/UDP**.
3. Click the **TCP Connections** tab.

TCP Connections field descriptions

Use the data in the following table to use the **TCP Connections** tab.

| Name | Description |
|-------------------------|---|
| LocalAddressType | Displays the type (IPv6 or IPv4) for the address in the LocalAddress field. |
| LocalAddress | Displays the IPv6 address for the TCP connection. |

| Name | Description |
|-----------------------|--|
| LocalPort | Displays the local port number for the TCP connection. |
| RemAddressType | Displays the type (IPv6 or IPv4) for the remote address of the TCP connection. |
| RemAddress | Displays the IPv6 address for the remote TCP connection. |
| RemPort | Displays the remote port number for the TCP connection. |
| State | Displays an integer that represents the state for the connection: <ul style="list-style-type: none"> • closed • listen • synSent • synReceived • established • finWait1 • finWait2 • closeWait • lastAck(9) • closing • timeWait • deleteTCB |
| Process | Displays the process ID for the system process associated with the TCP connection. |

Viewing TCP listeners information

View TCP listener information.

Before You Begin

Change the VRF instance as required to view TCP listeners information on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

The TCP listeners table provides a detailed list of systems that are in the listening state.

When a connection is in the listen state an end point system is waiting for a returning handshake (SYN).The normal listening state should be very transient, changing all of the time.

Two or more systems going to a common system in an extended listening state indicates the need for further investigation.

End systems in an extended listening state can indicate a broken TCP connection or a DOS attack on a resource.

This type of DOS attack, known as a SYN attack, results from the transmission of SYNs with no response to return replies.

While many systems can detect a SYN attack, the TCP listener statistics can provide additional forensic information.

Procedure

1. In the navigation pane, expand the **Configuration > IPv6** folders.
2. Click **TCP/UDP**.
3. Click the **TCP Listeners** tab.

TCP Listeners field descriptions

Use the data in the following table to use the **TCP Listeners** tab.

| Name | Description |
|-------------------------|--|
| LocalAddressType | Displays the type (IPv6 or IPv4) for the address in the LocalAddress field. |
| LocalAddress | Displays the IPv6 address for the TCP connection. |
| LocalPort | Displays the local port number for the TCP connection. |
| Process | Displays the process ID for the system process associated with the TCP connection. |

Viewing UDP endpoint information

View UDP Endpoints to confirm correct configuration.

Before You Begin

Change the VRF instance as required to view UDP endpoint information on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

You can use UDP endpoint information to display local and remote UDP activity.

Since UDP is a protocol used to establish connectionless network sessions, you need to monitor local and remote UDP activity and to know which applications are running over UDP.

You can determine which applications are active by checking the port number.

Processes are further identified with a UDP session to allow for the multiplexing of a port mapping for UDP.

Procedure

1. In the navigation pane, expand the **Configuration > IPv6** folders.
2. Click **TCP/UDP**.
3. Click the **UDP Endpoints** tab.

UDP Endpoints field descriptions

Use the data in the following table to use the **UDP Endpoints** tab.

| Name | Description |
|--------------------------|---|
| LocalAddressType | Displays the local address type (IPv6 or IPv4). |
| LocalAddress | Displays the local IPv6 address. |
| LocalPort | Displays the local port number. |
| RemoteAddressType | Displays the remote address type (IPv6 or IPv4). |
| RemoteAddress | Displays the remote IPv6 address. |
| RemotePort | Displays the remote port number. |
| Instance | Distinguishes between multiple processes connected to the UDP endpoint. |
| Process | Displays the ID for the UDP process. |

IPv6 alternative routes configuration example

To avoid traffic interruption, you can enable alternative routes globally to replace the best route with the next-best route, if the best route becomes unavailable.

The concept of alternative route applies between routing protocols. For example, if an OSPFv3 route becomes unavailable and an alternative RIPng route is available, the system activates the RIPng route immediately without waiting for an update interval to expire.

By default, the alternative routes feature is globally enabled on the switch.

The following example demonstrates this behavior.

In this example, you configure OSPFv3 and RIPng routes on two switches Switch-1 and Switch-2, as shown in the following figure.

Configuration on Switch-1

VLAN configuration:

On Switch-1, configure VLAN 2 and the IPv6 interface address 2000:0:0:0:0:0:0:1/64.

```
Switch1:1:1>enable
Switch1:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```

Switch1:1(config)#vlan create 2 type port-mstprstp 0
Switch1:1(config)#vlan members 2 4/5
Switch1:1(config)#interface vlan 2
Switch1:1(config-if)#ipv6 interface address 2000:0:0:0:0:0:1/64
Switch1:1(config-if)#ipv6 interface enable
Switch1:1(config-if)#exit

Switch1:1(config)#show vlan basic

```

```

Viewing route and alternative route configuration on the switches

On Switch-1 and Switch-2, the route `3000:0:0:0:0:0:0:2/64` is learned using the protocols RIPng and OSPFv3. The OSPFv3 route is learned as the best route because of its route preference value of 20. The RIPng route is added as alternative route as it has the route preference 100, which is greater than the OSPFv3 route preference of 20. On Switch-2, the route `3000:0:0:0:0:0:0:2/64` is a local route.

Viewing route and alternative route configuration on Switch-1:

```

Switch1:1(config)#show ipv6 route alternative

```

```

Changing the route preference on Switch-1

On the switch, default preferences are assigned to all standard routing protocols. You can modify the global preference for a protocol to give it a higher or lower priority than other protocols. When you change the preference for a static route, if all best routes remain best routes, only the local route tables change. However, if changing the protocol preference causes best routes to no longer be best routes, neighboring route tables can be affected.

In the following example scenario, you configure a different routing preference for the RIPng protocol on Switch-1 and observe the learning of best and alternative routes. The existing route preference for RIPng is 100.

```
Switch1:1#show ipv6 route alternative
```

```
-----

```

Configure a different route preference for the RIPng protocol, for example, 19:

```

Switch1:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch1:1(config)#ipv6 route preference protocol ripng 19
Switch1:1(config)#exit

```

Verify the route preference configuration:

```

Switch1:1#show ipv6 route preference

=====
                        IPv6 Route Preference - GlobalRouter
=====
PROTOCOL      DEFAULT  CONFIG
-----

IPv6 Neighbor Discovery

[Neighbor discovery](#) on page 1895

[Host autoconfiguration](#) on page 1899

[Neighbor Discovery Configuration using CLI](#) on page 1901

[Neighbor Discovery Configuration using EDM](#) on page 1911

The following sections provide concepts and procedures to complete IPv6 neighbor discovery configuration.

Neighbor discovery

IPv6 nodes (routers and hosts) on the same link use neighbor discovery (ND) to discover link-layer addresses and to obtain and advertise various network parameters and reachability information. ND combines the services for IPv4 with the Address Resolution Protocol (ARP) and router discovery. In IPv6 ND performs a function similar to ARP (Address Resolution Protocol) in IPv4.

Hosts use ND to discover the routers in the network that you can use as the default routers, and to determine the link-layer address of neighbors attached to local links. Routers also use ND to discover neighbors and link-layer information. ND updates the neighbor database with valid entries, invalid entries, and entries migrated to various locations.

The ND protocol provides the following services:

- address and prefix discovery

Hosts determine the set of addresses that are on-link for the given link. Nodes determine which addresses or prefixes are locally reachable or remote with address and prefix discovery.

- router discovery

Hosts discover neighboring routers with router discovery. Hosts establish neighbors as default packet-forwarding routers.

- parameter discovery

Hosts and routers discover link parameters such as the link MTU or the hop-limit value placed in outgoing packets.

- address autoconfiguration

Hosts configure an address for an interface with address autoconfiguration.

- duplicate address detection

Hosts and nodes determine if an address is assigned to another router or a host.

- address resolution

Hosts determine link-layer addresses (MAC for Ethernet) of the local neighbors (attached on the local network), provided the IP address is known.

- next-hop determination

Hosts determine how to forward local or remote traffic with next-hop determination. The next hop can be a local or remote router.

- neighbor unreachability detection

Hosts determine if the neighbor is unreachable, and if address resolution must be performed again to update the database. For neighbors you use as routers, hosts attempt to forward traffic through alternative default routers.

- redirect

Routers inform the host of more efficient routes with redirect messages.

Neighbor discovery uses three components:

- host-router discovery

Host-router discovery performs the following functions:

- router discovery
- prefix discovery
- parameter discovery
- address autoconfiguration

- host-host communication

Host-host communication performs the following functions:

- address resolution
- next-hop determination
- neighbor unreachability detection
- duplicate address detection

- route redirect

Note

When a neighbor transitions to the STALE state, to initiate Neighbor Unreachability detection (NUD), a duplicate copy of the traffic destined to this neighbor is sent to the switch Control Processor (CP) on a low priority queue (queue 0). The original packet is forwarded to this neighbor. Once NUD is initiated, the hardware records are updated and the traffic is no longer sent to the CP. When a high rate of such traffic is sent to CP, the switch can drop some of these packets due to the in built CP rate limiting feature, which protects the CP from DOS attacks.

Use the command **show qos cosq-stats cpu-port** to view drop statistics on the CPU queue. This design does not result in loss of traffic.

Use the command **ipv6 nd reachable-time <0-3600000>** to increase the default value of 3000 milliseconds which in turn delays the scenario of data path sending STALE neighbor destined packets to the CP.

Recommended values for reachable time is 180000, and for retransmit interval is 5000.

ND messages

The following table compares the ICMP message types.

Table 225: IPv4 and IPv6 neighbor comparison

| IPv4 Function | IPv6 Function | Description |
|---------------------|---|--|
| ARP request message | Neighbor solicitation message | A node sends this message to determine the link-layer address of a neighbor or to verify that a neighbor is still reachable through a cached link-layer address. You can also use neighbor solicitations for duplicate address detection. |
| ARP reply message | Neighbor advertisement | A node sends this message either in response to a received neighbor solicitation message or to communicate a link-layer address change. |
| ARP cache | Neighbor cache | The neighbor cache contains information about neighbor types on the network. |
| Gratuitous ARP | Duplicate address detection
New VRRP master interface announcement | A host or node sends a request with its own IP address to determine if another router or host uses the address. If the sender receives a reply, then there is a device with a duplicate address.
Both hosts and routers use this function.
Gratuitous ARP can also be used to announce the new VRRP master interface so that all switches can adjust their MAC tables. |

Table 225: IPv4 and IPv6 neighbor comparison (continued)

| IPv4 Function | IPv6 Function | Description |
|---|---|--|
| Router solicitation message (optional) | Router solicitation message (required) | The host sends this message after it detects a change in a network interface operational state. The message includes a request for routers to generate router advertisement immediately rather than at the scheduled time. |
| Router advertisement message (optional) | Router advertisement message (required) | Routers send this message to advertise their presence with various links and Internet parameters either periodically or in response to a router solicitation message. Router advertisements contain prefixes that you use for on-link determination or address configuration, and a suggested hop limit value. |
| Redirect message | Redirect message | Routers send this message to inform hosts of a better first hop for a destination. |

Neighbor discovery cache

The neighbor discovery cache lists information about neighbors in the network and can contain the following types of neighbors:

- static: a configured neighbor
- local: a device on the local system
- dynamic: a discovered neighbor

The following table describes the states in the neighbor cache.

Table 226: Neighbor cache states

| State | Description |
|------------|--|
| Incomplete | Address resolution is in progress and the system has not yet determined the link-layer address of the neighbor.
The neighbor cache may also enter the Incomplete state when the switch cannot confirm subsequent reachability during the ND process for router neighbors. By contrast, the system deletes host neighbors, rather than enter the Incomplete state, if ND fails to confirm reachability.

Tip:
Router neighbors: when the R bit is set in the received neighbor advertisement
Host neighbors: when the R bit is not set in the received neighbor advertisement |
| Reachable | A node receives positive confirmation within the last reachable time period. |
| Stale | Reachability of the neighbor is unknown.
Until the system sends traffic to the neighbor, make no attempt to verify its reachability. |

Table 226: Neighbor cache states (continued)

| State | Description |
|-------|---|
| Delay | A time period longer than the reachable time period passes since the node received the last positive confirmation, and a packet was sent within the last DELAY_FIRST_PROBE_TIME period.
If no reachability confirmation is received within the DELAY_FIRST_PROBE_TIME period after entering the DELAY state, neighbor solicitation is sent and the state changes to probe. |
| Probe | Reachability confirmation is sought from the device every retransmit timer period. |

The following events involve Layer 2 and Layer 3 interaction during processing and affect the neighbor cache:

- flushing the virtual LAN (VLAN) MAC
- removing a VLAN or brouter port
- performing an action on all VLANs
- removing a port from a VLAN
- removing a port from a spanning tree group (STG)
- removing a multilink trunk (MLT) group from a VLAN
- removing an MLT port from a VLAN
- removing an MLT port from an STG
- performing an action that disables a VLAN, such as removing all ports from a VLAN
- disabling a tagged port that is a member of multiple routable VLANs

Router discovery

IPv6 nodes discover routers on the local link with router discovery.

IPv6 nodes discover routers on the local link with router discovery.

Router advertisement

Configured interfaces on an IPv6 router send router-advertisement messages. Interfaces also send router advertisements in response to router-solicitation messages from IPv6 nodes on the link.

Router solicitation

An IPv6 host without a configured unicast address sends router solicitation messages.

Host autoconfiguration

The switch can automatically configure a host (node), and assign IPv6 addresses automatically. This process is called stateless address autoconfiguration (SLAAC). The neighbor discovery (ND) protocol performs autoconfiguration.

Stateless autoconfiguration enables serverless basic configuration of IPv6 nodes and renumbering from a mathematical perspective.

Stateless autoconfiguration uses the following equation:

$$\text{Stateless autoconfiguration} = \text{network prefix (router advertisement)} + \text{IPv6 interface identifiers}$$

Stateless autoconfiguration uses the network prefix information in the router advertisement and integrates this with the interface ID to form the node global address(es).

Note

The switch cannot autoconfigure an IPv6 address local to itself because IPv6 routers do not process router advertisements in the same manner as hosts. That is, routers check only for consistency in information advertised in IPv6 Router Advertisements on the same link.

Tip

You must manually assign all addresses/prefixes local to the switch.

Assuming an EUI-64 based interface ID is used, the IPv6 interface address is created from the 48-bit (6-byte) MAC address as follows:

1. EUI-64 hexadecimal digits 0xff-fe are inserted between the third and fourth bytes of the MAC address to obtain the EUI-64.
2. The universal or local bit, the second lower-order bit of the first byte of the MAC address, is complemented.

For example, the IPv6 identifier for host A uses the MAC address 00-AA-00-3F-2A-1C.

To automatically assign an address, the following occurs:

1. Convert to EUI-64 format
00-AA-00-FF-FE-3F-2A-1C
2. Complement the Universal/Local (U/L) bit.

The first byte in binary form is 00000000. When the seventh bit is complemented, it becomes 00000010 (0x02).

The result is 02-AA-00-FF-FE-3F-2A-1C or 2AA:FF:FE3F:2A1C.

Host A with MAC address 00-AA-00-3F-2A-1C, combined with network prefix 2001::/64 provided by router advertisement, uses an IPv6 address 2001::2AA:FF:FE3F:2A1C.

A host generates a link-local address with the prefix FE80 regardless of whether an IPv6 router is present or not.

The link-local address for a node with the MAC address 00-AA-00-3F-2A-1C is FE80::2AA:FF:FE3F:2A1C.

The following list explains the states of an autoconfiguration address:

- Tentative: the address is being verified as unique (link-local address)
- Valid: an address from which unicast traffic can be sent and received; can be in one of two states—either preferred or deprecated

- Preferred: an address for which uniqueness was verified for unrestricted use; can be in one of three states—either tentative, preferred, or deprecated
- Deprecated: an address that remains valid but is withheld for new communication
- Invalid: an address for which a node can no longer send or receive unicast traffic

Neighbor Discovery Configuration using CLI

Use the procedures in this section for neighbor discovery configuration using CLI.

Configuring an IPv6 discovery prefix

Configure the discovery prefixes to send in router advertisement.

About This Task

Hosts on the link use router advertisements to perform IPv6 autoconfiguration.

The discovery prefix controls which IPv6 addresses will be automatically configured, and for how long they are valid.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create neighbor discovery prefixes for an interface:

```
ipv6 nd prefix-interface WORD<0-255> [eui <1-3>] [no-advertise] [no-
autoconfig] [no-onlink]
```

3. Modify an existing neighbor discovery prefix:

```
ipv6 nd prefix WORD<0-255> infinite [no-advertise] [preferred-life
<0-4294967295>] [valid-life <0-4294967295>]
```

Example

Create a new neighbor discovery prefix:

```
Switch:1(config-if)#ipv6 nd prefix-interface fd48:bfb6:4c09:9499::1/64
```

Variable definitions

Use the data in the following table to use the **ipv6 nd prefix** and **ipv6 nd prefix-interface** commands.

| Variable | Value |
|--|--|
| <i>eui <1-3></i> | <p>Configures the EUI address. The values are:</p> <ul style="list-style-type: none"> • (1) EUI not used • (2) EUI with Universal/Local bit (U/L) complement enabled • (3) EUI used without U/L <p>Use an EUI-64 interface ID in the address field. If enabled, use EUI, or use EUI-64 and the complement Universal/Local (U/L) bit. This operation provides for both global- and link-local addresses. After you create the entry, you cannot modify this value. This value is valid for use only when the prefix length is 64 or less. The default is EUI not used.</p> <p>If you select EUI not used, this configuration creates an IPv6 ND prefix but no associated IPv6 address on the router. If you select either EUI used with UL complement or EUI used without UL complement, an associated IPv6 address is created by concatenating the specified prefix with the EUI-64 interface ID.</p> |
| <i>infinite</i> | Configures the prefix valid lifetime so it never expires. The default is disabled, which means the prefix expires. |
| <i>no-advertise</i> | Removes the prefix from the neighbor advertisement. The default is disabled, which means the prefix is advertised. |
| <i>no-autoconfig</i> | Configures the prefix for use as the autonomous address configuration. This value is placed in the autoflag field in the prefix information option. The value is a 1-bit flag. The default is enabled. |
| <i>no-onlink</i> | Configures the prefix for use when determining if a node is online. This value is placed in the L-bit field in the prefix information option. The value is a 1-bit flag. The default is enabled. |
| <i>preferred-life <0-4294967295></i> | <p>Configures the preferred lifetime in seconds that indicates the length of time this prefix is advertised. The default value is 604800.</p> <p>The preferred lifetime is the length of time for the tentative, preferred, and deprecated state of an autoconfiguration address.</p> <p>The preferred lifetime value must be less than the valid lifetime value. If you must configure the valid lifetime value to a value lower than the current preferred lifetime, you must lower the preferred lifetime value first.</p> |

| Variable | Value |
|--|---|
| <code>valid-life <0-0-4294967295></code> | Configures the valid lifetime in seconds that indicates the length of time this prefix is advertised. The default is 2592000.
A valid lifetime is the length of time of the preferred and depreciated state of an autoconfiguration address.
The preferred lifetime value must be less than the valid lifetime value. If you must configure the valid lifetime to a value lower than the current preferred lifetime, you must lower the preferred lifetime value first. |
| <code>WORD <0-255></code> | Specifies the IPv6 address and prefix. |

Use the data in the following table to use the **interface** command.

| Variable | Value |
|---|--|
| <code><1-4059></code> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| <code>{slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]}</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Configuring route advertisement

Configure route advertisement in IPv6 for neighbor discovery (ND).

About This Task

IPv6 nodes on the same link use ND to discover link-layer addresses and to obtain and advertise various network parameters and reachability information. ND combines the services provided by Address Resolution Protocol (ARP) and router discovery for IPv4.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the number of neighbor solicitation messages from duplicate address detection:

```
ipv6 nd dad-ns <0-600>
```

3. Configure the hop limit sent in router advertisements:

```
ipv6 nd hop-limit <0-255>
```

4. Enable managed address configuration (M-bit) on the router:

```
ipv6 nd managed-config-flag
```

5. Configure the MTU for router advertisements:

```
ipv6 nd mtu <0-9500>
```

6. Enable other stateful configuration (O-bit) on the router:

```
ipv6 nd other-config-flag
```

7. Configure the router lifetime included in router advertisement:

```
ipv6 nd ra-lifetime <0-9000>
```

8. Configure the neighbor reachable time:

```
ipv6 nd reachable-time <0-3600000>
```

9. Configure the time between neighbor solicitation messages:

```
ipv6 nd retransmit-timer <0-4294967295>
```

10. Configure the maximum time allowed between sending unsolicited multicast router advertisements:

```
ipv6 nd rtr-advert-max-interval <4-1800>
```

11. Configure the minimum time allowed between sending unsolicited multicast router advertisements:

```
ipv6 nd rtr-advert-min-interval <3-1350>
```

12. Enable periodic router advertisement messages:

```
ipv6 nd send-ra
```

Example

Configure the maximum time between sending unsolicited router advertisements:

```
Switch:1(config-if)#ipv6 nd rtr-advert-max-interval 700
```

Configure the minimum time between sending unsolicited router advertisements:

```
Switch:1(config-if)#ipv6 nd rtr-advert-min-interval 500
```

Enable periodic router advertisement messages:

```
Switch:1(config-if)#ipv6 nd send-ra
```

Variable definitions

Use the data in the following table to use the **ipv6 nd** commands.

| Variable | Value |
|--------------------------------|---|
| <i>dad-ns <0-600></i> | Specifies the number of neighbor solicitation messages for duplicate address detection (DAD). A value of 0 disables the DAD process on this interface.
A value of 1 sends one advertisement without retransmissions. |
| <i>hop-limit <0-255></i> | Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet.
A value of zero indicates that the advertisement does not specify a hop-limit value. The default is 64. |
| <i>managed-config-flag</i> | Enables the system to configure the M-bit, or managed address configuration flag, in the router advertisements
When set, the M-bit flag indicates that addresses are available through DHCPv6.
If the M flag is set, the O flag is redundant because DHCPv6 returns all available configuration information.
If neither the M nor O flags are set, no information is available through DHCPv6.
The default is disabled. |
| <i>mtu <0-9500></i> | Shows the MTU value sent in router advertisements on this interface.
A value of zero indicates that the system sends no MTU options.
The default is 0. |
| <i>other-config-flag</i> | Enables the O-bit, or other stateful configuration, flag in the router advertisement.
Other stateful configuration autoconfigures received information without addresses.
When set, the O-bit flag indicates that other configuration information is available through DHCPv6; for example, DNS-related information or information about other servers within the network.
If neither the M nor O flags are set, no information is available through DHCPv6.
The default is disabled. |

| Variable | Value |
|---|---|
| <code>ra-lifetime <0-9000></code> | Specifies a value placed in the router lifetime field of router advertisements sent from this interface. This value must be either 0, or 4 to 9000 seconds. A value of zero indicates that the system is not a default router. The default is 1800. |
| <code>reachable-time <0-3600000></code> | Specifies a value (in milliseconds) placed in the router advertisement message sent by the router. The value zero means unspecified (by this system). Configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event. The default is 0. |
| <code>retransmit-timer <0-4294967295></code> | Specifies a value (in milliseconds) placed in the retransmit timer field in the router advertisement message sent from this interface. The value zero means unspecified (by this system). The value configures the amount of time the system waits for the transmission to occur. The default is 0. |
| <code>rtr-advert-max-interval <4-1800></code> | Specifies the maximum interval (in seconds) at which the transmission of route advertisements occurs on this interface. The default is 600. |
| <code>rtr-advert-min-interval <3-1350></code> | Specifies the minimum interval (in seconds) at which the transmission of route advertisements occurs on this interface. The default is 200. |
| <code>send-ra</code> | Specifies whether the router sends periodic router advertisements and responds to router solicitations on this interface. The default is enabled. |

Use the data in the following table to use the **interface** command.

| Variable | Value |
|--|--|
| <code><1-4059></code> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <code>vrf-scaling</code> and <code>spbm-config-mode</code> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| <code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

System interface values versus advertised values

There are differences in the relationship between the system interface values and advertised values related to Neighbor Discovery (ND). The information in this section describes differences and similarities and provides examples for important IPv6 interface and IPv6 ND commands.

Comparison of default values per interface and as advertised

The following table compares the default behavior of values per interface and advertised values.

| Default values per interface | Default advertised values |
|------------------------------|----------------------------------|
| hop-limit 64 | hop-limit 64 |
| mtu 1500 | mtu 0 (unspecified) |
| reachable-time 30000 ms | reachable-time 0 (unspecified) |
| retransmit-timer 1000 ms | retransmit-timer 0 (unspecified) |

What happens when you change the per interface value and the advertised value?

When you change per-interface values from default to non-default values, the system changes the advertised values to match the interface values.

For example, when you enter the `ipv6 interface mtu 1300` command the values become

- interface mtu 1300
- advertised mtu 1300

Then, when you enter the `show ipv6 nd interface` command, the system marks the mtu value with an (i) which signifies that the ND advertised value is inherited from the interface configuration.

Example: Changing both values

```
Switch:1(config-if)#ipv6 interface mtu 1300
```

```
Switch:1(config-if)#
show ipv6 nd interface GigabitEthernet 1/1
```

```
=====
                        Port Ipv6 Nd
=====
IFID BTR  RTR-  MAX-  MIN-  LIFE-  MANAG  OTHER  DAD-NS  MTU    HOP  REACH-  RETRANS-
      ADV  INT  INT  TIME  TIME  LIMIT  TIME  TIME  TIME  HOP  ABLE  MIT
      FLAG  CONF
-----
320  1/1  True  600  200    0    False False   1    1300(i)  64(d)  0(d)  0(d)
Note: (s) = Set, (d) = Default, (i) = inherit
=====
```

What happens when you change the per interface value but do not change the advertised value?

To change the per-interface value from the default value to a non-default value but retain the advertised value of 0 (unspecified), you must enter two commands.

For example, to set the reachable-time to 60000 but retain the advertised value of the reachable-time parameter at 0, enter the following commands:

```
ipv6 interface reachable-time 6000
```

```
ipv6 nd reachable-time 0
```

When you enter the `show ipv6 nd interface` command, the system marks the reachable-time value with an (s) to signify that this value is explicitly set by the ND configuration.

Example: Changing only the per interface value

```
Switch:1(config-if)#ipv6 interface reachable-time 60000
```

```
Switch:1(config-if)#ipv6 nd reachable-time 0
```

```
Switch:1(config-if)#
show ipv6 nd interface GigabitEthernet 1/1

Configuring the neighbor cache

Configure the address translation table used to map IPv6 addresses to physical addresses. You can manually add static neighbors to the cache.

Note

IPv6 static neighbors are not supported on SMLT.

About This Task

Neighbor cache in IPv6 is similar to the IPv4 Address Resolution Protocol (ARP) table.

The neighbor cache is a set of entries for individual neighbors to which traffic was recently sent.

You make entries on the neighbor on-link unicast IP address, including information such as the link-layer address.

A neighbor cache entry contains information used by the Neighbor Unreachability Detection algorithm, including the reachability state, the number of unanswered probes, and the time the next Neighbor Unreachability Detection event is scheduled.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create a static neighbor:

```
ipv6 neighbor WORD<0-128> port {slot/port[sub-port]} mac
<0x00:0x00:0x00:0x00:0x00:0x00> [vlan <1-4059> ]
```

When you create a static neighbor, it always remains in the reachable state. This differs from the general neighbor cache behavior where, among other things, timers and neighbor unreachability detection events can be generated.

Example

Create a static neighbor:

```
Switch:1(config)#ipv6 neighbor 3000::3 port 1/11 mac 00-1A-4B-8A-FB-6B
```

Variable definitions

Use the data in the following table to use the **ipv6 neighbor** command.

| Variable | Value |
|---|--|
| <i>mac</i>
<0x00:0x00:0x00:0x00:0x00:0x00> | Specifies the MAC address. |
| { <i>slot/port[/sub-port]</i> } | Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <i>vlan</i> <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| <i>WORD</i> <0-128> | Specifies the IPv6 address in hexadecimal colon format. |

View Cached Destination Information

View the destination cache to see next-hop addresses for destinations.

The destination cache is only populated or updated when IPv6 packets originate locally on the central processor of the switch.

The main purpose of the destination cache is to store, on a per-destination basis, the dynamic Path MTU value currently used when transmitting packets from the local system to the remote destination.

The system uses the PMTU value to calculate how many bytes can fit into an individual packet before fragmentation should be applied.

About This Task

The command output shows the following information:

- the IPv6 destination address
- the IPv6 address for the next hop to the destination
- the path maximum transmission unit (MTU) for the destination
- the time, in seconds, since an ICMPv6 packet-too-big message was received

Not all parameters are available in non-default VRFs.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. View the destination cache for all interfaces:

```
show ipv6 dcache [vrf WORD<1-16> | vrfids WORD<0-512>]
```

3. View the destination cache for a brouter port:

```
show ipv6 dcache gigabitethernet {slot/port[/sub-port]}
```

4. View the destination cache for a management port:

```
show ipv6 dcache mgmtethernet mgmt
```

Note

This step applies to VSP 8600 Series only.

Note

This step only applies to hardware with a dedicated, physical management interface.

5. View the destination cache for a specific tunnel ID:

```
show ipv6 dcache tunnel <1-2000>
```

6. View the destination cache for a VLAN:

```
show ipv6 dcache vlan <1-4059>
```

7. Clear the destination cache:

```
clear ipv6 dcache [gigabitethernet {slot/port[/sub-port]}]
[mgmtethernet {slot/port[/sub-port]}] [tunnel <1-2000>] [vlan <1-4059>]
[vrf WORD<1-16> | vrfids WORD<0-512>]
```

Note

mgmtEthernet is supported on VSP 8600 Series only.

Example

```
Switch:1(config-if)#show ipv6 dcache
```

```

Variable definitions

Use the data in the following table to use the **show ipv6 dcache** and **clear ipv6 dcache** commands.

| Variable | Value |
|------------------------|--|
| <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| {slot/port[/sub-port]} | Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| vrf WORD<1-16> | Specifies the VRF name. |
| vrfids WORD<0-512> | Specifies the VRF ID. |

Neighbor Discovery Configuration using EDM

Use the procedures in this section for neighbor discovery configuration using EDM.

Configuring an IPv6 discovery prefix

Configure the discovery prefixes to send in router advertisement.

Before You Begin

Change the VRF instance as required to configure an IPv6 discovery prefix on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

Hosts on the link use router advertisements to perform IPv6 autoconfiguration. The discovery prefix controls what IPv6 addresses to autoconfigure and how long they are valid.

You can also configure an IPv6 interface for a brouter port through the **Edit > Port > IPv6** navigation path, and for a VLAN through the **VLAN > VLANs > Basic > IPv6** navigation path. This procedure uses the main IPv6 navigation path where you can configure both types of interfaces.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.

2. Click **IPv6**.
3. Click the **Discovery Prefix** tab.
4. Click **Insert**.
5. Beside the **Interface** field, click **Port** or **VLAN**.
6. Select a port or VLAN.
7. Click **OK**.
8. Specify the prefix and prefix length.
9. Click **Insert**.
10. Click **Apply**.

Discovery Prefix field descriptions

Use the data in the following table to use the **Discovery Prefix** tab.

| Name | Description |
|----------------------|---|
| Interface | Shows a read-only value that indicates an IPv6 interface. For the brouter port, it is the ifindex of the port and, in the case of the VLAN, it is the ifindex of the VLAN. |
| Prefix | Configures the prefix to create an IPv6 prefix entry as either advertised or suppressed. |
| PrefixLen | Configures the mask to create an IPv6 address in the IPv6 interface table. |
| VlanId | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| UseDefaultVal | Specifies one included value to use the default value, or use all bits to configure all options to their default value. |
| ValidLifetime | Configures the valid lifetime in seconds that indicates the length of time this prefix is advertised. The default is 2592000.
A valid lifetime is the length of time of the preferred and depreciated state of an autoconfiguration address.
The preferred lifetime value must be less than the valid lifetime value. If you must configure the valid lifetime value to a value lower than the current preferred lifetime, you must lower the preferred lifetime value first. |

| Name | Description |
|--------------------------|---|
| PreferredLifetime | Configures the preferred lifetime in seconds that indicates the length of time this prefix is advertised. The default value is 604800. The preferred lifetime is the length of time for the tentative, preferred, and depreciated state of an autoconfiguration address. The preferred lifetime value must be less than the valid lifetime value. If you must configure the valid lifetime value to a value lower than the current preferred lifetime, you must lower the preferred lifetime value first. |
| Infinite | Configures the prefix valid lifetime so it never expires. The default is false. |
| OnLinkFlag | Configures the prefix for use when determining if a node is online. This value is placed in the L-bit field in the prefix information option. It is a 1-bit flag. The default is true. |
| AutoFlag | Configures the prefix for use as the autonomous address configuration. This value is placed in the autoflag field in the prefix information option. It is a 1-bit flag. The default is true. |
| AddressEui | Configures the EUI address. Use an EUI-64 interface ID in the address field. If enabled, use EUI, or use EUI-64 and the complement Universal/Local (U/L) bit. This operation provides for both global and link-local addresses. After you create the entry, you cannot modify this value. This value is valid for use only when the PrefixLength is 64 or less. The default is eui-not-used. If you select eui-not-used, this configuration creates an IPv6 ND prefix but no associated IPv6 address on the router. If you select either eui-used-with-ul-complement or eui-used-without-ul-complement, an associated IPv6 address is created by concatenating the specified prefix with the EUI-64 interface ID. |
| NoAdvertise | Configures if the prefix is included in the router advertisement. Select true to not include the prefix in the router advertisement. The default is false. |

Configuring an IPv6 discovery prefix port

Configure the discovery prefixes to send in router advertisement.

About This Task

Hosts on the link use router advertisements to perform IPv6 autoconfiguration. The discovery prefix controls what IPv6 addresses to autoconfigure and how long they are valid.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > Edit > Port**.
2. Click **IPv6**.
3. Click **Discovery Prefix**.
4. Click **Insert**.
5. Click **OK**.
6. Specify the prefix and prefix length.
7. Click **Insert**.
8. Click **Apply**.

IPv6 Discovery Prefix field descriptions

Use the data in the following table to use the **IPv6 Discovery Prefix** tab.

| Name | Description |
|----------------------|---|
| Interface | Shows a read-only value that indicates an IPv6 interface. For the brouter port, it is the ifindex of the port and, in the case of the VLAN, it is the ifindex of the VLAN. |
| Prefix | Configures the prefix to create an IPv6 prefix entry as either advertised or suppressed. |
| PrefixLen | Configures the mask to create an IPv6 address in the IPv6 interface table. |
| VlanId | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| UseDefaultVal | Specifies one included value to use the default value, or use all bits to configure all options to their default value. |
| ValidLifetime | Configures the valid lifetime in seconds that indicates the length of time this prefix is advertised. The default is 2592000.
A valid lifetime is the length of time of the preferred and depreciated state of an autoconfiguration address.
The preferred lifetime value must be less than the valid lifetime value. If you must configure the valid lifetime value to a value lower than the current preferred lifetime, you must lower the preferred lifetime value first. |

| Name | Description |
|--------------------------|---|
| PreferredLifetime | Configures the preferred lifetime in seconds that indicates the length of time this prefix is advertised. The default value is 604800. The preferred lifetime is the length of time for the tentative, preferred, and depreciated state of an autoconfiguration address. The preferred lifetime value must be less than the valid lifetime value. If you must configure the valid lifetime value to a value lower than the current preferred lifetime, you must lower the preferred lifetime value first. |
| Infinite | Configures the prefix valid lifetime so it never expires. The default is false. |
| OnLinkFlag | Configures the prefix for use when determining if a node is online. This value is placed in the L-bit field in the prefix information option. It is a 1-bit flag. The default is true. |
| AutoFlag | Configures the prefix for use as the autonomous address configuration. This value is placed in the autoflag field in the prefix information option. It is a 1-bit flag. The default is true. |
| AddressEui | Configures the EUI address. Use an EUI-64 interface ID in the address field. If enabled, use EUI, or use EUI-64 and the complement Universal/Local (U/L) bit. This operation provides for both global and link-local addresses. After you create the entry, you cannot modify this value. This value is valid for use only when the PrefixLength is 64 or less. The default is eui-not-used. If you select eui-not-used, this configuration creates an IPv6 ND prefix but no associated IPv6 address on the router. If you select either eui-used-with-ul-complement or eui-used-without-ul-complement, an associated IPv6 address is created by concatenating the specified prefix with the EUI-64 interface ID. |
| NoAdvertise | Configures if the prefix is included in the router advertisement. Select true to not include the prefix in the router advertisement. The default is false. |

Configuring an IPv6 discovery prefix on a VLAN

Configure the discovery prefixes to send in router advertisement.

About This Task

Hosts on the link use router advertisements to perform IPv6 autoconfiguration. The discovery prefix controls what IPv6 addresses to autoconfigure and how long they are valid.

Procedure

1. In the navigation pane, expand the following folders: **VLAN > VLANs**.
2. Click the **Basic** tab.
3. Select an interface row.
4. Click **IPv6**.
5. Click the **IPv6 Discovery Prefix** tab.
6. Click **Insert**.
7. Specify the prefix and prefix length.
8. Configure the remaining parameters, as required.
9. Click **Insert**.
10. Click **Apply**.

IPv6 Discovery Prefix field descriptions

Use the data in the following table to use the **IPv6 Discovery Prefix** tab.

| Name | Description |
|----------------------|---|
| Interface | Shows a read-only value that indicates an IPv6 interface. For the brouter port, it is the ifindex of the port and, in the case of the VLAN, it is the ifindex of the VLAN. |
| Prefix | Configures the prefix to create an IPv6 prefix entry as either advertised or suppressed. |
| PrefixLen | Configures the mask to create an IPv6 address in the IPv6 interface table. |
| VlanId | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| UseDefaultVal | Specifies one included value to use the default value, or use all bits to configure all options to their default value. |
| ValidLifetime | Configures the valid lifetime in seconds that indicates the length of time this prefix is advertised. The default is 2592000.
A valid lifetime is the length of time of the preferred and depreciated state of an autoconfiguration address.
The preferred lifetime value must be less than the valid lifetime value. If you must configure the valid lifetime value to a value lower than the current preferred lifetime, you must lower the preferred lifetime value first. |

| Name | Description |
|--------------------------|---|
| PreferredLifetime | Configures the preferred lifetime in seconds that indicates the length of time this prefix is advertised. The default value is 604800. The preferred lifetime is the length of time for the tentative, preferred, and depreciated state of an autoconfiguration address. The preferred lifetime value must be less than the valid lifetime value. If you must configure the valid lifetime value to a value lower than the current preferred lifetime, you must lower the preferred lifetime value first. |
| Infinite | Configures the prefix valid lifetime so it never expires. The default is false. |
| OnLinkFlag | Configures the prefix for use when determining if a node is online. This value is placed in the L-bit field in the prefix information option. It is a 1-bit flag. The default is true. |
| AutoFlag | Configures the prefix for use as the autonomous address configuration. This value is placed in the autoflag field in the prefix information option. It is a 1-bit flag. The default is true. |
| AddressEui | Configures the EUI address. Use an EUI-64 interface ID in the address field. If enabled, use EUI, or use EUI-64 and the complement Universal/Local (U/L) bit. This operation provides for both global and link-local addresses. After you create the entry, you cannot modify this value. This value is valid for use only when the PrefixLength is 64 or less. The default is eui-not-used. If you select eui-not-used, this configuration creates an IPv6 ND prefix but no associated IPv6 address on the router. If you select either eui-used-with-ul-complement or eui-used-without-ul-complement, an associated IPv6 address is created by concatenating the specified prefix with the EUI-64 interface ID. |
| NoAdvertise | Configures if the prefix is included in the router advertisement. Select true to not include the prefix in the router advertisement. The default is false. |

Configuring route advertisement

Configure route advertisement in IPv6 for neighbor discovery (ND).

Before You Begin

Change the VRF instance as required to configure route advertisement on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

IPv6 nodes on the same link use ND to discover link-layer addresses and to obtain and advertise various network parameters and reachability information. ND combines the services provided by Address Resolution Protocol (ARP) and router discovery for IPv4.

Note

You only use the ND level configuration when you want to create advertised values that differ from the interface values for reachable-time, retransmit-timer, mtu, or hop-limit.

You can also configure an IPv6 interface for a brouter port through the **Edit > Port > IPv6** navigation path, and for a VLAN through the **VLAN > VLANs > Basic > IPv6** navigation path. This procedure uses the main IPv6 navigation path where you can configure both types of interfaces.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6**.
3. Click the **Route Advertisement** tab.
4. Double-click a parameter to change the current value.
You cannot modify the parameters in gray shading.
5. Click **Apply**.

Route Advertisement field descriptions

Use the data in the following table to use the **Route Advertisement** tab.

| Name | Description |
|----------------------|---|
| Interface | Specifies the interface to which this entry applies. |
| SendAdverts | Specifies whether the router sends periodic router advertisements and responds to router solicitations on this interface. The default is True. |
| UseDefaultVal | Specifies one included value to use the default value, or use all bits to configure all options to their default value. |
| MaxInterval | Specifies the maximum interval (in seconds) at which the transmission of route advertisements occurs on this interface. The value must be between 4 seconds and 1800 seconds. The default is 600. |
| MinInterval | Specifies the minimum interval (in seconds) at which the transmission of route advertisements occurs on this interface. The value must be between 3 seconds and $0.75 \times \text{max-interval}$. The default is 200. |

| Name | Description |
|------------------------|--|
| ReachableTime | Shows a value (in milliseconds) placed in the router advertisement message sent by the router. The value zero means unspecified (by this system). Configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event. You cannot modify this parameter; use the Interfaces tab to change the value for the interface. |
| RetransmitTime | Shows a value (in milliseconds) placed in the retransmit timer field in the router advertisement message sent from this interface. The value zero means unspecified (by this system). The value configures the amount of time the system waits for the transmission to occur. You cannot modify this parameter; use the Interfaces tab to change the value for the interface. |
| DefaultLifeTime | Specifies a value placed in the router lifetime field of router advertisements sent from this interface. This value must be either 0 or between 4 and 9000 seconds. A value of zero indicates that the system is not a default router. The default is 1800. |
| CurHopLimit | Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet. A value of zero indicates that the advertisement does not specify a value for CurHopLimit. The default is 64. |
| ManagedFlag | Enables the system to configure the M-bit or managed address configuration in the router advertisements. The default is false. |
| DadNsNum | Specifies the number of neighbor solicitation messages for duplicate address detection (DAD). A value of 0 disables the DAD process on this interface. A value of 1 sends one advertisement without retransmissions. |
| LinkMTU | Shows the MTU value sent in router advertisements on this interface. A value of zero indicates that the system sends no MTU options. |
| OtherConfigFlag | Enables the O-bit (other stateful configuration) in the router advertisement. Other stateful configuration autoconfigures received information without addresses. The default is disabled. |

Configuring route advertisement on an IPv6 interface for a brouter port

Configure route advertisement in IPv6 for neighbor discovery (ND).

About This Task

IPv6 nodes on the same link use ND to discover link-layer addresses and to obtain and advertise various network parameters and reachability information. ND combines the services provided by Address Resolution Protocol (ARP) and router discovery for IPv4.

Note

You only use the ND level configuration when you want to create advertised values that differ from the interface values for reachable-time, retransmit-timer, mtu, or hop-limit.

You can also configure an IPv6 interface for a VLAN through the **VLAN > VLANs > Basic > IPv6** navigation path.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > Edit > Port**.
2. Click **IPv6**.
3. Click the **Route Advertisement** tab.
4. Double-click a parameter to change the current value.
You cannot modify the parameters in gray shading.
5. Click **Apply**.

Route Advertisement field descriptions

Use the data in the following table to use the **Route Advertisement** tab.

| Name | Description |
|----------------------|--|
| Interface | Specifies the interface to which this entry applies. |
| SendAdverts | Specifies whether the router sends periodic router advertisements and responds to router solicitations on this interface. The default is True. |
| UseDefaultVal | Specifies one included value to use the default value, or use all bits to configure all options to their default value. |
| MaxInterval | Specifies the maximum interval (in seconds) at which the transmission of route advertisements occurs on this interface. The value must be between 4 seconds and 1800 seconds. The default is 600. |
| MinInterval | Specifies the minimum interval (in seconds) at which the transmission of route advertisements occurs on this interface. The value must be between 3 seconds and 0.75 x max-interval. The default is 200. |

| Name | Description |
|------------------------|--|
| ReachableTime | Shows a value (in milliseconds) placed in the router advertisement message sent by the router. The value zero means unspecified (by this system). Configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event. You cannot modify this parameter; use the Interfaces tab to change the value for the interface. |
| RetransmitTime | Shows a value (in milliseconds) placed in the retransmit timer field in the router advertisement message sent from this interface. The value zero means unspecified (by this system). The value configures the amount of time the system waits for the transmission to occur. You cannot modify this parameter; use the Interfaces tab to change the value for the interface. |
| DefaultLifeTime | Specifies a value placed in the router lifetime field of router advertisements sent from this interface. This value must be either 0 or between 4 and 9000 seconds. A value of zero indicates that the system is not a default router. The default is 1800. |
| CurHopLimit | Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet. A value of zero indicates that the advertisement does not specify a value for CurHopLimit. The default is 64. |
| ManagedFlag | Enables the system to configure the M-bit or managed address configuration in the router advertisements. The default is false. |
| DadNsNum | Specifies the number of neighbor solicitation messages for duplicate address detection (DAD). A value of 0 disables the DAD process on this interface. A value of 1 sends one advertisement without retransmissions. |
| LinkMTU | Shows the MTU value sent in router advertisements on this interface. A value of zero indicates that the system sends no MTU options. |
| OtherConfigFlag | Enables the O-bit (other stateful configuration) in the router advertisement. Other stateful configuration autoconfigures received information without addresses. The default is disabled. |

Configuring route advertisement on an IPv6 interface for a VLAN

Configure route advertisement in IPv6 for neighbor discovery (ND).

About This Task

IPv6 nodes on the same link use ND to discover link-layer addresses and to obtain and advertise various network parameters and reachability information. ND combines the services provided by Address Resolution Protocol (ARP) and router discovery for IPv4.

Note

You only use the ND level configuration when you want to create advertised values that differ from the interface values for reachable-time, retransmit-timer, mtu, or hop-limit.

Procedure

1. In the navigation pane, expand the following folders: **VLAN > VLANs**.
2. Click the **Basic** tab.
3. Select an interface row, and click **IPv6**.
4. Click **Route Advertisement**.
5. Double-click a parameter to change the current value.
 You cannot modify the parameters in gray shading.
6. Click **Apply**.

Route Advertisement field descriptions

Use the data in the following table to use the **Route Advertisement** tab.

| Name | Description |
|----------------------|--|
| Interface | Specifies the interface to which this entry applies. |
| SendAdverts | Specifies whether the router sends periodic router advertisements and responds to router solicitations on this interface. The default is True. |
| UseDefaultVal | Specifies one included value to use the default value, or use all bits to configure all options to their default value. |
| MaxInterval | Specifies the maximum interval (in seconds) at which the transmission of route advertisements occurs on this interface. The value must be between 4 seconds and 1800 seconds. The default is 600. |
| MinInterval | Specifies the minimum interval (in seconds) at which the transmission of route advertisements occurs on this interface. The value must be between 3 seconds and 0.75 x max-interval. The default is 200. |
| ReachableTime | Shows a value (in milliseconds) placed in the router advertisement message sent by the router. The value zero means unspecified (by this system). Configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event. You cannot modify this parameter; use the Interfaces tab to change the value for the interface. |

| Name | Description |
|------------------------|--|
| RetransmitTime | Shows a value (in milliseconds) placed in the retransmit timer field in the router advertisement message sent from this interface. The value zero means unspecified (by this system). The value configures the amount of time the system waits for the transmission to occur. You cannot modify this parameter; use the Interfaces tab to change the value for the interface. |
| DefaultLifeTime | Specifies a value placed in the router lifetime field of router advertisements sent from this interface. This value must be either 0 or between 4 and 9000 seconds. A value of zero indicates that the system is not a default router. The default is 1800. |
| CurHopLimit | Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet. A value of zero indicates that the advertisement does not specify a value for CurHopLimit. The default is 64. |
| ManagedFlag | Enables the system to configure the M-bit or managed address configuration in the router advertisements. The default is false. |
| DadNsNum | Specifies the number of neighbor solicitation messages for duplicate address detection (DAD). A value of 0 disables the DAD process on this interface. A value of 1 sends one advertisement without retransmissions. |
| LinkMTU | Shows the MTU value sent in router advertisements on this interface. A value of zero indicates that the system sends no MTU options. |
| OtherConfigFlag | Enables the O-bit (other stateful configuration) in the router advertisement. Other stateful configuration autoconfigures received information without addresses. The default is disabled. |

Configuring the neighbor cache

Configure the address translation table used to map IPv6 addresses to physical addresses. You can manually add static neighbors to the cache.

Note

IPv6 static neighbors are not supported on SMLT.

Before You Begin

Change the VRF instance as required to configure neighbor cache on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

About This Task

Neighbor cache in IPv6 is similar to the IPv4 Address Resolution Protocol (ARP) table. The neighbor cache is a set of entries for individual neighbors to which traffic was sent recently. You make entries on the neighbor on-link unicast IP address, including information such as the link-layer address. A neighbor cache entry contains information used by the Neighbor Unreachability Detection algorithm, including the reachability state, the number of unanswered probes, and the time the next Neighbor Unreachability Detection event is scheduled.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6**.
3. Click the **Neighbors** tab.
4. Click **Insert**.
5. Beside the **Interface** field, click **Port** or **Port in Vlan**.
6. Select a port or VLAN.
7. Configure the remaining parameters as required.
8. Click **Insert**.
9. Click **Apply**.

Neighbors field descriptions

Use the data in the following table to use the **Neighbors** tab.

| Name | Description |
|--------------------|---|
| Interface | Specifies the interface to which this entry applies. |
| NetAddress | Specifies the IP address of the media-dependent physical address. |
| PhyAddress | Specifies the MAC address. |
| Interface | Specifies a physical port ID or a MLT port ID. |
| LastUpdated | Specifies the value of sysUpTime of the last modification to this entry. If the entry was created prior to the last reinitialization of the local management subsystem, the object contains a zero value. |
| Type | Specifies the mapping type from manually configured entries. While the selection of either dynamic, static, or local is allowed; static is currently the only valid selection. |

| Name | Description |
|--------------|--|
| State | Specifies the Neighbor Unreachability Detection state for the interface after the address mapping in this entry is used. If Neighbor Unreachability Detection is not in use (for example, for IPv4), this object is always unknown. The options include the following: <ul style="list-style-type: none"> • reachable: confirmed reachability • stale: unconfirmed reachability • delay: waiting for reachability confirmation before entering the probe state • probe: actively probing • invalid: an invalidated mapping • unknown: state cannot be determined. • incomplete: address resolution is being performed |
| BMac | Specifies the backbone MAC address. |
| Cvid | Specifies the customer VID. |

Viewing cached destination information

View the destination cache to see next-hop addresses for destinations.

The destination cache is only populated or updated when IPv6 packets are locally originated on the central processor of the switch.

The main purpose of the destination cache is to store, on a per-destination basis, the dynamic Path MTU value currently used when transmitting packets from the local system to the remote destination. The PMTU value itself is used to calculate how many bytes can fit into an individual packet before fragmentation should be applied.

Before You Begin

Change the VRF instance as required to view cached destination information on a specific VRF instance. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6**.
3. Click the **Destination Cache** tab.

Destination Cache field descriptions

Use the data in the following table to use the **Destination Cache** tab.

| Name | Description |
|------------------|--|
| DestAddr | Shows the IPv6 destination address. |
| Interface | Shows the interface number that is used to reach the destination. |
| NextHop | Shows the IPv6 address for the next hop to the destination. |
| IfType | Specifies the interface type (tunnel, VLAN, or brouter) or virtual circuit (VRRP, RSMLT). |
| IfData | Displays additional information about virtual circuits. For instance, for a VRRP or RSMLT the virtual router ID displays. If the interface type is tunnel, VLAN, or brouter, no additional information displays. |
| Pmtu | Shows the path maximum transmission unit (MTU) for the destination. |
| PmtuAge | Shows the time, in seconds, since an ICMPv6 packet too big message was received. |

Tunneling

Tunneling provides a mechanism to transfer IPv6 traffic through an IPv4-only network.

How tunneling works

IPv6 tunneling encapsulates IPv6 packets in IPv4 packets for delivery across an IPv4 infrastructure.

At the tunnel source, or head end, the system encapsulates an IPv6 packet into an IPv4 packet and sends it to the remote tunnel destination.

The tunnel destination strips the IPv4 packet header and forwards the original IPv6 packet further into an IPv6 cloud.

These types of tunnels are called dual-stack tunnels because they support both IPv4 and IPv6.

Manually configured tunnels

Manually configured tunnels can provide communication between two isolated IPv6 domains over an IPv4 network.

Manually configured tunnels are point-to-point.

You can configure tunnel endpoints to create a point-to-point connection between two isolated IPv6 domains by configuring IPv6 and IPv4 addresses at each end of the tunnel.

Note

The router or host at the source and destination ends of the tunnel must support both IPv4 and IPv6 protocol stacks.

Caution

Ensure that all single-homed point-to-point traffic ingresses and egresses a configured tunnel. Otherwise the traffic is dropped.

IPv6 reachability enables tunnel forwarding but tunnel operational status depends on the IPv4 reachability of the tunnel endpoint.

The IPv4 tunnel endpoint configuration must be symmetrical; that is, if you configure a tunnel with a source of 10.10.10.1 and a destination of 11.11.11.1 from switch A, then Switch B must have a source of 11.11.11.1 and a destination of 10.10.10.1.

Tunnel interfaces are logical point-to-point interfaces.

You can enable dynamic routing when you enable a routing protocol, for example OSPFv3, on the tunnel interfaces.

Unicast routing protocols can detect link loss and redirect IPv6 route information

There is no explicit signaling protocol applied to IPv6-in-IPv4 configured tunnels (refer to RFC 4213).

Therefore, if the remote endpoint of a tunnel that terminates several Layer 3 hops away in the network fails, the local state of the tunnel remains active even though the endpoint has failed.

However, you can enable unicast routing protocols over tunnels, for example OSPFv3. These unicast routing protocols introduce their own protocol-specific signaling and, when a unicast routing protocol is present over the tunnel link, the routing protocol can detect link loss and re-direct the IPv6 route information to use an alternate, reachable nexthop.

Operational events that trigger tunnel state transition

The switch must be able to locally detect operational events that can trigger a tunnel state transition.

These events include:

- deletion of local IPv4 interface
- change or loss of the IPv4 route to the remote tunnel endpoint
- change in the nexthop of the IPv4 route to the remote tunnel endpoint
- loss of the ARP entry for the nexthop router that is used to reach the IPv4 tunnel endpoint

Tunnels and MTU

You cannot configure the MTU for tunnels.

The default MTU value for tunnels is 1280.

Packets are forwarded through the tunnel using the line card network processing units (NPUs) only. Since the packets are not forwarded through the central processing unit (CPU) they do not impact the CPU load.

Tunnels and BGP+

You must configure an IPv6 tunnel and static routes on BGP+ peers when you use BGP+. For more information on IPv6 tunnel configuration for BGP+, see [IPv6 Tunnel Configurations for BGP+](#) on page 497.

Limitations

The following list identifies tunnel configuration limitations.

- You cannot configure IPv6 CLIP addresses for IPv6-in-IPv4 tunnels. Also, you cannot configure an IPv6 CLIP interface as the source or destination endpoint of a tunnel.
- You cannot configure SMLT on the switch terminating a tunnel.
- Termination of tunnels on vIST peers is not supported.

Tunneling Configuration using CLI

Use the procedures in this section to configure Tunnel using CLI.

Configuring a tunnel

Configure a tunnel for IPv6 VLANs or brouter ports to communicate through an IPv4-only network. Create a point-to-point connection between the two isolated IPv6 devices by configuring the tunnel endpoints.

Do not create tunnels in a native IPv6 network.

Before You Begin

- The router or host at the source and destination of the tunnel must support both IPv4 and IPv6 protocol stacks.

About This Task

Manual tunnels are point-to-point, so you configure both source and destination addresses. You must configure both IPv6 and IPv4 addresses for both source and destination devices. The IPv6 addresses must represent the same network, for example 6666::1/96 and 6666::2/96.

Tunnel interfaces are automatically configured with a link-local address in the format fe80::<local_ipv4_source_address>.

You cannot configure the maximum transmission unit (MTU) for tunnels. The default MTU value for tunnels is 1280.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Create a tunnel:
ipv6 tunnel <1-2000> source {A.B.C.D} address WORD<0-46> destination {A.B.C.D}

Example

Create tunnel 2:

```
Switch:1(config)#ipv6 tunnel 2 source 11.11.11.1 address
3000:0:0:0:0:0:1/64 destination 12.12.12.2
```

Variable definitions

Use the data in the following table to use the **ipv6 tunnel** command.

| Variable | Value |
|-----------------------|--|
| <1-2000> | Configures the ID for the tunnel. |
| address WORD<0-46> | Assigns an IPv6 address and prefix to the tunnel. |
| destination {A.B.C.D} | Configures the address of the remote endpoint of the tunnel. |
| source {A.B.C.D} | Configures the address of the local endpoint of the tunnel. |

Viewing tunnel interfaces

View tunnel interfaces to verify the current configuration and operational status of IPv6 tunnels.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Show IPv6 tunnel information:
show ipv6 tunnel [<1-2000>] [detail] [local {A.B.C.D}] [remote {A.B.C.D}]

Example

```
Switch:1#show ipv6 tunnel detail

=====
                        Tunnel Interface Information
=====

```

Variable definitions

Use the data in the following table to use the **show ipv6 tunnel** command.

| Variable | Value |
|-------------------------------|--|
| <code><1-2000></code> | Shows information for a specific tunnel ID. |
| <code>detail</code> | Shows detailed address information for the tunnel. |
| <code>local {A.B.C.D}</code> | Shows information for a specific local address (the local endpoint of the tunnel). |
| <code>remote {A.B.C.D}</code> | Shows information for a specific remote address (the remote endpoint of the tunnel). |

Modifying tunnel hop limits

Modify tunnel hop limits to update hop-limit values on previously configured tunnels.

About This Task

The tunnel hop limit configures the value of the time-to-live (TTL) for IPv4 packets.

Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```
2. Modify the hop limit:

```
ipv6 tunnel <1-2000> hop-limit <0-255>
```

Example

Modify the hop limit for tunnel ID 5:

```
Switch:1(config)#ipv6 tunnel 5 hop-limit 200
```

Variable definitions

Use the data in the following table to use the **ipv6 tunnel** command.

| Variable | Value |
|----------|--|
| <0–255> | Configures the maximum number of hops in the tunnel. The default value is 255. |
| <1–2000> | Specifies the tunnel ID. |

Tunneling Configuration using EDM

Use the procedures in this section to configure Tunnel using EDM.

Configuring a tunnel

Configure a tunnel for IPv6 VLANs or brouter ports to communicate through an IPv4-only network. Create a point-to-point connection between the two isolated IPv6 devices by configuring the tunnel endpoints.

Do not create tunnels in a native IPv6 network.

Before You Begin

- The router or host at the source and destination of the tunnel must support both IPv4 and IPv6 protocol stacks.

About This Task

Manual tunnels are point-to-point, so you configure both source and destination addresses. You must configure both IPv6 and IPv4 addresses for both source and destination devices. The IPv6 addresses must represent the same network, for example 6666::1/96 and 6666::2/96.

Tunnel interfaces are automatically configured with a link-local address in the format fe80::<local_ipv4_source_address>.

You cannot configure the maximum transmission unit (MTU) for tunnels. The default MTU value for tunnels is 1280.

Procedure

- In the navigation tree, expand the following folders: **Configuration > IPv6**.
- Click **Tunnel**.
- Click the **Tunnel Config** tab.
- Click **Insert**.
- Beside the **LocalAddress** field, click the button, and then select the IPv4 address for the local VLAN or brouter port.
- In the **RemoteAddress** field, type the IPv4 address for the destination VLAN or brouter port.
- In the **ID** field, type a number to represent the tunnel.
- In the **IPv6AddressAddr** field, type the IPv6 address for the tunnel VLAN or brouter port.
- In the **IPv6AddressPrefixLength** field, type the number of bits to advertise in the IPv6 address.
- Click **Insert**.

Tunnel Config field descriptions

Use the data in the following table to use the **Tunnel Config** tab.

| Name | Description |
|--------------------------------|--|
| AddressType | Shows the address type over which the tunnel encapsulates packets. |
| LocalAddress | Configures the address of the local endpoint of the tunnel. |
| RemoteAddress | Configures the address of the remote endpoint of the tunnel. |
| EncapsMethod | Configures the tunnel mode, which is manual for manually configured tunnels. |
| ID | Configures the ID for the tunnel. |
| IfIndex | Shows the value of ifIndex that corresponds to the tunnel interface. A value of 0 indicates that the interface index has not yet been assigned. This field appears only on the Tunnel Config tab. |
| Ipv6AddressAddr | Specifies the IPv6 address for the local VLAN or brouter port. This field appears only on the Insert Tunnel Config dialog box. |
| Ipv6AddressPrefixLength | Specifies the number of bits to advertise in the IPv6 address. This field appears only on the Insert Tunnel Config dialog box. |

Modifying tunnel hop limits

Modify tunnel hop limits to update hop-limit values on previously configured tunnels.

Use this procedure to modify the hop limits for multiple tunnels simultaneously.

About This Task

The tunnel hop limit configures the value of the time-to-live (TTL) for IPv4 packets.

Procedure

1. In the navigation pane, expand the **Configuration > IPv6** folders.
2. Click **Tunnel**.
3. Click the **Tunnel Interface** tab.
4. Double-click the **HopLimit** value to modify the information as required.
5. Click **Apply**.

Tunnel Interface field descriptions

Use the data in the following table to use the **Tunnel Interface** tab.

| Name | Description |
|--------------------------|---|
| Index | Identifies the tunnel interface internally. The value is derived from the tunnel ID. |
| EncapsMethod | Displays the encapsulation method for the tunnel: manual for manually configured tunnels and 6to4 for automatically configured tunnels. |
| HopLimit | Configures the maximum number of hops in the tunnel. The default value is 255. |
| Security | Indicates the type of security on the tunnel interface. |
| TOS | Displays the method used to configure the high 6 bits (the differentiated services codepoint) of the IPv4 type of service (TOS) or IPv6 traffic class in the outer IP header.
A value of -1 indicates that the bits are copied from the payload header. A value of -2 indicates that a traffic conditioner is invoked and more information can be available in a traffic conditioner MIB module. A value from 0 to 63 indicates that the bit field is configured to the indicated value. |
| FlowLabel | Displays the method used to configure the IPv6 flow label value. This object is not required where AddressType indicates the tunnel is not over IPv6. A value of -1 indicates that a traffic conditioner is invoked and more information can be available in a traffic conditioner MIB. Any other value indicates that the flow label field is configured to the indicated value. |
| AddressType | Displays manual for a manually configured tunnel, or sixToFour for autoconfigured tunnels. |
| LocalInetAddress | Identifies the local endpoint address of the tunnel. |
| RemoteInetAddress | Identifies the remote endpoint of the tunnel. |
| EncapsLimit | Displays the maximum number of additional encapsulations permitted for packets undergoing encapsulation at this node. A value of -1 indicates that no limit exists, except as a result of the packet size. |

Modifying tunnel hop limits for a specific tunnel

Modify tunnel hop limits to update hop-limit values on previously configured tunnels.

Use this procedure to modify the hop limits for a specific tunnel interface.

About This Task

The tunnel hop limit configures the value of the time-to-live (TTL) for IPv4 packets.

Procedure

1. In the navigation pane, expand the **Configuration > IPv6** folders.
2. Click **Tunnel**.
3. Click the **Tunnel Config** tab.
4. Select the tunnel row.
5. Click **Tunnel Interface**.
6. Double-click the **HopLimit** value to modify the information as required.
7. Click **Apply**.

Tunnel Interface field descriptions

Use the data in the following table to use the **Tunnel Interface** tab.

| Name | Description |
|------------------------|---|
| Index | Identifies the tunnel interface internally. The value is derived from the tunnel ID. |
| EncapsMethod | Displays the encapsulation method for the tunnel: manual for manually configured tunnels and 6to4 for automatically configured tunnels. |
| HopLimit | Configures the maximum number of hops in the tunnel. The default value is 255. |
| Security | Indicates the type of security on the tunnel interface. |
| TOS | Displays the method used to configure the high 6 bits (the differentiated services codepoint) of the IPv4 type of service (TOS) or IPv6 traffic class in the outer IP header.
A value of -1 indicates that the bits are copied from the payload header. A value of -2 indicates that a traffic conditioner is invoked and more information can be available in a traffic conditioner MIB module. A value from 0 to 63 indicates that the bit field is configured to the indicated value. |
| FlowLabel | Displays the method used to configure the IPv6 flow label value. This object is not required where AddressType indicates the tunnel is not over IPv6. A value of -1 indicates that a traffic conditioner is invoked and more information can be available in a traffic conditioner MIB. Any other value indicates that the flow label field is configured to the indicated value. |
| AddressType | Displays manual for a manually configured tunnel, or sixToFour for autoconfigured tunnels. |
| LocalNetAddress | Identifies the local endpoint address of the tunnel. |

| Name | Description |
|--------------------------|--|
| RemoteInetAddress | Identifies the remote endpoint of the tunnel. |
| EncapsLimit | Displays the maximum number of additional encapsulations permitted for packets undergoing encapsulation at this node. A value of -1 indicates that no limit exists, except as a result of the packet size. |

Viewing IPv6 addresses on a tunnel

View a tunnel for IPv6 addresses.

You can assign an IPv6 address to a VLAN or brouter port.

About This Task

To create MLT and LAG interfaces with IPv6, you must configure VLAN-based connections and you cannot use brouter ports.

You can also assign an IPv6 address through the **Edit > Port > IPv6** navigation path, and through the **VLAN > VLANs > Basic > IPv6** navigation path.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > IPv6**.
2. Click **Tunnel**.
3. Click the **Tunnel Config** tab.
4. Click **IPv6 Address**.

Tunnel Config field descriptions

Use the data in the following table to use the **Tunnel Config** tab.

| Name | Description |
|----------------------|--|
| AddressType | Shows the address type over which the tunnel encapsulates packets. |
| LocalAddress | Configures the address of the local endpoint of the tunnel. |
| RemoteAddress | Configures the address of the remote endpoint of the tunnel. |
| EncapsMethod | Configures the tunnel mode, which is manual for manually configured tunnels. |
| ID | Configures the ID for the tunnel. |
| IfIndex | Shows the value of ifIndex that corresponds to the tunnel interface. A value of 0 indicates that the interface index has not yet been assigned. This field appears only on the Tunnel Config tab. |

IPv6 Tunnel Configuration Example

This section shows examples of manually configured tunnels between router ports and VLANs.

Between router ports

The following figure shows the tunnel configuration between router ports.

Figure 169: Tunnel configuration between router ports

You must configure static routes, RIP, or OSPF on both the source (Switch 1) and destination (Switch 2) IPv4 interfaces to communicate on the IPv4 network. You must configure IPv4 addresses on the source and destination.

Configuring Switch 1

Create an IPv6 VLAN and add ports to the VLAN.

```
vlan create 10 type port-mstprstp 0
vlan mlt 10 4
vlan members 10 1/1 portmember
interface vlan 10
ipv6 interface
ipv6 interface enable
ipv6 interface address 4000:0:0:0:0:0:0:1/64
exit
```

Create an IPv4 router port and enable OSPF on the port.

```
interface GigabitEthernet 1/30
brouter port 1/30 vlan 1000 subnet 172.21.80.1/255.255.255.0 mac-offset
6
```

Create the tunnel from the source to the destination.

```
ipv6 tunnel 1 source 172.21.80.1 address 2500:0000:0000:0000:0000:0000:0000:0001/64
destination 192.168.20.1
```

Configure a static route on the source.

```
ipv6 route 4000:0:0:0:0:0:0:2/64 cost 1 tunnel 1
```

Optionally, you can create an OSPFv3 interface through the tunnel.

```
router ospf ipv6-enable
router ospf
ipv6 tunnel 1 area 0.0.0.0
ipv6 tunnel 1 enable
exit
```

Configuring Switch 2

Create an IPv6 VLAN and add ports to the VLAN.

```
vlan create 40 type port-mstprstp 0
vlan mlt 40 4
vlan members 40 1/2 portmember
interface vlan 40
ipv6 interface
ipv6 interface enable
ipv6 interface address 4000:0:0:0:0:0:2/64
exit
```

Create an IPv4 brouter port and enable OSPF on the port.

```
interface GigabitEthernet 1/30
brouter port 1/30 vlan 2000 subnet 192.168.20.1/255.255.255.0 mac-offset 6
```

Create the tunnel from the destination to the source.

```
ipv6 tunnel 1 source 192.168.20.1 address 2500:0000:0000:0000:0000:0000:0002/64
destination 172.21.80.1
```

Configure a static route on the destination.

```
ipv6 route 4000:0:0:0:0:0:1/64 cost 1 tunnel 1
```

Optionally, you can create an OSPFv3 interface through the tunnel.

```
router ospf ipv6-enable
router ospf
ipv6 tunnel 1 area 0.0.0.0
ipv6 tunnel 1 enable
exit
```

Between VLANs

The following figure shows the tunnel configuration between VLANs.

Figure 170: Tunnel configuration between VLANs

You must configure static routes, and either RIP or OSPF on both the source (Switch 1) and destination (Switch 2) IPv4 interfaces to communicate on the IPv4 network. You must configure IPv4 addresses on the VLANs.

Configuring Switch 1

Create an IPv6 VLAN and add ports to the VLAN.

```
vlan create 10 type port-mstprstp 0
vlan mlt 10 4
vlan members 10 1/1 portmember
interface vlan 10
ipv6 interface
ipv6 interface enable
ipv6 interface address 4000:0:0:0:0:0:1/64
exit
```

Create an IPv4 VLAN, add ports to the VLAN, and enable OSPF on the VLAN.

```
vlan create 20 type port-mstprstp 0
vlan mlt 20 4
vlan members 20 1/30 portmember
interface vlan 20
ip address 172.21.80.1 255.0.0.0
ip ospf enable
exit
```

Create the tunnel from the source to the destination.

```
ipv6 tunnel
1 source 172.21.80.1 address 2500:0000:0000:0000:0000:0000:0001/64
destination 192.168.20.1
```

Configuring Switch 2

Create an IPv6 VLAN and add ports to the VLAN.

```
vlan create 40 type port-mstprstp 0
vlan mlt 40 4
vlan members 40 1/2 portmember
interface vlan 40
ipv6 interface
```

```

ipv6 interface enable
ipv6 interface address 4000:0:0:0:0:0:2/64
exit

```

Create an IPv4 VLAN , add ports to the VLAN, and enable OSPF on the VLAN.

```

vlan create 30 type port-mstprstp 0
vlan mlt 30 4
vlan members 30 1/30 portmember
interface vlan 30
ip address 192.168.20.1 255.0.0.0
ip ospf enable
exit

```

Create the tunnel from the destination to the source.

```

ipv6 tunnel 1 source 192.168.20.1 address 2500:0000:0000:0000:0000:0000:0002/64
destination 172.21.80.1

```

Verification

Use the following show command to verify tunnel creation on the source device:

```

Switch:1(config)#show ipv6 tunnel 1 detail
=====
                        Tunnel Interface Information
=====
ID          LOCAL ADDRESS  REMOTE ADDRESS  OPER STATUS  TYPE

Key Health Indicators (KHI)

[Key Health Indicators Using the CLI on page 1942](#)
[Key Health Indicators Using EDM on page 1956](#)

Table 228: Key Health Indicator product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| Key Health Indicator (KHI) | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VSP 4000 4.0 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 4.2.1 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VSP 8200 4.0 |
| | VSP 8400 Series | VOSS 4.2 |
| | VSP 8600 Series | VSP 8600 4.5 |
| | XA1400 Series | VOSS 8.0.50 |

The Key Health Indicators (KHI) feature provides a subset of health information that allows for quick assessment of the overall operational state of the device.

Note

KHI was not designed to provide a comprehensive debugging solution. Instead, KHI identifies key information that could lead support personnel towards discovery of a specific failure. After the technician assesses the KHI information, further debugging is required to determine the specific reason for the fault.

You should capture KHI information during normal operations to provide a baseline for support personnel when detecting fault situations.

Key Health Indicators Using the CLI

Use the procedures in this section to display Key Health Indicator (KHI) information using the CLI.

Displaying KHI Performance Information

Use the following commands to display KHI information about the performance of the switch.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display buffer performance and utilization statistics:

```
show khi performance buffer-pool [{slot[-slot] [, ...]}
```
3. Show current utilization, 5-minute average utilization, and 5-minute high water mark with date and time of event:

```
show khi performance cpu [{slot[-slot] [, ...]}
```
4. Display memory performance and utilization statistics on the specified slot or all slots:

```
show khi performance memory [history | {slot[-slot] [, ...]}
```

Note

Depending on the hardware platform, you can display virtual memory history.

5. Display process performance and utilization statistics on the specified slot or all slots:

```
show khi performance process [{slot[-slot] [, ...]}
```
6. Display thread performance and utilization statistics on the specified slot or all slots:

```
show khi performance pthread [{slot[-slot] [, ...]}
```
7. Display internal memory management resource performance and utilization statistics on the specified slot or all slots:

```
show khi performance slabinfo [{slot[-slot] [, ...]}
```

Example

```
Switch:1>show khi performance buffer-pool 1
Slot:1
  CPP:
    UsedFBuffs: 12
    FreeFBuffs: 3060
    RxQ0FBuffs: 0
    RxQ1FBuffs: 0
    RxQ2FBuffs: 0
    RxQ3FBuffs: 0
    RxQ4FBuffs: 0
    RxQ5FBuffs: 0
    RxQ6FBuffs: 0
    RxQ7FBuffs: 0
    TxQueueFBuffs: 0
    NoFbuf: 0

  Network stack system:
    UsedMbuf: 244
    FreeMbuf: 47606
    SocketMbuf: 19

  Network stack data:
    UsedMbuf: 4
    FreeMbuf: 10748

  Letter API message queue:
    QHigh: 0
    QNormal: 0
```

```

FreeQEntries: 51200

Switch:1>show khi performance cpu 1
Slot:1
  Current utilization: 9
  1-minute average utilization: 9
  1-minute high water mark: 14 (06/20/16 06:03:08)
  5-minute average utilization: 8
  5-minute high water mark: 10 (06/19/16 08:35:58)
    
```

Depending on the switch hardware, any one of the following output can appear for **show khi performance memory** [{slot[-slot][, ...]}].

```

Switch:1>show khi performance memory 1
Slot:1
  Used: 514560 (KB)
  Free: 521260 (KB)
  Current utilization: 49 %
  5-minute average utilization: 49 %
  5-minute high water mark: 22 (10/08/14 14:48:01)

Switch:1>show khi performance memory 1
Slot:1
  Used: 1684000 (KB)
  Free: 2321704 (KB)
  Current utilization: 42 %
  5-minute average utilization: 41 %
  5-minute high water mark: 41 (%)
  10-minute average utilization: 41 %
  10-minute high water mark: 41 (%)
  1-Hour average utilization: 41 %
  1-Hour high water mark: 41 (%)
  1-Day average utilization: 41 %
  1-Day high water mark: 41 (%)
  1-Month average utilization: 39 %
  1-Year average utilization: 0 %
    
```

Depending on the hardware platform, you can display virtual memory history using **show khi performance memory history**.

```

Switch:1>show khi performance memory history
Slot:1
Values indicate VMSize in KB

Variable Definitions

Use the data in the following table to use the **show khi performance** command.

| Variable | Value |
|--|---|
| <code>{slot[-slot][, ...]}</code> | Specifies the slot number. Valid slot is 1. |
| <code>history</code> | Specifies virtual memory consumed for each process. |
| Note:
Depending on the hardware platform, this parameter appears in show khi performance memory . | |

Displaying KHI Control Processor Information

Display key health information about the type of packets and protocols received on a port. This command helps debug high CPU utilization issues.

About This Task

You can use the packets-per-second information in the output to identify where the bulk of packets destined for the CPU enter the switch.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display statistics for control packets that go to the control processor:

```
show khi cpp port-statistics [{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```

Example

```
Switch:1>show khi cpp port-statistics
=====
                KHI CPP Details - Port Statistics
=====
Port          Packet Type                Rx Packets  Rx Diff  Rx Pps  Tx Packets  Tx Diff  Tx Pps
-----
1653 seconds since issuing the last KHI command.

2/2          LLC_BPDU(128)              0           0         0       33508      10         0
2/2          LLC_TDP(134)              11100        4         0       11090       4         0
2/3          Ether2_LLDP(3)              0           0         0       2233        56         0
2/3          LLC_BPDU(128)              16           0         0       33504      837         0
2/3          LLC_TDP(134)              11100       278         0       11090      278         0
2/4          Ether2_LLDP(3)              0           0         0       2233        56         0
2/4          LLC_BPDU(128)              2           0         0       33508      837         0
2/4          LLC_TDP(134)              11100       278         0       11090      278         0
```

Variable Definitions

Use the data in the following table to use the **show khi cpp port-statistics** command.

| Variable | Value |
|--|---|
| <code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). |

View KHI Segmented Management Instance Information

Use the following commands to view Key Health Indicator (KHI) for segmented management instance interface information of the switch.

Procedure

1. To enter User EXEC mode, log on to the switch.

- View KHI management instance statistics:

**Note**

This command and all parameters do not apply to all hardware platforms.

```
show khi mgmt statistics [clip | oob | vlan]
```

Example

```
Switch:1>show khi mgmt statistics
```

```
=====
=====
                                     Packet Counters - Interface Mgmt-oob
=====
=====
```

| Packet Type | Rx Packets | Tx Packets | Rx Packets Dropped |
|-------------------------|------------|------------|--------------------|
| Telnet | 1034 | 682 | 0 |
| Ntp | 0 | 0 | 173 |
| Dhcp | 0 | 0 | 837 |
| OtherUdpWellKnown | 0 | 0 | 1182 |
| Arp-reply | 74 | 303 | 0 |
| Arp-request | 59915 | 74 | 0 |
| IcmpV6-nd-nbr-solicit | 0 | 1 | 0 |
| IcmpV6-nd-router-advert | 27 | 0 | 0 |

Clear KHI Information

KHI information can be cleared globally across the whole device. Use the command to clear the CPP port statistics or Segmented Management Instance statistics.

Procedure

- Enter Privileged EXEC mode:

```
enable
```
- Clear CPP statistics:

```
clear khi cpp port-statistics
```
- Clear segmented management instance statistics:

**Note**

This step does not apply to VSP 8600 Series.

```
clear khi mgmt statistics
```

Displaying KHI Fabric Extend ONA Status

About This Task

Note

This feature only applies to platforms that have an Open Networking Adapter (ONA) connected to it.

Use the following command to display the current status of the Fabric Extend ONA, which includes release information.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display the ONA status:
show khi fe-ona status

Example

The following output displays the `show khi fe-ona status` when the ONA is operating normally.

```
Switch:1#show khi fe-ona status

=====
                        ONA STATUS
=====
ONA Device Status : UP
Running Release Name : v1.0.0.0int006-3-g9749735-dirty
Last Image Upgrade Status : UPGRADE_SUCCESS
Last Image File Used For Upgrde: gdb-secure_ona.tgz
-----
```

The following examples display the output when communication from the switch to the ONA is disrupted. Note that the `ONA Down reason` lists the cause of the failure. The reason changes depending on the context of the failure.

The following output displays when the configuration push from the switch to the ONA fails:

```
Switch:1#show khi fe-ona status

=====
                        ONA STATUS
=====
ONA Device Status : DOWN
ONA DOWN reason : ONA_CONFIG_DOWNLOAD_FAILED
Running Release Name :
Image Upgrade Status : UNKNOWN
-----
```

The following output displays when the port connecting to the ONA device port is DOWN:

```
Switch:1#show khi fe-ona status

=====
                        ONA STATUS
=====
ONA Device Status : DOWN
ONA DOWN reason : ONA_DEVICE_PORT_DOWN
```

```
Running Release Name :
Image Upgrade Status : UNKNOWN
Image File Is Being Used For Upgrade :
-----
```

The following output displays when the switch is not receiving LLDP packets from the ONA:

```
Switch:1#show khi fe-ona status

=====
                        ONA STATUS
=====
ONA Device Status : DOWN
ONA DOWN reason : ONA_LLDP_TIMEOUT
Running Release Name :
Image Upgrade Status : UNKNOWN
-----
```

Note

On the switch console, the following log message precedes all three of the above cases:

```
CP1 [03/22/71 09:30:15.336:UTC] 0x00378601 00000000 GlobalRouter
ONA WARNING ONA device status detected down
```

Displaying KHI Fabric Extend ONA Global Information

About This Task

Note

This feature only applies to platforms that have an Open Networking Adapter (ONA) connected to it.

Use the following command to display Fabric Extend ONA global information such as port numbers, IP addresses, and MTU.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Display the ONA global information:

```
show khi fe-ona detail
```

Example

```
Switch:1#show khi fe-ona detail

=====
                        ONA RUNTIME INFORMATION
=====
ONA Port Number : 1/15
ONA Management Address : 100.1.1.11
Tunnel Source IP Address : 198.51.100.11
ONA LLDP Port Status : Enabled
ONA Device Port Status : UP
ONA Device Status : UP
MTU : 1000
ONA Network Port Number : 1/35
ONA Mac (ARP) Address : 10:cd:ae:69:b6:50
```

```

ONA Source VlanId : 1050
ONA Source VlanIP : 192.0.2.1
ONA Gateway IP : 192.0.2.1
ONA Management IP Mask : 255.255.255.0
ONA Bootmode : 1
ONA Uptime : 0 day(s), 00:00:00
pbit-to-dscp-map p0=16 p1=20 p2=24 p3=30 p4=36 p5=40 p6=48 p7=46
-----

```

Note

In the above example, the switch receives LLDP packets with the Management IP address of the ONA over the ONA Port (1/15). The switch extracts the ONA Management IP from the LLDP packet and resolves the ARP of the ONA over the network port (1/35). After the switch resolves the ARP of the ONA IP, the `show khi fe-ona detail` updates the following details:

- ONA Network Port Number
- ONA Mac(ARP) Address
- ONA Source VlanId

Note the following in regard to the `show khi fe-ona detail` output shown above:

- `ONA Source VlanIP : 192.0.2.1`—This is the IP address of the switch VLAN that switches traffic to the ONA network port. In the above output, this is VLAN 1050.
- `ONA Gateway IP : 192.0.2.1`—This is the ONA gateway IP address that the switch gets by querying the ONA. The ONA receives this gateway IP from the DHCP server.

Important

The `ONA Source VlanIP`, and `ONA Gateway IP` addresses must be the same for the tunnels to come up and the traffic to switch.

Key Health Indicators Using EDM

Use the procedures in this section to display KHI information using EDM.

Clearing KHI Statistics

About This Task

Clear KHI statistics.

Procedure

1. In the Device Physical View tab, select the Device.
2. In the navigation pane, expand the **Configuration > Edit** folders.
3. Click **Chassis**.
4. Click the **CPP Stats Control** tab.
5. Select the statistics you want to clear.
6. Click **Apply**.

CPP Stats Control Field Descriptions

Use the data in the following table to use the **CPP Stats Control** tab.

| Name | Description |
|-----------------------|-------------------------|
| PortStatsClear | Clears port statistics. |

Displaying KHI Port Information

About This Task

Use the following commands to display key health information about the types of control packets and protocols received on a port and sent to the control processor.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand the **Configuration > Graph** folders.
3. Click **Port**.
4. Click the **CPP Stats** tab.

CPP Stats Field Descriptions

Use the data in the following table to use the **CPP Stats** tab.

| Name | Description |
|-------------------|--|
| Port | Identifies the slot and port. |
| Packet | Shows the packet type. |
| PacketName | Shows the name of the packet. |
| RxPackets | Indicates the number of received packets on the port for the packet type. |
| TxPackets | Indicates the number of transmitted packets on the port for the packet type. |

View KHI Segmented Management Instance Statistics Information

About This Task**Note**

This procedure does not apply to VSP 8600 Series.

Use the following procedure to view key health information about the types of control packets and protocols received on a port and sent to the segmented management instance interface.

Procedure

1. In the navigation pane, expand the **Configuration > Edit** folders.
2. Expand **Mgmt Instance**.

3. Select **Stats**
4. Select the **KHI** tab.
5. To clear KHI statistics for a management interface, select an **InstanceId** and select **Clear Stats**.

KHI Field Descriptions

Use the data in the following table to use the **KHI** tab.

| Name | Description |
|-------------------|---|
| InstanceId | Shows the management interface instance. |
| PacketType | Shows the packet type. |
| PacketName | Shows the name of the packet. |
| RxPackets | Shows the number of received packets on the port for the packet type. |
| TxPackets | Shows the number of transmitted packets on the port for the packet type. |
| RxDropped | Shows the number of received packets dropped on the port for the packet type. |

Layer 2 Security

[Layer 2 Security for IPv4 and IPv6 Deployments](#) on page 1959

[Layer 2 Security Configuration Using the CLI](#) on page 1978

[Layer 2 Security Configuration using EDM](#) on page 2020

[Layer 2 security example scenarios](#) on page 2043

Layer 2 Security for IPv4 and IPv6 Deployments

This chapter describes Layer 2 security concerns and the security features you can use to mitigate them.

Security features for IPv4 deployments:

- DHCP Snooping
- Dynamic ARP Inspection
- IP Source Guard for IPv4 addresses

Security features for IPv6 deployments:

- First Hop Security (FHS)
- DHCP Snooping and IPv6 Neighbor Discovery Inspection
- IP Source Guard for IPv6 addresses

Dynamic ARP Inspection (DAI)

Table 229: Dynamic ARP Inspection (DAI) product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| Dynamic ARP Inspection (DAI) | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VOSS 6.1 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 6.1 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VOSS 6.1 |
| | VSP 8400 Series | VOSS 6.1 |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | Not Supported |

Dynamic ARP Inspection (DAI) is a security feature that validates ARP packets in the network.

Without DAI, a malicious user can attack hosts, switches, and routers connected to the Layer 2 network by poisoning the ARP caches of systems connected to the subnet, and intercepting traffic intended for other hosts on the subnet. DAI prevents these attacks by intercepting, logging, and discarding the ARP packets with invalid IP to MAC address bindings.

The switch dynamically builds the address binding table from the information gathered from the DHCP requests and replies when DHCP Snooping is enabled. The switch pairs the MAC address from the DHCP request with the IP address from the DHCP reply to create an entry in the DHCP binding table. For more information, see [Create DHCP Binding Table Entries](#) on page 2037.

When you enable DAI, the switch filters ARP packets on untrusted ports based on the source MAC and IP addresses seen on the switch port. The switch forwards an ARP packet when the source MAC and IP address matches an entry in the address binding table. Otherwise, the switch drops the ARP packet.

Note

- For DAI to function, you must enable DHCP Snooping globally.
- Configure DAI on a VLAN to VLAN basis.

DAI cannot be enabled on:

- Private VLANs (Etree)
- SPBM B-VLANs
- MLT port members

First Hop Security

First Hop Security (FHS) improves local network security by employing a number of mitigation techniques. This section describes the base set functionality which provides protection from a wide host

of rogue or mis-configured users, and this can be extended with additional features for different deployment scenarios. For example, see the following topology.

Sample Topology

In the following topology, Layer 2 switch SW-1 is connected to another Layer 2 switch SW-2. SW-2 is connected to three hosts and SW-1 is connected to two hosts.

In this network, if FHS is enabled only on SW-1, then it can only save the nodes which are directly connected to it. To protect the good node connected to SW-2, the FHS must be enabled on SW-2.

Figure 171: First Hop Security topology

First Hop Security contains the majority of the RIPE 554 mandatory requirements for Layer 2 switches. This includes the following:

- DHCPv6 Guard or DHCPv6 filtering
- RA Guard or Router Advertisement filtering

DHCPv6 security concerns

The enhancements in IPv6 provide better security in certain areas, but some of these areas are still open to exploitation by attackers. This section identifies the IPv6 FHS concerns associated with Dynamic Host Configuration Protocol version 6 (DHCPv6).

DHCPv6 (RFC 3315) describes how a host can acquire an IPv6 address and other configuration options from a server that is available on its local link. DHCPv6 is described as a stateful protocol. In other words, DHCPv6 can operate in a stateless fashion where it provides configuration information to nodes and does not perform address assignments (RFC 3736). In addition, it can operate in a stateful manner, where it assigns IPv6 addresses and configuration information to hosts that request it.

As in IPv4 DHCP, DHCPv6 is susceptible to rogue server attacks. In other words, if DHCPv6 is used to provide IPv6 addresses to the hosts, an attacker that managed to insert a rogue DHCPv6 server in the

link can potentially assign addresses and configuration options to the link hosts. In turn, the attacker can deploy man-in-the-middle, traffic interception, or blackhole traffic, similar to those in the stateless address autoconfiguration scenario. Therefore, it is important to use DHCP protections for both IPv4 and IPv6.

DHCPv6 Guard

Table 230: DHCPv6 Guard product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| DHCPv6 Guard | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VOSS 5.0 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 5.0 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VOSS 5.0 |
| | VSP 8400 Series | VOSS 5.0 |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | Not Supported |

DHCPv6 Guard is a type of security for IPv6 deployments in an enterprise environment, it provides Layer 2 security to DHCPv6 clients by protecting them against rogue DHCPv6 servers. The basic concept of DHCPv6 Guard is that a Layer 2 device filters DHCPv6 messages meant to DHCPv6 clients, based on a number of different criteria. The basic filtering criterion is, the DHCPv6 server generated packets which are received on non-server ports or from an untrusted server will be dropped by the Layer 2 device.

Various levels of granularity are provided. Following are the policies that are supported:

- Port based filtering using device role (server or client)
- Server or relay agent IPv6 address based filtering
- Advertising IPv6 prefix based filtering
- DHCPv6 packet filtering based on Server Preference checks

The following figures are DHCPv6 topology samples:

Figure 172: DHCPv6 Topology 1

Figure 173: DHCPv6 Topology 2

DHCPv6 Guard Policies Configuration

You can configure DHCPv6 Guard policies using CLI, SNMP and EDM. The following policies are supported for DHCPv6 Guard.

Port-based Filtering Using Device-role

Port-based filtering using device-role is an interface-level configuration. Only a DHCPv6 server or relay agent can send a DHCPv6 advertisement or reply. By configuring the device-role attached to the port (whether it is a client or server), the rogue server generating DHCPv6 advertisement or reply packets can be blocked if these packets are received on a port configured as a client. Device-role can be applied only on port, and not on MLT, SMLT, or VLAN. If you configure device-role on an MLT, SMLT, or VLAN, you must configure same device-role on all the MLT, SMLT, or VLAN member ports.

In DHCPv6 Guard Topology 1, only DHCPv6 server packets (that is, advertisement, reply) received on a port configured as a Server port accept the packets and process them for security validation and

forwarding. The Client port drops the packets if it receives packets generated from a DHCPv6 rogue server.

Server or Relay Agent IPv6 Address Based Filtering

Server or relay agent IPv6 address-based filtering enables the verification of the advertised DHCPv6 server and relay address in messages with the configured authorized server access list. In DHCPv6 Guard Topology 1 and Topology 2, you can configure the access list to accept DHCPv6 server packets from a specific Source IPv6 address such as a DHCPv6 server or DHCPv6 relay IPv6 address.

Advertising IPv6 prefix-based filtering

Advertising IPv6 prefix-based filtering enables verification of the advertised prefixes in DHCPv6 reply messages with the configured authorized prefix list.

Server preference-based filtering

Server preference-based filtering enables verification by checking if the advertised preference (in preference option) is greater than or less than the specified limit.

RA Guard

Table 231: IPv6 Router Advertisement (RA) Guard product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| IPv6 Router Advertisement (RA) Guard | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VOSS 5.0 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 5.0 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VOSS 5.0 |
| | VSP 8400 Series | VOSS 5.0 |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | Not Supported |

IPv6 hosts can configure themselves automatically when connected to a routed IPv6 network through ICMPv6 router discovery messages. When the host is connected to the network for the first time, it sends a link-local router solicitation multicast request for its configuration parameters. If the host is configured correctly, routers respond to the request with a Router Advertisement (RA) packet. The RA packet contains network-layer configuration parameters.

In addition to filtering RAs, RA Guard introduces the concept of router authorization proxy. Instead of each node on the link analyzing RAs and making an individual decision, a legitimate node-in-the-middle performs the analysis on behalf of all other nodes on the link.

Stateless and statefull RA Guard functions are available. The switch supports only the stateless RA Guard function.

Stateless RA Guard examines incoming RAs and decides whether to forward or block them based on the information found in the message or in the Layer 2 device configuration. The following list identifies the typical information available in the received frames that are used for RA validation:

- Port on which the frame is received
- Source IPv6 address
- Prefix list which RA carries
- Link-Layer address of the sender

After the Layer 2 device successfully validates the RA packet content against the configuration, the RA is forwarded to its destination, whether unicast or multicast. If the validation fails, the RA is dropped at the Layer 2 device.

RA Guard policies description

This section describes the RA Guard policies. The following policies are supported for RA Guard:

- Port-based filtering using device role (host or router)
- Source IPv6 based filtering
- Advertised IPv6 prefix-based filtering
- Source MAC address-based filtering
- RA packet for managed address configuration flag validation
- RA packet for hop count limit validation
- RA packet for Router Preference validation

Port-based Filtering Using Device-role

This configuration is an interface-level configuration. According to Neighbor Discovery (ND) RFC 4861, only the IPv6 router can generate the RA packets. By configuring the device-role attached to the port whether it is a host or router, the rogue host which is generating RA packets can be blocked. Device-role can be applied only on a port, and not on an MLT, SMLT, or VLAN. If you configure device-role on an MLT, SMLT, or VLAN, you must configure the same device-role on all the MLT, SMLT, or VLAN member ports.

In the following topology, the switch is connected to a Layer 3 router and three hosts. Because the router is directly connected to port 1/2, the device-role of the port 1/2 is configured in Router mode. The other hosts are connected to ports 1/3, 1/4, and 1/5, and the device-role of ports 1/3, 1/4, and 1/5 are configured in Host Mode.

The host connected to the port 1/4 is a rogue host and if it is trying to send RA packets, then the switch drops those RA packets received on the interface 1/4 as the device-role of this port is Host Mode.

Figure 174: RA Guard Topology1

IPv6 Source Address Based Filtering

An IPv6 source address based filtering policy enables the source IPv6 address verification of the RA packets against the configured RA source IPv6 list.

The following figure shows the RA packet format. RA Guard policy verifies the IPv6 source address (SrcIP) in the IPv6 Header against the configured RA source IPv6 list.

Figure 175: IPv6 ICMP RA Data Packet Outline

Advertised IPv6 Prefix-based Filtering

Advertised IPv6 prefix-based filtering enables verification of the advertised prefixes in inspected messages against the configured RA prefix list.

The following figure illustrates the IPv6 ICMP RA data packet outline. This RA Guard policy verifies the RA (Prefix Information) in ICMPv6 data against the configured RA prefix list.

Figure 176: IPv6 ICMP RA Data Packet Outline

Source MAC Address-based Filtering

Source MAC address-based filtering enables the source MAC address of the RA packets verification against the configured authorized MAC list.

The following figure illustrates the IPv6 Ethernet packet. This RA Guard policy verifies the received RA packets source MAC address against the configured authorized MAC access list.

Figure 177: IPv6 Ethernet Packet

RA packet for managed address configuration flag validation

In the RA packets, there is an “M” flag (managed address configuration flag) that can be configured to indicate that the address assignments are available through DHCPv6. This means that DHCPv6 takes care of the interface address assignment in that LAN segment. If a filtering policy is enabled, then all the RA packets without an “M” flag are dropped. By default, this validation is not performed.

The following figure illustrates IPv6 ICMP RA data packet outline for managed address configuration.

Figure 178: IPv6 ICMP RA data packet outline

RA packet for hop count limit validation

RA packet for hop count limit validation policy verifies the advertised RA message if the hop count limit is within the configured hop count limit. If the received hop count limit is not within the configured limit, then those RA packets are dropped.

The following figure illustrates IPv6 ICMP RA data packet outline for hop count limit validation.

Figure 179: IPv6 ICMP RA data packet outline

RA packet for router preference validation

The RA packet contains the Router Preference as part of the flags field. This can be high, medium, or low. This filtering policy option verifies if the advertised default router preference parameter value is lower than or equal to a specified limit.

The following figure illustrates IPv6 ICMP RA data packet outline for router preference validation.

Figure 180: IPv6 ICMP RA data packet outline for router preference validation

Capturing and verifying FHS specific packets against the configured policies

First Hop Security filters can be installed only if FHS is enabled globally. The DHCPv6 Guard or RA Guard filters are created as a part of First Hop Security filter with port bit mask “0”.

The following list identifies the high-level tasks to capture DHCPv6 packets received on a physical port:

1. Enable FHS globally.
2. Enable DHCPv6 Guard or RA Guard globally.
3. Create a DHCPv6 Guard or an RA Guard policy.
4. Configure RA Guard or DHCPv6 Guard device role on the port.
5. Attach DHCPv6 Guard and/or RA Guard policy to a physical port if needed.

On configuring RA Guard or DHCPv6 Guard device role on the port, the appropriate port bitmask for that port will be updated in the data path filter.

The RA or DHCPv6 sever initiated packets received on trusted ports (router or server ports) will be sent to the local CPU for further validations. If these packets pass the RA Guard and DHCPv6 Guard validation, they will be forwarded towards the intended host or DHCPv6 client; if not, they will be dropped by the switch.

FHS limitations

The following limitations exist in First Hop Security:

- Fragmented RA and DHCPv6 server initiated packets are dropped on the FHS enabled switch.
- DHCPv6 Guard and RA Guard do not work on devices connected on shared media or on tunneled interfaces.

- DHCPv6 Guard or RA Guard policies are not VLAN or MLT based.
- FHS is not supported on the Out Of Band (OOB) port on the switch.
- Packets received on FHS ports with more than one extension header, and if they are destined to link-local unicast or link-scope multicast address, are dropped as they cannot be classified as RA or DHCPv6 reply packets.
- The FHS functionality can be bypassed at the first hop switch, if the malicious packets are destined to global address, and have more than one extension header.
- If the FHS rules and IPv6 filters match for a packet, the IPv6 filter has precedence.
- In a Layer 2 VSN, packets are not filtered based on FHS rules. Enable FHS on the required UNI ports to protect the connected devices from FHS attacks.

Guidelines for FHS configuration

Some of the FHS configurations need details on how they work and how they should be used. Following are the details:

1. FHS IPv6 Access lists are generic access/prefix lists which can be applied on IPv6 source address or the prefixes advertised in RA or DHCPv6 messages. If you filter on the basis of a particular IPv6 source address, you must configure the access list entry with complete source address with prefix-length value of 128. If you allow a group of source addresses within a prefix range, you must configure the IPv6 ACL entry with an appropriate prefix length and attach this IPv6 ACL to the appropriate match parameters in RA Guard or DHCPv6 Guard policies.

If you filter a particular prefix, you must configure an IPv6 access list entry with appropriate prefix and prefix-lengths. To filter based on prefix, prefix-lengths should be less than 128. Following is an example of IPv6 access list entry:

```
ipv6 fhs ipv6-access-list match_src_allow fe80:0:0:0:0:ff:fe00:113/128
mode allow
```

Note

- a. If no IPv6 ACL is attached to an RA Guard or DHCPv6 Guard policy as a source ACL, then IPv6 source address in the incoming RA packets or packets from DHCP server will not be validated, and such packets will not be dropped due to source address validations.
 - b. If no IPv6 ACL is attached to an RA Guard or DHCPv6 Guard policy as a prefix ACL, then prefix information in incoming RA packets or packets from DHCP server will not be validated and these packets will not be dropped due to prefix validations.
 - c. The FHS access or prefix lists are different from IPv6 prefix lists. For FHS, the switch maintains a separate list (cannot reuse IPv6 prefix lists) as IPv6 prefix lists do not have any action associated with them, whereas FHS has an action associated with each ACL entry.
2. When an IPv6 ACL is attached to an RA Guard or DHCPv6 Guard policy and the address or prefix in the incoming RA Guard or DHCPv6 server packets received on port to which this RA Guard or DHCPv6 Guard policy is attached does not match any of the entries in that IPv6 ACL, the packet will be dropped by default. If you want to change this behavior to default (allow, for IPv6 ACLs), you can add an entry that matches all the packets and set the action as allow. To do this, use the following command:

```
ipv6 fhs ipv6-access-list no_match_src_def_allow 0:0:0:0:0:0:0:0/0
mode allow
```

3. IPv6 ACL entries with conflicting prefixes within an IPv6 ACLs are not allowed, and such configuration will fail with appropriate error message. Conflicting entries can be present in two or more different IPv6 ACLs.
4. The entries within an IPv6 ACL will be sorted in increasing order of IPv6 prefixes. If there are two entries with same prefix address within an ACL, then such entries will be ordered with increasing value of their prefix-lengths.
5. MAC ACL entries are ordered in the increasing order of MAC addresses within a MAC ACL. If none of the entries in the MAC ACL match the source MAC address of RA packet, then the packet will be dropped by default. If no MAC ACL is attached to an RA Guard policy, then the source MAC address of RA packets is not validated.
6. When matching for a prefix using IPv6 ACL entry, if you advertise a prefix with matching prefix but prefix-length lesser than configured prefix-length, then the packet has to be considered as no match and prefix matching process has to continue with remaining IPv6 ACL entries in that ACL.

The rationale behind this functionality is to avoid wrong configuration of access side devices. This functionality safeguards the devices in an access network if a wrongly configured IPv6 prefix is advertised or a malicious user is sending invalid (wrong) prefixes. For example, consider the following scenario:

Configure the prefix in ACL entry (without ge and le values): **ipv6 fhs ipv6-access-list ipv6_acl_entry_1 2001:0123:4567:89ab::/64 mode allow**

Advertise the prefix in RA packet: **2001:0123:4567:89ab::/48**

This advertised prefix matches the configured IPv6 ACL entry and without this prefix-length check functionality, the packet is allowed to pass through. But, actually it is configuring all access devices in that network with wrong IPv6 configurations in different IPv6 network (**2001:0123:4567::/48**)

With prefix-length check functionality (explained above), this configuration is not allowed as advertised prefix length is not equal to configured prefix length. So, the wrong configurations of access devices is avoided.

7. Importance of “ge” and “le” parameters in an IPv6 ACL entry:

A user can optionally configure “ge” (greater than or equal to) and “le” (lesser than or equal to) parameters while configuring an IPv6 ACL entry. If the prefix advertised in a packet matches the configured prefix in an IPv6 ACL entry, and “ge” and “le” values are configured (not default) for that IPv6 ACL entry:

- The packet will be allowed to go through only if the prefix-length in the packet is within the range of configured “ge” and “le” values.
- If prefix lengths in the packet are not within the configured range of “ge” and “le” values (non-default values), then the packets would be considered as no match for that IPv6 ACL entry and search for matching IPv6 ACL entry continues within that IPv6 ACL.
- If no ge and le values are configured, those values by default are set to configured prefix length in that IPv6 ACL entry.
- ge and le values are allowed only if they are greater than configured prefix.
- When both are configured (not default values), ge value should always be smaller than le value.

These configurations provide more control over the advertised prefixes in RA or DHCPv6 packets.

8. As “ge” and “le” values are valid only for advertised prefixes, they will not be applied to IPv6 addresses, which are not prefixes. For such addresses, prefix match is considered as match for that IPv6 ACL entry and the corresponding action of that ACL entry is applied on that packet. “ge” and “le” configurations are irrelevant for the following:

- IPv6 source address in RA packet
- IPv6 source address in packets from DHCPv6 server (like DHCPv6 advertise, DHCPv6 reply)
- IPv6 address (temporary or non-temporary) advertised in packets from DHCPv6 server. For example, IPv6 addresses advertised in IANA option of DHCPv6 reply packets

9. Order of packet validations:

In RA or DHCPv6 packets received at the CP for FHS processing, the following order of processing is carried out:

- a. Packet parsing
- b. Checking for presence of IPv6 fragment header
- c. Checking if packets are RA packets or DHCPv6 packets from server (Advertise, Reply, Reconfigure, Relay-Reply)
- d. Basic validations:
 - Non-Link-Local source IPv6 address (only for RA packets)
 - L4 length validations
 - Checksum validations
- e. If an RA Guard or DHCPv6 Guard policy is attached to a port:
 - MAC ACL validations (if configured) (Only for RA packets)
 - IPv6 source address ACL validation (if configured)
 - IPv6 prefix ACL validations (if configured)
 - Other packet parameter validations like:
 - Managed config flag (RA)
 - ICMP hop limit (RA)
 - Router preference (RA)
 - Server preference (DHCPv6)

If any of these validations fail or if action associated with a match ACL entry indicates to DROP (or default drop if ACL is attached to corresponding policy but packet does not match any ACL entry in that ACL), then the packets are dropped and corresponding statistics are updated. If all these pass or actions related to all matched ACL entries are PERMIT, then the packet is allowed to go through.

10. Longest prefix match: If a packet matches multiple entries in an ACL, then the action associated with an entry with longest prefix match would be applied on the packet.
11. If a port is configured as untrusted (“host” as device role for RA Guard or “client” as device role for DHCPv6 Guard), all the FHS trusted traffic (RA packets for RA Guard or packets from DHCPv6 server for DHCPv6 Guard) are dropped in data path itself. Also for such drops, statistics are not incremented.

If a port is neither configured as trusted nor untrusted, then the FHS traffic (RA packets or DHCPv6 packets from DHCPv6 server) is switched as if FHS is not present.

12. Creation of FHS port policy mappings:

Until, and unless, any of the FHS parameters are configured on a port, port policy mappings are not created and thus with no port to policy mapping configured, no entries appear while listing port policy mappings using the command **show ipv6 fhs port-policy**.

13. If a RA Guard or DHCPv6 Guard policy is attached to any of the ports, deletion of such policy is not allowed. In the contrary, to delete an RA Guard or DHCPv6 Guard policy, those policies need to be detached from all the ports in the switch. However, modification of an RA Guard or DHCPv6 Guard policy is allowed even if it is attached to ports.

14. If a MAC or IPv6 ACL is attached to an RA Guard or DHCPv6 Guard policy, you cannot delete the ACL itself. You can delete the entries from this policy even if it is attached to any policy. At least one entry needs to exist in a MAC or IPv6 ACL; you cannot delete the last entry in that ACL if that ACL is attached to any RA Guard or DHCPv6 Guard policy. You must detach that ACL from all the policies to delete that ACL. However, you can update the entries in that ACL even if it is attached to a policy.

If a port is configured as trusted (“Server” port for DHCPv6 Guard and “Router” port for RA Guard), then only one can attach a DHCPv6 Guard or RA Guard policy to that port. In the contrary, if any policy is attached to a port, the port role cannot be changed from trusted (“Server” port for DHCPv6 Guard and “Router” port for RA Guard) to other role (“Client” port for DHCPv6 Guard, “Host” port for RA Guard or “None” for both) until that policy is not detached from port.

DHCP Snooping and Neighbor Discovery inspection

DHCP Snooping

DHCP Snooping is a Layer 2 security feature, that provides network security by filtering untrusted DHCP messages received from the external network causing traffic attacks within the network. DHCP Snooping is based on the concept of trusted versus untrusted switch ports. Switch ports configured as trusted can forward DHCP Replies, and the untrusted switch ports cannot. DHCP Snooping acts like a firewall between untrusted hosts and DHCP servers.

**Note**

The switch supports:

- DHCP Snooping for both IPv4 and IPv6.
- Neighbor Discovery (ND) inspection for IPv6.

Security is critically important in an access network because various devices can connect to an access network that may not be administratively controlled by a single administrator. Stateless Address Autoconfiguration (SLAAC) and Duplicate Address Detection (DAD) mechanisms used by IPv6 are more vulnerable to attacks from a malicious user. If any person, intentionally or unintentionally, configures an IP address on the device interface wrongly and advertises that IP address as one's own address during DAD mechanism initiated by other device, DAD initiated devices cannot assign this

address. If a malicious user replies to all the DAD IP addresses as own address, none of the devices in the access network can assign any IP addresses to their interfaces. Thus, DoS attacks can be easily carried out by the malicious user making the entire network unfunctional. In another kind of attack, a malicious user can try to poison the neighbor cache of a host by sending ND packets with bogus MAC address which is learnt by other hosts into their neighbor table. Due to the infiltration of the bogus MAC address in the host's neighbor table, the packets destined to its neighbor is sent to the bogus MAC address and is eventually dropped or received by an unintended host.

In general, these kinds of attacks are carried out by sending different Neighbor Discovery (ND) packets – either through solicited ND packet exchanges or as a result of unsolicited ND packet exchanges triggered due to an event like the expiry of ND timers. These packets carry interface IP address information and link-layer address information. Other devices use this information to build their neighbor table for forwarding traffic to or through the malicious device. As part of ND inspection mechanism, ND (specifically, NS, NA, and redirect) packets from only trusted hosts are allowed to pass through and the packets from un-trusted hosts are dropped in the switch itself. Other network devices can safely use ND mechanisms for correctly assigning IP address to their interfaces resulting in a smooth traffic flow.

For validating the ND packets, the switch must first learn the trusted information by various mechanisms and store the information in a DHCP binding table. If the switch receives ND packets on an untrusted port, the packets are validated against entries in the DHCP binding table. If the ND packets pass the validation, the packets are forwarded. If the packets fail the validation, they are dropped in the switch itself. This process avoids invalid NA packets from propagating beyond the access switch.

DHCP Snooping and ND inspection feature protects the network from the following types of attacks:

- **User misconfigurations:** Host assigns an address which should not be used by the recipient device. ND inspection blocks this address in the access switch because binding entry does not exist for that address for that host.
- **DAD spoofing:** Malicious user claims that the address is taken even if it is not.
- **NUD spoofing:** Malicious host responds to NUD NS packets indicating that the address is still reachable via that host even if that neighbor is actually not reachable.
- **ND cache poisoning:** Malicious user sends different (invalid) link-layer addresses for a target IP address causing other hosts in the network to program bogus MAC for a given IP neighbor, as a result of which, the traffic gets black-holed or misused by malicious host.

DHCP Binding Table

DHCP Snooping builds and maintains a binding table, this binding table contains the MAC address, IP address, lease time, binding type, VLAN number, and port information that correspond to the local untrusted ports of the switch. When the switch receives a DHCPRELEASE or DHCPDECLINE broadcast message, DHCP Snooping performs a lookup of the MAC address in the binding table to determine if the port information in the binding table matches the port on which the message was received. If the port information matches, the DHCP packet is forwarded, otherwise it is dropped.

Trust Bindings

A switch enabled with the Neighbor Discovery inspection feature allows NA packets through, if the packets are from a trusted host. To allow or deny Neighbor Advertisement (NA) packets, trust bindings must be established using following methods:

- Configuring the port connected to a device (or host) as trusted.

- Building a DHCP binding table which contains entries from trusted devices (or hosts) only. This DHCP binding table is used for validating NA packets.

This method of trust binding involves 2 processes:

- IP address learning (snooping) process

In this process an IP address is learnt through a trusted means and a DHCP binding table is built. The switch supports the DHCP binding table entry learning by:

- Statically configuring the entries
 - Dynamically learning by DHCP Snooping packets
- NA packet validation (inspection) process

This process uses the DHCP binding table entries which are populated as part of IP address learning process to validate the incoming NA packets.

After the DHCP binding tables are built, the information gathered using trust binding is used to validate the ND packets. If the ND packets cannot be validated using this information, they are considered as packets received from an un-trusted host and are dropped by the switch.

Restrictions

In addition to the FHS restrictions, DHCP Snooping and ND inspection have the following restrictions:

- Link-local address validation is not supported under ND inspection. Thus, an FHS enabled switch is vulnerable to attackers who try to attack with link-local addresses.
- As a 5-second timer is used to cleanup expired DHCP binding table entries, the expired DHCP binding table entries may remain in the DHCP binding table for up to 5 seconds after they expire.
- If a FHS-enabled switch gets rebooted, all the dynamically-learned binding entries get flushed and those entries need to be re-learned for ND inspection to pass. However, when the switch is rebooted, DHCP clients connected to it do not re-initiate DHCP learning, due to which, the switch cannot learn these assigned IP addresses. As a result, ND inspection fails for these addresses. To overcome this problem either DHCP client must learn the IP address again through DHCP mechanisms or the administrator must add static entries for these addresses.
- For IPv6, DHCP binding table entries learned through DHCP are not removed from the DHCP table on DHCP clients that release these addresses. The administrator must manually remove these entries once the addresses are released.
- A dynamic DHCP binding table entry is learned only using the DHCP mechanism. For other modes of address configuration on the host, a relevant DHCP binding table entry must be configured on the FHS switch so that ND packets from such host are not blocked due to ND inspection processing.
- DHCP Snooping is not supported on:
 - DHCP Relay
 - Etree
 - Private VLANs
 - Split Multi-Link Trunking (SMLT)

IP Source Guard

Table 233: IP Source Guard product support

IP Source Guard (IPSG) is a Layer 2 port-to-port feature that works closely with DHCP Snooping. It prevents IP spoofing by allowing only IP addresses obtained using DHCP Snooping. When you enable IPSG on an untrusted port with DHCP Snooping enabled, an IP filter is automatically created or deleted for that port based on the information stored in the corresponding DHCP Snooping binding table entry. When a connecting client receives a valid IP address from the DHCP server, the filter installed on the port allows traffic only from that assigned IP address.

You can configure IPSG on a port using the command line interface (CLI), the Enterprise Device Manager (EDM), or SNMP.

Note

The switch supports configuration of IP Source Guard for both IPv4 and IPv6 addresses.

Important

If you enable Application Telemetry, IPv6 Source Guard commands and configurations are blocked and not available on VSP 4450 Series, VSP 4900 Series, VSP 7200 Series, and VSP 8000 Series switches.

The following table shows you how IPSG works with DHCP Snooping.

Table 234: IP Source Guard and DHCP snooping

| IP Source Guard configuration state | DHCP snooping configuration state | DHCP snooping Binding Entry action (untrusted ports) | IP Source Guard action |
|-------------------------------------|-----------------------------------|--|---|
| change from disabled to enabled | enabled | creates a binding entry | creates a filter for the IP address using the IP address from the binding table entry |
| enabled | enabled | creates a binding entry | creates a filter for the IP address using the IP address from the binding table entry |
| enabled | enabled | deletes a binding entry | deletes the IP filter and installs a default filter to block all IP traffic on the port |
| enabled | enabled | deletes binding entries when one of the following conditions occur: <ul style="list-style-type: none"> • a DHCP release packet is received • the port link is down • the lease time has expired • the port is removed from the VLAN • the VLAN is deleted • the port is set as trusted • the binding entries are manually deleted | deletes the corresponding IP filter and installs a default filter to block all IP traffic |
| change from enabled to disabled | enabled | not applicable | deletes the installed IP filter for the port |
| disabled | enabled | creates a binding entry | not applicable |
| disabled | enabled | deletes a binding entry | not applicable |

IPSG Limitations

- You can enable IP Source Guard (IPSG) only on a port that is DHCP Snooping and Dynamic ARP Inspection untrusted.
- The port must be a member of a VLAN. DHCP Snooping must be enabled globally and on the VLAN. You must also enable Dynamic ARP Inspection on the same VLAN.
- You cannot enable IPSG on MLT, SMLT, DMLT or LAG ports.
- You cannot enable IPSG on a brouter port.
- You cannot enable IPSG on ports that are members of a private VLAN.

- You cannot remove a port that is IPSG enabled from a VLAN. Similarly, you cannot delete a VLAN that has at least one port that is IPSG enabled.
- A maximum of 10 IP addresses are allowed on each IPSG enabled port. Correspondingly, a maximum of 10 IP filters are automatically created for each of those ports. When this number is reached, no more filters are set up and all traffic is dropped.
- On the switch, the total number of IP filters must not exceed 256. This limit includes both IP filters that are automatically created on IPSG ports and the manually created ACLs.
- IPv6 Security Filters and IPv6 Source Guard cannot coexist with Application Telemetry:
 - If there are IPv6 Security Filters or IPv6 Source Guard configurations on the system, the switch blocks you from enabling Application Telemetry.
 - If you do enable Application Telemetry, the switch blocks you from configuring IPv6 Security Filters or IPv6 Source Guard.

**Note**

This restriction applies to the VSP 4450 Series, VSP 7200 Series, and VSP 8000 Series platforms only.

Layer 2 Security Configuration Using the CLI

Use the following sections to help you configure Layer 2 security features and protect the network by mitigating various types of attacks, using the Command Line Interface (CLI).

For IPv4 deployments, configure:

- DHCP Snooping
- Dynamic ARP Inspection
- IP Source Guard for IPv4 addresses

For IPv6 deployments, configure:

- First Hop Security (FHS)

**Note**

FHS does not solve all cases of denial of services like blocking flooding of the IPv6 messages.

- DHCP Snooping and IPv6 Neighbor Discovery Inspection
- IP Source Guard for IPv6 addresses

DHCP Snooping Configuration Using CLI

The following section provides procedures to configure DHCP Snooping using the CLI.

Enable or Disable DHCP Snooping globally

Use the following procedure to enable DHCP Snooping globally. If DHCP Snooping is globally disabled, the switch forwards DHCP reply packets to all required ports, both trusted or untrusted.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable DHCP Snooping globally:

```
ip dhcp-snooping enable
```
3. Disable DHCP Snooping globally:

```
no ip dhcp-snooping enable
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ip dhcp-snooping enable
```

Variable Definitions

The following table defines parameters for the **ip dhcp-snooping** command.

| Variable | Value |
|---------------|--|
| <i>enable</i> | Enables or disables DHCP Snooping globally. By default, DHCP Snooping is disabled. |

Enable or Disable DHCP Snooping on a VLAN

Use the following procedure to configure DHCP Snooping on a specific VLAN. If DHCP Snooping is globally disabled, the switch forwards DHCP reply packets (received on trusted or untrusted ports) to all ports.

If you enable DHCP Snooping globally, the agent determines whether to forward DHCP reply packets based on the DHCP Snooping mode of the VLAN and trusted state of the port.

Note

You cannot enable DHCP Snooping on Private VLANs (E-Tree) and SPBM B-VLANs.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```
2. Enable DHCP Snooping on the VLAN:

```
ip dhcp-snooping enable
```

3. Disable DHCP Snooping on the VLAN:

```
no ip dhcp-snooping enable
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 5
Switch:1(config-if)#ip dhcp-snooping enable
```

Variable Definitions

The following table defines parameters for the **ip dhcp-snooping** command.

| Variable | Value |
|---------------|--|
| <i>enable</i> | Enables or disables DHCP Snooping on the specified VLAN. |

Configure Trusted and Untrusted Ports

Use the following procedure to set the trust factor associated with a port for DHCP Snooping. By default, the trust factor is set to untrusted.

Note

For ports that are members of an MLT, DHCP Snooping must be configured using the MLT configuration mode.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface mlt <1-512>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Set the trust factor for the port:

```
ip dhcp-snooping <trusted|untrusted>
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#ip dhcp-snooping trusted
```

Variable Definitions

The following table defines parameters for the **ip dhcp-snooping** command.

| Variable | Value |
|---------------------|---|
| <trusted untrusted> | Specifies the trust factor of the port for DHCP Snooping. |

Display DHCP Snooping Global Configuration

Use the following procedure to display the global status of DHCP Snooping configuration.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the global configuration:

```
show ip dhcp-snooping
```

Example

```
Switch:1>show ip dhcp-snooping
=====
                        Dhcp Snooping General Info
=====
Dhcp Snooping                : Enabled
=====
```

Display DHCP Snooping Interface Information

Use the following procedure to view the DHCP Snooping interface information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display DHCP Snooping brouter port information:

```
show ip dhcp-snooping interface [ gigabitEthernet [ {slot/port[/sub-
port] [-slot/port[/sub-port]] [,...]} [ vrf WORD<1-16> | vrfids
WORD<0-512> ] | <1-4059> [ {slot/port[/sub-port] [-slot/port[/sub-
port]] [,...]} [ vrf WORD<1-16> | vrfids WORD<0-512> ] | vrf
WORD<1-16> | vrfids WORD<0-512> ] | vrf WORD<1-16> | vrfids
WORD<0-512> ] ]
```

3. Display DHCP Snooping VLAN information:

```
show ip dhcp-snooping vlan <1-4059>
```

4. Display DHCP Snooping information for specific VRF name:

```
show ip dhcp-snooping vrf WORD<1-16>
```

5. Display DHCP Snooping information for specific VRF ID:

```
show ip dhcp-snooping vrfids WORD<0-512>
```

Example

```
Switch:1>show ip dhcp-snooping interface gigabitEthernet
=====
                        Dhcp Snooping Interface Info
=====
```

| PORT

```
All 1 out of 3 Total DHCP Snooping binding entries displayed
```

Add Static Entries to DHCP Snooping Binding Table

Use the following procedure to add devices with a specified MAC address to the DHCP Snooping binding table.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Add the static entry to the DHCP Snooping binding table:

```
ip dhcp-snooping binding <1-4059> 0x00:0x00:0x00:0x00:0x00:0x00 ip
{A.B.C.D} port {slot/port[sub-port]} [expiry <0-2147483646>]
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)# ip dhcp-snooping binding 1 00-14-22-01-23-45 ip 10.10.10.01 port 1/2
expiry 2
```

Variable Definitions

The following table defines parameters for the **ip dhcp-snooping binding** command.

| Variable | Value |
|--|--|
| <1-4059> | Specifies the VLAN ID. |
| 0x00:0x00:0x00:0x00:0x00:0x00 | Specifies the MAC address of the DHCP client. |
| ip {A.B.C.D} | Specifies the IP address of the DHCP client. |
| port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]} | Specifies the switch port to which the DHCP client connects. |
| expiry <0-2147483646> | Specifies the expiry time (in seconds) for the DHCP client. |

Clear Entries from DHCP Snooping Binding Table

Use the following procedure to clear entries (static or dynamic) from the DHCP Snooping binding table.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Enter:

```
clear ip dhcp-snooping binding [dynamic|static]
```

Example

```
Switch:1>enable
Switch:1#clear ip dhcp-snooping binding static
```

Variable Definitions

The following table defines parameters for the **clear ip dhcp-snooping binding** command.

| Variable | Value |
|----------------|--|
| <i>static</i> | Clears static entries from the DHCP Snooping binding table. |
| <i>dynamic</i> | Clears dynamic entries from the DHCP Snooping binding table. |

Display DHCP Snooping Binding Table Information

Use the following procedure to display the DHCP Snooping binding table, you can filter the entries displayed based on the type, port, or VLAN.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display all binding entries:

```
show ip dhcp-snooping binding
```
3. Display binding entries based on the MAC address or IP address:

```
show ip dhcp-snooping binding address [0x00:0x00:0x00:0x00:0x00:0x00 | {A.B.C.D}]
```
4. Display binding entries configured on the ports:

```
show ip dhcp-snooping binding interface [gigabitEthernet{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```
5. Display binding entries configured on the VLANs:

```
show ip dhcp-snooping binding vlan <1-4059>
```
6. Display binding entries configured on a specific VRF:

```
show ip dhcp-snooping binding vrf WORD<1-16>
```
7. Display binding entries configured on a specific VRF ID:

```
show ip dhcp-snooping binding vrfids WORD<0-512>
```
8. Display a summary of the DHCP Snooping binding table:

```
show ip dhcp-snooping binding summary [<1-4059>] [vrf WORD<1-16>] [vrfids WORD<0-512>] [{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```
9. Display binding entries based on the type of entry:

```
show ip dhcp-snooping binding type [dynamic|static]
```

Example

```
Switch:1>show ip dhcp-snooping binding

Dynamic ARP Inspection Configuration Using CLI

The following section provides procedures to configure Dynamic ARP Inspection (DAI) using CLI.

Enable or disable Dynamic ARP Inspection on a VLAN

You must enable DAI separately for each VLAN. When you enable DAI on a specific VLAN, the ARP packets are captured and inspected on that VLAN. DAI is disabled by default.

Note

DAI cannot be enabled on Private VLANs (E-Tree) and SPBM B-VLANs.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable

configure terminal

interface vlan <1-4059>
```
2. Enable DAI on the VLAN:

```
ip arp-inspection enable
```
3. Disable DAI on the VLAN:

```
no ip arp-inspection enable
```

Example

```

Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 5
Switch:1(config-if)#ip arp-inspection enable

```

Variable Definitions

The following table defines parameters for the **ip arp-inspection** command.

| Variable | Value |
|---------------|--|
| <i>enable</i> | Enables or disables DAI on the specified VLAN. |

Configuring Trusted and Untrusted Ports

Use the following procedure to set the trust factor associated with a port for DAI. By default, the trust factor is set to untrusted.

Note

For ports that are part of an MLT, DAI must be configured using the MLT configuration mode.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]} or interface mlt <1-512>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Set the trust factor for the port:

```
ip arp-inspection <trusted|untrusted>
```

Example

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface gigabitEthernet 1/2  
Switch:1(config-if)#ip arp-inspection trusted
```

Variable Definitions

The following table defines parameters for the **ip arp-inspection** command.

| Variable | Value |
|----------------------------------|---|
| <i><trusted untrusted></i> | Specifies the trust factor of the port for DAI. |

Display Dynamic ARP Inspection Interface Information

Use the following procedure to view the DAI interface information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display DAI brouter port information:

```
show ip arp-inspection interface [ gigabitEthernet [ {slot/port[/sub-
port] [-slot/port[/sub-port]] [,...]} [ vrf WORD<1-16> | vrfids
WORD<0-512> ] | <1-4059> [ {slot/port[/sub-port] [-slot/port[/sub-
port]] [,...]} [ vrf WORD<1-16> | vrfids WORD<0-512> ] | vrf
WORD<1-16> | vrfids WORD<0-512> ] | vrf WORD<1-16> | vrfids
WORD<0-512> ] ]
```
3. Display DAI VLAN information:

```
show ip arp-inspection vlan <1-4059>
```
4. Display DAI information for specific VRF name:

```
show ip arp-inspection vrf WORD<1-16>
```
5. Display DAI information for specific VRF ID:

```
show ip arp-inspection vrfids WORD<0-512>
```

Example

```
Switch:1>show ip arp-inspection interface gigabitEthernet 1/2
```

```

```

FHS configuration

Configure IPv6 FHS features to enable IPv6 link security and management over the Layer 2 links.

Enable or Disable FHS Globally

About This Task

You must enable First Hop Security globally for RA Guard or DHCPv6 Guard to be operational.

Enabling FHS globally installs the required filters for FHS. Disabling FHS, uninstalls these filters. By default, FHS is disabled.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Enable First Hop Security globally:

```
ipv6 fhs enable
```
3. Disable First Hop Security globally:

```
no ipv6 fhs enable
```

OR

```
default ipv6 fhs enable
```

Managing the FHS IPv6 access list

About This Task

You can create an FHS IPv6 access list or add IPv6 prefixes to an existing IPv6 access list.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Create an FHS IPv6 access list or add IPv6 prefixes to an existing IPv6 access list:

```
ipv6 fhs ipv6-access-list [WORD<1-64>] [WORD<0-46>] [ge<0-128>] [le
<0-128>] [mode <allow | deny>]
```
3. Delete an FHS IPv6 access list or delete a particular IPv6 prefix from the IPv6 access list:

```
no ipv6 fhs ipv6-access-list [WORD<1-64>] [WORD<0-46>]
```

- Set the ge/le values and mode of the FHS IPv6 access list to default value:

```
default ipv6 fhs ipv6-access-list [WORD<1-64>] [WORD<0-46>] [ge|le|
mode]
```

Example

```
Switch>enable
Switch#config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#ipv6 fhs ipv6-access-list ipv6_acl_1 fe80::221:2fff:fe31:5376/64
Switch(config)#
```

Variable Definitions

The following table defines parameters for the **ipv6 fhs ipv6-access-list** command.

| Variable | Description |
|----------------------------------|--|
| <i>WORD<1-64></i> | Specifies the IPv6 access list name. |
| <i>WORD<0-46></i> | Specifies the IPv6 address or the prefix length to be added to the IPv6 access list. |
| <i>ge <0 -128></i> | Specifies the minimum value of prefix length advertised in prefix information of RA or DHCPv6 packets.
By default, the value is equal to the configured prefix length.

Note:
If you manually configure the value, ensure that it is greater than the configured prefix length. Also ensure, the ge value is always less than the le value. |
| <i>le <0 -128></i> | Specifies the maximum value of prefix length advertised in prefix information of RA or DHCPv6 packets.
By default, the value is equal to the configured prefix length.

Note:
If you manually configure the value, ensure that it is greater than the configured prefix length. |
| <i>mode <allow deny></i> | Specifies the access mode.
By default, the value is allow. |

Displaying FHS IPv6 access list information

About This Task

Displays the current FHS IPv6 access list information.

Procedure

- Enter Privileged EXEC mode:

```
enable
```
- Display the current FHS IPv6 access list information:

```
show ipv6 fhs ipv6-access-list [WORD<1-64>]
```

Example

```
Switch:1# show ipv6 fhs ipv6-access-list

=====
                        IPv6 FHS Access List Table Info
=====
ACC-LIST-NAME          IPV6-PREFIX                MASK-RANGE
                        MASK FROM TO      MODE
-----
v6_acl1                1:0:0:0:0:0:1            64  64  64  Allow

-----

All 2 out of 2 Total Num of ipv6 access list entries displayed
```

Job aid

The following table shows the field descriptions for the **show ipv6 fhs ipv6-access-list** command.

| Field | Description |
|------------------|---|
| Access list name | Indicates the IPv6 access list name. |
| ipv6_prefix | Indicates the IPv6 prefix added to the IPv6 access list. |
| mask_len | Indicates prefix mask length added to the IPv6 access list. |
| mask_range_from | Indicates the IPv6 range start mask length. |
| mask_range_to | Indicates the IPv6 range end mask length. |
| mode | Indicates the access mode. |

*Managing the FHS MAC access list***About This Task**

You can create an FHS MAC access list or add MAC addresses to an existing MAC access list.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Create an FHS MAC access list or add MAC addresses to an existing MAC access list:

```
ipv6 fhs mac-access-list WORD<1-64> <0x00:0x00:0x00:0x00:0x00:0x00>
[mode <allow | deny>]
```
3. Delete an FHS MAC access list or delete a particular MAC address from the MAC access list:

```
no ipv6 fhs mac-access-list WORD<1-64> <0x00:0x00:0x00:0x00:0x00:0x00>
```
4. Set the MAC ACL mode to its default value:

```
default ipv6 fhs mac-access-list WORD<1-64>
<0x00:0x00:0x00:0x00:0x00:0x00> [mode]
```

Variable Definitions

The following table defines parameters for the **ipv6 fhs mac-access-list** command.

| Variable | Description |
|--|--|
| <i>WORD</i> <1-64> | Specifies the MAC access list name. |
| <
<i>0x00:0x00:0x00:0x00:</i>
<i>0x00:0x00</i> > | Specifies the MAC address to be added or deleted. |
| <i>mode</i> < <i>allow</i> <i>deny</i> > | Specifies the access mode.
By default, the value is Allow |

Displaying FHS MAC access list information

About This Task

Displays the current FHS MAC access list information.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. Display the current FHS MAC access list information:
`show ipv6 fhs mac-access-list [WORD<1-64>]`

Example

```
Switch#show ipv6 fhs mac-access-list
=====
IPv6 FHS Mac Access List Table Info
=====
ACC-LIST-NAME      MAC-ADDRESS      ACL-MODE
-----
List2              10:20:30:40:50:60    Allow
                   00:11:22:33:44:55    Deny
-----
All 1 out of 1 Total Num of MAC access list entries displayed
=====
```

Job aid

The following table shows the field descriptions for the **show ipv6 fhs mac-access-list** command.

| Field | Description |
|---------------|-------------------------------------|
| ACC-LIST-NAME | Indicates the MAC access list name. |
| MAC-ADDRESS | Indicates the MAC address. |
| ACL-MODE | Indicates the ACL mode. |

Displaying current FHS configuration

About This Task

Displays the current FHS configuration.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display the current FHS configuration:
show ipv6 fhs port-policy {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}

Example

```
Switch:1#show ipv6 fhs port-policy

=====
                        IPv6 FHS Port Policy Info
=====
PORT  DHCPG-DEVICE-ROLE  DHCPG-POLICY          RAG-DEVICE-ROLE  RAG-POLICY
-----
1/1   Server              dhcp_poll              Router            ra_poll
-----

All 1 out of 1 Total Num of fhs port policy entries displayed
```

Job Aid

The following table shows the field descriptions for the **show ipv6 fhs port-policy** command.

| Field | Description |
|----------------|-------------------------------------|
| PORT | Indicates the port number. |
| DHCPV6G-POLICY | Indicates the DHCPv6 policy name. |
| RA-POLICY | Indicates the RA Guard policy name. |

DHCPv6 Guard Policy Configuration

DHCPv6 Guard policy blocks DHCPv6 reply and advertisement messages that originate from unauthorized DHCPv6 servers and relay agents that forward DHCPv6 packets from servers to clients.

Enable or Disable DHCPv6 Guard Globally

About This Task

Enabling DHCPv6 Guard globally installs filters on the configured interfaces. By default, DHCPv6 Guard is disabled.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Enable FHS globally:
ipv6 fhs enable
3. Enable DHCPv6 Guard globally:
ipv6 dhcp-guard enable

4. Disable DHCPv6 Guard globally:

```
no ipv6 dhcp-guard enable
```
5. Set DHCPv6 Guard to its default value:

```
default ipv6 dhcp-guard enable
```

Manage the DHCPv6 Guard Policy

About This Task

Configure or modify the DHCPv6 Guard policy.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Create a DHCPv6 Guard policy:

```
ipv6 dhcp-guard policy WORD<1-64>
```
3. Delete a DHCPv6 Guard policy:

```
no ipv6 dhcp-guard policy WORD<1-64>
```

Note

You cannot delete a policy that is already attached to a port.

Variable Definitions

The following table defines parameters for the **ipv6 dhcp-guard policy** command.

| Variable | Description |
|-------------------------|--|
| <i>WORD<1-64></i> | Specifies the created or deleted DHCPv6 Guard policy name. |

Attach a DHCPv6 Guard Policy to a Port

About This Task

Applies a DHCPv6 Guard policy to a specific interface.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Apply a DHCPv6 Guard policy.

```
ipv6 fhs dhcp-guard attach-policy WORD<1-64>
```

3. Detach a DHCPv6 Guard policy from an interface.

```
no ipv6 fhs dhcp-guard attach-policy
```

OR

```
default ipv6 dhcp-guard attach-policy
```

4. Enable device role verification attached to the port. By default, router is selected.

```
ipv6 fhs dhcp-guard device-role {client|server} attach-policy
WORD<1-64>
```

Note

A DHCPv6 Guard policy can be attached to a port only if the device-role configured on that port is 'server'.

Variable Definitions

The following table defines parameters for the **ipv6 fhs dhcp-guard attach-policy** and **ipv6 fhs dhcp-guard device-role** command.

| Variable | Description |
|--------------------------|---|
| <i>WORD<1-64></i> | Specify the name of the DHCPv6 Guard policy to be attached or detached. |
| <i>{client server}</i> | Sets the DHCPv6 Guard device role as client or server. |

Configure DHCPv6 Guard in dhcp-guard Mode

About This Task

Configures DHCPv6 Guard under dhcp-guard mode.

Procedure

1. Enter DHCP-guard Configuration mode.
`enable`
`configure terminal`
`ipv6 fhs dhcp-guard policy WORD<1-64>`
2. Specify IPv6 access list to verify IPv6 source address of DHCPv6 packets..
`match server access-list <ipv6-access-list-name>`
3. Remove DHCPv6 Guard filtering for the sender's IPv6 addresses.
`no match server access-list`

OR

`default match server access-list`
4. Specify IPv6 prefix list to verify advertised prefixes.
`match reply prefix-list <ipv6-prefix-list-name>`
5. Remove DHCPv6 Guard filtering for advertised prefixes.
`no match reply prefix-list`

OR

`default match reply prefix-list`
6. Specify the minimum limit for verification of the advertised preference.
`preference min-limit <0-255>`
7. Set the minimum limit for verification of the advertised preference to its default value.
`default preference min-limit`
8. Specify the maximum limit for verification of the advertised preference.
`preference max-limit <0-255>`
9. Set the maximum limit for verification of the advertised preference to its default value.
`default preference max-limit`

Variable Definitions

The following table defines parameters for the **dhcp-guard** configuration mode commands.

| Variable | Description |
|---|--|
| <code>match server access-list</code>
<code><ipv6-access-list-name></code> | <p>Enables verification of the sender's IPv6 address in inspected messages from the configured authorized device source access list specified.</p> <p>Note:
If the access-list is not attached, the IPv6 source address in DHCPv6 packet is not validated.
If the list is attached and it does not match any entries in IPv6 access list, the switch drops the DHCPv6 packet. If you wish to change this behavior, add an entry with IPv6 prefix "0::0/0" with the Allow option, which changes the default drop to default Allow.</p> |
| <code>{ no default }</code>
<code>match server access-list</code> | Removes the sender's IPv6 address based DHCPv6 Guard filtering. |
| <code>match reply prefix-list</code>
<code><ipv6-prefix-list-name></code> | <p>Enables verification of the advertised prefixes in DHCPv6 reply messages from the configured authorized prefix list. If prefix-list is not configured, this check is bypassed.</p> <p>Note:
If the access-list is not attached, the inspection does not occur.
If the list is attached and advertised IPv6 address does not match any IPv6 prefixes in the list, the switch drops the DHCPv6 packet. If you wish to change this behavior, add an IPv6 access list entry with prefix 0::0/0 with the Allow option, which changes the default drop to default Allow.</p> |
| <code>{ no default }</code>
<code>match reply prefix-list</code> | Removes the advertised prefix-based DHCPv6 Guard filtering. |
| <code>preference min-limit</code>
<code><0-255></code> | <p>Enables validation of advertised preference (in preference option) to check if it is greater than the specified limit. If preference is not specified, this field in the packet is not validated.</p> <p>While changing the preference limit, ensure the maximum limit is greater than the minimum limit.</p> |
| <code>default preference min-limit</code> | Sets the specified limit to its default value.
By default, the value is 0. |
| <code>preference max-limit</code>
<code><0-255></code> | <p>Enables validation of advertised preference (in preference option) to check if it is less than the specified limit. If preference is not specified, this field in the packet is not validated.</p> <p>Note:
The preference value in the packet is not validated if both minimum and maximum values are zero.</p> |
| <code>default preference max-limit</code> | Sets the specified limit to its default value.
By default, the value is 0. |

*Display the DHCPv6 Guard Policy***About This Task**

Displays DHCPv6 Guard policy information for all the configured DHCPv6 Guard policies or a particular policy.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display DHCPv6 Guard policy information:

```
show ipv6 fhs dhcp-guard policy WORD<1-64>
```

Example

```
Switch:1# show ipv6 fhs dhcp-guard policy
=====
IPv6 DHCP Guard Policy Info
=====
POLICY-NAME          SERVER-ACC-LIST      REPLY-PREF-LIST     MIN-RTR-PREF  MAX-RTR-PREF
-----
dhcp_pol1            v6_acl1             v6_acl2              0              0
-----
All 1 out of 1 Total Num of dhcp-guard stats entries displayed
```

Variable Definitions

The following table defines parameters for the `show ipv6 dhcp-guard policy` command.

| Variable | Description |
|-------------------------------|---|
| <code>WORD<1-64></code> | Displays DHCPv6 Guard policy information for all the configured DHCPv6 Guard policies.
Policy name is an optional parameter. If policy name is provided, only the DHCPv6 Guard policy of the specified policy-name is displayed. |

Job Aid

The following table shows the field descriptions for the `show ipv6 dhcp-guard policy` command.

| Field | Description |
|-----------------|--|
| POLICY-NAME | Indicates the DHCPv6 Guard policy name. |
| SERVER-ACC-LIST | Indicates if the received DHCPv6 server packet source IPv6 address matches the configured IPv6 access list. |
| REPLY-PREF-LIST | Indicates if the advertised prefix in received DHCPv6 server packet matches the configured IPv6 access list. |
| MIN-RTR-PREF | Indicates the advertised router preference minimum limit. |
| MAX-RTR-PREF | Indicates the advertised router preference maximum limit. |

RA Guard Configuration

IPv6 RA Guard provides support to the administrator to block or reject unwanted RA Guard messages that arrive at the network switch platform. The routers use Router Advertisements (RAs) to announce themselves on the link. The RA Guard feature analyzes these RAs and filters out bogus RAs sent by unauthorized routers. The RA Guard feature compares configuration information on the Layer 2 device with the information found in the received RA frame. After the Layer 2 device validates the content of the RA packet against the configuration, it forwards the RA to its destination. If the RA packet validation fails, the RA is dropped.

Enable or Disable RA Guard Globally

About This Task

Enables RA Guard globally. By default, RA Guard is disabled.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable FHS globally:
`ipv6 fhs enable`
3. Enable RA Guard globally:
`ipv6 fhs ra-guard enable`
4. Disable RA Guard globally:
`no ipv6 fhs ra-guard enable`
5. Set the RA Guard to its default value:
`default ipv6 fhs ra-guard enable`

Manage the RA Guard Policy

About This Task

Configure or modify RA Guard policy. This command also enables the RA Guard configuration mode.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Create the RA Guard policy:
`ipv6 fhs ra-guard policy WORD<1-64>`

3. Delete the RA Guard policy:

```
no ipv6 fhs ra-guard policy WORD<1-64>
```

Note

You cannot delete a policy that is attached to a port.

Variable Definitions

The following table defines parameters for the **ipv6 fhs ra-guard policy** command.

| Variable | Description |
|-------------------------|--|
| <i>WORD<1-64></i> | Specifies the name of the RA Guard policy to be created or deleted. This is a mandatory parameter in this command. |

Configure RA Guard on an Interface

About This Task

Attaches or detaches a RA Guard policy on the specific interface.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Apply a RA Guard policy.

```
ipv6 fhs ra-guard attach-policy WORD<1-64>
```

Note

RA Guard device-role on the port has to be configured as 'router' before attaching any RA Guard policy to the port. If device-role on the port is not 'router', this command will fail with an appropriate error message.

3. Detach a RA Guard policy from an interface.

```
no ipv6 fhs ra-guard attach-policy
```

OR

```
default ipv6 fhs ra-guard attach-policy
```

4. Enable device role verification attached to the port.

```
ipv6 fhs ra-guard device-role {router|host} attach-policy WORD<1-64>
```

Note

A DHCPv6 Guard policy can be attached to a port only if the device-role configured on that port is 'server'.

Variable Definitions

The following table defines parameters for the **ipv6 fhs ra-guard attach-policy** and **ipv6 fhs ra-guard device-role** command.

| Variable | Description |
|-------------------------|---|
| <i>WORD<1-64></i> | Specifies the name of the RA Guard policy to be attached or detached. |
| <i>{host router}</i> | Sets the RA Guard device role as host or router. |

Configure RA Guard in RA Guard Mode

About This Task

Configures RA Guard in the RA Guard configuration mode.

Procedure

1. Enter RA Guard Configuration mode.

```
enable
```

```
configure terminal
```

```
ipv6 fhs ra-guard policy WORD<1-64>
```

2. Configure the filter to match the IPv6 prefixes advertised in RA packets.

```
match ra-prefix-list WORD<1-64>
```

3. Remove RA Guard filtering for the advertised prefixes.

```
no match ra-prefix-list
```

OR

```
default match ra-prefix-list
```

4. Configure the filter to match the source MAC address of RA packets.

```
match ra-macaddr-list WORD<1-64>
```

5. Remove the source MAC address-based RA Guard filtering.

```
no match ra-macaddr-list
```

OR

```
default match ra-macaddr-list
```

6. Configure the filter to match source IPv6 address of RA packets.

```
match ra-srcaddr-list WORD<1-64>
```

7. Remove the source IPv6 address based RA Guard filtering.

```
no match ra-srcaddr-list
```

OR

```
default match ra-srcaddr-list
```

8. Enable managed address configuration flag verification in the advertised RA packet.

```
managed-config-flag <none | on | off>
```

9. Enable advertised hop count limit verification.

```
hop-limit {maximum | minimum} <0-255>
```

10. Enable the advertised default router-preference parameter value verification.

```
router-preference maximum {none | high | low | medium}
```

Variable Definitions

The following table defines parameters to configure RA Guard policy.

| Variable | Description |
|---|---|
| match ra-prefix-list
<i>WORD</i> <1-64> | Verifies the advertised prefixes in RA packets against the configured authorized prefix list.

Note:
RA packet's sender IPv6 address is not validated if no IPv6 source access list is attached to the RA Guard policy.
If the list is attached and if RA packet's sender IPv6 address does not match any entry in that IPv6 prefix list, then the RA packet is dropped. To change this behavior, add a entry with ipv6 prefix "0::0/0" with Allow option. The default value changes from Drop to Allow. |
| {no default} match ra-prefix-list | Removes the advertised prefix-based RA Guard filtering |
| match ra-macaddr-list
<i>WORD</i> <1-64> | Verifies sender's source MAC address against the configured mac-access-list.

Note:
Advertised prefixes in RA packet are not validated if no IPv6 prefix list is attached to the RA Guard policy.
If the list is attached and if it does not match any MAC in the list, then the RA packet is dropped. |
| {no default} match ra-macaddr-list | Removes the source MAC address-based RA Guard filtering for the specified MAC address access list names. |
| match ra-srcaddr-list
<i>WORD</i> <1-64> | Verifies sender's source IPv6 address against the configured list.

Note:
Inspection is not done if the access-list is not attached.
If the list is attached and if it does not match any IPv6 in the list, then the RA packet is dropped. To change the behavior, add a dummy IPv6 "0:0:0:0:0" to the list with Allow option. The default value changes from Drop to Allow. |

| Variable | Description |
|--|---|
| {no default} match ra-srcaddr-list | Removes the source IPv6 address-based RA Guard filtering for the specified IPv6 address access list names. |
| managed-config-flag
<none on off> | Verifies managed address configuration flag in the advertised RA packet. By default, the value is none and check is bypassed. |
| hop-limit {maximum minimum} <0-255> | Verifies the advertised hop count limit. The limit value range is from 0 to 255. While changing the minimum or maximum value, ensure the maximum value is greater than the minimum value. By default, the minimum and maximum limit are 0. In this case, the hop-limit check is bypassed. |
| router-preference maximum {none high low medium} | Verifies if the advertised default router-preference parameter value is lower than or equal to a specified limit. By default, the value is none and the check is bypassed. |

Display RA Guard Configuration

About This Task

Display configured RA Guard policy information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display configured RA Guard policy information:

```
show ipv6 fhs ra-guard policy WORD<1-64>
```

Example

```
Switch:1# show ipv6 fhs ra-guard policy
=====
=====
                                     IPv6 Ra Guard Policy Info
=====
=====
                                     MIN-HOP  MAX-HOP
MANAGED
POLICY-NAME  RA-SRC-ADDR-LIST  RA-MAC-ADDR-LIST  RA-PREFIX-LIST  LIMIT  LIMIT  CON-FLAG  PREF
-----
Ra_guard_pol1  None              None              ac11             0      0
None          None
-----
All 1 out of 1 Total Num of ra-guard policy entries displayed
```

Variable Definitions

The following table defines parameters for the **show ipv6 fhs ra-guard policy** command.

| Variable | Description |
|------------|---|
| WORD<1-64> | Displays the RA Guard policy for the specified policy-name. By default, all the configured RA Guard policies are displayed. |

Job Aid

The following table shows the field descriptions for the **show ipv6 fhs ra-guard policy** command.

| Field | Description |
|-------------------|--|
| POL-NAME | Indicates the RA Guard policy name. |
| DEVICE-ROLE | Indicates if the device role is router or host. |
| IPv6-ACC-LIST | Indicates the IPv6 access list against which the incoming RA packet's source IPv6 address has to be validated. |
| MAC-ACC-LIST | Indicates the MAC access list against which the incoming RA packet's source MAC address has to be validated. |
| PREFIX-LIST | Specifies the IPv6 prefix list against which advertised prefix information in incoming RA packets source need to be validated. |
| MIN HOP-LIMIT | Indicates the advertised hop count minimum limit. |
| MAX HOP-LIMIT | Indicates the advertised hop count maximum limit. |
| MANAGED CONF-FLAG | Indicates the managed address configuration flag status in the advertised RA packet. |
| RTR-PREF | Indicates the advertised default router preference value. |

IPv6 Neighbor Discovery inspection configuration

This section describes how to configure ND inspection on the switch and protect the network by mitigating the various types of attacks.

Important

Enable FHS globally before enabling ND inspection.

Enabling ND inspection globally

Before You Begin

Enable FHS globally for ND inspection to work.

About This Task

Use this procedure to enable Neighbor Discovery (ND) inspection globally.

Procedure

1. Enter Global Configuration mode:

```
enable
      configure terminal
```
2. Enable ND inspection globally:

```
ipv6 fhs nd-inspection enable
```

Clear Neighbor Discovery Inspection Statistics

About This Task

Use this procedure to clear the Neighbor Discovery inspection statistics.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Clear the Neighbor Discovery inspection statistics:

```
clear ipv6 fhs statistics nd-inspection [{slot/port[/sub-port] [-slot/
port[/sub-port]] [,...]]
```

Note

Alternatively, you can use the command `clear ipv6 fhs statistics all` to clear the ND inspection statistics along with RA guard statistics and DHCPv6 Guard statistics.

Variable Definitions

The following table defines parameters for the `clear ipv6 fhs statistics nd-inspection` command.

| Variable | Value |
|--|---|
| <code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Enabling Neighbor Discovery inspection on a VLAN

Before You Begin

Enable FHS globally for ND inspection to work.

About This Task

Use this procedure to enable Neighbor Discovery inspection on a VLAN.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```

2. Enable Neighbor Discovery inspection on the VLAN:

```
ipv6 fhs nd-inspection enable
```

Enabling Neighbor Discovery inspection on a port

Before You Begin

Enable FHS globally for ND inspection to work.

About This Task

Use this procedure to enable Neighbor Discovery inspection on a port

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable Neighbor Discovery inspection on the port:

```
ipv6 fhs nd-inspection enable
```

Viewing Neighbor Discovery inspection status globally

About This Task

Use this procedure to view the Neighbor Discovery inspection status globally

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display the ND inspection status globally:

```
show ipv6 fhs status
```

Viewing Neighbor Discovery inspection status on a port

About This Task

Use this procedure to view Neighbor Discovery inspection status on a port.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display port-wise ND inspection status:

```
show ipv6 fhs port-policy
```

*Viewing Neighbor Discovery inspection statistics on a port***About This Task**

Use this procedure to view the Neighbor Discovery inspection statistics on a port or set of ports.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display ND inspection statistics on a port or a set of ports:
show ipv6 fhs statistics nd-inspection {slot/port[/sub-port] [-slot/
port[/sub-port]] [,...]}

Variable Definitions

The following table defines parameters for the **show ipv6 fhs statistics nd-inspection** command.

| Variable | Value |
|---|---|
| {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]} | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

IPv6 DHCP Snooping Configuration

This section describes how to configure IPv6 DHCP snooping on the switch and protect the network by mitigating the various types of attacks.

**Important**

Configure DHCPv6 Guard before enabling IPv6 DHCP snooping. DHCPv6 Guard classifies the ports as trusted or untrusted and extracts DHCPv6 reply packets received on trusted ports to the control path. For more information on how to configure DHCPv6 Guard, see [DHCPv6 Guard Policy Configuration](#) on page 1992.

Creating a static Security Binding Table entry

Use this procedure to enable learning Security Binding Table (SBT) entries on all the VLANs where IPv6 DHCP snooping is configured.

About This Task

Use this procedure to create a static SBT entry.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal

2. Add a static SBT entry:

```
ipv6 fhs snooping static-binding ipv6-address WORD<0-46> vlan <1-4059>
mac-address 0x00:0x00:0x00 port {slot/port[/sub-port]}
```

Note

To delete an SBT entry, use the command `no ipv6 fhs snooping static-binding`.

Example

Add a static SBT entry.

```
Switch:1> enable
Switch:1# configure terminal
Switch:1(config)#ipv6 fhs snooping static-binding ipv6-address
2001:DB8:89ab:cdef:0123:4567:89ab:cdef vlan 1000 mac-address 00:11:22:33:44:55 port 1/2
```

Variable Definitions

The following table defines parameters for the `ipv6 fhs snooping static-binding ipv6-address` command.

| Variable | Value |
|---|--|
| <code>mac-address</code>
<code>0x00:0x00:0x00</code> | Specifies the MAC address of the binding entry. |
| <code>port {slot/port[/sub-port]}</code> | Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <code>vlan <1-4059></code> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <code>vrf-scaling</code> and <code>spbm-config-mode</code> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| <code>WORD<0-46></code> | Specifies the IPv6 address for the binding entry. |

Clearing a dynamic SBT entry

About This Task

Use this procedure to clear all or a particular dynamic SBT entry.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Clear a dynamic SBT entry:

```
clear ipv6 fhs snooping [vlan <1-4059>][ipv6-address WORD<0-46>]
```

Example

Clear a dynamic SBT entry on a VLAN.

```
Switch:1> enable
Switch:1>clear ipv6 fhs snooping vlan 1000 ipv6-address
2001:DB8:89ab:cdef:0123:4567:89ab:cdef
```

Variable Definitions

The following table defines parameters for the **clear ipv6 fhs snooping** command.

| Variable | Value |
|---|---|
| <i>ipv6-address</i>
<i>WORD</i> <0-46> | Specifies the IPv6 address for the binding entry to clear. You cannot specify an address without first specifying the VLAN. |
| <i>vlan</i> <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
If you do not specify a VLAN, the command clears all entries. |

Enable IPv6 DHCP Snooping on a VLAN

Before You Begin

Enable IPv6 DHCPv6 Guard for IPv6 DHCP snooping to work.

About This Task

Use this procedure to configure IPv6 DHCP snooping on a VLAN.

Procedure

1. Enter VLAN Interface Configuration mode:
enable

configure terminal

interface vlan <1-4059>
2. Configure IPv6 DHCP snooping on the VLAN:
ipv6 fhs snooping dhcp enable

Viewing IPv6 DHCP snooping and ND inspection status on a VLAN

About This Task

Use this procedure to view IPv6 DHCP snooping and ND inspection status on a VLAN.

Procedure

1. Enter Privileged EXEC mode:
enable

- View the IPv6 DHCP snooping and ND inspection status on a VLAN:

```
show ipv6 fhs status vlan [<1-4059>]
```

Example

View the status for all VLANs.

```
Switch:1#show ipv6 fhs status vlan

=====
                        IPv6 FHS VLAN Information
=====
VLAN-ID                DHCP-SNOOPING-STATUS    ND-INSPECTION-STATUS
-----
1                       Disabled                Disabled
3                       Disabled                Disabled
4                       Disabled                Disabled
22                      Disabled                Disabled
=====

All 4 out of 4 Total Num of FHS VLAN entries displayed
```

Variable Definitions

The following table defines parameters for the **show ipv6 fhs status vlan** command.

| Variable | Value |
|----------|--|
| <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. If you do not specify a VLAN ID, the command output includes all VLANs. |

Viewing SBT entries

About This Task

Use this procedure to view SBT entries.

Procedure

- Enter Privileged EXEC mode:

```
enable
```

- View all SBT entries:

```
show ipv6 fhs snooping binding
```

- View the SBT entries by type:

```
show ipv6 fhs snooping binding type {dynamic | static}
```

- View the SBT entries by VLAN:

```
show ipv6 fhs snooping binding vlan <1-4059>[ipv6-address WORD<0-46>]
```

Variable Definitions

The following table defines parameters for the **show ipv6 fhs snooping binding** command.

| Variable | Value |
|--|--|
| <code>ipv6-address</code>
<code>WORD<0-46></code> | Specifies the IPv6 address for the binding entry. |
| <code>type {dynamic static}</code> | Shows only dynamic binding entries or static binding entries. |
| <code>vlan <1-4059></code> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <code>vrf-scaling</code> and <code>spbm-config-mode</code> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |

IP Source Guard Configuration

The following sections provide procedural information you can use to configure IP Source Guard (IPSG) using the Command Line Interface (CLI).

Note

The switch supports configuration of IP Source Guard for both IPv4 and IPv6 addresses.

Enable IP Source Guard on a Port for IPv4 Addresses

About This Task

Enable IP Source Guard (IPSG) on a port to add a higher level of security to the port by preventing IP spoofing. When you enable IPSG on the interface, filters are automatically installed for the IPv4 addresses that are already learned on that interface.

Important

Do not enable IPSG on MLT, DMLT, SMLT, LAG, trunk ports or ports that are a part of private VLANs.

Before You Begin

Ensure that the following conditions are all satisfied, before you enable IPSG on a port. Otherwise, the system displays error messages.

- DHCP Snooping is enabled globally.
- The port is a member of a VLAN that is configured with both DHCP Snooping and Dynamic ARP Inspection.
- The port is an untrusted port enabled with both DHCP Snooping and Dynamic ARP Inspection.
- The port has enough resources allocated, to support the maximum number of 10 IP addresses allowed for IPSG.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable IPSG on the port:

```
ip source verify enable
```

3. Verify IPSG configuration:

```
show ip source verify interface gigabitEthernet [{slot/port[/sub-port]
[-slot/port[/sub-port]] [,...]]
```

Example

Configure IPSG on port 4/1.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 4/1
Switch:1(config-if)#ip source verify enable
```

Verify the configuration.

```
Switch:1(config-if)#show ip source verify interface gigabitEthernet

| Variable | Value |
|----------|--------------------------------------|
| enable | Enables IP Source Guard on the port. |

Disable IP Source Guard for IPv4 Addresses

About This Task

Disable IP Source Guard (IPSG) on a port to allow traffic from all IPv4 addresses to go through the port without being filtered.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable IPSG for IPv4 addresses:

```
no ip source verify
```

3. Verify IPSG configuration:

```
show ip source verify interface gigabitEthernet [{slot/port[/sub-port]}
[-slot/port[/sub-port]] [,...]]
```

Example

Disable IPSG on port 4/1.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 4/1
Switch:1(config-if)#no ip source verify
```

Verify the configuration.

```
Switch:1(config-if)#show ip source verify interface gigabitEthernet 4/1
```

```

View IP Source Guard Configuration on a Port

About This Task

View IP Source Guard (IPSG) configuration on a port, with filters for IPv4 addresses.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View IPSG configuration:

```
show ip source verify interface gigabitEthernet [{slot/port[/sub-port]}
[-slot/port[/sub-port]] [,...]]
```

Example

```

Switch:1>show ip source verify interface gigabitEthernet 4/1

=====
Source Guard Port Info
=====
PORT
NUM      ENABLE
-----
4/1      true
-----

All 1 out of 1 Total Num of Ip Source Guard entries displayed

```

Variable Definitions

The following table defines parameters for the **show ip source verify interface gigabitEthernet** command.

| Variable | Value |
|--|---|
| <code>{slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

View IPv4 Address Bindings

About This Task

View the IPv4 address bindings that IP Source Guard (IPSG) allows.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View the allowed IPv4 address bindings for a specific interface:

```
show ip source binding [interface gigabitEthernet {slot/port[/sub-
port]} [-slot/port[/sub-port]] [,...]]| [vlan <1-4059>]| [vrf
WORD<1-16>]| [vrfids WORD<0-512>]
```
3. View the allowed IPv4 address bindings for a specific IP address:

```
show ip source binding {A.B.C.D}
```

Example

View the allowed IPv4 address bindings for the port 4/1.

```
Switch:1>show ip source binding interface gigabitEthernet 4/1

=====
IPSG Source Table

-----

All 1 out of 1 Total IP Source Guard entries displayed
```

Variable Definitions

The following table defines parameters for the **show ip source binding** command.

| Variable | Value |
|--|---|
| <i>{A.B.C.D}</i> | Identifies the IPv4 address. |
| <i>interface gigabitEthernet {slot/
port[/sub-port]} [-slot/port[/
sub-port]] [,...]</i> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <i>vlan <1-4059></i> | Specifies the VLAN ID of the VLAN for which to view IPv4 address bindings. |

| Variable | Value |
|----------------------------|--|
| vrf <i>WORD</i> <1-16> | Specifies the VRF name of the VRF for which to view the IPv4 address bindings. |
| vrfids <i>WORD</i> <0-512> | Specifies the VRF ID of the VRF for which to view IPv4 address bindings. |

Enable IP Source Guard on a Port for IPv6 Addresses

About This Task

Enable IP Source Guard (IPSG) on a port, to add a higher level of security to the port by preventing IP spoofing. When you enable IPSG on the interface, filters are installed for IPv6 addresses that are already learned on that interface.

Important

Do not enable IPSG on MLT, DMLT, SMLT, LAG, trunk ports or ports that are a part of private VLANs.

Before You Begin

Ensure that the following conditions are all satisfied, before you enable IPSG on a port. Otherwise, the system displays error messages.

- DHCP Snooping is enabled globally.
- The port is a member of a VLAN that is configured with both DHCP Snooping and IPv6 Neighbor Discovery inspection.
- The port is an untrusted port enabled with both DHCP Snooping and IPv6 Neighbor Discovery inspection.
- The port has enough resources allocated, to support the maximum number of 10 IP addresses allowed for IPSG.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

- Configure the maximum number of allowed IPv6 addresses on a port:

```
ipv6 source-guard [max-allowed-addr <2-10>]
```

Note

Ensure that you configure the maximum number of allowed IPv6 addresses on a port, before you enable IPSG on that port.

- Enable IPSG on the port:

```
ipv6 source-guard enable
```

- Verify IPSG configuration information on the port:

```
show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-  
port]} [-slot/port[/sub-port]] [,...]]
```

Example

Enable IPSG on a port.

Configure the maximum allowed IPv6 addresses on port 4/1 as 10 and enable IPSG on that port.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 4/1
Switch:1(config-if)#ipv6 source-guard max-allowed-addr 10
Switch:1(config-if)#ipv6 source-guard enable
```

Verify the configuration.

```
Switch:1(config-if)#show ipv6 source-guard interface gigabitEthernet 4/1
Slot/Port  Source Guard  Number of IPv6  Address
           Mode      address allowed  overflow count
=====
4/1        Enabled      10              0
```

Optionally view all interfaces with IPSG enabled.

```
Switch:1(config-if)#show ipv6 source-guard interface enabled
Slot/Port  Source Guard  Number of IPv6  Address
           Mode      address allowed  overflow count
=====
4/1        Enabled      4               0
3/1        Enabled      9               0
```

Variable Definitions

The following table defines parameters for the **ipv6 source-guard** command.

| Variable | Value |
|--|---|
| <code>enable</code> | Enables IP Source Guard on a port. |
| <code>max-allowed-addr <2-10></code> | Specifies the maximum number of IPv6 addresses allowed to transmit data through the port. The default value is 4.

Note:
To reset the value to default, IPSG must be disabled on the interface. |

Disable IP Source Guard for IPv6 Addresses

About This Task

Disable IP Source Guard (IPSG) on a port to allow traffic from all IPv6 addresses to go through the port without being filtered.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable IPSG for IPv6 addresses on a port:

```
no ipv6 source-guard enable
```

3. Verify IPSG configuration on the port:

```
show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-
port] [-slot/port[/sub-port]] [,...]]
```

Example

Disable IPSG on port 4/1.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 4/1
Switch:1(config-if)#no ipv6 source-guard enable
```

Verify the configuration.

```
Switch:1(config-if)#show ipv6 source-guard interface gigabitEthernet 4/1
Slot/Port Source Guard Number of IPv6 Address
```

| | Mode | address allowed | overflow count |
|-----|----------|-----------------|----------------|
| 4/1 | Disabled | 10 | 0 |

Clear IP Source Guard Overflow Counters

About This Task

Overflow counters consist of IPv6 addresses that are not added to IP Source Guard (IPSG) due to lack of filter resources. Use this procedure to clear the overflow counters for an IPSG port.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Clear the overflow counters:

```
ipv6 source-guard overflow-count clear
```

3. Verify the configuration on the port:

```
show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-
port] [-slot/port[/sub-port]] [,...]]
```

4. (Optional) View the overflow counters on all IPSG enabled ports:

```
show ipv6 source-guard interface enabled
```

Example

Clear overflow counters on the IPSG port 4/1.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 4/1
Switch:1(config-if)#ipv6 source-guard overflow-count clear
```

Verify the configuration on port 4/1.

```
Switch:1(config-if)#show ipv6 source-guard interface gigabitEthernet 4/1
Slot/Port Source Guard Number of IPv6 Address
          Mode          address allowed overflow count
=====
4/1       Enabled           10             0
```

Optionally view the overflow counters on all IPSG enabled ports.

```
Switch:1(config-if)#show ipv6 source-guard interface enabled
Slot/Port Source Guard Number of IPv6 Address
          Mode          address allowed overflow count
=====
```

| | | | |
|-----|---------|---|---|
| 4/1 | Enabled | 4 | 0 |
| 3/1 | Enabled | 9 | 0 |

View IP Source Guard Configuration for IPv6 Addresses

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View IPSG configuration on a specified interface:

```
show ipv6 source-guard interface gigabitEthernet [{slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]]
```
3. View IPSG configuration on all IPSG enabled interfaces:

```
show ipv6 source-guard interface enabled
```

Example

```
Switch:1#show ipv6 source-guard interface gigabitEthernet 4/1
```

```
Slot/Port  Source Guard  Number of  IPv6  Address
           Mode      address allowed  overflow count
=====
4/1        Enabled      4           0
```

```
Switch:1#show ipv6 source-guard interface enabled
```

```
Slot/Port  Source Guard  Number of  IPv6  Address
           Mode      address allowed  overflow count
=====
4/1        Enabled      4           0
4/2        Enabled      9           0
```

Variable Definitions

The following table defines parameters for the **show ipv6 source-guard interface gigabitEthernet** command.

| Variable | Value |
|---|---|
| enabled | Displays IPSG configuration on all IPSG enabled interfaces. |
| gigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]] [,...] | Displays IPSG configuration on the specified interface. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

View IPv6 Address Bindings

About This Task

View the IPv6 address bindings that IP Source Guard (IPSG) allows.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. View the allowed IPv6 address bindings:

```
show ipv6 source-guard binding [WORD<0-46>] [interface gigabitEthernet
 {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```

Example

View the IPv6 address bindings for port 1/3.

```
Switch:1>show ipv6 source-guard binding interface gigabitEthernet 1/3
Slot/Port   IPv6   Address
-----
1/3         2001::10:10:0:1
1/3         fe80::210:94ff:fe00:550b
-----
```

View the IPv6 address bindings for a specific IPv6 address.

```
Switch:1>show ipv6 source-guard binding fe80::210:94ff:fe00:550b
Slot/Port   IPv6   Address
-----
1/3         fe80::210:94ff:fe00:550b
-----
```

Variable Definitions

The following table defines parameters for the **show ipv6 source-guard binding** command.

| Variable | Value |
|--|---|
| <i>WORD<0-46></i> | Identifies the IPv6 address. |
| <i>interface gigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Layer 2 Security Configuration using EDM

Use the following sections to help you configure Layer 2 security features and protect the network by mitigating various types of attacks, using Enterprise Device Manager (EDM).

For IPv4 deployments, configure:

- DHCP Snooping
- Dynamic ARP Inspection
- IP Source Guard for IPv4 addresses

For IPv6 deployments, configure:

- First Hop Security (FHS)

Note

FHS does not solve all cases of denial of services like blocking flooding of the IPv6 messages.

- DHCP Snooping and IPv6 Neighbor Discovery Inspection
- IP Source Guard for IPv6 addresses

Dynamic ARP Inspection Configuration Using EDM

The following section provides procedures to configure Dynamic ARP Inspection (DAI) using EDM.

Configure Dynamic ARP Inspection on VLANs

Use the following procedure to enable or disable DAI on one or more VLANs.

Note

DAI cannot be enabled on Private VLANs (E-Tree) and SPBM B-VLANs.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **ARP Inspection**.
3. Click the **ARP Inspection-VLAN** tab.
4. In the row for the VLAN, double-click the **Enabled** field, and select **true** to enable DAI.
5. Click **Apply**.

ARP Inspection-VLAN Field Descriptions

Use the data in the following table to use the **ARP Inspection-VLAN** tab.

| Name | Description |
|----------------|---|
| VlanId | Specifies the VLAN ID. |
| Enabled | Specifies if DAI is enabled or disabled for the particular VLAN. By default, DAI is disabled. |

Configure Dynamic ARP Inspection on Ports

Use the following procedure to set the trust factor associated with a port for DAI . By default, the trust factor is set to untrusted.

Note

For ports that are part of an MLT, DAI must be configured using the MLT configuration mode.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **ARP Inspection**.
3. Click the **ARP Inspection-port** tab.
4. In the row for the port, double-click the **IfTrusted** field, and select **trusted** or **untrusted** to set DAI.
5. Click **Apply**.

ARP Inspection-port Field Descriptions

Use the data in the following table to use the **ARP Inspection-port** tab.

| Name | Description |
|------------------|--|
| Port | Specifies the port on the switch. |
| IfTrusted | Specifies the trust factor for DAI on the specific port. By default, it is set as untrusted. |

Configure FHS Globals

About This Task

Use this procedure to enable FHS to enable DHCPv6 Guard, RA Guard, and ND-inspection globally, and to configure the lifetime for these policies.

Procedure

1. From the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **Globals** tab.
4. Select FHS global options.
5. Click **Apply** to save the changes.
6. (Optional) Click **Refresh** to update the results.

Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

| Name | Description |
|-------------------------|--|
| Admin | Enables or disables the FHS policy. |
| RAGuardAdmin | Enables or disables the RA Guard policy. |
| DHCPv6GuardAdmin | Enables or disables the DHCPv6 Guard policy. |
| NdInspectAdmin | Enables or disables Neighbor Discovery inspection. |

IPv6 access list configuration

An IPv6 access list is created to verify the sender's IPv6 address in the inspected messages. You can create, view, or delete an IPv6 access list.

Creating IPv6 access list

About This Task

Use this procedure to create an FHS IPv6 access list or add IPv6 prefixes to the existing IPv6 access list.

Procedure

1. In the navigation pane, expand **Configuration**—> **IPv6**.
2. Click **FHS**.
3. Click the **IPv6 Access List** tab.
4. Click **Insert**.
5. Configure the parameters for the IPv6 access list.
6. Click **Insert**.

IPv6 Access List field descriptions

Use the data in the following table to use the **IPv6 Access List** tab.

| Name | Description |
|----------------------|---|
| Name | Specify the IPv6 access list name to create the IPv6 access list. |
| Prefix | Specify the IPv6 prefix for adding it to the IPv6 access list. |
| PrefixMaskLen | Specify the prefix length for adding it to the IPv6 access list. The value range is from 0 to 128. By default, the value is 0. |
| MaskLenFrom | Specify the start mask length for providing the IPv6 range. The value range is from 0 to 128. By default, the value is set to the configured prefix length of the IPv6 access list entry. |
| MaskLenTo | Specify the end mask length for providing the IPv6 range. The value range is from 0 to 128. By default, the value is set to the configured prefix length of the IPv6 access list entry. |
| AccessType | Select the access type to allow or deny the entry. By default, the access type is allow. |

Note

- **MaskLenFrom** and **MaskLenTo** must always be greater than or equal to the configured **PrefixMaskLen** for this IPv6 access list entry
- The **MaskLenFrom** value must always be less than or equal to the **MaskLenTo** value.

*View IPv6 access List***About This Task**

Use this procedure to display the IPv6 access list.

Procedure

1. In the navigation pane, expand **Configuration**—> **IPv6**.
2. Click **FHS**.
3. Click the **IPv6 Access List** tab.

IPv6 Access List field descriptions

Use the data in the following table to use the **IPv6 Access List** tab.

| Name | Description |
|----------------------|---|
| Name | Specify the IPv6 access list name to create the IPv6 access list. |
| Prefix | Specify the IPv6 prefix for adding it to the IPv6 access list. |
| PrefixMaskLen | Specify the prefix length for adding it to the IPv6 access list. The value range is from 0 to 128. By default, the value is 0. |
| MaskLenFrom | Specify the start mask length for providing the IPv6 range. The value range is from 0 to 128. By default, the value is set to the configured prefix length of the IPv6 access list entry. |
| MaskLenTo | Specify the end mask length for providing the IPv6 range. The value range is from 0 to 128. By default, the value is set to the configured prefix length of the IPv6 access list entry. |
| AccessType | Select the access type to allow or deny the entry. By default, the access type is allow. |

**Note**

- **MaskLenFrom** and **MaskLenTo** must always be greater than or equal to the configured **PrefixMaskLen** for this IPv6 access list entry
- The **MaskLenFrom** value must always be less than or equal to the **MaskLenTo** value.

*Delete the IPv6 Access List***About This Task**

Use this procedure to delete the created IPv6 access list.

Procedure

1. In the navigation pane, expand **Configuration**—> **IPv6**.
2. Click **FHS**.

3. Click the **IPv6 Access List** tab.
4. Select a row from the IPv6 access list to delete.
5. Click **Delete**.

MAC access list configuration

A MAC access list is created to verify the sender's MAC address in the RA packet. You can view, create or delete a MAC access list.

Create MAC Access List

About This Task

Use this procedure to create a MAC access list or add a MAC address to the existing MAC access list.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **MAC Access List** tab.
4. Click **Insert**.
5. Configure the parameters for the MAC access list.
6. Click **Insert**.

MAC Access List field descriptions

Use the data in the following table to use the **MAC Access List** tab.

| Name | Description |
|-------------------|---|
| Name | Specify a name to create a MAC access list. |
| Mac | Specify the MAC address to add to the MAC access list, in (xx:xx:xx:xx:xx:xx) format. |
| AccessType | Specify allow or deny. By default, the access type is allow. |

View a MAC Access List

About This Task

Use this procedure to display a configured MAC access list.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **MAC Access List** tab.

MAC Access List field descriptions

Use the data in the following table to use the **MAC Access List** tab.

| Name | Description |
|-------------------|---|
| Name | Specify a name to create a MAC access list. |
| Mac | Specify the MAC address to add to the MAC access list, in (xx:xx:xx:xx:xx:xx) format. |
| AccessType | Specify allow or deny. By default, the access type is allow. |

Delete a MAC Access List

About This Task

Use this procedure to delete the created MAC access list.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **MAC Access List** tab.
4. Select a row from the MAC access list to delete.
5. Click **Delete**.

DHCPv6 Guard Policy Configuration

Configure the DHCPv6 Guard policy to block DHCPv6 reply and advertisement messages that originate from unauthorized DHCPv6 servers and relay agents that forward DHCPv6 packets from servers to clients. You can view, create or delete a DHCPv6 Guard policy.

Create DHCPv6 Guard Policy

About This Task

Use this procedure to create the DHCPv6 Guard policy to block DHCPv6 reply and advertisement messages that originate from unauthorized DHCPv6 servers and relay agents.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **DHCPv6 Guard Policy** tab.
4. Click **Insert**.
5. Configure the parameters for the DHCPv6 Guard policy.
6. Click **Insert**.
7. (Optional) Click **Refresh** to update the results.

DHCPv6 Guard Policy Field Descriptions

Use the data in the following table to use the **DHCPv6 Guard Policy** tab.

| Name | Description |
|-----------------------------|--|
| PolicyName | Specifies the policy name to create or modify DHCPv6 Guard policy. |
| ServerAccessListName | <p>Enables verification of the sender IPv6 address in the DHCPv6 reply or advertisement packets against attached IPv6 server access list.</p> <p>Note:
If the access-list is not attached, the source IPv6 address is not validated. If the list is attached and it does not match with any entries in attached IPv6 access list, the switch drops the DHCPv6 packet. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow, which changes the drop by default to allow by default.</p> |
| ReplyPrefixListName | <p>Enables verification of the advertised prefixes in DHCPv6 reply messages against the attached prefix list. If not configured, this check is bypassed.</p> <p>Note:
If the access-list is not attached, the advertised address/prefix is not validated. If the list is attached and it does not match with any entries in attached IPv6 access list, the switch drops the DHCPv6 packet. To change this behavior, an entry in the IPv6 access list with prefix 0::0/0 with access type as allow, which changes the drop by default to allow by default.</p> |
| PrefLimitMin | Enables verification if the advertised preference (in reference option) is greater than the specified limit. If not specified, this check does not occur. The value range is from 0 to 255. |
| PrefixLimitMax | <p>Enables verification if the advertised preference (in preference option) is less than the specified limit. If not specified, this check does not occur. The value range is from 0 to 255.</p> <p>Note:
If both the maximum and minimum limit is 0, this preference check is ignored.</p> |

View a DHCPv6 Guard Policy

About This Task

Use this procedure to display configured DHCPv6 Guard policies.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.

2. Click **FHS**.
3. Click the **DHCPv6 Guard Policy** tab.

DHCPv6 Guard Policy Field Descriptions

Use the data in the following table to use the **DHCPv6 Guard Policy** tab.

| Name | Description |
|-----------------------------|--|
| PolicyName | Specifies the policy name to create or modify DHCPv6 Guard policy. |
| ServerAccessListName | <p>Enables verification of the sender IPv6 address in the DHCPv6 reply or advertisement packets against attached IPv6 server access list.</p> <p>Note:
If the access-list is not attached, the source IPv6 address is not validated. If the list is attached and it does not match with any entries in attached IPv6 access list, the switch drops the DHCPv6 packet. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow, which changes the drop by default to allow by default.</p> |
| ReplyPrefixListName | <p>Enables verification of the advertised prefixes in DHCPv6 reply messages against the attached prefix list. If not configured, this check is bypassed.</p> <p>Note:
If the access-list is not attached, the advertised address/prefix is not validated. If the list is attached and it does not match with any entries in attached IPv6 access list, the switch drops the DHCPv6 packet. To change this behavior, an entry in the IPv6 access list with prefix 0::0/0 with access type as allow, which changes the drop by default to allow by default.</p> |
| PrefLimitMin | Enables verification if the advertised preference (in reference option) is greater than the specified limit. If not specified, this check does not occur. The value range is from 0 to 255. |
| PrefixLimitMax | <p>Enables verification if the advertised preference (in preference option) is less than the specified limit. If not specified, this check does not occur. The value range is from 0 to 255.</p> <p>Note:
If both the maximum and minimum limit is 0, this preference check is ignored.</p> |

Delete a DHCPv6 Guard Policy

About This Task

Use this procedure to delete the created DHCPv6 Guard policy.

Note

If this policy is already attached to an interface, then this policy cannot be deleted.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **DHCPv6 Guard Policy** tab.
4. Select a row from DHCPv6 Guard policies to delete.
5. Click **Delete**.

RA Guard Policy Configuration

Configure RA Guard to block or reject unwanted or rogue RA messages that arrive at the network device platform. You can view, create or delete RA Guard policy.

Create RA Guard Policy

About This Task

Use this procedure to create a RA Guard policy to block or reject unwanted or rogue RA messages that arrive at the network device platform.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **RA Guard Policy** tab.
4. Click **Insert**.
5. Configure the parameters for the RA Guard policy.
6. Click **Insert**.
7. (Optional) Click **Refresh** to update the results.

RA Guard Policy Field Descriptions

Use the data in the following table to use the **RA Guard Policy** tab.

| Name | Description |
|--------------------------|--|
| PolicyName | Specifies the name of the RA Guard policy to be created or modified. |
| SrcAddrList | <p>Specify the IPv6 access list name to verify the sender IPv6 address in the RA packets against the attached IPv6 access list.</p> <p>Note:
The source address in the RA packet is not validated if the access-list is not attached. If the list is attached and the IPv6 source address in RA packet does not match any IPv6-prefix in the list, then the RA packet is dropped. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow. The default value changes from drop to allow.</p> |
| PrefixList | <p>Specify the IPv6 prefix list name to verify the advertised prefixes in the RA packet against the attached IPv6 prefix list.</p> <p>Note:
Advertised prefixes are not validated if the access-list is not attached. If the list is attached and the advertised prefix in the RA packet does not match any IPv6-prefix in the list, then the RA packet is dropped. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow. The default value changes from drop to allow.</p> |
| MacAddrList | <p>Specify the MAC list name to verify the sender source MAC address against the attached MAC access list.</p> <p>Note:
The source MAC address in the RA packet is not validated if the access-list is not attached. If the list is attached and the source MAC address in the RA packet does not match any MAC address in the list, then the RA packet is dropped.</p> |
| ManagedConfigFlag | <p>Select the managed configuration flag to verify managed address configuration in the advertised RA packet.</p> <p>By default, none is selected and managed configuration flag validation is skipped.</p> |
| RouterPrefMax | <p>Select the router preference maximum to verify the if the advertised default router preference parameter value is lower than or equal to a specified limit.</p> <p>By default, none is selected and router preference validation is skipped.</p> |

| Name | Description |
|--------------------|---|
| HopLimitMin | Specify the minimum hop limit to verify the advertised hop count limit.
The value range is from 0 to 255
By default, minimum hop limit is 0. |
| HopLimitMax | Specify the maximum hop limit to verify the advertised hop count limit.
The value range is from 0 to 255
By default, the maximum hop limit is 0 and If both HopLimitMin and HopLimitMax are set to 0, then the hop limit parameter in the RA packet is not validated. |

View RA Guard Policy

About This Task

Use this procedure to display configured RA Guard policies.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **RA Guard Policy** tab.

RA Guard Policy Field Descriptions

Use the data in the following table to use the **RA Guard Policy** tab.

| Name | Description |
|--------------------|---|
| PolicyName | Specifies the name of the RA Guard policy to be created or modified. |
| SrcAddrList | Specify the IPv6 access list name to verify the sender IPv6 address in the RA packets against the attached IPv6 access list.

Note:
The source address in the RA packet is not validated if the access-list is not attached.
If the list is attached and the IPv6 source address in RA packet does not match any IPv6-prefix in the list, then the RA packet is dropped. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow. The default value changes from drop to allow. |

| Name | Description |
|--------------------------|--|
| PrefixList | <p>Specify the IPv6 prefix list name to verify the advertised prefixes in the RA packet against the attached IPv6 prefix list.</p> <p>Note:
Advertised prefixes are not validated if the access-list is not attached.
If the list is attached and the advertised prefix in the RA packet does not match any IPv6-prefix in the list, then the RA packet is dropped. To change this behavior, add an entry in the IPv6 access list with prefix 0::0/0 with access type as allow. The default value changes from drop to allow.</p> |
| MacAddrList | <p>Specify the MAC list name to verify the sender source MAC address against the attached MAC access list.</p> <p>Note:
The source MAC address in the RA packet is not validated if the access-list is not attached.
If the list is attached and the source MAC address in the RA packet does not match any MAC address in the list, then the RA packet is dropped.</p> |
| ManagedConfigFlag | <p>Select the managed configuration flag to verify managed address configuration in the advertised RA packet.</p> <p>By default, none is selected and managed configuration flag validation is skipped.</p> |
| RouterPrefMax | <p>Select the router preference maximum to verify the if the advertised default router preference parameter value is lower than or equal to a specified limit.</p> <p>By default, none is selected and router preference validation is skipped.</p> |
| HopLimitMin | <p>Specify the minimum hop limit to verify the advertised hop count limit.</p> <p>The value range is from 0 to 255
By default, minimum hop limit is 0.</p> |
| HopLimitMax | <p>Specify the maximum hop limit to verify the advertised hop count limit.</p> <p>The value range is from 0 to 255
By default, the maximum hop limit is 0 and If both HopLimitMin and HopLimitMax are set to 0, then the hop limit parameter in the RA packet is not validated.</p> |

*Delete an RA Guard Policy***About This Task**

Use this procedure to delete the created RA Guard policy.

**Note**

If this policy is already attached to an interface, then you cannot delete this policy.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **RA Guard Policy** tab.
4. Select a row from the RA Guard policies to delete.
5. Click **Delete**.

Port Policy Mapping Configuration

This configuration allows you to map the port with DHCPv6 Guard or RA Guard policy. You can view, create or delete the mappings.

*Create Port to Policy Mapping***About This Task**

Use this procedure to map a port to a RA Guard or DHCPv6 Guard policy, DHCPv6 Guard or RA Guard statistics.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **Port Policy Mapping** tab.
4. Click **Insert**.
5. Configure the parameters for the port policy mapping.
6. Click **Insert**.
7. (Optional) Click **Refresh** to update the results.

Port Policy Mapping Field Descriptions

Use the data in the following table to use the **Insert Port Policy Mapping** dialog box.

| Name | Description |
|------------------------------|--|
| IfIndex | Specify the port. |
| DHCPv6GuardPolicyName | Enter an already-created DHCPv6 Guard policy name to map it with the port. |
| RAGuardPolicyName | Enter an already-created RA Guard policy name to map it with the port. |

| Name | Description |
|--------------------------|---|
| Dhcpv6gDeviceRole | Select server or client configuration. The default is server. |
| RagDeviceRole | Select host or router configuration. The default is router. |

View Port Policy Mapping

About This Task

Use this procedure to display port policy mapping information.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **Port Policy Mapping** tab.

Port Policy Mapping Field Descriptions

Use the data in the following table to use the **Port Policy Mapping** tab.

| Name | Description |
|------------------------------|---|
| IfIndex | Identifies the port. |
| Dhcpv6gDeviceRole | Specifies the DHCPv6 Guard device-role of the received port. If the device role is client and if it receives DHCPv6 reply then those packets should be dropped. |
| DHCPv6GuardPolicyName | Specifies the DHCPv6 Guard policy name associated with the port. |
| TotalDHCPv6PktRcv | Shows the total number of DHCPv6 packets received on the DHCPv6 Guard enabled interface. |
| TotalDHCPv6PktDropped | Shows the total number of DHCPv6 packets dropped due to DHCPv6 Guard filtering. |
| RagDeviceRole | Specifies the RA Guard device-role. |
| RAGuardPolicyName | Specifies the RA Guard policy name associated with the port. |
| TotalRAPktRcv | Shows the total number of RA packets received on the RA Guard enabled interface. |
| TotalRAPktDropped | Shows the total number of RA packets dropped due to RA Guard filtering. |
| NDInspection | Enables or disables Neighbor Discovery (ND) inspection. The default is disabled. |
| TotNdPktRcv | Shows the total number of ND packets received on the RA Guard enabled interface. |
| TotNdPktDropped | Shows the total number of ND packets dropped due to RA Guard filtering. |

| Name | Description |
|----------------------------|---|
| ClearDHCPGuardStats | Clears, if true, the DHCPv6 Guard statistics for the port. |
| ClearRAGuardStats | Clears, if true, the RA Guard statistics for the port. |
| ClearNDInspectStats | Clears, if true, the ND-inspection statistics for the port. |

Delete Port Policy Mapping

About This Task

Use this procedure to delete the created port policy mapping.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **Port Policy Mapping** tab.
4. Select a row from Port Policy Mapping to delete.
5. Click **Delete**.
6. Click **Apply**.

DHCP Snooping Configuration Using EDM

The following section provides procedures to configure DHCP Snooping using EDM.

Enable DHCP Snooping Globally

Use the following procedure to enable DHCP Snooping globally. If DHCP Snooping is globally disabled, the switch forwards DHCP reply packets (received on trusted or untrusted ports) to all ports.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **DHCP Snooping**.
3. Click the **DHCP Snooping Globals** tab.
4. Select **Enabled**.
5. Click **Apply**.

DHCP Snooping Globals Field Descriptions

Use data in the following table to use the **DHCP Snooping Globals** tab.

| Name | Description |
|----------------|--|
| Enabled | Enables DHCP Snooping globally. By default, DHCP Snooping is disabled. |

Configure DHCP Snooping on VLANs

Use the following procedure to configure DHCP Snooping on a specific VLAN. If DHCP Snooping is globally disabled, the switch forwards DHCP reply packets (received on trusted or untrusted ports) to all ports.

If you enable DHCP Snooping globally, the agent determines whether to forward DHCP reply packets based on the DHCP Snooping mode of the VLAN and trusted state of the port.

**Note**

You cannot enable DHCP Snooping on Private VLANs (E-Tree) and SPBM B-VLANs.

Before You Begin

You must enable DHCP Snooping globally.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **DHCP Snooping**.
3. Click the **DHCP Snooping-VLAN** tab.
4. In the row for the VLAN, double-click the **DhcpSnoopingEnabled** field, and select **true** to enable DHCP Snooping.
5. Click **Apply**.

DHCP Snooping-VLAN Field Descriptions

Use the data in the following table to use the **DHCP Snooping-VLAN** tab.

| Name | Description |
|----------------------------|---|
| VlanId | Specifies the VLAN ID. |
| DhcpSnoopingEnabled | Specifies if DHCP Snooping is enabled or disabled for the particular VLAN. By default, DHCP Snooping is disabled. |

Configure Trusted and Untrusted Ports

Use the following procedure to set the trust factor associated with a port for DHCP Snooping. By default, the trust factor is set to untrusted on all ports.

**Note**

For ports that are members of an MLT, DHCP Snooping must be configured using the MLT configuration mode.

Before You Begin

To enable DHCP Snooping on a port, you must enable DHCP Snooping globally.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **DHCP Snooping**.

3. Click the **DHCP Snooping-port** tab.
4. In the row for the port, double-click the **DhcpSnoopingIfTrusted** field, and select **trusted** or **untrusted** to set DHCP Snooping.
5. Click **Apply**.

DHCP Snooping-port Field Descriptions

Use data in the following table to use the **DHCP Snooping-port** tab.

| Name | Description |
|------------------------------|--|
| Port | Specifies the port on the switch. |
| DhcpSnoopingIfTrusted | Specifies if the switch ports are trusted for DHCP Snooping. By default, it is set as untrusted. |

DHCP binding configuration

The following section provides procedures to configure the DHCP binding table using EDM.

Create DHCP Binding Table Entries

Use the following procedure to add entries for devices with static IP addresses to the DHCP binding table.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **DHCP Snooping**.
3. Click the **DHCP Bindings** tab.
4. Click **Insert**.
5. In the **VlanId** field, enter the VLAN ID.
6. In the **MacAddress** field, enter the MAC address of the DHCP client.
7. In the **AddressType** field, select a value.
8. In the **Address** field, enter the IP address of the DHCP client.
9. In the **Interface** field, select a port.
10. In the **LeaseTime(sec)** field, enter the time in seconds.
11. Click **Insert**.
12. Click **Apply**.

DHCP Bindings field descriptions

Use data in the following table to use the **DHCP Bindings** tab.

| Name | Description |
|--------------------|--|
| VlanId | Specifies the VLAN to which the DHCP client belongs. |
| MacAddress | Specifies the MAC address of the DHCP client. |
| AddressType | Specifies the type of address. The default address type is IPv4. |
| Address | Specifies the IP address assigned to the DHCP client. |
| Interface | Specifies the interface to which the DHCP client connects. |

| Name | Description |
|--------------------------|--|
| LeaseTime(sec) | Specifies the lease time (in seconds) of the particular DHCP binding entry. The time range is 0 to 2147483646 seconds. |
| TimeToExpiry(sec) | Species the time of expiry (in seconds) of the DHCP binding entry. |
| EntryType | Specifies the type of the DHCP binding entry. <ul style="list-style-type: none"> • If the entry was created through DHCP snooping, the type is learned(1). • If the entry was created through a management operation, the type is static(2). |

Viewing DHCP Binding Information

Use the following procedure to view all entries in the DHCP binding table.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **DHCP Snooping**.
3. Click the **DHCP Bindings** tab.

DHCP Bindings field descriptions

Use data in the following table to use the **DHCP Bindings** tab.

| Name | Description |
|--------------------------|--|
| VlanId | Specifies the VLAN to which the DHCP client belongs. |
| MacAddress | Specifies the MAC address of the DHCP client. |
| AddressType | Specifies the type of address. The default address type is IPv4. |
| Address | Specifies the IP address assigned to the DHCP client. |
| Interface | Specifies the interface to which the DHCP client connects. |
| LeaseTime(sec) | Specifies the lease time (in seconds) of the particular DHCP binding entry. The time range is 0 to 2147483646 seconds. |
| TimeToExpiry(sec) | Species the time of expiry (in seconds) of the DHCP binding entry. |
| EntryType | Specifies the type of the DHCP binding entry. <ul style="list-style-type: none"> • If the entry was created through DHCP snooping, the type is learned(1). • If the entry was created through a management operation, the type is static(2). |

SBT configuration

This configuration allows you to build a snooping binding table (SBT) which contains entries from only trusted devices or hosts. This SBT table is used to validate Neighbor Discovery (ND) packets. You can view, create, or delete the entries in the SBT.

Create an SBT Entry

About This Task

Use this procedure to create an SBT entry.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **Snoop Binding** tab.
4. Click **Insert**.
5. Configure the parameters for the snoop binding.
6. Click **Insert**.
7. (Optional) Click **Refresh** to update the results.

Snoop Binding field descriptions

Use the data in the following table to use the **Snoop Binding** tab. A subset of these fields appear if click **Insert**.

| Name | Description |
|-----------------------|--|
| VlanId | Specify the VLAN to which the snooped entry belongs. |
| Ipv6Address | Enter the IPv6 address assigned to the IPv6 host. |
| MacAddress | Enter the MAC address of the snooped entry. |
| InterfaceIndex | Specify the interface on which the entry is learnt. |
| EntryType | Indicates the type of entry - static (1) or dynamic (2). |
| EntrySource | Indicates the method entry was learnt from - static (1) or dhcp (2). |
| ValidTime | Indicates the valid time for the snooped entry. |
| TimeToExpiry | Indicates the time to expiry of the snooped entry. |

View SBT Entries

About This Task

Use this procedure to display a configured SBT table.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **Snoop Binding** tab.

Snoop Binding field descriptions

Use the data in the following table to use the **Snoop Binding** tab. A subset of these fields appear if click **Insert**.

| Name | Description |
|-----------------------|--|
| VlanId | Specify the VLAN to which the snooped entry belongs. |
| Ipv6Address | Enter the IPv6 address assigned to the IPv6 host. |
| MacAddress | Enter the MAC address of the snooped entry. |
| InterfaceIndex | Specify the interface on which the entry is learnt. |
| EntryType | Indicates the type of entry - static (1) or dynamic (2). |
| EntrySource | Indicates the method entry was learnt from - static (1) or dhcp (2). |
| ValidTime | Indicates the valid time for the snooped entry. |
| TimeToExpiry | Indicates the time to expiry of the snooped entry. |

Delete an SBT Entry

About This Task

Use this procedure to delete an entry from the SBT table.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **FHS**.
3. Click the **Snoop Binding** tab.
4. Select a row from the list to delete.
5. Click **Delete**.

IP Source Guard Configuration using EDM

Note

The switch supports configuration of IP Source Guard for both IPv4 and IPv6 addresses.

Enable IP Source Guard on a Port for IPv4 Addresses

About This Task

Enable IP Source Guard (IPSG) to add a higher level of security to a desired port by preventing IP spoofing. When you enable IPSG on the interface, filters are installed for IPv4 addresses that are already learned on that interface.

Before You Begin

Ensure that the following conditions are all satisfied, before you enable IPSG on a port. Otherwise, the system displays error messages.

- DHCP Snooping is enabled globally.
- The port on which you want to enable IPSG is a member of a VLAN that is configured with both DHCP Snooping and Dynamic ARP Inspection.

- The port is an untrusted port enabled with both DHCP Snooping and Dynamic ARP Inspection.
- The port has enough resources allocated to support the maximum number of 10 IP addresses allowed for IPSPG.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **Source Guard**.
3. Click the **IP Source Guard-port** tab.
4. Double-click the **Mode** field
5. Select **ip** from the list, to enable IPSPG.
6. Repeat the steps above to configure IPSPG on additional ports.
7. Click **Apply** to save your changes.
8. Click **Refresh** to update the **IP Source Guard-port** tab.

IP Source Guard-port field descriptions

Use the data in the following table to use the **IP Source Guard-port** tab.

| Name | Description |
|-------------|---|
| Port | Identifies the port on which to enable IPSPG. |
| Mode | Displays whether IPSPG is enabled on the port. The default is disabled. |

View IPv4 Address Bindings

View the IPv4 address bindings that IPSPG allows.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **Source Guard**.
3. Select the **IP Source Guard-addresses** tab.

IP Source Guard-addresses field descriptions

Use the data in the following table to use the **IP Source Guard-addresses** tab.

| Field | Description |
|----------------|---|
| Port | Indicates the port on which IPSPG is configured. |
| Type | Indicates the address type. |
| Address | Indicates the IPv4 address that is allowed by IPSPG on the port. |
| Source | Indicates the source of the IPv4 address, which is DHCP Snooping. |

*Configure IP Source Guard on a Port for IPv6 Addresses***About This Task**

Enable IPSG to add a higher level of security to a desired port, by preventing IP spoofing. When you enable IPSG on an interface, filters are automatically installed for the IPv6 addresses that are already learned on that interface.

Before You Begin

Ensure that the following conditions are all satisfied, before you enable IPSG on a port. Otherwise, the system displays error messages.

- DHCP Snooping is enabled globally.
- The port is a member of a VLAN that is configured with both DHCP Snooping and IPv6 Neighbor Discovery inspection.
- The port is an untrusted port enabled with both DHCP Snooping and IPv6 Neighbor Discovery inspection.
- The port has enough resources allocated to support the maximum number of 10 IP addresses allowed for IPSG.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **IPv6**.
3. Click the **Source Guard** tab.
4. Double-click the **InterfaceState** field.
5. Select a value from the list: **true** or **false**.
6. Double-click the **MaxAddr** field.
7. Enter the maximum number of IPv6 addresses that are allowed to transmit data on the port.
8. (Optional) To clear the overflow counters, double-click **ClearOverflowCount** and select **true**.
9. Click **Apply** to save your changes.
10. Click **Refresh** to update the **Source Guard** tab.

Source Guard field descriptions

Use the data in the following table to use the **Source Guard** tab.

| Name | Description |
|-----------------------|---|
| IfIndex | Specifies a value that uniquely identifies the port. |
| InterfaceState | Specifies the state of the interface. The default value is false. |
| MaxAddr | Specifies the maximum number of IPv6 addresses allowed to transmit data through the port. The default value is 4.

Note:
To reset the value to default, IPSG must first be disabled on the interface. |

| Name | Description |
|---------------------------|---|
| OverflowCount | Specifies the number of IPv6 addresses for which filters are not added on the IPSG port, due to a lack of filter resources. The default value is 0. |
| ClearOverflowCount | Specifies whether the overflow counter must be cleared. By default, the value is false. |

View IPv6 Address Bindings

View the IPv6 address bindings that IPSG allows.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Click **IPv6**.
3. Click the **Source Guard Binding** tab.

Source Guard Binding field descriptions

Use the data in the following table to use the **Source Guard Binding** tab.

| Field | Description |
|-----------------|--|
| IfIndex | Specifies a value that uniquely identifies the port. |
| IPv6Addr | Specifies the binding entry for the IPv6 address. |

Layer 2 security example scenarios

The following sections describe configuration examples to configure Layer 2 security features for IPv4 and IPv6 deployments.

FHS deployment scenario

In the following example, the Layer 2 switch “SW-1” is connected to another Layer 2 switch “SW-2”, two hosts and a DHCP server. Switch “SW-2” is connected to two other hosts and a router. Out of the two hosts connected to SW-2, one is a malicious host, which can generate bogus RA packets to advertise route prefix, and can also generate bogus DHCP reply packets to configure wrong IPv6 address or wrong default gateway. By doing this, it tries denial-of-service or Man-in-the-Middle attacks. These attacks must be prevented as it affects all the nodes present in the Layer 2 network and FHS can be effective in preventing these attacks.

These attacks can spread over the entire Layer 2 network and thus can affect the hosts connected to SW-2 as well as the hosts connected to SW-1. If you enable FHS only on SW-2, then it could only save the nodes which are directly connected to it. To prevent the good node connected to SW-1 from these attacks, the SW-1 switch also should be FHS enabled.

The following figure shows the FHS deployment scenario topology.

Figure 181: FHS deployment topology

By default, all the ports are trusted, until you configure DHCPv6 Guard or RA Guard policies.

See the following procedures to configure FHS RA Guard and DHCPv6 Guard for the preceding topology.

Creating FHS IPv6 ACL

About This Task

Filter IPv6 traffic by creating IPv6 Access Control Lists (ACLs) and applying them to the interfaces similar to the way that you create and apply IPv4 named ACLs.

Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```
2. Create an IP ACL name (ipv6_acl_1) to match the source IPv6 address of the router connected to the interface.

```
ipv6 fhs ipv6-access-list ipv6_acl_1
fe80:0:0:0:cef9:54ff:feb4:9481/128 mode allow
```

3. Create an IP ACL name (ipv6_acl_1) to match the source IPv6 address of the DHCPv6-server connected to the interface.

```
ipv6 fhs ipv6-access-list ipv6_acl_1
fe80:0:0:0:cef9:54ff:feb4:9481/128 mode allow
```

What to Do Next

Create a First Hop Security MAC ACL.

Creating an FHS MAC ACL

About This Task

Filter the IPv6 traffic by creating a MAC access list with the ACL mode.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Create a MAC ACL name (rtr_smac) to match the source MAC of the router connected to the interface 1/2.

```
ipv6 fhs mac-access-list mac_acl_1 00:11:22:33:44:66 mode allow
```

Creating a DHCPv6 Guard policy for the router

About This Task

Create a DHCPv6 Guard policy to provide Layer 2 security to DHCPv6 clients by protecting them against rogue DHCPv6 servers.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enter DHCP Guard mode with the DHCPv6 Guard policy name (dhcpv6g_pol_1). The DHCPv6 Guard policy for the interface is connected to a router.

```
ipv6 fhs dhcp-guard policy dhcpv6g_pol_1
```
3. Configure the source IPv6 access list to allow only a DHCPv6 server replies that originate from the IPv6 address fe80:0:0:0:cef9:54ff:feb4:9481/128 and check the preceding IPv6 ACL configuration for ipv6_acl_1 list.

```
match server access-list ipv6_acl_1
```
4. Verify the prefixes sent in the DHCPv6 server reply message so that the ipv6_acl_2 IPv6 ACL configuration allows only the prefix 1000::1/64.

```
match reply prefix-list ipv6_acl_1
```

Creating an RA Guard policy for the router

About This Task

Create an `rag_pol_1` RA Guard policy for the router and configure the source IPv6 access list to allow only the RA packets that originate from the source IPv6 address `fe80:0:0:0:cef9:54ff:feb4:9481/128`. This configuration verifies the prefixes sent in the RA packets.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enter the RA Guard mode and configure RA Guard policy (`rag_pol_1`) for the interface connected to a router.
`ipv6 fhs ra-guard policy rag_pol_1`
3. Configure the source IPv6 access list to allow only RA packets originating from the source IPv6 address `fe80:0:0:0:cef9:54ff:feb4:9481/128`.
`match ipv6 ra-srcaddr-list ipv6_acl_1`
4. Verify the prefixes sent in the RA packets so that the `rtr_pip` IPv6 ACL configuration allows only the prefix `60::0/64`.
`match reply ra-prefix-list ipv6_acl_1`

Attaching FHS policies to the interfaces

About This Task

Attach the FHS policies to the interfaces.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Configure DHCPv6 Guard and RA Guard policies on the interface (1/2) that connects to the router.
`interface ethernet 1/2`

`ipv6 dhcp-guard attach-policy dhcpv6g_pol_1`

`ipv6 ra-guard attach-policy rag_pol_1`

IPv6 DHCP Snooping and ND Inspection configuration example

This section shows examples of IPv6 DHCP snooping and ND inspection configuration.

Enable DHCPv6 Guard, ND inspection, and First Hop Security.

```
ipv6 fhs dhcp-guard enable
ipv6 fhs nd-inspection enable
ipv6 fhs enable
```

Create VLAN 1000 and add port members.

```
vlan create 1000 type port-mstprstp 0
vlan members add 1000 1/1-1/10
```

Enable DHCPv6 snooping and ND inspection on VLAN 1000.

```
interface vlan 1000
ipv6 fhs snooping dhcp enable
ipv6 fhs nd-inspection enable
exit
```

Add static SBT entry.

```
ipv6 fhs snooping static-binding ipv6-address 2001:DB8:0:0:0001:02ff:fe03:0405 vlan 1000
mac-address 00:01:02:03:04:05 port 1/5
```

Set the DHCPv6 Guard device-role on port 1/1 of the device on which DHCPv6 Guard is configured.

```
interface gigabitEthernet 1/1
ipv6 fhs dhcp-guard device-role server
exit
```

Enable ND inspection on ports 1/2 through 1/10.

```
interface gigabitEthernet 1/2-1/10
ipv6 fhs nd-inspection enable
exit
```

View the status.

```
show ipv6 fhs port-policy
show ipv6 fhs status
show ipv6 fhs status vlan
show ipv6 fhs snooping binding
```

Configuring IP Source Guard

The following section describes a simple configuration example to configure IP Source Guard (IPSG) on a port.

When you enable IPSG on a port, filters are installed for the IPv4 or IPv6 addresses that are already learned on that port.

Procedure

Enable DHCP Snooping globally on the switch and verify the configuration.

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable DHCP Snooping globally.

```
ip dhcp-snooping enable
```

3. Verify the configuration.

```
show ip dhcp-snooping
```

Enable DHCP Snooping and Dynamic ARP Inspection on the VLAN that the port is a member of.

4. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```

5. Enable DHCP Snooping on the VLAN.

```
ip dhcp-snooping enable
```

6. Verify the configuration.

```
show ip dhcp-snooping vlan <1-4059>
```

7. Enable Dynamic ARP Inspection on the VLAN.

```
ip arp-inspection enable
```

8. Verify the configuration.

```
show ip arp-inspection vlan <1-4059>
```

9. Verify that the port on which you want to configure IPSG is a DHCP Snooping and a Dynamic ARP Inspection untrusted port.

```
show ip dhcp-snooping interface gigabitEthernet [{slot/port[/sub-port]}
[-slot/port[/sub-port]] [,...]]
```

```
show ip arp-inspection interface gigabitEthernet [{slot/port[/sub-
port]} [-slot/port[/sub-port]] [,...]]
```

Configure IPSG on a port and verify the configuration.

10. Perform one of the following steps to configure IPSG on a port, for IPv4 or IPv6 addresses.

- Enable and verify IPSG on a port for IPv4 addresses:
 - a. `ip source verify enable`
 - b. `show ip source verify interface gigabitEthernet [{slot/port[/sub-
port]} [-slot/port[/sub-port]] [,...]]`
- Enable and verify IPSG on a port for IPv6 addresses:
 - a. `ipv6 source-guard enable`
 - b. `ipv6 source-guard [max-allowed-addr <2-10>]`

Note

The default value is 4. To reset the value to default, IPSG must first be disabled on the interface.

- c. `show ipv6 source-guard interface gigabitEthernet [{slot/port[/
sub-port]} [-slot/port[/sub-port]] [,...]]`

Example

The following example describes how to enable IPSG on port 4/5 which is a member of VLAN 10, for IPv4 or IPv6 addresses.

```
Switch:1>en
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#
```

Enable DHCP Snooping globally and verify the configuration.

```
Switch:1(config)#ip dhcp-snooping enable
Switch:1(config)#show ip dhcp-snooping
```

```

Licensing Fundamentals

This section provides conceptual information about licensing. Subsequent sections discuss how to acquire, install, and enable licenses.

New switches include a Factory Default License to use all features (excluding MACsec). You can configure all features, except MACsec, without restrictions and save the configuration. Evaluation periods differ depending on the platform.

The hardware platforms support different levels and types of licenses. Refer to the topics in this section for detailed licensing information for your specific device.

- [Feature Licensing for the VSP 4450 Series, VSP 4900 Series, VSP 7200 Series, VSP 7400 Series, and VSP 8000 Series](#) on page 2052
- [Feature Licensing for VSP 8600](#) on page 2055
- [Port Licensing for the VSP 7200 Series](#) on page 2054
- [Subscription Licensing for XA1400 Series](#) on page 2056
- [Feature Licensing for Universal Hardware](#) on page 2058

License Files on VSP 4450 Series

The VSP 4450 Series switch supports two types of legacy license files — .dat and .lic. License files with .dat and .lic extension were created using an older license generator and are considered legacy licenses. License files that have an .xml extension are created using a newer license generator and are considered newer license files.

Licensing for non-Universal Hardware

Non-Universal hardware products include:

- VSP 4450 Series
- VSP 4900 Series
- VSP 7200 Series
- VSP 7400 Series
- VSP 8200 Series
- VSP 8400 Series
- VSP 8600 Series
- XA1400 Series

Feature Licensing for the VSP 4450 Series, VSP 4900 Series, VSP 7200 Series, VSP 7400 Series, and VSP 8000 Series

The VSP 4450 Series, VSP 4900 Series, VSP 7200 Series, VSP 7400 Series, VSP 8200 Series, and VSP 8400 Series support a licensing model that includes Base Licenses and Premier Licenses. The Base License, which is included with the purchase of the switch, enables the basic networking capabilities of the device. You can purchase Premier Licenses separately to enable advanced features on the switch.

Licenses are tied to the switch Base MAC address. After you generate the license through the Extreme Networks Support Portal at <https://extremeportal.force.com/ExtrLicenseLanding>, you can install the license on the switch.

**Important**

If you require a change to or regeneration of legacy licenses for the VSP 4450 Series, send your email request to datalicensing@extremenetworks.com.

**Note**

Release 6.1.2 or later is required to support licenses generated through the Extreme Networks Support Portal.

Extreme Networks supports only a single host (system MAC address) for each license file. You cannot use the same license file on multiple hosts.

The software continues to support .xml licenses generated by Avaya.

The following sections detail the different categories of licenses.

Factory Default License

New switches include a 60-day Factory Default License to use all features (excluding MACsec). You can configure all features, except MACsec, without restrictions and save the configuration.

You cannot configure any new feature after the 60-day period, but the switch continues to run with the existing configured features. If you reboot the switch after the 60-day period, and a valid software license is not present, licensed features in the configuration are not loaded. You must install a valid license to enable licensed features.

**Note**

The 60-day evaluation period is based on the switch System Up Time.

Trial License

Trial licenses allow users to test licensed features at any time. The following two types of Trial Licenses are available:

- Trial License that allows the use of all features excluding MACsec
- Trial License that allows the use of all features including MACsec

A Trial License is valid for 60 days. You can activate a Trial License once per switch.

The system generates warning messages to inform you about the time remaining in the license period. The alerts appear once every 5 days for the first 55 days, and then once daily for the last 5 days. If you reboot the switch after the 60-day period, and a valid software license is not present, the configuration does not load. You must install a valid license to enable licensed features.

Base License

A Base license gives customers the right to use Base software features on the switch.

Premier License

Premier Licenses enable advanced features not available in the Base License. The following table provides information on the Premier Licenses that the switch supports.

| License type | Supported features |
|-----------------------------|--|
| Premier License | <ul style="list-style-type: none"> • DvR Controller • Extreme Integrated Application Hosting • Fabric Connect Layer 3 Virtual Services Networks (VSNs) • Greater than 16 BGP peers • Greater than 24 VRFs • VXLAN Gateway |
| Premier with MACsec License | <ul style="list-style-type: none"> • DvR Controller • Extreme Integrated Application Hosting • Fabric Connect Layer 3 Virtual Services Networks (VSNs) • Greater than 16 BGP peers • Greater than 24 VRFs • IEEE 802.1AE MACsec • VXLAN Gateway |

License Types and Part Numbers

The following table lists the license types and the associated part numbers.

| License Type | Part Number / Order Code |
|---|--------------------------|
| VSP 4450 Series and VSP 4900 Series Premier License | 338836 |
| VSP 7200 Series, VSP 8200 Series, and VSP 8400 Series Premier License | 380176 |
| VSP 4450 Series and VSP 4900 Series Premier with MACsec License | 338835 |
| VSP 7200 Series, VSP 8200 Series, and VSP 8400 Series Premier with MACsec License | 380177 |
| VSP 7400 Series Premier License | VSP-PRMR-LIC-P |

Port Licensing for the VSP 7200 Series

The VSP 7200 Series hardware models are available with twenty four 1/10 GbE SFP/SFP+ and four 40 GbE QSFP+ ports enabled by default. You must purchase a Port License to enable the remaining ports on the switch. You can use the Port License alone or combined with a Premier License or Premier License with MACsec at any time. When combining these licenses, the old license file must be deleted and the new license file that has the combination of Port and Premier or Premier with MACsec must be installed and loaded on the switch.

See [Feature Licensing for the VSP 4450 Series, VSP 4900 Series, VSP 7200 Series, VSP 7400 Series, and VSP 8000 Series](#) on page 2052 for more information about Premier License features.

The Port License order code is 386914.

**Note**

Port Licenses are not available with Trial Licenses.

Feature Licensing for VSP 8600

The VSP 8600 Series supports a licensing model that has two main categories of licenses: Base License and Feature Pack Licenses. A Base License enables base software features and one is required per IOC in the chassis. You require a Feature Pack License to enable additional features that are grouped into Feature Packs. These licenses are optional.

Licenses are tied to the switch Base MAC address. After you generate the license through Extreme Networks Support Portal at <https://extremeportal.force.com/ExtrLicenseLanding>, you can install the license on the switch.

**Note**

Release 6.1 is required to support licenses generated through the Extreme Networks Support Portal.

**Important**

The software continues to support .xml licenses generated by Avaya.

The following sections detail the different categories of licenses supported on the VSP 8600 Series switch.

Factory Default License

New switches include a 30-day Factory Default License that allows you to use all features, excluding MACsec. You can configure all features, except MACsec, without restrictions and save the configuration.

The system generates warning messages to inform you about the time remaining in the license period. The alerts appear once every 5 days for the first 25 days, and then once daily for the last 5 days. If you reboot the switch after the 30-day period, and a valid software license is not present, the licensed features in the configuration are not loaded. You must install a valid license to enable the licensed features.

Trial License

Trial Licenses allow you to test the licensed features at any time. The following two types of Trial Licenses are available:

- Trial License that allows the use of all features excluding MACsec
- Trial License that allows the use of all features including MACsec

A Trial License is valid for 60 days. You can activate a Trial License once per switch.

The system generates warning messages to inform you about the time remaining in the license period. The alerts appear once every 5 days for the first 55 days, and then once daily for the last 5 days. If you reboot the switch after the 60-day period, and a valid software license is not present, the licensed features in the configuration are not loaded. You must install a valid license to enable the licensed features.

Base License

A Base License allows you to use the Base software features on the switch. A Base License is required for each IOC module that you plan to install in the chassis. If the number of IOCs exceeds the licensed IOC quantity, the ports on the excess IOCs are license-locked and appear administratively down.

The software validates the number of license entitlements against the IOC modules present and assigns the licenses sequentially to the I/O slots, starting from slot 1 to slot 8. For example, if you install modules in I/O slots 1 through 4 but only purchase three Base Licenses, the switch automatically assigns the licenses to slots 1 to 3. The ports on the module in slot 4 are in the license-locked state and appear administratively down because the license entitlements on the switch are only for 3 IOCs. If you would like to override the default entitlement assignment, you can reassign it to a different slot by using the **license-grant** command.

Feature Pack Licenses

Features that are not available in the Base License are grouped into Feature Packs based on use case. You require a license to use a Feature Pack. A Feature Pack License applies to the entire chassis; you do not need to purchase this license type for each installed IOC module. Feature Pack Licenses are optional, incremental to the Base License and sold separately.

The following table provides information on the Feature Pack licenses that the VSP 8600 Series supports.

| License type | Supported features |
|------------------------------------|--|
| Layer 3 Virtualization | <ul style="list-style-type: none"> Fabric Connect Layer 3 Virtual Services Networks (VSNs) DVR Controller Greater than 25 VRFs Greater than 17 BGP Peers |
| Layer 3 Virtualization with MACsec | <ul style="list-style-type: none"> Fabric Connect Layer 3 Virtual Services Networks (VSNs) DVR Controller Greater than 25 VRFs Greater than 17 BGP Peers MACsec |

VSP 8600 License types and part numbers

The following table provides the part numbers for the various licenses the VSP 8600 supports.

Table 236: Supported licenses

| License type | Part number/ Order code |
|--|-------------------------|
| Base License - one per IOC Module | 392259 |
| Layer 3 Virtualization Feature Pack License - one per chassis | 392670 |
| Layer 3 Virtualization+MACsec Feature Pack License - one per chassis | 392671 |

Subscription Licensing for XA1400 Series

Each XA1400 Series device requires a subscription license.

Licenses are tied to the switch Base MAC address and switch model type. After you generate the license through Extreme Networks Support Portal at <https://extremeportal.force.com/ExtrLicenseLanding>, you can install the license on the switch.

**Note**

VOSS Release 8.0.50 or later is required to support subscription licenses generated through the Extreme Networks Support Portal.

The following sections detail the different categories of licenses supported on the XA1400 Series switch.

Factory Default Trial License

A new switch includes a 60-day Factory Default Trial License starting from the time the switch is first booted. You can configure all features (except MACsec), without restrictions and save the configuration. No license file is required.

The system generates warning messages to inform you about the time remaining in the license period. The alerts appear once every 5 days for the first 55 days, and then once daily for the last 5 days. If you reboot the switch after the 60-day period, and a valid software license is not present, the licensed features in the configuration are not loaded. You must install a valid license to enable the licensed features.

Subscription License

All subscription licenses support all VOSS features on the switch, plus software upgrades and technical support services entitlement during the license term. A one, three, or five year subscription license is required for each XA1400 Series device. Three services entitlement tiers of license are available: ExtremeWorks, PartnerWorks, and ExtremeWorks Premier.

A Subscription License is available in two bandwidth tiers of licenses: Small License and Medium License. A Small License enables up to 100 Mbps aggregate throughput Fabric Extend WAN tunneling connectivity, and a Medium License enables up to 500 Mbps aggregate throughput Fabric Extend WAN tunneling connectivity.

License expiry notifications are sent to the console and management station every 30 days until the last 30 days of the subscription. Then every 5 days until the last 9 days of the subscription, and then daily until the Subscription License expires.

When a subscription expires, notification messages are shown on the console and in the alarms database, indicating that the license is expired. Existing software functionality is not impaired upon subscription license expiry. However, software upgrades are disallowed until the new license is activated. Additionally, access to Software and Services GTAC support is suspended for the product until a valid license is activated.

XA1400 Series License Types and Part Numbers

The following table provides the part numbers for the various licenses the XA1400 Series supports.

Table 237: Supported licenses

| Small Subscription Licenses (up to 100 Mbps) | Part number/ Order code |
|--|-------------------------|
| 1 year, ExtremeWorks | FCVPN-100-EW-1Y |
| 1 year, PartnerWorks | FCVPN-100-PW-1Y |
| 1 year, ExtremeWorks Premier | FCVPN-100-EWP-1Y |
| 3 years, ExtremeWorks | FCVPN-100-EW-3Y |
| 3 years, PartnerWorks | FCVPN-100-PW-3Y |
| 3 years, ExtremeWorks Premier | FCVPN-100-EWP-3Y |
| 5 years, ExtremeWorks | FCVPN-100-EW-5Y |
| 5 years, PartnerWorks | FCVPN-100-PW-5Y |
| 5 years, ExtremeWorks Premier | FCVPN-100-EWP-5Y |

| Medium Subscription Licenses (up to 500 Mbps) | Part number/ Order code |
|---|-------------------------|
| 1 year, ExtremeWorks | FCVPN-500-EW-1Y |
| 1 year, PartnerWorks | FCVPN-500-PW-1Y |
| 1 year, ExtremeWorks Premier | FCVPN-500-EWP-1Y |
| 3 years, ExtremeWorks | FCVPN-500-EW-3Y |
| 3 years, PartnerWorks | FCVPN-500-PW-3Y |
| 3 years, ExtremeWorks Premier | FCVPN-500-EWP-3Y |
| 5 years, ExtremeWorks | FCVPN-500-EW-5Y |
| 5 years, PartnerWorks | FCVPN-500-PW-5Y |
| 5 years, ExtremeWorks Premier | FCVPN-500-EWP-5Y |

Note

500 Mbps Subscription Licenses are only supported on XA1480 devices.

Licensing for Universal Hardware

The following topics apply to Extreme Networks 5520 Series hardware. Because the 5520 Series hardware supports more than one Network Operating System (NOS) personality, it uses a licensing scheme that is NOS agnostic.

Feature Licensing for Universal Hardware

Extreme Networks offers universal hardware products that support more than one Network Operating System (NOS) personality. The universal hardware products share a unified license, which is NOS agnostic.

The Base License, which is included with the purchase of the switch, enables the basic networking capabilities of the device. You can purchase additional licenses separately to enable advanced features on the switch.

Licenses are tied to the switch serial number. After you generate the license through the Extreme Networks Support Portal at <https://extremeportal.force.com/ExtrLicenseLanding>, you can install the license on the switch manually. You can also use ExtremeCloud IQ to obtain licenses for universal hardware switches.

The following sections detail the different categories of licenses.

Evaluation License

New ExtremeSwitching 5520 Series switches include a factory-default (Evaluation) license that enables the use of all features, except MACsec, for a duration of 30 days. You can configure all features without restrictions and save the configuration.

You cannot configure new features after the 30-day period, but the switch continues to run with the existing configured features. If you reboot the switch after the 30-day period, and a valid software license is not present, licensed features in the configuration are not loaded. You must install a valid license to enable licensed features.

Base License

A Base license gives customers the right to use Base software features on the switch.

Licenses for Advanced Features

Licenses enable advanced features not available in the Base License. The following table provides information on the features enabled by each license, if the hardware supports the feature. For information on supported features, see [VOSS Feature Support Matrix](#).

| License type | Supported features |
|-----------------|---|
| MACsec License | IEEE 802.1AE MACsec |
| Premier License | <ul style="list-style-type: none"> DvR Controller Fabric Connect Layer 3 Virtual Services Networks (VSNs) Greater than four OSPF active Interfaces Greater than two BGP peers Greater than 24 VRFs |

License Types and Part Numbers

The following table lists the license types and the associated part numbers.

| License Type | Part Number / Order Code |
|---------------------------------|--------------------------|
| MACsec License for 5520 Series | 5000-MACSEC-LIC |
| Premier License for 5520 Series | 5000-PRMR-LIC |

ExtremeCloud™ IQ Pilot License

ExtremeSwitching 5520 Series switches include a one-year subscription to an ExtremeCloud™ IQ Pilot license.

Note

The entitlement period starts the day the switch ships from Extreme Networks or an Extreme Networks distribution partner.

ExtremeCloud IQ enables end-to-end network management and operations, delivering a fully integrated, extensible platform that simplifies the design, deployment, and security of networks from the edge to the data center, while simultaneously unlocking valuable IT and business insights. To activate these premium Pilot level capabilities, go to <https://www.extremenetworks.com/universal-switch-xiq-pilot>.

Install and Uninstall Licenses on Universal Switches

This topic explains how to obtain, activate, and transfer licenses on universal hardware switches.

Obtain and Install a License

For universal hardware switches, you can activate a license on the switch using either of the following methods:

- Manual activation by obtaining the license activation file from the [Extreme Networks Support portal](#).
- Automated activation using ExtremeCloud IQ. For information about using ExtremeCloud IQ for bulk automated license activation, go to <https://www.extremenetworks.com/support/documentation/extremecloud-iq>.

To obtain and install a license, follow these steps:

Note

You should have received by email a license voucher after your purchase of a switch. You will need the voucher ID number on this email to generate a license.

For manual license generation and installation:

1. Upgrade the switch so that it is running the most recent GA version of the software.

To download the latest GA software, visit the [Extreme Networks Support portal](#).

2. Follow manual activation instructions for license generation available on the [Extreme Networks Support portal](#): **Products > Products Home > ExtremeSwitching > Universal > VOSS (for your switch) > Activation Instructions.**
3. Download the license file onto the switch.
4. Install the license, using the command `load-license license_filename`.

VOSS verifies the license and activates the features that correspond to the license category (MACsec or Premier).

For more information, see either of the following:

- [License Installation using CLI](#) on page 2061
- [License Installation using EDM](#) on page 2066

Transfer a License

You can permanently remove a license, which allows you to transfer the license to another switch. This should only be done when preparing to return a defective switch for a replacement switch (RMA).

For more information, see either of the following:

- [Revoke a License](#) on page 2063 (using CLI)
- [Revoke a License](#) on page 2070 (using EDM)

To transfer a license from a defective switch to a replacement switch (RMA), follow these steps.

1. Go to the [Extreme Networks Support portal](#).
2. Select **Assets > Licenses Home**.
3. Select **License Transfer**.
4. Enter the serial number of the defective unit, replacement unit serial number, and the RMA/case number.
5. Generate the new license, following the process in step 2 in [Obtain and Install a License](#) on page 2060.
6. Download the license file onto the switch.
7. Install the license, using the command `load-license license_filename`.

License Installation using CLI

Install and manage a license file for the switch by using the Command Line Interface (CLI).

Note

This section applies to multiple platforms. The command syntax and example outputs may not be identical on all hardware platforms.

Install a License File

Before You Begin

- File Transfer Protocol (FTP) and Trivial File Transfer Protocol (TFTP) support both IPv4 and IPv6 addresses, with no difference in functionality or configuration.
- You must enable the File Transfer Protocol (FTP) or Trivial File Transfer Protocol (TFTP) server depending on which protocol you use to download the license file to the device.
- Ensure that you have the correct license file with the base MAC address of the switch on which you need to install the license. Otherwise, the system does not unblock the licensed features.

About This Task

Install a license file on the switch to enable licensed features.

You can use the same procedure to load legacy license files, `license.dat`, on a VSP 4450 Series switch.

Note

You can enable FTP or TFTP in the boot config flags, and then initiate an FTP or a TFTP session from your workstation to put the file on the switch.

Procedure

1. From a remote station or PC, use FTP or TFTP to download the license file to the device and store the license file in the /intflash directory.

2. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

3. Load the license:

```
load-license WORD<0-63>
```

Note

If filename parameter is not used and more than one valid .xml license file exists in the /intflash/ directory, the switch uses the license with the highest capability.

Examples

Use FTP to transfer a license file from a PC to the internal flash on the device:

```
C:\Users\jsmith>ftp 192.0.2.16
Connected to 192.0.2.16 (192.0.2.16).
220 FTP server ready
Name (192.0.2.16:(none)): rwa
331 Password required
Password:
230 User logged in
ftp> bin
200 Type set to I, binary mode
ftp> put L3VWithMACsec.xml /intflash/L3VWithMACsec.xml
local: L3VWithMACsec.xml remote: /intflash/L3VWithMACsec.xml
227 Entering Passive Mode (192,0,2,16,4,2)
150 Opening BINARY mode data connection
226 Transfer complete
101 bytes sent in 2.7e-05 secs (3740.74 Kbytes/sec)
ftp>
```

Log in to the device and load the license. The following example shows a successful operation.

```
Switch:1(config)#load-license L3VWithMACsec.xml
Switch:1(config)#CP1 [06/12/15 15:59:57.636:UTC] 0x000005bc 00000000 GlobalRouter SW INFO
License Successfully Loaded From </intflash/L3VWithMACsec.xml> License Type -- L3V with
MACsec
```

The following example shows an unsuccessful operation.

```
Switch:1(config)#load-license license_Switch_example.xml
Switch:1(config)#CP1 [06/12/15 15:58:48.376:UTC] 0x000006b9 00000000 GlobalRouter SW
INFO Invalid license file /intflash/license_Switch_example.xml HostId is not Valid

CP1 [06/12/15 15:58:48.379:UTC] 0x000005c4 00000000 GlobalRouter SW INFO No Valid
License found.
```

Variable Definitions

The following table defines parameters for the **copy** command.

| Variable | Value |
|--------------------|---|
| < <i>a.b.c.d</i> > | Specifies the IPv4 and IPv6 address of the TFTP server from which to copy the license file. |
| < <i>file</i> > | Specifies the name of the license file when copied to the flash. The destination file name must meet the following requirements: <ul style="list-style-type: none"> • Maximum of 63 alphanumeric characters • No spaces or special characters allowed • Underscore (_) is allowed • The file extension ".xml" is required |
| < <i>srcfile</i> > | Specifies the name of the license file on the TFTP server. For example, license.xml. |

The following table defines parameters for the **load-license** command.

| Variable | Value |
|---|---|
| <i>WORD</i> <0-63> | Specifies the name of the license file when copied to the flash. The destination file name must meet the following requirements: <ul style="list-style-type: none"> • Maximum of 63 alphanumeric characters • No spaces or special characters allowed • Underscore (_) is allowed • The file extension ".xml" is required |
| Note:
Exception: only supported on 5520 Series, VSP 8600 Series, and XA1400 Series. | |

Revoke a License

Revoke a license on the switch if you need to transfer the license to a different switch.

You can permanently remove a license, which allows you to transfer the license to another switch. This should only be done when preparing to return a defective switch for a replacement switch (RMA).

Note

This procedure only applies to 5520 Series.

About This Task

The **no license** command invalidates the feature license and generates a revocation certificate, which is the first step to releasing the license entitlement back to the license entitlement manager (LEM). The revocation certificate is contained in a file where the first part of the file name is the switch serial number and the file extension is .rvk.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```

2. Revoke a license:

```
no license <macsec | premier>
```

Show a License File

Display the existing software licenses on your device. If the switch uses a Trial License, the output shows the time remaining in the trial period.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show the existing software licenses on your device:

```
show license
```

Examples

The following output shows a system with time remaining on a Trial License:

```
Switch:1>show license
License Type           : TRIAL
LicenseTrialPeriodRemainingDays : 59

*****
Features requiring a Premier license:
- Layer 3 VSNS
- MACsec
- Distributed Virtual Routing (DvR) Controller
- VXLAN GATEWAY
- >24 VRFs
- >16 BGP Peers
- Insight Virtualization
```

The following output is for a VSP 4450 Series switch that uses legacy .dat licenses. The output for the **show license** command for legacy licenses shows non-zero values for MD5 of Key and MD5 of File:

```
Switch:1>show license

License file name      : /intflash/premier.dat
License Type          : PREMIER
MD5 of Key             : 7ce34d20 0caf0074 6657d928 1b4a0a18
MD5 of File           : 9e0e5a4c 4855efb1 90909c11 bb870d84
Generation Time       : 2015/08/12 01:53:39
Expiration Time       :
Base Mac Addr         : b4:47:5e:37:9a:00
flags                 : 0x00000001 SINGLE
memo                  :

*****
Features requiring a Premier license:
- Layer 3 VSNS
- MACsec
- Distributed Virtual Routing (DvR) Controller
- >24 VRFs
```

The output for the **show license** command for .xml licenses shows all zeroes for MD5 of Key and MD5 of File:

```
Switch:1>show license

License file name      : /intflash/premier_macsec.xml

License Type          : PREMIER+MACSEC (includes Base features)
MD5 of Key            : 00000000 00000000 00000000 00000000
MD5 of File           : 00000000 00000000 00000000 00000000
Generation Time       : 2015/2/26 11:09:53
Expiration Time       :
Base Mac Addr         : b0:ad:aa:46:f0:00
flags                 : 0x00000001 SINGLE
memo                  :

*****
Features requiring a Premier license:
- Layer 3 VSNS
- MACsec
- Distributed Virtual Routing(DvR) Controller
- VXLAN GATEWAY

- >16 BGP Peers
```

The following **show license** command output is from a platform that supports Base Licenses per IO slot and Feature Pack Licenses.

```
Switch:1>show license

License file name      : /intflash/.sys/Base.xml
License Type           : BASE
Duration Type          : Perpetual
Generation Time        : 2017/01/05 20:57:22
Expiration Time        :
Host ID                : F873A2045000

*****
Features requiring a L3V + MacSec license:
- Layer 3 VSNS
- MACsec

*****

Number of IO license entitlements: 8
License granted for slots      : 1 2 5 8

*****
```

The following **show license** command output is from a XA1400 Series platform that supports Subscription Licenses.

```
Switch:1>show license

License file name      : FCVPN500-EW-5YR.xml
License Type           : FCVPN500-EW-5YR
Duration Type          : TimeBased
Generation Time        : 2019/06/10 06:50:08
Expiration Time        : 2024/06/08
Host ID                : DCB808B66000
```

```
*****
```

The following **show license** command output is from a universal hardware platform that supports Base, Premier, and MACsec licenses.

```
Switch:1>show license

      BASE License: Activated, Perpetual
      PREMIER License: Not available
      MACSEC License: Not Available
*****
```

Assigning a Base License to an IOC module slot

About This Task

The system validates the number of license entitlements against the IOC modules present and assigns the licenses sequentially to the I/O slots, starting from slot 1 to slot 8.

If you install a module in a slot that has a license assigned and later, when the module is moved to another slot that does not have a license assigned, you can reassign the license to the new slot by using the **license-grant** command.

Procedure

1. Enter Global Configuration mode:

```
enable

      configure terminal
```
2. Load the license on the slot and enable the ports on the IOC module:

```
license-grant slot {slot[-slot] [,...]}
```
3. Release the license from a slot:

```
no license-grant slot {slot[-slot] [,...]}
```

Example

Load the license on the specified slot and enable the ports on the IOC module:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#license-grant slot 2
License granted for slot: 2
Switch:1(config)#
```

License Installation using EDM

Install and manage a license file for the switch by using Enterprise Device Manager (EDM).

Note

This section applies to multiple platforms. The fields may not be identical on all hardware platforms.

Install a License File

Before You Begin

- You must store the license file on a file server.
- Ensure that you have the correct license file with the base MAC address of the switch on which you need to install the license. Otherwise, the system does not unblock the licensed features.

About This Task

Install a license file on the switch to enable licensed features. The license filename stored on a device must meet the following requirements:

- Maximum of 63 alphanumeric characters
- No spaces or special characters allowed
- Underscore (_) is allowed
- The file extension ".xml" is required

Note

You can use the same procedure to load legacy license files, license.dat, on a VSP 4450 Series switch.

IPv4 and IPv6 addresses are supported.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Click **File System**.
3. Click the **Copy File** tab.
4. In the **Source** box, type the IP address of the file server where the license file is located and the name of the license file.
5. In the **Destination** box, type the flash device and the name of the license file.
The license file name must have a file extension of .xml.
6. Select **start**.
7. Click **Apply**.
The license file is copied to the flash of the device. The status of the file copy appears in the Result field.
8. In the navigation pane, expand **Configuration > Edit**.
9. Click **Chassis**.
10. Click the **System** tab.
11. In **ActionGroup1**, select **loadLicense**.
12. In **LicenseFileName** box, type the name of the license file.
13. Click **Apply**.

Important

If the loading fails, the switch cannot unlock the licensed features and reverts to base functionality.

14. On the **System** tab, in **ActionGroup1**, select **saveRuntimeConfig**.

15. Click **Apply**.

Copy File Field Descriptions

Use the data in the following table to use the **Copy File** tab.

| Name | Description |
|--------------------|---|
| Source | Identifies the device and file name to copy. You must specify the full path and filename, for example, <deviceip-ftp server>:/<filename> |
| Destination | Identifies the location to which to copy the source file with the filename, for example, /intflash/<filename> |
| Action | Starts or stops the copy process. |
| Result | Specifies the result of the copy process: <ul style="list-style-type: none"> • none • inProgress • success • fail • invalidSource • invalidDestination • outOfMemory • outOfSpace • fileNotFound |

System Field Descriptions

Use the data in the following table to use the **System** tab.

| Name | Description |
|--------------------------------|--|
| sysDescr | Shows the system assigned name and the software version. |
| sysUpTime | Shows the elapsed time since the system last started. |
| sysContact | Configures the contact information. |
| sysName | Configures the name of this device. |
| sysLocation | Configures the physical location of this device. |
| VirtualIpAddr | Configures the virtual IP address that the primary CPU advertises and stores in the switch configuration file. |
| VirtualNetMask | Configures the net mask of the virtual management IP address. |
| VirtualIpv6Addr | Specifies the virtual IPv6 address. |
| VirtualIpv6PrefixLength | Specifies the length of the virtual IPv6 address prefix (in bits). |
| DnsDomainName | Configures the default domain for querying the DNS server. |

| Name | Description |
|---|---|
| LastChange | Displays the time since the last configuration change. |
| LastVlanChange | Displays the time since the last VLAN change. |
| LastStatisticsReset | Displays the time since the statistics counters were last reset. |
| LastRunTimeConfigSave | Displays the last run-time configuration saved. |
| DefaultRuntimeConfigFileName | Displays the default Run-time configuration file directory name. |
| ConfigFileName | Specifies the name of a new configuration file. |
| ActionGroup1

Note:
Exception: revokeLicensePremier and revokeLicenseMacsec only supported on the 5520 Series. | Can be one of the following actions: <ul style="list-style-type: none"> • resetCounters—resets all statistic counters • saveRuntimeConfig—saves the current run-time configuration • loadLicense—Loads a software license file to enable features • revokeLicensePremier—Revokes the Premier license and generates a revocation certificate in XML format • revokeLicenseMacsec—Revokes the MACsec license and generates a revocation certificate in XML format |
| LicenseFileName

Note:
Exception: only supported on the 5520 Series, VSP 8600 Series, and the XA1400 Series. | Specifies the name of the license file when copied to the flash. The destination file name must meet the following requirements: <ul style="list-style-type: none"> • Maximum of 63 alphanumeric characters • No spaces or special characters allowed • Underscore (_) is allowed • The file extension ".xml" is required |
| ActionGroup2 | Specifies the following action:
resetIstStatCounters —Resets the IST statistic counters |
| ActionGroup3 | Can be the following action:
• flushIpRouteTbl —flushes IP routes from the routing table |
| ActionGroup4 | Can be the following action:
• softReset —resets the device without running power-on tests
• cpuSwitchOver —switches over to the other CPU
• softResetCoreDump —reset with coredump |

| Name | Description |
|--|--|
| Result | Displays a message after you click Apply . |
| LocatorLED

Note:
Exception: only supported on 5520 Series and VSP 4900 Series. | Configures the system Locator LED on or off. The default is off. |

Revoke a License

Revoke a license on the switch if you need to transfer the license to a different switch.

You can permanently remove a license, which allows you to transfer the license to another switch. This should only be done when preparing to return a defective switch for a replacement switch (RMA).

Note

This procedure only applies to 5520 Series.

About This Task

The **revokeLicensePremier** or **revokeLicenseMacsec** parameter invalidates the feature license and generates a revocation certificate, which is the first step to releasing the license entitlement back to the license entitlement manager (LEM). The revocation certificate is contained in a file where the first part of the file name is the switch serial number and the file extension is .rvk.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **System** tab.
4. In **ActionGroup1**, select either **revokeLicensePremier** or **revokeLicenseMacsec**.
5. Select **Apply**.
6. In **ActionGroup1**, select **saveRuntimeConfig**.
7. Select **Apply**.

System Field Descriptions

Use the data in the following table to use the **System** tab.

| Name | Description |
|-------------------|--|
| sysDescr | Shows the system assigned name and the software version. |
| sysUpTime | Shows the elapsed time since the system last started. |
| sysContact | Configures the contact information. |
| sysName | Configures the name of this device. |

| Name | Description |
|--|---|
| sysLocation | Configures the physical location of this device. |
| VirtualIpAddr | Configures the virtual IP address that the primary CPU advertises and stores in the switch configuration file. |
| VirtualNetMask | Configures the net mask of the virtual management IP address. |
| VirtualIpv6Addr | Specifies the virtual IPv6 address. |
| VirtualIpv6PrefixLength | Specifies the length of the virtual IPv6 address prefix (in bits). |
| DnsDomainName | Configures the default domain for querying the DNS server. |
| LastChange | Displays the time since the last configuration change. |
| LastVlanChange | Displays the time since the last VLAN change. |
| LastStatisticsReset | Displays the time since the statistics counters were last reset. |
| LastRunTimeConfigSave | Displays the last run-time configuration saved. |
| DefaultRuntimeConfigFileName | Displays the default Run-time configuration file directory name. |
| ConfigFileName | Specifies the name of a new configuration file. |
| ActionGroup1

Note:
Exception: revokeLicensePremier and revokeLicenseMacsec only supported on the 5520 Series. | Can be one of the following actions: <ul style="list-style-type: none"> • resetCounters—resets all statistic counters • saveRuntimeConfig—saves the current run-time configuration • loadLicense—Loads a software license file to enable features • revokeLicensePremier—Revokes the Premier license and generates a revocation certificate in XML format • revokeLicenseMacsec—Revokes the MACsec license and generates a revocation certificate in XML format |
| LicenseFileName

Note:
Exception: only supported on the 5520 Series, VSP 8600 Series, and the XA1400 Series. | Specifies the name of the license file when copied to the flash. The destination file name must meet the following requirements: <ul style="list-style-type: none"> • Maximum of 63 alphanumeric characters • No spaces or special characters allowed • Underscore (_) is allowed • The file extension ".xml" is required |
| ActionGroup2 | Specifies the following action: <ul style="list-style-type: none"> • resetIstStatCounters—Resets the IST statistic counters |

| Name | Description |
|--|---|
| ActionGroup3 | Can be the following action: <ul style="list-style-type: none"> • flushIpRouteTbl—flushes IP routes from the routing table |
| ActionGroup4 | Can be the following action: <ul style="list-style-type: none"> • softReset—resets the device without running power-on tests • cpuSwitchOver—switches over to the other CPU • softResetCoreDump—reset with coredump |
| Result | Displays a message after you click Apply . |
| LocatorLED

Note:
Exception: only supported on 5520 Series and VSP 4900 Series. | Configures the system Locator LED on or off. The default is off. |

View License File Information

About This Task

View information about the license file for the switch.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Click **Chassis**.
3. Click the **License** tab.

License field descriptions

Use the data in the following table to use the **License** tab.

| Name | Description |
|----------------------|--|
| FileName | Indicates the file name of the current license.

Note:
If this field is empty it indicates that there is no license installed on the switch. |
| LicenseType | Indicates the level type of the current license. |
| DurationType | Indicates the duration type of the current license. |
| RemainingDays | Indicates the days left before the factory default trial period or subscription license expires.

Note:
For other license types, the field displays 0. |

| Name | Description |
|-----------------------|--|
| GenerationTime | Indicates the date on which the license file was generated.

Note:
If there is no license installed on the system, this field displays 0000000000000000 H. |
| ExpirationTime | Indicates the date on which the license file expired.

Note:
If there is no license installed on the system, this field displays 0000000000000000 H. |

System Field Descriptions

Use the data in the following table to use the **System** tab.

| Name | Description |
|-------------------------------------|--|
| sysDescr | Shows the system assigned name and the software version. |
| sysUpTime | Shows the elapsed time since the system last started. |
| sysContact | Configures the contact information. |
| sysName | Configures the name of this device. |
| sysLocation | Configures the physical location of this device. |
| VirtualIpAddr | Configures the virtual IP address that the primary CPU advertises and stores in the switch configuration file. |
| VirtualNetMask | Configures the net mask of the virtual management IP address. |
| VirtualIpv6Addr | Specifies the virtual IPv6 address. |
| VirtualIpv6PrefixLength | Specifies the length of the virtual IPv6 address prefix (in bits). |
| DnsDomainName | Configures the default domain for querying the DNS server. |
| LastChange | Displays the time since the last configuration change. |
| LastVlanChange | Displays the time since the last VLAN change. |
| LastStatisticsReset | Displays the time since the statistics counters were last reset. |
| LastRunTimeConfigSave | Displays the last run-time configuration saved. |
| DefaultRuntimeConfigFileName | Displays the default Run-time configuration file directory name. |

| Name | Description |
|---|---|
| ConfigFileName | Specifies the name of a new configuration file. |
| ActionGroup1

Note:
Exception: revokeLicensePremier and revokeLicenseMacsec only supported on the 5520 Series. | Can be one of the following actions: <ul style="list-style-type: none"> • resetCounters—resets all statistic counters • saveRuntimeConfig—saves the current run-time configuration • loadLicense—Loads a software license file to enable features • revokeLicensePremier—Revokes the Premier license and generates a revocation certificate in XML format • revokeLicenseMacsec—Revokes the MACsec license and generates a revocation certificate in XML format |
| LicenseFileName

Note:
Exception: only supported on the 5520 Series, VSP 8600 Series, and the XA1400 Series. | Specifies the name of the license file when copied to the flash. The destination file name must meet the following requirements: <ul style="list-style-type: none"> • Maximum of 63 alphanumeric characters • No spaces or special characters allowed • Underscore (_) is allowed • The file extension ".xml" is required |
| ActionGroup2 | Specifies the following action:
resetIstStatCounters —Resets the IST statistic counters |
| ActionGroup3 | Can be the following action:
• flushIpRouteTbl —flushes IP routes from the routing table |
| ActionGroup4 | Can be the following action:
• softReset —resets the device without running power-on tests
• cpuSwitchOver —switches over to the other CPU
• softResetCoreDump —reset with coredump |
| Result | Displays a message after you click Apply . |
| LocatorLED

Note:
Exception: only supported on 5520 Series and VSP 4900 Series. | Configures the system Locator LED on or off. The default is off. |

Assign a Base License to an IOC Module Slot

About This Task

The system validates the number of license entitlements against the IOC modules present and assigns the licenses sequentially to the I/O slots, starting from slot 1 to slot 8.

If you install a module in a slot that has a license assigned and later, when the module is moved to another slot that does not have a license assigned, you can reassign the license to the new slot.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Click **Chassis**.
3. Click the **License Grant** tab.
4. Do any one of the following:
 - To assign a license to a slot, double-click the cell in the **SlotGrant** column, and change the value to **true**.
 - To release a license from a slot, double-click the cell in the **SlotGrant** column and then change the value to **false**.
5. Click **Apply**.

License Grant field descriptions

Use the data in the following table to use the **License Grant** tab.

| Name | Description |
|------------------|---|
| Slot | Specifies the IO slot number. Valid slots are 1 to 8. |
| SlotGrant | Specifies the license status on the IO slot. <ul style="list-style-type: none">• True if valid license is granted to the slot• False if license is not granted to the slot |

Link Aggregation Control Protocol

[Link Aggregation Overview](#) on page 2076

[MultiLink Trunking with LACP](#) on page 2077

[LACP configuration considerations](#) on page 2080

[Important Information and Restrictions](#) on page 2081

[LACP configuration using CLI](#) on page 2082

[LACP configuration using EDM](#) on page 2095

The following sections provide the concepts and procedures you need to configure the Link Aggregation Control Protocol (LACP) to dynamically aggregate links as they become available to a trunk group.

Link Aggregation Overview

Link aggregation provides link level redundancy and increases load sharing. Use Link aggregation to bundle the ports into a port group, which is represented as one logical interface to the Media Access Control (MAC) layer.

The switch supports the following types of link aggregation:

- MultiLink Trunking (MLT)—a statically configured link bundling method. MLT is not standards based, but it interoperates with static link methods of other vendors.
- IEEE 802.3ad based link aggregation, through the Link Aggregation Control Protocol (LACP), dynamically aggregates links as they become available to a trunk group. Link Aggregation Control Protocol dynamically detects whether links can be aggregated into a link aggregation group (LAG) and does so after links become available. Link Aggregation Control Protocol also provides link integrity checking at Layer 2 for all links within the LAG.

Both MLT and IEEE 802.3ad based link aggregation are point-to-point functions.

The switch software offers LACP functionality layered with MLT. This document uses the term MLT with LACP to refer to this functionality.

Split MultiLink Trunking (SMLT)

Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency by providing for the addition of failure redundancy with subsecond failover, on top of all standard MLT link failure protection and flexible bandwidth scaling functionality. Use SMLT to connect a device that supports some form of link aggregation, be it a switch or a server, to two distinct separate SMLT endpoints or switches. These SMLT devices form a virtualized Switch Cluster through the SPBM cloud and are referred to as a Virtual Inter-Switch Trunk (vIST) Core Switch pair.

For more information, see the following sections:

- [Virtual Inter-Switch Trunk \(vIST\)](#) on page 2254
- [Simplified Virtual-IST](#) on page 2256
- [Split MultiLink Trunking](#) on page 2259

LACP with SMLT

You can use LACP on SMLT configurations. The switch provides modifications to the LACP in SMLT configurations. LACP-capable devices can connect to an SMLT aggregation pair.

Note

Virtual IST is not supported on LACP-enabled MLTs.

VLACP with SMLT

You can also configure Virtual LACP (VLACP) with an SMLT configuration. VLACP is a modification that provides end-to-end failure detection. VLACP is not a link aggregation protocol.

VLACP implements link status control protocol at the port level. This mechanism periodically checks the end-to-end health of a point-to-point or end-to-end connection. You can run VLACP on single ports or on ports that are part of an MLT.

Note

Do not configure VLACP on LACP-enabled ports. VLACP does not operate properly with LACP.

MultiLink Trunking with LACP

MultiLink Trunking (MLT) with Link Aggregation Control Protocol (LACP) manages ports and port memberships to form a link aggregation group (LAG). Use Link Aggregation Control Protocol to gather one or more links to form a LAG, which a Media Access Control (MAC) client treats as a single link. Link Aggregation Control Protocol can dynamically add or remove LAG ports, depending on availability and state.

IEEE 802.3ad overview

The IEEE 802.3ad standard comprises service interfaces, the LACP, the Marker Protocol, link aggregation selection logic, a parser or multiplexer, frame distribution, and frame collection functions.

The following illustration shows the major functions of IEEE 802.3ad defined as multiple link aggregation.

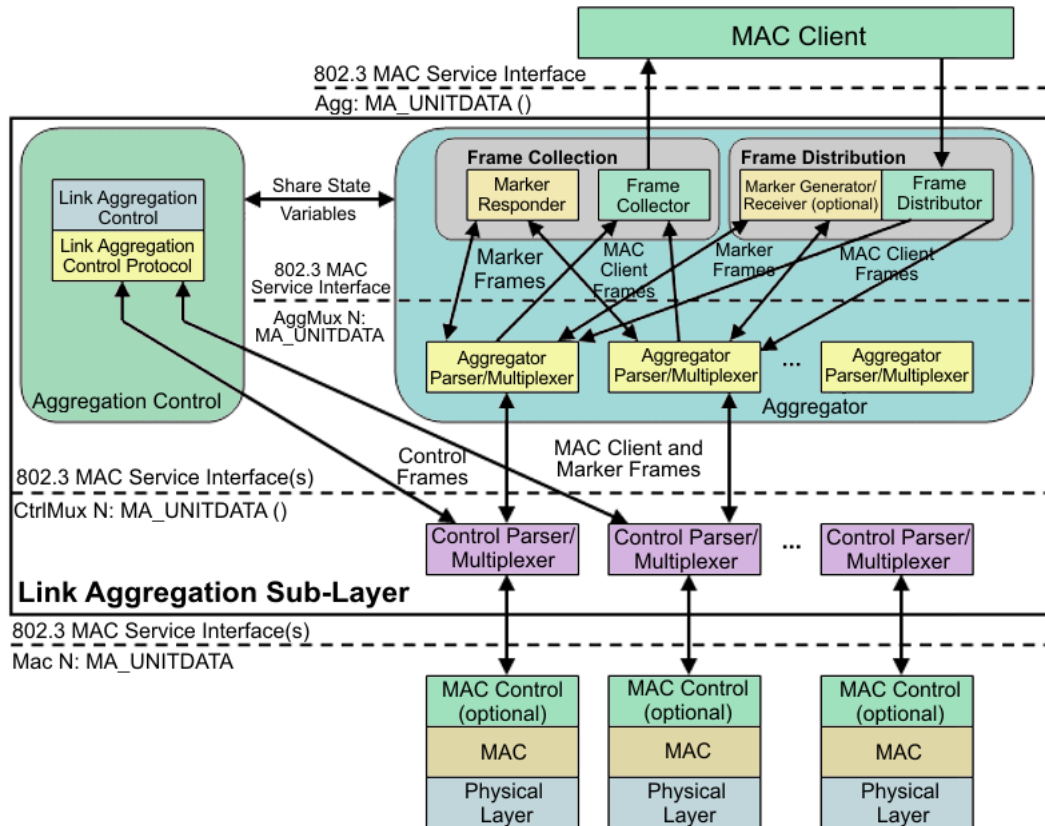

Figure 182: Link aggregation sublayer (according to IEEE 802.3ad)

The link aggregation sublayer comprises the following functions:

- frame distribution

This block takes frames submitted by the MAC client and sends them for transmission on the appropriate port based on a frame distribution algorithm employed by the Frame Distributor.

Frame distribution also includes an optional Marker Generator/Receiver used for the Marker Protocol. The switch only implements the Marker Receiver function. For more information about the frame distribution algorithm, see [MLT traffic distribution algorithm](#) on page 2257.

- frame collection

This block passes frames received from the various ports to the MAC client. Frame collection also includes a Marker Responder used for the Marker Protocol.

- aggregator parser or multiplexers

During transmission operations, these blocks pass frame transmission requests from the Distributor, Marker Generator, and Marker Responder to the appropriate port.

During receive operations, these blocks distinguish among Marker Request, Marker Response, MAC Client Protocol Data Units (PDU), and pass the blocks to the appropriate entity (Marker Responder, Marker Receiver, and Collector, respectively).

- aggregator

The combination of frame distribution and collection, and aggregator parser or multiplexers.

- aggregation control

This block configures and controls link aggregation. It incorporates LACP for the automatic communication of aggregation capabilities between systems and automatic configuration of link aggregation.

- control parser/multiplexers

During transmission operations, these blocks pass frame transmission requests from the aggregator and Control entities to the appropriate port.

During receive operations, these blocks distinguish Link Aggregation Control Protocol Data Units (LACPDUs) from other frames. The blocks pass, passing the LACPDUs to the appropriate sublayer entity and all other frames to the aggregator.

802.3ad link aggregation principles

Use link aggregation to group ports together to form a link group to another device. Link groups increase aggregate throughput between devices and provide link redundancy.

Link aggregation employs the following principles and concepts:

- A MAC client communicates with a set of ports through an aggregator, which presents a standard IEEE 802.3 service interface to the MAC client. The aggregator binds to one or more ports within a system.
- The aggregator distributes frame transmissions from the MAC client to various ports, collects received frames from the ports, and transparently passes the frames to the MAC client.
- A system can contain multiple aggregators serving multiple MAC clients. A port binds to a single aggregator at a time. A MAC client is served by a single aggregator at a time.
- The Link Aggregation Control function binds ports to aggregators within a system. The control function aggregates links, binds the system ports to an appropriate aggregator, and monitors conditions to determine if a change in aggregation is needed. Network managers can manually provide link aggregation control by manipulating the link aggregation state variables (for example, keys). You can also use LACP to automatically determine, configure, bind, and monitor link aggregation.
- LACP uses peer exchanges across links to continually determine the aggregation capability of the links and provide the maximum level of aggregation capability between a pair of systems.
- Frame ordering is maintained for certain sequences of frame exchanges between MAC Clients. The distributor ensures that all frames of a conversation pass to a single port. The collector passes frames to the MAC client in the order they are received from the port. The collector can select frames received from the aggregated ports. Because the frames are not ordered on a single link, this guarantees that frame ordering is maintained for all conversations.
- Conversations move among ports within an aggregation for load balancing and for maintaining availability if a link fails.
- Each port is assigned a unique, globally administered MAC address.

After entities initiate frame exchanges within the link aggregation sublayer, the source address is the MAC address. An example of an entity that initiates frame exchanges is LACP and Marker Protocol exchanges.

- Each aggregator is assigned a unique, globally administered MAC address that is used from the perspective of the MAC client, both as a source address for transmitted frames and as the destination address for received frames. You can use one of the port MAC addresses in the associated LAG as the MAC address of the aggregator.

Input/output port redundancy

You can use the MLT link aggregation mechanism to protect I/O ports. MLT is compatible with 802.3ad static, and provides a load sharing and failover mechanism to protect against module, port, fiber, or complete link failures.

You can use MLT with Link Access Control Protocol (LACP) disabled or use LACP enabled by itself.

LACP configuration considerations

You can configure priorities, keys, modes, and timers for the LACP.

LACP priority

You can configure LACP priority at the system and port level as follows:

- Port priority—determines which ports are aggregated into a LAG that has more than eight ports configured to it.
- System priority—generates the switch ID after communicating with other systems. As a best practice, use the default value. If you need to change it, first disable the LACP, and then enable it again after you change the value.

LACP keys

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

- Keys do not have to match between two LACP peers.

LACP timers

You can customize failover times by changing the LACP timer attributes (fast periodic time, slow periodic time, and aggregate wait time). Values are set by default to match the IEEE 802.3ad values. If you change the values, they must match on the ports participating in aggregation between two devices.

Changes to LACP timer values at the global level are reflected on all ports. However, you can change the LACP timer values for each port level. After you change an LACP timer globally, this value is set on all ports. The global timer value overwrites the local port value irrespective of the LACP state. You must configure port values that differ from the global values.

The switch software uses the following LACP timers:

- fast periodic timer—200 to 20 000 milliseconds (ms); default 1000 ms
- slow periodic timer—10 000 to 30 000 ms; default 30000 ms
- aggregation-wait timer—200 to 2000; default 2000

You cannot aggregate a link if it does not receive an LACPDU for a period of timeout x slow periodic time = 3 x 30 seconds = 90 seconds. If you use the fast periodic time, the timeout period is 3 x 1000 ms = 3 seconds. You must make timer changes to all ports participating in link aggregation and to the ports on the partnering node.

Configuration changes to the LACP timers are not reflected immediately. Link Aggregation Control Protocol timers do not reset until the next time you restart LACP globally or on a port. This ensures consistency with peer switches.

After you enable LACP on a port, the timer values are set at the port level. You must toggle the LACP status after timer values change. This does not impact existing ports unless you toggle the LACP status on the port.

LACP modes

LACP uses two active and passive modes.

- Active mode—ports initiate the aggregation process. Active mode ports aggregate with other active mode ports or passive mode ports.
- Passive mode—ports participate in LACP but do not initiate the aggregation process. You must partner passive mode ports with active mode ports for aggregation to occur.

LACP and private VLANs

- When using LACP, configure the private-vlan at the interface level.

Link aggregation scaling

For the latest applicable scaling information, see [Release Notes for VOSS](#) for the version of the software running on the switch.

Important Information and Restrictions

Before you use the switch, review the following important information and restrictions.

LACP with Simplified vIST/SPB NNI links

You should not use LACP on SPB NNI MLT links or on the Simplified Virtual IST.

vIST VLAN IP addresses

Do not configure a Rendezvous Point (RP) or Bootstrap Router (BSR) on the vIST VLAN because you cannot ping them outside of the vIST VLAN subnet. When you enter the `ip pim enable` command on the vIST VLAN, the following message displays:

```
WARNING: Please do not use virtual IST VLAN IP address for BSR and RP
related configurations, as unicast packets to virtual IST vlan IP
address from outside of virtual IST vlan subnet will be dropped. Use
Loopback or CLIP interface IP address for BSR and RP related
configurations.
```

Simplified vIST and egress port-based filters

On Simplified vIST nodes, egress port-based filters may not work for IP multicast routed traffic because vIST internal filter rules (to prevent duplicate traffic) have higher precedence than user-created filters.

Note

- This issue is specific to IP multicast routed traffic only.
- Egress port-based filters work for Layer 2 multicast, broadcast and unicast traffic.

LACP configuration using CLI

This section describes how to configure and manage link aggregation using the Command Line Interface (CLI), including Link Aggregation Control Protocol (LACP), to increase the link speed and redundancy for higher availability.

MultiLink Trunking (MLT) with LACP manages switch ports and port memberships to form a link aggregation group (LAG). Configure LACP to allow dynamic bundling of physical ports to form a single logical channel.

You can describe the LACP in terms of link aggregation operations within a single system. You can configure a single piece of equipment so it contains more than one system (from the point of view of the link aggregation operation).

Before You Begin

- Changes to LACP made at the global level overrides and resets all port level settings.

Important

After you globally configure the LACP system priority, it applies to all LACP-enabled aggregators and ports. After you enable the LACP on an aggregator or port, it uses the global system priority value.

- After you make a timer change, restart the LACP (globally or on the port) so the changes are consistent across the link.

**Important**

Configuration changes to LACP timers are not reflected immediately. LACP timers are not reset until the next time LACP is restarted globally or on a port. This action ensures consistency with peer switches.

- The switch does not support standby ports for LACP aggregation groups.

Configuring global LACP parameters

Configure LACP parameters globally. After you configure the LACP system priority globally, it applies to all LACP-enabled aggregators and ports. After you enable the LACP on an aggregator or a port, it uses the global system priority value.

A change to the global parameter configuration takes effect after you restart the LACP globally or on each port.

About This Task

**Important**

Changes made at the global level override and reset all port level settings.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Change the system priority:

```
lACP system-priority <0-65535>
```

3. Configure additional LACP parameters as required:

```
lACP enable [aggr-wait-time <200-2000>] [fast-periodic-time  
<200-20000>] [slow-periodic-time <10000-30000>] [smlt-sys-id  
<0x00:0x00:0x00:0x00:0x00:0x00> ] [system-priority <0-65535> ]  
[timeout-scale <2-10>]
```

If you do not configure the optional parameters, the system uses the default values.

Example

```
Switch:1(config)#lACP fast-periodic-time 2000  
Switch:1(config)#lACP enable
```

Variable definitions

Use the data in the following table to use the **lacp** command.

| Variable | Value |
|---|--|
| <i>aggr-wait-time</i> <200-2000> | Configures the aggregation wait time (in milliseconds) globally. The default value is 2000. |
| <i>enable</i> | Enables LACP globally. The default value is disabled. |
| <i>fast-periodic-time</i> <200-20000> | Configures the fast periodic time (in milliseconds) globally. The default value is 1000. |
| <i>slow-periodic-time</i> <10000-30000> | Configures the slow periodic time globally. The default value is 30000. |
| <i>smlt-sys-id</i>
<0x00:0x00:0x00:0x00:0x00:0x00> | Configures the LACP system ID globally. Enter a MAC address in the following format:
0x00:0x00:0x00:0x00:0x00:0x00. |
| <i>system-priority</i> <0-65535> | Configures the LACP system priority globally. The default value is 32768. |
| <i>timeout-scale</i> <2-10> | Configures the timeout scale globally. The default value is 3. |

Configuring LACP on a port

Configure LACP on a port to enable or disable LACP on the selected ports.

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

Note

When enabling or disabling LACP on a port, as a best practice, disable the port first and re-enable the port after the configuration is complete.

The minimum LACP configuration is as follows:

- Assign a given key to a set of ports.
- Assign the same key to an MLT with no members. The ports will automatically become MLT members.

Keys do not have to match between two LACP peers.

About This Task

Important

Changes made at the global level override and reset all port level settings.

A port can operate in active or passive mode. You can configure a port to be an individual link or an aggregated link.

Note

When using LACP with private VLANs, configure the private VLAN at the interface level.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Assign an LACP key to a set of ports.

```
lacp key <1-512|defVal>
```

3. Change the LACP mode:

```
lacp mode <active|passive>
```

4. Change the port priority:

```
lacp priority <0-65535>
```

5. (Optional) Change the system priority:

```
lacp system-priority <0-65535>
```

6. Configure aggregation for the port:

```
lacp agrgr-wait-time <200-2000>[aggregation enable]
```

If you do not configure the optional parameter, the system uses the default values.

7. Configure parameters for the partner device at the opposite end of the link:

Note

All the parameters beginning with **partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what's learned from the partner, there will be trace or log message.

```
lacp partner-key <0-65535|defVal>
```

```
lacp partner-port <0-65535>
```

```
lacp partner-port-priority <0-65535>
```

```
lacp partner-state <0-255 | 0x0-0xff>
```

```
lacp partner-system-id 0x00:0x00:0x00:0x00:0x00:0x00
```

```
lacp partner-system-priority <0-65535>
```

8. Configure additional LACP parameters as required:

```
lacp enable [fast-periodic-time <200-20000>] [slow-periodic-time
<10000-30000>] [timeout-time <long|short>] [timeout-scale <2-10>]
```

If you do not configure the optional parameters, the system uses the default values.

Example

Configure LACP on ports 1/2 and 1/3:

```
Switch:1(config)# interface gigabitethernet 1/2-1/3
```

```
Switch:1(config-if)# lacp key 1 timeout short
```

```
Switch:1(config-if)# lacp aggregation enable
```

```
Switch:1(config-if)# lacp enable
```

Variable definitions

Use the data in the following table to use the **lacp** command.

Note

All the parameters beginning with **partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what's learned from the partner, there will be trace or log message.

| Variable | Value |
|--|--|
| <i>aggr-wait-time</i> <200-2000> | Configures the aggregation wait time (in milliseconds) for this port. The default is 2000. |
| <i>aggregation enable</i> | Enables aggregation on the port, which makes it an aggregated link. |
| <i>enable</i> | Enables LACP for this port. The default is disabled. |
| <i>fast-periodic-time</i> <200-20000> | Configures the fast periodic time (in milliseconds) for this port. The default is 1000 ms. |
| <i>key</i> <1-512 defVal> | Configures the aggregation key for this port. Enter the aggregation key value or defVal (1024 + IfIndex) |
| <i>mode</i> { <i>active</i> <i>passive</i> } | Configures the LACP mode to be active or passive. |
| <i>partner-key</i> <0-65535> | Configures the partner administrative key. |
| <i>partner-port</i> <0-65535> | Configures the partner administrative port value. |
| <i>partner-port-priority</i> <0-65535> | Configures the partner administrative port priority value. |

| Variable | Value |
|--|--|
| <code>partner-state <0-255 0x0-0xff></code> | Configures the partner administrative state bitmask. Specify the partner administrative state bitmap in the range 0x0–0xff. The bit to state mapping is Exp, Def, Dis, Col, Syn, Agg, Time, and Act.
For example, to set the two partner-state parameters <ul style="list-style-type: none"> • Act = true • Agg = true specify a value of 0x05 (bitmap = 00000101). |
| <code>partner-system-id <0x00:0x00:0x00:0x00:0x00:0x00></code> | Configures the partner administrative system ID. Specify a MAC address in the format 0x00:0x00:0x00:0x00:0x00:0x00. |
| <code>partner-system-priority <0-65535></code> | Configures the partner administrative system priority value. |
| <code>priority <0-65535></code> | Configures the port priority. The default value is 32768. To set this option to the default value, use the default operator with the command. |
| <code>slow-periodic-time <10000-30000></code> | Configures the slow periodic time for this port. The default is 30000 ms. To set this option to the default value, use the default operator with the command. |
| <code>system-priority <0-65535></code> | Configures the system priority for this port. The default is 32768. |
| <code>timeout-scale <2-10></code> | Configures a timeout scale for this port. The default value is 3. The LACP timeout is equal to the slow periodic time or fast periodic time multiplied by the timeout-scale, depending how you configure the timeout-time variable. |
| <code>timeout-time {long short}</code> | Configures the timeout to either long or short. |

Configure LACP on an MLT

Configure an MLT with LACP to use the dynamic link aggregation function.

About This Task

Important

Attach ports to an aggregator only if their system priorities are the same; otherwise, they are considered to be operating in two different switches. You can attach ports to an aggregator only if their keys are the same.

When you add a VLAN to a dynamic MLT, only the active ports of the MLT are added as port members of the VLAN. Ports configured with the same aggregation key, but not active, are not added to the VLAN. If these inactive ports become active later, the system does not automatically add them to the VLAN port member list.

You must add all inactive ports to the VLAN. If you do not add the inactive ports to the VLAN, when they become active later, hashing can result in choosing a newly active port for traffic forwarding. Because the port is not a port member of the VLAN, traffic will be dropped. When you add the VLAN to the MLT, also add the inactive aggregation ports to the VLAN. You may need to disable LACP on the

inactive ports before you can add them to the VLAN. Because the ports are inactive, disabling LACP does not cause a traffic interruption.

Similarly when you remove a VLAN from a dynamic MLT, all active ports of the MLT are removed from the VLAN port member list but the inactive members are not removed. You must remove the inactive aggregation members from the VLAN.

If you later configure a port for the same aggregation, you must add this port to all VLANs that are members of the MLT.

Procedure

1. Enter MLT Interface Configuration mode:

```
enable

configure terminal

interface mlt <1-512>
```
2. Configure LACP on an MLT:

```
lACP enable [key <0-512>] [system-priority <0-65535>]
```

Example

Enable LACP and configure the LACP key on MLT 3:

```
Switch:1(config)# interface mlt 3

Switch:1(config-mlt)# lACP enable key 1281
```

Variable definitions

Use the data in the following table to use the **lACP** command.

| Variable | Value |
|--|--|
| <code>enable</code> | Enables LACP on the MLT interface. |
| <code>key <0-512></code> | Configures the LACP aggregator key for a specific MLT. <ul style="list-style-type: none"> • <code>0-512</code> is the LACP actor admin key. |
| <code>system-priority <0-65535></code> | Configures the LACP system priority for a specific MLT. <ul style="list-style-type: none"> • <code>0-65535</code> is the system priority. |

Configuring LACP and Private VLANs

About This Task

Use the following procedure to configure Link Aggregation Control Protocol (LACP) on a private VLAN.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable trunking:

```
encapsulation dot1q
```

3. Set private VLAN port type:

```
private-vlan [isolated|promiscuous|trunk]
```

Example

```
Switch:1(config)#interface GigabitEthernet 1/6
Switch:1(config-if)#encapsulation dot1q
Switch:1(config-if)#private-vlan promiscuous
Switch:1(config-if)#exit
```

```
Switch:1(config)#interface GigabitEthernet 1/37
Switch:1(config-if)#encapsulation dot1q
Switch:1(config-if)#private-vlan promiscuous
```

Configuring LACP on a VLAN

Use this procedure to configure LACP on a VLAN.

About This Task**Important**

Configuration at the global level overrides and resets all settings at the VLAN level.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface vlan <1-4059>
```

2. Configure global aggregation wait time for the VLAN:

```
lACP aggr-wait-time <200-2000>
```

3. Enable LACP:

```
lACP enable
```

- Configure the global periodic time:

```
lacp enable [fast-periodic-time <200-20000>] [slow-periodic-time <10000-30000>]
```

If you do not configure the optional parameters, the system uses the default values.

- Configure a global LACP system ID.

```
lacp smlt-sys-id 0x00:0x00:0x00:0x00:0x00:0x00
```

- Configure the system priority:

```
lacp system-priority <0-65535>
```

- Configure the timeout-scale:

```
lacp timeout-scale <2-10>
```

Example

```
Switch:1(config)#interface vlan 20
Switch:1(config-if)#lacp fast-periodic-time 2000
Switch:1(config-if)#lacp enable
```

Variable definitions

Use the data in the following table to use the **lacp** command.

| Variable | Value |
|---|---|
| <i>aggr-wait-time</i> <200-2000> | Configures the aggregation wait time (in milliseconds) globally. The default is 2000. |
| <i>enable</i> | Enables LACP for the VLAN. The default is disabled. |
| <i>fast-periodic-time</i> <200-20000> | Configures the fast periodic time (in milliseconds) globally for the VLAN. The default is 1000 ms. |
| <i>slow-periodic-time</i> <10000-30000> | Configures the slow periodic time globally for the VLAN. The default is 30000 ms. |
| <i>smlt-sys-id</i>
0x00:0x00:0x00:0x00:0x00:0x00 | Configures the LACP system ID globally. |
| <i>system-priority</i> <0-65535> | Configures the LACP system priority globally. |
| <i>timeout-scale</i> <2-10> | Configures a timeout scale for the VLAN. The default value is 3.
The LACP timeout is equal to the slow periodic time or fast periodic time multiplied by the timeout-scale, depending how you configure the timeout-time variable. |

Viewing LACP configuration information

View LACP configuration information to determine the LACP parameters and to ensure your configuration is correct.

Procedure

1. View the global configuration:

```
show lacp
```

2. View LACP administrative information for the local device:

```
show lacp actor-admin interface [gigabitethernet]
```

OR

```
show lacp actor-admin interface gigabitethernet [vid <1-4059>] [{slot/  
port[/sub-port] [-slot/port[/sub-port]] [,...]]
```

3. View LACP operational information for the actor device:

```
show lacp actor-oper interface [gigabitethernet]
```

OR

```
show lacp actor-oper interface gigabitethernet [vid <1-4059>] [{slot/  
port[/sub-port] [-slot/port[/sub-port]] [,...]]
```

4. View LACP timer information:

```
show lacp extension interface [gigabitethernet]
```

5. View LACP interface configuration information

```
show lacp interface
```

OR

```
show lacp interface gigabitethernet [vid <1-4059>] [{slot/port[/sub-  
port] [-slot/port[/sub-port]] [,...]]
```

OR

```
show lacp interface mlt [<64-6399>]
```

OR

```
show lacp interface mlt [id<1-512>]
```

6. View LACP administrative information for the partner device:

```
show lacp partner-admin interface [gigabitethernet]
```

OR

```
show lacp partner-admin interface gigabitethernet [vid <1-4059>]  
[{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```

7. View LACP operational information for the partner device:

```
show lacp partner-oper interface [gigabitethernet]
```

OR

```
show lacp partner-oper interface gigabitethernet [vid <1-4059>]  
[{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```

Example

```
Switch:1# show lacp
=====
                        LACP Global Information
=====
      SystemId: 00:24:7f:a1:70:00
      SmltSystemId: 00:00:00:00:00:00
      LACP: enable
      system-priority: 32768
      timeout-admin: 3
      fast-periodic-time-admin: 1000
      slow-periodic-time-admin: 30000
      aggr-wait-time-admin: 2000
      timeout-oper: 3
      fast-periodic-time-oper: 2000
      slow-periodic-time-oper: 30000
      aggr-wait-time-oper: 2000
```

In the following example output, `aggr` indicates the port has become part of an aggregation. `indi` indicates individual.

```
Switch:1(config-if)# show lacp actor-admin interface gigabitethernet 1/1
=====
                        Actor Admin
=====
INDEX SYS  SYS          KEY  PORT  PORT  STATE
   Prio ID                               Prio
-----
1/1  32768 00:24:7f:9f:c0:00 1    0x114  32768 act short aggr

Switch:1(config-if)# show lacp partner-admin interface gigabitethernet 1/1
=====
                        Partner Admin
=====
INDEX SYS  SYS          KEY  PORT  PORT  STATE
   Prio ID                               Prio
-----
1/1  0      00:00:00:00:00:00 0    0x0    0      pas          long indi
```

Variable definitions

Use the data in the following table to use the **show lacp** command.

| Variable | Value |
|---|---|
| <pre>actor-admin interface gigabitethernet [vid <1-4059> {slot/ port[/sub-port] [-slot/port[/sub- port]] [,...]]</pre> | <p>Shows LACP actor (or local) administrative information for all interfaces or the specified interface.</p> <ul style="list-style-type: none"> Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. <i>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> is the port or port list. |
| <pre>actor-oper interface gigabitethernet [vid <1-4059> [{slot/ port[/sub-port] [-slot/port[/sub- port]] [,...]]]</pre> | <p>Shows LACP actor operational information for all interfaces or the specified interface.</p> <ul style="list-style-type: none"> Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. <i>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> is the port or port list. |
| <pre>extension interface gigabitethernet [vid <1-4059> [{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]]</pre> | <p>Shows LACP timer information for all interfaces or the specified interface.</p> <ul style="list-style-type: none"> Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. LACP configuration using EDM

MultiLink Trunking (MLT) with Link Aggregation Control Protocol (LACP) manages switch ports and port memberships to form a link aggregation group (LAG). Configure LACP to allow dynamic bundling of physical ports to form a single logical channel.

Note

The switch does not support standby ports for LACP aggregation groups.

Configuring global LACP parameters

Use LACP parameters to manage switch ports and their port memberships to form link aggregation groups (LAG). Link Aggregation Control Protocol (LACP) can dynamically add or remove LAG ports, depending on their availability and states.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > VLAN**.
2. Click **MLT/LACP**.
3. Click the **LACP Global** tab.
4. To enable LACP globally, select the **Enable** check box.
5. Configure the remaining parameters as required.

Important

Configuration changes to the LACP timers are not effective immediately. Link Aggregation Control Protocol timers are not reset until the next time LACP is restarted globally or on a port. This ensures consistency with peer switches.

6. Click **Apply**.

LACP Global field descriptions

Use the data in the following table to use the **LACP Global** tab.

| Name | Description |
|-----------------------------|--|
| Enable | Enables or disables LACP globally. |
| SystemPriority | Configures the system priority for all LACP enabled aggregators and ports.
The default value is 32768. |
| FastPeriodicTime | Configures the number of milliseconds between periodic transmissions that use short timeouts. Sets this value to all LACP-enabled ports. The range is 200-20000.
The default value is 1000. |
| FastPeriodicTimeOper | Displays the operating value of the fast periodic timer on the port.
The default value is 1000. |

| Name | Description |
|-----------------------------|---|
| SlowPeriodicTime | Configures the number of milliseconds between periodic transmissions that use long timeouts. All LACP enabled ports get the same value from this setting. The range is 10000–30000. The default value is 30000. |
| SlowPeriodicTimeOper | Displays the operating value of the slow periodic timer on the port. The default value is 30000. |
| AggrWaitTime | Configures the number of milliseconds to delay aggregation to allow multiple links to aggregate simultaneously. The range is 200–2000. The default value is 2000. |
| AggrWaitTimeOper | Displays the operating value of the aggregate wait timer on the port. The default value is 2000. |
| TimeoutScale | Configures the value used to calculate timeout time from the periodic time. All LACP-enabled ports get the same value from this setting. The range is 2–10. The default value is 3. |
| TimeoutScaleOper | Displays the operating value of the timeout scale on the port. The default value is 3. |
| SysId | Specifies the LACP system ID. The default value is f8:73:a2:00:90:00. |
| SmltSysId | Specifies the LACP system ID for Split MultiLink Trunking (SMLT). |

Configuring LACP parameters

Configure LACP parameters to manage LACP information.

About This Task

Important

The switch does not support standby ports for LACP aggregation groups.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > VLAN**.
2. Click **MLT/LACP**.
3. Click the **LACP** tab.
4. Double-click a field to change the value.

You cannot edit grey-shaded fields in the table.
5. Click **Apply**.

LACP field descriptions

Use the data in the following table to use the **LACP** tab.

| Name | Description |
|------------------------------|---|
| Index | The unique identifier the local system allocates to this aggregator. This attribute identifies an aggregator instance among the subordinate managed objects of the containing object. This value is read-only. |
| MACAddress | The six octet read-only value carrying the individual MAC address assigned to the aggregator. |
| ActorSystemPriority | The two octet read-write value indicating the priority value associated with the actor system ID. The default value is 32768. |
| ActorSystemID | The six octet read-write MAC address value used as a unique identifier for the system that contains this aggregator. From the perspective of the link aggregation mechanisms, only a single combination of actor system ID and system priority are considered. No distinction is made between the values of these parameters for an aggregator and the ports that are associated with it. The protocol is described in terms of the operation of aggregation within a single system. However, the managed objects provided for the both the aggregator and the port allow management of these parameters. The result permits a single piece of equipment to be configured by management to contain more than one system from the point of view of the operation of link aggregation, which is useful in the configuration of equipment that has limited aggregation capability. |
| AggregateOrIndividual | Indicates whether the aggregator represents an aggregate (true) or an individual link (false). |
| ActorAdminKey | Specifies the current administrative value of the key for the aggregator, which is a 16-bit read-write value. The administrative key value can differ from the operational key value. This key needs to match the LAG key. The default value is 0. |
| ActorOperKey | Displays the current read-only operational value of the key for the aggregator. The operational key value can differ from the administrative key value. The meaning of particular key values is of local significance. |
| PartnerSystemID | The six octet read-only MAC address value consisting of the unique identifier for the current protocol partner of this aggregator. A value of zero indicates that there is no known partner. If the aggregation is manually configured, the value is assigned by the local system. |
| PartnerSystemPriority | The two octet read-only value that indicates the priority value associated with the partner system ID. If the aggregation is manually configured, this system priority value is a value assigned by the local system. |
| PartnerOperKey | The current operational value of the key for the aggregator current protocol partner, which is a 16-bit read-only value. If the aggregation is manually configured, the value is assigned by the local system. |

Configuring LACP on a port

Configure LACP on a port to enable LACP.

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

The minimum LACP configuration is as follows:

- Assign a given key to a set of ports.
- Assign the same key to an MLT with no members. The ports will automatically become MLT members.

Keys do not have to match between two LACP peers.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation tree, expand the following folders: **Configuration > Edit > Port**.
3. Click **General**.
4. Click the **LACP** tab.
5. To enable LACP on the port, select the **AdminEnable** check box.
6. To assign an LACP key, configure the **ActorAdminKey** field.
7. Configure the remaining parameters as required.
8. Click **Apply**.

LACP field descriptions

Use the data in the following table to use the **LACP** tab.

All the parameters beginning with **Partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what is learned from the partner, there will be trace or log message.

| Name | Description |
|-----------------------------|--|
| AdminEnable | Enables LACP status for the port.
The default value is false. |
| OperEnable | Displays the operational status of LACP for the port.
The default value is false. |
| FastPeriodicTime | Specifies the number of milliseconds between periodic transmissions using short timeouts for all LACP enabled ports. The range is 200–20000.
The default value is 1000. |
| FastPeriodicTimeOper | Displays the operating value of the fast periodic timer on the port.
The default value is 1000. |
| SlowPeriodicTime | Specifies the number of milliseconds between periodic transmissions using long timeouts for all LACP enabled ports. The range is 10000–30000.
The default value is 30000. |

| Name | Description |
|-----------------------------|---|
| SlowPeriodicTimeOper | Displays the operating value of the slow periodic timer on the port.
The default value is 30000. |
| AggrWaitTime | Specifies the number of milliseconds to delay aggregation to allow multiple links to aggregate simultaneously. The range is 200–2000.
The default value is 2000. |
| AggrWaitTimeOper | Displays the operating value of the aggregate wait timer on the port.
The default value is 2000. |
| TimeoutScale | Assigns the value used to calculate timeout time from the periodic time. Set this value to all LACP enabled ports. The range is 2–10.
The default value is 3. |
| TimeoutScaleOper | Displays the operating value of the timeout scale on the port.
The default value is 3. |
| ActorSystemPriority | Specifies the two octet read-write value indicating the priority value associated with the actor system ID. The range is 0–65535.
The default value is 32768. |
| ActorSystemID | Displays the six octet read-write MAC address value used as a unique identifier for the system that contains this aggregator.
From the perspective of the link aggregation mechanisms, only a single combination of actor system ID and system priority are considered, and no distinction is made between the values of these parameters for an aggregator and the ports that are associated with it; that is, the protocol is described in terms of the operation of aggregation within a single system. However, the managed objects provided for the aggregator and the port both allow management of these parameters. The result of this is to permit a single piece of equipment to be configured by management to contain more than one system from the point of view of the operation of link aggregation. This can be of particular use in the configuration of equipment that has limited aggregation capability. |
| ActorAdminKey | Specifies the current read-write administrative value of the key for the aggregator, which is a 16-bit value in the range of 0–65535. The administrative key value can differ from the operational key value. This key needs to match the LAG key. |
| ActorOperKey | Displays the current read-only operational value of the key for the aggregator. The operational key value can differ from the administrative key value. The meaning of particular key values is of local significance. |

| Name | Description |
|--------------------------|--|
| SelectedAggID | Displays the identifier value of the aggregator that this aggregation port has currently selected. Zero indicates that the aggregation port has not selected an aggregator, either because it is in the process of detaching from an aggregator or because there is no suitable aggregator available for it to select. This value is read-only. |
| AttachedAggID | Displays the identifier value of the aggregator to which this aggregation port is currently attached. Zero indicates that the aggregation port is not currently attached to an aggregator. This value is read-only. |
| ActorPort | Displays the port number locally assigned to the aggregation port. The port number is communicated in LACPDUs as the Actor_Port. This value is read-only. |
| ActorPortPriority | Specifies the priority value assigned to this aggregation port. This 16-bit value is read-write in the range of 0–65535. The default value is 32768. |
| ActorAdminState | <p>Specifies a string of eight bits, corresponding to the administrative values as transmitted by the actor in LACPDUs, by selecting check boxes. The values are</p> <ul style="list-style-type: none"> • the first bit corresponds to bit 0 of Actor_State (LACP_Activity) (the default value) • the second bit corresponds to bit 1 (LACP_Timeout) • the third bit corresponds to bit 2 (Aggregation) • the fourth bit corresponds to bit 3 (Synchronization) • the fifth bit corresponds to bit 4 (Collecting) • the sixth bit corresponds to bit 5 (Distributing) • the seventh bit corresponds to bit 6 (Defaulted) • the eighth bit corresponds to bit 7 (Expired) <p>These values allow administrative control over the values of LACP_Activity, LACP_Timeout, and aggregation. This attribute value is read-write.</p> |
| ActorOperState | Displays a string of eight bits, corresponding to the current operational values of Actor_State as transmitted by the actor in LACPDUs. This attribute value is read-only. The default value is lacpActive. |

| Name | Description |
|-----------------------------------|--|
| PartnerAdminSystemPriority | Specifies the current administrative value of the port number for the protocol partner. It is a 16-bit read-write value in the range of 0–65535. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation. The default value is 0. |
| PartnerOperSystemPriority | Displays a two octet read-only value indicating the operational value of priority associated with the partner system ID. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemPriority if there is no protocol partner. The default value is 0. |
| PartnerAdminSystemID | Specifies a six octet read-write MAC address value that represents the administrative value of the aggregation port protocol partners system ID. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminKey, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation. The default value is 00:00:00:00:00:00. |
| PartnerOperSystemID | Displays a six octet read-only MAC address value that indicates representing the current value of the aggregation port protocol partner system ID. A value of zero indicates that there is no known protocol partner. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemID if there is no protocol partner. The default value is 00:00:00:00:00:00. |
| PartnerAdminKey | Specifies the current administrative value of the key for the protocol partner. It is a 16-bit read-write value in the range of 0–65535. The assigned value is used with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation. The default value is 0. |
| PartnerOperKey | Displays the current operational value of the key for the aggregator current protocol partner. It is a 16-bit read-only value. If the aggregation is manually configured, this value is assigned by the local system. The default value is 0. |

| Name | Description |
|---------------------------------|---|
| PartnerAdminPort | Specifies the current administrative value of the port number for the protocol partner. It is a 16-bit read-write value in the range of 0-65535. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation. The default value is 0. |
| PartnerOperPort | Displays the operational port number assigned to this aggregation port by the aggregation port protocol partner. The value of this attribute can contain the manually configured value carried in AggPortPartnerAdminPort if there is no protocol partner. This 16-bit value is read-only. The default value is 0. |
| PartnerAdminPortPriority | Specifies the current administrative value of the port priority for the protocol partner. It is a 16-bit read-write value in the range of 0-65535. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPort to achieve manually configured aggregation. The default value is 0. |
| PartnerOperPortPriority | Displays the priority value assigned to this aggregation port by the partner. The value of this attribute can contain the manually configured value carried in PartnerAdminPortPriority if there is no protocol partner. This 16 bit value is read-only. The default value is 0. |
| PartnerAdminState | Specifies a string of eight bits, corresponding to the current administrative value of Actor_State for the protocol partner, by selecting check boxes. This attribute value is read-write. The assigned value is used to achieve manually configured aggregation. The default value is none. |
| PartnerOperState | Displays a string of eight bits, corresponding to the current values of Actor_State in the most recently received LACPDU transmitted by the protocol partner. In the absence of an active protocol partner, this value can reflect the manually configured value PartnerAdminState. This attribute value is read-only. The default value is none. |

Configuring LACP on an Extreme Integrated Application Hosting Port

About This Task

Perform this procedure to configure Link Aggregation Control Protocol (LACP) on an Extreme Integrated Application Hosting (IAH) port. You must use the LACP keys to determine which IAH ports

are eligible for link aggregation. The LACP keys are defined by the IAH ports after you configure the multilink trunk (MLT). You can aggregate the IAH port key that matches the MLT key into that multilink trunk.

The minimum LACP configuration is as follows:

- Assign a given key to a set of IAH ports.
- Assign the same key to an MLT with no members. The IAH ports automatically become MLT members.

The keys do not have to match between two LACP peers.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > Edit > Insight Port**.
2. Select the IAH port you want to configure.
3. Select the **LACP** tab.
4. Select **AdminEnable**.
5. In the **ActorAdminKey** field, enter a value.
6. Configure the other parameters as required.
7. Click **Apply**.

LACP Field Descriptions

Use data in the following table to use the **LACP** tab.

Note

The **Partner** fields in the **LACP** tab are for debug purpose only. If you configure them locally and there is a mismatch with what is learned from the partner, trace or log messages are generated.

| Name | Description |
|-----------------------------|---|
| AdminEnable | Enables LACP status for the Extreme Integrated Application Hosting port.
The default value is false. |
| OperEnable | Specifies the LACP operational status for the Extreme Integrated Application Hosting port.
The default value is false. |
| FastPeriodicTime | Specifies the number of milliseconds between periodic transmissions using short timeouts for all LACP enabled Extreme Integrated Application Hosting ports.
The default value is 1000. |
| FastPeriodicTimeOper | Specifies the operating value of the fast periodic timer on the Extreme Integrated Application Hosting port.
The default value is 1000. |

| Name | Description |
|-----------------------------|--|
| SlowPeriodicTime | Specifies the number of milliseconds between periodic transmissions using long timeouts for all LACP enabled Extreme Integrated Application Hosting ports.
The default value is 30000. |
| SlowPeriodicTimeOper | Specifies the operating value of the slow periodic timer on the Extreme Integrated Application Hosting port.
The default value is 30000. |
| AggrWaitTime | Specifies the number of milliseconds to delay aggregation to enable multiple links to aggregate simultaneously.
The default value is 2000. |
| AggrWaitTimeOper | Specifies the operating value of the aggregate wait timer on the Extreme Integrated Application Hosting port.
The default value is 2000. |
| TimeoutScale | Specifies the value used to calculate timeout duration from the periodic time. Set the same value for all LACP enabled Extreme Integrated Application Hosting ports.
The default value is 3. |
| TimeoutScaleOper | Specifies the operating value of the timeout scale on the Extreme Integrated Application Hosting port.
The default value is 3. |
| ActorSystemPriority | Specifies the two octet read-write value indicating the priority value associated with the actor system ID.
The default value is 32768. |
| ActorSystemID | Specifies the six octet read-write MAC address value used as a unique identifier for the system that contains this aggregator.
From the perspective of the link aggregation mechanisms, only a single combination of actor system ID and system priority are considered, and no distinction is made between the values of these parameters for an aggregator and the Extreme Integrated Application Hosting ports that are associated with it; that is, the protocol is described in terms of the operation of aggregation within a single system. However, the managed objects provided for the aggregator and the Extreme Integrated Application Hosting port both allow management of these parameters. The result of this is to permit a single piece of equipment to be configured by management to contain more than one system from the point of view of the operation of link aggregation. This can be of particular use in the configuration of equipment that has limited aggregation capability. |

| Name | Description |
|--------------------------|--|
| ActorAdminKey | Specifies the current read-write administrative value of the key for the aggregator, which is a 16-bit value. The administrative key value can differ from the operational key value. This key must match the LAG key. |
| ActorOperKey | Specifies the current read-only operational value of the key for the aggregator. The operational key value can differ from the administrative key value. The meaning of particular key values is of local significance. |
| SelectedAggID | Specifies the identifier value of the aggregator that this aggregation port has currently selected. Zero indicates that the aggregation port has not selected an aggregator, either because it is in the process of detaching from an aggregator or because there is no suitable aggregator available for it to select. This value is read-only. |
| AttachedAggID | Specifies the identifier value of the aggregator to which this aggregation port is currently attached. Zero indicates that the aggregation port is not currently attached to an aggregator. This value is read-only. |
| ActorPort | Specifies the port number locally assigned to the aggregation port. The port number is communicated in LACPDUs as the Actor_Port. This value is read-only. |
| ActorPortPriority | Specifies the priority value assigned to this aggregation port. This 16-bit value is read-write. The default value is 32768. |
| ActorAdminState | <p>Specifies a string of eight bits, corresponding to the administrative values as transmitted by the actor in LACPDUs. The values are:</p> <ul style="list-style-type: none"> • the first bit corresponds to bit 0 of Actor_State (LACP_Activity) (the default value) • the second bit corresponds to bit 1 (LACP_Timeout) • the third bit corresponds to bit 2 (Aggregation) • the fourth bit corresponds to bit 3 (Synchronization) • the fifth bit corresponds to bit 4 (Collecting) • the sixth bit corresponds to bit 5 (Distributing) • the seventh bit corresponds to bit 6 (Defaulted) • the eighth bit corresponds to bit 7 (Expired) <p>These values enable administrative control over the values of LACP_Activity, LACP_Timeout, and aggregation. This attribute value is read-write.</p> |

| Name | Description |
|-----------------------------------|--|
| ActorOperState | Specifies a string of eight bits, corresponding to the current operational values of Actor_State as transmitted by the actor in LACPDUs. This attribute value is read-only. The default value is lacpActive. |
| PartnerAdminSystemPriority | Specifies the current administrative value of the Extreme Integrated Application Hosting port number for the protocol partner. It is a 16-bit read-write value. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation. The default value is 0. |
| PartnerOperSystemPriority | Displays a two octet read-only value indicating the operational value of priority associated with the partner system ID. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemPriority if there is no protocol partner. The default value is 0. |
| PartnerAdminSystemID | Specifies a six octet read-write MAC address value that represents the administrative value of the aggregation port protocol partners system ID. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminKey, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation. The default value is 00:00:00:00:00:00. |
| PartnerOperSystemID | Displays a six octet read-only MAC address value that indicates representing the current value of the aggregation port protocol partner system ID. A value of zero indicates that there is no known protocol partner. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemID if there is no protocol partner. The default value is 00:00:00:00:00:00. |
| PartnerAdminKey | Specifies the current administrative value of the key for the protocol partner. It is a 16-bit read-write value. The assigned value is used with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation. The default value is 0. |
| PartnerOperKey | Specifies the current operational value of the key for the aggregator current protocol partner. It is a 16-bit read-only value. If the aggregation is manually configured, this value is assigned by the local system. The default value is 0. |

| Name | Description |
|---------------------------------|--|
| PartnerAdminPort | Specifies the current administrative value of the port number for the protocol partner. It is a 16-bit read-write value. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation. The default value is 0. |
| PartnerOperPort | Specifies the operational Extreme Integrated Application Hosting port number assigned to this aggregation port by the aggregation port protocol partner. The value of this attribute can contain the manually configured value carried in AggPortPartnerAdminPort if there is no protocol partner. This 16-bit value is read-only. The default value is 0. |
| PartnerAdminPortPriority | Specifies the current administrative value of the port priority for the protocol partner. It is a 16-bit read-write value. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPort to achieve manually configured aggregation. The default value is 0. |
| PartnerOperPortPriority | Specifies the priority value assigned to this aggregation port by the partner. The value of this attribute can contain the manually configured value carried in PartnerAdminPortPriority if there is no protocol partner. This 16 bit value is read-only. The default value is 0. |
| PartnerAdminState | Specifies a string of eight bits, corresponding to the current administrative value of Actor_State for the protocol partner, by selecting check boxes. This attribute value is read-write. The assigned value is used to achieve manually configured aggregation. The default value is none. |
| PartnerOperState | Specifies a string of eight bits, corresponding to the current values of Actor_State in the most recently received LACPDU transmitted by the protocol partner. In the absence of an active protocol partner, this value can reflect the manually configured value PartnerAdminState. This attribute value is read-only. The default value is none. |

The following sections describe how to use Link Layer Discovery Protocol (LLDP) and Industry Standard Discovery Protocol (ISDP).

Link Layer Discovery Protocol (802.1AB) Fundamentals

With Link Layer Discovery Protocol (LLDP) you can obtain node and topology information to help detect and correct network and configuration errors.

LLDP

802.1AB is the IEEE standard called Station and Media Access Control Connectivity Discovery. This standard defines the Link Layer Discovery Protocol.

LLDP stations connected to a local area network (LAN) can advertise station capabilities to each other, allowing the discovery of physical topology information for network management.

LLDP-compatible stations can comprise any interconnection device, including PCs, IP Phones, switches, and routers.

Each LLDP station stores LLDP information in a standard Management Information Base (MIB), making it possible for a network management system (NMS) or application to access the information.

The functions of an LLDP station include:

- Advertising connectivity and management information about the local station to adjacent stations
- Receiving network management information from adjacent stations
- Enabling the discovery of certain configuration inconsistencies or malfunctions that can result in impaired communications at higher layers

For example, you can use LLDP to discover duplex mismatches between an IP Phone and the connected switch.

LLDP is compatible with IETF PROTO MIB (IETF RFC 2922).

The following figure shows an example of a LAN using LLDP.

Figure 183: LLDP in a LAN

Legend:

1. The switch and an LLDP-enabled router advertise chassis and port IDs and system descriptions to each other
2. The devices store the information about each other in local MIB databases, accessible with SNMP
3. A network management system retrieves the data stored by each device and builds a network topology map
4. Switch
5. Router
6. Management work station
7. IP Phone

LLDP modes

LLDP is a one-way protocol.

An LLDP agent can transmit information about the capabilities and current status of the system associated with its MAC service access point (MSAP) identifier.

The LLDP agent also can receive information about the capabilities and current status of the system associated with a remote MSAP identifier.

However, LLDP agents cannot solicit information from each other.

You can configure the local LLDP agent to transmit and receive.

Connectivity and management information

The information parameters in each LLDP frame are in a Link Layer Discovery Protocol Data Unit (LLDP PDU) as a sequence of short, variable length information elements known as TLVs (type, length, value).

Each LLDP PDU includes the following mandatory TLVs:

- Chassis ID
- Port ID
- Time To Live
- Port Description
- System Name
- System Description
- System Capabilities (indicates both the system supported capabilities and enabled capabilities, such as end station, bridge, or router)
- Management Address

The chassis ID and the port ID values are concatenated to form a logical MSAP identifier that the recipient uses to identify the sending LLDP agent and port.

A non-zero value in the Time to Live (TTL) field of the TTL TLV indicates to the receiving LLDP agent how long the LLDP PDU information from the MSAP identifier remains valid.

The receiving LLDP agent automatically discards all LLDP PDU information, if the sender fails to update it in a timely manner.

A zero value in TTL field of Time To Live TLV tells the receiving LLDP agent to discard the information associated with the LLDP PDU MSAP identifier.

LLDP for the Segmented Management Instance

LLDP and SONMP both advertise the same topology IP address for the Segmented Management Instance management interface. LLDP supports IPv4 and IPv6 advertisement. If all three management interfaces are configured, the advertised default topology IP priority is management CLIP, then management VLAN, then management OOB. You can change the default topology IP using CLI or EDM. If multiple IPv4 addresses are configured on an OOB or VLAN management interface, the advertised IP priority is static IP address, then DHCP IP address, then link-local IP address.

Transmitting LLDP PDUs

When a transmit cycle is initiated, the LLDP manager extracts the managed objects from the LLDP local system MIB and formats this information into TLVs. TLVs are inserted into the LLDP PDU.

LLDP PDUs are regularly transmitted at a user-configurable transmit interval (tx-interval) or when any of the variables in the LLPDU is modified on the local system; for example, system name or management address.

Transmission delay (tx-delay) is the minimum delay between successive LLDP frame transmissions.

TLV system MIBs

The LLDP local system MIB stores the information to construct the various TLVs for transmission.

The LLDP remote systems MIB stores the information received from remote LLDP agents.

LLDP PDU and TLV error handling

The system discards LLDP PDUs and TLVs that contain detectable errors.

The system assumes that TLVs that contain no basic format errors, but that it does not recognize, are valid and stores them for retrieval by network management.

LLDP and MultiLink Trunking

You must apply TLVs on a per-port basis.

Because LLDP manages trunked ports individually, TLVs configured on one port in a trunk do not propagate automatically to other ports in the trunk.

And the system sends advertisements to each port in a trunk, not on a per-trunk basis.

LLDP and Fabric Attach

Fabric Attach uses LLDP to signal a desire to join the SPB network. When a switch is enabled as an FA Server, it receives IEEE 802.1AB LLDP messages from FA Client and FA Proxy devices requesting the creation of Switched UNI service identifiers (I-SIDs). All of the discovery handshakes and I-SID mapping requests are using LLDP TLV fields. Based on the LLDP standard, FA information is transmitted using organizational TLVs within LLDP PDUs.

FA also leverages LLDP to discover directly connected FA peers and to exchange information associated with FA between those peers.

Link Layer Discovery Protocol-Media Endpoint Discovery

Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) defined in ANSI/TIA-1057, is an extension to the LLDP standard protocol as defined in IEEE 802.1AB. LLDP-MED provides support to deploy Voice over Internet Protocol (VoIP) telephones into the LAN environment. LLDP-MED provides additional TLVs for basic configuration, network policy configuration, location identification, and inventory management.

Following are the types of LLDP-MED devices:

- Network connectivity devices: provide access to the IEEE 802 based LAN infrastructure for LLDP-MED endpoint devices. The LLDP-MED Network Connectivity device is a LAN access device based on:
 - LAN Switch or Router
 - IEEE 802.1 Bridge

- IEEE 802.3 Repeater
- IEEE 802.11 Wireless Access Point
- Any device that supports the IEEE 802.1AB, LLDP-MED, and can relay IEEE 802 frames.
- Endpoint devices: located at the IEEE 802 LAN network edge, participating in the IP communication service using the LLDP-MED framework. The endpoint devices are divided into three classes:
 - Class 1 - LLDP-MED Generic Endpoint devices, for example, IP communication controllers.
 - Class 2 - LLDP-MED Media Endpoint devices, for example, media servers, conference bridges.
 - Class 3 - LLDP-MED Communication Endpoint devices, for example, IP telephones.

Organizational-specific TLVs for LLDP-MED

The organizational-specific TLVs for use by LLDP-MED network connectivity and endpoint devices are:

- Capabilities TLV — enables a network element to determine whether particular connected devices support LLDP-MED, and also discover the TLVs supported by specific network connectivity or endpoint devices.
- Network Policy Discovery TLV — enables both network connectivity and endpoint devices to advertise VLAN information, Layer 2, and Layer 3 priorities associated with a specific set of applications on a port. In addition, an LLDP-MED endpoint advertises this TLV for supported application types to enable the discovery of specific policy information and the diagnosis of network policy configuration mismatch issues.
- Location Identification Discovery TLV — allows network connectivity devices to advertise the appropriate location information for communication endpoint devices, including emergency call service location, to use in the context of location-based applications.
- Extended Power-via-MDI Discovery TLV — enables advanced power management between an LLDP-MED network connectivity and endpoint devices. The Extended Power-via-MDI TLV enables the advertisement of fine grained power requirement details, endpoint power priority, and power status for network connectivity and endpoint devices.

Important

Product notice: This TLV is not applicable on the VSP 8600 Series because Power over Ethernet (PoE) is not supported.

- Inventory Management Discovery TLV — enables tracking and identification of inventory-related attributes for endpoint devices. For example, manufacturer, model name, and software version.

Link Layer Discovery Protocol configuration using CLI

This section describes how to configure Link Layer Discovery Protocol using the Command Line Interface (CLI).

IPv4 management IP addresses are supported by LLDP, including the management virtual IP address, and they are advertised in the Management address TLV.

Configuring global LLDP transmission parameters

Before You Begin

- In the GigabitEthernet Interface Configuration mode, specify the LLDP port status as transmit only or transmit and receive.

About This Task

Use this procedure to configure global LLDP transmission parameters on the switch. If required, you can also restore these parameters to their default values.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. To configure the LLDP transmission parameters, enter:

```
lldp [tx-interval|tx-hold-multiplier]
```

3. (Optional) To restore specific LLDP transmission parameters to their default values, enter:

```
default lldp [tx-interval|tx-hold-multiplier]
```

4. (Optional) To restore all LLDP transmission parameters to their default values, enter:

```
default lldp
```

Example

Configure the LLDP transmission interval. The LLDP port status is set to transmit and receive prior to the configuration.

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface GigabitEthernet 4/4  
Switch:1(config-if)#lldp status txAndRx  
Switch:1(config-if)#exit  
Switch:1(config)#lldp tx-interval 31
```

Optionally, restore the LLDP transmission interval to its default value:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#default lldp tx-interval
```

Variable Definitions

The following table defines parameters for the **lldp** command.

| Variable | Value |
|----------------------------------|--|
| <i>tx-interval</i> <5-32768> | Specifies the global LLDP transmit interval in seconds, that is, the interval in which LLDP frames are transmitted. The default is 30 seconds. |
| <i>tx-hold-multiplier</i> <2-10> | Configures the multiplier for the transmit interval used to compute the Time To Live (TTL) value in LLDP frames. The default is 4 seconds. |

Configuring LLDP status on ports

About This Task

Use this procedure to configure LLDP and configure the status to transmit and receive on a port, or ports, on your switch.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. To configure LLDP and configure the status for transmit and receive on a port or ports, enter:

```
lldp port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]} status
<txAndRx>
```

3. To configure LLDP to the default setting for a port or ports, enter:

```
default lldp port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} status <txAndRx>
```

Example

Configure LLDP on your switch and set the status for transmit and receive on a port:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface GigabitEthernet 4/4
Switch:1(config-if)#lldp status txAndRx
```

Restore LLDP port status to the default value. The default status is disabled.

```
Switch:1>enable
Switch:1#configure terminal
```

```
Switch:1(config)#interface GigabitEthernet 4/4
Switch:1(config-if)#default lldp status
```

Disable LLDP on your switch:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface GigabitEthernet 4/4
Switch:1(config-if)#no lldp status
```

Variable Definitions

The following table defines parameters for the **lldp port** command.

| Variable | Value |
|--|---|
| <i>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <i>status <txAndRx></i> | Configures the LLDP Data Unit (LLDP PDU) transmit and receive status on the port(s). <ul style="list-style-type: none"> default—restores LLDP port parameters to default values txAndRx—enables LLDP PDU transmit and receive |

Enabling CDP Mode on a Port

To configure the switch as CDP-compatible, you must enable the Industry Standard Discovery Protocol (ISDP) on a port, or ports, on the switch. To enable ISDP, you use the **lldp cdp** command.

If CDP is enabled, the interface accepts only CDP packets. Similarly, if CDP is disabled but LLDP is enabled, the interface accepts only LLDP packets.

To switch a port from CDP mode to LLDP mode, the LLDP status on that port must be txAndRx.

About This Task

Do not enable CDP mode if you plan to use the port with an ONA or Fabric Attach.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. To enable CDP, enter the following command:

```
lldp cdp enable
```
3. (Optional) To disable CDP, enter the following command:

```
no lldp cdp enable
```

Example

To enable CDP on a port:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface GigabitEthernet 4/4
Switch:1(config-if)#lldp cdp enable
```

Note

To switch a port from CDP mode to LLDP mode, LLDP status on that port must be txAndrx.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface GigabitEthernet 4/4
Switch:1(config-if)#no lldp cdp enable
```

To shutdown LLDP or CDP on a port:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface GigabitEthernet 4/4
Switch:1>(config-if)#no lldp status
```

View Global LLDP Information

About This Task

Use this procedure to view global LLDP information, to know which LLDP settings and parameters are configured.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Display LLDP local system data:

```
show lldp local-sys-data [med]
```
3. Display the LLDP neighbor system information:

```
show lldp neighbor [summary] [port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```
4. Display the list of ports:

```
show lldp port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```
5. Display the LLDP reception statistics:

```
show lldp rx-stats [port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]
```

6. Display the LLDP statistics:

```
show lldp stats
```

7. Display the LLDP transmission statistics:

```
show lldp tx-stats [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]]]
```

Example

View global LLDP information:

```
Switch:1#show lldp
802.1ab Configuration:
-----
          TxInterval: 30
    TxHoldMultiplier: 4
          ReinitDelay: 1
              TxDelay: 1
    NotificationInterval: 5
```

View the LLDP local system data on the switch:

```
Switch:1#show lldp local-sys-data

Variable Definitions

The following table defines parameters for the **show lldp** command.

| Variable | Value |
|---|---|
| <code>local-sys-data</code> | Displays the LLDP local system data. |
| <code>neighbor [summary] [port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]</code> | Displays the LLDP neighbor system information. You can also view this on a specific port. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <code>port [{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]]</code> | Displays the LLDP administrative status of a port or all ports on the switch. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

| Variable | Value |
|--|---|
| <code>rx-stats [port {slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]]</code> | Displays the LLDP reception statistics on all ports on the switch, or on a specific port. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <code>stats</code> | Displays the LLDP statistics. |
| <code>tx-stats [port {slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]]</code> | Displays the LLDP transmission statistics on all ports on the switch or on a specific port. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

View LLDP Neighbor Information

Display information about LLDP neighbors to help you configure LLDP for maximum benefit.

About This Task

Use this procedure to display LLDP neighbor information.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. To view LLDP neighbor information, enter:

```
show lldp neighbor {[port {slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]] | [summary {slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]] [med]}
```

Examples

The following example shows how two switches—an FA Server and an FA Proxy discover each other as LLDP neighbors. Switch A, which is the FA Server is an VSP 7200 Series switch (model 7254XSQ) and switch B which is the proxy device is an ERS 4826GTS switch.

The following examples shows neighbor discovery on non-channelized and channelized ports (if your platform supports channelization).

On the non-channelized port 1/1 on the FA Server, verify neighbor discovery of the proxy switch.

On the proxy switch, verify discovery of the FA Server switch.

```
SwitchB:1>en
SwitchB:1#show lldp neighbor
```

```

Variable Definitions

The following table defines parameters for the **show lldp neighbor** command.

| Variable | Value |
|---|--|
| port {slot/
port[/sub-
port] [-slot/
port[/sub-
port]] [,...]} | Displays LLDP neighbor information on the specified port. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| med | Displays LLDP neighbors learned based on LLDP-MED TLV information. |
| summary {slot/
port[/sub-
port] [-slot/
port[/sub-
port]] [,...]} | Displays the summary of LLDP neighbors of a port or all ports on the switch. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Viewing global LLDP statistics

Use this procedure to view and verify global LLDP statistics.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. To view LLDP statistics, enter:
`show lldp stats`
3. To view LLDP reception statistics, enter:
`show lldp rx-stats`
4. To view LLDP transmission statistics, enter:
`show lldp tx-stats`
5. (Optional) Clear global LLDP statistics:
`clear lldp stats summary`

Example

View LLDP statistics:

```
Switch:1>enable
Switch:1#show lldp stats

=====
                                LLDP Stats

Inserts    Deletes    Drops    Ageouts
-----
0           0           0         0
=====
```

View LLDP transmission statistics:

```
Switch:1#show lldp tx-stats
=====
                        LLDP Tx-Stats
=====
PORT NUM                FRAMES
-----
1/2                      100
```

View LLDP reception statistics:

```
Switch:1#show lldp rx-stats
=====
                        LLDP Rx-Stats
=====
Port  Frames      Frames  Frames  TLVs      TLVs      AgeOuts
Num   Discarded   Errors  Total   Discarded  Unrecognized
-----
1/2   0           0       46     0         0         0
```

Viewing Port-based LLDP Statistics

Use this procedure to verify port-based LLDP statistics.

About This Task

LLDP operates at the interface level. Enabling FA on a port automatically enables LLDP transmission and reception on the port. It also enables traffic tagging and disables spanning tree on that port.

Enabling FA on an MLT enables LLDP transmission and reception on all ports in the MLT.

Note

When FA is enabled on ports in an MLT or LACP MLT, tagging is enabled and spanning tree is disabled on those ports.

When a port is removed from an MLT, LLDP transmission on that port stops and spanning tree is enabled. Any I-SID-to-VLAN mappings on that port are removed, if not already learned on any other port in the MLT. This also causes the Switched UNI I-SID to be deleted from the MLT. If however, the mappings are learned on another port on the MLT, then the Switched UNI I-SID continues to exist for that MLT.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. To verify successful LLDP transmission on a port, enter:

```
show lldp tx-stats port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

- To verify that a port receives LLDP PDUs successfully, enter:

```
show lldp rx-stats port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

- (Optional) To clear LLDP statistics on a port, or ports, enter:

```
clear lldp stats {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}
```

Example

Verify LLDP transmission statistics on a port:

```
Switch:1>en
Switch:1#show lldp tx-stats port 1/2
=====
LLDP Tx-Stats
=====
PORT NUM          FRAMES
-----
1/2                100
```

Verify that the port is receiving LLDP PDUs:

```
Switch:1#show lldp rx-stats port 1/2
=====
LLDP Rx-Stats
=====
Port      Frames   Frames   Frames   TLVs     TLVs     AgeOuts
Num       Discarded Errors   Total    Discarded Unsupported
          (Non FA) (Non FA)
-----
1/2       0        0        46      0        0        0
```

LLDP-MED Configuration Using CLI

Configure LLDP-MED information for local and remote systems on specific ports. LLDP-MED is enabled by default and all its TLVs are enabled for transmission.

To configure LLDP-MED TLVs in the LLDP PDUs on an interface:

- Configure LLDP-MED.
- Configure LLDP-MED network policy and location information.
- The switch automatically configures LLDP-MED capabilities, power, and inventory information.

Configure LLDP-MED Network Policies on Ports

About This Task

Perform this procedure to configure network policies on specific ports.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure a network policy:

```
lldp med-network-policies {guest-voice | guest-voice-signaling |
softphone-voice | streaming-video | video-conferencing | video-
signaling | voice | voice-signaling} [dscp <0-63>] [priority <0-7>]
[tagging {tagged|untagged}] [vlan-id <0-4059>]
```

Example

Configuring guest voice network policy on port 1/2:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#lldp med-network-policies guest-voice dscp 1 priority 5 tagging
tagged vlan-id 5
```

Variable Definitions

The following table defines parameters for the **lldp med-network-policies** command.

| Variable | Value |
|---|---|
| <i>{guest-voice guest-voice-signaling softphone-voice streaming-video video-conferencing video-signaling voice voice-signaling}</i> | Specifies the type of network policy. |
| <i>dscp <0-63></i> | Specifies the Layer 3 DiffServ Code Point (DSCP) value, as defined in IETF RFC 2474 and RFC 2475. The default is 0. |
| <i>priority <0-7></i> | Specifies the priority level, as defined in IEEE 802.1D. The default is 0. |
| <i>tagging {tagged untagged}</i> | Specifies the type of VLAN tagging to apply on the selected ports. The default is untagged. |
| <i>vlan-id <0-4059></i> | Specifies the VLAN ID for the port, as defined in IEEE 802.1Q. If you configure priority tagged frames, the system recognizes only the 802.1D priority level and uses a value of 0 for the VLAN ID of the ingress port. The default is 0. |

Configure LLDP-MED Civic Address Location Information

About This Task

Perform the following procedure to configure civic address location information of local LLDP-MED on specific ports.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the civic address location by configuring the country-code and at least one other location parameter:

```
lldp location-identification civic-address country-code WORD<2-2>  
(additional-code additional-information apartment block building city  
city-district county floor house-number house-number-suffix landmark  
leading-street-direction name place-type pobox postal-community-name  
postal-zip-code room-number state street street-suffix trailing-  
street-suffix) WORD<0-255>
```

Note

If you try to configure a civic-address with a large number of arguments, 26 or more, the command fails and a software message informs you to split the command into multiple smaller commands.

Example

Configuring civic address location on port 2/12:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#interface gigabitEthernet 2/12  
Switch:1(config-if)#lldp location-identification civic-address country-code US city New  
York
```

Variable Definitions

The following table defines parameters for the **lldp location-identification civic-address** command.

| Variable | Value |
|--------------------------------------|--|
| additional-code WORD<0-255> | Specifies the location information parameters. |
| additional-information WORD<0-255> | Example: South Wing |
| apartment WORD<0-255> | Example: Apt 42 |
| block WORD<0-255> | Specifies a block, e.g. 3 |
| building WORD<0-255> | Example: Low Library |
| city WORD<0-255> | Specifies a city, e.g. Sunnyvale |
| city-district WORD<0-255> | Specifies a city district, e.g. Santa Clara |
| country-code WORD<2-2> | Specifies a country using a 2 character string, example US (United States), CA (Canada). |
| county WORD<0-255> | Specifies a county, e.g. Alameda |
| floor WORD<0-255> | Example: 8 |
| house-number WORD<0-255> | Specifies a house number, e.g. 123 |
| house-number-suffix WORD<0-255> | Specifies a house number suffix, e.g. A, 1/2 |
| landmark WORD<0-255> | Specifies a landmark, e.g. Columbia University |
| leading-street-direction WORD<0-255> | Specifies a leading street direction, e.g. N |
| name WORD<0-255> | Example: Joe's Barbershop |
| place-type WORD<0-255> | Example: office |
| poobox WORD<0-255> | Example: 12345 |
| postal-community-name WORD<0-255> | Example: Leonia |
| postal-zip-code WORD<0-255> | Specifies a postal or zip code, e.g. 95054 |
| room-number WORD<0-255> | Example: 450F |
| state WORD<0-255> | Specifies a state, e.g. NJ, FL |
| street WORD<0-255> | Specifies a street, e.g. Great America Parkway |
| street-suffix WORD<0-255> | Specifies a street suffix, e.g. Ave, Blvd |
| trailing-street-suffix WORD<0-255> | Specifies a trailing street suffix, e.g. SW |

Configure LLDP-MED Coordinate Based Location Information

About This Task

Perform the following procedure to configure coordinate based location information of local LLDP-MED on specific ports.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure coordinate based location:

```
lldp location-identification coordinate (altitude WORD<1-13> {floors |
meters} datum {NAD83/MLLW | NAD83/NAVD88 | WGS84} latitude WORD<1-14>
{NORTH | SOUTH} longitude WORD<1-14> {EAST | WEST})
```

Example

Configuring coordinate based location on port 1/2:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#lldp location-identification coordinate-base altitude 3 floors
```

Variable Definitions

The following table defines parameters for the **lldp location-identification coordinate** command.

| Variable | Value |
|-----------------------------|--|
| <i>altitude</i> WORD<1-13> | Specifies the value for altitude. The units of measurement are: <ul style="list-style-type: none"> • <i>floors</i> • <i>meters</i> |
| <i>datum</i> | Specifies the reference datum. The formats are: <ul style="list-style-type: none"> • NAD83/MLLW • NAD83/NAVD88 • WGS84 |
| <i>latitude</i> WORD<1-14> | Specifies the latitude in degrees, and its relation to the equator from North or South. |
| <i>longitude</i> WORD<1-14> | Specifies the longitude in degrees, and its relation to the prime meridian from East or West. |

Configure LLDP-MED Emergency Call Service Location

Perform the following procedure to configure emergency call service location of local LLDP-MED on specific ports.

About This Task

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure emergency call service location:

```
lldp location-identification ecs-elin WORD<10-25>
```

Example

Configuring emergency call service location on port 2/1-2/10:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabitEthernet 2/1-2/10
Switch:1(config-if)#lldp location-identification ecs-elin 123456789
```

Variable Definitions

The following table defines parameters for the **lldp location-identification ecs-elin** command.

| Variable | Value |
|--------------------------|---|
| <i>WORD<10-25></i> | Specifies the emergency line information number for emergency call service. |

Display Local LLDP-MED Location Information

About This Task

Perform this procedure to display location information of the LLDP-MED configured locally.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display location information for local LLDP-MED:

```
show lldp [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...]]
location-identification
```

Example

```
Switch:1>enable
Switch:1#show lldp port 1/1-1/3 location-identification

Display LLDP-MED Local Network Policies Configuration

About This Task

Perform this procedure to display LLDP-MED network policies locally configured on specific ports.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display LLDP-MED network policies configured:

```
show lldp [port {slot/port[/sub-port]}[-slot/port[/sub-port]][,...]]
med-network-policies [guest-voice | guest-voice-signaling | softphone-
voice | streaming-video | video-conferencing | video-signaling | voice
| voice-signaling]
```

Example

```
Switch:1>enable
Switch:1#show lldp med-network-policies
```

| LLDP-MED Network Policies | | | | | | |
|---------------------------|------------------|--------|----------|------|----------|--------|
| Port | Application Type | VlanID | Tagging | DSCP | Priority | Origin |
| 1/2 | Voice | 4 | Untagged | 0 | 0 | CONFIG |
| 1/2 | Guest Voice | 0 | Untagged | 3 | 0 | CONFIG |

Link Layer Discovery Protocol configuration using EDM

This section describes how to configure LLDP on your switch using EDM.

Configure LLDP Global Information

Use this procedure to configure or view LLDP global information.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **LLDP**.
3. Click the **Globals** tab.
4. After you make the required configuration changes, click **Apply** to save changes.

Globals field descriptions

Use the data in the following table to use the **Globals** tab.

| Field | Description |
|------------------------------------|--|
| lldpMessageTxInterval | Specifies the interval at which LLDP messages are transmitted.
The default is 30 seconds. |
| lldpMessageTxHoldMultiplier | Specifies the multiplier used to calculate the time-to-live (TTL) value of an LLDP message.
The default value is 4 seconds. |
| lldpReinitDelay | Specifies the delay in seconds between the time a port is disabled and the time it is re-initialized.
The default is 1 second. |
| lldpTxDelay | Specifies the delay in seconds between successive LLDP transmissions.
The default is 1 second.
The value is as follows:
$1 < \text{lldpTxDelay} < (0.25 \times \text{lldpMessageTxInterval})$ |

| Field | Description |
|---------------------------------|---|
| lldpNotificationInterval | Specifies the time interval between successive LLDP notifications. It controls the transmission of notifications. The default is 5 seconds. |
| Stats | |
| RemTablesLastChangeTime | Specifies the timestamp of LLDP missed notification events on a port, for example, due to transmission loss. |
| RemTablesInserts | Specifies the number of times the information advertised by a MAC Service Access Point (MSAP) is inserted into the respective tables. |
| RemTablesDeletes | Specifies the number of times the information advertised by an MSAP is deleted from the respective tables. |
| RemTablesDrops | Specifies the number of times the information advertised by an MSAP was not entered into the respective tables. |
| RemTablesAgeouts | Specifies the number of times the information advertised by an MSAP was deleted from the respective tables. |

View the LLDP Port Information

Use this procedure to view the LLDP port information.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **LLDP**.
3. Click the **Port** tab.
4. View the administrative status of the port in the **AdminStatus** field. To modify, double-click on a cell and select a value from the drop-down list.
5. View whether the port is enabled for notifications in the **NotificationEnable** field. To modify, double-click on a cell and select a value from the drop-down list.
6. View the set of TLVs whose transmission using LLDP is always allowed by network management in the **TLVsTxEnable** field.
7. (Optional) Modify the TLVs as follows:
 - a. To enable a TLV, select the appropriate check box, and click **Ok**. You can select more than one check box.
 - b. To enable all TLVs, click **Select All**, and click **Ok**.
 - c. To disable all TLVs, click **Disable All**, and click **Ok**.
8. View the CDP administrative status in the **CdpAdminState** field. To modify, double-click on a cell and select a value from the drop-down list.
9. Click **Apply** to save any configuration changes.
10. Click **Refresh** to verify the configuration.

Port Field Descriptions

Use the data in the following table to use the **Port** tab.

| Name | Description |
|---------------------------|--|
| PortNum | Specifies the port number. This is a read-only cell. |
| AdminStatus | <p>Specifies the administrative status of the port. The options are:</p> <ul style="list-style-type: none"> txOnly: LLDP frames are only transmitted on this port. rxOnly: LLDP frames are only received on this port. txAndRx: LLDP frames are transmitted and received on this port. disabled: LLDP frames are neither transmitted or received on this port. Any information received on this port from remote systems before this is disabled, ages out. <p>The default is disabled.</p> |
| NotificationEnable | <p>Specifies whether the port is enabled or disabled for notifications.</p> <ul style="list-style-type: none"> true: indicates that the notifications are enabled. false: indicates that the notifications are disabled. <p>The default is false.</p> |
| TLVsTxEnable | <p>Specifies the set of TLVs whose transmission using LLDP is always allowed by network management. The following list describes the TLV types:</p> <ul style="list-style-type: none"> portDesc — indicates that the Port Description TLV is transmitted. sysName — indicates that the System Name TLV is transmitted. sysDesc — indicates that the System Description TLV is transmitted. sysCap — indicates that the System Capabilities TLV is transmitted. <p>The default is an empty set of TLVs.</p> |
| CdpAdminState | <p>Specifies the CDP administrative status of the port. Configure this field to true to enable the Industry Standard Discovery Protocol (ISDP) on a port. ISDP is CDP-compatible.</p> <ul style="list-style-type: none"> true: indicates CDP is enabled. false: indicates CDP is disabled. <p>The default is false.</p> <p>If CDP is enabled, the interface accepts only CDP packets. Similarly, if CDP is disabled but LLDP is enabled, the interface accepts only LLDP packets. To switch a port from CDP mode to LLDP mode, the LLDP status on that port must be txAndRx.</p> |

View LLDP Transmission Statistics

Use this procedure to view the LLDP transmission statistics. You can also view the statistics graphically.

About This Task

LLDP operates at the port interface level. Enabling FA on a port automatically enables LLDP transmission and reception on that port. It also enables traffic tagging and disables spanning tree on that port.

Enabling FA on an MLT enables LLDP transmission and reception on all ports in that MLT.

**Note**

When a port is removed from an MLT, LLDP transmission on that port stops and spanning tree is enabled. Any I-SID-to-VLAN mappings on that port are removed, if not already learned on any other port in the MLT. This also causes the Switched UNI I-SID to be deleted from the MLT. If however, the mappings are learned on another port on the MLT, then the Switched UNI I-SID continues to exist for that MLT.

For ports in an LACP MLT, when FA is enabled, tagging is enabled on all ports in the LACP MLT. The consistency check for FA is based on key membership. If all ports with the same key do not support FA, FA is not successfully enabled on those ports.

**Note**

If a slot is removed from the switch chassis, the statistics are not displayed on the slot ports. When the slot is inserted back again, the statistics counters are reset.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **LLDP**.
3. Click the **TX Stats** tab.

The transmission statistics are displayed.

4. To view the transmission statistics graphically for a port:
 - a. In the content pane (on the right-hand-side), select a row and click the **Graph** button.

The **TX Stats-Graph,<port-number>** tab displays.

You can view a graphical representation of the LLDP frames transmitted (**FramesTotal**), for the following parameters:

- AbsoluteValue
 - Cumulative
 - Average/sec
 - Minimum/sec
 - Maximum/sec
 - LastVal/sec
- b. To view the graph, select one of the above parameters and click the appropriate icon on the top left-hand-side of the menu bar to draw a line chart, area chart, bar chart or a pie chart.
 - c. Click **Clear Counters** to clear the existing counters, and fix a reference point in time to restart the counters.
 - d. Click **Export**, to export the statistical data to a file.
 - e. To fix a poll interval, select an appropriate value from the **Poll Interval** drop-down list.

TX Stats Field Descriptions

Use the data in the following table to use the **TX Stats** tab.

| Name | Description |
|--------------------|--|
| PortNum | Specifies the port number. |
| FramesTotal | Specifies the total number of LLDP frames transmitted. |

View LLDP Reception Statistics

Use this procedure to view the LLDP reception statistics. You can also view these statistics graphically.

About This Task

LLDP operates at the port interface level. Enabling FA on a port automatically enables LLDP transmission and reception on that port. It also enables traffic tagging and disables spanning tree on that port.

Enabling FA on an MLT enables LLDP transmission and reception on all ports in that MLT.

Note

When a port is removed from an MLT, LLDP transmission on that port stops and spanning tree is enabled. Any I-SID-to-VLAN mappings on that port are removed, if not already learned on any other port in the MLT. This also causes the Switched UNI I-SID to be deleted from the MLT. If however, the mappings are learned on another port on the MLT, then the Switched UNI I-SID continues to exist for that MLT.

For ports in an LACP MLT, when FA is enabled, tagging is enabled on all ports in the LACP MLT. The consistency check for FA is based on key membership. If all ports with the same key do not support FA, FA is not successfully enabled on those ports.

Note

If a slot is removed from the switch chassis, the statistics are not displayed on the slot ports. When the slot is inserted back again, the statistics counters are reset.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **LLDP**.
3. Click the **RX Stats** tab.
4. To view the reception statistics graphically for a port:
 - a. Select a row and click **Graph**.

The **RX Stats-Graph,<port-number>** tab displays.

You can view a graphical representation of the following data:

- **FramesDiscardedTotal** — Total number of LLDP received frames that were discarded.
- **FramesErrors** — Total number of erroneous LLDP frames received.
- **FramesTotal** — Total number of frames received.

- **TLVsDiscardedTotal** — Total number of received TLVs that were discarded.
 - **TLVsUnrecognizedTotal** — Total number of unrecognized TLVs received.
- b. Select one of the above parameters and click the appropriate icon on the top left-hand-side corner of the menu bar to draw a line chart, area chart, bar chart or a pie chart.
 - c. Click **Clear Counters** to clear the existing counters, and fix a reference point in time to restart the counters.
 - d. Click **Export**, to export the statistical data to a file.
 - e. To fix a poll interval, select an appropriate value from the **Poll Interval** drop-down list.

RX Stats Field Descriptions

Use the data in the following table to use the **RX Stats** tab.

| Name | Description |
|------------------------------|--|
| PortNum | Specifies the port number. |
| FramesDiscardedTotal | Specifies the number of LLDP frames received on the port, but discarded, for any reason.
This counter provides an indication of possible LLDP header formatting problems in the sending system, or LLDP PDU validation problems in the receiving system. |
| FramesErrors | Specifies the number of invalid LLDP frames received on the port. |
| FramesTotal | Specifies the total number of LLDP frames received on the port. |
| TLVsDiscardedTotal | Specifies the number of LLDP TLVs discarded on the port, for any reason. |
| TLVsUnrecognizedTotal | Specifies the number of LLDP TLVs on the port, that are unrecognized on that port.
An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001-111 1110). An unrecognized TLV could be, for example, a basic management TLV from a later LLDP version. |
| AgeoutsTotal | Specifies the number of LLDP age-outs that occur on a specific port.
An age-out is the number of times the complete set of information advertised by a particular MSAP is deleted, because the information timeliness interval has expired. |

View LLDP Local System Information

Use this procedure to view the LLDP local system information.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **LLDP**.
3. Click the **Local System** tab.

Local System field descriptions

Use the data in the following table to use the **Local System** tab.

| Name | Description |
|-------------------------|---|
| ChassisIdSubType | Indicates the encoding used to identify the local system chassis. <ul style="list-style-type: none"> chassisComponent interfaceAlias portComponent macAddress networkAddress interfaceName local |
| ChassisId | Indicates the chassis ID of the local system. |
| SysName | Indicates local system name. |
| SysDesc | Indicates local system description. |
| SysCapSupported | Indicates the system capabilities supported on the local system. |
| SysCapEnabled | Indicates the system capabilities that are enabled on the local system. |

View LLDP Local Port Information

Use this procedure to view the LLDP local port information.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **LLDP**.
3. Click the **Local Port** tab.

Local port field descriptions

Use the data in the following table to use the **Local Port** tab.

| Name | Description |
|----------------------|--|
| PortNum | Indicates the port number. |
| PortIdSubType | Indicates the type of port identifier. <ul style="list-style-type: none"> interfaceAlias portComponent macAddress networkAddress interfaceName agentCircuitId local |
| PortId | Indicates the identifier associated with the port, on the local system. |
| PortDesc | Indicates the description of the port, on the local system. |

View LLDP CDP Remote Information

Use this procedure to view the remote device information received through the Industry Standard Discovery Protocol (ISDP) (CDP-compatible) messages on the local interface.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Select **LLDP**.
3. Select the **CDP Remote** tab.

CDP Remote Field Descriptions

Use the data in the following table to use the **CDP Remote** tab.

| Name | Description |
|--------------------|---|
| PortNum | Indicates the port number on which the remote system information is received. |
| CallServers | Indicates the remote call server IP addresses that are received on this port. |
| FileServers | Indicates remote file server IP addresses that are received on this port. |

View LLDP Neighbor Information

Use this procedure to view the LLDP neighbor information.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **LLDP**.
3. Click the **Neighbor** tab.

Neighbor Field Descriptions

Use the data in the following table to use the **Neighbor** tab.

| Name | Description |
|----------------------|---|
| TimeMark | Indicates the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021. |
| LocalPortNum | Identifies the port on which the remote system information is received. |
| Index | Indicates a particular connection instance that is unique to the remote system. |
| ProtocolType | Indicates whether the entry protocol is CDP or LLDP. |
| SysName | Indicates the name of the remote system. |
| IpAddress | Indicates the neighbor's IP address. |
| PortIdSubType | Indicates the type of encoding used to identify the remote port. |
| PortId | Indicates the remote port ID. |

| Name | Description |
|-------------------------|--|
| PortDesc | Indicates the remote port description. |
| ChassisIdSubtype | Indicates the type of encoding used to identify the remote system chassis. <ul style="list-style-type: none"> chassisComponent interfaceAlias portComponent macAddress networkAddress interfaceName local |
| ChassisId | Indicates the chassis ID of the remote system. |
| SysCapSupported | Identifies the system capabilities supported on the remote system. |
| SysCapEnabled | Identifies the system capabilities enabled on the remote system. |
| SysDesc | Indicates the description of the remote system. |

LLDP-MED Configuration Using EDM

Configure LLDP-MED information for local and remote systems on specific ports. LLDP-MED is enabled by default and all its TLVs are enabled for transmission.

To configure LLDP-MED TLVs in the LLDP PDUs on an interface:

- Configure LLDP-MED.
- Configure LLDP-MED location information.
- The switch automatically configures LLDP-MED capabilities, power, and inventory information.

View LLDP-MED Local Policy Information

About This Task

Perform this procedure to view policy information for local LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Local Policy** tab.

Local Policy Field Descriptions

| Name | Description |
|----------------------|---------------------------------|
| PortNum | Specifies the port. |
| PolicyAppType | Specifies the application type. |

| Name | Description |
|-----------------------|--|
| PolicyVlanId | Specifies the VLAN ID for the port, as defined in IEEE 802.1Q-2003. The value 0 is used if the device is using priority tagged frames, which means only the 802.1D priority level is significant, and the default VLAN ID of the ingress port is used instead. |
| PolicyPriority | Specifies the Layer 2 priority used for the specified application type, as defined in IEEE 802.1D-2004. The default is 0. |
| PolicyDscp | Specifies the value of the Differentiated Service Code Point (DSCP) associated with a specific port on the local LLDP-MED, as defined in IETF RFC 2474 and RFC 2475. The default is 0. |
| PolicyTagged | Specifies whether the application uses a tagged or untagged VLAN, as defined by IEEE 802.1Q-2003. <ul style="list-style-type: none"> • true – uses tagged VLAN • false – uses untagged VLAN or does not support a port-based VLAN |

Add LLDP-MED Local Location Information

About This Task

Perform this procedure to add location information of local LLDP-MED configured on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Local Location** tab.
4. In **LocationInfo** column, double-click on the cell, and type the information.

Local Location Field Descriptions

| Name | Description |
|------------------------|---|
| PortNum | Specifies the port number. |
| LocationSubtype | Specifies the location subtype of the local LLDP-MED: <ul style="list-style-type: none"> • coordinateBased • civicAddress • elin |
| LocationInfo | Specifies the location information of local LLDP-MED. The parsing of this information depends on the location subtype. |

View LLDP-MED Local PoE PSE Information

About This Task

Perform this procedure to view PoE Power Sourcing Entity (PSE) information for local LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Local PoE PSE** tab.

Local PoE PSE Field Descriptions

| Name | Description |
|------------------------------|--|
| PortNum | Specifies the port. |
| PSEPortPowerAvailable | Specifies the value of the power available (in units of 0.1 watts) from the PSE through the specific port. |
| PSEPortPDPriority | Specifies the Power Device (PD) power priority for the PSE port (see RFC 3621): <ul style="list-style-type: none"> • unknown — priority is not configured or known by the PD • critical • high • low |

View LLDP-MED Neighbor Capabilities Information

About This Task

Perform this procedure to view capabilities information for remote LLDP-MED on specific ports based on the information advertised by the remote device and received on each port in the capabilities TLV.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Neighbor Capabilities** tab.

Neighbor Capabilities Field Descriptions

| Name | Description |
|---------------------|---|
| TimeMark | Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021. |
| LocalPortNum | Specifies the port on which the remote LLDP-MED information is received. |

| Name | Description |
|---------------------|--|
| Index | Specifies the connection instance unique to the remote LLDP-MED. |
| CapSupported | Specifies the LLDP-MED capabilities supported on the remote system. |
| CapCurrent | Specifies the LLDP-MED capabilities that are enabled on the remote system. |
| DeviceClass | Specifies the remote LLDP-MED device class. |

View LLDP-MED Neighbor Policy Information

About This Task

Perform this procedure to view policy information of remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Neighbor Policy** tab.

Neighbor Policy Field Descriptions

| Name | Description |
|-----------------------|--|
| TimeMark | Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021. |
| LocalPortNum | Specifies the port on which the remote LLDP-MED information is received. |
| Index | Specifies the particular connection instance that is unique to the remote LLDP-MED. |
| PolicyAppType | Specifies the policy application type. |
| PolicyVlanId | Specifies the VLAN ID for the port, as defined in IEEE 802.1Q-2003. The value 0 is used if the device is using priority tagged frames, which means only the 802.1D priority level is significant, and the default VLAN ID of the ingress port is used instead. |
| PolicyPriority | Specifies the Layer 2 priority used for the specified application type, as defined in IEEE 802.1D-2004. The default value is 0. |
| PolicyDscp | Specifies the value of the Differentiated Service Code Point (DSCP) associated with a specific port on the remote LLDP-MED, as defined in IETF RFC 2474 and RFC 2475. The default value is 0. |

| Name | Description |
|----------------------|---|
| PolicyUnknown | Specifies the network policy for the remote LLDP-MED is currently unknown. |
| PolicyTagged | Specifies whether the application uses a tagged or untagged VLAN, as defined by IEEE 802.1Q-2003. <ul style="list-style-type: none"> • true — uses tagged VLAN • false — uses untagged VLAN or does not support a port based VLAN |

View LLDP-MED Neighbor Location Information

About This Task

Perform this procedure to view location information of remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Neighbor Location** tab.

Neighbor Location Field Descriptions

| Name | Description |
|------------------------|--|
| TimeMark | Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021. |
| LocalPortNum | Specifies the port on which the remote LLDP-MED information is received. |
| Index | Specifies the particular connection instance that is unique to the remote LLDP-MED. |
| LocationSubType | Specifies the subtype of the remote LLDP-MED location: <ul style="list-style-type: none"> • coordinateBased • civicAddress • elin |
| LocationInfo | Specifies the location information of the remote LLDP-MED. |

View LLDP-MED Neighbor PoE Information

About This Task

Perform this procedure to view PoE information of remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.

2. Click **Port MED**.
3. Click the **Neighbor PoE** tab.

Neighbor PoE Field Descriptions

| Name | Description |
|----------------------|--|
| TimeMark | Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021. |
| LocalPortNum | Specifies the port on which the remote LLDP-MED information is received. |
| Index | Specifies the particular connection instance that is unique to the remote LLDP-MED. |
| PoEDeviceType | Specifies the type of PoE LLDP-MED. <ul style="list-style-type: none"> • PseDevice: specifies the device as a Power Sourcing Entity (PSE). • pdDevice: specifies the device as a Power Device (PD). • none: specifies that the device does not support PoE. |

View LLDP-MED Neighbor PoE PSE Information

About This Task

Perform this procedure to view PoE Power Sourcing Entity (PSE) information for remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Neighbor PoE PSE** tab.

Neighbor PoE PSE Field Descriptions

| Name | Description |
|--------------------------|---|
| TimeMark | Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021. |
| LocalPortNum | Specifies the port on which the remote LLDP-MED information is received. |
| Index | Specifies the particular connection instance that is unique to the remote LLDP-MED. |
| PSEPowerAvailable | Specifies the power available from the PSE connected remotely to the specific port. |

| Name | Description |
|-------------------------|---|
| PSEPowerSource | Specifies the type of PSE Power Source for the remote LLDP-MED. <ul style="list-style-type: none"> unknown primary backup |
| PSEPowerPriority | Specifies the power priority associated with the PSE LLDP-MED, for more information, see RFC 3621. <ul style="list-style-type: none"> unknown critical high low |

View LLDP-MED Neighbor PoE PD Information

About This Task

Perform this procedure to view PoE Powered Device (PD) information for remote LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Neighbor PoE PD** tab.

Neighbor PoE PD Field Descriptions

| Name | Description |
|---------------------|---|
| TimeMark | Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021. |
| LocalPortNum | Specifies the port on which the remote LLDP-MED information is received. |
| Index | Specifies the particular connection instance that is unique to the remote LLDP-MED. |
| PDPowerReq | Specifies the value of the power required by a PD LLDP-MED connected remotely to the port. |

| Name | Description |
|------------------------|--|
| PDPowerSource | Specifies the power source being utilized by the PD LLDP-MED. <ul style="list-style-type: none"> • from PSE: specifies that the device advertises its power source as received from a PSE. • local: specifies that the device advertises its power source as local. • local and PSE: specifies that the device advertises its power source as using both local and PSE power. |
| PDPowerPriority | Specifies the priority of the PD LLDP-MED connected remotely to the port, for more information, see RFC 3621. <ul style="list-style-type: none"> • unknown – priority is not configured for the PD LLDP-MED • critical • high • low |

View LLDP-MED Neighbor Inventory Information

About This Task

Perform this procedure to view inventory attributes for LLDP-MED on specific ports.

Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics > 802_1ab**.
2. Click **Port MED**.
3. Click the **Neighbor Inventory** tab.

Neighbor Inventory Field Descriptions

| Name | Description |
|---------------------|---|
| TimeMark | Specifies the time filter. For more information about TimeFilter, see the TimeFilter textual convention in IETF RFC 2021. |
| LocalPortNum | Specifies the port on which the remote LLDP-MED information is received. |
| Index | Specifies the particular connection instance that is unique to the remote LLDP-MED. |
| HardwareRev | Specifies the current hardware revision of the LLDP-MED. |
| FirmwareRev | Specifies the current firmware revision of the LLDP-MED. |
| SoftwareRev | Specifies the current software revision of the LLDP-MED. |

| Name | Description |
|------------------|---|
| SerialNum | Specifies the current serial number of the LLDP-MED. |
| MfgName | Specifies the manufacturer of the LLDP-MED. |
| ModelName | Specifies the model name of the LLDP-MED. |
| AssetID | Specifies the asset tracking identifier for the LLDP-MED. |

Link State Change Control

[Link State Change Control Using CLI on page 2150](#)

[Link State Change Control Using EDM on page 2152](#)

Rapid fluctuation in a port link state is called link flapping.

Link flapping is detrimental to network stability because it can trigger recalculation in spanning tree and the routing table.

If the number of port down events exceeds a configured limit during a specified interval, the system forces the port out of service.

You can configure link flap detection to control link state changes on a physical port. You can set thresholds for the number and frequency of changes allowed.

You can configure the system to take one of the following actions if changes exceed the thresholds:

- send a trap
- bring down the port

If changes exceed the link state change thresholds, the system generates a log entry.

Link State Change Control Using CLI

Detect and control link flapping to bring more stability to your network.

Controlling Link State Changes

Configure link flap detection to control state changes on a physical port.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure the interval for link state changes:
`link-flap-detect interval <2-600>`
3. Configure the number of changes allowed during the interval:
`link-flap-detect frequency <1-9999>`

4. Enable automatic port disabling:

```
link-flap-detect auto-port-down
```
5. Enable sending a trap:

```
link-flap-detect send-trap
```

Example

Enable automatic disabling of the port:

```
Switch:1(config)#link-flap-detect auto-port-down
```

Configure the link-flap-detect interval:

```
Switch:1(config)#link-flap-detect interval 20
```

Enable sending traps:

```
Switch:1(config)#link-flap-detect send-trap
```

Variable Definitions

Use the data in the following table to use the **link-flap-detect** command.

| Variable | Value |
|---------------------------------------|---|
| <code><auto-port-down></code> | Automatically disables the port if state changes exceed the link-flap threshold. By default, auto-port-down is enabled. Use the no operator to remove this configuration. To set this option to the default value, use the default operator with the command. |
| <code>frequency <1-9999></code> | Configures the number of changes that are permitted during the time specified by the <code>interval</code> command. The default is 20. To set this option to the default value, use the default operator with the command. |
| <code>interval <2-600></code> | Configures the link-flap-detect interval in seconds. The default value is 60. To set this option to the default value, use the default operator with the command. |
| <code>send-trap</code> | Activates traps transmission. The default setting is activated. Use the no operator to remove this configuration. To set this option to the default value, use the default operator with the command. |

Displaying Link State Changes

Displays link flap detection state changes on a physical port.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Display link state changes:

```
show link-flap-detect
```

Example

```
Switch:1>enable
Switch:1#show link-flap-detect

Auto Port Down : enable
Send Trap      : enable
Interval       : 60
Frequency      : 20
```

Link State Change Control Using EDM

Detect and control link flapping to bring more stability to your network.

Controlling Link State Changes

About This Task

Configure link flap detection to control link state changes on a physical port.

Procedure

1. In the navigation pane, expand the **Configuration > Edit > Diagnostics** folders.
2. Click **General**.
3. Click the **Link Flap** tab.
4. Configure the parameters as required.
5. Click **Apply**.

Link Flap Field Descriptions

Use the data in the following table to use the **Link Flap** tab.

| Name | Description |
|---------------------------|---|
| AutoPortDownEnable | Enables or disables Link Flap Detect. If you enable Link Flap Detect, the system monitors the number of times a port goes down during a designated interval. If the number of drops exceeds a specified limit, the system forces the port out-of-service. The default is enabled. |
| SendTrap | Specifies that a trap is sent if the port is forced out-of-service. |
| Frequency | Specifies the number of times the port can go down. The default is 20. |
| Interval | Specifies the interval (in seconds) between port failures. The default is 60. |

Link-state tracking (LST)

Note

DEMO FEATURE - Link-state tracking (LST) is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Link-state tracking (LST) Overview

Link-state tracking (LST) binds the link state of multiple interfaces, creating LST groups with upstream (to-be-followed) and downstream (to-follow) interfaces. LST monitors the state of upstream interfaces and automatically transfers the upstream state to the downstream interfaces. If all the upstream interfaces in a LST group are down, the downstream interfaces are administratively configured as down after approximately five seconds. If any upstream interface in a LST group is up, the downstream interfaces are not affected. The role of the LST group is to keep the downstream interfaces in the same state as the upstream interface.

An interface can be an aggregation of ports, multi-link trunks (MLT) or link aggregation groups (LAG). Interfaces can only belong to one LST group. You can configure LST using CLI or EDM. LST receives updates from Port Manager, MLT, and VLACP regarding the upstream state of ports and trunks in the group.

LST can detect a link failure of upstream interfaces and shutdown downstream interfaces, eliminating loss of traffic and allowing the source to reroute traffic. When a LST group disables a downstream interface, the interface can only be enabled by the LST group. You can recover the downstream interfaces that LST disabled by removing the interfaces from the LST group or by disabling the LST group. You can administratively enable or disable LST group downstream interfaces with shutdown commands. A LST group cannot enable ports that you administratively disabled.

**Note**

If you administratively enable an interface which LST disabled, only the administrative status of the interface changes. The interface remains disabled until the LST group enables the interface, or until you remove the interface from the LST group.

MLT interactions

For MLTs, a last-link-down event triggers a down operational state and a first-link-up event triggers an up operational state. You cannot delete a MLT that is a member of a LST group.

LAG and LACP interactions

For LAGs, a static LAG trunk ID associated with a LACP administrative key can be a member of a LST group. You can add LAGs to a LST group by specifying the LAG trunk ID. You cannot break the association between trunk ID, LACP key, and ports while the LAG trunk is in a LST group. For LACP, you cannot add ports with link-aggregation enabled to a LST group, or enable link-aggregation on interfaces already in a LST group.

VLACP interactions

You can add LST group interfaces configured with VLACP. For upstream interfaces with VLACP enabled, when the physical link is up with a VLACP partner, the operational state is up. Otherwise the operational state is down. If VLACP is enabled, the value of the VLACP have partner field and the link status correspond to the operational state of upstream interfaces. For upstream interfaces with VLACP disabled, the up and down operational states correspond directly with the physical link.

SLPP Guard interactions

You can add LST group interfaces configured with SLPP Guard. When LST disables a port that is already disabled by SLPP Guard, the interface is unblocked by SLPP Guard and the blocking timer clears.

BPDU Guard and MACsec interactions

You can add LST group interfaces configured with BPDU Guard or MACsec. BPDU Guard and MACsec can enable or disable ports administratively. An interface is enabled if both LST and BPDU Guard or

MACsec consider the port enabled. If BPDU Guard or MACsec disables the port, the port remains down and does not link up.

LST configuration using CLI

Note

DEMO FEATURE - Link-state tracking (LST) is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Configure Link-state tracking (LST) groups composed of upstream and downstream interfaces. Valid LST group members are switch ports, multi-link trunks (MLT), or link aggregation groups (LAG).

Configuring LST

Note

DEMO FEATURE - Link-state tracking (LST) is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Use this procedure to configure LST groups.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure the LST group upstream and downstream interface members:

```
link-state group <1-48> <upstream | downstream> interface
gigabitEthernet {slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]
```
3. Configure the LST group upstream and downstream mlt members:

```
link-state group <1-48> <upstream | downstream> mlt <1-512>
```
4. Enable the group:

```
link-state group <1-48> enable
```
5. Display the status of the groups:

```
show link-state group <1-48> [detail]
```

Example

The following example shows a LST group created with ports 1-4 and mlt 1 as upstream members and ports 11-14 and mlt 2 as downstream members. The LST group is enabled. Because port 1 is up, the LST group receives an up operational state and the downstream interfaces are enabled. Upstream ports 2, 4 and mlt 1 have VLACP admin enabled and are listed in the VLACP Upstream State section.

```
Switch:1> enable
Switch:1# configure terminal
```

```
Switch:1(config)# link-state group 1 upstream interface gigabitEthernet 1/1-1/4
Switch:1(config)# link-state group 1 upstream mlt 1
Switch:1(config)# link-state group 1 downstream interface gigabitEthernet 1/11-1/14
Switch:1(config)# link-state group 1 downstream mlt 2
Switch:1(config)# link-state group 1 enable
Switch:1(config)# show link-state group 1
```

```
=====
Link State Tracking General Info
=====
```

```
Group          1

Variable definitions

Use the data in the following table to use the **link-state** command.

| Variable | Value |
|--|---|
| <i>enable</i> | Activates the action specified for the LST group or specified interfaces. |
| <i>group <1-48></i> | Specifies a LST group ID. |
| <i>interface gigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> | Adds ports to the specified upstream or downstream LST group. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

| Variable | Value |
|--|---|
| <code>mlt <1-512></code> | Adds a MLT to the specified upstream or downstream LSTgroup. |
| <code><upstream downstream></code> | Specifies the upstream or downstream interfaces in the LST group. |

Use the data in the following table to use the **show link-state** command.

| Variable | Value |
|----------|---|
| detail | Displays the specified LST group status as enabled or disabled and if the operational status is up or down. Detail displays LST group additional information. |

LST configuration using EDM

Note

DEMO FEATURE - Link-state tracking (LST) is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Configure Link-state tracking (LST) groups composed of upstream and downstream interfaces. Valid LST group members are switch ports, multi-link trunks (MLT), or link aggregation groups (LAG).

Configuring LST

Note

DEMO FEATURE - Link-state tracking (LST) is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Use this procedure to configure LST groups.

Procedure

1. In the navigation pane, expand the **Configuration > Edit** folders.
2. Click **Link State Tracking**
3. Click the **Link State Tracking** tab.
4. Choose a **GroupId** row to configure.
5. To add upstream ports to the LST group, double click the **UpstreamPortList** field, select the upstream ports to add, then click **OK**.
6. To add downstream ports to the LST group, double click the **DownstreamPortList** field, select the upstream ports to add, then click **OK**.
7. To add an upstream MLT to the LST group, double click the **UpstreamMltList** field and enter an upstream MLT ID.

8. To add a downstream MLT to the LST group, double click the **DownstreamMltList** field and enter an upstream MLT ID.
9. To enable a LST group, double click the **Enabled** field and select **true**.
10. To activate the LST group configuration, click **Apply**.
11. View the **OperState** field of the LST groups to verify the current operating state.

Link State Tracking field descriptions

Use the data in the following table to use the **Link State Tracking** tab.

| Name | Description |
|---------------------------|--|
| GroupId | Specifies the LST group number between 1 and 48. |
| Enabled | Specifies if the LST group is enabled. Values are true or false. Default is false. |
| UpstreamPortList | Specifies upstream interface ports in the LST group. |
| DownstreamPortList | Specifies downstream interface ports in the LST group. |
| UpstreamMltList | Specifies an upstream multi-link trunk in the LST group. |
| DownstreamMltList | Specifies a downstream multi-link trunk in the LST group. |
| OperState | Displays the current operating status of the LST group. Values are up, down, or notConfigured. |

Logs and Traps Fundamentals

This section details SNMP traps and log files, available as part of the switch System Messaging Platform.

Overview of Traps and Logs

System Log Messaging

On a UNIX-based management platform, you can use system log (syslog) messaging to manage event messages. The switch syslog software communicates with a server software component named syslogd on the management workstation.

The UNIX daemon syslogd is a software component that receives and locally logs, displays, prints, and forwards messages that originate from sources internal and external to the workstation. For example, syslogd on a UNIX workstation concurrently handles messages received from applications that run on the workstation, as well as messages received from the switch that runs in a network accessible to the workstation.

The remote UNIX management workstation performs the following actions:

- Receives system log messages from the switch .
- Examines the severity code in each message.
- Uses the severity code to determine appropriate system handling for each message.

Log Consolidation

The switch generates a system log file and can forward that file to a syslog server for remote viewing, storage, and analyzing.

The system log captures messages for the following components:

- Extensible Authentication Protocol (EAP)
- Remote Authentication Dial-in User Service (RADIUS)
- Remote Monitoring (RMON)
- Web
- hardware (HW)
- MultiLink Trunking (MLT)
- filter
- Quality of Service (QoS)
- Command line interface (CLI) log
- software (SW)
- Central Processing Unit (CPU)
- Internet Protocol (IP)
- Virtual Local Area Network (VLAN)
- policy
- Simple Network Management Protocol (SNMP) log

The switch can send information in the system log file, including CLI command log and the SNMP operation log, to a syslog server.

View logs for CLILOG module to track all CLI commands executed and for fault management purposes. The CLI commands are logged to the system log file as CLILOG module.

View logs for SNMPLOG module to track SNMP logs. The SNMP operation log is logged to the system log file as SNMPLOG module.

The platform logs CLILOG and SNMPLOG as INFO. Normally, if you configure the logging level to WARNING, the system skips all INFO messages. However, if you enable CLILOG and SNMPLOG the system logs CLI Log and SNMP Log information regardless of the logging level you configure. This is not the case for other INFO messages.

System Log Client over IPv6 Transport

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration except in the following case. When you configure the system log table in EDM, under the **System Log Table** tab, you must select either IPv4 or IPv6.

Log Messages with Enhanced Secure Mode

Enhanced secure mode allows the system to provide role-based access levels, stronger password requirements, and stronger rules on password length, password complexity, password change intervals, password reuse, and password maximum age use. If you enable enhanced secure mode, the system encrypts the entire log file.

With enhanced secure mode enabled, only individuals in the administrator or auditor role can view log files to analyze switch access and configuration activity. However, no access level role can modify the content of the log files, not even the administrator or the auditor access level roles. The administrator has access to the **remove** and **delete** commands.

If you enable enhanced secure mode, you cannot access the following commands for log files at any role-based access level:

- **more**
- **edit**
- **rename**
- **copy**

If someone attempts to access a log file with the preceding commands, an information and warning message displays on the screen.

The following table summarizes log file command access based on role-based access levels.

Table 241: Log commands accessible for various users

| Access level role | Commands |
|------------------------------|--|
| Administrator | The remove and delete commands. |
| No user at any access level. | The following commands: <ul style="list-style-type: none"> • more • edit • rename • copy |

Table 241: Log commands accessible for various users (continued)

| Access level role | Commands |
|---|---|
| Administrator | All configuration commands can be accessed only by the individual in the administrator role, other than the preceding commands. |
| Administrator and auditor | All show commands for log files. |
| All users (Administrator, auditor, security, privilege, operator) | All show commands for log configurations. |

With enhanced secure mode enabled, authorized users can use SFTP to transfer files to a remote server with the content encrypted.

SNMP Traps

The SNMP trap is an industry-standard method used to manage events. You can set SNMP traps for specific types of log message (for example, warning or fatal), from specific applications, and send them to a trap server for further processing. For example, you can configure the switch to send SNMP traps to a server after a port is unplugged or if a power supply fails.

This section only describes SNMP commands related to traps. For more information about how to configure SNMP community strings and related topics, see [Simple Network Management Protocol \(SNMP\)](#) on page 2969.

Secure Syslog

Syslog is a standard used to send event log messages to devices within a network. The switch sends event messages to a logging server called syslog server. The syslog server stores the log messages and displays them for event reporting. Syslog messages are used for monitoring system activities and troubleshooting.

The secure syslog feature adds security and authenticated access to the plain text event log messages that are communicated between a remote syslog server and a syslog client. The secure syslog feature helps prevent unauthorized access to confidential data transmitted on an unsecured communication channel between a remote syslog server and client.

To implement the security, this feature employs port forwarding using the Transport Layer Security (TLS) to provide encrypted communication between a syslog server and client.

After starting the syslog server, to ensure authentication, you must setup a remote port forwarding connection to connect the switch with a remote TLS Server.

TLS client for secure syslog

The syslog server is installed on a host that serves as a TLS Server. The switch plays the role of a TLS client for secure syslog. A TLS handshake is initiated between the syslog server and the switch. The syslog server transmits a certificate which has a subject common name and an optional subject alternative name (SAN). The subject common name is always present in the certificate but the SAN is optional. The server-cert-name must match the SAN name, if present in the certificate. If the SAN name is not present, it must match the subject common name. Otherwise, TLS negotiation fails and the connection to the server is closed. If the server-cert-name part is not configured, this check is not done.

Once the TLS handshake is successful, the log messages sent from the switch to the syslog server are encrypted. The syslog server decrypts these messages using a private key. The server then stores the messages or forwards them to other servers.

This feature supports the Rsyslog, which is a Linux based open source syslog server for TLS tunneling.

Simple Network Management Protocol

The Simple Network Management Protocol (SNMP) provides facilities to manage and monitor network resources. SNMP consists of:

- Agents—An agent is software that runs on a device that maintains information about device configuration and current state in a database.
- Managers—An SNMP manager is an application that contacts an SNMP agent to query or modify the agent database.
- The SNMP protocol—SNMP is the application-layer protocol SNMP agents and managers use to send and receive data.
- Management Information Bases (MIB)—The MIB is a text file that specifies the managed objects by an object identifier (OID).

Important

The switch does not reply to SNMP requests sent to the Virtual Router Redundancy Protocol (VRRP) virtual interface address; it does, however, reply to SNMP requests sent to the physical IP address.

An SNMP manager and agent communicate through the SNMP protocol. A manager sends queries and an agent responds; however, an agent initiates traps. Several types of packets transmit between SNMP managers and agents:

- Get request—This message requests the values of one or more objects.
- Get next request—This message requests the value of the next object.
- Set request—This message requests to modify the value of one or more objects.
- Get response—An SNMP agent sends this message in response to a get request, get next request, or set request message.
- Trap—SNMP trap is a notification triggered by events at the agent.

Log Message Format

The log messages for the switch have a standardized format. All system messages are tagged with the following information, except that alarm type and alarm status apply to alarm messages only:

- CPU slot number—Indicates the CP slot where the command is logged.
- timestamp—Records the date and time at which the event occurred. The format is MM/DD/YY hh:mm:ss.uuu, where uuu is milliseconds. Example: [11/01/10 11:41:21.376].
- hostname—The Hostname from which the message is generated.
- event code—Precisely identifies the event reported.
- alarm code—Specifies the alarm code.
- alarm type—Identifies the alarm type (Dynamic or Persistent) for alarm messages.

- alarm status—Identifies the alarm status (set or clear) for alarm messages.
- VRF name—Identifies the Virtual Routing and Forwarding (VRF) instance, if applicable.
- module name—Identifies the software module or hardware from which the log is generated.
- severity level—Identifies the severity of the message.
- sequence number—Identifies a specific CLI command.
- context—Specifies the type of the session used to connect to the switch. If the session is a remote session, the remote IP address is identified.
- user name—Specifies the user name used to login to the switch.
- CLI command—Specifies the commands typed during the CLI session. The system logs anything type during the CLI session as soon as the user presses the `Enter` key.

The following messages are examples of an informational message for CLILog:

```

The system encrypts AP information before writing it to the log file.

The encrypted information in a log file is for debugging purposes. Only a Customer Service engineer can decrypt the encrypted information in a log file. CLI commands display the logs without the encrypted information. Do not edit the log file.

The following table describes the system message severity levels.

Table 242: Severity levels

| Severity level | Definition |
|----------------|--|
| EMERGENCY | A panic condition that occurs when the system becomes unusable. A severity level of emergency is usually a condition where multiple applications or servers are affected. You must correct a severity level of emergency immediately. |
| ALERT | Any condition requiring immediate attention and correction. You must correct a severity level of alert immediately, but this level usually indicates failure of a secondary system, such as an Internet Service Provider connection. |
| CRITICAL | Any critical conditions, such as a hard drive error. |
| ERROR | A nonfatal condition occurred. You can be required to take appropriate action. For example, the system generates an error message if it is unable to lock onto the semaphore required to initialize the IP addresses used to transfer the log file to a remote host. |
| WARNING | A nonfatal condition occurred. No immediate action is needed. An indication that an error can occur if action is not taken within a given amount of time. |
| NOTIFICATION | Significant event of a normal nature. An indication that unusual, but not error, conditions have occurred. No immediate action is required. |
| INFO | Information only. No action is required. |
| DEBUG | Message containing information useful for debugging. |
| FATAL | A fatal condition occurred. The system cannot recover without restarting. For example, a fatal message is generated after the configuration database is corrupted. |

Based on the severity code in each message, the platform dispatches each message to one or more of the following destinations:

- workstation display
- local log file
- one or more remote hosts

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration except in the following case. When you configure the system log table in EDM, under the **System Log Table** tab, you must select either IPv4 or IPv6.

Internally, the switch has four severity levels for log messages: INFO, WARNING, ERROR, and FATAL. The system log supports eight different severity levels:

- Debug
- Info
- Notice
- Warning
- Critical
- Error
- Alert
- Emergency

The following table shows the default mapping of internal severity levels to syslog severity levels.

Table 243: Default and system log severity level mapping

| UNIX system error codes | System log severity level | Internal severity level |
|-------------------------|---------------------------|-------------------------|
| 0 | Emergency | Fatal |
| 1 | Alert | |
| 2 | Critical | |
| 3 | Error | Error |
| 4 | Warning | Warning |
| 5 | Notice | |
| 6 | Info | Info |
| 7 | Debug | |

Log Files

The log file captures hardware and software log messages, and alarm messages. The switch logs to internal flash.

The system saves internal log messages in a circular list in memory, which overwrite older log messages as the log fills. Unlike the log messages in a log file, the internal log messages in memory do not contain encrypted information, which can limit the information available during troubleshooting. Free up the disk space on the flash if the system generates the disk space 75% full alarm. After the disk space utilization returns below 75%, the system clears the alarm, and then starts logging to a file again.

Log file naming conventions

The following list provides the naming conventions for the log file:

- The log file is named as log.xxxxxxx.sss format. The prefix of the log file name is log. The six characters after the log file prefix contain the last three bytes of the chassis base MAC address. The next two characters are 01. The last three characters (sss) denote the sequence number of the log file.

- The sequence number of the log file is incremented for each new log file created after the existing log file reaches the maximum configured size.
- At initial system start up when no log file exists, a new log file with the sequence number 000 is created. After a restart, the system finds the newest log file from internal flash based on file timestamps. If the newest log file is on the flash that is used for logging, the system continues to use the newest log file. And once the maximum configured size is reached, system continues to create a new log file with incremental sequence number on the internal flash for logging.

Log File Transfer

The system logs contain important information for debugging and maintaining the switch. After the current log file reaches the configured maximum size, the system creates a new log file for logging. The system transfers old log files to a remote host. You can configure up to 10 remote hosts, which creates long-term backup storage of your system log files.

Of the 10 configured remote hosts, 1 is the primary host and the other 9 are redundant. Upon initiating a transfer, system messaging attempts to use host 1 first. If host 1 is not reachable, system messaging tries hosts 2 to 10.

If log file transfer is unsuccessful, the system keeps the old log files on internal flash. The system attempts to transfer old log files after the new log file reaches the configured maximum size. The system also attempts to transfer old log files periodically (once in one hundred log writes) if the disk space on the flash is more than 75% full.

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration.

With enhanced secure mode enabled, authorized users can use SFTP to transfer files to a remote server with the content encrypted.

You can specify the following information to configure the transfer criteria:

- The maximum size of the log file.
- The IP address of the remote host.
- The name prefix of the log file to store on the remote host.

The system appends a suffix of .xxxxxxx.sss to the file name. The first six characters of the suffix contain the last three bytes of the chassis base MAC address. The next two characters are 01. The last three characters (sss) denote the sequence number of the log file. For example, if you configure the name prefix as mylog, a possible file name is mylog.90000001.001.

- The user name and password, if using File Transfer Protocol (FTP) for file transfer. Use the following commands to configure the user name and password:

```
boot config host user WORD<0-16>
```

```
boot config host password WORD<0-16>
```

Be aware of the following restrictions to transfer log files to a remote host:

- The remote host IP address must be reachable.

- If you transfer a log file from a host to the system, (for example, to display it with a show command), rename the log file. Failure to rename the log file can cause the system to use the recently transferred file as the current log, if the sequence number in the extension is higher than the current log file. For example, if bf860005.002 is the current log file and you transfer bf860005.007 to the system, the system logs future messages to the bf860005.007 file. You can avoid this if you rename the log file to something other than the format used by system messaging.
- If your TFTP server is a UNIX-based machine, files written to the server must already exist. For example, you must create dummy files with the same names as your system logs. This action is commonly performed by using the touch command (for example, **touch bf860005.001**).

Three parameters exist to configure the log file:

- the minimum acceptable free space available for logging
- the maximum size of the log file
- the percentage of free disk space the system can use for logging

Although these three parameters exist, you can only configure the maximum size of the log file. The switch does not support the minimum size and percentage of free disk space parameters. The internal flash must be less than 75% full for the system to log a file. If the internal flash is more than 75% full, logging to a file stops to prevent exhausting disk space.

Log file transfer using a wildcard filename

File transfers using SFTP require file permissions.

Use the command **attribute WORD<1-99> [+/-] R** to change the permissions of a file.

To change permissions for all log files, use the wildcard filename **log.***. Using the command in the wildcard form **attribute log.* [+/-]R** changes permissions for log files with names that begin with the characters “log.”.

Important

You cannot use a wildcard pattern other than **log.*** for this command.

Email Notification

The switch can send email notification for failed components or other critical log-event conditions. The switch can also send periodic health status notifications.

Enable and configure a Simple Mail Transfer Protocol (SMTP) client on the switch for one SMTP server by specifying the server hostname or IPv4 address. To use a hostname, you must also configure a Domain Name System (DNS) client on the switch.

You must configure at least one email recipient and can create a maximum of five email recipients.

The switch can periodically send general health status notifications. Status email messages include information about the following items:

- General switch
- Chassis
- Card

- Temperature
- Power supplies
- Fans
- LEDs
- System errors
- Port lock
- Message control
- Operational configuration changes
- Current Uboot
- Port interfaces
- Port statistics

The switch maintains a default list of event IDs for which it generates an email notification. You can add specific event IDs to this list. To see the default list of event IDs, run the **show smtp event-id** command.

The following example shows an email that the switch sends for log events.

```
Subject: Logs from LabSwitch - 50712100008
From: <LabSwitch@default.com>
To: <test1@default.com>
CP1 [08/04/15 21:48:04.527:UTC] 0x00004603 00400003.67108870 DYNAMIC CLEAR GlobalRouter
SNMP INFO 2k card up(CardNum=1 AdminStatus=1 OperStatus=1)
CP1 [08/04/15 21:48:04.527:UTC] 0x00004603 00400003.67108870 DYNAMIC CLEAR GlobalRouter
SNMP INFO 2k card up(CardNum=1 AdminStatus=1 OperStatus=1)
CP1 [08/04/15 21:48:04.527:UTC] 0x00004603 00400003.67108870 DYNAMIC CLEAR GlobalRouter
SNMP INFO 2k card up(CardNum=2 AdminStatus=1 OperStatus=1)
CP1 [08/04/15 21:50:03.511:UTC] 0x00088524 00000000 GlobalRouter SW INFO Boot sequence
successful
```

If you enable the SMTP client but the switch cannot reach the SMTP server, the switch generates an alarm. The switch holds log and status information in a queue until the connection with the SMTP server is restored. The message queue holds a maximum of 2,000 messages. If the queue fills, the switch drops new messages.

The following text is an example of the alarm that the switch generates when it cannot connect to the SMTP server.

```
CP1 [06/10/15 19:27:07.901:EST] 0x00398600 0e600000 DYNAMIC SET GlobalRouter SMTP
WARNING SMTP: Unable to establish connection with server: mailhost.usae.company.com,
port:25
```

If the switch cannot establish a connection to the SMTP server, verify that the server IP address or hostname, and the TCP port are correct. If you specify the server hostname, confirm that the IP address for the DNS server is correct. Check for network issues such as unplugged cables.

If the SMTP server rejects the email message, the switch generates a log message.

Log Configuration Using CLI

Use log files and messages to perform diagnostic and fault management functions.

Configure a UNIX System Log and Syslog Host

Configure the syslog to control a facility in UNIX machines that logs SNMP messages and assigns each message a severity level based on importance.

About This Task

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable the system log:

```
syslog enable
```
3. Specify the IP header in syslog packets:

Note

This step only applies to VSP 8600 Series.

- ```
syslog ip-header-type <circuitless-ip|default>
```
4. Configure the maximum number of syslog hosts:  

```
syslog max-hosts <1-10>
```
  5. Create the syslog host:  

```
syslog host <1-10>
```
  6. Configure the IP address for the syslog host:  

```
syslog host <1-10> address WORD <0-46>
```
  7. Enable the syslog host:  

```
syslog host <1-10> enable
```

Configure optional syslog host parameters by using the variables in the following variable definition tables.

8. View the configuration to ensure it is correct:  

```
show syslog [host <1-10>]
```

### Examples

```
Switch:1(config)#syslog enable
Switch:1(config)#syslog host 7 address 192.0.2.1
Switch:1(config)#syslog host 7 enable
Switch:1(config)#show syslog host 7

 Id : 7
 IpAddr : 192.0.2.1
 UdpPort : 514
 Facility : local7
 Severity : info|warning|error|fatal
 MapInfoSeverity : info
 MapWarningSeverity : warning
```

```

MapErrorSeverity : error
MapMfgSeverity : notice
MapFatalSeverity : emergency
 Enable : true
SecureForwardingMode: none
 Tcp Port : 1025
Switch:1(config)#show syslog

Enable : true
Max Hosts : 5
OperState : active
header : default
Total number of configured hosts : 3
Total number of enabled hosts : 1
Configured host : 7 8 9
Enabled host : 7

```

### Variable Definitions

The following table defines parameters for the **syslog** command.

Variable	Value
<i>enable</i>	Enables the sending of syslog messages on the device. Use the <i>no</i> operator before this parameter, <i>no syslog enable</i> , to disable the sending of syslog messages on the device. The default is enabled.
<i>ip-header-type</i> < <i>circuitless-ip</i>   <i>default</i> >	Specifies the IP header in syslog packets to <i>circuitless-ip</i> or <i>default</i> . <ul style="list-style-type: none"> <li>If the value is <i>default</i>, the IP address of the VLAN is used for syslog packets that are transmitted in-band using input/output (I/O) ports.</li> <li>If the value is <i>circuitless-ip</i>, then for all syslog messages (in-band or out-of-band), the <i>circuitless IP</i> address is used in the IP header. If you configure multiple <i>circuitless IP</i>s, the first <i>circuitless IP</i> configured is used.</li> </ul>
<i>max-hosts</i> < <i>1-10</i> >	Specifies the maximum number of syslog hosts supported, from 1-10. The default is 5.

The following table defines parameters for the **syslog host** command.

Variable	Value
<i>1-10</i>	Creates and configures a host instance. Use the <i>no</i> operator before this parameter, <i>no syslog host</i> , to delete a host instance.
<i>address WORD</i> < <i>0-46</i> >	Configures a host location for the syslog host. <i>WORD</i> < <i>0-46</i> > is the IPv4 or IPv6 address of the UNIX system syslog host in the format A.B.C.D or x:x:x:x:x:x. You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration.

Variable	Value
<code>enable</code>	Enables the syslog host. Use the <code>no</code> operator before this parameter, <code>no syslog host enable</code> , to disable syslog host. The default is disabled.
<code>facility {local0 local1 local2 local3 local4 local5 local6 local7}</code>	Specifies the UNIX facility in messages to the syslog host. <code>{local0 local1 local2 local3 local4 local5 local6 local7}</code> is the UNIX system syslog host facility. The default is <code>local7</code> .
<code>maperror {emergency alert critical error warning notice info debug}</code>	Specifies the syslog severity to use for error messages. The default is <code>error</code> .
<code>mapfatal {emergency alert critical error warning notice info debug}</code>	Specifies the syslog severity to use for fatal messages. The default is <code>emergency</code> .
<code>mapinfo {emergency alert critical error warning notice info debug}</code>	Specifies the syslog severity level to use for information messages. The default is <code>info</code> .
<code>mapwarning {emergency alert critical error warning notice info debug}</code>	Specifies the syslog severity to use for warning messages. The default is <code>warning</code> .
<code>severity &lt;info warning error fatal&gt; [&lt;info warning error fatal&gt;] [&lt;info warning error fatal&gt;] [&lt;info warning error fatal&gt;]</code>	Specifies the severity levels for which to send syslog messages. You can specify up to four severity levels in the same command string. The default is <code>info</code> .
<code>udp-port &lt;514-530&gt;</code>	Specifies the User Datagram Protocol port number on which to send syslog messages to the syslog host. This value is the UNIX system syslog host port number from 514-530. The default is 514.

## Configuring Secure Forwarding

Configuring secure forwarding includes setting the mode for the particular syslog host and setting the TCP port through which the logs are sent to the syslog server.

### Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create the syslog host:

```
syslog host <1-10>
```

Use the `no` operator before this parameter, that is, `no syslog host` to delete a host instance.

3. Configure an IP address for the syslog host:

```
syslog host <1-10> address WORD<0-46>
```

4. Enable the syslog host:

```
syslog host <1-10> enable
```

5. Enable syslog globally:  

```
syslog enable
```
6. Set the mode for secure forwarding on the host:  

```
syslog host <1-10> secure-forwarding mode <none | tls [server-cert-name WORD<1-64>]>
```
7. Set the TCP port:  

```
syslog host <1-10> secure-forwarding tcp-port <1025-49151>
```
8. Display the secure forwarding configured values:  

```
show syslog host <1-10>
```
9. (Optional) Remove the server certificate name:  

```
no syslog host <1-10> secure-forwarding mode tls server-cert-name
```
10. (Optional) Set secure-forwarding mode to none for a particular host:  

```
default syslog host <1-10> secure-forwarding mode
```

### What to Do Next

After configuring secure forwarding on the switch, set the syslog server to be able to see the log messages on the interactive syslog viewer.

- For TLS secure syslog, on the rsyslog server, configure the server to use TLS method and install the root certificate on the server in the switch.

### Variable Definitions

The following table defines parameters for the **syslog host** command.

Variable	Value
host <1-10>	Specifies the ID for the syslog host. The range is 1-10.
address WORD<0-46>	Configures a host location for the syslog host. WORD <0-46> is the IPv4 or IPv6 address of the UNIX system syslog host in the format A.B.C.D or x:x:x:x:x:x. You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration using CLI.
enable	Enables the syslog host. Use the no operator before this parameter, no syslog host enable to disable syslog host. The default is disabled.
secure-forwarding	Adds protected syslog using remote port forwarding for host.

The following table defines parameters for the **syslog host secure-forwarding** command.

Variable	Value
<code>host &lt;1-10&gt;</code>	Creates and configures a host instance. Use the no operator before this parameter, no syslog host to delete a host instance.
<code>mode &lt;none   tls [server-cert-name WORD&lt;1-64&gt;]&gt;</code>	Specifies the mode of secure forwarding of syslog on the host. The default mode is none, that is, tls mode is disabled by default.  <b>Note:</b> Certificate validation is done only if the server-cert-name is configured.
<code>tcp-port &lt;1025-49151&gt;</code>	Set tcp-port for secure forwarding of syslog for host. The default tcp-port is 1025. To set the TCP port to default value, use command <b>default syslog host &lt;1-10&gt; secure-forwarding tcp-port</b> .  <b>Important:</b> The tcp-port 6000 cannot be used, as it is used as an internal port for Internal Spanning Tree (IST).

## Installing Root Certificate for Syslog Client

Use the following procedure to install a root certificate for a syslog client.

### Procedure

1. Enter Global Configuration mode:  
`enable`  
  
`configure terminal`
2. Install a root certificate on the store:  
`syslog root-cert install-filename <file-name>`

The certificate is installed in folder: `/intflash/.cert/.syslogrootinstalledcert/`.

#### Note

The offline root certificate for TLS syslog must be kept in folder: `/intflash/.cert/..syslogofflinerootcert/`.

3. **Uninstall a root certificate from the store:**  
`no syslog root-cert install-filename <file-name>`
4. To display the installed syslog server root certificate file:  
`show syslog root-cert-file`

### Variable Definition

The following table defines parameters for the **syslog root-cert** command.

Variable	Value
<i>install-filename</i> <i>WORD&lt;1-128&gt;</i>	Specifies the name of the root certificate to be installed on the store.

## Configuring Logging

Configure logging to determine the types of messages to log and where to store the messages.

### About This Task

#### Note

The platform logs CLILOG and SNMPLOG as INFO. Normally, if you configure the logging level to WARNING, the system skips all INFO messages. However, if you enable CLILOG and SNMPLOG the system logs CLI Log and SNMP Log information regardless of the logging level you configure. This is not the case for other INFO messages.

### Procedure

1. Enter Global Configuration mode:  
`enable`  
`configure terminal`
2. Define which messages to log:  
`logging level <0-4>`
3. Write the log file from memory to a file:  
`logging write WORD<1-1536>`
4. Show logging on the screen:  
`logging screen`

### Example

```
Switch:1(config)#logging level 0
Switch:1(config)#logging write log2
Switch:1(config)#logging screen
```

### Variable Definitions

The following table defines parameters for the **logging** command.

Variable	Value
<i>level</i> <0-4>	Shows and configures the logging level. The level is one of the following values: <ul style="list-style-type: none"> <li>• 0: Information — all messages are recorded</li> <li>• 1: Warning — only warning and more serious messages are recorded</li> <li>• 2: Error — only error and more serious messages are recorded</li> <li>• 3: Manufacturing — this parameter is not available for customer use</li> <li>• 4: Fatal — only fatal messages are recorded</li> </ul>
<i>screen</i>	Configures the log display on the screen to on. Use the no form of the command to stop the log display on the screen: <b>no logging screen</b>
<i>transferFile</i> <1-10> <i>address</i> {A.B.C.D} <i>filename-prefix</i> WORD<0-200	Transfers the syslog file to a remote FTP or TFTP server. <1-10> specifies the file ID. The <i>address</i> {A.B.C.D} option specifies the IP address. The <i>filename-prefix</i> WORD<0-200> option sets the filename prefix for the log file at the remote host.
<i>write</i> WORD<1-1536>	Writes the log file with the designated string. WORD<1-1536> is the string or command that you append to the log file. If the string contains spaces, you must enclose the string in quotation marks (").

## Configuring the Remote Host Address for Log Transfer

Configure the remote host address for log transfer. The system transfers the current log file to a remote host after the log file size reaches the maximum size.

### Before You Begin

- The IP address you configure for the remote host must be reachable at the time of configuration.

### Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the remote host address for log transfer:

```
logging transferFile {1-10} address {A.B.C.D} [filename-prefix WORD<0-200>]
```

### Example

```
Switch:1(config)# logging transferFile 1 address 192.0.2.10
```

### Variable Definitions

The following table defines parameters for the **logging transferFile** command.

Variable	Value
<i>1-10</i>	Specifies the file ID to transfer.
<i>address {A.B.C.D}</i>	Specifies the IP address of the host to which to transfer the log file. The remote host must be reachable or the configuration fails.
<i>filename-prefix WORD&lt;0-200&gt;</i>	Specifies the name of the file on the remote host. If you do not configure a name, the current log file name is the default.

## Configuring System Logging

System logs are a valuable diagnostic tool. You can send log messages to flash files for later retrieval.

### About This Task

You can change log file parameters at anytime without restarting the system. Changes made to these parameters take effect immediately.

Configure logging to a flash file at all times as a best practice.

### Procedure

1. Enter Global Configuration mode:  

```
enable
```

```
configure terminal
```
2. Enable system logging to a PC card file:  

```
boot config flags logging
```
3. Configure the logfile parameters:  

```
boot config logfile <64-500> <500-16384> <10-90>
```

### Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#boot config logfile 64 600 10
```

Variable Definitions

The following table defines parameters for the **boot config** command.

Variable	Value
<i>flags logging</i>	Enables or disables logging to a flash file. The log file is named using the format log.xxxxxxxx.sss. The first six characters after the prefix of the file name log contain the last three bytes of the chassis base MAC address. The next two characters specify the slot number. The last three characters denote the sequence number of the log file.
<i>logfile &lt;64-500&gt; &lt;500-16384&gt; &lt;10-90&gt;</i>	Configures the following logfile parameters: <ul style="list-style-type: none"> <li>• <i>&lt;64-500&gt;</i> specifies the minimum free memory space on the external storage device from 64-500 KB. The switch does not support this parameter.</li> <li>• <i>&lt;500-16384&gt;</i> specifies the maximum size of the log file from 500-16384 KB.</li> <li>• <i>&lt;10-90&gt;</i> specifies the maximum percentage, ranging from 10-90 percent, of space on the external storage device the logfile can use. The switch does not support this parameter.</li> </ul>

## Configuring System Message Control

Configure system message control to suppress duplicate error messages on the console, and to determine the action to take if they occur.

### Procedure

1. Enter Global Configuration mode:  

```
enable
```

```
configure terminal
```
2. Configure system message control action:  

```
sys msg-control action <both|send-trap|suppress-msg>
```
3. Configure the maximum number of messages:  

```
sys msg-control max-msg-num <2-500>
```
4. Configure the interval:  

```
sys msg-control control-interval <1-30>
```
5. Enable message control:  

```
sys msg-control
```

### Example

```
Switch:1(config)#sys msg-control action suppress-msg
Switch:1(config)#sys msg-control max-msg-num 10
Switch:1(config)#sys msg-control control-interval 15
Switch:1(config)#sys msg-control
```

### Variable Definitions

The following table defines parameters for the **sys msg-control** command.

Variable	Value
<i>action</i> <both send-trap suppress-msg>	Configures the message control action. You can either suppress the message or send a trap notification, or both. The default is suppress.
<i>control-interval</i> <1-30>	Configures the message control interval in minutes. The valid options are 1-30. The default is 5.
<i>max-msg-num</i> <2-500>	Configures the number of occurrences of a message after which the control action occurs. To configure the maximum number of occurrences, enter a value from 2-500. The default is 5.

## Extending System Message Control

Use the force message control option to extend the message control feature functionality to the software and hardware log messages.

### About This Task

To enable the message control feature, you must specify an action, control interval, and maximum message number. After you enable the feature, the log messages that get repeated and cross the maximum message number in the control interval, trigger the force message feature. You can either suppress the message or send a trap notification, or both.

### Procedure

1. Enter Global Configuration mode:
 

```
enable

configure terminal
```
2. Configure the force message control option:
 

```
sys force-msg WORD<4-4>
```

### Example

Add a force message control pattern. If you use a wildcard pattern (\*\*\*\*), all messages undergo message control.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#sys force-msg ****
```

## Variable Definitions

The following table defines parameters for the **sys force-msg** command.

Variable	Value
<i>WORD</i> <4-4>	Adds a forced message control pattern, where <i>WORD</i> <4-4> is a string of 4 characters. You can add a four-byte pattern into the force-msg table. The software and the hardware log messages that use the first four bytes that match one of the patterns in the force-msg table undergo the configured message control action. You can specify up to 32 different patterns in the force-msg table, including a wildcard pattern (****) as well. If you specify the wildcard pattern, all messages undergo message control.

## Viewing Logs

View log files by file name, category, or severity to identify possible problems.

### About This Task

View CLI command and SNMP trap logs, which are logged as normal log messages and logged to the system log file.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. Show log information:  
show logging file [alarm] [CPU *WORD*<0-100>] [detail] [event-code *WORD*<0-10>] [module *WORD*<0-100>] [name-of-file *WORD*<1-99>] [save-to-file *WORD*<1-99>] [severity *WORD*<0-25>] [tail] [vrf *WORD*<0-32>]

### Example

Display log file information:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#show logging file

### Variable Definitions

The following table defines parameters for the **show logging file** command.

Variable	Value
<i>alarm</i>	Displays alarm log entries.
<i>CPU WORD &lt;0-100&gt;</i>	Filters and lists the logs according to the CPU that generated the message. Specify a string length of 0-25 characters. To specify multiple filters, separate each CPU by the vertical bar ( ), for example, CPU1 CPU2.
<i>detail</i>	Displays CLI and SNMP logging information.
<i>event-code WORD&lt;0-10&gt;</i>	Specifies a number that precisely identifies the event reported.

Variable	Value
<code>module WORD&lt;0-100&gt;</code>	Filters and lists the logs according to module. Specifies a string length of 0-100 characters. Categories include SNMP, EAP, RADIUS, RMON, WEB, HW, MLT, FILTER, QOS, CLILOG, SW, CPU, IP, VLAN, IPMC, and SNMPLOG. To specify multiple filters, separate each category by the vertical bar ( ), for example,   <i>FILTER</i>   <i>QOS</i> .
<code>name-of-file WORD&lt;1-99&gt;</code>	Displays the valid logs from this file. For example, /intflash/logcopy.txt. You cannot use this command on the current log file, the file into which the messages are currently logged. Specify a string length of 1 to 99 characters. If you enable enhanced secure mode, the system encrypts the entire log file. After you use the <b>show log file name-of-file WORD&lt;1-99&gt;</b> command, the system takes the encrypted log file name as input, then decrypts it, and prints the output to the screen. You can then redirect the decrypted output to a file that you can store onto the flash. If enhanced secure mode is disabled, the system only encrypts the proprietary portion of the log file.
<code>save-to-file WORD&lt;1-99&gt;</code>	Redirects the output to the specified file and removes all encrypted information. You cannot use the <i>tail</i> option with the <i>save-to-file</i> option. Specify a string length of 1-99 characters.
<code>severity WORD&lt;0-25&gt;</code>	Filters and lists the logs according to severity. Choices include INFO, ERROR, WARNING, and FATAL. To specify multiple filters, separate each severity by the vertical bar ( ), for example, <i>ERROR</i>   <i>WARNING</i>   <i>FATAL</i> .
<code>tail</code>	Shows the last results first.
<code>vrf WORD&lt;0-32&gt;</code>	Specifies the name of a VRF instance to show log messages that only pertain to that VRF.

## Configuring CLI Logging

Use CLI logging to track all CLI commands executed and for fault management purposes. The CLI commands are logged to the system log file as CLILOG module.

### About This Task

#### Note

The platform logs CLILOG and SNMPLOG as INFO. Normally, if you configure the logging level to WARNING, the system skips all INFO messages. However, if you enable CLILOG and SNMPLOG the system logs CLI Log and SNMP Log information regardless of the logging level you configure. This is not the case for other INFO messages.

### Procedure

- Enter Global Configuration mode:  

```
enable
```

```
configure terminal
```
- Enable CLI logging:  

```
clilog enable
```

3. (Optional) Disable CLI logging:
 

```
no clilog enable
```
4. Ensure that the configuration is correct:
 

```
show clilog
```
5. View the CLI log:
 

```
show logging file module clilog
```

### Example

Enable CLI logging, and view the CLI log:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#clilog enable
Switch:1(config)#show logging file module clilog

*Variable Definitions*

The following table defines parameters for the **cliilog** command.

Variable	Value
<i>enable</i>	Activates CLI logging. To disable, use the <b>no cliilog enable</b> command.

## Configure Email Notification

Configure the SMTP feature to generate email notifications for component failures, critical conditions, or general system health status.

### About This Task

The SMTP feature is disabled by default.

### Before You Begin

- To identify the SMTP server by hostname, you must first configure a DNS client on the switch.

### Procedure

- Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

- Configure the TCP port the client uses to open a connection with the SMTP server:

```
smtp port <1-65535>
```

**Note**

The port you specify must match the port that the SMTP server uses.

- Configure email recipients:

```
smtp receiver-email add WORD<3-1274>
```

```
smtp receiver-email remove WORD<3-1274>
```

**Note**

You must configure at least one recipient.

- Configure the SMTP server hostname or IPv4 address:

```
smtp server WORD<1-256>
```

- (Optional) Configure a sender email address:

```
smtp sender-email WORD<3-254>
```

6. (Optional) Add or remove log events to the default list that generate email notification:

```
smtp event-id add WORD<1-1100>
```

```
smtp event-id remove WORD<1-1100>
```

7. (Optional) Configure the status update interval:

```
smtp status-send-timer <0 | 30-43200>
```

8. Enable the SMTP client:

```
smtp enable
```

9. Configure an SMTP domain name:

```
smtp domain-name WORD<1-254>
```

10. Verify the configuration:

```
show smtp [event-id]
```

### Examples

Configure the SMTP client to use TCP port 26 to communicate with an SMTP server that is using port 26. Add two receiver email addresses, configure the server information using an IPv4 address, and enable the SMTP feature. Finally, configure an SMTP domain name, and then verify the configuration.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#smtp port 26
Switch:1(config)#smtp receiver-email add test1@default.com,test2@default.com
Switch:1(config)#smtp server 192.0.2.1
Switch:1(config)#smtp enable
Switch:1(config)#smtp domain-name test mailer
Switch:1(config)#show smtp
=====
SMTP Information
=====
SMTP Status: Enabled
Server Address: 192.0.2.1
Server Port: 26
Status send Timer: 30 (seconds)
Sender Email: LabSwitch@default.com
Domain Name: test mailer
Receiver Emails: test1@default.com
 test2@default.com
```

Add an event ID to the list for which the switch sends email notification on a log event. Verify the configuration.

```
Switch:1(config)#smtp event-id add 0x0000c5ec
Switch:1(config)#show smtp event-id

*Variable Definitions*

The following table defines parameters for the **smtp port** command.

Variable	Value
<1-65535>	<p>Specifies the TCP port on the switch that the SMTP client uses to communicate with the SMTP server. The default value is 25.</p> <p><b>Note:</b>                      You must disable the SMTP feature before you can change an existing SMTP port configuration.                      The port you specify must match the port that the SMTP server uses.</p>

The following table defines parameters for the **smtp receiver-email** command.

Variable	Value
<i>add</i> WORD<3-1274>	<p>Adds an email address to the recipient list. The recipients receive the email notification generated by the switch.</p> <p>You must configure at least one email recipient and can create a maximum of five email recipients. You can specify multiple addresses in a single command by separating them with a comma.</p> <p>You cannot use quotation marks (") or commas (,) in email addresses. Other restrictions for the format of the email address follow RFC 5321.</p> <p>The maximum length for the address is 254 characters.</p>
<i>remove</i> WORD<3-1274>	<p>Removes an email address from the recipient list. The recipients receive the email notification generated by the switch. You can specify multiple addresses in a single command by separating them with a comma.</p> <p>You cannot use quotation marks (") or commas (,) in email addresses. Other restrictions for the format of the email address follow RFC 5321.</p> <p>The maximum length for the address is 254 characters.</p>

The following table defines parameters for the **smtp server** command.

Variable	Value
<i>WORD</i> <1-256>	Specifies the SMTP server address. You can use either a hostname or IPv4 address. If you use a hostname, you must configure the DNS client on the switch.

The following table defines parameters for the **smtp sender-email** command.

Variable	Value
<i>WORD</i> <3-254>	Specifies the email address that appears in the From field of the message that the switch generates. By default, the switch uses <SystemName>@default.com.

The following table defines parameters for the **smtp event-id** command.

Variable	Value
<i>add WORD</i> <1-1100>	Adds a log event to the list of events that generate email notification. You can specify multiple event IDs in a single command by separating them with a comma. The event ID can be up to 10 digits in hexadecimal format.
<i>remove WORD</i> <1-1100>	Removes a log event from the list of events that generate email notification. You can specify multiple event IDs in a single command by separating them with a comma. The event ID can be up to 10 digits in hexadecimal format.

The following table defines parameters for the **smtp status-send-timer** command.

Variable	Value
<0   30-43200>	Specifies the interval, in seconds, at which the switch sends status information. The default is 30 seconds. A value of 0 means the switch does not send status information.

The following table defines parameters for the **smtp domain-name** command.

Variable	Value
<i>WORD</i> <1-254>	Specifies the SMTP host name or IPv4 address (string length 1-254).

The following table defines parameters for the **show smtp** command.

Variable	Value
<i>event-id</i>	Shows a list of active event IDs for which the switch generates email notification. The command output includes the default list of IDs and IDs you specifically add or remove.

## Log Configuration Using EDM

Use log files and messages to perform diagnostic and fault management functions. This section provides procedures to configure and use the logging system in Enterprise Device Manager (EDM).

## Configure the System Log

### About This Task

Configure the system log to track all user activity on the device. The system log can send messages of up to ten syslog hosts.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics**.
2. Click **System Log**.
3. In the **System Log** tab, select **Enable**.
4. Configure the maximum number of syslog hosts.
5. Configure the IP header type for the syslog packet.
6. Click **Apply**.

### *System Log* Field Descriptions

Use the data in the following table to use the **System Log** tab.

Name	Description
<b>Enable</b>	Enables or disables the syslog feature. If you select this variable, this feature sends a message to a server on a network that is configured to receive and store diagnostic messages from this device. You can configure the type of messages sent. The default is enabled.
<b>MaxHosts</b>	Specifies the maximum number of remote hosts considered active and can receive messages from the syslog service. The range is 0-10 and the default is 5.
<b>OperState</b>	Specifies the operational state of the syslog service. The default is active.
<b>Header</b>	<p>Specifies the IP header in syslog packets to circuitlessIP or default.</p> <ul style="list-style-type: none"> <li>• If the value is default, the IP address of the VLAN is used for syslog packets that are transmitted in-band using input/output (I/O) ports.</li> <li>• If the value is circuitlessIP, the circuitless IP address is used in the IP header for all syslog messages (in-band or out-of-band). If you configure multiple circuitless IPs, the first circuitless IP configured is used.</li> </ul> <p>The default value is default.</p>

## Configure the System Log Table

### About This Task

Use the system log table to customize the mappings between the severity levels and the type of alarms.

You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses with no difference in functionality or configuration except in the following case. When you configure the

system log table, under the **System Log Table** tab, you must select **ipv4** or **ipv6**, in the **AddressType** box. The **Address** box supports both IPv4 and IPv6 addresses.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics**.
2. Click **System Log**.
3. Click the **System Log Table** tab.
4. Click **Insert**.
5. Configure the parameters as required.
6. Click **Insert**.
7. To modify mappings, double-click a parameter to view a list of options.
8. Click **Apply**.

### **System Log Table** Field Descriptions

Use the data in the following table to use the **System Log Table** tab.

Name	Description
<b>Id</b>	Specifies the ID for the syslog host. The range is 1–10.
<b>AddressType</b>	Specifies if the address is an IPv4 or IPv6 address.
<b>Address</b>	Specifies the IP address of the syslog host. You can log system log messages to external system log hosts with both IPv4 and IPv6 addresses.
<b>UdpPort</b>	Specifies the UDP port to use to send messages to the syslog host (514–530). The default is 514.
<b>Enable</b>	Enables or disables the sending of messages to the syslog host. The default is disabled.
<b>HostFacility</b>	Specifies the syslog host facility used to identify messages (local0 to local7). The default is local7.
<b>Severity</b>	Specifies the message severity for which syslog messages are sent. The default is info warning error fatal.
<b>MapInfoSeverity</b>	Specifies the syslog severity to use for INFO messages. The default is info.
<b>MapWarningSeverity</b>	Specifies the syslog severity to use for WARNING messages. The default is warning.
<b>MapErrorSeverity</b>	Specifies the syslog severity to use for ERROR messages. The default is error.
<b>MapFatalSeverity</b>	Specifies the syslog severity to use for FATAL messages. The default is emergency.
<b>MapMfgSeverity</b>	Specifies the syslog severity to use for Accelar manufacturing messages. The default is notice.
<b>SecureForwardingTcpPort</b>	Specifies the TCP port to use for secure forwarding for a particular host. The default is 1025.

Name	Description
<b>SecureForwardingMode</b>	Enables or disables secure forwarding of syslog over remote port forwarding. The supported values are <code>tls</code> and <code>none</code> . The default is <code>none</code> , which means that secure forwarding is disabled.
<b>SecureForwardingServerCertName</b>	Specifies the server certificate name. Certificate validation is done only if the server certificate name is configured.

## Configure Email Notification

Configure the SMTP feature to generate email notifications for component failures, critical conditions, or general system health status.

### About This Task

The SMTP feature is disabled by default.

### Before You Begin

- To identify the SMTP server by hostname, you must first configure a DNS client on the switch.

### Procedure

- In the navigation pane, expand **Configuration > Edit**.
- Select **SMTP**.
- Select the **Globals** tab.
- In the **ServerAddress** field, configure the SMTP server address.
- In the **ReceiverEmailsList** field, add email recipients.

#### Note

You must configure at least one recipient.

- (Optional) In the **SenderEmail** field, configure a sender email address to use an address other than the default.
- In the **DomainName** field, configure an SMTP domain name.
- In the **Port** field, configure the TCP port that the client uses to open a connection with the SMTP server.
- (Optional) In the **SystemStatusSendTimer** field, configure the status update interval.
- Select **enable** to enable the SMTP client.
- (Optional) In the **LogEventIds** field, add or remove log events to the default list that generates an email notification.
- Select **Apply**.

### Globals Field Descriptions

Use the data in the following table to use the **Globals** tab.

Name	Description
<b>ServerAddressType</b>	Specifies the type of server address as either an IPv4 address or a hostname. If you use a hostname, you must configure the DNS client on the switch.
<b>ServerAddress</b>	Specifies the SMTP server address. You can use either a hostname or an IPv4 address. If you use a hostname, you must configure the DNS client on the switch.
<b>ReceiverEmailsList</b>	Specifies the recipient list. The recipients receive the email notification generated by the switch. You must configure at least one email recipient and can create a maximum of five email recipients. You can specify multiple addresses in a single command by separating them with a comma. You cannot use quotation marks (") or commas (,) in email addresses. Other restrictions for the format of the email address follow RFC5321. The maximum length for the address is 254 characters.
<b>NumOfEmails</b>	Shows the total number of addresses in <b>ReceiverEmailsList</b> .
<b>SenderEmail</b>	Specifies the email address that appears in the From field of the message that the switch generates. By default, the switch uses <i>SystemName@default.com</i> .
<b>DomainName</b>	Specifies the SMTP domain name. The maximum length is 254 characters.
<b>Port</b>	Specifies the TCP port on the switch that the SMTP client uses to communicate with the SMTP server. The default value is 25.  <b>Note:</b> You must disable the SMTP feature before you can change an existing SMTP port configuration. The port you specify must match the port that the SMTP server uses.
<b>SystemStatusSendTimer</b>	Specifies the interval, in seconds, at which the switch sends status information. The default is 30 seconds. A value of 0 means the switch does not send status information.
<b>Enable</b>	Enables or disables the SMTP feature. By default, SMTP is disabled.
<b>LogEventIds</b>	Specifies the list of events that generate email notification. You can specify multiple event IDs in a single command by separating them with a comma. The event ID can be up to 10 digits in hexadecimal format.
<b>NumOfEventIds</b>	Shows the total number of IDs in <b>LogEventIds</b> .

Name	Description
<b>DefaultLogEventIds</b>	Shows the default list of event IDs that generate email notification.
<b>NumOfDefaultEventIds</b>	Shows the total number of IDs in <b>DefaultLogEventIds</b> .

## SNMP Trap Configuration Using CLI

### Configuring an SNMP Host

Configure an SNMP host so that the system can forward SNMP traps to a host for monitoring. You can use SNMPv1, SNMPv2c, or SNMPv3. You configure the target table parameters (security name and model) as part of the host configuration.

#### Procedure

- Enter Global Configuration mode:
 

```
enable

configure terminal
```
- Configure an SNMPv1 host:
 

```
snmp-server host WORD<1-256> [port <1-65535>] v1 WORD<1-32> [filter WORD<1-32>]
```
- Configure an SNMPv2c host:
 

```
snmp-server host WORD<1-256> [port <1-65535>] v2c WORD<1-32> [inform [timeout <1-2147483647>] [retries <0-255>] [mms <0-2147483647>]] [filter WORD<1-32>]
```
- Configure an SNMPv3 host:
 

```
snmp-server host WORD<1-256> [port <1-65535>] v3 {noAuthNoPriv|authNoPriv|AuthPriv} WORD<1-32> [inform [timeout <1-2147483647>] [retries <0-255>]] [filter WORD<1-32>]
```
- Ensure that the configuration is correct:
 

```
show snmp-server host
```

#### Example

Configure the target table entry. Configure an SNMPv3 host.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmp-server host 192.0.2.207 port 162 v2c ReadView inform timeout 1500
retries 3 mms 484
Switch:1(config)#snmp-server host 192.0.2.207 port 163 v3 authPriv Lab3 inform timeout
1500 retries 3
```

### Variable Definitions

The following table defines parameters for the **snmp-server host** command.

Variable	Value
<i>inform</i> [ <i>timeout</i> <1-2147483647>] [ <i>retries</i> <0-255>] [ <i>mms</i> <0-2147483647>]	Sends SNMP notifications as inform (rather than trap). To use all three options in one command, you must use them in the following order: <ol style="list-style-type: none"> <li>1. <i>timeout</i> &lt;1-2147483647&gt; specifies the timeout value in seconds with a range of 1-214748364.</li> <li>2. <i>retries</i> &lt;0-255&gt; specifies the retry count value with a range of 0-255.</li> <li>3. <i>mms</i> &lt;0-2147483647&gt; specifies the maximum message size as an integer with a range of 0-2147483647.</li> </ol>
<i>filter</i> WORD<1-32>	Specifies the filter profile to use.
<i>noAuthNoPriv</i>   <i>authNoPriv</i>   <i>AuthPriv</i>	Specifies the security level.
<i>port</i> <1-65535>	Specifies the host server port number.
WORD<1-32>	Specifies the security name, which identifies the principal that generates SNMP messages.
WORD<1-256>	Specifies either an IPv4 or IPv6 address.

## Configuring an SNMP Notify Filter Table

Configure the notify table to select management targets to receive notifications, as well as the type of notification to send to each management target.

### Before You Begin

- For more information about the notify filter table, see RFC3413.

### Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Create a new notify filter table:

```
snmp-server notify-filter WORD<1-32> WORD<1-32>
```
3. Ensure that the configuration is correct:

```
show snmp-server notify-filter
```

### Example

```
Switch:1(config)#snmp-server notify-filter profile3 99.3.6.1.6.3.1.1.4.1
Switch:1(config)#show snmp-server notify-filter
```

```
=====
Notify Filter Configuration
=====
Profile Name Subtree Mask

```

profile1	+99.3.6.1.6.3.1.1.4.1	0x7f
profile2	+99.3.6.1.6.3.1.1.4.1	0x7f
profile3	+99.3.6.1.6.3.1.1.4.1	0x7f

*Variable Definitions*

The following table defines parameters for the **snmp-server notify-filter** command.

Variable	Value
<i>WORD</i> <1-32> <i>WORD</i> <1-32>	Creates a notify filter table. The first instance of <i>WORD</i> <1-32> specifies the name of the filter profile with a string length of 1-32. The second instance of <i>WORD</i> <1-32> identifies the filter subtree OID with a string length of 1-32. If the subtree OID parameter uses a plus sign (+) prefix (or no prefix), this indicates include. If the subtree OID uses the minus sign (-) prefix, it indicates exclude. You do not calculate the mask because it is automatically calculated. You can use the wildcard character, the asterisk (*), to specify the mask within the OID. You do not need to specify the OID in the dotted decimal format; you can alternatively specify that the MIB parameter names and the OIDs are automatically calculated.

## Configure SNMP Interfaces

**Note**

This procedure only applies to VSP 8600 Series.

Configure an interface to send SNMP traps. If the switch has multiple interfaces, configure the IP interface from which the SNMP traps originate.

**Procedure**

1. Enter Global Configuration mode:  
`enable`  
`configure terminal`
2. Configure the destination and source IP addresses for SNMP traps:  
`snmp-server sender-ip {A.B.C.D} {A.B.C.D}`
3. If required, send the source address (sender IP) as the sender network in the notification message:  
`snmp-server force-trap-sender enable`
4. If required, force the SNMP and IP sender flag to use the same value:  
`snmp-server force-iphdr-sender enable`

**Example**

```
Switch:1(config)#snmp-server sender-ip 192.0.2.2 192.0.2.5
Switch:1(config)#no snmp-server force-iphdr-sender enable
```

### Variable Definitions

The following table defines parameters for the **snmp-server** command.

Variable	Value
sender-ip <A.B.C.D> <A.B.C.D>  <b>Note:</b> Exception: only supported on VSP 8600 Series.	Configures the SNMP trap receiver and source IP addresses. Specify the IP address of the destination SNMP server that receives the SNMP trap notification in the first IP address. Specify the source IP address of the SNMP trap notification packet that is transmitted in the second IP address. If this address is 0.0.0.0, the system uses the IP address of the local interface that is closest (from an IP routing table perspective) to the destination SNMP server.
force-iphdr-sender enable  <b>Note:</b> Exception: only supported on VSP 8600 Series.	Automatically configures the SNMP and IP sender to the same value. The default is disabled.
force-trap-sender enable  <b>Note:</b> Exception: only supported on VSP 8600 Series.	Sends the configured source address (sender IP) as the sender network in the notification message.
authentication-trap enable	Activates the generation of authentication traps.
login-success-trap enable	Activates the generation of traps for successful login.

The following table defines parameters for the **snmp-server host** command.

Variable	Value
WORD<1-256>	Specifies either an IPv4 or IPv6 address.
port <1-65535>	Specifies the host server port number.
WORD<1-32>	Specifies the security name, which identifies the principal that generates SNMP messages.
filter WORD<1-32>	Specifies the filter profile to use.

## Enabling SNMP Trap Logging

Use SNMP trap logging to send a copy of all traps to the syslog server.

### Before You Begin

- You must configure and enable the syslog server.

### About This Task

**Note**

The platform logs CLILOG and SNMPLOG as INFO. Normally, if you configure the logging level to WARNING, the system skips all INFO messages. However, if you enable CLILOG and SNMPLOG the system logs CLI Log and SNMP Log information regardless of the logging level you set. This is not the case for other INFO messages.

### Procedure

1. Enter Global Configuration mode:  

```
enable
```

```
configure terminal
```
2. Enable SNMP trap logging:  

```
snmplog enable
```
3. (Optional) Disable SNMP trap logging:  

```
no snmplog enable
```
4. View the contents of the SNMP log:  

```
show logging file module snmplog
```

### Example

Enable SNMP trap logging and view the contents of the SNMP log:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#snmplog enable
Switch:1(config-app)#show logging file module snmp
CP1 [02/06/15 22:39:58.530:UTC] 0x00004595 00000000 GlobalRouter SNMP INFO Boot

alRouter SNMP INFO 2k card up(CardNum=3 AdminStatus=1 OperStatus=1)
CP1 [02/06/15 22:40:45.839:UTC] 0x000045e5 00400005 DYNAMIC SET GlobalRouter SN
MP INFO Sending Cold-Start Trap
```

#### Variable Definitions

The following table defines parameters for the **snmplog** command.

Variable	Value
<i>enable</i>	Enables the logging of traps. Use the command <code>no snmplog enable</code> to disable the logging of traps.

## SNMP Trap Configuration Using EDM

### Configure an SNMP Host Target Address

Configure a target table to specify the list of transport addresses to use in the generation of SNMP messages.

#### Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Click **Target Table**.
3. In the **Target Table** tab, click **Insert**.
4. In the **Name** box, type a unique identifier.
5. In the **TDomain** box, select the transport type of the address. Select either **ipv4Tdomain** or **ipv6Tdomain**.
6. In the **TAddress** box, type the transport address and User Datagram Protocol (UDP) port.
7. In the **Timeout** box, type the maximum round trip time.
8. In the **RetryCount** box, type the number of retries to be attempted.
9. In the **TagList** box, type the list of tag values.
10. In the **Params** box, type the SnmpAdminString.
11. In the **TMask** box, type the mask.
12. In the **MMS** box, type the maximum message size.
13. Click **Insert**.

#### **Target Table** Field Descriptions

Use the data in the following table to use the **Target Table** tab.

Name	Description
<b>Name</b>	Specifies a unique identifier for this table. The name is a community string.
<b>TDomain</b>	Specifies the transport type of the address. <b>ipv4Tdomain</b> specifies the transport type of address is an IPv4 address. <b>ipv6Tdomain</b> specifies the transport type of address is IPv6. The default is ipv4Tdomain.
<b>TAddress</b>	Specifies the transport address in xx.xx.xx.xx:port format, for example: 192.1.2.12:162, where 162 is the trap listening port on the system 192.1.2.12.
<b>Timeout</b>	Specifies the maximum round trip time required to communicate with the transport address. The value is in 1/100 seconds from 0–2147483647. The default is 1500. After the system sends a message to this address, if a response (if one is expected) is not received within this time period, you can assume that the response is not delivered.
<b>RetryCount</b>	Specifies the maximum number of retries if a response is not received for a generated message. The count can be in the range of 0–255. The default is 3.

Name	Description
<b>TagList</b>	Contains a list of tag values used to select target addresses for a particular operation. A tag refers to a class of targets to which the messages can be sent.
<b>Params</b>	Contains SNMP parameters used to generate messages to send to this transport address. For example, to receive SNMPv2C traps, use TparamV2.
<b>TMask</b>	Specifies the mask. The value can be empty or in six-byte hex string format. Tmask is an optional parameter that permits an entry in the TargetAddrTable to specify multiple addresses.
<b>MMS</b>	Specifies the maximum message size. The size can be zero, or 484–2147483647. The default is 484. Although the maximum message size is 2147483647, the device supports the maximum SNMP packet size of 8192.

## Configure Target Table Parameters

### About This Task

Configure the target table to configure the security parameters for SNMP. Configure the target table to configure parameters such as SNMP version and security levels.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Click **Target Table**.
3. Click the **Target Params Table** tab.
4. Click **Insert**.
5. In the **Name** box, type a target table name.
6. From the **MPModel** options, select an SNMP version.
7. From the **Security Model** options, select the security model.
8. In the **SecurityName** box, type `readview` or `writeview`.
9. From the **SecurityLevel** options, select the security level for the table.
10. Click **Insert**.

### *Target Params Table Field Descriptions*

Use the data in the following table to use the **Target Params Table** tab.

Name	Description
<b>Name</b>	Identifies the target table.
<b>MPModel</b>	Specifies the message processing model to use to generate messages: SNMPv1, SNMPv2c, or SNMPv3/USM.
<b>SecurityModel</b>	Specifies the security model to use to generate messages: SNMPv1, SNMPv2c, or USM. You can receive an inconsistentValue error if you try to configure this variable to a value for a security model that the implementation does not support.

Name	Description
<b>SecurityName</b>	Identifies the principal on whose behalf SNMP messages are generated.
<b>SecurityLevel</b>	Specifies the security level used to generate SNMP messages: noAuthNoPriv, authNoPriv, or authPriv.

## Configure SNMP Notify Filter Profiles

### About This Task

Configure the SNMP table of filter profiles to determine whether particular management targets receive particular notifications.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Click **Notify Table**.
3. Click the **Notify Filter Table** tab.
4. Click **Insert**.
5. In the **NotifyFilterProfileName** box, type a name for the notify filter profile.
6. In the **Subtree** box, type subtree location information in x.x.x.x.x.x.x.x format.
7. In the **Mask** box, type the mask location in hex string format.
8. From the **Type** options, select **included** or **excluded**.
9. Click **Insert**.

### **Notify Filter Table** Field Descriptions

Use the data in the following table to use the **Notify Filter Table** tab.

Name	Description
<b>NotifyFilterProfileName</b>	Specifies the name of the filter profile used to generate notifications.
<b>Subtree</b>	Specifies the MIB subtree that, if you combine it with the mask, defines a family of subtrees, which are included in or excluded from the filter profile. For more information, see RFC 2573.
<b>Mask</b>	Specifies the bit mask (in hexadecimal format) that, in combination with the subtree, defines a family of subtrees, which are included in or excluded from the filter profile.
<b>Type</b>	Indicates whether the family of filter subtrees are included in or excluded from a filter. The default is included.

## Configure SNMP Notify Filter Profile Table Parameters

### Before You Begin

- The notify filter profile exists.

### About This Task

Configure the profile table to associate a notification filter profile with a particular set of target parameters.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > SnmpV3**.
2. Click **Notify Table**.
3. Click the **Notify Filter Profile Table** tab.
4. Click **Insert**.
5. In the **TargetParamsName** box, type a name for the target parameters.
6. In the **NotifyFilterProfileName** box, type a name for the notify filter profile.
7. Click **Insert**.

### **Notify Filter Profile Table** *Field Descriptions*

Use the data in the following table to use the **Notify Filter Profile Table** tab.

Name	Description
<b>TargetParamsName</b>	Specifies the unique identifier associated with this entry.
<b>NotifyFilterProfileName</b>	Specifies the name of the filter profile to use to generate notifications.

## Enable Authentication Traps

### About This Task

Enable the SNMP agent process to generate authentication-failure traps.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > Diagnostics**.
2. Click **General**.
3. Click the **Error** tab.
4. Select **AuthenticationTraps**.
5. Click **Apply**.

**Error Field Descriptions**

Use the data in the following table to use the **Error** tab.

Name	Description
<b>AuthenticationTraps</b>	Enables or disables the sending of traps after an error occurs. The default is disabled.
<b>LastErrorCode</b>	Specifies the last reported error code.
<b>LastErrorSeverity</b>	Specifies the last reported error severity: 0= Informative Information 1= Warning Condition 2= Error Condition 3= Manufacturing Information 4= Fatal Condition

**View the Trap Sender Table****About This Task**

Use the Trap Sender Table tab to view source and receiving addresses.

**Procedure**

1. In the navigation pane, expand **Configuration > Edit**.
2. Click **Chassis**.
3. Click the **Trap Sender Table** tab.

**Trap Sender Table Field Descriptions**

Use the data in the following table to use the **Trap Sender Table** tab.

Name	Description
<b>RecvAddress</b>	IP address for the trap receiver. This is a read-only parameter that contains the IP address configured in the TAddress field in the TargetTable.
<b>SrcAddress</b>	Source IP address to use when sending traps. This IP address will be inserted into the source IP address field in the UDP trap packet.

## MACsec fundamentals

MAC Security (MACsec) is based on the IEEE 802.1ae standard that allows authorized systems in a network to transmit data confidentially and to protect against data transmitted or modified by unauthorized devices.

You can use MACsec for core and enterprise edge switches to do the following:

- Secure site-to-site connectivity between data centers.
- Provide data security on links that run over public ground.
- Provide data security on links that run outside the physically secure boundaries of a site.

You can use MACsec on access switches to secure host-to-switch connectivity, and host-to-switch connectivity in an environment where both trusted and untrusted hosts co-exist.

In addition to host level authentication, MACsec capable LANs provide data origin authentication, data confidentiality, and data integrity between authenticated hosts or systems. MACsec protects data from external hacking while the data passes through the public network to reach a receiver host.

MACsec enabled hosts encrypt and decrypt every frame exchanged between them using a MACsec key. The source MACsec host encrypts data frames, and the destination MACsec host decrypts the frames, ensuring delivery of the frame in its original condition to the recipient host. This ensures secure data communication.

You can configure MACsec encryption over any type of point-to-point Ethernet or emulated Ethernet connection, which includes:

- Dark fiber
- Conventional wavelength-division multiplexing/dense wavelength-division multiplexing (CWDM/DWDM) service
- Multiprotocol label switching (MPLS) point-to-point (ELINE)
- Provider Backbone Bridge Traffic Engineering (PBB-TE)

You can configure MACsec on physical ports only. However, the physical ports can belong to an MLT trunk group that includes: Split MultiLink Trunking (SMLT), distributed MultiLink Trunking (DMLT), or Link aggregate group (LAG).

**Note**

For VSP 8600 Series Release 6.2 and later, MACsec is not supported on channelized ports.

You configure a pre-shared key on either end of the MACsec link. The pre-shared key is an interface parameter, not a switch-wide parameter.

**Note**

MACsec encrypts all packets. If you configure MACsec on one or more MultiLink Trunking (MLT) port members on one side, you must configure MACsec on the same port members on the other side. If you do not do this, the port can physically be enabled, but any overlying protocols can be disabled. You do not have to provision MACsec on all MLT port members, but if you configure MACsec on an MLT port member on one side, you must also provision MACsec on the corresponding MLT port on the other side.

One way to detect a mismatch of MACsec configuration is to use Virtual Link Aggregation Control Protocol (VLACP) on the links. If VLACP is enabled on an MKA-enabled link, it takes approximately 30 seconds for the VLACP session to begin.

MACsec provides security at the data link layer or the physical layer. It provides enhancements at the MAC service sub layer for its operation and services to the upper layer.

MACsec is an interface-level feature and is disabled by default.

## MACsec keys

MACsec provides industry-standard security through secure point-to-point Ethernet links. The point-to-point links are secured after matching security keys.

Security keys are of two types:

- Connectivity Association Key (CAK), which is a configured pre-shared key.

**Important**

The switch supports the configuration of a pre-shared key to enable MACsec using the static connectivity association key (CAK) security mode.

The CAK must be identical across both ends of MACsec links.

- Secure Association Key (SAK):
  - Static SAKs: SAKs are static short-lived keys derived from the CAK or pre-configured for a particular secure channel (SC). MACsec uses a timer to refresh these keys so that the key and the session are secure.
  - Dynamic SAKs: MACsec Key Agreement (MKA) protocol generates SAKs. The MKA protocol determines which switch on the point-to-point link becomes the key server. The key server then generates SAKs and distributes them to the switch at the other end of the point-to-point link.

MACsec uses derived keys to encrypt or decrypt data at each end of the MACsec links.

### *Integrity Check Verification (ICV)*

MACsec ensures data integrity using Integrity Check Verification (ICV). MACsec introduces an 8-byte or 16-byte SecTag after the Ethernet header, and an 8-byte or 16-byte calculated ICV after the Encrypted Payload. MACsec computes the ICV for the entire frame, starting from the Ethernet header, SecTag until the Checksum. The receiving side recalculates the ICV after data decryption, and verifies if the received ICV and computed ICV match. If the ICVs do not match, it indicates that data is modified, and MACsec drops the frame.

## MACsec security modes

The static Connectivity Association Key (CAK) security mode is the only supported MACsec security mode on the platform, and is also the most common mode to enable MACsec.

When you use the static CAK security mode to enable MACsec, you configure a connectivity association on both ends of the link. Secure Association Keys (SAK) establish the MACsec relationship between the switches on each end of the Ethernet link. The SAKs include a connectivity association key name (CKN) and its own CAK. The MACsec CKN and CAK are configured in a connectivity association, and the CAK must match on both ends of the link to initially enable MACsec.

To ensure link security, the system periodically refreshes keys based on traffic volume and link speed.

To enable MACsec at the port level, you must first associate the port to the connectivity association. You complete the configuration within the connectivity association, but outside of the secure channel.

#### Note

If you use MKA, you must apply MKA profile to a port before you associate it with a Connectivity Association (CA). After you associate the port with a CA, you cannot enable MKA on the port.

When you use the static CAK security mode, the system automatically creates two secure channels, one for inbound traffic and another for outbound traffic. You cannot configure any parameters in the automatically created secure channels.

The CAK security mode ensures security by frequently refreshing to a new random security key, and by only sharing the security key between the two devices on the MACsec-secured point-to-point link.

MACsec provides options to encrypt all data, or configure a confidentiality offset, which specifies the number of unencrypted bytes in a frame that precede MACsec encryption.

You can configure the following optional features:

- Data encryption — If you disable encryption, MACsec forwards traffic in clear text. You can view that data that is not encrypted in the Ethernet frame that travels across the link. Even if you disable encryption the MACsec header applies to the frame and integrity checks make sure that traffic has not been tampered with.
- Confidentiality offset — If encryption is enabled, and an offset is not configured, all traffic in the connectivity is encrypted. The confidentiality offset specifies the bytes after the Ethernet header from which data encryption begins. Valid values are 30 bytes and 50 bytes. The confidentiality offset facilitates traffic flow inspection and classification on intermediate devices by not encrypting the Network Layer header for IPv4 or IPv6. For instance, if you configure the offset to 30, the IPv4

header and the TCP/UDP header are not encrypted. If you configure the offset to 50, the IPv6 header and the TCP/UDP header are not encrypted.

## Connectivity associations and secure channels

You configure MACsec in connectivity associations (CA). You can enable MACsec after you associate a connectivity association with an interface. To use the static Connectivity Association Key (CAK) security mode to enable MACsec, you must create, and configure connectivity associations on both ends of the link.

### Tip

Configure the Connectivity Association key name (CKN) in multiples of 4 characters to avoid MKA interoperability issues between VOSS switches and EXOS switches. For example, Macsecma (8 characters) or Macsecmka123 (12 characters) are valid, but Macsec (6 characters) is not valid.

A CA is a logical representation of a MACsec domain within a network. Each connectivity association is associated with a CAK. MACsec links are associated with a CA to establish end-to-end MACsec communication. Every MACsec enabled interface is a member of one CA. Switch ports are members of a CA, and can only be a member of one CA.

A secure channel (SC) is a unidirectional channel that connects two endpoints of MACsec. A secure channel is a long-term relationship that persists through the sequence of secure associations.

A secure association (SA) is a short-lived relationship within an SC. MACsec identifies each SA by AN, and supported secure association key (SAK), which is derived from the CAK or generated by the MKA key server. Both ends of the MACsec link use the SAK to encrypt and decrypt the frames. SAKs are frequently refreshed for security reasons. Periodically changing SAs allows the use of fresh keys without terminating the SC relationship.

For static MACsec, you configure CAs. SCs and SAs are internally created in the hardware.

For MKA MACsec, you configure CAs. SCs and SAs are internally created in the hardware based on the information provided by the MKA key server.

## MACsec 2AN and 4AN mode

MACsec 2AN mode implementations use two security associations (SA) for each secure channel (SC) and symmetric keys on both MACsec endpoints. The keys are symmetric because they are both derived from the same connectivity association key (CAK).

MACsec 4AN mode generates four Secure Associations Keys (SAK) per secure channel. It uses enhanced hashing algorithm to derive eight SAKs, and uses asymmetric keys on both ends. You can use the **macsec connectivity-association** command to configure different (asymmetric) transmit keys for each endpoint by using the *key-parity* keyword. If you do not specify a value for *key-parity*, the connectivity association is created in 2AN mode. For more information about configuring MACsec transmit keys, see [Configuring a connectivity association](#).

## MACsec components

MACsec has three major components:

- **Security entity (SecY)**

SecY is the entity that operates the MACsec protocol within the system. You configure a secure connectivity association (CA) to meet the requirements of MACsec for connectivity between stations that attach to an individual LAN. Unidirectional secure channels (SC) support each CA. Each SC supports secure transmission of frames by use of symmetric key cryptography from one of the systems to all others in the CA.

Each SecY transmits frames conveying secure MACsec service requests on a single SC, and receives frames conveying secure service indications on separate SCs, one for each of the other SecYs that participate in the secure CA.

A connectivity association (CA) is a logical representation of a MACsec domain within a network. Each connectivity association is associated with a connectivity association key (CAK). MACsec links are associated with a CA to establish end-to-end MACsec communication. Every MACsec enabled interface is a member of one connectivity association. Switch ports are members of a connectivity association, and can only be a member of one connectivity association.

A secure channel (SC) is a unidirectional channel that connects two endpoints of MACsec. A secure channel is a long-term relationship that persists through the sequence of secure associations. An SC is a unidirectional point-to-multipoint communication, and can persist through Secure Association Key (SAK) changes. A sequence of Secure Associations (SAs) support each SC and allow for the periodic use of fresh keys without terminating the relationship. A single secret key or a set of keys support each SA, where the cryptographic operations used to protect one frame require more than one key. A Secure Channel Identifier (SCI) identifies each SC. An SCI is comprised of a unique 48-bit universally administered MAC address, identifying the system to which the transmitting SecY belongs, concatenated with a 16-bit port number, identifying the SecY within that system.

The SCI concatenated with a two-bit AN identifies each SA. The Secure Association Identifier (SAI) that is created allows the receiving SecY to identify the SA. It also allows the SAK used to decrypt and authenticate the received frame. The AN, and hence the SAI, are unique only for the SAs that can be used or recorded by participating SecYs at any instant.

**Figure 184: MACsec relationship**

- **Key agreement entity (KaY)**

The KaY in MACsec is responsible for CAK and SAK computations, distributions and maintenance. CAK is a global key that is persistent until the CA exists. When you configure the CAK, ensure that it is identical across MACsec links.

In static SAK mode, SAKs are short-lived keys derived from the CAK, or pre-configured for a particular SC. MACsec uses a timer to refresh SAKs so that the key, as well the session, is secure.

In dynamic SAK mode, the MKA key server generates SAKs. The key server maintains the ethernet link by periodically generating and distributing SAKs across the point-to-point link as long as MACsec is enabled.

- **Integrity check verification or Cryptographic entity**

The Cryptographic entity provides integrity check protection and validation for frames transmitted or received through the SecY layer. The integrity check verification (ICV) is calculated for the frame source address/destination address (SA/DA), SecTag, User Payload, and Cyclic Redundancy Check (CRC). The calculated ICV is appended at the end-of-frame, recalculated at the receiver side of MACsec link and validated to see if they are equal. The frames that pass the integrity check are further processed, while the system drops the frames that fail the integrity check.

MACsec configuration provides an option to encrypt the user payload. There is also the option to start the encryption from N bytes after the Ethernet header.

In the following figure, CA connects switches A, B, and C by their respective SC and SAK. Switch D cannot participate in the secure communication between A, B, or C as switch D does not know the SAK.

## MACsec Key Agreement Protocol

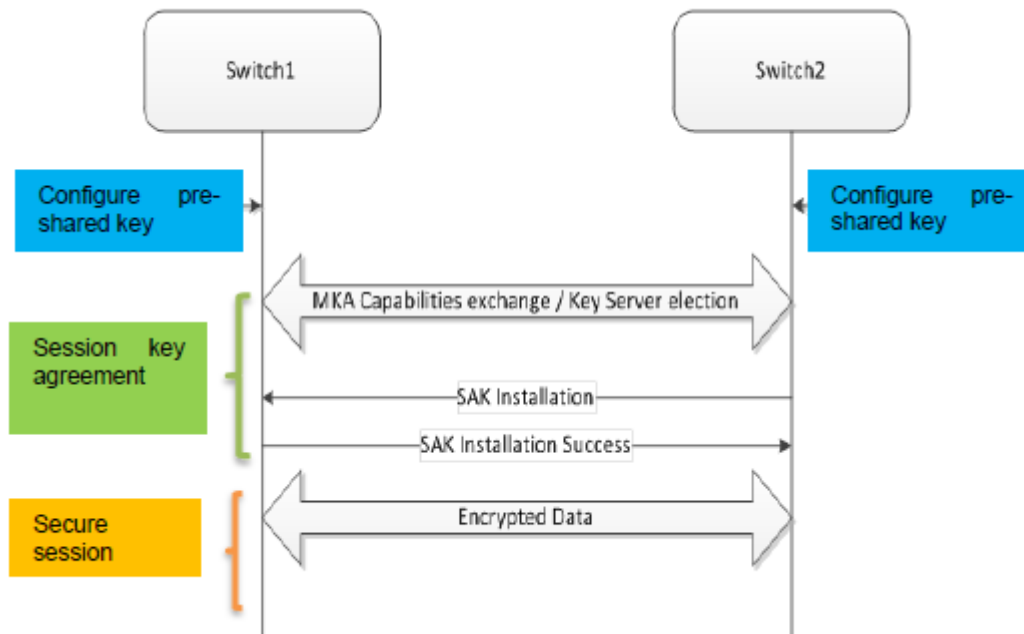

MKA protocol performs key server election and generates Secure Association Keys (SAK). SAKs and other MKA information is distributed in MACsec Key Agreement Protocol Data Units (MKPDU) between peers in the Connectivity Association (CA).

Initially you configure pre-shared keys on both ends of an Ethernet link, including values for the CAK and the connectivity association key name (CKN). The CAK and CKN values must match at both ends of the link.

You enable the MKA process by configuring pre-shared keys. MKA performs peer detection, identifies a live peer, and elects the peer with the highest priority as the key server.

The key server generates and distributes SAKs. After the key server and the peer successfully install the generated SAKs, the link can securely transmit encrypted data. The key server maintains the secure link by periodically generating and distributing SAKs for as long as MACsec is enabled.

The following figure illustrates the deployment of MACsec using MKA protocol.

**Figure 185: Switch to switch MACsec deployment scenario**

You can create and configure an MKA profile and then apply that profile to a port. After applying the profile to the port and associating the port with a connectivity association, you can enable MKA on the port and optionally assign a value for actor priority.

**Note**

If you enable MKA MACsec on a port, traffic is not sent or received on that link until the MKA session is active.

You can configure an MKA actor priority value for each MKA participant. You select priority values from the range 0x00 to 0xff, where lower numbers indicate higher priority. Each participant advertises an actor priority value, and the participant advertising the highest priority is elected as the key server. If there is a tie for the highest priority, the participant with the highest priority MAC address is selected.

**Note**

Do not configure both peers in an MKA session with an actor priority value of 0xff. If both peers are configured with an actor priority value of 0xff, key server election fails.

You can enable replay protect and configure a replay window size to protect against out of sequence packets. Window size specifies the maximum acceptable difference in packet ID numbers between out of order packets. If a packet ID number differs from the ID number of the previously received packet by more than the specified window size, the packet is dropped.

Confidentiality offset specifies the bytes after the Ethernet header from which data encryption begins. Valid values are 30 and 50. Configuring the offset to 30 allows an IPv4 header and TCP/UDP header to remain unencrypted, while configuring the offset to 50 allows an IPv6 header and TCP/UDP header to remain unencrypted.

### *MKA Interoperability with EXOS*

Switches configured with MKA MACsec in VOSS Release 8.1 can interoperate with Release 30.3 or later ExtremeXOS switches.

**Tip**

Configure the Connectivity Association key name (CKN) in multiples of 4 characters to avoid MKA interoperability issues between VOSS switches and EXOS switches. For example, Macsecma (8 characters) or Macsecmka123 (12 characters) are valid, but Macsec (6 characters) is not valid.

## MACsec Encryption Cipher Suites

MACsec cipher suites specify a set of encryption algorithms used to encrypt traffic on an Ethernet link that is secured with Media Access Control Security (MACsec).

MACsec supports two cipher suites, the GCM-AES-128 with a maximum key length of 128 bits and the GCM-AES-256 with a maximum key length of 256 bits. The default cipher suite is the GCM-AES-128. The 256-bit algorithm provides enhanced data security and also includes the security provided by the 128-bit algorithm.

**Note**

Not all VOSS products support both a 128 bit cipher suite and a 256 bit cipher suite. For information about product support, see [Table 244](#) on page 2203.

Both the GCM-AES-128 and GCM-AES-256 cipher suites use a 32-bit packet number (PN) as part of the unique initial value for every packet transmitted with a given secure association key (SAK). The system refreshes the SAK when all the permutations of the 32-bit PN are exhausted.

You typically configure a MACsec cipher suite at the port level on the switch. The configuration is optional. When you configure a cipher suite, ensure that you configure the same cipher suite on both MACsec peers.

## MACsec Operation

As shown in the following figure, a host that connects to Switch A sends an Ethernet frame to a host that connects to Switch B. Switch A encrypts the frame, excluding the Ethernet header and optionally the 802.1Q header. Switch A also appends MACsec information like SecTag and ICV to the encrypted payload and transmits the frame using normal frame transmission. This process ensures data confidentiality.

Switch B decrypts the frame once received. Switch B recalculates the ICV using a MACsec key and the SecTag present in the frame. If the ICV present in the received frame matches the recalculated ICV, the switch processes the frame. If the two ICVs do not match, the switch discards the frame. This process ensures data origin authenticity and data integrity.

The encryption and decryption algorithms follow either the AES-GCM-128 standard or the AES-GCM-256 standard depending on the configured cipher suite. The default is the AES-GCM-128 standard.

The MACsec connectivity association key (CAK) between switches A and B are statically pre-configured.

### Important

MACsec will be operational between two switches across Point-to-Point Connectivity only when the switches are either directly connected or across a network cloud that provides P2P connectivity between the two switches.

For example, in the following figure you can enable MACsec between two switches across a network cloud where P2P connectivity between the switches is provided via services such as P2P, MPLS, Layer 2 VPN (ELINE), or connectivity across Dark Fiber. However, it is important to note that MACsec will not be operational between two switches across a network cloud if the intermediate routers/switches need to inspect the VLAN tag or IP header for service classification. This is because MACsec encrypts the entire data frame including the VLAN header and as such the intermediate switches/routers will not have visibility into the same to perform service classification.

**Figure 186: MACsec operation**

## MACsec configuration using CLI

### Configuring MACsec encryption on a port

Use the following procedure to enable or disable encryption on a MACsec capable port. The default is disabled.

#### About This Task

If you disable encryption, MACsec forwards traffic in clear text. You can view that data that is not encrypted in the Ethernet frame that travels across the link. Even if you disable encryption the MACsec header applies to the frame and integrity checks make sure that traffic has not been tampered with.

## Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable MACsec encryption on the port:

```
macsec encryption enable
```

3. Disable MACsec encryption on the port:

```
no macsec encryption enable
```

## Example

Configure MACsec encryption on a port:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabit 1/2
Switch:1(config-if)#macsec encryption enable
```

## Configuring a MACsec Cipher Suite on a Port

### Note

Configuring a MACsec cipher suite is optional and is not supported on all hardware platforms. For more information on the physical hardware restrictions, see your hardware documentation.

## Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure a MACsec encryption cipher suite:

```
macsec cipher-suite {gcm-aes-128 | gcm-aes-256}
```

The default cipher suite is GCM-AES-128.

Ensure that you configure the same cipher suite on both MACsec peers.

3. Verify the configuration:

```
show macsec status {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

### Example

Configure the 256-bit MACsec cipher suite on the port 1/2 and verify the configuration.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#macsec cipher-suite gcm-aes-256
Switch:1>show macsec status 1/3
```

MACSEC Port Status								
Profile	MACSEC	Encryption	Replay	Replay	Encryption	Cipher	CA	MKA-
PortId	Status	Status	Protect	Protect W'dow	Offset	Suite	Name	Name
1/3	enabled	disabled	disabled	--	none	AES-128	SMLTCONN	mkaprol

The system displays the following error message if you attempt to configure a cipher suite on a port that is not MACsec capable.

```
Switch:1>enable
Switch:1(config)#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/2
Switch:1(config-if)#macsec cipher suite gcm-aes-256

Error: port 1/2, Port is not MACSec capable. No MACSec configurations allowed on port
```

The system displays the following error message if your hardware does not support the MACsec 256-bit cipher suite.

```
Switch:1>enable
Switch:1(config)#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 5/1
Switch:1(config-if)#macsec cipher-suite gcm-aes-256

Error: port 5/1, MACSec cipher-suite cannot be modified on port. Cipher-suite is by default AES-128
```

### Variable Definitions

The following table defines parameters for the **macsec cipher-suite** command.

Variable	Definition
<code>{gcm-aes-128   gcm-aes-256}</code>	Configures the cipher suite for encrypting traffic with MACsec. The supported cipher suites are: <ul style="list-style-type: none"> <li>AES-GCM-128, with a maximum key length of 128 bits</li> <li>AES-GCM--256, with a maximum key length of 256 bits</li> </ul> The default is the AES-GCM-128 cipher suite.

## Configure a Connectivity Association

Use the following procedure to configure a connectivity association (CA) in static Connectivity Association Key (CAK) security mode with static Secure Association Keys (SAK).

### Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure a CA:

```
macsec connectivity association WORD <5-16> connectivity-association-
key WORD<10-32> [key-parity even|odd]
```

#### Note

If you do not specify a key-parity value, the CA is created in 2AN mode.  
This applies only to platforms that support 2AN mode.

#### Note

The parameter `[key-parity even|odd]` applies only to static MACsec configurations.

3. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format `slot/port/sub-port`.

4. Associate a port with a CA:

```
macsec connectivity-association WORD<5-16>
```

## Example

Configure a connectivity association and enable MACsec on a port:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#macsec connectivity-association caname1 connectivity-association-key
1029384756abcdef key-parity even
Switch:1(config)#interface gigabitethernet 1/2
Switch:1(config-if)#macsec connectivity-association caname12
```

### Variable Definitions

The following table defines parameters for the **macsec** command.

Variable	Value
<i>connectivity-association</i> <i>WORD</i> <5-16>	Specifies a connectivity-association name. <b>Tip:</b> Configure the Connectivity Association key name (CKN) in multiples of 4 characters to avoid MKA interoperability issues between VOSS switches and EXOS switches. For example, Macsecma (8 characters) or Macsecmka123 (12 characters) are valid, but Macsec (6 characters) is not valid.
<i>connectivity-association-key</i> <i>WORD</i> <10-32>	Specifies the value of the connectivity-association key (CAK). This value should be a 32-character hexadecimal string.
<i>key-parity</i> <even   odd>	Specifies Tx key parity using the following values: <ul style="list-style-type: none"> <li>even — generates even-numbered keys for Tx</li> <li>odd — generates odd-numbered keys for Tx</li> </ul> <b>Note:</b> If you do not specify a key-parity value, the connectivity association (CA) is created in 2AN mode. This parameter applies only to platforms that support 4AN mode.

The following table defines parameters for the **interface gigabitethernet** command.

Variable	Value
<i>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i>	Specifies the port that you want to associate with the CA. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

## Update the Connectivity Association for a port

Use the following procedure to change the Connectivity Association (CA) to which a port is associated.

## Before You Begin

Ensure that the new CA is created at the global level. For information about configuring a CA, see [Configure a Connectivity Association](#) on page 2218.

## Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable MACsec on the port:

```
no macsec enable
```

3. Change the CA to which the port is associated:

```
macsec connectivity-association WORD<5-16>
```

4. Enable MACsec on the port:

```
macsec enable
```

## Example

Change the CA to which a port is associated:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabit 1/2
Switch:1(config-if)#no macsec enable
Switch:1(config-if)#macsec connectivity-association caname12
Switch:1(config-if)#macsec enable
```

### Variable Definitions

The following table defines parameters for the **macsec** command.

Variable	Value
<code>connectivity-association WORD&lt;5-16&gt;</code>	Specifies a connectivity-association name.  <b>Tip:</b> Configure the Connectivity Association key name (CKN) in multiples of 4 characters to avoid MKA interoperability issues between VOSS switches and EXOS switches. For example, Macsecma (8 characters) or Macsecmka123 (12 characters) are valid, but Macsec (6 characters) is not valid.

The following table defines parameters for the **interface gigabitethernet** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code>	Specifies the port to associate with the connectivity association (CA). Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

## Viewing MACsec Status

Perform this procedure to view MACsec status.

### About This Task

This command displays the status for the following:

- MACsec status
- MACsec encryption status
- MACsec encryption cipher suite, if supported on your hardware platform
- The associated Connectivity Association (CA) name

#### Note

If you do not specify a port number, the information on all MACsec capable interfaces is displayed.

### Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View the MACsec status:

```
show macsec status {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}
```

3. Display all MACsec related information:

```
show macsec
```

### Example

#### Note

Slot and port information can differ depending on hardware platform. For more information about specific hardware, see your hardware documentation.

The switch does not support replay protect.

#### Note

Configuration of a MACsec cipher suite is not supported on all hardware platforms. If you do not see it in your switch output, it is not supported. For more information on the hardware restrictions, see your hardware documentation.

View MACsec status:

```
Switch:1#show macsec status

=====
MACSEC Port Status
=====
Profile
PortId MACSEC Encryption Replay Replay Encryption Cipher CA MKA-
Status Status Protect Protect W'dow Offset Suite Name Name

## Viewing the MACsec Connectivity Association Details

Perform this procedure to view the MACsec connectivity association (CA) details.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View the MACsec CA details:  
show macsec connectivity-association [WORD<5-15>]

#### Note

This command displays the MACsec CA details, including the MD5 hashed value of the CA key.

### Example

View the MACsec connectivity association details:

#### Note

Slot and port information can differ depending on hardware platform. For more information about specific hardware, see your hardware documentation.

```

Switch:1>show macsec connectivity-association
=====
MACSEC Connectivity Associations Info
=====

```

Connectivity Association Name	Connectivity Association Key Hash	AN_Mode / TxKeyParity	Port Members
caname50	ba6b005bef79e7b95f3e08181e2501ce	2AN / NA	1/49
caname51	5b41f44ecaa54f3873e781557b39230b	4AN / odd	
caname15	053f26fb96b011191f2da28849f08677	4AN / Even	1/50

1/47	0	0	0	0	0

```

```

PortId	Delayed Packets	Unchecked Packets	Ok Pkts	Octets Validated	Octets Decrypted
1/47	0	0	1796	0	169282

```
Switch:1#show macsec statistics 1/50 secure-channel outbound
```

MACSEC Port Outbound Secure Channel Statistics				
PortId	Protected Packets	Encrypted Packets	Octets Protected	Octets Encrypted
1/47	0	2628	0	277182

#### Note

For MACsec Key Agreement (MKA) MACsec, the **show macsec statistics** `[{slot/port[/sub-port]}[-slot/port[/sub-port]][,...]` **secure-channel** `[inbound | outbound]` command displays only the statistics for the current Secure Association (SA), instead of displaying the statistics for all SAs created under that Secure Channel.

## Configure Static MACsec using CLI

Use the following procedures to configure static MACsec using the Command Line Interface (CLI).

### *Enable Static MACsec on a Port*

Use the following procedure to enable MACsec with static Secure Association Keys (SAK) on a port.

#### Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port]}[-slot/port[/sub-port]]
[,...]
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable MACsec on the port:

```
macsec enable
```

## Variable Definitions

The following table defines parameters for the **macsec enable** command.

**Table 245:**

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code>	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

### Configuring the confidentiality offset on a port

Use the following procedure to configure the confidentiality offset on a port. The default is disabled.

#### About This Task

The confidentiality offset provides a way to start encryption after a few bytes following the Ethernet header. The confidentiality offset facilitates traffic flow inspection and classification on intermediate devices by not encrypting the Network Layer header for IPv4 or IPv6. For instance, if you configure the offset to 30, the IPv4 header and the TCP/UDP header are not encrypted. If you configure the offset to 50, the IPv6 header and the TCP/UDP header are not encrypted.

#### Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure confidentiality offset on the port:

```
macsec confidentiality-offset <30-50>
```

3. Disable the confidentiality offset on the port:

```
no macsec confidentiality-offset
```

#### Example

Configuring the confidentiality offset on the port:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabit 1/2
Switch:1(config-if)#macsec confidentiality-offset 30
```

## Variable Definitions

The following table defines parameters for the **macsec confidentiality-offset** command.

Variable	Value
<30-50>	Specifies the bytes after the Ethernet header from which data encryption begins. Valid values are 30 and 50.

The following table defines parameters for the **interface gigabitethernet** command.

Variable	Value
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}	Specifies the port that you want to associate with the connectivity association (CA). Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

## Configure MKA MACsec using CLI

Use the following procedures to configure MACsec Key Agreement (MKA) MACsec using the Command Line Interface (CLI).

### Create an MKA Profile

#### About This Task

Use the following procedure to create a MACsec Key Agreement (MKA) profile. Creating an MKA profile changes the CLI command mode to mka profile mode.

You can also use this procedure to enter mka profile CLI command mode for an existing MKA profile.

#### About This Task

#### Note

This procedure only applies to VSP 8400 Series.

#### Procedure

1. Enter Global Configuration mode:  
enable  
  
configure terminal
2. Create an MKA profile:  
macsec mka profile WORD<1-16>

#### Note

An MKA profile name consists only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.

## Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka profile extreme19
Switch:1(mka-profile)#
```

## Variable Definitions

The following table defines parameters for the **macsec mka profile** command.

Variable	Value
WORD<1-16>	Specifies the MKA profile name. An MKA profile name consists only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.

### Apply an MKA Profile to a Port

#### Before You Begin

You must configure an MKA profile globally before you can apply it to a port.

#### Note

This procedure only applies to VSP 8400 Series.

#### Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Apply an MKA profile to the port:

```
macsec mka profile WORD<1-16>
```

## Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/3
Switch:1(config-if)#macsec mka profile test030519
```

## Variable Definitions

The following table defines parameters for the **macsec mka profile** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code>	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
WORD<1-16>	Specifies the MKA profile name. An MKA profile name consists only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.

### Configure MKA Actor Priority

#### About This Task

The MKA participant with the highest actor priority is designated as the key server.

#### Before You Begin

##### Note

This procedure only applies to VSP 8400 Series.

- You must enable MKA globally.
- You must apply an MKA profile to the port.
- You must disable MKA on the port before you configure a value for actor priority. Enable MKA on the port after you configure an actor priority value.

#### Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

##### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure a value for actor priority:

```
#macsec actor-priority <0x00-0xff>
```

#### Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitethernet 1/4
Switch:1(config-if)#macsec actor-priority 0x0f
```

## Variable Definitions

The following table defines parameters for the **macsec actor-priority** command.

Variable	Value
<0x00-0xff>	Specifies a hexadecimal value for actor priority, which determines key server selection. Lower values indicate a higher priority. The default is 10.
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

### Enable MKA on a Port

#### Before You Begin

#### Note

This procedure only applies to VSP 8400 Series.

- You must apply an MKA profile to a port before it can be enabled.
- Before you enable MKA on a port, the port must be a member of a connectivity association.

#### Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable MKA on a port:

```
macsec mka enable
```

#### Example

```
Switch:1#enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface gigabitEthernet 1/3
Switch:1(config-if)#macsec mka enable
```

## Variable Definitions

The following table defines parameters for the **macsec mka enable** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code>	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

## Configure MKA Confidentiality Offset

### About This Task

Use the following procedure to configure the confidentiality offset for an MKA profile. The confidentiality offset specifies the number of unencrypted bytes that precede MACsec encryption.

### About This Task

#### Note

This procedure only applies to VSP 8400 Series.

### Procedure

1. Enter mka profile Configuration mode:
 

```
enable

configure terminal

macsec mka profile WORD<1-16>
```
2. Configure a value for confidentiality offset:
 

```
confidentiality-offset <30-50>
```

### Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka profile test030519
Switch:1(mka-profile)#confidentiality-offset 30
```

## Variable Definitions

The following table defines parameters for the **confidentiality-offset** command.

Variable	Value
<code>WORD&lt;1-16&gt;</code>	Specifies the MKA profile name. An MKA profile name consists only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.
<code>&lt;30   50&gt;</code>	Specifies the number of bytes after the Ethernet header from which data encryption begins. Possible values are 30 (IPv4 plus TCP/UDP header) and 50 (IPv6 plus TCP/UDP header). The default is no offset.

*Configure MKA Replay Protect***About This Task**

Use the following procedure to configure replay protect for an MKA profile. Replay protect provides a configurable window that accepts a specified number of out of sequence frames.

**About This Task****Note**

This procedure only applies to VSP 8400 Series.

**Procedure**

1. Enter mka profile Configuration mode:
 

```
enable

configure terminal

macsec mka profile WORD<1-16>
```
2. Enable replay protection and configure the window size:
 

```
replay-protect enable window-size <5-500>
```

**Example**

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka profile test030519
Switch:1(mka profile)#replay-protect enable window-size 200
```

**Variable Definitions**

The following table defines parameters for the **replay-protect** command.

Variable	Value
enable	Enables replay protection on an MKA profile. The default is disabled.
window-size <5-500>	Specifies the maximum acceptable difference in packet ID numbers between out of order packets. If a packet ID number differs from the ID number of the previously received packet by more than the specified window size, the packet is dropped.
WORD<1-16>	Specifies the MKA profile name. An MKA profile name consists only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.

*Display MKA Profiles***About This Task**

Use the following procedure to display information about all MKA profiles configured on the switch. Optionally, you can view information about a specific MKA profile.

## About This Task

### Note

This procedure only applies to VSP 8400 Series.

## Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display all MKA profiles on the switch:  

```
show macsec mka profile
```
3. (Optional) Display a specific MKA profile:  

```
show macsec mka profile WORD<1-16>
```

## Examples

The following example displays MACsec MKA profile information:

```
Switch:1#show macsec mka profile
```

```
=====
```

```
MACsec MKA Profile
```

```
=====
```

Profile Name	Profile Id	Cipher Suite	Confidentiality Offset	Replay Protect	Window Size	Port
test030519	1	gcm-aes-128	30	Enabled	200	1/3
test031519	2	gcm-aes-128	50	Enabled	225	1/4
test032019	3	gcm-aes-128	30	Enabled	240	2/2

```

```

```
All 3 out of 3 Total Num of MACsec MKA Profiles displayed
```

```

```

The following example displays MACsec MKA information for a specific profile.

```
Switch:1#show macsec mka profile test030519
```

```
=====
```

```
MACsec MKA Profile
```

```
=====
```

Profile Name	Profile Id	Cipher Suite	Confidentiality Offset	Replay Protect	Window Size	Port
test030519	1	gcm-aes-128	30	Enabled	200	1/3

```

```

## Variable Definitions

The following table defines parameters for the **show macsec mka profile** command.

**Table 246:**

Variable	Value
WORD<1-16>	Specifies the MKA profile name. An MKA profile name can consist only of alphanumeric characters (0-9, A-Z, and a-z). The profile name is case sensitive.

*Display MKA Participants***About This Task**

Use the following procedure to display information about all participants in an MKA session. You can also display MKA information for a specific port participating in an MKA session.

**About This Task****Note**

This procedure only applies to VSP 8400 Series.

**Procedure**

1. To enter User EXEC mode, log on to the switch.
2. Display information about all participants in an MKA session:  

```
show macsec mka participant
```
3. (Optional) Display MKA information for a specific port participating in an MKA session:  

```
show macsec mka participant {slot/port[/sub-port]}[-slot/port[/sub-port]][,...]} [verbose]
```

**Examples**

The following example displays information for all participants in an MKA session.

```
Switch:1(config)#show macsec mka participant
```

```
=====
```

```
MACsec MKA Participants
```

```
=====
```

Port Id	CA Name	MKA-Profile Name	MKA Enable	Actor Priority
1/3	CA120022	extreme030519	Enabled	A
1/4	CA121023	extreme031519	Enabled	14
2/2	CA122024	extreme032019	Enabled	1E

```
=====
```

The following example displays information for a specific port participating in an MKA session.

```
Switch:1(config)#show macsec mka participant 1/3
```

```
=====
```

```
MACsec MKA Participant
```

```
=====
```

Port Id	CA Name	MKA-Profile Name	MKA Enable	Actor Priority
1/3	CA120022	extreme030519	Enabled	A

```
=====
```

## Variable Definitions

The following table defines parameters for the **show macsec mka participant** command.

**Table 247:**

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]}</code>	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
verbose	Displays detailed information for a specific port participating in an MKA session.

## MACsec configuration using EDM

Use the following procedures to configure MACsec in EDM.

### Configure Connectivity Associations

Use the following procedure to configure connectivity associations (CA) using EDM.

#### Note

- You can configure MACsec on physical ports *only*. However, the physical ports can belong to an MLT trunk group that includes: Split MultiLink Trunking (SMLT), distributed MultiLink Trunking (DMLT), or Link aggregate group (LAG).
- MACsec encryption and decryption algorithms follow either the AES-GCM-128 or the AES-GCM-256 standard, depending on the configured MAC-sec cipher suite. The default is the AES-GCM-128 standard.

#### Procedure

- In the navigation pane, expand **Configuration > Edit**.
- Select **Chassis**.
- Select the **MACSec** tab.
- Select **Insert**.
  - In **AssociationName**, type the connectivity-association name.
  - In **AssociationKey**, type the value of the connectivity-association key.

#### Note

The connectivity-association key appears as an MD5-hashed text in the MAC security table.

- c. In **AssociationTxKeyParity**, select an option for Tx key parity.

**Note**

Tx key parity configuration applies only to static MACsec configurations.

- d. Select **Insert** to save the configuration.

5. Select **Apply**.

### MACSec Field Descriptions

Use the data in the following table to use the **MACSec** tab.

Name	Description
<b>AssociationName</b>	Specifies a name for each connectivity association configured on the device.  <b>Tip:</b> Configure the Connectivity Association key name (CKN) in multiples of 4 characters to avoid MKA interoperability issues between VOSS switches and EXOS switches. For example, Macsecma (8 characters) or Macsecmka123 (12 characters) are valid, but Macsec (6 characters) is not valid.
<b>AssociationKey</b>	Specifies a pre-shared, connectivity association key associated with each connectivity association configured on the device.
<b>AssociationPortMembers</b>	Specifies the set of ports for which this connectivity association is associated.
<b>AssociationTxKeyParity</b>	Specifies Tx key parity using the following values: <ul style="list-style-type: none"> <li>• <b>None</b> — key parity is not specified</li> </ul> <b>Note:</b> The none value only applies to platforms that support 2AN mode. If you do not specify a key parity value, the system defaults to 2AN mode. <ul style="list-style-type: none"> <li>• <b>Even</b> — generates even-numbered keys</li> <li>• <b>Odd</b> — generates odd-numbered keys</li> </ul>

## Associate a Port with a Connectivity Association

Use the following procedure to associate a port with a connectivity association (CA) using EDM. You can optionally configure a MACsec encryption cipher suite on the port.

For the VSP 4450 Series, you can associate connectivity associations to device ports 1/49 and 1/50 only.

**Note**

You can configure MACsec on physical ports *only*. However, the physical ports can belong to an MLT trunk group that includes: Split MultiLink Trunking (SMLT), distributed MultiLink Trunking (DMLT), or Link aggregate group (LAG).

**Note**

MACsec encryption and decryption algorithms follow either the AES-GCM-128 or the AES-GCM-256 standard, depending on the configured MAC-sec cipher suite. The default is the AES-GCM-128 standard.

**Procedure**

1. On the **Device Physical View** tab, click on one or more ports that you want to associate with the connectivity association.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **MACsec** tab.
5. In **CAName**, type the connectivity-association name.
6. In **OffsetValue**, select the value of confidentiality offset to be achieved.
7. Select **EncryptionEnable** to enable encryption for the frames transmitted on the port.
8. Select **MACsec Enable** to enable MACsec on the port.
9. (Optional) In **CipherSuite**, select the MACsec encryption cipher suite.
10. Select **Apply**.

**MACsec Field Descriptions**

Use the data in the following table to configure the **MACsec** tab.

Name	Description
<b>CAName</b>	Specifies the name of the connectivity association attached to the port or interface.
<b>OffsetValue</b>	Offsets MACsec encryption in an IPv4 TCP/UDP header or IPv6 TCP/UDP header. The confidentiality offset provides a way to start encryption after a few bytes following the Ethernet header. The confidentiality offset facilitates traffic flow inspection and classification on intermediate devices by not encrypting the Network Layer header for IPv4 or IPv6. For instance, if you configure the offset to 30, the IPv4 header and the TCP/UDP header are not encrypted. If you configure the offset to 50, the IPv6 header and the TCP/UDP header is not encrypted.
<b>EncryptionEnable</b>	Specifies the encryption status per port. Use this field to enable or disable encryption for each MACsec capable port.

Name	Description
<b>MACsec Enable</b>	Enables or disables MACsec on the port.
<b>CipherSuite</b>	Configures the cipher suite for encrypting traffic with MACsec. The following cipher suites are supported: <ul style="list-style-type: none"> <li>AES-GCM-128 standard, with a maximum key length of 128 bits</li> <li>AES-GCM-256 standard, with a maximum key length of 256 bits</li> </ul> The default is the AES-GCM-128 standard.

## Configure MKA MACsec using EDM

Use the following procedures to configure MKA MACsec using EDM.

### Note

You must configure MKA MACsec by performing procedures in the following order:

1. [Apply an MKA Profile to a Port](#) on page 2238
2. [Associate a Port with a Connectivity Association](#) on page 2235
3. [Enable an MKA on a Port](#) on page 2238

If you apply a Connectivity Association to a port before you apply an MKA profile to the port, the port is considered to be configured with static MACsec and an error occurs.

### Configure an MKA Profile

#### Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **MACSec MKA Profile** tab.
4. Select **Insert**.
5. For **Id**, type an MKA ID value.
6. For **Name**, type the profile name.
7. (Optional) Select **ReplayProtectEnable** to enable replay protect.
8. (Optional) For **ReplayProtectWindow**, type a value for the replay protect window size.
9. (Optional) From the **OffsetValue** options, select a level for confidentiality offset.
10. Select **Insert**.

#### MACSec MKA Profile Field Descriptions

Use the data in the following table to use the **MACSec MKA Profile** tab.

Name	Description
<b>Id</b>	Specifies a unique identification number for an MKA profile.
<b>Name</b>	Specifies the profile name.

Name	Description
<b>ReplayProtectEnable</b>	Specifies whether replay protect is enabled. The default is disabled.
<b>ReplayProtectWindow</b>	Specifies the maximum acceptable difference in packet ID numbers between out of order packets. If a packet ID number differs from the ID number of the previously received packet by more than the specified window size, it is dropped.
<b>OffsetValue</b>	Specifies the number of bytes after the Ethernet header from which data encryption begins. The default is no offset.
<b>PortMembers</b>	Specifies the ports that are members of an MKA profile.

*Apply an MKA Profile to a Port*

### Before You Begin

You must configure an MKA profile globally before you can apply it to a port.

### About This Task

Use the following procedure to apply a MACsec Key Agreement (MKA) profile on a port.

### Procedure

1. In the Device Physical View, select the port to which you want to apply an MKA profile.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **MACsec MKA** tab.
5. For **MACsecMKAProfileName**, select the name of the MKA profile you want to apply.
6. Select **Apply**.

### MACsec MKA Field Descriptions

Use the data in the following table to use the **MACsec MKA** tab.

Name	Description
<b>MACsecMKAProfileName</b>	Specifies the MKA profile name.
<b>MKA Enable</b>	Enables the MKA profile on the port. The default is disabled.

*Enable an MKA on a Port*

### Before You Begin

Ensure that you apply an MKA profile to the port and associate the port with a Connectivity Association (CA) before you enable MKA on the port.

## About This Task

Use the following procedure to enable a MACsec Key Agreement (MKA) profile on a port.

### Procedure

1. In the Device Physical View, select the port to which you want to apply an MKA profile.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **MACsec MKA** tab.
5. For **MACsecMKAProfileName**, select the name of the MKA profile you want to apply.
6. Select **MKA Enable** to enable MKA on the port.
7. Select **Apply**.

### MACsec MKA Field Descriptions

Use the data in the following table to use the **MACsec MKA** tab.

Name	Description
<b>MACsecMKAProfileName</b>	Specifies the MKA profile name.
<b>MKA Enable</b>	Enables the MKA profile on the port. The default is disabled.

### Configure MKA Actor Priority

## About This Task

Use the following procedure to configure an actor priority value for a port. The MKA participant with the highest actor priority is designated as the key server.

#### Note

Ensure that peers in an MKA connection are not configured with the same actor priority value.

### Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **MACSec MKA Participants** tab.
4. Select a port.
5. For **ActorsPriority**, double-click the field and type a value for **ActorsPriority**.

### MACSec MKA Participants Field Descriptions

Name	Description
<b>PortNumber</b>	Specifies the port number of the MKA session participant.
<b>CAName</b>	Specifies the Connectivity Association (CA) name associated with the MKA session participant.
<b>MKAProfileName</b>	Specifies the name of the MKA profile.

Name	Description
<b>MKA Enable</b>	Specifies whether MKA is enabled for the port.
<b>ActorsPriority</b>	Specifies a hexadecimal value for actor priority. The default is 10.

## MACsec Performance

**Table 248: MACsec product support**

## MACsec Statistics

MAC Security (MACsec) is an IEEE 802® standard that allows authorized systems in a network to transmit data confidentially and to take measures against data transmitted or modified by unauthorized devices.

The switch supports the following statistics that provide a measure of MACsec performance.

**Table 249: General MACsec statistics**

Statistics	Description
TxUntaggedPkts	Specifies the number of transmitted packets without the MAC security tag (SecTAG), with MACsec disabled on the interface.
TxTooLongPkts	Specifies the number of transmitted packets discarded because the packet length is greater than the Maximum Transmission Unit (MTU) of the Common Port interface.
RxUntaggedPkts	Specifies the number of received packets without the MAC security tag (SecTAG), with MACsec not operating in strict mode.
RxNoTagPkts	Specifies the number of received packets without the MAC security tag (SecTAG), with MACsec operating in strict mode.
RxBadTagPkts	Specifies the number of received packets discarded with an invalid SecTAG or with a zero value Packet Number (PN)/invalid Integrity Check Value (ICV).
RxUnknownSCIPkts	Specifies the number of packets received with an unknown Secure Channel Identifier (SCI) and with MACsec not operating in strict mode.

**Table 249: General MACsec statistics (continued)**

Statistics	Description
RxNoSCIPkts	Specifies the number of packets received with an unknown Secure Channel Identifier (SCI) and with MACsec operating in strict mode.
RxOverrunPkts	Specifies the number of packets discarded because the number of received packets exceeded the cryptographic performance capabilities.

**Table 250: Secure-channel inbound MACsec statistics**

Statistics	Description
UnusedSAPkts	Specifies the summation of received unencrypted packets on all SAs of this secure channel, with MACsec not in strict mode.
NoUsingSAPkts	Specifies the summation of received packets that were discarded along with either encrypted packets or packets that were received with MACsec operating in strict mode.
LatePkts	Specifies the number of packets received that have been discarded for this Secure Channel (SC) with Replay Protect enabled.  <b>Note:</b> Replay Protect is supported only by MACsec configurations using MACsec Key Agreement (MKA) protocol.
NotValidPkts	Specifies the summation of packets that were discarded in all SAs of the SC because they were not valid with one of the following conditions: <ul style="list-style-type: none"> <li>• MACsec was operating in strict mode</li> <li>• The packets received were encrypted but contained erroneous fields.</li> </ul>
InvalidPkts	Specifies the summation of all packets received that were not valid for this SC, with MACsec operating in check mode.
DelayedPkts	Specifies the summation of packets for this SC, with the Packet Number (PN) of the packets lower than the lower bound replay protection PN.  <b>Note:</b> Replay Protect is supported only by MACsec configurations using MKA protocol.
UncheckedPkts	The total number of packets for this SC that: <ul style="list-style-type: none"> <li>• were encrypted and failed the integrity check</li> <li>• were not encrypted and failed the integrity check</li> <li>• were received when MACsec validation was not enabled</li> </ul>
OKPkts	Specifies the total number of Integrity Check Validated (ICV) packets for all SAs of this Secure Channel. The number of octets of User Data recovered from received frames that were integrity protected but not encrypted.

**Table 250: Secure-channel inbound MACsec statistics (continued)**

Statistics	Description
OctetsValidated	Specifies the number of octets of plain text recovered from received packets that were integrity protected but not encrypted.
OctetsDecrypted	Specifies the number of octets of plain text recovered from received packets that were integrity protected and encrypted.

**Table 251: Secure-channel outbound MACsec statistics**

Statistics	Description
ProtectedPkts	Specifies the number of integrity protected but not encrypted packets for this transmitting SC.
EncryptedPkts	Specifies the number of integrity protected and encrypted packets for this transmitting SC.
OctetsProtected	Specifies the number of plain text octets that are integrity protected but not encrypted on the transmitting SC.
OctetsEncrypted	Specifies the number of plain text octets that are integrity protected and encrypted on the transmitting SC.

**Table 252: MACsec Key Agreement statistics**

Statistics	Description
MKPDUs Validated & Rx	Specifies the number of MACsec Key Agreement Protocol Data Units (MKPDU) validated and received.
Rx Distributed SAK	Specifies the number of Secure Association Keys (SAK) received.
MKPDUs Transmitted	Specifies the number of MKPDUs transmitted.
Tx Distributed SAK	Specifies the number of SAKs transmitted.

### *Interoperability behaviors*

If your static key MACsec configuration involves interoperability with VSP 4900 Series, VSP 8200 Series, VSP 8400 Series, VSP 7200 Series, VSP 7400 Series, 5520 Series (only front panel ports), and VIMs, you might see the following display inconsistencies for MACsec statistics:

- one side can show delayed packets on the Ingress side
- one side can throw an Ingress Key expiry log message or it might never show an Ingress Key expiry log message

## View MACsec Statistics using CLI

Use the following procedures to view statistics for MACsec using the Command Line Interface (CLI).

### Note

For MACsec Key Agreement (MKA) MACsec, the **show macsec statistics** `[{slot/port[/sub-port]}[-slot/port[/sub-port]][,...]]` **secure-channel** `[inbound | outbound]` command displays only the statistics for the current Secure Association (SA), instead of displaying the statistics for all SAs created under that Secure Channel.

### Viewing MACsec Statistics

Perform this procedure to view the MACsec statistics.

#### Procedure

1. Enter Privileged EXEC mode:  
`enable`
2. View the general MACsec statistics:  
`show macsec statistics` `[{slot/port[/sub-port]}[-slot/port[/sub-port]]` `[,...]]`
3. View the secure-channel inbound MACsec statistics:  
`show macsec statistics` `[{slot/port[/sub-port]}[-slot/port[/sub-port]]` `[,...]]` `secure-channel inbound`
4. View the secure-channel outbound MACsec statistics:  
`show macsec statistics` `[{slot/port[/sub-port]}[-slot/port[/sub-port]]` `[,...]]` `secure-channel outbound`

#### Example

Display general MACsec statistics, inbound MACsec statistics, and outbound MACsec statistics:

### Note

Slot and port information can differ depending on hardware platform. For more information, see the hardware documentation for your platform.

The switch supports MACsec on specific ports. For more information, see your hardware documentation.

### Note

Display inconsistencies might occur for MACsec statistics when different ports interoperate with one another.

```
Switch:1>enable
Switch:1#show macsec statistics 1/40

=====

### Clear MACsec Statistics

#### About This Task

You have the option to clear MACsec statistics for all ports, or clear MACsec statistics for a specific port. Clearing MACsec statistics can be useful for debugging purposes.

#### Procedure

1. Enter Global Configuration mode:  
enable  
  
configure terminal
2. Clear all MACsec statistics:  
macsec clear-stats
3. (Optional) Clear MACsec statistics for a specific port:  
macsec clear-stats port {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]}

#### Example

Clear all MACsec statistics:

```

Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec clear-stats

```

Clear MACsec statistics for a specific port:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec clear-stats port 1/3
```

### Variable Definitions

Use the data in the following table to use the **clear macsec-stats** command.

**Table 253:**

Variable	Value
port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

## View MKA MACsec Statistics using CLI

Use the following procedures to view statistics for MKA MACsec using the Command Line Interface (CLI).

### Display MKA Statistics

#### Note

This procedure only applies to VSP 8400 Series.

### Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display MKA statistics for a specific port:

```
show macsec mka statistics {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}
```

### Example

The following example displays MACsec MKA statistics for a port.

```
Switch:1>show macsec mka statistics 3/5
```

```
=====
 MKPDU Statistics on interface 3/5
=====
```

```

MKPDUs Validated & Rx : 1630
Rx Distributed SAK : 2
MKPDUs Transmitted : 1694
Tx Distributed SAK : 0
=====
=====
```

## Variable Definitions

Use the data in the following table to use the **show macsec mka statistics** command.

**Table 254:**

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code>	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

### Clear MKA Statistics

#### About This Task

You have the option to clear MKA statistics for all ports, or clear MKA statistics for a specific port. Clearing MKA statistics can be useful for debugging purposes.

#### Procedure

1. Enter Global Configuration mode:
 

```
enable

configure terminal
```
2. Clear all MKA statistics:
 

```
macsec mka clear-stats
```
3. (Optional) Clear MKA statistics for a specific port:
 

```
macsec mka clear-stats port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}
```

#### Example

Clear all MKA statistics:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka clear-stats
```

Clear MKA statistics for a specific port:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#macsec mka clear-stats port 1/3
```

## Variable Definitions

Use the data in the following table to use the `macsec mka clear-stats` command.

**Table 255:**

Variable	Value
<code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code>	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

## View MACsec Statistics using EDM

Use the following procedures to view statistics for static MACsec using EDM.

### Note

For MACsec Key Agreement (MKA) MACsec, the procedures View Secure Channel Inbound Statistics and View Secure Channel Outbound Statistics display only the statistics for the current Secure Association (SA), instead of displaying the statistics for all SAs created under that Secure Channel.

### View MACsec Interface Statistics

Use this procedure to view the MACsec interface statistics using EDM.

### Procedure

1. In the Device Physical View tab, select one or more ports for which you need to view the MACsec interface statistics.  
The switch supports MACsec on specific ports. For more information, see your hardware documentation.
2. In the navigation pane, expand the **Edit > Port > General** folders.
3. Select the **MACsec Interface Stats** tab.

### Note

Use the **Clear Stats** button to clear MACsec interface statistics. The **Clear Stats** button is available to clear single-port as well as multiple-port MACsec interface statistics.

## MACsec Interface Stats Field Descriptions

The following table describes the fields in the **MACsec Interface Stats** tab.

Field	Description
<b>TxUntaggedPkts</b>	Specifies the number of transmitted packets without the MAC security tag (SecTAG), with MACsec disabled on the interface.
<b>TxTooLongPkts</b>	Specifies the number of transmitted packets discarded because the packet length is greater than the maximum transmission unit (MTU) of the common port interface.
<b>RxUntaggedPkts</b>	Specifies the number of received packets without the MAC security tag (SecTAG), with MACsec <i>not</i> operating in strict mode.
<b>RxNoTagPkts</b>	Specifies the number of received packets without the MAC security tag (SecTAG), with MACsec operating in strict mode.
<b>RxBadTagPkts</b>	Specifies the number of received packets discarded with an invalid SecTAG, or with a zero value packet number (PN), or invalid Integrity Check Value (ICV).
<b>RxUnknownSCIPkts</b>	Specifies the number of packets received with an unknown secure channel identifier (SCI), and with MACsec <i>not</i> operating in strict mode.
<b>RxNoSCIPkts</b>	Specifies the number of packets received with an unknown secure channel identifier (SCI), and with MACsec operating in strict mode.
<b>RxOverrunPkts</b>	Specifies the number of packets discarded because the number of received packets exceeded the cryptographic performance capabilities.

### View Secure Channel Inbound Statistics

Use this procedure to view the secure channel (SC) inbound statistics using EDM.

#### Procedure

1. In the Device Physical View tab, select one or more ports for which to view the SC inbound statistics.  
The switch supports MACsec on specific ports. For more information, see your hardware documentation.
2. In the navigation pane, expand **Edit > Port > General**.
3. Select the **SC Inbound Stats** tab.

#### Note

Use the **Clear Stats** button to clear single-port secure channel inbound statistics. The **Clear Stats** button is not available to clear multiple-port secure channel inbound statistics.

### SC Inbound Stats Field Descriptions

The following table describes the fields in the **SC Inbound Stats** tab.

Field	Description
<b>UnusedSAPkts</b>	Specifies the summary of received unencrypted packets on all SAs of this secure channel, with MACsec <i>not</i> in strict mode.
<b>NoUsingSAPkts</b>	Specifies the summary of received packets that were discarded along with either encrypted packets or packets that were received with MACsec operating in strict mode.
<b>LatePkts</b>	Specifies the number of packets received that have been discarded for this secure channel (SC) with Replay Protect enabled.  <b>Note:</b> Replay Protect is supported only by MACsec configurations using MACsec Key Agreement (MKA) protocol.
<b>NotValidPkts</b>	Specifies the summary of packets that were discarded in all SAs of the SC because they were not valid with one of the following conditions: <ul style="list-style-type: none"> <li>• MACsec was operating in strict mode.</li> <li>• The packets received were encrypted but contained erroneous fields.</li> </ul>
<b>InvalidPkts</b>	Specifies the summary of all packets received that were not valid for this SC, with MACsec operating in <i>check</i> mode.
<b>DelayedPkts</b>	Specifies the summary of packets for this SC, with the packet number (PN) of the packets lower than the lower bound replay protection PN.  <b>Note:</b> Replay Protect is supported only by MACsec configurations using MACsec Key Agreement (MKA) protocol.
<b>UncheckedPkts</b>	The total number of packets for this SC that: <ul style="list-style-type: none"> <li>• Were encrypted and failed the integrity check.</li> <li>• Were <i>not</i> encrypted and failed the integrity check.</li> <li>• Were received when MACsec validation was not enabled.</li> </ul>
<b>AcceptedPkts</b>	Specifies the total number of Integrity Check Validated (ICV) packets for all SAs of this Secure Channel. The number of octets of User Data recovered from received frames that were integrity protected but not encrypted.

Field	Description
<b>OctetsValidated</b>	Specifies the number of octets of plain text recovered from received packets that were integrity protected but not encrypted.
<b>OctetsDecrypted</b>	Specifies the number of octets of plain text recovered from received packets that were integrity protected and encrypted.

### View Secure Channel Outbound Statistics

Use this procedure to view the secure channel (SC) outbound statistics using EDM.

#### Procedure

1. In the Device Physical View tab, select one or more ports for which you need to view the SC outbound statistics.  
The switch supports MACsec on specific ports. For more information, see your hardware documentation.
2. In the navigation pane, expand the **Edit > Port > General** folders.
3. Select the **SC Outbound Stats** tab.

#### Note

Use the **Clear Stats** button to clear single-port secure channel outbound statistics. The **Clear Stats** button is not available to clear multiple-port secure channel outbound statistics.

### SC Outbound Stats Field Descriptions

The following table describes the fields in the **SC Outbound Stats** tab.

Field	Description
<b>ProtectedPkts</b>	Specifies the number of integrity protected but not encrypted packets for this transmitting SC.
<b>EncryptedPkts</b>	Specifies the number of integrity protected and encrypted packets for this transmitting SC.
<b>OctetsProtected</b>	Specifies the number of plain text octets that are integrity protected but not encrypted on the transmitting SC.
<b>OctetsEncrypted</b>	Specifies the number of plain text octets that are integrity protected and encrypted on the transmitting SC.

### View MKA MACsec Statistics using EDM

Use the following procedure to view statistics for MKA MACsec using EDM.

### Display MKA Statistics for a Port

#### Note

This procedure only applies to VSP 8400 Series.

### Procedure

1. In the Device Physical View, select the port or ports for which to display MKA statistics.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **MACsec MKA Stats** tab.
5. (Optional) Select **Clear Stats** to clear MKA MACsec statistics for the selected port or ports. Clearing MKA MACsec statistics can be useful for debugging purposes.

### MACsec MKA Stats Field Descriptions

Use the data in the following table to use the **MACsec MKA Stats** tab.

Name	Description
<b>MKPDUValidatedPkts</b>	Specifies the number of MKPDU packets received and validated.
<b>RxDistributedSAKPkts</b>	Specifies the number of SAK packets received.
<b>MKPDUTransmittedPkts</b>	Specifies the number of MKPDU packets transmitted.
<b>TxDistributedSAKPkts</b>	Specifies the number of SAK packets transmitted.

# MultiLink Trunking and Split MultiLink Trunking

[Simplified Virtual-IST on page 2256](#)

[MultiLink Trunking on page 2257](#)

[Split MultiLink Trunking on page 2259](#)

[MLT and SMLT Configuration Requirements on page 2267](#)

[MLT and SMLT link aggregation configuration using the CLI on page 2271](#)

[MLT and SMLT Link Aggregation Configuration using EDM on page 2289](#)

[MLT configuration examples on page 2298](#)

[MLT network topology and configuration reference on page 2300](#)

This section provides the concepts and procedures you need to configure MultiLink Trunking (MLT) and Split MultiLink Trunking (SMLT).

## Virtual Inter-Switch Trunk (vIST)

**Table 256: Virtual Inter-Switch Trunk product support**

Feature	Product	Release introduced
For configuration details, see <a href="#">VOSS User Guide</a> .		
Switch cluster (multi-chassis LAG) -Virtual Inter-Switch Trunk (vIST)	5520 Series	VOSS 8.2.5
	VSP 4450 Series	VOSS 4.1
	VSP 4900 Series	VOSS 8.1
	VSP 7200 Series	VOSS 4.2.1
	VSP 7400 Series	VOSS 8.0
	VSP 8200 Series	VSP 8200 4.0
	VSP 8400 Series	VOSS 4.2
	VSP 8600 Series	VSP 8600 6.1
	XA1400 Series	Not Supported

Split MultiLink Trunking provides subsecond failover when a switch fails. Virtual Inter-Switch Trunk (vIST) improves upon that Layer 2 and Layer 3 resiliency by using a virtualized IST channel through the SPBM cloud. The vIST channel carries the vIST control traffic and data traffic during an SMLT failover. This feature dramatically improves resiliency over other methods.

Because vIST uses a virtual channel and because IS-IS runs over it, vIST eliminates the potential single point of failure with a dedicated MLT. The vIST channel is always up as long as there is SPBM connectivity between the vIST peers.

vIST interoperates between any two devices that support vIST, and the devices do not have to be of the same type.

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

### Important

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of the header size increase when transmitting packets over the SPBM cloud.

### Note

- Users may observe a momentary increase in activity when a MAC delete message is received from a peer. This is due to vIST engaging in MAC learning activities. This is a normal operational procedure.
- For proper traffic flow, if a Layer 2 VSN is created on one vIST peer, it must also be created on the other vIST peer. For more information on Layer 2 VSN, see [Layer 2 VSN configuration](#) on page 1141.

## vIST configuration note

If you need to update the vIST VLAN IP address on vIST peers by deleting and recreating the vIST vlan IP address (for example, as part of maintenance), ensure that you update one vIST BEB at a time.

### Caution

Always perform vIST configuration updates under no traffic. Otherwise, it results in traffic loss.

Before you begin updating a device, as a first step, isolate the device by shutting down all the links and failing over the traffic to its vIST peer. Then, delete and recreate the vIST VLAN IP on the device and save your configuration. When bringing the device back into operation, first unshut those NNI ports that bring up vIST, followed by the SMLT configured ports, and then all the remaining ports, to prevent network loops or duplicate traffic.

For information on vIST configuration, see [Creating a Virtual IST](#) on page 2278 or [Create a Virtual IST using EDM](#) on page 2293.

## vIST operational note

When you enable IST and boot the chassis, the SMLT enabled trunk ports (SMLT ports) are automatically locked. A timeout mechanism automatically unlocks the SMLT ports when the IST control channel fails to establish within a reasonable amount of time. The timeout mechanism prevents the SMLT ports from being locked forever. Initially 240 seconds are allowed for the switch to determine the IST VLAN status.

The IST VLAN is considered up if at least one port is forwarding traffic and an ARP entry is populated for the IP address of the IST peers. Once the IST VLAN is up, the timeout value is reset to 60 seconds. The IST control channel must be up within the timeout period. If the timeout period is exceeded, then the SMLT ports are automatically unlocked and a message is logged stating that the SMLT ports are unlocked due to a timeout.

**Note**

If the IST filter is enabled before the timeout, then the IST filter is unaffected and remains enabled.

If a virtual BMAC mismatch occurs between two vIST peers, incorrect information can show in CLI regarding the ports that the client information is learned on, such as MAC addresses or IPv6 neighbor addresses. This can occur before the mismatch is detected, because the two peers receive traffic from each other and learn the information on the local ports. Each vIST peer synchronizes the information as learned locally, even when learned from vIST peer. You can resolve the mismatch by changing the virtual BMAC on one of the vIST peers, but the traffic might remain affected. After confirming the mismatch is resolved from a log report, you can resolve the traffic issue by disabling and enabling the router ISIS on both vIST peers.

## Simplified Virtual-IST

---

Simplified Virtual-IST (vIST) is for conventional switch clustering deployments that use SMLT and not SPB. The Simplified vIST feature provides a single CLI command to enable the virtual IST for SMLT deployments.

- Simplified vIST is available for conventional multicast deployments with PIM and IGMP only when the boot flag (**spbm-config-mode**) is disabled.

**Important**

PIM is supported with Simplified vIST only, not with SPB vIST.

- When the `spbm-config-mode` boot flag is enabled (default setting), Simplified vIST is not available. This means that you continue to configure SPB/IS-IS for vIST as described in [Creating a Virtual IST](#) on page 2278 and [Create a Virtual IST using EDM](#) on page 2293.
- Simplified vIST requires that the two vIST devices be directly connected.
- For legacy IGMP snooping and IGMP snooping over Simplified vIST, the IGMP sender information is NOT synchronized across the vIST. This means that **show ip igmp sender** displays the sender record only on the switch that the multicast stream actually ingresses.
- In Simplified vIST mode, you should not use LACP on vIST MLT.

**Note**

For Simplified vIST deployment, if a VLAN is part of an SMLT it must be configured on both the IST peers.

**Important**

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of a header size increase.

For configuration information, see [Configuring Simplified vIST in SMLT topologies](#) on page 2282 or [Configuring Simplified vIST in SMLT topologies](#) on page 2295.

For information about how to configure Simplified vIST with multicast, see [Enabling multicast on the switch](#) on page 1319.

## MultiLink Trunking

**Table 257: MultiLink Trunking product support**

Feature	Product	Release introduced
For configuration details, see <a href="#">VOSS User Guide</a> .		
MultiLink Trunking (MLT) / Link Aggregation Group (LAG)	5520 Series	VOSS 8.2.5
	VSP 4450 Series	VSP 4000 4.0
	VSP 4900 Series	VOSS 8.1
	VSP 7200 Series	VOSS 4.2.1
	VSP 7400 Series	VOSS 8.0
	VSP 8200 Series	VSP 8200 4.0
	VSP 8400 Series	VOSS 4.2
	VSP 8600 Series	VSP 8600 4.5
	XA1400 Series	VOSS 8.0.50

MultiLink Trunking (MLT) is a point-to-point connection that aggregates multiple ports to logically act like a single port with aggregated bandwidth. Grouping multiple ports into a logical link provides a higher aggregate on a switch-to-switch or switch-to-server application.

To include ports as trunk group members of an MLT, you must statically configure the ports.

### MLT traffic distribution algorithm

You can use a multilink trunk to aggregate bandwidth between two switches. The MLT algorithm ensures that each packet in a flow does not arrive out of sequence, and that a flow always traverses the same link path.

The hashing algorithm uses the following packet fields and the incoming interface (source) port number to calculate the index to outgoing (destination) port number in a MLT:

Traffic type	Hashing algorithm
IPv4 traffic	Hash Key = [Destination IP Address (32 bits), Source IP Address (32 bits), Source TCP/UDP Port, Destination TCP/UDP port]
IPv4 traffic without TCP/UDP header	Hash Key = [Source IP Address (32 bits), Destination IP address (32 bits)]

Traffic type	Hashing algorithm
IPv6 traffic	Hash Key = [Destination IPv6 Address (128 bits), Source IPv6 address (128 bits), Source TCP/UDP Port, Destination TCP/UDP port]
IPv6 traffic without TCP/UDP header	Hash Key = [Source IP Address (128 bits), Destination IP address (128 bits)]
Mac-In-Mac transit traffic	For VSP 7400 Series: Hash Key = [Destination IP Address (32 bits), Source IP Address (32 bits), Source Port (8 bits), BackBone Destination MAC Address (48 bits), BackBone Source Mac Address (48 bits)] For all other platforms: Hash Key = [Source Port (8 bits), BackBone Destination MAC Address (48 bits), BackBone Source Mac Address (48 bits)]
Layer 2 Non-IP traffic	Hash Key = [Destination MAC Address (48 bits), Source MAC Address(48 bits)]

## MultiLink trunking and autonegotiation interaction

To use MLT with the switch, you can have ports running at different speeds. After you use MLT with LACP, LACP dynamically checks for proper speed on all port members. You do not need to have similar physical connection types. After you use autonegotiation with MLT and not LACP, you need to ensure that all ports run at the same speed.

## MLT configuration rules

Multilink trunks adhere to the following rules. Unless otherwise stated, these rules also apply to MLT with LACP.

- You cannot configure an MLT name that uses all numbers, for example, 222.
- Multilink trunk ports support mixed speed links, for example, one link can be 10Gb and another 1Gb. However, no weighting of traffic distribution occurs so if you mix links of different operational speeds, you can overload the lower speed link or under utilize a higher speed link.

This rule applies to multilink trunks only. MLT with LACP does not support different link speeds.

- All multilink trunk ports must be in the same Spanning Tree Group (STG) unless the port is tagged. Use tagging so ports can belong to multiple STGs, as well as multiple VLANs.
- After the port is made a member of MLT, it inherits the properties of the MLT and hence the STG properties are inherited from the VLAN associated with that MLT. After you remove the port from MLT or after you delete the MLT, the ports are removed from the MLT STG and added into the default STG.
- MLT is compatible with Multiple Spanning Tree Protocol (MSTP) (IEEE 802.1s) and Rapid Spanning Tree Protocol (RSTP) (IEEE 802.1w).
- Tagging (IEEE 802.1Q) is supported on a multilink trunk.

Multilink trunks have the following general features and requirements:

- Supports MLT groups with as many as 8 ports belonging to a single multilink trunk. For more information about the number of MLT groups supported for each hardware platform, see [Release Notes for VOSS](#).
- Apply filters individually to each port in a multilink trunk.

With MSTP or RSTP enabled, ports in the same multilink trunk operate as follows:

- The designated port sends the Bridge Protocol Data Unit (BPDU).
- The multilink trunk port ID is the ID of the lowest numbered port.
- If identical BPDUs are received on all ports, the multilink trunk mode is forwarding.
- If ports do not receive BPDUs on a port or BPDU and port tagging do not match, the individual port is taken offline.
- Path cost is inversely proportional to the active multilink trunk bandwidth.

## MLT with LACP LAG rules

The Link Aggregation Group (LAG) adheres to the following rules:

- All LAG ports operate in full-duplex mode.
- All LAG ports operate at the same data rate.
- All LAG ports must belong to the same set of VLANs.
- Link aggregation is compatible with MSTP, and RSTP.
- Assign all LAG ports to the same MSTP or RSTP groups.
- You can configure a LAG with up to 24 ports, but only a maximum of 8 can be active at a time.
- After you configure a multilink trunk with LACP, you cannot add or delete ports or VLANs manually without first disabling LACP.

## Split MultiLink Trunking

Split MultiLink Trunking (SMLT) is an option that improves Layer 2 and Layer 3 resiliency. The following sections discuss SMLT in more detail.

### SMLT overview

Split MultiLink Trunking is an option that improves Layer 2 (bridged) resiliency by providing for the addition of switch failure redundancy with subsecond failover, on top of all standard MLT link failure protection and flexible bandwidth scaling functionality. Use Split MultiLink Trunking to connect a device that supports some form of link aggregation, be it a switch or a server, to two distinct separate SMLT endpoints or switches. These SMLT devices form a virtualized Switch Cluster through the SPBM cloud and are referred to as a Virtual Inter-Switch Trunk (vIST) Core Switch pair.

Switch Clusters are always formed as a pair, but you can combine pairs of clusters in either a square or full-mesh fashion to increase the size and port density of the Switch Cluster. If you configure SMLT in a Layer 3 or routed topology, the configuration is referenced as Routed SMLT (RSMLT).

For information about Routed SMLT, see [RSMLT](#) on page 2786.

You can form SMLT connections through single links from the Switch Cluster to the edge connection, standard MLTs, or MLTs with LACP. Optionally, SMLT links can have VLACP enabled as well. You can mix these various link connections. Within the same Switch Cluster, you can configure both SMLT and RSMLT to allow a mixture of both Layer 2 and Layer 3 VLANs.

Split MultiLink Trunking networks do not need to use RSTP or MSTP to enable loop-free triangle topologies because SMLT inherently avoids loops due to its superior enhanced link aggregation protocol. The loop-free link is accomplished by having two aggregation switches appear as a single device to edge switches, which dual-home to the aggregation switches. The aggregation switches interconnect using a Virtual Inter-Switch trunk (vIST), exchanging addressing and state information (permitting rapid fault detection and forwarding path modification). Split MultiLink Trunking is designed for Layer 2 network connectivity, but you can configure in Layer 3 networks by working with VRRP or RSMLT Layer 2 edge.

## SMLT advantages

SMLT eliminates all single points of failure and creates multiple paths from all user access switches to the network core. In case of failure, SMLT recovers as quickly as possible using all capacity. SMLT provides a transparent and interoperable solution that requires no modification on the part of the majority of existing user access devices.

SMLT improves the reliability of Layer 2 networks that operate between user access switches and the network center aggregation switch by providing:

- load sharing among all links
- fast failover in case of link failure
- elimination of single points of failure
- fast recovery in case of node failure
- transparent and interoperable solutions
- removal of MSTP and RSTP convergence issues

## SMLT, MSTP, and RSTP

Networks designed to have user access switches dual-home to two aggregation switches, and have VLANs spanning two or more user access switches, experience the following design constraints:

- no load sharing exists over redundant links
- network convergence is slow in case of failure

With the introduction of SMLT, all dual-home Layer 2 frame-switched network devices with dual homes are no longer dependent on the MSTP or RSTP for loop detection. A properly designed SMLT network inherently does not have logical loops.

SMLT solves the spanning tree problem by combining two aggregation switches into one logical MLT entity, thus making it transparent to all types of edge switches. In the process, it provides quick convergence, while load sharing across all available trunks.

If you use STP mode on a switch that is in an SMLT configuration, you can experience traffic loss for 30 seconds if you change the port membership of the MLT, even if the port is in a down state. The traffic

loss is because the convergence time for STP is 30 seconds. Use MSTP or RSTP on all switches in SMLT configurations.

## SMLT topologies

The following are the three generic topologies in which you can deploy SMLT, depending on the resiliency and redundancy required:

- a triangle topology
- a square topology
- a full-mesh topology

## SMLT and Virtual Inter-Switch Trunk (vIST)

The following illustration shows an SMLT configuration with a pair of switches as aggregation systems (E and F) and four separate switches as user access switches (A, B, C, and D).

### Note

In the following figure, the pair of aggregation switches (E and F) are connected by a Virtual Inter-Switch Trunk (vIST). This means that although these two switches appear to be directly connected, they could be anywhere within the SPBM cloud.

**Figure 187: SMLT aggregation switches and operations**

You must connect SMLT aggregation switches through vIST. For example, user access switches B and C connect to the aggregation systems through multilink trunks split between the two aggregation systems. As shown above, the implementation of SMLT only requires two SMLT-capable aggregation switches.

Aggregation switches use vIST to do the following:

- Confirm that they are alive and exchange MAC address forwarding tables.
- Send traffic between single switches attached to the aggregation switches.
- Serve as a backup if one SMLT link fails.

Because SMLT requires vIST, use multiple links on vIST to ensure reliability and high availability. Use Gigabit Ethernet links for vIST connectivity to provide enough bandwidth for potential cross traffic.

For more information about vIST, see [Virtual Inter-Switch Trunk \(vIST\)](#) on page 2254.

A vIST multilink trunk must contain at least two physical ports.

## Other SMLT aggregation switch connections

The figure above includes end stations that connect to each of the switches. In this example, a, b1, b2, c1, c2, and d are clients and printers, while e and f are servers and routers.

User access switches B and C can use a method to determine which link of the multilink trunk connections to use to forward a packet, as long as the same link is used for a Source Address and Destination Address (SA/DA) pair. The packet is routed correctly regardless of whether B or C knows the DA. SMLT aggregation switches always send traffic directly to a user access switch, and only use vIST for traffic that they cannot forward in another, more direct way.

## SMLT environment traffic flow rules

Traffic flow in an SMLT environment adheres to the following rules:

- If a packet is received from a vIST trunk port, it is not forwarded to an active SMLT group in order to prevent network loops.
- After a packet is received, the system performs a look-up on the forwarding database. If an entry exists, and if the entry was learned locally from the SMLT or through the vIST as a remote SMLT, it is forwarded to the local port (the packet must not be sent to the vIST for forwarding unless there is no local connection). Unknown and Broadcast packets flood out all ports that are members of this VLAN.
- For load sharing purposes in an SMLT configuration, the switch obeys the MLT traffic distribution algorithm.

## SMLT traffic flow examples

The following traffic flow examples are based on the figure above.

### Example 1: Traffic flow from a to b1 or b2

Assuming a and b1/b2 are communicating through Layer 2, traffic flows from A to switch E and is forwarded over its direct link to B. Traffic coming from b1 or b2 to a is sent by B on one of its multilink trunk ports.

B can send traffic from b1 to a on the link to switch E, and traffic from b2 to a on the link to F. In the case of traffic from b1, switch E forwards the traffic directly to switch A, while traffic from b2, which arrived at F, is forwarded across the vIST to E and then to A.

### Example 2: Traffic flow from b1/b2 to c1/ c2

Traffic from b1/b2 to c1/c2 is always sent by switch B through its multilink trunk to the core. No matter at which switch E or F arrives at, it is sent directly to C through the local link.

### Example 3: Traffic flow from a to d

Traffic from a to d (and d to a) is forwarded across vIST because it is the shortest path. The link is treated as a standard link; SMLT and vIST parameters are not considered.

## Example 4: Traffic flow from f to c1/c2

Traffic from f to c1/c2 is sent out directly from F. Return traffic from c1/c2 passes through one active VRRP Master for each IP subnet. The traffic is passed across vIST if switch C sends it to E.

## SMLT and vIST traffic flow example

In an SMLT environment, the two aggregation switches share the same forwarding database by exchanging forwarding entries using the vIST. The entry for 00:E0:7B:B3:04:00 is shown on switch C as an entry learned on MLT-1, but because SMLT Remote is true, this entry was actually learned from switch B. On B, that same entry is shown as directly learned through MLT-1 because SMLT Remote is false.

The following illustration shows the network topology.

**Figure 188: Network topology for traffic flow example**

After a packet arrives at switch C destined for 00:E0:7B:B3:04:00, if the SMLT Remote status is true, the switch tries to send the packet to MLT-1 rather than through vIST. Traffic rarely traverses vIST unless there is a failure. If this same packet arrives at B, it is then forwarded to MLT-1 on the local ports.

## SMLT and LACP support

The switch fully supports IEEE 802.3ad LACP on MLTs and on a pair of SMLT systems.

With LACP the switch provides a standardized external link aggregation interface to third-party vendor IEEE 802.3ad implementations. This protocol extension provides dynamic link aggregation mechanisms. Only dual-home devices benefit from this enhancement.

Advantages of this protocol extension include the following:

- MLT peers and SMLT client devices can be both network switches and a type of server or workstation that supports link bundling through IEEE 802.3ad.
- Single link and multilink trunk solutions support dual-home connectivity for attached devices, so that you can build dual-home server farm solutions.

## Supported SMLT/LACP scenarios

SMLT/IEEE link aggregation interaction supports all known SMLT scenarios in which an IEEE 802.3ad SMLT pair connects to SMLT clients, or in which two IEEE 802.3ad SMLT pairs connect to each other in a square or full-mesh topology.

## Unsupported SMLT/LACP scenarios

Some of the unsupported SMLT/LACP scenarios include the following factors, which lead to failure:

- Incorrect port connections.
- Mismatched MLT IDs assigned to SMLT client. SMLT switches can detect if MLT IDs are not consistent. The SMLT aggregation switch, which has the lower IP address, does not allow the SMLT port to become a member of the aggregation thereby avoiding misconfigurations.
- The SMLT client switch does not have automatic aggregation enabled (LACP disabled). SMLT aggregation switches can detect that aggregation is not enabled on the SMLT client, thus no automatic link aggregation is established until the configuration is resolved.

## SMLT and the Virtual Router Redundancy Protocol

Use Virtual Router Redundancy Protocol (VRRP) to have one active primary router for each IP subnet, with all other network VRRP interfaces operating in backup mode.

The VRRP has only one active routing interface enabled. Users that access switches aggregated into two SMLT switches send their shared traffic load (based on source and destination MAC or IP addresses) on all uplinks towards the SMLT aggregation switches.

### Note

A VRRP virtual IP address must not be the same as the VLAN IP address of the device.

The VRRP is less efficient if you use it with SMLT. All other interfaces are in backup (standby) mode. In this case, all traffic is forwarded over the vIST link towards the primary VRRP switch. All traffic that arrives at the VRRP backup interface is forwarded, so there is not enough bandwidth on the vIST link to carry all the aggregated riser traffic. However, an enhancement to VRRP overcomes this issue by ensuring that the vIST trunk is not used in such a case for primary data forwarding.

## SMLT and VRRP BackupMaster

The VRRP BackupMaster acts as an IP router for packets destined for the logical VRRP IP address. The system directly routes all traffic to the destined subnetwork and not through Layer 2 switches to the VRRP master. This avoids a potential limitation in the available vIST bandwidth.

To avoid potential frame duplication problems, you can only use the VRRP BackupMaster feature for SMLT on interfaces that you configure for SMLT. You cannot use VRRP BackupMaster with hubs to avoid frame duplication or on brouter or VLAN interfaces.

If you use an SMLT with routing on SMLT aggregation switches, use VRRP for default gateway redundancy. In a VRRP environment, one switch is active and the other is a backup. In an SMLT environment, you can enable the VRRP BackupMaster and use an active-active concept. The VRRP

BackupMaster router routes traffic that is received on the SMLT VLAN and avoids traffic flow across the vIST. This provides true load-sharing abilities.

Follow these guidelines if you use VRRP BackupMaster with SMLT:

- The VRRP virtual IP address and the VLAN IP address cannot be the same.
- Configure the hold-down timer for VRRP to a value that is approximately one hundred and fifty percent of the Interior Gateway Protocol (IGP) convergence time to allow the IGP enough time to reconverge following a failure. For example, if OSPF takes 40 seconds to reconverge, configure the hold-down timer to 60 seconds.
- Enable hold-down times on both VRRP sides (Master and BackupMaster).

## SMLT and SLPP

You can use Simple Loop Prevention Protocol (SLPP) to prevent loops in an SMLT network. SLPP focuses on SMLT networks but works with other configurations. Always use SLPP in an SMLT environment.

### Note

If SLPP is used in a vIST environment, it must be enabled on both the vIST peers. Because, when an SLPP packet of a vIST peer is looped through UNI ports to the other device, that device will shut down its UNI port due to receiving SLPP packets from its peer. A device's own SLPP packets will go over a vIST connection but will not be forwarded by its vIST peer back onto its UNI ports.

For square and full-mesh configurations that use a routed core, create a separate core VLAN. Enable SLPP on the core VLAN and the square or full mesh links between switch clusters. This configuration detects loops created in the core and loops at the edge do not affect core ports. If you use RSMLT between the switch clusters, enable SLPP on the RSMLT VLAN. Because you enable SLPP only on one or two VLANs in the core, changing the RX threshold values will not be necessary.

The SLPP design is to shut down the port where the SLPP packets originate or to shut down the vIST peer switch port, after the counter reaches the threshold. A loop can still occur after ports are shut down. SLPP can shut down all SMLT ports on a triangle SMLT topology, which results in isolating the edge switch.

## SLPP Guard

**Table 258: SLPP Guard product support**

Feature	Product	Release introduced
For configuration details, see <a href="#">VOSS User Guide</a> .		
SLPP Guard	5520 Series	VOSS 8.2.5
	VSP 4450 Series	VOSS 6.1
	VSP 4900 Series	VOSS 8.1
	VSP 7200 Series	VOSS 6.1
	VSP 7400 Series	VOSS 8.0
	VSP 8200 Series	VOSS 6.1
	VSP 8400 Series	VOSS 6.1
	VSP 8600 Series	VSP 8600 6.2
	XA1400 Series	VOSS 8.0.50

Use SLPP Guard with SMLT to provide additional loop protection to protect wiring closets from erroneous connections.

SLPP Guard requires Simple Loop Prevention Protocol (SLPP) to be configured in the core of the network. SLPP detects loops in the SMLT network. Because SMLT networks disable Spanning Tree (STP), Rapid Spanning Tree (RSTP), or Multiple Spanning Tree Protocol (MSTP) for participating ports, SLPP Guard provides additional network loop protection, extending the loop detection to individual edge access ports.

SLPP Guard can be configured on MLT or LAG ports. If the edge switch with SLPP Guard enabled receives an SLPP-PDU packet on a port, SLPP Guard operationally disables the port for the configured timeout interval and appropriate log messages and SNMP traps are generated. If the disabled port does not receive any SLPP-PDU packets after the configured timeout interval expires, the port automatically reenables and generates a local log message, a syslog message, and SNMP traps, if configured.

## MLT and SMLT Configuration Requirements

Use the information in this section to understand the considerations and guidelines while configuring link aggregation into your network.

### Note

Static MAC is not supported against SMLT.

## MLT with LACP

After you configure MLT with LACP, you must enable the aggregation parameter. After you enable the aggregation parameter, the LACP aggregator maps one-to-one to the specified multilink trunk.

The following lists the steps that are involved to configure MLT with LACP:

1. Assign a numeric key to the ports you want to include.
2. Configure the LAG for aggregation.
3. Enable LACP on the port.
4. Create an MLT and assign to it the same key as in step 1.

The multilink trunk with LACP only aggregates ports whose key matches its own.

The newly created MLT with LACP adopts the VLAN membership of its member ports after the first port is attached to the aggregator associated with this LAG. After a port detaches from an aggregator, the associated LAG port deletes the member from its list.

After a multilink trunk is configured with LACP, you cannot add or delete ports manually without first disabling LACP. You can add or remove VLANs to an MLT without manually disabling LACP.

The following list identifies expected configuration behavior for all platforms when you add VLANs to an LACP-enabled MLT:

- If only one port is part of the MLT/LAG, use the **vlan members add <1-4059> {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]}** command to add newer VLANs to the LAG.
- If two or more ports with several VLANs are active members of the MLT/LAG, you must use the **mlt <1-512> vlan <1-4059>** command to add new VLANs.
- If at least one port is active on the MLT/LAG (LACP), and you need to add a second port that is physically up and has the same key, you must use the **mlt <1-512> vlan <1-4059>** command. The port values must match otherwise the new port enters the churn condition.
- If the switch displays a persistent error that you cannot change the port VLAN membership, you must correct the configuration during a maintenance window:
  1. Shutdown the ports.
  2. Disable LACP on the ports.
  3. Add all VLANs to the port members being aggregated.
  4. Enable LACP on the ports.
  5. Enable the ports.

To enable tagging on ports belonging to a LAG, disable LACP on the port, and then enable tagging and LACP on the port.

If you enable Open Shortest Path First (OSPF) routing on a port, do not set the LACP periodic transmission timer to less than 1 second.

## MLT with LACP and SMLT

You can configure Split MultiLink Trunking (SMLT) with MLT, or with MLT with LACP. Follow these guidelines while you configure SMLT with LACP:

- If you configure LACP for SMLT, you must configure the same LACP smlt-sys-id on both sides. After you configure the LACP system ID for SMLT, configure the same LACP smlt-sys-id on both aggregation switches to avoid loss of data. Configure the LACP smlt-sys-id to be the base MAC

address of one of the aggregate switches, and include the MLT-ID. Configure the same system ID on both of the SMLT core aggregation switches.

- If you use LACP in an SMLT square configuration, the LACP ports must have the same keys for that SMLT LAG; otherwise, the aggregation can fail if a switch fails.
- If an SMLT aggregation switch has LACP enabled on some of its multilink trunks, do not change the LACP system priority.
- After you configure SMLT links, set the multicast packets per-second value to 6000 pps.
- To avoid traffic loss when an SMLT goes down during a CP switchover, distribute multiple SMLT links across different slots.
- To avoid unnecessary processing, do not enable LACP on vISTs . Use VLACP if an optical network between the SMLT core switches requires a failure detection mechanism.

Using the LACP `smlt-sys-id` enables you to use a third-party switch as a wiring closet switch in an SMLT configuration. This enhancement provides an option for the administrator to configure the SMLT Core Aggregation Switches to always use the system ID. In this way, the SMLT Core Aggregation Switch always uses the same LACP key regardless of the state of the SMLT Core Aggregation Switch neighbor (or the vIST link). Therefore no change in LAGs must occur on the attached device regardless of whether the device is a server or a third-party switch. This situation does not affect edge switches used in SMLT configurations. The actor system priority of `LACP_DEFAULT_SYS_PRIO`, the actor system ID the user configures, and an actor key equal to the MLT-ID are sent to the wiring closet switch. Configure the system ID to be the base MAC address of one of the aggregate switches along with its MLT-ID. The administrator must ensure that the same value for the system ID is configured on both of the SMLT Core Aggregation Switches.

You can configure the LACP `smlt-sys-id` used by SMLT core aggregation switches. After you set the LACP system ID for SMLT, configure the same LACP `smlt-sys-id` on both aggregation switches to avoid the loss of data.

The LACP System ID is the base MAC address of the switch, which is carried in Link Aggregation Control Protocol Data Units (LACPDU). If two links interconnect two switches that run LACP, each switch knows that both links connect to the same remote device because the LACPDUs originate from the same System ID. If you enable the links for aggregation using the same key, LACP can dynamically aggregate them into an MLT LAG.

If SMLT is used between the two switches, they act as one logical switch. Both aggregation switches must use the same LACP System ID over the SMLT links so that the edge switch sees one logical LACP peer, and can aggregate uplinks towards the SMLT aggregation switches. This process automatically occurs over the vIST connection, where the base MAC address of one of the SMLT aggregation switches is chosen and used by both SMLT aggregation switches.

However, if the switch that owns that Base MAC address restarts, the vIST goes down, and the other switch reverts to using its own Base MAC address as the LACP System ID. This action causes all edge switches that run LACP to think that their links are connected to a different switch. The edge switches stop forwarding traffic on their remaining uplinks until the aggregation can reform (which can take several seconds). Additionally, after the restarted switch comes back on line, the same actions occur, thus disrupting traffic twice.

The solution to this problem is to statically configure the same LACP smlt-sys-id MAC address on both aggregation switches.

#### Note

The SMLT ID is always the same as the MLT ID. For instance, both sides can have an MLT 10, but once SMLT is enabled on both sides it will function as an SMLT. Until SMLT is enabled on both peers however, it will function as a normal MLT.

## MLT with LACP and Spanning Tree

Only the physical link state or its LACP peer status affects LACP module operation. After a link is enabled or disabled, an LACP module is notified. The MSTP or RSTP forwarding state does not affect LACP module operation. LACPDUs can be sent if the port is in an MSTP or RSTP blocking state.

Unlike legacy MultiLink trunks, configuration changes (such as speed and duplex mode) to a LAG member port are not applied to all member ports in the multilink trunks. The changed port is removed from the LAG and the corresponding aggregator, and the user is alerted that the configuration is created.

#### Important

Link Aggregation Control Protocol, as defined by IEEE, is a protocol that exists between two bridge endpoints; therefore, the LACP PDUs are terminated at the next Server Provider (SP) interface.

## Link Aggregation Scaling

For the latest applicable scaling information, see [Release Notes for VOSS](#) for the version of the software running on the switch.

## SMLT and VLACP

Use Virtual Link Aggregation Control Protocol (VLACP) for all SMLT access links configured as MultiLink Trunks to ensure both end devices can communicate. The switch does not support LACP and VLACP on the same links simultaneously.

VLACP for SMLT also protects against CPU failures by causing traffic to switch or reroute to the SMLT peer if the CPU fails or stops responding.

The following table provides the values for VLACP in an SMLT environment:

**Table 259: VLACP values**

Parameter	Value
SMLT access	
Timeout	Short
Timer	500ms
Timeout scale	5

**Table 259: VLACP values (continued)**

Parameter	Value
VLACP MAC	01:80:C2:00:00:0F
SMLT core	
Timeout	Short
Timer	500ms
Timeout scale	5
VLACP MAC	01:80:C2:00:00:0F
vIST	
Timeout	Long
Timer	10000
Timeout scale	3
VLACP MAC	01:80:C2:00:00:0F

## SMLT with NNI Ports

If you want to modify SMLTs that contain NNI ports, do the modification during maintenance windows. Otherwise, if you create or delete SMLTs that contain NNI ports running MSTP, IS-IS adjacencies that connect to those ports can bounce even if the SMLT is not used.

## MLT and Private VLANs

The switch supports private VLANs and E-Tree configuration. MLT and private VLANs operate as follows:

- When using static MLT, configure the private-vlan as part of the overall MLT configuration, not at the port member level. All ports in the MLT use the private VLAN type for that MLT.
- When using LACP, configure the private-vlan at the interface level.
- When the private VLAN port type is trunk, the MLT automatically becomes tagged.
- If there are other non-private VLANs using the MLT configured as isolated, the following message is displayed: `All non private VLANs using this interface will be removed once this mlt becomes isolated. Do you wish to continue (y/n) ?`
- If there are other non-private VLANs using the MLT configured as promiscuous, the following message is displayed: `All non private VLANs using this interface will be removed once this mlt becomes promiscuous. Do you wish to continue (y/n) ?`

## MLT and SMLT link aggregation configuration using the CLI

This section describes how to configure and manage link aggregation using the CLI, including MultiLink Trunking (MLT), to increase the link speed and redundancy for higher availability.

Configure link aggregation to provide link level redundancy and increase load sharing. MultiLink Trunking (MLT) is a link aggregation technology that you can use to group several physical Ethernet

links into one logical Ethernet link to provide fault-tolerance and high-speed links between routers, switches, and servers. Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency.

## Configure an MLT

Perform this procedure to create and configure an MLT.

### Before You Begin

See [MLT and SMLT Configuration Requirements](#) on page 2267 to understand the commands you can use to add VLANs to an LACP-enabled MLT. Ensure you use the correct command to avoid the LACP churn condition.

### Procedure

1. Enter Global Configuration mode:  

```
enable
```

```
configure terminal
```
2. Create an MLT:  

```
mlt <1-512>
```
3. (Optional) Set the private VLAN type for the MLT:  

```
mlt <1-512> private-vlan <isolated|promiscuous|trunk>
```
4. Add a VLAN to the MLT:  

```
mlt <1-512> vlan <1-4059>
```
5. (Optional) Change the name of the MLT:  

```
mlt <1-512> name WORD<0-20>
```
6. Enable trunking on the MLT:  

```
mlt <1-512> encapsulation dot1q
```
7. Enable the MLT:  

```
mlt <1-512> enable
```
8. Display the MLT configuration:  

```
show mlt <1-512>
```

### Examples

Create MLT 40. Configure the private VLAN type for MLT 40 to isolated. Add VLAN 10 to the MLT. Enable the MLT.

```
Switch:1(config)#mlt 40
Switch:1(config)#mlt 40 private-vlan isolated
Switch:1(config)#mlt 40 vlan 10
Switch:1(config)#mlt 40 enable
```

Display the MLT configuration:

```
Switch:1(config)#show mlt 40
```

```
=====
Mlt Info
=====
```

MLTID	IFINDEX	NAME	PORT TYPE	MLT ADMIN	MLT CURRENT	PORT MEMBERS	VLAN IDS
40	6183	MLT-40	access	norm	norm		10
MLTID	IFINDEX	DESIGNATED PORTS	LACP ADMIN	LACP OPER			
40	6183	null	disable	down			
MLTID	NAME	WHERE CREATED	LOCAL PORT MEMBERS	REMOTE PORT MEMBERS	WHICH PORTS PROGRAMMED IN DATA PATH		
40	MLT-40	LOCAL			NONE		
MLTID	IFINDEX	ENCAP DOT1Q	LOSSLESS	PVLAN	PVLAN TYPE	VID TYPE	FLEX-UNI
40	6183	disable	disable	enable	isolated	secondary	disable

### Variable definitions

Use the data in the following table to use the **mlt** command.

Variable	Value
<i>enable</i>	Creates and enables a new MLT.
<i>encapsulation dot1q</i>	Enables trunking on the MLT.
<i>member {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i>	Adds ports to the MLT. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<i>&lt;1-512&gt;</i>	Specifies the MLT ID.
<i>name WORD&lt;0-20&gt;</i>	Configures the name for the MLT.
<i>private-vlan {isolated promiscuous trunk}</i>	Specifies a private VLAN type for the MLT.
<i>vlan &lt;1-4059&gt;</i>	Specifies a VLAN ID to add to the MLT.

## Viewing MLT port members

View the port members in the specified MLT, or for all MLTs.

### Procedure

1. Enter Global Configuration mode:
 

```
enable
configure terminal
```

- View information about the specified MLT:

```
show mlt [<1-512>]
```

### Example

#### Note

The **show mlt [<1-512>]** command displays remote port members only if the MLTs are configured on vIST peers that use the same MLT ID.

If the MLT is between two devices that use the same MLT ID, but they are not vIST peers, **show mlt [<1-512>]** does not display the remote port members in the output.

In this first example, MLT 512 is an MLT between two vIST peers with the same ID used on both peers. In this case, the output displays the remote port members.

```
Switch:1(config)# show mlt 512
```

```
=====
```

```
 Mlt Info
```

```
=====
```

MLTID	IFINDEX	NAME	PORT TYPE	MLT ADMIN	MLT CURRENT	PORT MEMBERS	VLAN IDS
512	6655	MLT-512	trunk	norm	norm	1/24	1000 2000

```
=====
```

MLTID	IFINDEX	DESIGNATED PORTS	LACP ADMIN	LACP OPER
512	6655	null	disable	down

```
=====
```

MLTID	NAME	WHERE CREATED	LOCAL PORT MEMBERS	REMOTE PORT MEMBERS	WHICH PORTS PROGRAMMED IN DATA PATH
512	MLT-512	LOCAL	1/24	3/24	LOCAL

```
=====
```

MLTID	IFINDEX	ENCAP DOT1Q	LOSSLESS
512	6655	enable	disable

```
=====
```

In this second example, MLT 1 is an MLT between two devices that are not vIST peers so the output does not display the remote port members.

```
Switch:1(config)# show mlt 1
```

```
=====
```

```
 Mlt Info
```

```
=====
```

MLTID	IFINDEX	NAME	PORT TYPE	MLT ADMIN	MLT CURRENT	PORT MEMBERS	VLAN IDS
1	6144	MLT-1	trunk	norm	norm	1/5	1000 2000

```
=====
```

MLTID	IFINDEX	DESIGNATED PORTS	LACP ADMIN	LACP OPER

```
=====
```

```

1 6144 1/5 disable down

MLTID NAME WHERE LOCAL REMOTE WHICH PORTS
CREATED CREATED PORT MEMBERS PORT MEMBERS PROGRAMMED
IN DATA PATH

1 MLT-1 LOCAL 1/5 LOCAL

MLTID IFINDEX ENCAP DOT1Q LOSSLESS

1 6144 enable disable

```

### Variable definitions

Use the data in the following table to use the **show mlt error collision** command.

Variable	Value
<1-512>	Specifies the MLT ID. The value ranges from 1-512.

## Adding ports to an MLT LAG

Perform this procedure to add ports to an MLT LAG.

### Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Add ports to an MLT LAG:

```
mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

### Example

Add port 1/24 to MLT 40:

```
Switch:1(config)# mlt 40 member 1/24
```

### Variable definitions

Use the data in the following table to use the **mlt** command.

Variable	Value
<i>enable</i>	Creates and enables a new MLT.
<i>encapsulation dot1q</i>	Enables trunking on the MLT.

Variable	Value
<code>member {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code>	Adds ports to the MLT. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<code>&lt;1-512&gt;</code>	Specifies the MLT ID.
<code>name WORD&lt;0-20&gt;</code>	Configures the name for the MLT.
<code>private-vlan {isolated promiscuous trunk}</code>	Specifies a private VLAN type for the MLT.
<code>vlan &lt;1-4059&gt;</code>	Specifies a VLAN ID to add to the MLT.

## Removing ports from an MLT LAG

Remove ports from an MLT LAG.

### About This Task

#### Important

Before removing a port member from an MLT, you must first disable the port. This ensures that the other side brings its corresponding port member down. This achieves parity on both sides and avoids traffic disruptions.

The shutdown port requires that you enter the interface GigabitEthernet configuration mode. However, to remove ports from an MLT LAG, you can enter any configuration mode.

### Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable the ports:

```
shutdown port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}
```

3. Remove ports from an MLT LAG:

```
no mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

**Example**

Remove port 1/24 from MLT 40:

```
Switch:1(config)# interface GigabitEthernet 1/24
```

```
Switch:1(config-mlt)# shutdown port 1/24
```

```
Switch:1(config-mlt)# no mlt 40 member 1/24
```

*Variable definitions*

Use the data in the following table to use the **mlt** command.

Variable	Value
<1-512>	Specifies which MLT to add the ports to.
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}	Specifies the ports to add to the MLT. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

**Creating an SMLT from an existing MLT**

Create an SMLT from an existing MLT to split physical ports between two switches to improve resiliency and provide active load sharing.

**Before You Begin**

- Create an MLT before you create a split in the MLT.

**Procedure**

1. Log on to the MLT Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface mlt <1-512>
```

2. Create an SMLT from an existing MLT:

```
smlt
```

#### Important

If you want to remove SMLT configuration from the MLT on a vIST switch, first shut the SMLT MLT ports on its vIST peer.

Failure to perform this operation may lead to layer 2 loops.

#### Important

- If you are configuring SMLT with vIST, all the SMLT VLANs associated with vIST must have an I-SID.

### Example

Create an SMLT on MLT 1:

```
Switch:1(config)#interface mlt 1
```

```
Switch:1(config-mlt)#smlt
```

## Virtual interswitch trunk (vIST)

### Creating a Virtual IST

Use this procedure to create a virtual IST (vIST).

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

#### Important

- When you create a vIST, VLANs assigned to SMLT ports must have an I-SID assigned.
- If you assign a VLAN to an I-SID on one SMLT-BEB node, then you must create the same VLAN and assign it to the same I-SID on the peer SMLT-BEB node even if no devices are connected to this second node.
- The vIST VLAN must also be associated with an I-SID. You can use the same vIST VLAN in another part of your network, but the I-SID associated with the vIST VLAN must not be used anywhere else.

#### Note

Simplified Virtual-IST (vIST) is for non-SPB customers who use SMLT with legacy IST.

Simplified VIST is available for legacy multicast deployments only when the boot flag (**spbm-config-mode**) is disabled.

For more information, see [Configuring Simplified vIST in SMLT topologies](#) on page 2282 .

## About This Task

The following list provides an overview of the configuration steps:

- Enable SPBM and IS-IS globally.
- Configure SPBM and IS-IS.
- Configure an L2 VSN by assigning an I-SID to the C-VLAN, which is used by the vIST.

For information about SPBM and IS-IS, see [SPBM and IS-IS Infrastructure Fundamentals](#) on page 876.

### Important

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of the header size increase when transmitting packets over the SPBM cloud.

## Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create a vIST:

```
virtual-ist peer-ip <A.B.C.D> vlan <1-4059>
```

3. Verify your vIST configuration:

```
show virtual-ist
```

## Example

The configuration example contains annotations (in parenthesis) to explain the configuration information.

**Figure 189: SMLT with vIST configuration example**

**Note**

This configuration example is for vIST peer B.

```
#
ISIS SPBM CONFIGURATION

```

### Variable definitions

Use the data in the following table to use the **ist peer-ip** command.

Variable	Value
<A.B.C.D>	Specifies the peer IP address—the IP address of the vIST VLAN on the other aggregation switch.
<1-4059>	Specifies the VLAN ID for this vIST.

### Editing a virtual IST

If you need to change the virtual IST (vIST) **peer-ip** or **vlan**, use this procedure to delete the vIST first.

#### Note

- You must disable IS-IS globally before deleting a vIST, and then re-enable it after creating a new vIST.
- You do not have to set the SMLT peer system ID or the virtual B-MAC to 0 before you change the vIST peer IP address or VLAN ID number.

### Procedure

1. Enter Global Configuration mode:  
`enable`  
`configure terminal`
2. Disable IS-IS globally:  
`no router isis enable`
3. Delete the vIST:  
`no virtual-ist peer-ip`
4. Create a vIST:  
`virtual-ist peer-ip <A.B.C.D> vlan <1-4059>`
5. Enable IS-IS globally:  
`router isis enable`

### Configuring Simplified vIST in SMLT topologies

This procedure shows how to configure Simplified vIST in an SMLT environment. It includes steps to configure the following:

- Setting the boot config flag
- Configuring the vIST peer
- Enabling Simplified vIST

#### Important

When you enable Simplified vIST with the **virtual-ist enable** command, two VLANs are automatically created to support vIST. The VLAN IDs are: 4086 and 4087.

### Before You Begin

SPBM must not be enabled on the vIST peers.

### About This Task

#### Important

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of a header size increase.

## Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```

2. Disable the boot flag:

```
no boot config flags spbm-config-mode
```

The system responds with these messages:

```
Warning: Please save the configuration and reboot the switch for this
to take effect.
```

```
Warning: Please carefully save your configuration file before
rebooting the switch. Saving configuration file when spbm-config-mode
is changed to disable, removes SPBM configurations from the
configuration file.
```

3. Save the configuration, and then reboot the switch.

### Important

Any change to the **spbm-config-mode** boot flag requires a reboot for the change to take effect.

4. Create the vIST VLAN:

```
vlan create <2-4059> type port-mstprstp <0-63>

interface vlan <1-4059>

ip address <A.B.C.D/X>
```

5. Configure the vIST peer address and VLAN:

```
virtual-ist peer-ip <A.B.C.D> vlan <1-4059>
```

6. Configure the SMLT MLT:

```
mlt <1-512> enable

mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}

interface mlt <1-512>

smlt
```

## 7. Configure the vIST MLT:

```
mlt <1-512> enable

mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}

mlt <1-512> encapsulation dot1q

interface mlt <1-512>

virtual-ist enable
```

**Note**

The **virtual-ist enable** command enables Simplified vIST and is only available when the **spbm-config-mode** boot flag is disabled.

## 8. Create a customer VLAN and assign the SMLT MLT ID:

```
vlan create <2-4059>

vlan mlt <1-4059> <1-512>

interface vlan <1-4059>

ip address <A.B.C.D/X>
```

**Example**

```
enable
configure terminal
no boot config flags spbm-config-mode
```

Save the configuration and reboot the switch.

```
virtual-ist peer-ip 192.0.2.1 vlan 50

mlt 3 enable
mlt 3 member 1/35,1/36
interface mlt 3
smlt
exit
mlt 5 enable
mlt 5 member 2/15,2/17
mlt 5 encapsulation dot1q
interface mlt 5
virtual-ist enable
exit
vlan create 50 type port-mstprstp 0
interface vlan 50
ip address 192.0.2.2 255.255.255.0 1
exit
vlan create 100
vlan mlt 100 3
interface vlan 100
ip address 198.51.100.1 255.255.255.0 2
exit
```

## Viewing all ports configured for SMLT

View all ports for a SMLT to ensure the correct ports are configured.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View all ports configured for SMLT:  
show smlt mlt

### Example

```
Switch:1#show smlt mlt
```

```
=====
 Mlt SMLT Info
=====
MLT ADMIN CURRENT
ID TYPE TYPE

 1 smlt smlt
 4 smlt smlt
```

### Variable definitions

Use the data in the following table to use the **show smlt** command.

Variable	Value
mlt	Displays SMLT information for the MLT interface.

## Viewing information about collision errors

View information about collision errors to obtain information about collision errors in the specified MLT, or for all MLTs.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View information about collision errors:  
show mlt error collision [<1-512>]

### Example

```
Switch:1#show mlt error collision 4
```

```
=====
 Mlt Collision Error
=====
MLT -----COLLISIONS-----
ID SINGLE MULTIPLE LATE EXCESSIVE

 40 0 0 0 0
```

*Variable definitions*

Use the data in the following table to use the **show mlt error collision** command.

Variable	Value
<1-512>	Specifies the MLT ID. The value ranges from 1-512.

## Viewing information about Ethernet errors

View information about Ethernet errors to display information about the types of Ethernet errors sent and received by a specific MLT or all MLTs.

### About This Task

#### Important

The IMAC columns refer to internal MAC address errors.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View information about Ethernet errors:  
show mlt error main [<1-512>]

### Example

```
Switch:1#show mlt error main 40
```

```
=====
 Mlt Ethernet Error
=====
MLT ALIGN FCS IMAC IMAC CARRIER FRAMES SQETEST DEFER
ID ERROR ERROR TRNSMIT RECEIVE SENSE TOOLONG ERROR TRNSMSS
=====
40 0 0 0 0 0 0 0 0
```

*Variable definitions*

Use the data in the following table to use the **show mlt error main** command.

Variable	Value
<1-512>	Specifies the MLT ID. The value ranges from 1-512.

## SLPP Guard configuration

This section provides the procedures to configure Simple Loop Prevention Protocol (SLPP) Guard.

#### Important

Enable SLPP Guard on the edge switches of an SMLT network and SLPP on the aggregation layer switches.

### Configuring SLPP Guard

Configure SLPP Guard on MLT and LAG ports to provide additional network loop protection.

SLPP Guard is disabled by default.

#### Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable SLPP Guard on the port:

```
slpp-guard enable
```

3. (Optional) Configure the timeout value on the port:

```
slpp-guard timeout {<10-65535> | 0}
```

#### Example

```
Switch:1(config-if)#slpp-guard enable
Switch:1(config-if)#slpp-guard timeout 120
```

#### Variable definitions

Use the data in the following table to use the **slpp-guard** command.

Variable	Value
timeout <0   10-65535>	Specifies the time period, in seconds, for which SLPP Guard disables the port. After the timeout period expires, the switch reenables the port. The timeout value can be 0 or a value ranging from 10 to 65535. With a value of 0, the port remains disabled until it is manually re-enabled. The default timeout value is 60 seconds.

#### Reenabling an operationally disabled port

Reenable a port that has been operationally disabled by SLPP Guard.

#### Note

You cannot reenoble a disabled port if the timer count has not reached its timeout value. Either wait until it reaches the timeout or disable SLPP Guard for that port and then re-enable it.

## Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Reenable SLPP Guard on the port:

```
slpp-guard enable
```

3. (Optional) Configure the timeout value on the port:

```
slpp-guard timeout {<10-65535> | 0}
```

## Example

```
Switch:1(config-if)#slpp-guard enable
Switch:1(config-if)#slpp-guard timeout 120
```

## Variable definitions

Use the data in the following table to use the **slpp-guard** command.

Variable	Value
timeout <0   10-65535>	Specifies the time period, in seconds, for which SLPP Guard disables the port. After the timeout period expires, the switch reenables the port. The timeout value can be 0 or a value ranging from 10 to 65535. With a value of 0, the port remains disabled until it is manually re-enabled. The default timeout value is 60 seconds.

## Viewing SLPP Guard status

View current SLPP Guard settings.

## Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display SLPP Guard status:

```
show slpp-guard {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}
```

## Example

```
Switch:1#>show slpp-guard
```

```
=====
 SLPP Guard
=====
SLPP-guard Ethertype: 0x8102
=====
 Port Interface
=====
```

Port	Link	Oper	SLPP-guard	State	Timeout	TimerCount
1/1	Up	Down	Disabled	N/A	60	N/A
1/2	Up	Down	Enabled	N/A	120	N/A
1/3	Up	Up	Enabled	Monitoring	60	N/A
1/4	Up	Down	Enabled	N/A	120	N/A
1/5	Down	Down	Disabled	N/A	60	N/A
1/6	Down	Down	Disabled	N/A	60	N/A
1/7	Down	Down	Disabled	N/A	60	N/A
1/8	Down	Down	Disabled	N/A	60	N/A
1/9	Down	Down	Disabled	N/A	60	N/A
1/10	Down	Down	Disabled	N/A	60	N/A
1/11	Down	Down	Disabled	N/A	60	N/A
1/12	Down	Down	Disabled	N/A	60	N/A

### Note

The TimerCount column in the preceding example output indicates the time, in seconds, that elapses after SLPP Guard disables a port. When the value TimerCount value equals the Timeout value, the switch re-enables the port.

### Variable definitions

Use the data in the following table to use the **show slpp-guard** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]][,...]}</code>	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

## MLT and SMLT Link Aggregation Configuration using EDM

Configure link aggregation to provide link level redundancy and increase load sharing. MultiLink Trunking (MLT) is a link aggregation technology that you can use to group several physical Ethernet links into one logical Ethernet link to provide fault-tolerance and high-speed links between routers, switches, and servers. Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency.

### Adding a multilink or LACP trunk

Perform this procedure to add a multilink or LACP trunk.

#### About This Task

#### Important

Ensure that all ports that belong to the same MLT/LACP group use the same port speed, for example, 1 Gbit/s, even if autonegotiation is used. This requirement is not enforced by the software.

When you add a VLAN to a dynamic MLT, only the active ports of the MLT are added as port members of the VLAN. Ports configured with the same aggregation key, but not active, are not added to the

VLAN. If these inactive ports become active later, the system does not automatically add them to the VLAN port member list.

You must add all inactive ports to the VLAN. If you do not add the inactive ports to the VLAN, when they become active later, hashing can result in choosing a newly active port for traffic forwarding. Because the port is not a port member of the VLAN, traffic will be dropped. When you add the VLAN to the MLT, also add the inactive aggregation ports to the VLAN. You may have to disable LACP on the inactive ports before you can add them to the VLAN. Because the ports are inactive, disabling LACP does not cause a traffic interruption.

Similarly when you remove a VLAN from a dynamic MLT, all active ports of the MLT are removed from the VLAN port member list but the inactive members are not removed. You must remove the inactive aggregation members from the VLAN.

If you later configure a port for the same aggregation, you must add this port to all VLANs that are members of the MLT.

### Procedure

1. In the navigation tree, expand the following folders: **Configuration > VLAN**.
2. Click **MLT/LACP**.
3. Click the **MultiLink/LACP Trunks** tab.
4. Click **Insert**.
5. In the **Id** box, type the ID number of the MLT.
6. In the **PortType** section, select **access** or **trunk**.
7. In the **Name** box, type a name for the MLT, or accept the default.
8. In the **PortMembers** box, click the (...) button.
9. In the **Port Editor: PortMembers** dialog box, select the desired ports.
10. Click **Ok**.
11. In the **VlanIdList** box, click the (...) button,
12. In the **VlanIdList** dialog box, select the desired VLANs.
13. Click **Ok**.
14. In the **MltType** section, select the MLT type.
15. In the **Aggregatable** box, select **enable** or **disable**.
16. In the **PrivateVlanType** box, select **trunk**, **isolated**, or **promiscuous**.
17. Click **Insert**.

The MLT is added to the MultiLink/LACP Trunks tab in the MLT\_LACP box.

### **MultiLink/LACP Trunks** Field Descriptions

Use the data in the following table to use the **MultiLink/LACP Trunks** tab

Name	Description
<b>Id</b>	Specifies a unique value for this MLT.
<b>PortType</b>	Specifies the value to access or trunk port. If the aggregatable field is set to enable, this field is read-only. The default value is access.

Name	Description
<b>Name</b>	Configures the name given to the MLT.
<b>PortMembers</b>	<p>Assigns ports to the MLT. All ports in an MLT must have the same settings for speed and duplex, but can have different media types. All untagged ports must belong to the same STG. Up to eight same-type ports can belong to a single MLT. If the aggregatable field is set to enable, this field becomes read-only.</p> <p><b>Important:</b> Ensure that all ports that belong to the same MLT/LACP group use the same port speed, for example, 1 Gbps, even if autonegotiation is enabled.</p>
<b>VlanIdList</b>	Indicates to which ports the VLANs belong. If the aggregation field is set to enable, this field is read-only.
<b>MltType</b>	<p>Specifies the type of MLT</p> <ul style="list-style-type: none"> <li>• normalMLT (default)</li> <li>• istMLT</li> <li>• splitMLT</li> </ul>
<b>RunningType</b>	Specifies the MLT running type.
<b>IfIndex</b>	Specifies the interface of the trunk.
<b>ClearLinkAggregate</b>	Clears the link aggregate, disabling and reenabling the trunk.
<b>DesignatedPort</b>	Specifies the designated port of this trunk.
<b>Aggregatable</b>	Enables or disables link aggregation. The default value is disable.
<b>AggOperState</b>	Specifies the aggregation state of the trunk.
<b>AggTimeOfLastOperChange</b>	Specifies the time value since the interface entered its current operational state.
<b>PeerPortMembersList</b>	Specifies the peer ports connected to the local ports of this trunk.
<b>EntryOwner</b>	Defines the owner of the MLT.
<b>DatapathProgrammingState</b>	Defines the datapath programming state of the MLT.
<b>PrivateVlanType</b>	Specifies the type of private VLAN for the MLT.
<b>FlexUniEnable</b>	Specifies whether the Flex UNI is enabled or disabled on the port. The default value is disable.

## Adding ports to an MLT

Add ports to an MLT to insert MultiLink/LACP trunks.

### Procedure

1. In the navigation tree, expand the following folders: **Configuration > VLAN**.
2. Click **MLT/LACP**.
3. Click the **MultiLink/LACP Trunks** tab.
4. In the **PortMembers** column, double-click the field associated with the MLT to which you want to add ports to.
5. Select the port numbers to add, or click **All** to add all ports to the MLT.  
Up to 16 same-type ports can belong to a single MLT.
6. Click **Ok**.
7. Click **Apply**.

## Viewing trunks

Perform this procedure to view the MLT-based SMLT configuration.

### Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN**.
2. Click **SMLT**.
3. Click the **SMLT Info** tab.

### **SMLT Info** field descriptions

Use the data in the following table to use the **SMLT Info** tab.

Name	Description
<b>Id</b>	Shows the MLT ID for this SMLT Read-only.
<b>MltType</b>	Shows the MLT type of this trunk.
<b>RunningType</b>	Shows the SMLT running type.

## Create a Virtual IST using EDM

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

### Important

- When you create a vIST, VLANs assigned to SMLT ports must have an I-SID assigned.
- If you assign a VLAN to an I-SID on one SMLT-BEB node, then you must create the same VLAN and assign it to the same I-SID on the peer SMLT-BEB node even if no devices are connected to this second node.
- The vIST VLAN must also be associated with an I-SID. You can use the same vIST VLAN in another part of your network, but the I-SID associated with the vIST VLAN must not be used anywhere else.

### Note

Simplified Virtual-IST (vIST) is for non-SPB customers who use SMLT with legacy IST. Simplified VIST is available only for legacy multicast deployments when the boot configuration flag (`spbm-config-mode`) is disabled.

### Before You Begin

- Enable SPBM and IS-IS globally.
- Configure SPBM and IS-IS.
- Configure a Layer 2 VSN by assigning an I-SID to the C-VLAN, which is used by the vIST.

### About This Task

### Important

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of the header size increase when transmitting packets over the SPBM cloud.

### Procedure

1. In the navigation pane, expand the **Configuration > VLAN > MLT/LACP** folders.
2. Select the **Virtual IST** tab.
3. In the **PeerIp** field, type the peer IP address.
4. In the **VlanId** field, enter a VLAN ID.
5. Select **Apply**.

**Virtual IST** field descriptions

Use the data in the following table to help you configure the **Virtual IST** tab.

Name	Description
<b>SessionStatus</b>	Displays the status of the vIST session.
<b>PeerIp</b>	Specifies the peer IP address, which is the IP address of the vIST VLAN on the other aggregation switch.
<b>VlanId</b>	Configures a vIST VLAN ID number.

## Editing a virtual IST

If you need to change the virtual IST **PeerIp** or **VlanId**, use this procedure to delete the vIST first.

**Note**

- You must disable IS-IS globally before deleting a vIST, and then re-enable it after creating a new vIST.
- You do not have to set the SMLT peer system ID or the virtual B-MAC to 0 before you change the virtual IST peer IP address or VLAN ID number.

**Procedure**

1. Disable IS-IS globally.
  - a. In the navigation pane, expand the following folders: **Configuration > IS-IS > IS-IS**.
  - b. Click the **Globals** tab.
  - c. In the **AdminState** field, click **off**.
  - d. Click **Apply**.
2. Delete the vIST.
  - a. In the navigation pane, expand the following folders: **Configuration > VLAN > MLT/LACP**.
  - b. Click the **Virtual IST** tab.
  - c. Click **Apply**.
3. Create a vIST:
  - a. In the navigation pane, expand the following folders: **Configuration > VLAN > MLT/LACP**.
  - b. Click the **Virtual IST** tab.
  - c. In the **PeerIp** field, enter the peer IP address.
  - d. In the **VlanId** field, enter a VLAN ID.
  - e. Click **Apply**.
4. Enable IS-IS globally.
  - a. In the navigation pane, expand the following folders: **Configuration > IS-IS > IS-IS**.
  - b. Click the **Globals** tab.
  - c. In the **AdminState** field, click **on**.
  - d. Click **Apply**.

## Configuring Simplified vIST in SMLT topologies

This procedure shows how to configure Simplified vIST in an SMLT environment. It includes steps to configure the following:

- Setting the boot config flag
- Configuring the vIST peer
- Enabling Simplified vIST

### Important

When you enable Simplified vIST with the **virtual-ist enable** command, two VLANs are automatically created to support vIST. The VLAN IDs are: 4086 and 4087.

### Before You Begin

SPBM must not be enabled on the vIST peers.

### About This Task

### Important

Do not change the system MTU to less than the default value of 1950 bytes. The system MTU must be 1950 or jumbo because of a header size increase.

### Procedure

1. In the navigation pane, expand the **Configuration > Edit > Chassis** folders.
2. Click the **Boot Config** tab.
3. Clear the **EnableSpbmConfigMode** field to disable the boot flag.

The system responds with the following messages:

```
Warning: Please save the configuration and reboot the switch for this
to take effect.
```

```
Warning: Please carefully save your configuration file before
rebooting the switch. Saving configuration file when spbm-config-mode
is changed to disable, removes SPBM configurations from the
configuration file.
```

4. Click **Apply**.
5. Save the configuration, and then reboot the switch.

### Important

A change to the **EnableSpbmConfigMode** boot flag requires a reboot for the change to take effect.

6. Configure the SMLT MLT:
  - a. Expand the **Configuration > VLAN** folders.
  - b. Click **MLT/LACP**.
  - c. Click the **MultiLink/LACP Trunks** tab.
  - d. Click **Insert**.

- e. In the **Id** box, type the ID number of the MLT.
- f. In the **PortType** section, select access or trunk.
- g. In the **Name** box, type a name for the MLT, or accept the default.
- h. In the **PortMembers** box, click the (...) button.
- i. In the **Port Editor: PortMembers** dialog box, select the desired ports.
- j. Click **Ok**.
- k. In the **VlanIdList** box, click the (...) button.
- l. In the **VlanIdList** dialog box, select the desired VLANs.
- m. Click **Ok**.
- n. In the **MltType** section, select splitMLT
- o. Click **Insert**.

The switch adds the SMLT MLT to the MultiLink/LACP Trunks tab in the MLT\_LACP box.

7. Configure the vIST MLT:
  - a. Repeat steps 6.a on page 2295 to 6.o to configure the MLT.
  - b. Click **virtualistMLT** to enable Simplified vIST.
  - c. Click **Insert**.
8. Create the vIST VLAN:
  - a. Expand the **Configuration > VLAN > VLANs** folders.
  - b. In the **Basic** tab, click **Insert**.
  - c. In the **Id** box, enter an unused VLAN ID, or use the ID provided.
  - d. In the **MstpInstance** box, click the down arrow, and then choose an MSTI instance from the list.
  - e. In the **Type** box, select **byPort**.
  - f. In the **PortMembers** box, click the (...) button.
  - g. In the **Port Editor: PortMembers** dialog box, select the desired ports.
  - h. Click **OK**.
  - i. Click **Insert**.
  - j. Select the vIST VLAN from the list of VLANs, and then click **IP**.
  - k. Click **Insert**.
  - l. Configure the IP address for the vIST VLAN.
9. Repeat step 8 to create an SMLT VLAN and assign the SMLT MLT ID to it. Do not use the vIST MLT ID.

## SLPP Guard configuration

This section provide the procedures to configure Simple Loop Prevention Protocol (SLPP) Guard using EDM.

### Important

Enable SLPP Guard on the edge switches of an SMLT network and SLPP on the aggregation layer switches.

### Configuring SLPP Guard

Configure SLPP Guard on MLT and LAG ports to provide additional network loop protection.

SLPP Guard is disabled by default.

## Procedure

1. In the navigation pane, expand the **Configuration > VLAN** folders.
2. Click **SLPP**.
3. Click the **SLPP Guard** tab.
4. In the port row, double-click the cell in the **Enabled** column.
5. Select true from the drop-down list to enable SLPP Guard, or false to disable SLPP Guard for the port.
6. (Optional) In the port row, double-click the cell in the **Timeout** column.
7. (Optional) Type a value in the **Timeout** field.
8. Click **Apply**.
9. On the toolbar, click **Refresh** to update the work area data display.

## SLPP Guard Ethernet type field descriptions

Use the data in the following table to use the **SLPP Guard** tab.

Name	Description
<b>IfIndex</b>	Specifies the port on which to configure SLPP Guard.
<b>Enable</b>	Enables (true) or disables (false) SLPP Guard for the port. The default is disabled.
<b>Timeout</b>	Specifies the time period, in seconds, for which SLPP Guard disables the port. After the timeout period expires, the switch re-enables the port. The timeout value can be 0 or a value ranging from 10 to 65535. With a value of 0, the port remains disabled until it is manually re-enabled. The default Timeout value is 60 seconds.
<b>Status</b>	Displays the SLPP Guard status for the port.
<b>TimerCount</b>	Indicates the time, in seconds, that elapses after SLPP Guard disables a port. When the TimerCount value equals the Timeout value, the switch re-enables the port.

### *Reenabling an operationally disabled port*

Reenable a port that has been operationally disabled by SLPP Guard.

#### Note

You cannot reenabling a disabled port if the timer count has not reached its timeout value. Either wait until it reaches the timeout or disable SLPP Guard for that port and then re-enable it.

## Procedure

1. In the navigation pane, expand the **Configuration > VLAN** folders.
2. Click **SLPP**.
3. Click the **SLPP Guard** tab.

4. In the port row, double-click the cell in the **Enabled** column.
5. Select true from the drop-down list to enable SLPP Guard, or false to disable SLPP Guard for the port.
6. (Optional) In the port row, double-click the cell in the **Timeout** column.
7. (Optional) Type a value in the **Timeout** field.
8. Click **Apply**.
9. On the toolbar, click **Refresh** to update the work area data display.

### Viewing SLPP Guard status

View current SLPP Guard settings.

#### Procedure

1. In the navigation pane, expand the **Configuration > VLAN** folders.
2. Click **SLPP**.
3. Click the **SLPP Guard** tab.

### SLPP Guard Ethernet type field descriptions

Use the data in the following table to use the **SLPP Guard** tab.

Name	Description
<b>IfIndex</b>	Specifies the port on which to configure SLPP Guard.
<b>Enable</b>	Enables (true) or disables (false) SLPP Guard for the port. The default is disabled.
<b>Timeout</b>	Specifies the time period, in seconds, for which SLPP Guard disables the port. After the timeout period expires, the switch re-enables the port. The timeout value can be 0 or a value ranging from 10 to 65535. With a value of 0, the port remains disabled until it is manually re-enabled. The default Timeout value is 60 seconds.
<b>Status</b>	Displays the SLPP Guard status for the port.
<b>TimerCount</b>	Indicates the time, in seconds, that elapses after SLPP Guard disables a port. When the TimerCount value equals the Timeout value, the switch re-enables the port.

## MLT configuration examples

This chapter contains configuration examples for configuring MultiLink Trunking (MLT) and MLT with Link Aggregation Control Protocol (LACP) using the Command Line Interface (CLI).

#### Note

Examples and network illustrations in this document may illustrate only one of the supported platforms. Unless otherwise noted, the concept illustrated applies to all supported platforms.

## MultiLink Trunking

This configuration example shows you how to create a multilink trunk and a Virtual Local Area Network (VLAN) between two switches.

The following illustration shows you an MLT within a VLAN used to carry user traffic.

**Figure 190: MLT within a VLAN**

*Switch A and B configuration*

Configure MLT 10 on VLAN 100 on each device.

```
#
MLT CONFIGURATION
#

mlt 10 enable
interface mlt 10
exit
#
VLAN CONFIGURATION
#
vlan create 100 name VLAN-MLT-10 type port-mstpvrstp 0 color 1
vlan mlt 100 10
vlan members 100 1/1-1/4 portmember
```

## MultiLink Trunking with Link Aggregation Control Protocol

This configuration example shows you how to configure and enable a multilink trunk with LACP.

You must configure all aggregatable ports to use the same aggregator key so they can form an MLT.

The following illustration shows you an MLT created with LACP within a VLAN used to carry user traffic.

**Figure 191: MLT within a VLAN**

The following procedures show you how to configure both switches.

*Switch A and B configuration*

Configure the two devices to connect with MLT with LACP.

```
#
MLT CONFIGURATION
#
```

```
mlt 10 enable
interface mlt 10
lACP enable key 10
exit
#
VLAN CONFIGURATION
#
vlan create 100 name VLAN-MLT-10" type port-mstprstp 0 color 1
vlan mlt 100 1
vlan mlt 100 10
vlan members 100 1/1-1/4 portmember

#
PORT CONFIGURATION - PHASE II
#

interface GigabitEthernet 1/1
lACP key 10 aggregation enable
lACP enable
exit
interface GigabitEthernet 1/2
lACP key 10 aggregation enable
lACP enable
exit
```

## MLT network topology and configuration reference

The following reference information contains examples of MLT network topology and configuration. The same topologies apply to MLT with LACP.

### Note

Examples and network illustrations in this document may illustrate only one of the supported platforms. Unless otherwise noted, the concept illustrated applies to all supported platforms.

### Example 1: Switch-to-switch MLT

The following illustration shows two multilink trunks (MLT1 and MLT2) connecting three switches.

**Figure 192: Switch-to-switch multilink trunks configuration**

In this example, you can configure each trunk with multiple switch ports to increase bandwidth and redundancy. If traffic between switch-to-switch connections approaches single port bandwidth limitations, you can create a multilink trunk to supply the additional bandwidth required to improve performance, as well as providing physical link layer redundancy.

## Example 2: Switch-to-server MLT

In this example, File server 1 uses dual MAC addresses, with one MAC address for each Network Interface Card (NIC). No multilink trunk is configured on File server 1. File server 2 is a single MAC server (with a four-port NIC) configured as multilink trunk configuration MLT1.

The following illustration shows a typical switch-to-server multilink trunk configuration.

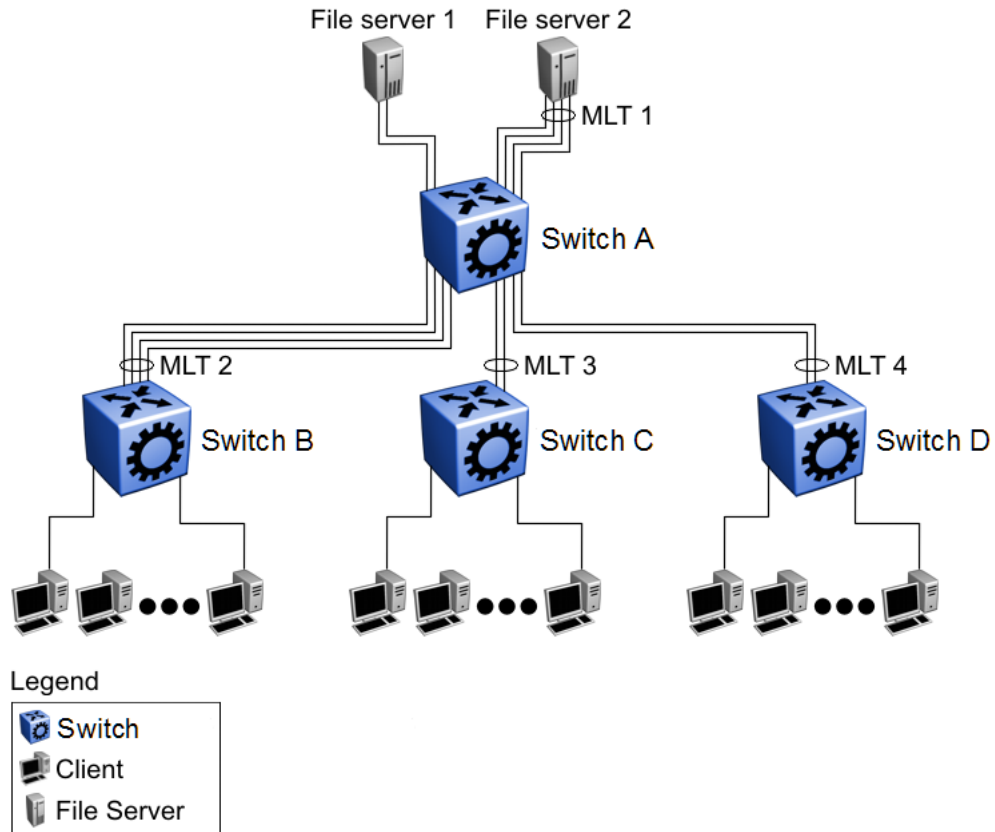

**Figure 193: Switch-to-server multilink trunk configuration**

In this example, one port on File server 1 is blocked and unused and File server 2 benefits from aggregated bandwidth on multilink trunk T1.

### Example 3: Client/Server MLT

In this example, both servers are connected directly to the switch. File server 2 is connected through multilink trunk MLT 1. The switch-to-switch connections are through MLT 2, MLT 3, and MLT 4. Clients access data from the servers (File server 1 and File server 2) and receive maximized bandwidth through MLT 1, MLT 2, MLT 3, and MLT 4.

The following illustration shows how you can use multilink trunks in a client/server configuration.

**Figure 194: Client/server multilink trunk configuration**

# Network Operating System Personalities

[Network Operating System Personality Configuration using CLI on page 2305](#)

**Table 260: Network operating system personality product support**

Feature	Product	Release introduced
For configuration details, see <a href="#">VOSS User Guide</a> .		
Dual-boot personalities	5520 Series	VOSS 8.2.5
	VSP 4450 Series	Not Supported
	VSP 4900 Series	Not Supported
	VSP 7200 Series	Not Supported
	VSP 7400 Series	Not Supported
	VSP 8200 Series	Not Supported
	VSP 8400 Series	Not Supported
	VSP 8600 Series	Not Supported
	XA1400 Series	Not Supported

Extreme Networks offers universal hardware products that support more than one Network Operating System (NOS) personality. These hardware products ship with a default NOS personality but you can select a non-default personality. After you log in using the default NOS username and password for the first time, you can respond to an initialization question to change the NOS personality.

The following table identifies universal hardware products capable of running VOSS and indicates the default NOS personality.

**Table 261: Universal hardware with VOSS support**

Product	NOS support	Documentation
5520 Series	ExtremeXOS (default) VOSS	<ul style="list-style-type: none"> <li><a href="#">ExtremeSwitching 5520 Series Quick Reference</a></li> <li><a href="#">ExtremeSwitching 5520 Series Hardware Installation Guide</a></li> </ul>

---

## Network Operating System Selection

---

The primary method to select a NOS personality is by using ExtremeCloud IQ or Extreme Management Center. To select a NOS personality using ExtremeCloud IQ, see [Read Me First – Universal Hardware](#). If the network is not accessible, or if you do not use Extreme Networks management software, you can also change the NOS personality manually by using CLI commands in the running NOS.

The procedure in this document includes the commands you use if the personality is VOSS and you need to change the NOS personality manually. To change the personality to VOSS, see the documentation for the running NOS.

---

## VOSS Default Behavior

---

The following list provides details about the default behavior after you deploy a universal hardware product with the VOSS personality:

- Port behavior:
  - All ports are isolated members of private VLAN 4040 and 4049.
  - The Segmented Management Instance Management VLAN and Management OOB interfaces are enabled.
  - All ports are administratively enabled.
  - To provide loop protection, no switching occurs between ports.
- DHCP:
  - DHCP client requests are cycled between In-Band, all ports untagged, and Out-of-Band ports.
- DNS:
  - The DHCP client issues a DNS query on the interface selected by Zero Touch Deployment to look for ExtremeCloud IQ. For information about Zero Touch Deployment, see [Zero Touch Deployment](#) on page 40.
  - You can then use ExtremeCloud IQ to upgrade or change the switch configuration. If you do not use ExtremeCloud IQ, you can use Extreme Management Center or on-switch VOSS user interfaces.

---

## Network Operating System Personality Configuration using CLI

---

### Change the Network Operating System Personality

Use this procedure on a VOSS switch to change the Network Operating System (NOS) personality.

The primary method to select a NOS personality for the switch is by using ExtremeCloud IQ. If the network is not accessible, or if you do not use Extreme Networks management software, you can change the NOS personality by using VOSS CLI commands.

#### **Before You Begin**

Use FTP to transfer the NOS image to the `/inf1ash/` directory in the VOSS file system.

## About This Task

If you change the NOS personality, the system deletes all configuration, licensing, and log files that pertain to the previous NOS personality.

If a power interruption occurs during a personality change, the system restarts the process after you restore power to the switch.

As part of the NOS personality change, you must restart the switch. If, during the restart, the system detects a failure, the NOS personality does not change. After the original NOS restarts, it logs an error message and raises a persistent alarm.

## Procedure

1. Enter Privileged EXEC mode:  

```
enable
```
2. Unpack the NOS image:  

```
software add WORD<1-99>
```
3. Install the NOS image:  

```
software activate WORD<1-99>
```
4. Confirm you want to change the NOS personality by entering `Y`.
5. Confirm the new image has been added and will become active after the next restart:  

```
show software
```

### Important

If you decide not to change the NOS personality, before you restart the switch, you can run the **software activate** command again with the primary release as the image name and the system cancels the NOS personality change.

6. Restart the switch.

## Example

Change the NOS personality to ExtremeXOS.

```
5520-24W-VOSS:1>enable
5520-24W-VOSS:1#software add summit_arm-31.1.0.540.xos
EXOS image validated successfully
Adding EXOS software - /intflash/summit_arm-31.1.0.540.xos
Extraction of /intflash/summit_arm-31.1.0.540.xos to /intflash/release/
summit_arm-31.1.0.540.xos successful
5520-24W-VOSS:1#show software
=====
 software releases in /intflash/release/
=====
summit_arm-31.1.0.540.xos
5520.v8.2.5int030 (Primary Release)

Auto Commit : enabled
Commit Timeout : 10 minutes
5520-24W-VOSS:1#software activate summit_arm-31.1.0.540.xos
Executing software activate for version summit_arm-31.1.0.540.xos.
Validated EXOS software
WARNING: The specified image is for the EXOS Network Operating System and the VOSS
Network Operating System
```

```
is currently running.
If you continue, all data including configurations, logs and debugs will be cleared,
except for the license activation
status. EXOS will be installed and VOSS image files will be removed. Do you want to
continue (y/n) ?y
```

### Variable Definitions

The following table defines parameters for the **software** command.

Variable	Value
<code>activate WORD&lt;1-99&gt;</code>	Specifies the software version to copy to the boot flash file.
<code>add WORD&lt;1-99&gt;</code>	Specifies the software version to unpack.

**Note**

DEMO FEATURE - NTPv4 Master Mode and Restrict is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information, see [VOSS Feature Support Matrix](#).

The following sections provide information on NTPv3 and NTPv4. If your platform supports both versions, the default is NTPv3.

### Important

For NTPv4:

- The switch can operate as both NTPv4 client and NTPv4 server.
- The server selection algorithm can deem a server to be unfit to sync even though there is connectivity.
- It can take several iterations (intervals) for the server to sync.
- You need to configure a Segmented Management Instance on applicable switches before you use NTPv4.

## NTP fundamentals

---

This section provides conceptual material about the Network Time Protocol (NTP). Review this content before you make changes to the NTP configuration.

### NTP Overview

NTP synchronizes the internal clocks of various network devices across large, diverse networks to universal standard time. NTP protocol runs over the User Datagram Protocol (UDP), which in turn runs over IP.

The NTPv3 specification is documented in RFC 1305 and supports IPv4 addresses.

### Note

NTPv3 is only supported on VSP 8600 Series.

The NTPv4 specification is documented in RFC 5905 and supports both IPv4 and IPv6 addresses.

Every network device relies on an internal system clock to maintain accurate time. On local devices, the internal system clock is typically manually set to within a minute or two of the actual time and is rarely reset at regular intervals. Many local clocks are battery-backed devices that use room temperature clock oscillators that can drift as much as several seconds each day. NTP adjusts the time of the devices so that they synchronize within a millisecond (ms) on LANs and up to a few tens of milliseconds on WANs relative to Coordinated Universal Time (UTC).

The NTP client on the switch supports only unicast client mode. In this mode, the NTP client sends NTP time requests to other remote time servers in an asynchronous fashion. The NTP client collects four samples of time from each remote time server. A clock selection algorithm determines the best server among the selected samples based on stratum, delay, dispersion and the last updated time of the remote server. The real time clock (RTC) is adjusted to the selected sample from the chosen server.

### *NTP Terms*

A peer is a device that runs NTP software. However, this implementation of NTP refers to peers as remote time servers that provide time information to other time servers on the network and to the local NTP client. An NTP client refers to the local network device, the switch, that accepts time information from other remote time servers.

## NTP system implementation model

NTP is based on a hierarchical model that consists of a local NTP client that runs on the switch and on remote time servers. The NTP client requests and receives time information from one or more remote time servers. The local NTP client reviews the time information from all available time servers and synchronizes its internal clock to the time server whose time is most accurate. The NTP client does not forward time information to other devices that run NTP.

Two types of time servers exist in the NTP model: primary time servers and secondary time servers. A primary time server is directly synchronized to a primary reference source, usually a wire or radio clock that is synchronized to a radio station that provides a standard time service. The primary time server is the authoritative time source in the hierarchy, meaning that it is the one true time source to which the other NTP devices in the subnet synchronize their internal clocks.

A secondary time server uses a primary time server or one or more secondary time servers to synchronize its time, forming a synchronization subnet. A synchronization subnet is a self-organizing, hierarchical master-backup configuration with the primary servers at the root and secondary servers of decreasing accuracy at successive levels.

The following figure shows NTP time servers forming a synchronization subnet.

**Figure 195: NTP time servers forming a synchronization subnet**

In the NTP model, the synchronization subnet reconfigures in a hierarchical primary-secondary configuration to produce accurate and reliable time, even if one or more primary time servers or the path between them fails. This feature applies in a case in which all the primary servers on a partitioned subnet fail, but one or more backup primary servers continue to operate. If all of the primary time servers in the subnet fail, the remaining secondary servers synchronize among themselves.

## Time distribution within a subnet

NTP distributes time through a hierarchy of primary and secondary servers, with each server adopting a stratum, see [NTP system implementation model](#) on page 2311. A stratum defines how many NTP hops away a particular secondary time server is from an authoritative time source (primary time server) in the synchronization subnet. A stratum 1 time server is located at the top of the hierarchy and is directly attached to an external time source, typically a wire or radio clock; a stratum 2 time server receives its

time through NTP from a stratum 1 time server; a stratum 3 time server receives its time through NTP from a stratum 2 time server, and so forth.

Each NTP client in the synchronization subnet chooses as its time source the server with the lowest stratum number with which it is configured to communicate through NTP. This strategy effectively builds a self-organizing tree of NTP speakers. The number of strata is limited to 15 to avoid long synchronization loops.

NTP avoids synchronizing to a remote time server with inaccurate time. NTP never synchronizes to a remote time server that is not itself synchronized. NTP compares the times reported by several remote time servers.

## Synchronization

Unlike other time synchronization protocols, NTP does not attempt to synchronize the internal clocks of the remote time servers to each other. Rather, NTP synchronizes the clocks to universal standard time, using the best available time source and transmission paths to that time source.

Use the **show NTP statistics** command to verify the NTP synchronization status. NTP uses the following criteria to determine the best available time server:

- The time server with the lowest stratum.
- The time server closest in proximity to the primary time server (reduces network delays).
- The time server that offers the highest claimed precision.

NTP accesses several (at least three) servers at the lower stratum level because it can apply an agreement algorithm to detect a problem on the time source.

## NTP Modes of Operation

NTP uses unicast client mode to enable time servers and NTP clients to communicate in the synchronization subnet. The switch supports only unicast client mode.

After you configure a set of remote time servers (peers), NTP creates a list that includes each time server IP address. The NTP client uses this list to determine the remote time servers to query for time information.

After the NTP client queries the remote time servers, the servers respond with various timestamps, along with information about their clocks, such as stratum, precision, and time reference. The NTP client reviews the list of responses from all available servers and chooses one as the best available time source from which to synchronize its internal clock.

The following figure shows how NTP time servers operate in unicast mode.

**Figure 196: NTP Time Servers Operating in Unicast Client Mode**

#### *NTP Master Mode*

#### Note

DEMO FEATURE - NTPv4 Master Mode is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

The switch can operate as both an NTPv4 client and an NTPv4 server. You can configure the NTPv4 server by enabling the master mode. When the master mode is configured, peers can synchronize themselves with the local clock when the NTPv4 server loses synchronization or if an external NTPv4 source is not reachable. For information about configuring NTPv4 server master mode, see [Configuring NTP Master Mode](#) on page 2321 and [Configure NTP Globally](#) on page 2326.

#### *NTP Restrict*

#### Note

DEMO FEATURE - NTPv4 Restrict is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

The switch offers the restrict capability on the NTPv4 server. When the NTPv4 server master mode is disabled, the restrict capabilities are disabled by default. All IPv4 or IPv6 addresses or networks except for those addresses configured as servers are ignored. For addresses configured as servers, traffic is allowed but there are some default restriction values.

When the NTPv4 server master mode is enabled, there are no restrict rules configured, which means all connections are allowed or there are one or multiple rules configured and only those addresses or

networks with the configured rules are allowed. For more information about creating NTP restrict entries, see [Creating NTP Restrict Entries](#) on page 2322.

## NTP authentication

You can authenticate time synchronization to ensure that the local time server obtains its time services only from known sources. NTP authentication adds a level of security to your NTP configuration. By default, network time synchronization is not authenticated.

If you select authentication, the switch uses the Message Digest 5 (MD5) or the Secure Hash Algorithm 1 (SHA1) algorithm to produce a message digest of the key. The message digest is created using the key and the message, but the key itself is not sent. Depending on which algorithm you select, the MD5 or SHA1 algorithm verifies the integrity of the communication, authenticates the origin, and checks for timeliness.

To authenticate the message, the client authentication key must match that of the time server. Therefore, you must securely distribute the authentication key in advance (the client administrator must obtain the key from the server administrator and configure it on the client).

While a server can know many keys (identified by many key IDs), it is possible to declare only a subset of these as trusted. The time server uses this feature to share keys with a client that requires authenticated time and that trusts the server, but that is not trusted by the time server.

## Configuring NTP Using CLI

This section describes how to configure the Network Time Protocol (NTP) using Command Line Interface (CLI).

Before you configure NTP, you must perform the following tasks:

- NTPv3 does not use the Segmented Management Instance. For NTPv3, configure a traditional IP interface on the switch and ensure that the NTP server is reachable through this interface.

### Note

NTPv3 is only supported on VSP 8600 Series.

- For NTPv4, you must create a Segmented Management Instance and configure routing for that instance.

### Important

NTP server MD5 authentication or SHA1 authentication does not support passwords (keys) that start with a special character or that contain a space between characters.

The following task flow diagram shows the sequence of procedures you perform to configure NTP.

Figure 197: NTP Configuration Procedures

## Configure the NTP Version

### Note

This procedure only applies to VSP 8600 Series.

Configure the switch to use NTPv3 or NTPv4. The default is NTPv3.

### Before You Begin

You must globally disable NTP before you change the version.

### About This Task

NTPv3 supports IPv4 addresses. NTPv4 supports both IPv4 and IPv6 addresses.

### Procedure

1. Enter Global Configuration mode:  
`enable`  
`configure terminal`
2. Configure the version:  
`ntp version <3 | 4>`

## Enable NTP Globally

Enable NTP globally. Default values are in effect for most parameters. You can customize NTP by modifying parameters.

### Procedure

1. Enter Global Configuration mode:  
`enable`  
`configure terminal`
2. (Optional) Configure the NTP interval time (between successive NTP updates):  
`ntp interval <1-2185>`

OR

- `ntp interval <4-17>`
3. Enable NTP globally:  
`ntp`
4. Confirm the global configuration:  
`show ntp`

### Example

Specify the time interval between NTP updates, and then enable NTP globally.

```
Switch:1>enable
Switch:1#configure terminal
```

```
Switch:1(config)#ntp interval 10
Switch:1(config)#ntp
```

Confirm the configuration:

```
Switch:1(config)#show ntp
```

```
=====
 NTP Master
=====
Version Enabled Stratum

4 False 10
=====

 NTP Client
=====
Version Enabled Interval Last Update Time Synchronized To

3 True 10 Thu Jul 18 08:32:59 2019 EDT 192.0.2.0 (Stratum:2)
=====
```

```
Switch:1(config)#show ntp
```

```
=====
 NTP
=====
Version Enabled Interval Last Update Time Synchronized To

3 True 10
=====
```

### Variable Definitions

The following table defines parameters for the **ntp** command.

Variable	Value
<code>authentication-key &lt;1-65534&gt; WORD&lt;0-20&gt;</code>	Creates an authentication key for MD5 or SHA1 authentication. To configure this option to the default value, use the <b>default</b> operator with the command. The default configuration is to delete the authentication key. NTP server MD5 or SHA1 authentication does not support passwords (keys) that start with a special character or contain a space between characters. <code>WORD&lt;0-20&gt;</code> specifies the secret key.
<code>type &lt;md5   sha1&gt;</code>	Specifies the type of authentication as MD5 or SHA1. The default is MD5 authentication.
<code>interval&lt;1-2185&gt; OR &lt;4-17&gt;</code>  <b>Note:</b> Exception: interval range 1-2185 is supported on VSP 8600 Series only.	<b>VSP 8600 Series:</b> Specifies the time interval between successive NTP updates in minutes. The default for NTPv3 is 15 minutes. The default for NTPv4 is 6 minutes. <b>VOSS switches:</b> Specifies the time interval between successive NTP updates as a power of 2 in seconds. The default for NTPv4 is 2 to the power of 8 seconds.  <b>Note:</b> Exception: NTPv3 is supported on VSP 8600 Series only.  To restore the NTP interval to the default value, use the <b>default ntp interval</b> command.

## Add an NTP Server

Add a remote NTP server to the configuration by specifying its IP address. NTP adds this IP address to a list of servers, which the local NTP client uses to query remote time servers for time information. The list of qualified servers called to is a peer list.

### About This Task

For NTPv3, you can configure a maximum of 10 IPv4 NTP servers.

#### Note

NTPv3 is only supported on VSP 8600 Series.

For NTPv4, this procedure adds the NTP server information to the switch that is acting as an NTP client. You can configure a maximum of 10 IPv4 NTP servers and 10 IPv6 NTP servers.

### Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Add an NTP server:

```
ntp server WORD<0-255>
```

3. Configure additional options for the NTP server:

```
ntp server WORD<0-255> [auth-enable] [authentication-key <0-65534>]
[enable] [source-ip WORD<0-46>]
```

#### Note

The *source-ip* parameter applies only to NTPv3 on VSP 8600 Series.

The NTP server is automatically enabled by default.

4. Confirm the configuration:

```
show ntp server
```

### Example

```
Switch:>enable
Switch:1configure terminal
Switch:1(config)#ntp server 192.0.2.187
```

The output for the **show ntp server** command includes different information for NTPv3 and NTPv4.

For NTPv3:

```
Switch:1(config)#show ntp server
```

```
=====
 NTP Server
=====
Server Ip Enabled Auth Key Id Source IP Auth Type

192.0.2.187 true false 0 0.0.0.0 N/A
```

For NTPv4:

```
Switch:1(config)#show ntp server
```

```
=====
 NTP Server
=====
Server Ip Enabled Auth Key Id Auth Type

192.0.2.187 true false 0 N/A
```

### Variable Definitions

The following table defines parameters for the **ntp server** command.

Variable	Value
<i>auth-enable</i>	Activates MD5 or SHA1 authentication on this NTP server. Without this option, the NTP server will not have any authentication by default.
<i>authentication-key &lt;0-65534&gt;</i>	Specifies the key ID value used to generate the MD5 or SHA1 digest for the NTP server. The default authentication key is 0, which indicates disabled authentication.

Variable	Value
<code>enable</code>	Activates the NTP server. To set this option to the default value, use the default operator with the command.
<code>source-ip WORD&lt;0-46&gt;</code> <b>Note:</b> Exception: only supported on VSP 8600 Series.	Specifies the source IP for the server. If you do not configure this parameter, by default, the source IP entry is initialized to 0.0.0.0. The IP address specified can be any local interface. The <code>source-ip</code> parameter applies only to NTPv3.
<code>WORD&lt;0-255&gt;</code>	Specifies the IPv4 or IPv6 address of the NTP server.

## Configuring Authentication Keys

### About This Task

Configure up to 10 NTP authentication keys to use MD5 or SHA1 authentication.

### Procedure

1. Enter Global Configuration mode:  

```
enable
```

```
configure terminal
```
2. Create an authentication key:  

```
ntp authentication-key <1-65534> WORD<0-20> [type <md5|sha1>]
```
3. Enable MD5 or SHA1 authentication for the server:  

```
ntp server WORD<0-255> auth-enable
```
4. Assign an authentication key to the server:  

```
ntp server WORD<0-46> authentication-key <0-65534>
```

#### Note

If you must disable authentication on the server, you must also disable authentication on the switch for example: `no ntp server WORD<0-255> auth-enable`

5. Confirm the configuration:  

```
show ntp key
```

### Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ntp authentication-key 5 SecretKey type md5
Switch:1(config)#ntp server 192.0.2.187 auth-enable
Switch:1(config)#ntp server 192.0.2.187 authentication-key 5
Switch:1(config)#show ntp key
```

```
=====
 NTP Key
=====
```

Key_Id	Key	Type
5	SecretKey	MD5
10	a	SHA1

20	abcdef&^%#1112	MD5
30	1234567abcdtest	SHA1
100	b	MD5

### Variable Definitions

The following table defines parameters for the **ntp** and **ntp server** commands.

Variable	Value
<code>auth-enable</code>	Activates MD5 or SHA1 authentication on this NTP server. The default is no authentication. To set this option to the default value, use the <b>default</b> operator with the command.
<code>authentication-key &lt;1-65534&gt; WORD&lt;0-20&gt;</code>	Creates an authentication key for MD5 or SHA1 authentication. To set this option to the default value, use the <b>default</b> operator with the command. The default configuration is to delete the authentication key.
<code>authentication-key &lt;0-65534&gt;</code>	Specifies the key ID value used to generate the MD5 or SHA1 digest for the NTPv4 server. The default value is 0, which indicates disabled authentication. To set this option to the default value, use the <b>default</b> operator with the command.
<code>type &lt;md5 sha1&gt;</code>	Specifies the type of authentication, whether MD5 or SHA1. The default is MD5 authentication.
<code>WORD&lt;0-255&gt;</code>	Specifies the IPv4 or IPv6 address of the server.

## Configuring NTP Master Mode

### About This Task

#### Note

DEMO FEATURE - NTPv4 Master Mode is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Perform the following procedure to set the switch to act as the Network Time Protocol (NTP) server, which means it will run in the master mode. The default value is disabled. You can also enable NTP master mode for a specific stratum.

### Procedure

1. Enter Global Configuration mode:
 

```
enable

configure terminal
```
2. Enable NTP master:
 

```
ntp master
```
3. (Optional) Configure NTP master for a specific stratum:
 

```
ntp master <1-16>
```

4. Verify the configuration:

```
show ntp
```

**Example**

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ntp master
Switch:1(config)#show ntp
=====
 NTP Master
=====
Version Enabled Stratum

4 True 11
=====
 NTP Client
=====
Version Enabled Interval Last Update Time Synchronized To

3 False 60
```

*Variable Definitions*

The following table defines parameters for the **ntp master** command:

Variable	Value
<1-16>	Specifies a stratum value. The default value is 10.  <b>Note:</b> If there is a better stratum available, it is preferred than what is configured.

**Creating NTP Restrict Entries**

**Note**

DEMO FEATURE - NTPv4 Restrict is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Perform the following procedure to configure the NTP restrict capability for a specific IPv4 or IPv6 address(es), which means the switch permits NTP traffic flow from the specified IP addresses only. By default the NTP restrict capability is disabled.

**Note**

- You can configure a maximum of 128 NTP Restrict entries (IPv4 or IPv6 addresses).
- 0.0.0.0/0 or ::/0 NTP restrict entries are equivalent to no NTP restrict rules configured.

**Procedure**

1. Enter Global Configuration mode:  
enable  
  
configure terminal
2. Configure a specific NTP restrict IP address:  
ntp restrict WORD<0-255>
3. Verify the restricted IP address:  
show ntp restrict

**Example**

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ntp restrict 192.0.0.0
Switch:1(config)#show ntp restrict
=====
 NTP Restrict Information
=====
TYPE ADDRESS MASK/PREFIX LEN

IPv4 192.0.0.0 23
=====
```

*Variable Definitions*

The following table defines parameters for the **ntp restrict** command:

Variable	Value
WORD<0-255>	Specifies the IPv4 or IPv6 address.  <b>Note:</b> You can configure a maximum of 128 IPv4 and IPv6 addresses in the NTP restrict list.

**Example of NTPv3 Configuration to NTPv4 Migration****Note**

This procedure only applies to VSP 8600 Series.

**Procedure**

1. Configure a Segmented Management Instance.

```
Switch:1(config)#mgmt vlan 10
Switch:1(mgmt:vlan)#ip address 192.0.2.1/24
Switch:1(mgmt:vlan)# enable
```

OR

```
Switch:1(config)#mgmt clip
Switch:1(mgmt:clip)#ip address 198.51.100.1/32
Switch:1(mgmt:clip)#enable
```

2. Configure routing for the Management Instance.

For the VLAN interface, create a static route to reach the NTP server:

```
Switch:1(config)#mgmt vlan
Switch:1(mgmt:vlan)#ip route 203.0.113.1/24 next-hop 192.0.2.2
```

OR for the CLIP interface:

```
Switch:1(config)#router ospf
Switch:1(config-ospf)#redistribute direct
Switch:1(config-ospf)#redistribute direct enable
Switch:1(config-ospf)#exit
Switch:1(config)#ip ospf apply redistribute direct
```

3. Verify connectivity between the Management Instance and the NTPv4 server.

```
Switch:1(config)#ping 203.0.113.1 mgmt
```

4. Disable NTP globally.

```
Switch:1(config)#no ntp
```

5. Change the NTP version.

```
Switch:1(config)#ntp version 4
```

6. Enable NTP globally.

```
Switch:1(config)#ntp
```

7. Enable NTP master.

```
Switch:1(config)#ntp master
```

## Configuring NTP Using EDM

This section describes how to configure the Network Time Protocol (NTP) using Enterprise Device Manager (EDM).

Before you configure NTP, you must perform the following tasks:

- NTPv3 does not use the Segmented Management Instance. For NTPv3, configure a traditional IP interface on the switch and ensure that the NTP server is reachable through this interface.

### Note

NTPv3 is only supported on VSP 8600 Series.

- For NTPv4, you must create a Segmented Management Instance and configure routing for that instance.

### Important

NTP server MD5 authentication or SHA1 authentication does not support passwords (keys) that start with a special character or that contain a space between characters.

This task flow shows you the sequence of procedures you perform to configure NTP.

Figure 198: NTP Configuration Procedures

## Configure NTP Globally

### Note

DEMO FEATURE - NTPv4 Master Mode is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

You can use the following procedure to globally enable NTP. For the VSP 8600 Series, you can configure the NTP version.

You can also enable master mode on the NTP server configured on the switch. When the master mode is configured, peers can synchronize themselves with the local clock when the NTP server loses synchronization or if an external NTP source is not reachable.

### Before You Begin

You must globally disable NTP before you change the version.

### About This Task

NTPv3 supports IPv4 addresses. NTPv4 supports both IPv4 and IPv6 addresses.

### Procedure

1. In the navigation pane, expand **Configuration** > **Edit** > **NTP**.
2. Select **General**.
3. Select the **Globals** tab.
4. Select **Enable**.
5. Enter a time interval.

6.  **Note**  
This step only applies to VSP 8600 Series.

Select the NTP version.

7. (Optional) To configure the switch as an NTP server, in the **NTP Master** section, select **Enable**.
8. In the **Stratum** field, enter a value.
9. Select **Apply**.

### **Globals** Field Descriptions

Use data in the following table to use the **Globals** tab.

**NTP Client** section:

Name	Description
<b>Enable</b>	Enables the client NTP server. By default, NTP is disabled.
<b>Interval</b>  <b>Note:</b> Exception: NTPv3 is only supported on VSP 8600 Series.	<b>VSP 8600 Series:</b> Specifies the time interval between successive NTP updates in minutes. The default values are: <ul style="list-style-type: none"> <li>• NTPv3: 15 minutes</li> <li>• NTPv4: 6 minutes</li> </ul> <b>VOSS switches:</b> Specifies the time interval between successive NTP updates as a power of 2 in seconds. The default value for NTPv4 is 2 to the power of 8 seconds.
<b>Note:</b> Exception: only supported on VSP 8600 Series.  <b>Version</b>	Configures the NTP version. The default is NTPv3.

**NTP Master** section:

Name	Description
<b>Enable</b>	Enables master mode for the configured NTP server. The default value is disabled.
<b>Stratum</b>	Specifies the stratum for the master NTP server. The default value is 10.  <b>Note:</b> If a better stratum is available, it is preferred over what is configured.

## Add an NTPv3 Server

Add a remote NTP server to the configuration by specifying its IP address. NTP adds this IP address to a list of servers, which the local NTP client uses to query remote time servers for time information. The list of qualified servers called to is a peer list.

**Note**

This procedure is only supported on VSP 8600 Series.

**About This Task**

For NTPv3, you can configure a maximum of 10 IPv4 NTP servers.

## Procedure

1. In the navigation pane, expand **Configuration > Edit > NTP**.
2. Select **NTPv3**.
3. Select the **Server** tab.
4. Select **Insert**.
5. Specify the IP address of the NTP server.
6. Select **Insert**.

### *Server Field Descriptions*

Use the data in the following table to use the **Server** tab.

Name	Description
<b>ServerAddressType</b>	Specifies the IP address of the remote NTP server.
<b>Enable</b>	Activates or disables the remote NTP server. The default is enabled.
<b>Authentication</b>	Activates or disables MD5 or SHA1 authentication on this NTP server. MD5 or SHA1 produces a message digest of the key. MD5 or SHA1 verifies the integrity of the communication, authenticates the origin, and checks for timeliness. The default is no authentication.
<b>KeyId</b>	Specifies the key ID used to generate the MD5 or SHA1 digest for this NTP server. The default is 0, which indicates that authentication is disabled.
<b>AccessAttempts</b>	Specifies the number of NTP requests sent to this NTP server.
<b>Success</b>	Specifies the number of times this NTP server updated the time.
<b>Failure</b>	Specifies the number of times the client rejected this NTP server while it attempted to update the time.
<b>Stratum</b>	This variable is the stratum of the server.
<b>Version</b>	This variable is the NTP version of the server.
<b>RootDelay</b>	This variable is the root delay of the server.
<b>Precision</b>	This variable is the NTP precision of the server in seconds.
<b>Reachable</b>	This variable is the NTP reachability of the server.
<b>Synchronized</b>	This variable is the status of synchronization with the server.
<b>SourceIpAddr</b>  <b>Note:</b> Exception: only supported on VSP 8600 Series.	Specifies the source IP for the server. If you do not configure a source IP, by default, the entry is initialized to 0.0.0.0. The IP address specified can be any local interface.

## Configure Authentication Keys for NTPv3

Assign an NTP key to use MD5 or SHA1 authentication on the server.

### Note

This procedure is only supported on VSP 8600 Series.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > NTP**.
2. Select **NTPv3**.
3. Select the **Key** tab.
4. Select **Insert**.
5. Specify the secret key.
6. Select **Insert**.

### Key field descriptions

Use the data in the following table to use the **Key** tab.

Name	Description
<b>KeyId</b>	Specifies the key ID that generates the MD5 or SHA1 digest.
<b>KeySecret</b>	Specifies the MD5 or SHA1 key that generates the MD5 or SHA1 digest. You must specify an alphanumeric string.
<b>KeyType</b>	Specifies the type of authentication, whether MD5 or SHA1. The default is MD5 authentication.

## Add an NTPv4 Server

Add a remote NTP server to the configuration by first specifying its IP address. NTP adds this IP address to a list of servers, which the local NTP client uses to query remote time servers for time information. The list of qualified servers called to is a peer list.

### About This Task

For NTPv4, this procedure adds the NTP server information to the switch that is acting as an NTP client. You can configure a maximum of 10 IPv4 NTP servers and 10 IPv6 NTP servers.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > NTP**.
2. Click **NTPv4**.
3. Click the **Server** tab.
4. Click **Insert**.
5. Specify if the IP address is IPv4 or IPv6.
6. Specify the IP address of the NTP server.
7. Click **Insert**.

**Server** field descriptions

Use the data in the following table to use the **Server** tab.

Name	Description
<b>ServerAddressType</b>	Specifies the address type as IPv4 or IPv6.
<b>ServerAddress</b>	Specifies the IP address of the remote NTP server.
<b>Enable</b>	Activates or disables the remote NTP server. The default is enabled.
<b>Authentication</b>	Activates or disables MD5 or SHA1 authentication on this NTP server. MD5 or SHA1 produces a message digest of the key. MD5 or SHA1 verifies the integrity of the communication, authenticates the origin, and checks for timeliness. The default is no authentication.
<b>KeyId</b>	Specifies the key ID used to generate the MD5 or SHA1 digest for this NTP server. The default is 0, which indicates that authentication is disabled.
<b>Stratum</b>	Shows the stratum of the server.
<b>Version</b>	Shows the NTP version of the server.
<b>Broadcast</b>	Shows if broadcast is enabled or disabled
<b>AuthEnabled</b>	Shows if authentication is enabled or disabled
<b>AuthStatus</b>	Shows the authentication status.
<b>Synchronized</b>	Shows the status of synchronization with the server.
<b>Reachable</b>	Shows the NTP reachability status of the server.
<b>RootDelay</b>	Shows the root delay of the server.
<b>RootDisp</b>	Shows the root dispersion of the server.
<b>ServerDelay</b>	Shows the delay of the server.
<b>Dispersion</b>	Shows the dispersion of the server.
<b>Offset</b>	Shows the offset of the server.
<b>Precision</b>	Shows the NTP precision of the server in seconds.
<b>Jitter</b>	Shows the jitter of the server
<b>LastEvent</b>	Shows the last event of the server.

## Configure Authentication Keys for NTPv4

Assign an NTP key to use MD5 or SHA1 authentication on the server.

### Procedure

1. In the navigation pane, expand **Configuration > Edit > NTP**.
2. Click **NTPv4**.
3. Click the **Key** tab.
4. Click **Insert**.
5. Complete the fields.
6. Click **Insert**.

**Key** field descriptions

Use the data in the following table to use the **Key** tab.

Name	Description
<b>KeyId</b>	Specifies the key ID that generates the MD5 or SHA1 digest.
<b>KeySecret</b>	Specifies the MD5 or SHA1 key that generates the MD5 or SHA1 digest. You must specify an alphanumeric string.
<b>KeyType</b>	Specifies the type of authentication as MD5 or SHA1. The default is MD5 authentication.

## Creating NTPv4 Restrict Entries

**Note**

DEMO FEATURE - NTPv4 Restrict is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Perform the following procedure to configure the NTP restrict capability for a specific IPv4 or IPv6 address(es), which means the switch permits traffic flow from the specified IP address only. By default the NTP restrict capability is disabled.

**Note**

- You can configure a maximum of 128 NTP Restrict entries (IPv4 or IPv6 addresses).
- 0.0.0.0/0 or ::/0 NTP restrict entries are equivalent to no NTP restrict rules configured.

**Before You Begin**

You must enable NTPv4 server master mode. For more information, see [Configure NTP Globally](#) on page 2326.

**Procedure**

1. In the Navigation pane, expand **Configuration > Edit > NTP**.
2. Click **Restrict**.
3. Click the **Restrict Info** tab.
4. Click **Insert**.
5. In the **RowIndex** field, enter a value.
6. Select the IP address type.
7. Enter the IPv4 or IPv6 address.
8. Enter the restrict mask value.
9. Click **Insert**.

**Restrict Info** Field Descriptions

Use data in the following table to use the **Restrict Info** tab.

Name	Description
<b>RowIndex</b>	Specifies the NTP Restrict entry.
<b>AddressType</b>	Specifies the NTP Restrict address type.
<b>RestrictAddress</b>	Specifies the NTP address to be restricted.
<b>RestrictMask</b>	Specifies the prefix length of the IPv4 or IPv6 NTP address to be restricted.

## OSPF fundamentals

Use the information in these sections to help you understand Open Shortest Path First (OSPF).

OSPF is an Interior Gateway Protocol (IGP) that distributes routing information between routers that belong to a single autonomous system (AS). Intended for use in large networks, OSPF is a link-state protocol that supports IP subnets, Type of Service (TOS)-based routing, and tagging of externally-derived routing information.

For information about the Border Gateway Protocol (BGP), see [BGP](#) on page 390.

### OSPF overview

In an OSPF network, each router maintains a link-state database that describes the topology of the AS. The database contains the local state for each router in the AS, including its usable interfaces and

reachable neighbors. Each router periodically checks for changes in its local state and shares detected changes by flooding link-state advertisements (LSA) throughout the AS. Routers synchronize their topological databases based on the sharing of information from LSAs.

From the topological database, each router constructs a shortest-path tree, with itself as the root. The shortest-path tree provides the optimal route to each destination in the AS. Routing information from outside the AS appears on the tree as leaves.

OSPF routes IP traffic based on the destination IP address, subnet mask, and IP TOS.

In large networks, OSPF offers the following benefits:

- fast convergence

After network topology changes, OSPF recalculates routes quickly.

- minimal routing protocol traffic

Unlike distance vector routing protocols, such as Routing Information Protocol (RIP), OSPF generates a minimum of routing protocol traffic.

- load sharing

OSPF provides support for Equal Cost Multipath (ECMP) routing. If several equal-cost routes to a destination exist, ECMP distributes traffic equally among them.

- type of service

OSPF can calculate separate routes for each IP TOS.

## OSPFv3

The Open Shortest Path First Protocol (OSPF) for IPv6, defined in RFC 2740 and RFC 5340, is an Interior Gateway Protocol used to distribute IPv6 routing information within a single Autonomous System (AS).

The IPv4 terms subnet and network are replaced in IPv6 by link. An IPv6 link is a communication medium between nodes at the link layer. You can assign multiple IP subnets (prefixes) to a link. Two IPv6 nodes with common or different prefixes can communicate over a single link.

OSPF for IPv6 operates on each link rather than each subnet as in IPv4. IPv6 makes the following changes to how packets are received and to the contents of network LSAs and hello packets:

- The OSPF packet contains no IPv6 addresses. LSA payloads carried in link state update packets contain IPv6 addresses.
- The following IDs remain at 32-bits and are not assigned IPv6 addresses: area IDs, LSA link state IDs, and OSPF router IDs.
- IPv6 OSPF neighbors use Router IDs to identify neighboring routers on broadcast and nonbroadcast multiaccess (NBMA) networks and for other communication media, point to point.

### *Flooding scope*

LSA flooding scope is generalized in OSPFv3 and coded in the LS type field of the LSA. The following three flooding scopes are available for LSAs:

- Link scope: The LSA is not flooded beyond the local link.

- Area scope: The LSA is flooded in a single OSPF area. Area scope is used in router LSAs, network LSAs, Inter-Area-Prefix-LSAs, Inter-Area-Router LSAs, and Intra-Area-Prefix- LSAs.
- AS scope: The LSA is flooded through the routing domain. AS scope is used for ASexternal- LSAs.

#### *Link-local addresses*

IPv6 uses link-local addresses on a single link. Link-local addresses facilitate features such as neighbor discovery and autoconfiguration. Datagrams with link-local sources are not forwarded. Instead, routers assign link-local unicast addresses from the IPv6 address range.

OSPF for IPv6 does not assign link-local unicast addresses to physical segments attached to a router, it assumes that each router already has link-local unicast addresses assigned. The source for all OSPF packets sent on OSPF physical interfaces is the associated link-local unicast address. Routers learn link-local addresses for all other nodes on links. The nexthop information during packet forwarding includes the learned addresses.

OSPFv3 packets always use link-local addresses as the source and destination, except on a virtual link. All OSPFv3 packets sent over a virtual link use global addresses.

Link LSA is the only OSPF LSA type that includes link-local addresses. Link-local addresses must not be advertised in other LSA types.

#### *Authentication*

OSPFv3 for IPv6 requires the IP authentication header and the IP encapsulating security payload for authentication and security. OSPFv3 does not support the authentication feature from OSPFv2.

#### *Packet format*

OSPFv3 runs directly over IPv6. All other addressing information is absent in OSPF packet headers. OSPFv3 is network-protocol-independent. LSA types contain addressing information.

OSPFv3 implements the following packet changes from OSPFv2:

- The hello packet and database description packet operations fields are expanded to 24 bits.
- The packet header does not include Authentication and AuType fields.
- The interface ID replaces the address information in the hello packet. The Interface ID becomes the network LSA link-state ID, if the router becomes the designated router on the link.
- Router-bit (R-bit) and V6-bit in the options field process router LSAs during Shortest Path First (SPF) calculation. R-bits and V6-bits determine participation in topology distribution. The V6-bit specializes the R-bit. If the V6-bit is clear, the OSPF speaker can participate in the OSPF topology distribution without forwarding IPv6 datagrams. If the R-bit is set and the V6-bit is clear, the OSPF speaker still does not forward IPv6 datagrams, but it can forward IPv4 datagrams.
- The packet header includes the instance ID, which allows multiple OSPF protocol instances on the same link.

#### *R-bit*

Unlike OSPF for IPv4, OSPFv3 for IPv6 supports the R-bit. The R-bit indicates whether the originating node is an active router. If the R-bit is cleared, routes that transit the advertising node cannot be calculated.

For example, if a multi-homed host participates in routing without forwarding non-locally-addressed packets, the R-bit is cleared.

An IPv6-enabled switch can continue to operate as an OSPFv3 neighbor even if you disable IPv6 forwarding on the switch. This behavior differs from IPv4 OSPF, in which the switch drops a neighbor, if IP forwarding on the neighbor is disabled.

### LSAs

OSPFv3 includes link LSAs and Intra-Area-Prefix LSAs.

#### Link LSA

The link LSA uses link flooding scope, not flooded beyond the associated link.

Link LSAs have three purposes:

- to provide the link-local address of the router to all other nodes on the link
- to provide the list of IPv6 prefixes associated with the link
- to allow the router to associate options bits with the network LSA for the link

#### Intra-Area-Prefix LSA

The Intra-Area-Prefix-LSA carries all IPv6 prefix information. In IPv4, this information is in router LSAs and network LSAs.

#### Unknown LSA types

In OSPFv3, unknown LSA types are either stored and flooded as though understood or given link flooding scope. Specific behavior is coded in the LS type field of the header.

#### *Link LSA Suppression*

To decrease unnecessary link LSA generation and flooding for non-broadcast and non-NBMA interfaces, the Link LSA Suppression interface configuration parameter has been added in RFC 5340. If Link LSA Suppression is configured for an interface, and the interface type is not broadcast or NBMA, the originated link LSA may be suppressed. Link LSA suppression is disabled, by default. For more information on configuration see, [Configuring OSPF on a port or VLAN](#) on page 2410.

#### *Stub area*

OSPFv3 retains the concept of stub areas, which minimize link-state databases and routing table sizes.

IPv6 stub areas carry only router LSAs, network LSAs, Inter-Area-Prefix-LSAs, link LSAs, and Intra-Area-Prefix-LSAs.

Unlike IPv4, IPv6 can store LSAs with unrecognized link-state (LS) types or flood them as though they are understood. Rules applied to the stub area prevent the excessive growth of the link-state database. An LSA with an unrecognized link state can be flooded only if the LSA uses area- or link-flooding scope, and the LSA U-bit is 1 throughout stub and NSSA areas.

#### *Stub area*

OSPFv3 retains the concept of stub areas, which minimize link-state databases and routing table sizes.

IPv6 stub areas carry only router LSAs, network LSAs, Inter-Area-Prefix-LSAs, link LSAs, and Intra-Area-Prefix-LSAs.

Unlike IPv4, IPv6 can store LSAs with unrecognized link-state (LS) types or flood them as though they are understood. Rules applied to the stub area prevent the excessive growth of the link-state database. An LSA with an unrecognized link state can be flooded only if the LSA uses area- or link-flooding scope, and the LSA U-bit is 0.

#### *Deprecation of MOSPF for IPV6*

OSPFv3 in RFC 5340 deprecates Multicast Extensions to OSPF (MOSPF) support, and its attendant protocol fields.

#### *NSSA Specification*

RFC 2740 partially specifies this protocol feature, the level of specification was insufficient to implement it. However, RFC 5340 includes an NSSA specification unique to OSPFv3. This specification coupled with NSSA provide sufficient specification for implementation. Current Infinity IPv6 OSPF has full support for NSSA feature and is consistent with the additional specifications in RFC 5340.

#### *Stub Area Unknown LSA Flooding Restriction Deprecated*

In RFC 2740, flooding of unknown LSA was restricted within stub and NSSA areas. Following were the restrictions:

- Unlike IPv4, in IPv6 you can label unrecognized LS types as "Store and flood the LSA, as if type understood". Uncontrolled introduction of such LSAs could cause a stub area's link-state database to grow larger than its component router's capacities
- To guard the above situation, the following rule regarding stub areas has been established:

An LSA whose LS type is unrecognized can be flooded only into a stub area, if both the LSAs have area or link-local flooding scope, and the LSA has U-bit set to 0

Now the above restrictions have been deprecated. OSPFv3 routers flood link and area scope LSAs whose LS type is unrecognized and U-bit is set to 1 throughout stub and NSSA areas. The only backward compatibility issue is that the OSPFv3 routers still supporting the restrictions may not propagate newly defined LSA types.

#### *LSA Options and Prefix Options Updates*

The LSA Options and Prefix Options fields have been updated to reflect recent protocol additions. Specifically, bits related to MOSPF have been deprecated, Options field bits common with OSPFv2 have been reserved, and the DN-bit has been added to the prefix- options.

#### *IPv6 Site-Local Address*

All references to IPv6 site-local addresses have been removed in RFC 5340. Infinity IPv6 OSPF does not contain any reference to IPv6 site-local addresses and is already compliant with RFC 5340 for this.

## Dijkstras algorithm

A separate copy of the OSPF routing algorithm (Dijkstra's algorithm) runs in each area. Routers that connect to multiple areas run multiple copies of the algorithm. The sequence of processes governed by the routing algorithm is as follows:

1. After a router starts, it initializes the OSPF data structures, and then waits for indications from lower-level protocols that the router interfaces are functional.
2. A router then uses the Hello protocol to discover neighbors. On point-to-point and broadcast networks the router dynamically detects neighbors by sending hello packets to the multicast address AllSPFRouters. On Non-Broadcast Multiple Access (NBMA) networks, you must provide some configuration information to discover neighbors.
3. On all multiaccess networks (broadcast or nonbroadcast), the Hello protocol elects a designated router (DR) for the network.
4. The router attempts to form adjacencies with some of its neighbors. On multiaccess networks, the DR determines which routers become adjacent. This behavior does not occur if you configure a router as a passive interface because passive interfaces do not form adjacencies.
5. Adjacent neighbors synchronize their topological databases.
6. The router periodically advertises its link state, and does so after its local state changes. LSAs include information about adjacencies, enabling quick detection of dead routers on the network.
7. LSAs flood throughout the area to ensure that all routers in an area have an identical topological database.
8. From this database each router calculates a shortest-path tree, with itself as the root. This shortest-path tree in turn yields a routing table for the protocol.

## Autonomous system and areas

The AS subdivides into areas that group contiguous networks, routers that connect to these networks, and attached hosts. Each area has a topological database, which is invisible from outside the area. Routers within an area know nothing of the detailed topology of other areas. Subdividing the AS into areas significantly reduces the amount of routing protocol traffic compared to treating the entire AS like a single link-state domain.

You can attach a router to more than one area. When you perform this action, you can maintain a separate topological database for each connected area. Two routers within the same area maintain an identical topological database for that area. Each area uses a unique area ID and the area ID 0.0.0.0 is reserved for the backbone area.

The router routes packets in the AS based on their source and destination addresses. If the source and destination of a packet reside in the same area, the router uses intra-area routing. If the source and destination of a packet reside in different areas, the router uses inter-area routing. Intra-area routing protects the area from bad routing information because it does not use routing information obtained from outside the area. Inter-area routing must pass through the backbone area. For more information about the backbone area, see [Backbone area](#) on page 2340.

In large networks with many routers and networks, the link-state database (LSDB) and routing table can become excessively large. Large route tables and LSDBs consume memory. The processing of link-state advertisements results in additional CPU cycles to make forwarding decisions. To reduce these undesired effects, you can divide an OSPF network into subdomains called areas.

An area comprises a number of OSPF routers that have the same area identification (ID).

By dividing a network into multiple areas, the router maintains a separate LSDB, which consists of router LSAs and network LSAs, for each area. Each router within an area maintains an LSDB only for the area to which it belongs. Area router LSAs and network LSAs do not flood beyond the area borders.

The impact of a topology change is localized to the area in which it occurs. The only exception is for the area border router (ABR), which must maintain an LSDB for each area to which they belong. The area border routers advertise changes in topology to the remainder of the network by advertising summary LSAs.

A 32-bit area ID, expressed in IP address format (x.x.x.x), identifies areas. Area 0 is the backbone area and distributes routing information to all other areas.

If you use multiple areas, they must all attach to the backbone through an ABR, which connects area 0.0.0.0 to the nonbackbone areas. If you cannot physically and directly connect an area through an ABR to area 0, you must configure a virtual link to logically connect the area to the backbone area.

### *Backbone area*

The backbone area consists of the following network types:

- networks and attached routers that do not exist in other areas
- routers that belong to multiple areas

The backbone is usually contiguous but you can create a noncontiguous area by configuring virtual links.

You can configure virtual links between two backbone routers that have an interface to a nonbackbone area. Virtual links belong to the backbone and use intra-area routing only.

The backbone distributes routing information between areas. The topology of the backbone area is invisible to other areas, while it knows nothing of the topology of those areas.

In inter-area routing, a packet travels along three contiguous paths in a point-to-multipoint configuration:

- an intra-area path from the source to an ABR
- a backbone path between the source and destination areas
- another intra-area path to the destination

The OSPF routing algorithm finds the set of paths that has the smallest cost. The topology of the backbone dictates the backbone paths used between areas. OSPF selects inter-area paths by examining the routing table summaries for each connected ABR. The router cannot learn OSPF routes through an ABR unless it connects to the backbone or through a virtual link.

### *Stub area*

Configure a stub area at the edge of the OSPF routing domain. A stub area has only one ABR. A stub area does not receive LSAs for routes outside its area, which reduces the size of its link-state database. A packet destined outside the stub area is routed to the ABR, which examines it before forwarding the packet to the destination. The network behind a passive interface is treated as a stub area and does not form adjacencies. The network is advertised into the OSPF area as an internal route.

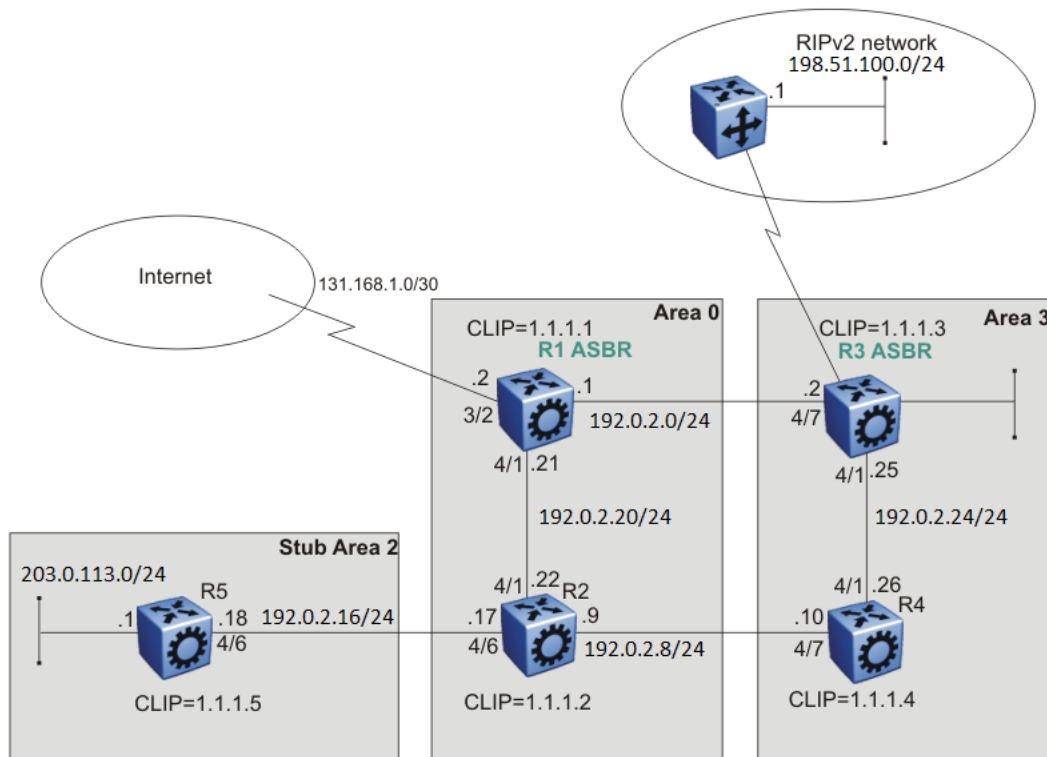

*Not so stubby area*

A not-so-stubby area (NSSA) prevents the flooding of external LSAs into the area by replacing them with a default route. An NSSA can import small stub (non-OSPF) routing domains into OSPF. Like stub areas, NSSAs are at the edge of an OSPF routing domain. Non-OSPF routing domains attach to the NSSAs to form NSSA transit areas. Accessing the addressing scheme of small stub domains permits the NSSA border router to also perform manual aggregation.

In an OSPF NSSA, the NSSA N/P bit notifies the ABR which external routes to advertise to other areas. If the NSSA N/P bit is set (the value is 1), the ABR exports the external route. This configuration is the default. When the NSSA N/P bit is not set (the value is 0), the ABR drops the external route. You can create a route policy to manipulate the N/P bit.

*Multiarea OSPF configuration*

The following figure shows five devices (R1 to R5) in a multi-area configuration.

**Figure 199: Multiarea configuration example**

The following list explains the configuration for devices R1 through R5:

- R1 is an OSPF AS boundary router (ASBR) that is associated with OSPF Area 0 and OSPF Area 3. R1 distributes a default route for Internet traffic.
- R2 is an OSPF stub ABR for OSPF Area 2 and ABR to OSPF Area 3.
- R3 is an OSPF ASBR and distributes OSPF to RIP and RIP to OSPF.
- R4 is an OSPF internal router in Area 3.
- R5 is an internal OSPF subrouter in Area 2.
- All OSPF interfaces are brouter ports except R5.

Network 203.0.113.0/24 on R5 uses a VLAN configuration instead of a brouter port. This example uses brouter ports rather than VLANs because the spanning tree algorithm is disabled by default if you use brouter interfaces.

- All interfaces are Ethernet; therefore, the OSPF interfaces are broadcast, except the circuitless IP (CLIP) interfaces, which are passive.
- The interface priority on R5 is 0; therefore, R5 cannot become a DR.
- Configure the OSPF router priority so that R1 becomes the DR (priority 100) and R2 becomes the backup designated router (BDR) with a priority value of 50.

Use stub or NSSA areas to reduce the LSDB size by excluding external LSAs. The stub ABR advertises a default route into the stub area for all external routes.

## OSPF neighbors

In an OSPF network, two routers that have an interface to the same network are neighbors. Routers use the Hello protocol to discover their neighbors and to maintain neighbor relationships. On a broadcast or point-to-point network, the Hello protocol dynamically discovers neighbors. On an NBMA network, you must manually configure neighbors for the network.

The Hello protocol provides bidirectional communication between neighbors. Periodically, OSPF routers send hello packets over all interfaces. Included in these hello packets is the following information:

- router priority
- router hello timer and dead timer values
- list of routers that sent the router hello packet on this interface
- router choice for DR and backup designated router (BDR)

Bidirectional communication is determined after one router discovers itself listed in the hello packet of its neighbor.

NBMA interfaces whose router priority is a positive, nonzero value are eligible to become DRs for the NBMA network and are configured with a list of all attached routers. The neighbors list includes each neighbor IP address and router priority. In an NBMA network, a router with a priority other than zero is eligible to become the DR for the NBMA network. You must manually configure the IP address, mask, and router priority of neighbors on routers that are eligible to become the DR or BDR for the network.

Log messages indicate when an OSPF neighbor state change occurs. Each log message indicates the previous state and the new state of the OSPF neighbor. The log message generated for system traps also indicates the previous state and the current state of the OSPF neighbor.

Neighbors can form an adjacency to exchange routing information. After two routers form an adjacency, they perform a database exchange process to synchronize their topological databases. After the databases synchronize, the routers are fully adjacent. Adjacency conserves bandwidth because, from this point, the adjacent routers pass only routing change information.

All routers connected by a point-to-point network or a virtual link always form an adjacency. All routers on a broadcast or NBMA network form an adjacency with the DR and the BDR.

In an NBMA network, before the routers elect a DR, the router sends hello packets only to those neighbors eligible to become a DR. The NBMA DR forms adjacencies only with its configured neighbors

and drops all packets from other sources. The neighbor configuration also notifies the router of the expected hello behavior for each neighbor.

If a router receives a hello packet from a neighbor with a priority different from that which is already configured for the neighbor, the router can automatically change the configured priority to match the dynamically learned priority.

## Router types

To limit the amount of routing protocol traffic, the Hello protocol elects a DR and a BDR on each multiaccess network. Instead of neighboring routers forming adjacencies and swapping link-state information, which on a large network can mean significant routing protocol traffic, all routers on the network form adjacencies with the DR and the BDR only, and send link-state information to them. The DR redistributes this information to every other adjacent router.

If the BDR operates in backup mode, it receives link-state information from all routers on the network and listens for acknowledgements. If the DR fails, the BDR can transition quickly to the role of DR because its routing tables are up-to-date.

Routers in an OSPF network can have various roles depending on how you configure them. The following table describes the router types you can configure in an OSPF network.

**Table 265: Router types in an OSPF network**

Router type	Description
AS boundary router	A router that attaches at the edge of an OSPF network is an ASBR. An ASBR generally has one or more interfaces that run an interdomain routing protocol such as Border Gateway Protocol. In addition, a router that distributes static routes or RIP routes into OSPF is an ASBR. The ASBR forwards external routes into the OSPF domain. In this way, routers inside the OSPF network learn about destinations outside their domain.
Area border router	A router that attaches to two or more areas inside an OSPF network is an ABR. ABRs play an important role in OSPF networks by condensing the amount of disseminated OSPF information.
Internal router (IR)	A router that has interfaces only within a single area inside an OSPF network is an IR. Unlike ABRs, IRs have topological information only about the area in which they reside.
Designated router	In a broadcast or NBMA network, the routers elect a single router as the DR for that network. A DR makes sure that all routers on the network synchronize and advertises the network to the rest of the AS.
Backup designated router	A BDR is elected in addition to the DR and, if the DR fails, can assume the DR role quickly.

## OSPF Interfaces

Configure an OSPF interface, or link, on an IP interface. An IP interface can be either a single link (brouter port) or a logical interface configured on a VLAN (multiple ports). The state information

associated with the interface is obtained from the underlying lower-level protocols and the routing protocol itself.

#### Important

To change the interface type of an enabled OSPF interface, you must first disable it, change the type, and then reenale it. For an NBMA interface, you must first delete manually configured neighbors.

OSPF network types allow OSPF-neighboring between routers over various types of network infrastructures. You can configure each interface to support various network types. The following table describes the supported OSPF network interface types:

**Table 266: OSPF Network Types**

Network interface type	Description
<a href="#">Broadcast Interfaces</a> on page 2344	Broadcast interfaces automatically discover every OSPF router on the network by sending OSPF hello packets to the multicast group AllOSPF Routers (224.0.0.5). Neighboring is automatic and requires no configuration.
<a href="#">Non-Broadcast Multiple Access Interfaces</a> on page 2344	The NBMA network type models network environments that do not have native Layer 2 broadcast or multicast capabilities, such as Frame Relay and X.25. OSPF hello packets are unicast to manually configured neighbors.
<a href="#">Passive Interfaces</a> on page 2348	A passive interface is an interfacing network in OSPF that does not generate LSAs or form adjacencies. Use a passive interface on an access network or on an interface used for BGP peering. Using passive interfaces limits the amount of CPU cycles required to perform the OSPF routing algorithm.

#### *Broadcast Interfaces*

Broadcast interfaces support many attached routers and can address a single physical message to all attached broadcast routers (sent to AllOSPF Routers and AllDRouters).

Broadcast interfaces dynamically discover neighboring routers using the OSPF Hello protocol. Each pair of routers on a broadcast network, such as an Ethernet, communicate directly.

#### *Non-Broadcast Multiple Access Interfaces*

An NBMA network interconnects multiple devices through point-to-point links. NBMA does not use broadcast and multicast data transmission.

NBMA interfaces support many routers, but cannot broadcast. NBMA networks perform the following activities:

- statically establish OSPF neighbor relationships

You must establish neighbor relationships because hub-and-spoke Wide Area Network (WAN) topologies do not support any-to-any broadcasting.

- control meshed WAN connections

In contrast to a broadcast network, where some OSPF protocol packets are multicast (sent to AllSPFRouters and AllDRouters), OSPF packets on an NBMA interface are replicated and sent in turn to each neighboring router as unicast. NBMA networks drop all OSPF packets with destination address AllSPFRouters and AllDRouters.

The following figure shows an example of four routers attached to an NBMA subnet. The NBMA segment uses a single IP subnet and each router uses an IP address within the subnet.

**Figure 200: NBMA Subnet**

#### *NBMA Interface Operations and Parameters*

OSPF treats an NBMA network much like it treats a broadcast network. Because many routers attach to the network, the Hello protocol elects a DR to generate the network link-state advertisements.

Because the NBMA network does not broadcast, you must manually configure neighbors for each router eligible to become DR (those networks with a positive, nonzero router priority value). You must also configure a poll interval for the network.

NBMA interfaces with a positive, nonzero router priority can become DR for the NBMA network and contain a list of all attached routers, or neighbors. This neighbors list includes each neighbor IP address and router priority.

The router uses neighbor information both during and after the DR election process. After an interface to a nonbroadcast network with a nonzero priority initializes, and before the Hello protocol elects a DR,

the router sends hello packets only to those neighbors eligible to become DR. After the Hello protocol elects a DR, it forms adjacencies only with its configured neighbors and drops all packets from other sources. This neighbor configuration also notifies the router of the expected hello behavior of each neighbor.

If a router eligible to become the DR receives a hello packet from a neighbor that shows a different priority from that which is already configured for this neighbor, the DR changes the configured priority to match the dynamically learned priority.

Configure an NBMA interface with a poll interval. The poll interval designates the interval at which the router sends hello packets to inactive neighboring routers. The router typically sends hello packets at the Hello interval, for example, every 10 seconds. If a neighboring router becomes inactive, or if the router does not receive hello packets for the established RouterDeadInterval period, the router sends hello packets at the specified poll interval, for example, every 120 seconds.

You must configure a neighbors list for the DR to allow an NBMA network to send hello packets. If the router is eligible to become a DR, it periodically sends hello packets to all neighbors that are also eligible. The effect of this action is that two eligible routers always exchange hello packets, which is necessary for the correct DR election. You can minimize the number of hello packets by minimizing the number of eligible routers on a nonbroadcast network.

After the Hello protocol elects a DR, it sends hello packets to all manually configured neighbors to synchronize their link-state databases, establish itself as the DR, and identify the BDR.

If a router is not eligible to become DR, it periodically sends hello packets to both the DR and the BDR. The router also sends a hello packet in reply to a hello packet received from an eligible neighbor (other than the current DR and BDR). This process establishes an initial bidirectional relationship with a potential DR.

When a router sends hello packets to a neighbor, the neighbor state determines the interval between hello packets. If the neighbor is in the down state, the router sends hello packets at the designated poll interval, for example, every 120 seconds. Otherwise, the router sends hello packets at the designated hello interval, for example, every 10 seconds.

#### *OSPF and NBMA Example: Adjacency Formation*

In an NBMA network, as in a broadcast network, all routers become adjacent to the DR and the BDR. The adjacencies form after you assign the router priorities, configure the neighbors, and the Hello protocol elects the network DR.

The following figure shows an NBMA subnet with router priorities and manually configured neighbors.

**Figure 201: NBMA Subnet Configuration Example**

Because R1 and R2 have a router priority of 0, they are not eligible to become the DR. Also, R1 and R2 do not require configuration of a neighbors list; R1 and R2 discover neighbors dynamically through the Hello protocol.

R3 and R4 both have a positive, nonzero priority and are eligible to become the DR. Manually configure neighbor lists on R3 and R4.

To create this NBMA network, configure the following parameters:

1. On each router: NBMA interface type, poll interval, router priority
2. On R3: R1, R2, and R4 as neighbors
3. On R4: R1, R2, and R3 as neighbors

If all routers start at the same time, the routers perform the following steps:

1. R3 and R4 send each other a hello packet to elect a DR.
2. The Hello protocol elects R3 as the DR, and R4 as the BDR.
3. R3 (DR) and R4 (BDR) send hello packets to all other routers on the NBMA subnet to synchronize their link-state databases and establish themselves as DR and BDR.

4. R1 and R2 reply to R3 and R4.
5. R3 and R4 each form three adjacencies (one with each router on the NBMA subnet).
6. R1 and R2 each form two adjacencies (one with the DR and one with the BDR).

### *Passive Interfaces*

Use a passive interface to enable an interface to advertise into an OSPF domain while limiting its adjacencies.

After you change the interface type to passive, the router advertises the interface into the OSPF domain as an internal stub network with the following behaviors:

- does not send hello packets to the OSPF domain
- does not receive hello packets from the OSPF domain
- does not form adjacencies in the OSPF domain

If you configure an interface as passive, the router advertises it as an OSPF internal route. If the interface is not a passive interface, to advertise a network into OSPF and not form OSPF adjacencies, you must configure the interface as nonOSPF, and the router must redistribute the local network as an autonomous system external (ASE) LSA.

## OSPF and IP

OSPF runs over IP, which means that an OSPF packet transmits with an IP data packet header. The protocol field in the IP header is 89, which identifies it as an OSPF packet and distinguishes it from other packets that use an IP header.

An OSPF route advertisement expresses a destination as an IP address and a variable-length mask. Together, the address and the mask indicate the range of destinations to which the advertisement applies.

Because OSPF can specify a range of networks, it can send one summary advertisement that represents multiple destinations. For example, a summary advertisement for the destination 192.0.2.0 with a mask of 255.255.0.0 describes a single route to destinations 192.0.2.0 to 192.0.2.255.

## OSPF Packets

All OSPF packets start with a 24-octet header that contains information about the OSPF version, the packet type and length, the ID of the router that transmits the packet, and the ID of the OSPF area that sends the packet. An OSPF packet is one of the following types:

- The router transmits hello packets between neighbors and never forwards them. The Hello protocol requires routers to send hello packets to neighbors at predefined hello intervals. A neighbor router that does not receive a hello packet declares the other router dead.
- The router exchanges DD packets after neighboring routers establish a link, which synchronizes their LSDBs.
- Link-state request packets describe one or more link-state advertisements that a router requests from its neighbor. Routers send link-state requests if the information received in DD packets from a neighbor is not consistent with its own link-state database.

- Link-state update packets contain one or more LSAs and the router sends them following a change in network conditions.
- The router sends link-state acknowledgement packets to acknowledge receipt of link-state updates. Link-state acknowledgement packets contain the headers of the received LSAs.

## Intra-area Link-state Advertisements

OSPF does not require each router to send its entire routing table to its neighbors. Instead, each OSPF router floods only link-state change information in the form of LSAs throughout the area or AS. LSAs in OSPF are one of the following five types:

- A router link advertisement is flooded only within the area and contains information about neighbor routers and the LANs to which the router attaches. A backbone router can flood router link advertisements within the backbone area.
- A DR on a LAN generates network links advertisement to list all routers on that LAN, and floods network links advertisements only within the area. A backbone DR can flood network links advertisements within the backbone area.
- An ABR floods a network summary link advertisement into an area and describes networks that are reachable outside the area. An ABR attached to two areas generates a different network summary link advertisement for each area. ABRs also generate area summary link advertisements that contain information about destinations within an area that are flooded to the backbone area.
- An ASBR summary link advertisement describes the cost of the path to an ASBR from the router that generates the advertisement.
- An ASBR sends an ASE link advertisement to describe the cost of the path to a destination outside the AS from the ASBR that generates the advertisement. This information is flooded to all routers in the AS.

## ASE routes

OSPF considers the following routes as ASE routes:

- a route to a destination outside the AS
- a static route
- a default route
- a route derived by RIP
- a directly connected network that does not run OSPF

## OSPF virtual links

On an OSPF network, a switch that acts as an ABR must connect directly to the backbone. If no physical connection is available, you can automatically or manually configure a virtual link.

An automatic virtual link can provide redundancy support for critical network connections. Automatic virtual linking creates virtual paths for vital traffic paths in your OSPF network. If a connection fails on the network, such as after an interface cable that provides connection to the backbone (either directly or indirectly) disconnects from the switch, the virtual link is available to maintain connectivity.

Use automatic virtual linking to ensure that a link is created to another router. If automatic virtual linking uses more resources than you want to expend, creating a manual virtual link can be the better solution. Use this approach to conserve resources and control virtual links in the OSPF configuration.

On the switch, OSPF behavior follows OSPF standards; the router cannot learn OSPF routes through an ABR unless the ABR connects to the backbone or through a virtual link.

The following figure shows how to configure a virtual link between the ABR in area 2.2.2 and the ABR in area 0.0.0.0.

**Figure 202: Virtual link between ABRs through a transit area**

To configure a virtual link between the ABRs in area 1 and area 3, define area 2 as the transit area between the other two areas, and identify R2 as the neighbor router through which R2 must send information to reach the backbone through R1.

## OSPF ASBRs

ASBRs advertise nonOSPF routes into OSPF domains so that they can pass through the OSPF routing domain. A router can function as an ASBR if one or more interfaces connects to a nonOSPF network, for example, RIP, BGP, or Exterior Gateway Protocol (EGP).

An ASBR imports external routes into the OSPF domain by using ASE LSAs (LSA type 5) originated by the ASBR.

ASE LSAs flood across area borders. When an ASBR imports external routes, it imports OSPF route information using external type 1 or type 2 metrics. The result is a four-level routing hierarchy, as shown in the following table, according to routing preference.

**Table 267: ASBR routing hierarchy**

Level	Description
1	Intra-area routing
2	Inter-area routing
3	External type 1 metrics
4	External type 2 metrics

The use of these metrics results in a routing preference from most preferred to least preferred of

- routing within an OSPF area
- routing within the OSPF domain
- routing within the OSPF domain and external routes with external type 1 metrics
- routing within the OSPF domain and external routes with external type 2 metrics

For example, an ASBR can import RIP routes into OSPF with external type 1 metrics. Another ASBR can import Internet routes and advertise a default route with an external type 2 metric. This results in RIP-imported routes that have a higher preference than the Internet-imported default routes. In reality, BGP Internet routes must use external type 2 metrics, whereas RIP imported routes must use external type 1 metrics.

Routes imported into OSPF as external type 1 are from IGP's whose external metric is comparable to OSPF metrics. With external type 1 metrics, OSPF adds the internal cost of the ASBR to the external metric. EGP's, whose metric is not comparable to OSPF metrics, use external type 2 metrics. External type 2 metrics use only the internal OSPF cost to the ASBR in the routing decision.

To conserve resources, you can limit the number of ASBRs in your network or specifically control which routers perform as ASBRs to control traffic flow.

#### *Area link-state advertisements*

The following table explains the seven LSA types exchanged between areas. LSAs share link-state information among routers. LSAs typically contain information about the router and its neighbors. OSPF generates LSAs periodically to ensure connectivity or after a change in state of a router or link (that is, up or down).

**Table 268: OSPF LSA types**

LSA type	Description	Area of distribution
1	A router originates type 1 LSAs (router LSAs) to describe its set of active interfaces and neighbors.	Passed only within the same area
2	Type 2 LSAs (network LSAs) describe a network segment such as broadcast or NBMA. In a broadcast network, the DR originates network LSAs.	Passed only within the same area
3	The ABR originates type 3 LSAs (network-summary LSAs) to describe the networks within an area.	Passed between areas
4	Type 4 LSAs (ASBR-summary LSAs) advertise the location of the ASBRs from area to area.	Passed between areas
5	Type 5 LSAs (ASE LSAs) describe networks outside of the OSPF domain. The ASBR originates type 5 LSAs. In stub and NSSA areas, a single default route replaces type 5 LSA routes.	Passed between areas
6	Type 6 LSAs (group membership LSAs) identify the location of multicast group members in multicast OSPF.	Passed between areas
7	Type 7 LSAs import external routes in OSPF NSSAs.	Translated between areas

## OSPF metrics

For OSPF, the best path to a destination is the path that offers the least-cost metric (least-cost delay). You can configure OSPF cost metrics to specify preferred paths. You can configure metric speed globally or for specific ports and interfaces on the network. In addition, you can control redistribution options between nonOSPF interfaces and OSPF interfaces.

Assign default metric speeds for different port types, such as 10 Mb/s or 1 Mb/s ports. You can specify a new metric speed for an IP interface. An IP interface can be a brouter port or a VLAN.

RFC1583 states the following:

"OSPF supports two types of external metrics. Type 1 external metrics are equivalent to the link state metric. Type 2 external metrics are greater than the cost of path internal to the Autonomous System. Use of Type 2 external metrics assumes that routing between Autonomous Systems is the major cost of routing a packet, and eliminates the need for conversion of external costs to internal link state metrics."

"Both Type 1 and Type 2 external metrics can be present in the Autonomous System at the same time. In that event, Type 1 external metrics always take precedence."

## OSPF security mechanisms

The switch implementation of OSPF includes security mechanisms to prevent unauthorized routers from attacking the OSPF routing domain. These security mechanisms prevent a malicious person from joining an OSPF domain and advertising false information in the OSPF LSAs. Likewise, security prevents a misconfigured router from joining an OSPF domain.

### *Simple password*

The simple password security mechanism is a simple-text password; only routers that contain the same authentication ID in their LSA headers can communicate with each other.

Do not use this security mechanism because the system stores the password in plain text. A user or system can read the password from the configuration file or from the LSA packet.

### *Message Digest 5*

Message Digest 5 (MD5) for OSPF security provides standards-based (RFC1321) authentication using 128-bit encryption, usually expressed as a 32-digit hexadecimal number. When you use MD5 for OSPF security, it is almost impossible for a malicious user to compute or extrapolate the decrypting codes from the OSPF packets.

If you use MD5, each OSPF packet has a message digest appended to it. The digest must match between the sending and receiving routers. Both the sending and receiving routers calculate the message digest based on the MD5 key and padding, and then compare the results. If the message digest computed at the sender and receiver does not match, the receiver rejects the packet.

### *Secure hash algorithm 1*

The secure hash algorithm 1 (SHA-1) is a cryptographic hash function that uses 160-bit encryption, usually given in a 40 digit hexadecimal number. SHA-1 is one of the most widely used of the existing SHA hash functions and is more secure than MD5.

SHA-1 takes a variable length input message and SHA-1 creates a fixed length output message referred to as the hash, or message digest, of the original message. If you use SHA-1 with OSPF, each OSPF packet has a message digest appended to it.

The message digest or hash must match between the sending and receiving routers. If the message digest computed at the sender and receiver does not match, the receiver rejects the packet. The hash functions produce a type of checksum or summary of the input.

It is almost impossible to determine the original input message based on the output hash message.

A cryptographic hash function is fully defined and uses no secret key.

#### *Secure hash algorithm 2*

Secure hash algorithm 2 (SHA-2) is also a cryptographic hash function. SHA-2 updates SHA-1 and offers six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits message digest size values. Output size depends on the hash function, so, for instance, SHA-256 is 256 bits.

SHA-2 is more secure than SHA-1 and MD5.

SHA-2 works similarly to SHA-1, in that SHA-2 takes a variable length input message and creates a fixed length output message referred to as the hash, or message digest, of the original message. If you use SHA-2 with OSPF, each OSPF packet has a message digest appended to it. Among the differences in SHA-2 from SHA-1 are an increased bit encryption length.

Similarly with other hash functions, for SHA-2, the message digest or hash must match between the sending and receiving routers. If the message digest computed at the sender and receiver does not match, the receiver rejects the packet. The hash functions produce a type of checksum or summary of the input.

## IPsec Support with OSPFv3

You can use Internet Protocol Security (IPsec) with OSPFv3 virtual link for the security protection of communication between the end points. You can also use IPsec with OSPFv3 on a brouter port or VLAN interface, for example, if you want to encrypt OSPFv3 control traffic on a broadcast network.

OSPF virtual link provides connectivity to the OSPF backbone area for redundancy or to provide a virtual link if a physical connection is not possible.

Because the device does not know the IPv6 addresses of the OSPFv3 virtual link end points at the time of configuration, you cannot manually configure the security policy ahead of time. The system must self-manage its security policy dynamically. The device also dynamically manages the IPsec enable flag, which the virtual link uses on a Layer 2 interface, either a VLAN or brouter port interface.

The following events can trigger an IPsec policy activation:

1. An OSPFv3 routing module detects the establishment of a virtual link.
2. IPsec is enabled on the already established virtual link.

On the other hand, the following two events can dynamically trigger an IPsec policy deactivation:

1. The virtual link is turn down.

2. IPsec is disabled on the virtual link.

IPsec policies can also change dynamically if a neighbor address or a local address changes.

You can enable IPsec support for IPv6 OSPF virtual link at the system level through CLI. You must disable IPsec before you can perform virtual link policy configuration changes.

Until you enable IPsec on both sides of the virtual links, the links cannot exchange OSPFv3 control messages, and the system drops OSPFv3 exchange packets.

You can configure the direction you want IPsec to protect, either, ingress, egress, or both. In addition, you can permit or drop communication for the OSPF virtual link.

You can also use IPsec with OSPFv3 on a brouter port or VLAN interface. For a full configuration example, see [OSPFv3 IPsec configuration example](#) on page 1728 and [OSPFv3 virtual link IPsec configuration example](#) on page 1735.

## OSPF and route redistribution

Redistribution imports routes from one protocol to another. Redistribution sends route updates for a protocol-based route through another protocol. For example, if OSPF routes exist in a router and they must travel through a BGP network, then configure redistribution of OSPF routes through BGP. This configuration sends OSPF routes to a router that uses BGP.

You can redistribute routes

- on an interface basis
- on a global basis between protocols on a single VRF instance (intraVRF)
- between the same or different protocols on different VRF instances (interVRF)

To configure interface-based redistribution, configure a route policy, and then apply it to the interface. Configure the match parameter to the protocol from which to learn routes.

Use the **ip ospf redistribute** command to accomplish the (intraVRF) redistribution of routes through OSPF, so that OSPF redistribution occurs globally on all OSPF-enabled interfaces. This redistribution does not require a route policy, but you can use one for more control.

### Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

### *OSPF route redistribution and DvR*

DvR Controllers redistribute routes (direct routes, static routes and the default route) into the DvR domain. You can configure redistribution of DvR host routes into OSPF.

## ECMP with OSPFv3

The ECMP feature supports and complements OSPFv3 protocol.

With Equal Cost Multipath (ECMP), you can use multiple paths for load sharing of traffic. These multiple paths allow faster convergence to other active paths in case of network failure. By maximizing load sharing among equal-cost paths, you can use your links between routers more efficiently when sending IP and IPv6 traffic. Equal Cost Multipath is formed using routes from the same protocol.

#### Note

To add OSPFv3 equal cost paths in the routing table, you must first enable IPv6 ECMP feature globally.

For scaling information on the ECMP paths supported per destination prefix, see [Release Notes for VOSS](#).

## OSPFv3 and Route Redistribution

Redistribution imports routes from one protocol to another. Redistribution sends route updates for a protocol-based route through another protocol. For example, if OSPFv3 routes exist in a router and they must travel through a BGP network, then configure redistribution of OSPFv3 routes through BGP. This configuration sends OSPFv3 routes to a router that uses BGP.

You can redistribute routes on a global basis between protocols on a single VRF instance (intraVRF).

Use the **ipv6 ospf redistribute** command to accomplish the (intraVRF) redistribution of routes through OSPF, so that OSPF redistribution occurs globally on all OSPF-enabled interfaces. This redistribution does not require a route policy, but you can use one for more control.

#### Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For a redistribute policy (OSPFv3) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

## OSPF configuration considerations

This section describes considerations to keep in mind as you configure OSPF.

## OSPF host route advertisements and nonbackbone areas

The switch does not associate a host route with a specific area. Therefore, if you create a host route in a nonbackbone area, nonbackbone (nonOSPF core) areas do not advertise it.

For example, in an OSPF network with multiple areas, including areas not adjacent to the core, which use virtual links, a host route on a router that belongs to a nonOSPF core area is not advertised on noncore routers.

To ensure host route advertisement, disable and enable OSPF on the noncore routers.

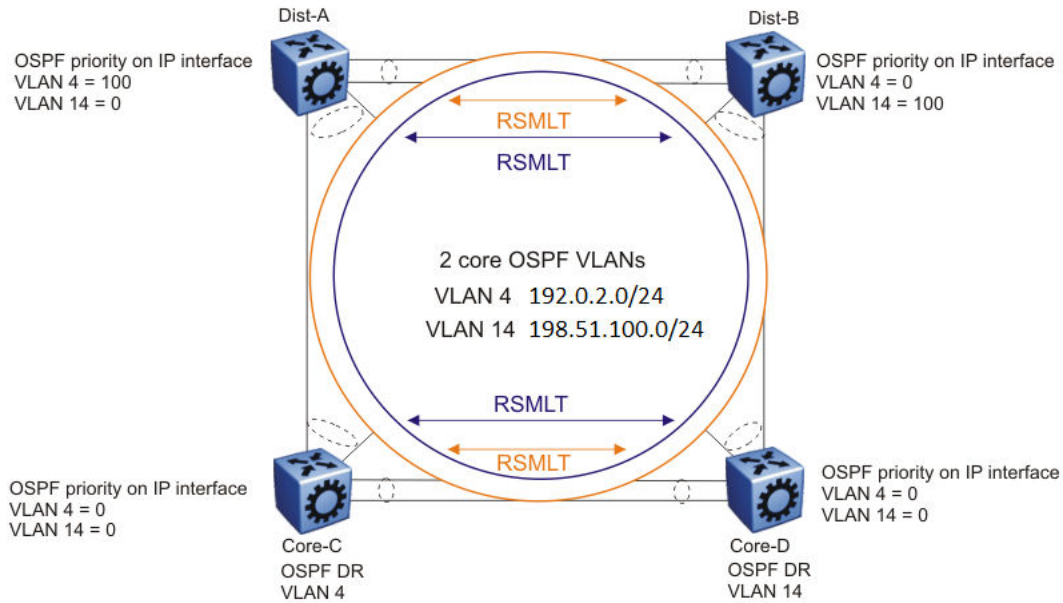

## OSPF with switch clustering

If the network loses the DR, the BDR immediately becomes the new DR on the broadcast segment. After OSPF elects the new DR, all routers perform an SPF run and issue new LSAs for the segment. The new DR generates a new network LSA for the segment and every router on the segment must refresh the router LSA.

Each router performs the SPF run as soon as it detects a new DR. Depending on the speed of the router, the router can perform the SPF run before it receives the new LSAs for the segments, which requires a second SPF run to update and continue routing across the segment. The OSPF hold-down timer does not permit two consecutive SPF runs within the value of the timer. This limitation can lead to traffic interruption of up to 10 seconds.

In a classical OSPF routed design, this situation never causes a problem because OSPF runs over multiple segments so even if a segment is not usable, routes are recalculated over alternative segments. Typical Routed Split MultiLink Trunking (RSMLT) designs only deploy a single OSPF routed vlan, which constitutes a single segment.

You can use RSMLT in a configuration with dual core VLANs to minimize traffic interruption when the network loses the DR. This configuration creates a second OSPF core VLAN, forcing different nodes to become the DR for each VLAN. Each OSPF core VLAN has a DR (priority of 100) and no BDRs. This configuration does not require a BDR because the two VLANs provide backup for each other from a routing perspective. See the following figure for a network example.

**Figure 203: RSMLT with dual core VLANs**

## OSPF Graceful Restart

In many OSPF networks, OSPF routers remove a restarting OSPF router from the network topology, if the router is restarted. This action causes all OSPF routers to re-converge and route around the restarting router. The OSPF Graceful Restart feature is an OSPF enhancement to allow an OSPF router to stay on the forwarding path when the software is restarting.

This feature is documented under RFC 3623 for OSPFv2 (IPv4) and RFC 5187 for OSPFv3 (IPv6). The switch software supports only helper mode for both OSPFv2 and OSPFv3 protocols.

### Helper Mode

Helper mode is a part of the OSPF Graceful restart feature. Helper mode uses the OSPF routers to help other OSPF routers on the network stay on the forwarding path while the software is restarting. The OSPF router sends a type of LSA called a GRACE-LSA to inform the other OSPF routers that it is restarting the software. When an OSPF router receives a GRACE-LSA from a neighbor OSPF Router, it enters the Helper mode for that neighbor on that network. An OSPF router supports Helper mode by default.

### Operations of Helper Mode

The following section describes the operations in the Helper mode:

- Entering Helper mode — An OSPF router enters the Helper mode provided the following conditions are true:
  - The router is fully adjacent with the neighbor already.
  - No changes have been made in the LSDB since the neighbor router started.
  - The grace period has not expired.

- Local policy configured parameters allow it to help the neighbor.
- The router is not in the process of restarting itself.

The OSPF router will not help the neighbor if any of the above conditions are not met.

If the OSPF router is already helping a neighbor, and receives another GRACE-LSA from the neighbor, it accepts the latest GRACE-LSA, and updates the grace period accordingly. The OSPF router in Helper mode continues to advertise its LSAs like the neighbor it is helping is still full, until any changes are made on the network during the grace period.

- Exiting Helper mode — An OSPF router exits the Helper mode, under the following conditions:
  - The GRACE-LSA is flushed. It means graceful restart has successfully terminated.
  - The GRACE-LSA's grace period expires.
  - There is a network topology change.

When an OSPF router exits Helper mode, the following actions occur:

- It recalculates the DR for the network.
- It re-originates its router LSA.
- If it is the DR, it re-originates the network LSA for the network.
- If it is a virtual link, it re-originates the router LSA for the virtual link transit area.

## Open Shortest Path First guidelines

Use OSPF to ensure that the switch can communicate with other OSPF routers. This section describes some general design considerations and presents a number of design scenarios for OSPF.

### *OSPF LSA limits*

To determine OSPF link-state advertisement (LSA) limits:

1. Use the command **show ip ospf area** to determine the LSA\_CNT and to obtain the number of LSAs for a given area.
2. Use the following formula to determine the number of areas. Ensure the total is less than 16,000 (16K):

$$\sum Adj_N * LSA\_CNT_N < 16k$$

N = 1 to the number of areas for each switch

Adj<sub>N</sub> = number of adjacencies for each Area N

LSA\_CNT<sub>N</sub> = number of LSAs for each Area N

For example, assume that a switch has a configuration of three areas with a total of 18 adjacencies and 1000 routes. This includes:

- 3 adjacencies with an LSA\_CNT of 500 (Area 1)
- 10 adjacencies with an LSA\_CNT of 1000 (Area 2)
- 5 adjacencies with an LSA\_CNT of 200 (Area 3)

Calculate the number as follows:

$$3*500+10*1000+5*200=12.5K < 16K$$

This configuration ensures that the switch operates within accepted scalability limits.

### *OSPF design guidelines*

Follow these additional OSPF guidelines:

- OSPF timers must be consistent across the entire network.
- Use OSPF area summarization to reduce routing table sizes.
- Use OSPF passive interfaces to reduce the number of active neighbor adjacencies.
- Use OSPF active interfaces only on intended route paths.

Configure wiring-closet subnets as OSPF passive interfaces unless they form a legitimate routing path for other routes.

- Minimize the number of OSPF areas for each switch to avoid excessive shortest-path calculations.

The switch executes the Dijkstra algorithm for each area separately.

- Ensure that the OSPF dead interval is at least four times the OSPF hello-interval.
- Use MD5 authentication on untrusted OSPF links.
- Use stub or NSSAs as much as possible to reduce CPU overhead.

### *OSPF and CPU utilization*

After you create an OSPF area route summary on an area border router, the summary route can attract traffic to the area border router for which the router does not have a specific destination route. Enabling ICMP unreachable-message generation on the switch can result in a high CPU utilization rate.

To avoid high CPU utilization, use a black-hole static route configuration. The black-hole static route is a route (equal to the OSPF summary route) with a next hop of 255.255.255.255. This configuration ensures that all traffic that does not have a specific next-hop destination route is dropped.

### *OSPF network design examples*

You can use OSPF routing in the core of a network.

The following figure describes a simple implementation of an OSPF network: enabling OSPF on two switches (S1 and S2) that are in the same subnet in one OSPF area.

**Figure 204: Example 1: OSPF on one subnet in one area**

The routers in the preceding figure use the following configuration:

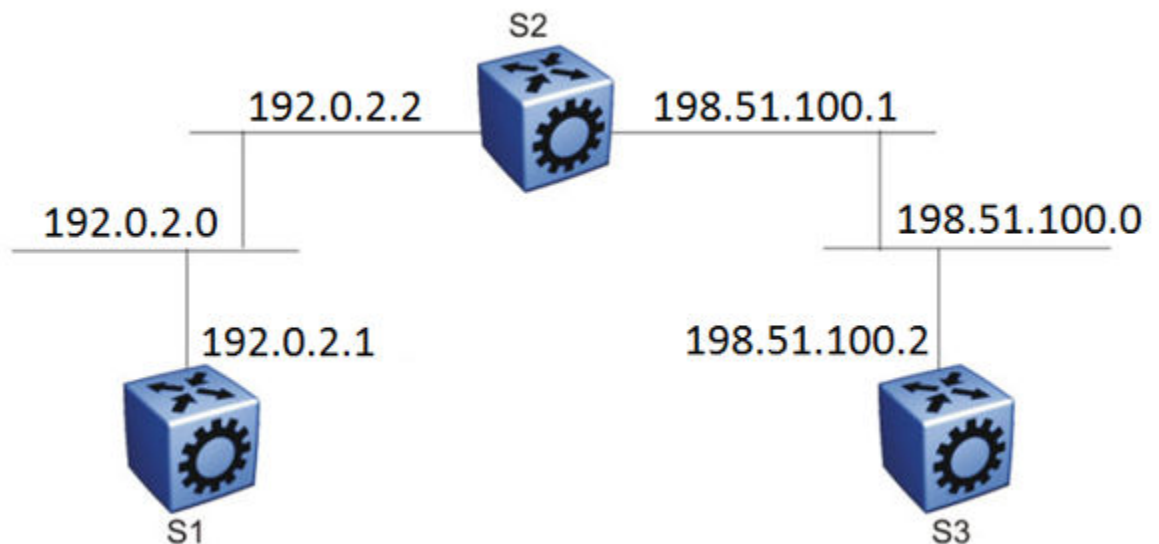

- S1 has an OSPF router ID of 1.1.1.1, and the OSPF port uses an IP address of 192.0.2.1.
- S2 has an OSPF router ID of 1.1.1.2, and the OSPF port uses an IP address of 192.0.2.2.

The general method to configure OSPF on each routing switch is:

1. Enable OSPF globally.
2. Enable IP forwarding on the switch.
3. Configure the IP address, subnet mask, and VLAN ID for the port.
4. Disable RIP on the port, if you do not need it.
5. Enable OSPF for the port.

After you configure S2, the two switches elect a designated router and a backup designated router. They exchange hello packets to synchronize their link state databases.

The following figure shows a configuration in which OSPF operates on three switches. OSPF performs routing on two subnets in one OSPF area. In this example, S1 directly connects to S2, and S3 directly connects to S2, but traffic between S1 and S3 is indirect, and passes through S2.

**Figure 205: Example 2: OSPF on two subnets in one area**

The routers in example 2 use the following configuration:

- S1 has an OSPF router ID of 1.1.1.1, and the OSPF port uses an IP address of 192.0.2.1.
- S2 has an OSPF router ID of 1.1.1.2, and two OSPF ports use IP addresses of 192.0.2.2 and 198.51.100.1.
- S3 has an OSPF router ID of 1.1.1.3, and the OSPF port uses an IP address of 198.51.100.2.

The general method to configure OSPF on each routing switch is:

1. Enable OSPF globally.
2. Insert IP addresses, subnet masks, and VLAN IDs for the OSPF ports on S1 and S3, and for the two OSPF ports on S2. The two ports on S2 enable routing and establish the IP addresses related to the two networks.

3. Enable OSPF for each OSPF port allocated with an IP address.

After you configure all three switches for OSPF, they elect a designated router and a backup designated router for each subnet and exchange hello packets to synchronize their link-state databases.

The following figure shows an example where OSPF operates on two subnets in two OSPF areas. S2 becomes the area border router for both networks.

**Figure 206: Example 3: OSPF on two subnets in two areas**

The routers in scenario 3 use the following configuration:

- S1 has an OSPF router ID of 1.1.1.1. The OSPF port uses an IP address of 192.0.2.1, which is in OSPF area 1.
- S2 has an OSPF router ID of 1.1.1.2. One port uses an IP address of 192.0.2.2, which is in OSPF area 1. The second OSPF port on S2 uses an IP address of 198.51.100.1, which is in OSPF area 2.
- S3 has an OSPF router ID of 1.1.1.3. The OSPF port uses an IP address of 198.51.100.2, which is in OSPF area 2.

The general method to configure OSPF for this three-switch network is:

1. On all three switches, enable OSPF globally.
2. Configure OSPF on one network.

On S1, insert the IP address, subnet mask, and VLAN ID for the OSPF port. Enable OSPF on the port. On S2, insert the IP address, subnet mask, and VLAN ID for the OSPF port in area 1, and enable OSPF on the port. Both routable ports belong to the same network. Therefore, by default, both ports are in the same area.

3. Configure three OSPF areas for the network.
4. Configure OSPF on two additional ports in a second subnet.

Configure additional ports and verify that IP forwarding is enabled for each switch to ensure that routing can occur. On S2, insert the IP address, subnet mask, and VLAN ID for the OSPF port in area 2, and enable OSPF on the port. On S3, insert the IP address, subnet mask, and VLAN ID for the OSPF port, and enable OSPF on the port.

The three switches exchange hello packets.

In an environment with a mix of switches and routers from different vendors, you may need to manually modify the OSPF parameter `RtrDeadInterval` to 40 seconds.

## OSPF configuration using CLI

---

Configure Open Shortest Path First (OSPF) so that the switch can use OSPF routing to communicate with other OSPF routers and to participate in OSPF routing.

### Configuring OSPF globally

Configure OSPF parameters on the switch so that you can control OSPF behavior on the system. The switch uses global parameters to communicate with other OSPF routers. Globally configure OSPF before you configure OSPF for an interface, port, or VLAN.

#### Before You Begin

- Ensure that the switch has an IP interface.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix `ip ospf` to commands. Not all parameters are configurable on non0 VRFs.

#### Procedure

1. Enter OSPF Router Configuration mode:  
`enable`  
  
`configure terminal`  
  
`router ospf`
2. Configure the OSPF router ID:  
`router-id {A.B.C.D}`
3. Configure the router as an autonomous system boundary router (ASBR):  
`as-boundary-router enable`

#### Note

Configure the following steps as and when needed.

4. Enable the automatic creation of OSPF virtual links:  
`auto-vlink`
5. Configure the OSPF default metrics:  
`default-cost {ethernet|fast-ethernet|forty-gig-ethernet|gig-ethernet|  
hundred-gig-ethernet|ten-gig-ethernet|twentyfive-gig-ethernet}  
<1-65535>]`  
  
`default-cost vlan <1-65535>]`
6. Configure the OSPF hold-down timer value:  
`timers basic holddown <3-60>`
7. Enable the RFC1583 compatibility mode:  
`rfc1583-compatibility enable`

8. Enable the router to issue OSPF traps:

```
trap enable
```

9. Verify the OSPF configuration:

```
show ip ospf [vrf WORD<1-16>] [vrfs WORD<0-512>]
```

10. Exit OSPF Router Configuration mode:

```
exit
```

You return to Global Configuration mode.

11. Enable OSPF for the switch:

```
router ospf enable
```

## Example

Configure the OSPF router ID to 192.0.2.2, enable the automatic creation of OSPF virtual links, and enable traps. Configure the default cost metric for Ethernet to 101, for fast Ethernet to 110, and for gig-Ethernet, ten-gig-Ethernet, twentyfive-gig-ethernet, forty-gig-Ethernet, and hundred-gig-ethernet to 20, and vlan to 1. Configure the basic holdown to 10. Enable OSPF for the switch, and review the configuration.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#router-id 192.0.2.2
Switch:1(config-ospf)#auto-vlink
Switch:1(config-ospf)#default-cost ethernet 101
Switch:1(config-ospf)#default-cost fast-ethernet 110
Switch:1(config-ospf)#default-cost gig-ethernet 20
Switch:1(config-ospf)#default-cost ten-gig-ethernet 20
Switch:1(config-ospf)#default-cost twentyfive-gig-ethernet 20
Switch:1(config-ospf)#default-cost Forty-gig-ethernet 20
Switch:1(config-ospf)#default-cost hundred-gig-ethernet 20
Switch:1(config-ospf)#default-cost vlan 2
Switch:1(config-ospf)#timers basic holddown 10
Switch:1(config-ospf)#trap enable
Switch:1(config-ospf)#exit
Switch:1(config)#router ospf enable
Switch:1(config)#show ip ospf

### Variable definitions

The following table defines parameters for the **router-id** command.

Variable	Value
<code>&lt;A.B.C.D&gt;</code>	Configures the OSPF router ID IP address, where A.B.C.D is the IP address.

The following table defines parameters for the **default-cost** command.

Variable	Value
<code>ethernet &lt;1-65535&gt;</code>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>ethernet</i> is for 10 Mb/s Ethernet (default is 100).
<code>fast-ethernet &lt;1-65535&gt;</code>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>fast-ethernet</i> is for 100 Mb/s (Fast) Ethernet (default is 10).
<code>forty-gig-ethernet &lt;1-65535&gt;</code>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>forty-gig-ethernet</i> is for 40 Gigabit Ethernet (default is 1).
<code>gig-ethernet &lt;1-65535&gt;</code>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>gig-ethernet</i> is for Gigabit Ethernet (default is 1).
<code>hundred-gig-ethernet &lt;1-65535&gt;</code>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>hundred-gig-ethernet</i> is for 100 Gigabit Ethernet (default is 1).
<code>ten-gig-ethernet &lt;1-65535&gt;</code>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>ten-gig-ethernet</i> is for 10 Gigabit Ethernet (default is 1).
<code>twentyfive-gig-ethernet &lt;1-65535&gt;</code>	Configures the OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. On a channelized 100 Gbps port, the default-cost for each 25 Gbps channel is 1.
<code>vlan &lt;1-65535&gt;</code>	Configures the OSPF default metrics. <i>vlan</i> is for Vlan interfaces (default is 10).

The following table defines parameters for the **timers basic holddown** command.

Variable	Value
<3-60>	Configures the OSPF hold-down timer value in seconds. The default is 10.

The following table defines parameters for the **show ip ospf** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies a VRF by name.
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

## Configure OSPF for a Port or VLAN

Configure OSPF parameters on a port or VLAN so you can control OSPF behavior on the port or VLAN.

### Before You Begin

- Enable OSPF globally.
- Ensure IP interfaces exist and are enabled.

### About This Task

To configure OSPF on a VRF instance for a port or VLAN, you configure OSPF on the port or VLAN, and then associate the port or VLAN with the VRF.

#### Important

When you enable OSPF on a VLAN or a port, the switch automatically creates an area 0.0.0.0, and advertises it on the specific VLAN or port, by default. To avoid this behavior, you must manually configure the VLAN or port into a properly configured area on the switch.

### Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the OSPF interface area ID:

```
ip ospf area {A.B.C.D}
```

3. Enable OSPF routing:

```
ip ospf enable
```

4. Choose the OSPF update authentication method:

```
ip ospf authentication-type <message-digest|none|sha-1|sha-2|simple>
```

Both sides of an OSPF connection must use the same authentication type and key.

5. If you choose simple, you must configure the password.

```
ip ospf authentication-key WORD<0-8>
```

6. If you choose an authentication key other than simple such as MD5, Sha-1 or Sha-2, you must configure the digest key first and then assign it to the authentication type.

- a. Create the digest-key:

```
ip ospf digest-key <1-255> key WORD<0-16>
```

- b. Assign the newly created digest key to the authentication type:

```
ip ospf authentication-type <message-digest|none|sha-1|sha-2|simple>
primary-digest-key <1-255>
```

7. Specify the interface type:

```
ip ospf network <broadcast|nbma|passive>
```

8. Configure the remaining parameters as required, or accept their default values. View the following variable definitions table for more information.

### Example

Configure the OSPF interface area ID to 192.0.2.2, enable OSPF routing, choose the OSPF update authentication method as message-digest, and specify the interface type as broadcast.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 1
Switch:1(config-if)#ip ospf area 192.0.2.2
Switch:1(config-if)#ip ospf enable
Switch:1(config-if)#ip ospf authentication-type message-digest
Switch:1(config-if)#ip ospf network broadcast
```

### Variable Definitions

The following table defines parameters for the **ip ospf** commands.

Variable	Value
<i>advertise-when-down</i> <i>enable</i>	Enables or disables AdvertiseWhenDown. If enabled, OSPF advertises the network on this interface as up, even if the port is down. The default is disabled. After you configure a port with no link and enable advertise-when-down, OSPF does not advertise the route until the port is active. OSPF advertises the route even when the link is down. To disable advertising based on link status, you must disable this parameter.
<i>area {A.B.C.D}</i>	Configures the OSPF identification number for the area, typically formatted as an IP address.
<i>authentication-key</i> <i>WORD&lt;0-8&gt;</i>	Configures the eight-character simple password authentication key for the port or VLAN.

Variable	Value
<i>authentication-type</i> <message-digest none  sha-1 sha-2 simple>	<p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> <li>• none—Specifies that no authentication required.</li> <li>• simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter.</li> <li>• MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key.</li> <li>• sha-1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long.</li> <li>• sha-2—Specifies SHA-2, which offers the hash function SHA-256.</li> </ul> <p><b>Note:</b> SHA-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
<i>bfd</i>	Enable Bidirectional Forwarding Detection (BFD) at the OSPF application level. The default is disabled.
<i>cost</i> <0-65535>	Configures the OSPF cost associated with this interface and advertised in router link advertisements. The default is 0.
<i>dead-interval</i> <0-2147483647>	Configures the router OSPF dead interval, which is the number of seconds the OSPF neighbors of a switch must wait before they assume the OSPF router is down. The default is 40. The value must be at least four times the hello interval.
<i>enable</i>	Enables OSPF on the port or VLAN.
<i>hello-interval</i> <1-65535>	Configures the OSPF hello interval, which is the number of seconds between hello packets sent on this interface. The default is 10.
<i>message-digest-key</i> <1-255> md5 WORD<0-16>	<p>Configures the MD5 key. You can configure a maximum of two MD5 keys for an interface.</p> <p>If you configure two keys, the interface uses only the first key. To transition to the second key, configure a <i>primary-md5-key</i> to use the ID of the second configured key, and then delete the first key.</p> <p><b>Important:</b> Use the correct key id when two keys are configured. The key id and md5 password must match with the other OSPF routers, to form the OSPF adjacencies.</p> <p>&lt;1-255&gt; is the ID for the MD5 key WORD&lt;0-16&gt; is an alphanumeric password of up to 16 bytes {string length 0-16}</p>
<i>primary-digest-key</i> <1-255>	Use this parameter to transition to a new MD5 key. The new MD5 key changes the primary key used to encrypt outgoing packets. <1-255> is the ID for the new MD5 key.

Variable	Value
<code>mtu-ignore enable</code>	Enables maximum transmission unit (MTU) ignore. To allow the switch to accept OSPF database description (DD) packets with a different MTU size, enable <code>mtu-ignore</code> . The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes.
<code>network &lt;broadcast nbma passive&gt;</code>	Specifies the type of OSPF interface.
<code>poll-interval &lt;0-2147483647&gt;</code>	Configures the OSPF poll interval in seconds. The default is 120.
<code>priority &lt;0-255&gt;</code>	Configures the OSPF priority for the port during the election process for the designated router. The port with the highest priority number is the best candidate for the designated router. If you configure the priority to 0, the port cannot become either the designated router or a backup designated router. The default is 1.
<code>retransmit-interval &lt;0-3600&gt;</code>	Configures the retransmit interval for the virtual interface, which is the number of seconds between link-state advertisement retransmissions.
<code>transit-delay &lt;0-3600&gt;</code>	Configures the transit delay for the virtual interface, which is the estimated number of seconds required to transmit a link-state update over the interface.
<code>&lt;1-4059&gt;</code>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <code>vrf-scaling</code> and <code>spbm-config-mode</code> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This variable applies only to VLAN interfaces, not to ports.

## Viewing OSPF errors on a port

Check OSPF errors for administrative and troubleshooting purposes.

### Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display extended information about OSPF errors for the specified port or for all ports:

```
show ip ospf port-error [port {slot/port[/sub-port]} [-slot/port[/sub-port]][,...]] [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Variable definitions

The following table defines parameters for the **show ip ospf port-error** command.

Variable	Value
<code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code>	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<code>vrf WORD&lt;1-16&gt;</code>	Specifies the VRF by name.
<code>vrfids WORD&lt;0-512&gt;</code>	Specifies a range of VRFs by ID number.

## Configuring OSPF areas on the router

Import information from other areas to learn their OSPF relationships. Perform this procedure to create normal, stubby, or not-so-stubby areas (NSSA).

### Before You Begin

- Ensure that the VLAN exists if you configure OSPF on a VLAN.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

### About This Task

Place stubby or NSSAs at the edge of an OSPF routing domain. Ensure that you configure all routers in a stubby or NSSA as stubby or NSSA, respectively.

### Procedure

1. Enter OSPF Router Configuration mode:
 

```
enable

configure terminal

router ospf
```
2. Create an OSPF area:
 

```
area {A.B.C.D}
```
3. Specify the area type:
 

```
area {A.B.C.D} import <external|noexternal|nssa>
```
4. Configure other OSPF area parameters as required.
5. Ensure that the configuration is correct:
 

```
show ip ospf area [vrf WORD<1-16>] [vrfids WORD<0-255>]
```

## Example

Create the OSPF area 192.0.2.10, and specify the area type as NSSA. Configure the area support to import summary advertisements into a stub area and configure the import external option for this area as stub. Ensure the configuration is correct.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#area 192.0.2.10
Switch:1(config-ospf)#area 192.0.2.10 import nssa
Switch:1(config-ospf)#area 192.0.2.10 import stub
Switch:1(config-ospf)#area 192.0.2.10 import-summaries enable
Switch:1(config-ospf)#show ip ospf area
```

```

### Variable Definitions

The following table defines parameters for the **area {A.B.C.D}** command.

Variable	Value
<i>default-cost</i> <0-16777215>	Specifies the stub area default metric for this stub area, which is the cost from 0-16777215. This metric value applies at the indicated type of service.
<i>import</i> <external noexternal nssa>	Specifies the type of area: <ul style="list-style-type: none"> <li>external—stub and NSSA are both false</li> <li>noexternal—configures the area as stub area.</li> <li>nssa—configures the area as NSSA.</li> </ul>
<i>import-summaries enable</i>	Configures the area support to import summary advertisements into a stub area. Use this variable only if the area is a stub area.
<i>stub</i>	Configures the import external option for this area as stub. A stub area has only one exit point (router interface) from the area.

The following table defines parameters for the **show ip ospf area** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies a VRF.
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

## Viewing the OSPF area information

View the OSPF area information.

## Procedure

1. Enter Privileged EXEC mode:  
enable
2. View the OSPF area information:  
show ip ospf area [vrf WORD<1-16>] [vrfids WORD<0-512>]

## Example

View the OSPF area information:

```
Switch:1>enable
Switch:1#show ip ospf area

=====
 OSPF Area - GlobalRouter

0 9 0 0 6 117671
```

### Variable definitions

The following table defines parameters for the **show ip ospf area** command.

Variable	Value
vrf WORD<1-16>	Specifies a VRF by name.
vrfids WORD<0-512>	Specifies a range of VRF IDs.

## Configuring OSPF aggregate area ranges on the router

Use aggregate area ranges to reduce the number of link-state advertisements required within the area. You can also control advertisements.

### Before You Begin

- Enable OSPF globally.
- Ensure that an area exists.
- You configure OSPF area ranges on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

### Procedure

1. Enter OSPF Router Configuration mode:  
enable  
  
configure terminal  
  
router ospf

2. Configure an OSPF area range:
 

```
area range {A.B.C.D} {A.B.C.D/X} <summary-link|nssa-extlink>
```
3. Configure the advertised metric cost:
 

```
area range {A.B.C.D} {A.B.C.D/X} <summary-link|nssa-extlink>
advertise-metric <0-65535>
```
4. Configure the advertisement mode:
 

```
area range {A.B.C.D} {A.B.C.D/X} <summary-link|nssa-extlink>
advertise-mode <summarize|suppress|no-summarize>
```
5. Ensure that the configuration is correct:
 

```
show ip ospf area-range [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Example

Configure an OSPF area range to 192.0.2.2, configure the advertised metric cost to 10, and the advertisement mode to summarize.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)# area range 192.0.2.2 255.255.255.0/32 summary-link
Switch:1(config-ospf)# area range 192.0.2.2 255.255.255.0/32 summary-link advertise-
metric 10
Switch:1(config-ospf)# area range 192.0.2.2 255.255.255.0/32 summary-link advertise-mode
summarize
```

### Variable definitions

The following table defines parameters for the **area range** command.

Variable	Value
<i>{A.B.C.D} {A.B.C.D/X}</i>	<i>{A.B.C.D}</i> identifies an OSPF area and <i>{A.B.C.D/X}</i> is the IP address and subnet mask of the range, respectively.
<i>advertise-metric</i> <i>&lt;0-65535&gt;</i>	Changes the advertised metric cost of the OSPF area range.
<i>advertise-mode</i> <i>&lt;summarize suppress no-summarize&gt;</i>	Changes the advertisement mode of the range.
<i>&lt;summary-link nssa-extlink&gt;</i>	Specifies the link-state advertisement (LSA) type. If you configure the range as type nssa-extlink, you cannot configure the advertise-metric.

The following table defines parameters for the **show ip ospf area-range** command.

Variable	Value
<i>vrf WORD&lt;1-16&gt;</i>	Specifies a VRF by name.
<i>vrfids WORD&lt;0-512&gt;</i>	Specifies a range of VRF IDs.

## Viewing the OSPF area range information

View the OSPF area range information.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View the OSPF area range information:  
show ip ospf area-range [vrf WORD<1-16>] [vrfids WORD<0-512>]

#### Variable definitions

The following table defines parameters for the **ip ospf area-range** command.

Variable	Value
vrf WORD<1-16>	Specifies a VRF by name.
vrfids WORD<0-512>	Specifies a range of VRF IDs.

## Enabling automatic virtual links

Use automatic virtual links to provide an automatic, dynamic backup link for vital OSPF traffic. Automatic virtual links require more system resources than manually configured virtual links.

### Before You Begin

- You configure automatic virtual links on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

### Procedure

1. Enter OSPF Router Configuration mode:  
enable  
  
configure terminal  
  
router ospf
2. Enable the automatic virtual links feature for the router:  
auto-vlink

## Configuring an OSPF area virtual interface

Use manual virtual interfaces to provide a backup link for vital OSPF traffic with a minimum of resource use.

### Before You Begin

- Enable OSPF globally.
- You configure an OSPF area virtual interface on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

### About This Task

Both sides of the OSPF connection must use the same authentication type and key.

You cannot configure a virtual link using a stub area or an NSSA.

### Procedure

1. Enter OSPF Router Configuration mode:  

```
enable

configure terminal

router ospf
```
2. Create an OSPF area virtual interface:  

```
area virtual-link {A.B.C.D} {A.B.C.D}
```
3. Choose the OSPF update authentication method:  

```
area virtual-link {A.B.C.D} {A.B.C.D} authentication-type <message-
digest|none|sha-1|sha-2|simple>
```

Both sides of an OSPF connection must use the same authentication type and key.

4. If required, configure an MD5 key for the virtual interface:  

```
area virtual-link message-digest-key {A.B.C.D} {A.B.C.D} <1-255> md5-
key WORD<1-16>
```
5. Configure optional parameters, as required.
6. Ensure that the configuration is correct:  

```
show ip ospf virtual-link {A.B.C.D} {A.B.C.D} [vrf WORD<1-16>] [vrfsids
WORD<0-512>]
```

### Example

Create an OSPF area virtual interface with an area ID of 192.0.2.12 and the virtual interface ID of 198.51.100.2, choose the OSPF update authentication method to simple, and the hello-interval to 100.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#area virtual-link 192.0.2.12 198.51.100.2 198.51.100.2
Switch:1(config-ospf)#area virtual-link 192.0.2.12 198.51.100.2 198.51.100.2
authentication-type simple
Switch:1(config-ospf)#area virtual-link 192.0.2.12 198.51.100.2 198.51.100.2 hello-
interval 100
```

### Variable Definitions

The following table defines parameters for the **area virtual-link** command.

Variable	Value
<i>{A.B.C.D} {A.B.C.D}</i>	Specifies the area ID and the virtual interface ID.
<i>authentication-key</i> <i>WORD&lt;0-8&gt;</i>	Configures the authentication key of up to eight characters.

Variable	Value
<i>authentication-type</i> <message-digest none  sha-1 sha-2 simple>	<p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> <li>• none—Specifies that no authentication required.</li> <li>• simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter.</li> <li>• MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key.</li> <li>• sha-1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long.</li> <li>• sha-2—Specifies SHA-2, which offers the hash function SHA-256.</li> </ul> <p><b>Note:</b> sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
<i>dead-interval</i> <0-2147483647>	Configures the number of seconds between router hello packets before neighbors declare the router down. This value must be at least four times the hello interval value. The default is 60.
<i>hello-interval</i> <1-65535>	Configures the hello interval, in seconds, on the virtual interface for the length of time (in seconds) between the hello packets that the router sends on the interface. The default is 10.
<i>primary-digest-key</i> <1-255>	Use this parameter to transition to a new MD5 key; It changes the primary key used to encrypt outgoing packets. <1-255> is the ID for the MD5 key.
<i>retransmit-interval</i> <0-3600>	Configures the retransmit interval for the virtual interface, the number of seconds between LSA retransmissions. The range is from 1-3600.
<i>transit-delay</i> <0-3600>	Configures the transit delay for the virtual interface, the estimated number of seconds required to transmit a link-state update over the interface. The range is from 1-3600.

The following table defines parameters for the **area virtual-link message-digest-key** command.

Variable	Value
<i>{A.B.C.D} {A.B.C.D}</i>	Specifies the area ID and the virtual interface ID.
<i>&lt;1-255&gt;</i>	Specifies the ID for the message digest key
<i>md5-key WORD&lt;1-16&gt;</i>	<p>Configures the MD5 key, you can configure a maximum of two MD5 keys for an interface.</p> <p>If you configure two keys, the interface uses only the first key. To transition to the second key, configure a primary-md5-key to use the ID of the second configured key, and then delete the first key.</p> <p><b>Important:</b> Use the correct key id when two keys are configured. The key id and md5 password must match with the other OSPF routers, to form the OSPF adjacencies.</p> <p><i>WORD&lt;1-16&gt;</i> is an alphanumeric password of up to 16 characters.</p>

The following table defines parameters for the **show ip ospf virtual-link** command.

Variable	Value
<i>&lt;A.B.C.D&gt; &lt;A.B.C.D&gt;</i>	Specifies the area ID and the virtual interface ID.
<i>vrf WORD&lt;1-16&gt;</i>	Specifies a VRF.
<i>vrfids WORD&lt;0-512&gt;</i>	Specifies a range of VRF IDs.

## Configuring an OSPF area on a VLAN or port

Import information from other areas to learn their OSPF relationships. Perform this procedure to create normal, stubby, or NSSA. Place stubby or NSSAs at the edge of an OSPF routing domain.

### Before You Begin

- Enable OSPF globally.
- Ensure that the VLAN exists.

### About This Task

Ensure that you configure all routers in a stubby or NSSA as stubby or NSSA, respectively.

To configure OSPF areas on a VRF instance for a port or VLAN, you configure OSPF on the port or VLAN, and then associate the port or VLAN with the VRF.

## Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create an OSPF area on the VLAN or port:

```
ip ospf area {A.B.C.D}
```

3. Specify the type of network:

```
ip ospf network <broadcast|nbma|passive>
```

4. Configure other OSPF area parameters as required.

## Example

Create an OSPF area 192.0.2.2 on VLAN 1, and specify the type of network as broadcast.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 1
Switch:1(config-if)#ip ospf area 192.0.2.2
Switch:1(config-if)#ip ospf network broadcast
```

### Variable Definitions

The following table defines parameters for the **ip ospf** command.

Variable	Value
{A.B.C.D}	Specifies the area ID.
<i>authentication-key</i> WORD<0-8>	Configures the eight-character simple password authentication key for the port or VLAN.

Variable	Value
<i>authentication-type</i> <message-digest none  sha-1 sha-2 simple>	Specifies the type of authentication required for the interface. <ul style="list-style-type: none"> <li>• none—Specifies that no authentication required.</li> <li>• simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter.</li> <li>• MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key.</li> <li>• sha-1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long.</li> <li>• sha-2—Specifies SHA-2, which offers the hash function SHA-256.</li> </ul> <p><b>Note:</b> sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p>
<i>cost</i> <0-65535>	Configures the OSPF cost associated with this interface and advertised in router link advertisements. The default is 0.
<i>dead-interval</i> <0-2147483647>	Configures the the number of seconds between router hello packets before neighbors declare the router down. This value must be at least four times the hello interval value. The default is 60.
<i>hello-interval</i> <1-65535>	Configures the hello interval, in seconds, on the virtual interface for the length of time (in seconds) between the hello packets that the router sends on the interface. The default is 10.
<i>mtu-ignore enable</i>	Enables MTU ignore. To allow the switch to accept OSPF database description (DD) packets with a different MTU size, enable mtu-ignore. The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes.
<i>network</i> <broadcast nbma  passive>	Specifies the type of OSPF interface.
<i>poll-interval</i> <0-2147483647>	Configures the OSPF poll interval in seconds. The default is 120.
<i>primary-digest-key</i> <1-255>	Use this parameter to transition to a new MD5 key; it changes the primary key used to encrypt outgoing packets. <1-255> is the ID for the message digest key.
<i>priority</i> <0-255>	Configures the OSPF priority for the port during the election process for the designated router. The port with the highest priority number is the best candidate for the designated router. If you set the priority to 0, the port cannot become either the designated router or a backup designated router. The default is 1.
<i>retransmit-interval</i> <0-3600>	Configures the retransmit interval: the number of seconds between LSA retransmissions. The range is from 1-3600.
<i>transit-delay</i> <0-3600>	Configures the transit delay: the estimated number of seconds it takes to transmit a link-state update over the interface. The range is from 1-3600.

## Configuring an OSPF host route

Configure host routes when the switch resides in a network that uses routing protocols other than OSPF. A host route is a more-specific route and is used even if it is higher cost than a network route.

### Before You Begin

- Globally enable OSPF.
- You configure an OSPF host route on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

### About This Task

Use a host route to create a custom route to a specific host to control network traffic.

You can specify which hosts directly attach to the router, and the metrics and types of service to advertise for the hosts.

### Procedure

1. Enter OSPF Router Configuration mode:
 

```
enable

configure terminal

router ospf
```
2. Create a host route:
 

```
host-route {A.B.C.D} [metric <0-65535>]
```
3. Ensure that the configuration is correct:
 

```
show ip ospf host-route [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Example

Create a host route on IP address 192.0.2.20 with a metric of 20.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#host-route 192.0.2.20 metric 20
Switch:1(config-ospf)#show ip ospf host-route
Switch:1(config-ospf)#show ip ospf host-route
```

```
=====
 OSPF Host Route - GlobalRouter
=====
HOSTIPADDR TOS METRIC

192.0.2.20 - 20
```

*Variable definitions*

The following table defines parameters for the **host-route** command.

Variable	Value
<i>{A.B.C.D}</i>	Specifies the IP address of the host router in a.b.c.d format.
<i>metric &lt;0-65535&gt;</i>	Configures the metric (cost) for the host route.

The following table defines parameters for the **show ip ospf host-route** command.

Variable	Value
<i>vrf WORD&lt;1-16&gt;</i>	Specifies a VRF by name.
<i>vrfids WORD&lt;0-512&gt;</i>	Specifies a range of VRF IDs.

## Configuring OSPF NBMA neighbors

Configure NBMA neighbors so that the interface can participate in designated router election. All OSPF neighbors that you manually configure are NBMA neighbors.

### Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- Ensure that the interface is NBMA.
- You configure OSPF NBMA neighbors on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on non0 VRFs.

### Procedure

1. Enter OSPF Router Configuration mode:
 

```
enable

configure terminal

router ospf
```
2. Create an NBMA OSPF neighbor:
 

```
neighbor {A.B.C.D} priority <0-255>
```
3. Ensure that the configuration is correct:
 

```
show ip ospf neighbor [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Example

Create an NBMA OSPF neighbor.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#neighbor 198.51.100.2 priority 10
```

### Variable definitions

The following table defines parameters for the **neighbor** command.

Variable	Value
<i>{A.B.C.D}</i>	Identifies an OSPF area in IP address format a.b.c.d.
<i>priority &lt;0-255&gt;</i>	Changes the priority level of the neighbor.

The following table defines parameters for the **show ip ospf neighbors** command.

Variable	Value
<i>vrf WORD&lt;1-16&gt;</i>	Specifies a VRF by name.
<i>vrfids WORD&lt;0-512&gt;</i>	Specifies a range of VRF IDs.

## Enabling or disabling Helper mode for OSPFv2

### About This Task

By default, OSPF Helper mode is enabled when OSPF is configured. You can disable helper mode by the following command and re-enable it again by using **no** or **default** operators.

### Procedure

1. Enter OSPF Router Configuration mode:
 

```
enable

configure terminal

router ospf
```
2. Enter the following command to disable Helper mode:
 

```
helper-mode-disable
```
3. Enter the following command to enable Helper mode:
 

```
no helper-mode-disable
```

Or

```
default helper-mode disable
```

### Example

Disable Helper mode:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#helper-mode-disable
```

Enable Helper mode:

```
Switch:1>enable
Switch:1#configure terminal
```

```
Switch:1(config)#router ospf
Switch:1(config-ospf)#no helper-mode-disable
```

## Applying OSPF route acceptance policies

Use a route policy to define how the switch redistributes external routes from a specified source into an OSPF domain. The policy defines which route types the switch accepts and redistributes.

### Before You Begin

- Enable OSPF globally.
- Ensure that a route policy exists.
- Ensure that the area exists.
- You apply OSPF route acceptance policies on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip ospf**. The VRF must have an RP Trigger of OSPF. Not all parameters are configurable on nonO VRFs.

### Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

### Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```
2. Create an acceptance policy instance:

```
accept adv-rtr {A.B.C.D}
```
3. Configure the type of metric to accept:

```
accept adv-rtr {A.B.C.D} metric-type <type1|type2|any>
```
4. Indicate the route policy:

```
accept adv-rtr {A.B.C.D} route-map WORD<0-64>
```
5. Enable a configured OSPF route acceptance instance:

```
accept adv-rtr {A.B.C.D} enable
```
6. Ensure that the configuration is correct:

```
show ip ospf accept [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

## Example

Create an acceptance policy instance, configure the type of metric to accept, indicate the route policy and enable the OSPF route acceptance instance. Ensure the configuration is correct.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1#router ospf
Switch:1(config-ospf)#accept adv-rtr 192.0.2.11
Switch:1(config-ospf)#accept adv-rtr 192.0.2.11 metric-type type1
Switch:1(config-ospf)#accept adv-rtr 192.0.2.11 route-map test1
Switch:1(config-ospf)#accept adv-rtr 192.0.2.11 enable
Switch:1(config-ospf)#show ip ospf accept
=====
 Ospf Accept - GlobalRouter
=====
ADV_RTR MET_TYPE ENABLE POLICY

192.0.2.11 type1 true test1
```

### Variable definitions

The following table defines parameters for the **accept adv-rtr** command.

Variable	Value
<A.B.C.D>	Specifies the IP address.
<i>enable</i>	Enables an OSPF acceptance policy.
<i>metric-type</i> <type1  type2 any>	Configures the metric type as type 1, type 2, or any.
<i>route-map</i> WORD<0-64>	Configures the route policy by name.

The following table defines parameters for the **ip ospf accept** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies a VRF by name.
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

## Viewing the OSPF configuration information

View the OSPF configuration information.

### Procedure

1. Enter Privileged EXEC mode:
 

```
enable
```
2. View the OSPF configuration information:
 

```
show ip ospf accept [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Example

```
Switch:1#show ip ospf accept
```

```

=====
 Ospf Accept - GlobalRouter
=====
ADV_RTR MET_TYPE ENABLE POLICY

192.0.2.11 type1 true test1
=====

```

### Variable definitions

The following table defines parameters for the **show ip ospf accept** command.

Variable	Value
<code>vrf WORD&lt;1-16&gt;</code>	Specifies a VRF by name.
<code>vrfids WORD&lt;0-512&gt;</code>	Specifies a range of VRF IDs.

## Viewing the OSPF link-state database

View the area advertisements and other information in the LSDB to ensure correct OSPF operations.

### Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View the OSPF link-state database:

```
show ip ospf lsdb [adv_rtr {A.B.C.D}] [area {A.B.C.D}] [lsa-type
<0-7>] [lsid {A.B.C.D}] [vrf WORD<1-16>] [vrfids WORD<0-512>] [detail]
```

### Example

```

Switch(config-ospf)#show ip ospf lsdb

*Variable definitions*

The following table defines parameters for the **show ip ospf lsdb** command.

Variable	Value
<i>adv_rtr</i> {A.B.C.D}	Specifies the advertising router.
<i>area</i> {A.B.C.D}	Specifies the OSPF area.
<i>detail</i>	Provides detailed output.
<i>lsa-type</i> <0-7>	Specifies the link-state advertisement type in the range of 0-7.
<i>lsid</i> {A.B.C.D}	Specifies the link-state ID.
<i>vrf</i> WORD<1-16>	Specifies a VRF by name.
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

## Viewing the OSPF external link-state database

View the LSDB to determine externally learned routing information. Information appears for all metric types or for the type you specify.

**Procedure**

1. Enter Privileged EXEC mode:  

```
enable
```
2. View the OSPF autonomous system external (ASE) link-state advertisements:  

```
show ip ospf ase [metric-type <1-2>] [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

**Example**

```

Switch:1#show ip ospf ase
=====
 OSPF AsExternal Lsas - GlobalRouter
=====
LSTYPE LINKSTATEID ADV_ROUTER ETYPE METRIC ASE_FWD_ADDR AGE SEQ_NBR

```

CSUM  
-----

### Variable definitions

The following table defines parameters for the **show ip ospf ase** command.

Variable	Value
<i>metric-type</i> <1-2>	Specifies the metric type.
<i>vrf</i> WORD<1-16>	Identifies the VRF by name.
<i>vrfids</i> WORD<0-512>	Specifies a VRF by ID.

## Configuring route redistribution to OSPF

Configure a redistribute entry to announce certain routes into the OSPF domain, including DvR host routes, static routes, direct routes, Routing Information Protocol (RIP) routes, OSPF routes, IS-IS routes or Border Gateway Protocol (BGP) routes. Optionally, use a route policy to control the redistribution of routes.

### Before You Begin

- Enable OSPF globally.
- Ensure that a route policy exists.
- Ensure that you set OSPF as the boundary router.

#### Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

### Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Create the redistribution instance:

```
redistribute <bgp|direct|isis|ospf|rip|static|dvr> [vrf-src
WORD<0-16>]
```

3. Apply a route policy if required:

```
redistribute <bgp|direct|isis|ospf|rip|static|dvr> route-map
WORD<0-64> [vrf-src WORD<0-16>]
```

4. Configure other parameters, as required.
5. Enable the redistribution.

```
redistribute <bgp|direct|isis|ospf|rip|static|dvr> enable [vrf-src
WORD<0-16>]
```

6. Ensure that the configuration is correct:

```
show ip ospf redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

7. Exit to Global Configuration mode:

```
exit
```

8. Apply the redistribution.

```
ip ospf apply redistribute <bgp|direct|isis|ospf|rip|static|dvr> [vrf
WORD<1-16>] [vrf-src WORD<0-16>]
```

Changes do not take effect until you apply them.

9. View all routes (including DvR host routes) that are redistributed into OSPF:

- a. View the routes that are redistributed from the GRT to OSPF:

```
show ip ospf lsdb
```

- b. View the routes that are redistributed to OSPF for a specific VRF instance:

```
show ip ospf lsdb [vrf WORD<1-64>] [vrfids WORD<0-512>]
```

## Example

### Example 1:

Redistribute static routes from the GRT to OSPF.

Create the redistribution instance, apply a route policy, enable redistribution, and apply the redistribution.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#redistribute static

WARNING: Routes will not be injected until apply command is issued after enable command
Switch:1(config-ospf)#redistribute static route-map policy1
Switch:1(config-ospf)#redistribute static enable
Switch:1(config-ospf)#exit
Switch:1(config)#ip ospf apply redistribute static
Switch:1(config)#show ip ospf redistribute

=====
 OSPF Redistribute List - GlobalRouter
=====

SRC-VRF SRC MET MTYPE SUBNET ENABLE RPOLICY

GlobalRouter STAT 0 type2 allow TRUE policy1
GlobalRouter DVR 0 type2 allow FALSE
```

### Example 2:

Redistribute DvR host routes from the GRT to OSPF:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#redistribute dvr
Switch:1(config-ospf)#redistribute dvr enable
Switch:1(config-ospf)#exit
Switch:1(config)#ip ospf apply redistribute dvr
Switch:1(config)#show ip ospf redistribute
```

```
=====
 OSPF Redistribute List - GlobalRouter
=====
```

SRC-VRF	SRC	MET	MTYPE	SUBNET	ENABLE	RPOLICY
GlobalRouter	DVR	0	type2	allow	TRUE	test1

### Example 3:

Redistribute DvR host routes to OSPF for a specific VRF vrf1:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router vrf vrf1
Switch:1(router-vrf)#ip ospf redistribute dvr
Switch:1(router-vrf)#ip ospf redistribute dvr enable
Switch:1(router-vrf)#exit
Switch:1(config)#ip ospf apply redistribute dvr vrf vrf1
```

View the DvR host routes that are distributed into OSPF:

```
Switch:1(config)#show ip ospf lsdb vrf vrf1
```

```

### Variable definitions

The following table defines parameters for the **redistribute** command.

Variable	Value
<i>enable</i>	Enables the OSPF route redistribution instance.
<i>metric &lt;0-65535&gt;</i>	Configures the metric to apply to redistributed routes.
<i>metric-type &lt;type1 type2&gt;</i>	Specifies a type 1 or a type 2 metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone.
<i>route-map WORD&lt;0-64&gt;</i>	Configures the route policy to apply to redistributed routes.
<i>subnets &lt;allow suppress&gt;</i>	Allows or suppresses external subnet route advertisements when routes are redistributed into an OSPF domain.
<i>vrf-src WORD&lt;0-16&gt;</i>	Specifies the optional source VRF instance. You can use this variable with the other command variables.
<i>&lt;bgp direct isis ospf rip static dvr&gt;</i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, dvr or static.

The following table defines parameters for the **ip ospf apply redistribute** command.

Variable	Value
<i>vrf WORD&lt;1-16&gt;</i>	Specifies the VRF instance.
<i>vrf-src WORD&lt;0-16&gt;</i>	Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF.
<i>WORD&lt;0-32&gt;</i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static.

## Viewing the OSPF redistribution configuration information

Displays the OSPF redistribution configuration information.

### Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

### Procedure

1. Enter Privileged EXEC mode:  

```
enable
```
2. View the OSPF redistribution configuration information:  

```
show ip ospf redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Example

```
Switch:1#show ip ospf redistribute

=====
 OSPF Redistribute List - GlobalRouter
=====
SRC-VRF SRC MET MTYPE SUBNET ENABLE RPOLICY

GlobalRouter STAT 0 type2 allow TRUE
```

### Variable definitions

The following table defines parameters for the **show ip ospf redistribute** command.

Variable	Value
<code>vrf WORD&lt;1-16&gt;</code>	Specifies a VRF by name.
<code>vrfids WORD&lt;0-512&gt;</code>	Specifies a range of VRF IDs.

## Configuring interVRF route redistribution for OSPF

Use route redistribution so that a VRF interface can announce routes learned by other protocols, for example, OSPF or BGP. The switch supports interVRF route redistribution. Use a route policy to control the redistribution of routes.

You can also redistribute inter-VRF DvR routes to OSPF.

### Before You Begin

- Enable OSPF globally.
- Ensure that a route policy exists.
- Ensure that the VRFs exist.

#### Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

### Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

2. Create the redistribution instance:

```
ip ospf redistribute <bgp|direct|isis|ospf|rip|static|dvr>
```

3. Apply a route policy if required:

```
ip ospf redistribute <bgp|direct|isis|ospf|rip|static|dvr> route-map
WORD<0-64> [vrf-src WORD<0-16>]
```

4. Configure other parameters, as required.

5. Enable the redistribution:

```
ip ospf redistribute <bgp|direct|isis|ospf|rip|static|dvr> enable
[vrf-src WORD<0-16>]
```

6. Ensure that the configuration is correct:

```
show ip ospf redistribute [vrf WORD<1-16>] [vrffids WORD<0-512>]
```

7. Exit to Global Configuration mode:

```
exit
```

8. Apply the redistribution:

```
ip ospf apply redistribute <bgp|direct|isis|ospf|rip|static|dvr> [vrf
WORD<1-16>] [vrf-src WORD<0-16>]
```

## Example

### Example 1:

Create the redistribution instance, apply a route policy, enable the redistribution, and apply the redistribution.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router vrf red
Switch:1(router-vrf)#ip ospf redistribute isis
Switch:1(router-vrf)#ip ospf redistribute isis route-map test2
Switch:1(router-vrf)#ip ospf redistribute isis enable
Switch:1(router-vrf)#exit
Switch:1(config)#ip ospf apply redistribute isis
```

### Example 2:

This example demonstrates redistribution of inter-VRF routes (both direct and DvR routes) to OSPF, with a route policy configured.

Redistribute inter-VRF DvR routes between VRFs (with VRF IDs 10 and 30), to OSPF.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router vrf 10
Switch:1(router-vrf)#ip prefix-list "test10" 192.0.2.0/24 ge 25 le 32
Switch:1(router-vrf)#route-map "test10" 1
Switch:1(router-vrf)#permit
Switch:1(router-vrf)#enable
Switch:1(router-vrf)#match network "test10"
Switch:1(router-vrf)#set metric 99
Switch:1(router-vrf)#exit

Switch:1(config)#router vrf 30
Switch:1(router-vrf)#ip ospf redistribute direct vrf-src 10
Switch:1(router-vrf)#ip ospf redistribute direct enable vrf-src 10
Switch:1(router-vrf)#ip ospf redistribute dvr vrf-src 10
Switch:1(router-vrf)#ip ospf redistribute dvr route-map "test10" vrf-src 10
Switch:1(router-vrf)#ip ospf redistribute dvr enable vrf-src 10
Switch:1(router-vrf)#exit

Switch:1(config)#ip ospf apply redistribute direct vrf 30 vrf-src 10
Switch:1(config)#ip ospf apply redistribute dvr vrf 30 vrf-src 10
```

### Variable definitions

The following table defines parameters for the **ip ospf redistribute** command.

Variable	Value
<i>enable</i>	Enables the OSPF route redistribution instance.
<i>metric</i> <0-65535>	Configures the metric to apply to redistributed routes.
<i>metric-type</i> <type1 type2>	Specifies a metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone.
<i>route-map</i> WORD<0-64>	Configures the route policy to apply to redistributed routes.
<i>subnets</i> <allow suppress>	Allows or suppresses external subnet route advertisements when routes are redistributed into an OSPF domain.
<i>vrf-src</i> WORD<0-16>	Specifies the optional source VRF instance. You can use this variable with the other command variables.
<bgp direct isis ospf rip static dvr>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, static or dvr.

The following table defines parameters for the **ip ospf apply redistribute** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies the VRF instance.
<i>vrf-src</i> WORD<0-16>	Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF.
WORD<0-32>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static.

## Forcing shortest-path calculation updates

Force the switch to update its shortest-path calculations so that the switch uses the latest OSPF routing information. Manually initiate a shortest path first (SPF) run, or calculation, to immediately update the OSPF LSDB. This action is useful in the following circumstances:

- when you need to immediately restore a deleted OSPF-learned route
- when the routing table entries and the LSDB do not synchronize

### Before You Begin

- You can perform this procedure in one of the following CLI modes: User EXEC, Privileged EXEC, or Global Configuration.

### About This Task

This process is computationally intensive. Use this command only if required.

### Procedure

1. To enter User EXEC mode, log on to the switch.

- Force the router to update its shortest-path calculations:

```
ip ospf spf-run [vrf WORD<1-16>]
```

### Example

Force the router to update its shortest-path calculations:

```
Switch:1>ip ospf spf-run
```

### Variable definitions

The following table defines parameters for the **ip ospf spf-run** command.

Variable	Value
<code>vrf WORD&lt;1-16&gt;</code>	Specifies a VRF instance by name.

## Viewing the OSPF default cost information

View the OSPF default cost information to ensure accuracy.

### Procedure

- Enter Privileged EXEC mode:

```
enable
```

- View the OSPF cost information:

```
show ip ospf default-cost [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Example

View the OSPF cost information on the switch:

```
Switch:1#show ip ospf default-cost vrf 3
```

```
=====
 OSPF Default Metric - VRF 3
=====
10MbpsPortDefaultMetric: 100
100MbpsPortDefaultMetric: 10
1000MbpsPortDefaultMetric: 1
10000MbpsPortDefaultMetric: 1
25000MbpsPortDefaultMetric: 1
40000MbpsPortDefaultMetric: 1
100000MbpsPortDefaultMetric: 1
```

### Variable definitions

The following table defines parameters for the **show ip ospf default-cost** command.

Variable	Value
<code>vrf WORD&lt;1-16&gt;</code>	Specifies a VRF by name.
<code>vrfids WORD&lt;0-512&gt;</code>	Specifies a range of VRF IDs.

## Viewing the OSPF interface statistics

Use statistics to help you monitor OSPF performance.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View the OSPF interface statistics:  
show ip ospf ifstats [detail] [mismatch] [vlan <1-4059>] [vrf WORD<1-16>] [vrfids WORD<0-512>]

### Example

View the OSPF interface statistics:

```
Switch:1#show ip ospf ifstats

=====
 OSPF Interface Statistics - GlobalRouter
=====
INTERFACE ---HELLOS--- ---DBS--- -LS REQ-- --LS UPD--- -LS ACK---
 RX TX RX TX RX TX RX TX RX TX

192.0.2.3 428 431 0 0 0 0 0 0 0 0
192.0.2.11 1454 493 14 13 4 5 66 54 58 3
```

### Variable definitions

The following table defines parameters for the **show ip ospf ifstats** command.

Variable	Value
<1-4059>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
<i>detail</i>	Displays the details of the OSPF.
<i>mismatch</i>	Specifies the number of times the area ID is not matched.
<i>vrf</i> WORD<1-16>	Specifies a VRF by name.
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

## Viewing the OSPF timer information

Display OSPF timers information to ensure accuracy.

### Procedure

1. Enter Privileged EXEC mode:  
enable

- View the OSPF timers information:

```
show ip ospf int-timers [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Example

```
Switch:1#show ip ospf int-timers

=====
 OSPF Interface Timer - GlobalRouter
=====
INTERFACE AREAID TRANSIT RETRANS HELLO DEAD POLL
DELAY INTERVAL INTERVAL INTERVAL INTERVAL

192.0.2.1 0.0.0.0 1 5 10 40 120
192.0.2.11 0.0.0.0 1 5 10 40 120
192.0.2.3 0.0.0.0 1 5 10 40 120
=====

 Ospf Virtual Interface Timer
=====
AREAID NBRIPADDR TRANSIT RETRANS HELLO DEAD
DELAY INTERVAL INTERVAL INTERVAL INTERVAL

```

### Variable definitions

The following table defines parameters for the **show ip ospf int-timers** command.

Variable	Value
<code>vrf WORD&lt;1-16&gt;</code>	Specifies a VRF by name.
<code>vrfids WORD&lt;0-512&gt;</code>	Specifies a range of VRF IDs.

## Viewing the OSPF neighbor information

Displays OSPF neighbor information.

### Procedure

- Enter Privileged EXEC mode:
 

```
enable
```
- View the OSPF neighbor information:
 

```
show ip ospf neighbor [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

### Example

View OSPF neighbor information:

```
Switch:1#show ip ospf neighbor

=====
 OSPF Neighbors - GlobalRouter
=====

NumEnabledOspfAreas:0
```

### Variable definitions

The following table defines parameters for the **show ip ospf stats** command.

Variable	Value
<code>vrf WORD&lt;1-16&gt;</code>	Specifies a VRF by name.
<code>vrfids WORD&lt;0-512&gt;</code>	Specifies a range of VRF IDs.

## Viewing the OSPF virtual link information

Displays the OSPF virtual link information to ensure accuracy.

### Procedure

- Enter Privileged EXEC mode:  
`enable`
- View the OSPF virtual link information:  
`show ip ospf virtual-link {A.B.C.D} {A.B.C.D} [vrf WORD<1-16>] [vrfids WORD<0-512>]`

### Example

View the OSPF virtual link information:

```
Switch:1#show ip ospf virtual-link
```

```

=====
 OSPF Interface AuthKey - GlobalRouter
=====
INTERFACE AUTHTYPE AUTHKEY

192.0.2.11 none

```

*Variable definitions*

The following table defines parameters for the **show ip ospf virtual-link** command.

Variable	Value
{A.B.C.D} {A.B.C.D} vrf WORD<1-16>	Specifies the area ID and the virtual interface ID. The first IP address specifies the area ID and the second specifies the virtual interface ID.
{A.B.C.D} {A.B.C.D} vrfids WORD<0-512>	Displays OSPF configuration for a particular VRF. Specifies a VRF by name.
{A.B.C.D} {A.B.C.D}	Specifies a range of VRF IDs.

## Viewing the VRF configurations

Use the following command to view VRF configurations.

**Procedure**

1. Enter Privileged EXEC mode:  
enable
2. View the VRF configuration:  
show ip ospf vrf WORD<1-16>

**Example**

View the VRF configuration:

```

Switch:1#show ip ospf vrf virtualrandf1

=====
 OSPF General - VRF virtualrandf1
=====

RouterId: 192.0.2.1
AdminStat: disabled
VersionNumber: 2
AreaBdrRtrStatus: false
ASBdrRtrStatus: false
Bad-Lsa-Ignore: false
ExternLsaCount: 0
ExternLsaChecksumSum: 0(0x0)
TOSupport: 0
OriginateNewLsas: 0
RxNewLsas: 0
TrapEnable: false
AutoVirtLinkEnable: false
SpfHoldDownTime: 10
Rfc1583Compatibility: disable

```

```

 default-metric :
 ethernet - 100

--More-- (q = quit)

```

### Variable definitions

The following table defines parameters for the **show ip ospf vrf** command.

Variable	Value
<code>vrf WORD&lt;1-16&gt;</code>	Specifies a VRF by name.

## Viewing the VRFIDS

Use the following command to view VRFIDS.

### Procedure

1. Enter Privileged EXEC mode:
 

```
enable
```
2. View the VRF IDS:
 

```
show ip ospf vrfids WORD<0-512>
```

### Example

View the VRF IDs:

```

Switch:1#show ip ospf vrfids 1

=====
 OSPF General - VRF virtualrandf1
=====

 RouterId: 192.0.2.1
 AdminStat: disabled
 VersionNumber: 2
 AreaBdrRtrStatus: false
 ASBdrRtrStatus: false
 Bad-Lsa-Ignore: false
 ExternLsaCount: 0
 ExternLsaChecksumSum: 0(0x0)
 TOSSupport: 0
 OriginateNewLsas: 0
 RxNewLsas: 0
 TrapEnable: false
 AutoVirtLinkEnable: false
 SpfHoldDownTime: 10
 Rfc1583Compatibility: disable

 default-metric :
 ethernet - 100

--More-- (q = quit)

```

### Variable definitions

The following table defines parameters for the **show ip ospf vrfid** command.

Variable	Value
<i>vrfids</i> WORD<0-512>	Specifies a range of VRF IDs.

## OSPFv3 Configuration using CLI

Use the procedures in this section to configure OSPFv3 using CLI.

### Configuring OSPF globally

Configure OSPFv3 globally to enable it on the system and to configure the router ID.

#### Procedure

1. Enter either Global Configuration mode or VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

Optional: `router vrf WORD<1-16>`

2. Enable OSPFv3 for IPv6:

```
router ospf ipv6-enable
```

The default is disabled.

3. Log on to OSPF Router Configuration mode:

```
router ospf
```

4. Specify the router ID:

```
ipv6 router-id {A.B.C.D}
```

5. Optionally, make the router an autonomous system (AS) boundary router (BR):

```
ipv6 as-boundary-router enable
```

Enable the ASBR if the router attaches at the edge of the OSPF network, and has one or more interfaces that run an interdomain routing protocol. The default is disabled.

#### Example

Enable OSPFv3 for IPv6:

```
Switch:1(config)#router ospf ipv6-enable
```

Log on to OSPF Router Configuration mode:

```
Switch:1(config)#router ospf
```

Specify the router ID:

```
Switch:1(config-ospf)#ipv6 router-id 1.1.1.1
```

*Variable definitions*

Use the data in the following table to use the **ipv6 router-id** command.

Variable	Value
{A.B.C.D}	Specifies a 32-bit integer that identifies the router in the autonomous system. This value must be unique. The default value will be one of the IPv4 interface addresses.

## Creating an OSPF area

Create an area to subdivide the autonomous system (AS) into areas that group contiguous networks, routers that connect to these networks, and attached hosts. Subdividing the AS into areas significantly reduces the amount of routing protocol traffic compared to treating the entire AS like a single link-state domain.

### About This Task

A stub area does not receive advertisements for external routes, which reduces the size of the link-state database (LSDB). A stub area uses only one area border router (ABR). Any packets destined for outside the area are routed to the area border exit point, examined by the ABR, and forwarded to a destination.

A not so stubby area (NSSA) prevents the flooding of AS-External link-state advertisements into the area by replacing them with a default route. NSSAs also import small stub (non- OSPF) routing domains into OSPF.

### Before You Begin

You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace *ipv6* with *ipv6 ospf*.

### Procedure

- Enter OSPF Router Configuration mode:
 

```
enable

configure terminal

router ospf
```
- Specify the area ID:
 

```
ipv6 area {A.B.C.D}
```
- Configure optional area parameters if the default values do not meet your requirements:
  - Configure the area type if you need a stub or NSSA area:
 

```
ipv6 area {A.B.C.D} type <nssa|stub>
```

By default, the area is a normal area; neither a stub nor NSSA area.
  - Configure the default cost:
 

```
ipv6 area {A.B.C.D} default-cost <0-16777215>
```

You do not need to configure this parameter if the area is a normal area.

- c. Configure the area support for importing advertisements:

```
ipv6 area {A.B.C.D} import <external|noexternal|nssa>
```

The default is external.

- d. Disable the importation of summary advertisements into a stub area:

```
no ipv6 area {A.B.C.D} import-summaries enable
```

The default is enabled.

- e. Configure translation of Type 7 LSAs into Type 5 LSAs:

```
ipv6 area {A.B.C.D} translator-role <1-2>
```

The default value is 2-candidate.

### Example

Specify the area ID:

```
Switch:1(config-ospf)#ipv6 area 0.0.0.1
```

#### Variable definitions

Use the data in the following table to use the **ipv6 area** command.

Variable	Value
<i>{A.B.C.D}</i>	Specifies a 32-bit integer to uniquely identify an area. Use 0.0.0.0 for the OSPFv3 backbone.
<i>default-cost</i> <i>&lt;0-16777215&gt;</i>	Configures the metric value advertised for the default route to stub and NSSA areas.
<i>import &lt;external noexternal nssa&gt;</i>	Configures area support for importing AS-external LSAs: <ul style="list-style-type: none"> <li>external—normal area</li> <li>noexternal—stub area</li> <li>nssa—not-so-stubby area</li> </ul> AS-scope LSAs are not imported into stub areas or NSSAs. NSSAs import AS-External data at Type 7 LSAs, which use area scope. The default is external.
<i>import-summaries</i> <i>enable</i>	Controls the import of inter-area LSAs into a stub area. If you disable this parameter, the router does not originate nor propagate inter-area LSAs into the stub area. If you enable this parameter (the default), the router both summarizes and propagates inter-area LSAs.
<i>&lt;nssa stub&gt;</i>	Configures the type of area. By default, the area is neither a stub area or an NSSA.
<i>translator-role</i> <i>&lt;1-2&gt;</i>	Indicates if the NSSA border router can perform NSSA translation of Type 7 LSAs to Type 6 LSAs. The possible values are always (1) or candidate (2). The default is candidate (2).

## Creating OSPF area ranges

Create an area address range on the OSPF router to reduce the number of area border router (ABR) advertisements into other OSPF areas. An area address range is an implied contiguous range of area network addresses for which the ABR advertises a single summary route.

### Before You Begin

- You must create the OSPF area.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace `ipv6` with `ipv6 ospf`.

### About This Task

If you create two ranges, and one range is a subset of the other, the router uses the most specific match.

### Procedure

- Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```

- Create an area range:

```
ipv6 area range {A.B.C.D} WORD<0-255> [inter-area-prefix-link|nssa-
extlink] advertise-mode <advertise|not-advertise> [advertise-metric
<0-65535>]
```

### Example

Create an area range:

```
Switch:1(config-ospf)#ipv6 area range 0.0.0.1 3000::0/16 advertise-mode
advertise
```

### Variable definitions

Use the data in the following table to use the **ipv6 area range** command.

Variable	Value
<code>{A.B.C.D}</code>	Specifies the area in which the address aggregate exists. Use dotted decimal notation to specify the area name.
<code>advertise-metric</code> <code>&lt;0-65535&gt;</code>	Specifies a cost value to advertise for the OSPF area range. This value applies to summary LSAs (Type 3). If the value is 0, OSPF uses the cost to the farthest point in the network that is summarized.
<code>advertise-mode</code> <code>&lt;advertise not-</code> <code>advertise&gt;</code>	Specifies the advertisement mode for prefixes in the range. <code>advertise</code> advertises the aggregate summary LSA with the same link-state ID. <code>not-advertise</code> does not advertise networks that fall within the range. The default is <code>advertise</code> .

Variable	Value
<code>&lt;inter-area-prefix-link nssa-extlink&gt;</code>	Specifies the area LSDB type to which the address aggregate applies. <i>inter-area-prefix-link</i> generates an aggregated summary. <i>nssa-extlink</i> generates an NSSA link summary.
<code>WORD&lt;0-255&gt;</code>	Specifies the IPv6 address and prefix.

## Creating an OSPF virtual link

Create a virtual link if the switch does not connect directly to the backbone. The switch can create automatic virtual links or you can perform this procedure to create virtual links manually. Manual virtual links conserve resources and provide specific control over virtual link placement in your OSPF configuration.

### Before You Begin

- The router must be an ABR to create a virtual router interface.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace *ipv6* with *ipv6 ospf*.

### About This Task

Virtual linking is similar to backup redundancy. The switch creates a virtual link for vital traffic paths in your OSPF configuration if traffic is interrupted, such as when an interface cable that provides a connection to the backbone (either directly or indirectly) is disconnected from the switch. Automatic virtual linking ensures that a link is created by using another switch.

OSPF routes cannot be learned through an ABR unless it connects to the backbone directly or through a virtual link.

### Procedure

1. Enter OSPF Router Configuration mode:
 

```
enable

configure terminal

router ospf
```
2. Create a virtual link:
 

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D}
```
3. Configure optional parameters for the virtual link if the default values do not meet your requirements:
  - a. Configure the router dead interval:
 

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} dead-interval <1-65535>
```

The default is 60 seconds.
  - b. Configure the hello interval:
 

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} hello-interval <1-65535>
```

The default is 10 seconds.

- c. Configure the retransmit interval:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} retransmit-interval
<1-1800>
```

The default is 5 seconds.

- d. Configure the transit delay:

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} transit-delay <1-1800>
```

The default is 1 second.

### Example

Create a virtual link:

```
Switch:1(config-ospf)#ipv6 area virtual-link 0.0.0.1 2.2.2.2
```

Configure optional parameters for a virtual link:

```
Switch:1(config-ospf)#ipv6 area virtual-link 0.0.0.1 4.4.4.4 dead-
interval 90 retransmit-interval 10
```

### Variable definitions

Use the data in the following table to use the **ipv6 area virtual-link** command.

Variable	Value
<i>{A.B.C.D}</i> <i>{A.B.C.D}</i>	Specifies the ID for the transit area that the virtual link traverses and the router ID of the virtual neighbor. Do not use 0.0.0.0 for the transit area.
<i>dead-interval</i> <i>&lt;1-65535&gt;</i>	Specifies the number of seconds after which the neighbor declares the router down if it does not receive hello packets. Configure this value as a multiple of the hello interval. You must configure the same value on the virtual neighbor. The default is 60 seconds.
<i>hello-interval</i> <i>&lt;1-65535&gt;</i>	Specifies the number of seconds between hello packets that the router sends on this interface. Configure the same value on the virtual neighbor. The default is 10 seconds.
<i>retransmit-interval</i> <i>&lt;1-1800&gt;</i>	Specifies the number of seconds between link-state advertisement retransmissions for adjacencies that belong to this interface. This value also applies to the retransmissions of database description and link-state request packets. The default is 5 seconds.
<i>transit-delay</i> <i>&lt;1-1800&gt;</i>	Specifies the estimated number of seconds to transmit a link-state update packet over this interface. The default is 1 second.

## Configure IPsec for the OSPF Virtual Link

Use the following procedure to configure and enable IPsec for the OSPF virtual link.

IPsec is disabled by default.

### Before You Begin

- Configure the OSPF virtual link.

- Create the IPsec security association.

### About This Task

Until you enable IPsec on both sides of the virtual links, the links cannot exchange OSPFv3 control messages, and the system drops OSPFv3 exchange packets.

You must disable IPsec before you can perform virtual link policy configuration changes.

For configuration examples of IPsec used with OSPFv3 virtual link, see [OSPFv3 virtual link IPsec configuration example](#) on page 1735.

### Procedure

1. Enter OSPF Router Configuration mode:
 

```
enable

configure terminal

router ospf
```
2. Create the IPsec policy under the OSPF virtual link:
 

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec
```
3. Configure the action of the IPsec policy under the OSPF virtual link:
 

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec action <drop|permit>
```
4. Configure the direction of the IPsec policy under the OSPF virtual link:
 

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec direction <both|in|out>
```
5. Link the security association to the OSPF virtual link:
 

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec security-association WORD<0-32>
```
6. Enable the IPsec policy created under the OSPF virtual link:
 

```
ipv6 area virtual-link {A.B.C.D} {A.B.C.D} ipsec enable
```

### Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1#(config)router ospf
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec action permit
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec direction both
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec security-association test1
Switch:1(config-ospf)#ipv6 area virtual-link 1.1.1.1 2.2.2.2 ipsec enable
```

#### Variable definitions

Use the data in the following table to use the **ipv6 area virtual link {A.B.C.D} {A.B.C.D} ipsec** command.

Variable	Value
<code>{A.B.C.D} {A.B.C.D}</code>	The first IP address specifies the area IP address, and the second IP address specifies the virtual-link IP address.
<code>action &lt;drop permit&gt;</code>	Configures the action of the IPsec policy under the OSPF virtual tunnel to one of the following: <ul style="list-style-type: none"> <li>• drop—Drops the IP packets.</li> <li>• permit—Permits the IP packets.</li> </ul> The default is permit.
<code>direction &lt;both in out&gt;</code>	Specifies the direction you want to protect with IPsec: <ul style="list-style-type: none"> <li>• in—Specifies ingress traffic.</li> <li>• out—Specifies egress traffic.</li> <li>• both—Specifies both ingress and egress traffic.</li> </ul> The default is both.
<code>enable</code>	Enables the IPsec policy under the OSPF virtual link.
<code>security-association WORD&lt;0-32&gt;</code>	Links the security association to the OSPF virtual link.

## Configuring OSPF default metrics

### Before You Begin

You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace `ipv6` with `ipv6 ospf`.

### About This Task

Use the following procedure to configure global OSPF default metrics.

### Procedure

1. Enter OSPF Router Configuration mode:

```
enable
```

```
configure terminal
```

```
router ospf
```

2. Configure OSPF default-cost:

```
ipv6 default-cost {ethernet|fast-ethernet|forty-gig-ethernet|hundred-gig-ethernet|gig-ethernet|ten-gig-ethernet|twentyfive-gig-ethernet|vlan} <1-65535>
```

#### Note

Different hardware platforms support different port speeds. For more information, see your hardware documentation.

## Example

Configure IPv6 default cost metric for Ethernet to 100, for fast Ethernet to 20, for gig-ethernet, twentyfive-gig-ethernet, forty-gig-Ethernet, and hundred-gig-ethernet to 2, and VLAN to 1.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#ipv6 default-cost ethernet 100
Switch:1(config-ospf)#ipv6 default-cost fast-ethernet 20
Switch:1(config-ospf)#ipv6 default-cost gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost ten-gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost Forty-gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost twentyfive-gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost hundred-gig-ethernet 2
Switch:1(config-ospf)#ipv6 default-cost vlan 1
```

### Variable definitions

Use the data in the following table to use the **ipv6 default-cost** command.

#### Note

Different hardware platforms support different port speeds. For more information, see your hardware documentation.

Variable	Value
<i>ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>ethernet</i> is for 10 Mb/s Ethernet (default is 100).
<i>fast-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>fast-ethernet</i> is for 100 Mb/s Fast-Ethernet (default is 10).
<i>forty-gig-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>forty-gig-ethernet</i> is for 10 Mb/s Forty-Gigabit-Ethernet (default is 1).
<i>gigabit-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>gigabit-ethernet</i> is for 10 Mb/s Gigabit-Ethernet (default is 1).
<i>hundred-gig-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>hundred-gig-ethernet</i> is for 100 Gigabit Ethernet (default is 1).
<i>ten-gig-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>ten-gig-ethernet</i> is for 10 Mb/s Ten-Gigabit-Ethernet (default is 1).
<i>twentyfive-gig-ethernet</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. On a channelized 100 Gbps port, the default-cost for each 25 Gbps channel is 1.
<i>vlan</i> <1-65535>	Configures the IPv6 OSPF default metrics. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet. <i>vlan</i> is for Vlan interfaces (default is 10).

## Configuring OSPF on a port or VLAN

Configure the OSPF protocol on IPv6 interface to support dynamic routing on the interface.

### Before You Begin

- The IPv6 interface must exist.

### Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create an OSPF area on the interface:

```
ipv6 ospf area {A.B.C.D}
```

3. Enable OSPFv3 on the interface:

```
ipv6 ospf enable
```

The default is disabled.

4. Configure optional parameters to meet your requirements:

- a. Configure the interface metric:

```
ipv6 ospf cost <0-65535>
```

The default for a brouter port or VLAN is 1.

#### Note

If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface.

- b. Configure the router dead interval:

```
ipv6 ospf dead-interval <1-65535>
```

The default is 40 seconds.

- c. Configure the hello interval:

```
ipv6 ospf hello-interval <1-65535>
```

The default is 10 seconds.

- d. Configure the link LSA suppression:

```
ipv6 ospf link-lsa-suppression
```

**Note**

Before configuring Link LSA suppression for OSPF, configure Link LSA suppression for OSPF area for point to point (p2p) or point to multipoint interfaces (p2mp), otherwise it defaults to a broadcast interface type where you cannot use Link LSA suppression.

- e. Configure the poll interval:

```
ipv6 ospf poll-interval <0-65535>
```

The default is 120 seconds.

- f. Configure the interface priority:

```
ipv6 ospf priority <0-255>
```

The default is 1.

- g. Configure the retransmit interval:

```
ipv6 ospf retransmit-interval <1-1800>
```

The default is 5 seconds.

- h. Configure the transit delay:

```
ipv6 ospf transit-delay <1-1800>
```

The default is 1 second.

**Example**

Create an OSPF area on the interface:

```
Switch:1(config-if)#ipv6 ospf area 0.0.0.0
```

Enable OSPFv3 on the interface:

```
Switch:1(config-if)#ipv6 ospf enable
```

*Variable definitions*

Use the data in the following table to use the **ipv6 ospf** command.

Variable	Value
<i>area {A.B.C.D}</i>	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.
<i>cost &lt;0-65535&gt;</i>	Specifies the cost for the interface. The default for a brouter port or VLAN is 1.
<i>dead-interval &lt;1-65535&gt;</i>	Specifies the number of seconds after which the neighbor declares the router down, if it does not receive hello packets. Configure this value as a multiple of the hello interval. You must configure the same value on the virtual neighbor. The default is 40 seconds.

Variable	Value
<i>enable</i>	Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is disabled.
<i>hello-interval</i> <1-65535>	Specifies the number of seconds between hello packets that the router sends on this interface. Configure the same value on the virtual neighbor. The default is 10 seconds.
<i>link-lsa-suppression</i>	Configures link LSA suppression on the specified port or VLAN. It is only used for point to point or point to multipoint interfaces. By default, it is disabled.
<i>poll-interval</i> <0-65535>	Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120.
<i>priority</i> <0-255>	Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election. A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router. The default is 1.
<i>retransmit-interval</i> <1-1800>	Specifies the number of seconds between link-state advertisement retransmissions for adjacencies that belong to this interface. This value also applies to the retransmissions of database description and link-state request packets. The default is 5 seconds.
<i>transit-delay</i> <1-1800>	Specifies the estimated number of seconds to transmit a link-state update packet over this interface. The default is 1 second.

Use the data in the following table to use the **interface** command.

Variable	Value
<1-4059>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}	Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

## Configuring OSPF on a tunnel

Configure the OSPF protocol on IPv6 interface to support dynamic routing on the interface.

### Before You Begin

- The IPv6 interface must exist.

## Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```
2. Create an OSPF area on the interface:

```
ipv6 tunnel <1-2000> area {A.B.C.D}
```
3. Enable OSPFv3 on the interface:

```
ipv6 tunnel <1-2000> enable
```
4. Configure optional parameters to meet your requirements:
  - a. Configure the router dead interval:

```
ipv6 tunnel <1-2000> dead-interval <1-65535>
```

The default is 40 seconds.
  - b. Configure the hello interval:

```
ipv6 tunnel <1-2000> hello-interval <1-65535>
```

The default is 10 seconds.
  - c. Configure the interface metric:

```
ipv6 tunnel <1-2000> metric <0-65535>
```
  - d. Configure the poll interval:

```
ipv6 tunnel <1-2000> poll-interval <0-65535>
```

The default is 120 seconds.
  - e. Configure the interface priority:

```
ipv6 tunnel <1-2000> priority <0-255>
```

The default is 1.
  - f. Configure the retransmit interval:

```
ipv6 tunnel <1-2000> retransmit-interval <1-1800>
```

The default is 5 seconds.
  - g. Configure the transit delay:

```
ipv6 tunnel <1-2000> transit-delay <1-1800>
```

The default is 1 second.

## Example

Create an OSPF area on the interface:

```
Switch:1(config-if)#ipv6 tunnel 4 area 0.0.0.0
```

Enable OSPFv3 on the interface:

```
Switch:1(config-if)#ipv6 tunnel 4 enable
```

## Variable definitions

Use the data in the following table to use the **ipv6 tunnel** command.

Variable	Value
<1-2000>	Specifies the tunnel ID.
<i>area</i> {A.B.C.D}	Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone.
<i>dead-interval</i> <1-65535>	Specifies the number of seconds after which the neighbor declares the router down if it does not receive hello packets. Configure this value as a multiple of the hello interval.  <b>Tip:</b> You must configure the same value on the virtual neighbor.  The default is 40 seconds.
<i>enable</i>	Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled.
<i>hello-interval</i> <1-65535>	Specifies the number of seconds between hello packets that the router sends on this interface.  <b>Tip:</b> You must configure the same value on the virtual neighbor.  The default is 10 seconds.
<i>metric</i> <0-65535>	Specifies the cost for the interface. The default for a tunnel is 100.
<i>poll-interval</i> <0-65535>	Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120.
<i>priority</i> <0-255>	Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election. A higher priority value increases the likelihood that the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the system uses the router ID to determine which router becomes the designated router. The default is 1.
<i>retransmit-interval</i> <1-1800>	Specifies the number of seconds between link-state advertisement retransmissions for adjacencies that belong to this interface. The retransmit-interval value also applies to the retransmissions of database description and link-state request packets. The default is 5 seconds.
<i>transit-delay</i> <1-1800>	Specifies the estimated number of seconds required to transmit a link-state update packet over this interface. The default is 1 second.

## Viewing OSPFv3 Information

View information about OSPF to view the current configuration.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View OSPF global information:  
show ipv6 ospf [vrf WORD <1-16>] [vrfids WORD <0-512>]
3. View OSPF areas:  
show ipv6 ospf area [vrf WORD <1-16>] [vrfids WORD <0-512>]
4. View OSPF interface information  
show ipv6 ospf interface [gigabitEthernet {slot/port[sub-port]}|vlan <1-4059>] [vrf WORD <1-16>] [vrfids WORD <0-512>]
5. View OSPF interface timers:  
show ipv6 ospf int-timers [vrf WORD <1-16>] [vrfids WORD <0-512>]
6. View the link-state database (LSDB) table:  
show ipv6 ospf lsdb [adv-rtr <A.B.C.D>] [area <A.B.C.D>] [interface gigabitEthernet {slot/port[sub-port]}|vlan <1-4059> ] [lsa-type <1-11>] [lsid <0-4294967295>] [scope <1-3>] [tunnel <1-2000>] [detail] [vrf WORD <1-16>] [vrfids WORD <0-512>]
7. View OSPF neighbors to see routers with interfaces to a common network, including neighbors on the virtual link to the OSPF backbone:  
show ipv6 ospf neighbor [vrf WORD <1-16>] [vrfids WORD <0-512>]

### Example

```
Switch:1#show ipv6 ospf

*Variable Definitions*

Use the data in the following table to use the **show ipv6 ospf** commands.

Variable	Value
<i>adv-rtr</i> <A.B.C.D>	Shows information for the specified advertising router.
<i>area</i> <A.B.C.D>	Shows information for the specified area.
<i>detail</i>	Shows information beyond the basic information.
{ <i>slot/port[/sub-port]</i> }	Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<i>lsa-type</i> <1-11>	Shows information for the specified LSA type.
<i>lsid</i> <0-4294967295>	Shows information for the specified link-state ID.
<i>scope</i> <1-3>	Shows information for the specified scope: <ul style="list-style-type: none"> <li>1. link-scope LSAs-View the link-scope LSDB to view the LSAs that are not flooded beyond the local link.</li> <li>2. area-scope LSAs-View the area-scope LSDB to see the LSAs that are flooded in a single OSPF area. Area scope is used in router LSAs, network LSAs, Inter-Area-Prefix-LSAs, Inter-Area-Router LSAs, and Intra-Area-Prefix-LSAs.</li> <li>3. AS-scope LSAs-View the AS-scope LSDB to see the LSAs that are flooded through the routing domain. The AS scope is used for ASexternal- LSAs.</li> </ul>
<i>tunnel</i> <1-2000>	Specifies the ID number of the tunnel.

Variable	Value
<code>vlan &lt;1-4059&gt;</code>	Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <code>vrf-scaling</code> and <code>spbm-config-mode</code> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
<code>vrf WORD&lt;1-16&gt;</code>	Specifies the VRF name.
<code>vrfids WORD&lt;0-512&gt;</code>	Specifies VRF IDs.

## Viewing OSPFv3 Default Cost Information

### About This Task

Use the following procedure to view the OSPF default cost information, to ensure accuracy.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View the OSPF cost information:  
show ipv6 ospf default-cost [vrf WORD <1-16>] [vrfids WORD <0-512>]

### Example

```
Switch:1#show ipv6 ospf default-cost
=====
 IPv6 OSPF Default Metric - GlobalRouter
=====
 10MbpsPortDefaultMetric: 100
 100MbpsPortDefaultMetric: 10
 1000MbpsPortDefaultMetric: 1
 10000MbpsPortDefaultMetric: 1
 25000MbpsPortDefaultMetric: 1
 40000MbpsPortDefaultMetric: 1
 100000MbpsPortDefaultMetric: 1
 VlanDefaultMetric: 10
```

## Adding an NBMA neighbor

Add an NBMA neighbor for each interface that is eligible to become the DR.

An NBMA interface with a positive nonzero router priority is eligible to become the DR for the NBMA network and is configured with the identification of all attached routers, IPv6 addresses, and router priorities.

### Before You Begin

- Identify the following information:
  - specific interfaces to include in the NBMA network
  - the IPv6 address for each interface

- the router priority for each interface
- the hello interval for the network
- the router dead interval for the network
- the poll interval for the network

### About This Task

In contrast to a broadcast network where switches multicast (send to AllSPFRouters and AllDRouters) certain OSPF protocol packets, switches replicate and send NBMA packets to each neighboring router as unicast. NBMA networks drop all OSPF packets with destination addresses AllSPFRouters and AllDRouters. Because the NBMA network does not broadcast, you must manually configure a list of neighbors and priorities for all routers in the network that can become the DR. Potential DRs use a positive nonzero router priority.

### Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create a new NBMA neighbor:

```
ipv6 ospf nbma-nbr WORD<0-43> <0-255>
```

3. Change the priority of an existing NBMA neighbor:

```
ipv6 ospf nbma-nbr WORD<0-43> priority <0-255>
```

### Example

Create an NBMA neighbor that will not become the DR:

```
Switch:1(config-if)#ipv6 ospf nbma-nbr fe80:0:0:0:8217:7dff:fe76:8a03 0
```

#### Variable definitions

Use the data in the following table to use the **ipv6 ospf nbma-nbr** command.

Variable	Value
<i>priority</i> <0-255>	Specifies the priority to use for this neighbor in the designated router election process. A value of 0 indicates the neighbor cannot become the designated router. The higher the priority value, the higher chance the switch will win the election process. The default is 1.
<i>WORD</i> <0-43>	Specifies the IPv6 address of the neighbor.

## Configuring link LSA suppression

### About This Task

Use the following procedure to configure link LSA suppression on a port or a VLAN, to decrease unnecessary link LSA generation and flooding for non-broadcast and non-NBMA interface.

### Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

#### Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enter the following command:

```
ipv6 ospf area {A.B.C.D} network {p2p | p2mp} link-lsa-suppression
```

### Example

#### Variable definitions

Following table describes the variables to the **ipv6 ospf area {A.B.C.D} network p2p link-lsa-suppression** command.

Variable	Description
<i>area {A.B.C.D}</i>	Create an IPv6 OSPF area.
<i>network</i>	Sets the type of interface.
<i>[eth NBMA p2mp p2p passive]</i>	Specifies the type of interface.
<i>link-lsa-suppression</i>	Enables link LSA suppression.

## Configuring Route Redistribution to OSPFv3 in GRT mode

Configure a redistribute entry to announce certain routes into the OSPFv3 domain, including static routes, direct routes, RIPng, OSPF routes, IS-IS routes, or Border Gateway Protocol (BGP) routes. Optionally, use a route policy to control the redistribution of routes.

#### Note

RIPng is not virtualized, therefore RIPng redistribution in OSPFv3 works only in GRT.

### Before You Begin

- Enable OSPFv3 globally.
- Ensure that a route policy exists.
- Ensure that you set OSPFv3 as the boundary router.

#### Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For a redistribute policy (OSPFv3) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where the last sequence permits all routes that are not explicitly permitted or denied.
- You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace *ipv6* with *ipv6 ospf*.

### Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```

2. Create the redistribution instance:

```
ipv6 redistribute <bgp|direct|isis|rip|static>
```

#### Note

The switch loads the existing configuration when you upgrade to the current release. Once you have the configuration file saved using the current release, only the new configuration will be loaded.

3. Apply a route policy if required:

```
ipv6 redistribute <bgp|direct|isis|rip|static> route-map WORD<0-64>
```

#### Note

No inter-vrf Route Redistribution is supported for IPv6.

4. Configure other parameters, as required.
5. Enable the redistribution.

```
ipv6 redistribute <bgp|direct|isis|rip|static> enable
```

6. Ensure that the configuration is correct:

```
show ipv6 ospf redistribute [vrf WORD<1-16>] [vrfs WORD<0-512>]
```

7. Exit to Global Configuration mode:

```
exit
```

8. Apply the redistribution.

```
ipv6 ospf apply redistribute <bgp|direct|isis|rip|static> [vrf WORD<1-16>]
```

Changes do not take effect until you apply them.

9. View all routes that are redistributed into OSPFv3:

a. View the routes that are redistributed from the GRT to OSPFv3:

```
show ipv6 ospf redistribute
```

b. View the routes that are redistributed to OSPFv3 for a specific VRF instance:

```
show ipv6 ospf redistribute [vrf WORD<1-64>] [vrfids WORD<0-512>]
```

### Example

Redistribute static routes from the GRT to OSPF.

Create the redistribution instance, apply a route policy, enable redistribution, and apply the redistribution.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
Switch:1(config-ospf)#ipv6 redistribute static

WARNING: Routes will not be injected until apply command is issued after enable command
Switch:1(config-ospf)#ipv6 redistribute static route-map policy1
Switch:1(config-ospf)#ipv6 redistribute static enable
Switch:1(config-ospf)#exit
Switch:1(config)#ipv6 ospf apply redistribute static
Switch:1(config)#show ipv6 ospf redistribute

=====
 OSPFv3 Redistribute List - GlobalRouter
=====
SRC MET MTYPE ENABLE RPOLICY

STAT 0 type2 TRUE policy1
```

### Variable Definitions

Use the data in the following table to use the **ipv6 redistribute** command.

Variable	Value
<i>enable</i>	Enables the OSPF route redistribution instance.
<i>metric &lt;0-65535&gt;</i>	Configures the metric to apply to redistributed routes.
<i>metric-type &lt;type1 type2&gt;</i>	Specifies a type 1 or a type 2 metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone.
<i>route-map WORD&lt;0-64&gt;</i>	Configures the route policy to apply to redistributed routes.
<i>&lt;bgp direct isis rip static&gt;</i>	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, or static.

Use the data in the following table to use the **ipv6 ospf apply redistribute** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies the VRF instance.
< <i>bgp</i>   <i>direct</i>   <i>isis</i>   <i>rip</i>   <i>static</i> >	Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, or static.

## Viewing the Status of OSPFv3 Redistribution

View the status of OSPFv3 route redistribution to verify the current configuration. You can redistribute directly connected routes and IPv6 static routes into OSPFv3.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View the current configuration:  
show ipv6 ospf redistribute [*vrf* WORD <1-16>] [*vrfids* WORD <0-512>]

### Example

```
Switch:1#show ipv6 ospf redistribute

=====
 OSPFv3 Redistribute List - GlobalRouter
=====
SOURCE MET MTYPE ENABLE RPOLICY

Static 0 external TRUE

```

### Variable Definitions

Use the data in the following table to use the **show ipv6 ospf redistribute** command.

Variable	Value
<i>vrf</i> WORD<1-16>	Specifies the VRF name.
<i>vrfids</i> WORD<0-512>	Specifies VRF IDs.

## Disabling Helper mode for OSPFv3

### Before You Begin

You configure OSPF on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router configuration mode and replace *ipv6* with *ipv6 ospf*.

### About This Task

By default, OSPF Helper mode is enabled when OSPF is configured. You can disable helper mode by the following command and re-enable it again by using “no” or “default” commands.

### Procedure

1. Enter OSPF Router Configuration mode:  

```
enable

configure terminal

router ospf
```
  2. Enter the following command to disable Helper mode:  

```
ipv6 helper-mode-disable
```
  3. Enter the following command to enable Helper mode:  

```
no ipv6 helper-mode-disable
```
- Or
- ```
default ipv6 helper-mode disable
```

Example

Disabling Helper mode:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#router ospf  
Switch:1(config-ospf)#ipv6 helper-mode-disable
```

Enabling Helper mode:

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1(config)#router ospf  
Switch:1(config-ospf)#no ipv6 helper-mode-disable
```

OSPF configuration using EDM

Configure Open Shortest Path First (OSPF) parameters so that the switch can participate in OSPF routing operations. The following section describes procedures that you use while you configure OSPF using Enterprise Device Manager (EDM).

Configuring OSPF globally

Configure OSPF parameters, such as automatic virtual links and OSPF metrics, so you can control OSPF behavior on the system.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.
- Assign an IP address to the switch.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.

3. Click the **General** tab.
4. Specify the OSPF router ID.
5. In AdminStart, select **enabled**.
6. (Optional) If required, configure the metrics that OSPF uses for different link speeds.
The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet.
7. (Optional) To enable the switch to use OSPF SNMP traps, select the **TrapEnable** check box.
8. (Optional) To enable the automatic creation of virtual links, select the **AutoVirtLinkEnable** check box.
9. (Optional) Configure the OSPF holddown timer as required.
10. Click **Apply**.

General field descriptions

Use the data in the following table to use the **General** tab.

| Name | Description |
|---------------------------------|--|
| RouterId | Specifies the OSPF router ID. This variable has the same format as an IP address but distinguishes this router from other routers in the OSPF domain. |
| AdminStat | Shows the administrative status of OSPF for the router. Enabled denotes that the OSPF process is active on at least one interface; disabled disables it for all interfaces. The default is disabled. |
| VersionNumber | Specifies the OSPF version. |
| AreaBdrRtrStatus | Denotes if this router is an area border router (ABR). AreaBdrRtrStatus value must be true to create a virtual router interface. |
| ASBdrRtrStatus | Specifies ASBR status. If you select the ASBdrRtrStatus check box, the router is an autonomous system boundary router (ASBR). |
| ExternLsaCount | Shows the number of external (LS type 5) link-state advertisements in the link-state database. |
| ExternLsaChecksumSum | Shows the 32-bit unsigned sum of the link-state checksums of the external link-state advertisements in the link-state database. This sum determines if a change occurred in a router link-state database and compares the link-state databases of two routers. |
| OriginateNewLsas | Shows the number of new link-state advertisements originated from this router. This number increments each time the router originates a new link-state advertisement (LSA). |
| RxNewLsas | Shows the number of received link-state advertisements that are new instances. This number does not include new instances of self-originated link-state advertisements. |
| 10MbpsPortDefaultMetric | Indicates the default cost applied to 10 Mbps interfaces (ports). The default is 100. |
| 100MbpsPortDefaultMetric | Indicates the default cost applied to 100 Mbps interfaces (ports). The default is 10. |

| Name | Description |
|------------------------------------|---|
| 1000MbpsPortDefaultMetric | Indicates the default cost applied to 1 Gbps interfaces (ports). The default is 1. |
| 10000MbpsPortDefaultMetric | Indicates the default cost applied to 10 Gbps interfaces (ports). The default is 1. |
| 25000MbpsPortDefaultMetric | Indicates the default cost applied to 25 Gbps interfaces (channelized 100 Gbps ports). The default is 1. |
| 40000MbpsPortDefaultMetric | Indicates the default cost applied to 40 Gbps interfaces (ports). The default is 1. |
| 100000MbpsPortDefaultMetric | Indicates the default cost applied to 100 Gbps interfaces (ports). The default is 1. |
| VlanDefaultMetric | Configures the VLAN interfaces default metric. The default is 10. |
| TrapEnable | Indicates whether to enable traps for OSPF. The default is false. |
| AutoVirtLinkEnable | Enables or disables the automatic creation of virtual links. The default is false. |
| SpfHoldDownTime | Specifies the OSPF holddown timer (3–60 seconds). The default is 10 seconds.
The holddown timer delays a metric change due to a routing table update by x seconds. If you configure the timer to 0, OSPF accepts a new metric change immediately. |
| OspfAction | Initiates a new Shortest Path First (SPF) run to update the routing table. The default is none. |
| Rfc1583Compatability | Controls the preference rules used when the router chooses among multiple autonomous system external (ASE) LSAs which advertise the same destination. If enabled, the preference rule is the same as that specified by RFC 1583. If disabled, the preference rule is as described in RFC 2328, which can prevent routing loops when ASE LSAs for the same destination originate from different areas. The default is disable. |
| LastSpfRun | Indicates the time since the last SPF calculation made by OSPF. |
| HelperModeDisable | Disables the helper mode. It is enabled by default. |

Enabling OSPF globally

Enable OSPF globally enabled to use the protocol on the router. If you disable OSPF globally, all OSPF actions cease.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **General** tab.
4. For **AdminStat**, select the **enabled** or **disabled** option button, as required.

5. Click **Apply**.

Configuring global default metrics

Configure the metrics that OSPF uses for different link speeds. The lower the metric, the more likely that OSPF chooses the link to route an OSPF packet.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **General** tab.
4. Change the metric for one or all of the following:
 - 10MbpsPortDefaultMetric
 - 100MbpsPortDefaultMetric
 - 1000MbpsPortDefaultMetric
 - 10000MbpsPortDefaultMetric
 - 25000MbpsPortDefaultMetric
 - 40000MbpsPortDefaultMetric
 - 100000MbpsPortDefaultMetric
5. Click **Apply**.

Configuring an OSPF interface

Configure OSPF parameters, such as authentication and priority, so you can control OSPF interface behavior. You can specify the interface as passive, broadcast, or Non-Broadcast Multiple Access (NBMA).

Before You Begin

- Enable OSPF globally.
- Ensure that the interface exists (the port or VLAN has an IP address).
- You must know the network OSPF password to use password authentication.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Interfaces** tab.
4. Click **Insert**.
5. Select the IP address for the interface from the IP Address list.
6. To designate a router priority, in the **RtrPriority** box, type a new value.

7. In the **Type** area, select the type of OSPF interface you want to create.
8. Select the authentication type you want in the **AuthType** field.
9. If you chose **simplePassword**, in the **AuthKey** box, type a password of up to eight characters.
10. To change their values, select the current value in the **HelloInterval**, **RtrDeadInterval**, or **PollInterval** boxes, and then type new values.
11. Click **Insert**.
12. On the **Interfaces** tab, click **Apply**.

Interfaces Field Descriptions

Use the data in the following table to use the **Interfaces** tab.

| Name | Description |
|-------------------------------|--|
| IP Address | Specifies the IP address of the current OSPF interface |
| AddressLessIf | Designates whether an interface has an IP address:
Interfaces with an IP address = 0
Interfaces without IP address = ifIndex |
| AreaId | Specifies the OSPF area name in dotted-decimal format. For VLANs, keeping the default area setting on the interface causes link-state database (LSDB) inconsistencies. The area name is not related to an IP address. You can use a suitable value for the OSPF area name (for example, 1.1.1.1 or 200.200.200.200). |
| AdminStat | Specifies the current administrative status of the OSPF interface (enabled or disabled). |
| State | Specifies the current state of the OSPF interface. The value can be one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesignatedRouter • otherDesignatedRouter |
| RtrPriority | Specifies the OSPF priority to use during the election process for the designated router. The interface with the highest priority becomes the designated router. The interface with the second-highest priority becomes the backup designated router. If the priority is 0, the interface cannot become the designated router or the backup. The range is 0–255. The default is 1. |
| DesignatedRouter | Specifies the IP address of the designated router. |
| BackupDesignatedRouter | Specifies the IP address of the backup designated router. |

| Name | Description |
|------------------------|--|
| Type | <p>Specifies the type of OSPF interface (broadcast or NBMA).</p> <p>Note:
To make it passive, first create the interface. After interface creation, click VLAN > VLANs to select the VLAN that is created with the OSPF interface. Click the IP tab and select the IP interface that is created with the OSPF interface. Lastly, click the OSPF tab and select Passive for the IfType.</p> |
| AuthType | <p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note:
sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p> |
| AuthKey | <p>Specifies the key (up to 8 characters) required when you specify simple password authentication in the AuthType parameter.</p> |
| HelloInterval | <p>Specifies the length of time, in seconds, between hello packets. This value must be the same for all routers attached to a common network. The default is 10 seconds.</p> <p>After you change the hello interval values, you must save the configuration file, and then restart the switch. After the switch restarts, it restores the values and checks for consistency.</p> |
| TransitDelay | <p>Specifies the length of time, in seconds, required to transmit an LSA update packet over the interface. The default is 1.</p> |
| RetransInterval | <p>Specifies the length of time, in seconds, required between LSA retransmissions. The default is 5.</p> |
| RtrDeadInterval | <p>Specifies the interval used by adjacent routers to determine if the router was removed from the network. This interval must be identical on all routers on the subnet and a minimum of four times the Hello interval. To avoid interpretability issues, the RtrDeadInterval value for the OSPF interface must match with the RtrDeadInterval value for the OSPF virtual interface. The default is 40 seconds.</p> |

| Name | Description |
|---------------------|--|
| PollInterval | Specifies the length of time, in seconds, between hello packets sent to an inactive OSPF router. The default is 120. |
| Events | Indicates the number of times this OSPF interface has changed state, or an error has occurred. |

Changing an OSPF non-passive interface type

Change the interface type to designate the interface as either passive, NBMA, or broadcast.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- If the interface is currently an NBMA interface with manually configured neighbors, you must first delete all manually configured neighbors.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Interfaces** tab.
4. To disable the interface, double-click the **AdminStat** cell, and then select **disabled**.
5. Click **Apply**.
6. To change the interface type, double-click the **Type** cell, and then choose the new interface type.
7. Click **Apply**.
8. To enable the interface, double-click the **AdminStat** cell, and then select **enabled**.
9. Click **Apply**.

Changing an OSPF passive interface type

Change the interface type to designate the interface as either passive, NBMA, or broadcast.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- If the interface is currently an NBMA interface with manually configured neighbors, you must first delete all manually configured neighbors.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Click **VLANs**.

3. Click on the VLAN where the OSPF interface is created.
4. Click **IP**.
5. Select the IP Address where the OSPF interface is created.
6. Click the **OSPF** tab.
7. Clear the **Enable** check box to disable the OSPF interface.
8. Click **Apply**.
9. Modify the interface type to passive.
10. Select the **Enable** check box.
11. Click **Apply**.

Viewing the OSPF advanced interface

View the OSPF advanced interface.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Interface Advanced** tab.

Interface Advanced field description

Use the data in the following table to use the OSPF Interface Advanced tab.

| Name | Description |
|--------------------------|---|
| Index | Indicates the Index of the OSPF interface. |
| Metric | Specifies the metric for the type of service (TOS) on this port. The value of the TOS metric is $(10^9 / \text{interface speed})$. The default is 1. <ul style="list-style-type: none"> • FFFF—No route exists for this TOS. • IPCP links—Defaults to 0. • 0—Use the interface speed as the metric value when the state of the interface is up. |
| AdvertiseWhenDown | Advertises the network on this port as up, even if the port is down. The default is false.
After you configure a port with no link and enable AdvertiseWhenDown, it does not advertise the route until the port is active. Then, OSPF advertises the route even if the link is down. To disable advertising based on linkstates, disable AdvertiseWhenDown. |
| IfMtuIgnore | Specifies whether the interface ignores the global maximum transmission unit (MTU) configuration. To allow the switch to accept OSPF database description (DD) packets with a different MTU size, enable MtuIgnore. The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes. |

Configuring NBMA interface neighbors

Configure NBMA neighbors so that the interface can participate in designated router election. All neighbors that you manually insert on the Neighbors tab are NBMA neighbors.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- Ensure that the interface type is NBMA.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Neighbors** tab.
4. Click **Insert**.
5. Enter the IP address and priority for the first neighbor.
6. Click **Insert**.
7. Add all required neighbors.
8. Click **Apply**.

Neighbors field descriptions

Use the data in the following table to use the **Neighbors** tab.

| Name | Description |
|------------------------------------|---|
| NbrIpAddr | Specifies the neighbor IP address. |
| AddressLessIndex | Indicates addressless and addressless interfaces. This value is 0 on an interface with an IP address. On addressless interfaces, the corresponding value of ifIndex in the Internet standard management information base (MIB). |
| NbrRtrId | Specifies the router ID of the neighboring router. The router ID has the same format as an IP address but identifies the router independent of its IP address. |
| Options | Specifies the bit mask that corresponds to the neighbor options parameter. |
| Priority | Specifies the priority. |
| State | Specifies the OSPF interface state. |
| Events | Specifies the number of state changes or error events that occur between the OSPF router and the neighbor router. |
| Retransmission Queue Length | Specifies the number of elapsed seconds between advertising retransmissions of the same packet to a neighbor. |
| ospfNbmaNbrPermanence | Indicates whether the neighbor is a manually configured NBMA neighbor; permanent indicates it is an NBMA neighbor. |
| HelloSuppressed | Indicates whether hello packets to a neighbor are suppressed. |

Configuring OSPF interface metrics

Configure the metrics associated with the peer layer interface to control OSPF behavior. For finer control over port-specific metric speed, you can specify the metric speed when you configure OSPF on a port.

Before You Begin

- Enable OSPF globally.
- Ensure that the interface uses an IP address.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **If Metrics** tab.
4. Double-click the value cell, and type a new value.
5. Click **Apply**.

When you enable a port for OSPF routing, the default metric in the port tab is 0. A value of 0 means that the port uses the default metrics for port types that you specify on the OSPF General tab.

If Metrics field descriptions

Use the data in the following table to use the **If Metrics** tab.

| Name | Description |
|----------------------|--|
| IP Address | Specifies the IP address of the device used to represent a point of attachment in a TCP/IP internetwork. |
| AddressLessIf | Indicates addressed and addressless interfaces. This variable is 0 on interfaces with IP addresses and equals ifIndex for interfaces that have no IP address. |
| TOS | Specifies the type of service (TOS). The TOS is a mapping to the IP type of service flags as defined in the IP forwarding table management information base (MIB). |
| Value | Indicates the metric from the OSPF router to a network in the range. |
| Status | Specifies the status of the interface as active or not active. This variable is read-only. |

Viewing all OSPF-enabled interfaces

View all OSPF-enabled interfaces to determine which interfaces use OSPF routing.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Interfaces** tab.

4. To ensure the latest information appears, click **Refresh**.

Configure OSPF on a Port

Configure OSPF parameters on a port so you can control OSPF behavior on the port.

Important

When you enable OSPF on a port, the switch automatically creates an area 0.0.0.0, and advertises it on the specific port, by default. To avoid this behavior, you must manually configure the port into a properly configured area on the switch.

Before You Begin

- Enable OSPF globally .
- Ensure that the port uses an IP address.
- Ensure that the `ospf_md5key.txt` file is on the switch to use MD5 authentication.
- You must know the network OSPF password to use password authentication.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **IP**.
4. Select the **OSPF** tab.
5. Select **Enable**.
6. Specify the hello interval.
7. Specify the router dead interval.
8. Designate a router priority.
9. Configure a metric.
10. If you want, select an authentication type.
11. If you select **simplePassword** authentication, type a password in the **AuthKey** box.
12. Configure the area ID.
13. If desired, select the **AdvertiseWhenDown** check box.
14. Select an interface type.
15. Type a value in the **PollInterval** box.
16. For `IfMtuIgnore`, select either **enable** or **disable**.
- 17.
18. For **BfdEnable**, select **enable**.
19. Select **Apply**.

OSPF Field Descriptions

Use the data in the following table to use the **OSPF** tab.

| Name | Description |
|-------------------------|--|
| Enable | Enables or disables OSPF routing on the specified port. The default is false. |
| HelloInterval | Specifies the length of time, in seconds, between the transmission of hello packets. This value must be the same for all routers attached to a common network. The default is 10 seconds. After you change the hello interval values, you must save the configuration file, and then restart the switch. After the switch restarts, it restores the values and checks for consistency. |
| RtrDeadInterval | Specifies the interval used by adjacent routers to determine if the router was removed from the network. This interval must be identical on all routers on the subnet, and a minimum of four times the hello interval. To avoid interoperability issues, the RtrDeadInterval value for the OSPF interface needs to match with the RtrDeadInterval value for the OSPF virtual interface. The default is 40 seconds. |
| DesigRtrPriority | Specifies the priority of this port in multiaccess networks to use in the designated router election algorithm. The value 0 indicates the router is not eligible to become the designated router on this particular network. If a tie occurs, routers use their router ID as a tie breaker. The default is 1. |
| Metric | <p>Specifies the metric for the type of service (TOS) on this port. The value of the TOS metric is $(10^9 / \text{interface speed})$. The default is 1.</p> <ul style="list-style-type: none"> • FFFF—No route exists for this TOS. • IPCP links—Defaults to 0. • 0—Use the interface speed as the metric value when the state of the interface is up. |
| AuthType | <p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha1—Specifies secure hash algorithm (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. You can only access and enable the SHA-1 authentication type after you enable enhanced secure mode. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note:
sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p> |

| Name | Description |
|--------------------------|---|
| AuthKey | Specifies the key (up to 8 characters) when you specify simple password authentication in the port AuthType variable. |
| Areald | Specifies the OSPF area name in dotted-decimal format. The area name is not related to an IP address. You can use a suitable value for the OSPF area name (for example, 1.1.1.1 or 200.200.200.200). |
| AdvertiseWhenDown | Advertises the network on this port as up, even if the port is down. The default is false.
After you configure a port with no link and enable AdvertiseWhenDown, it does not advertise the route until the port is active. Then, OSPF advertises the route even if the link is down. To disable advertising based on link-states, disable AdvertiseWhenDown. |
| IfType | Specifies the type of OSPF interface (broadcast, NBMA, or passive).
Before you change an OSPF interface type, you must first disable the interface. If the interface is an NBMA interface, you must also delete all configured neighbors. |
| PollInterval | Specifies the length of time, in seconds, between hello packets sent to an inactive OSPF router. Neighbors must have the same poll interval. |
| IfMtuIgnore | Specifies whether the interface ignores the global maximum transmission unit (MTU) configuration. To allow the switch to accept OSPF database description (DD) packets with a different MTU size, enable MtuIgnore. The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes. |
| BfdEnable | Enable Bidirectional Forwarding Detection (BFD) for OSPF. |

Configuring OSPF on a VLAN

Configure OSPF parameters on a VLAN to control OSPF behavior on the VLAN.

Important

When you enable OSPF on a VLAN, the switch automatically creates an area 0.0.0.0, and advertises it on the specific VLAN, by default. To avoid this behavior, you must manually configure the VLAN into a properly configured area on the switch.

Before You Begin

- Enable OSPF globally.
- Ensure that the VLAN uses an IP address.
- Ensure that the ospf_md5key.txt file is on the switch to use MD5 authentication.
- Ensure that you know the network OSPF to use password authentication.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Click **VLANs**.
3. Click the **Basic** tab.
4. Select a VLAN.
5. Click **IP**.
6. Click the **OSPF** tab.
The information on the OSPF tab applies only to a routed port or VLAN, which means the VLAN uses an IP address.
7. To enable OSPF on the VLAN interface, select the **Enable** check box.
8. To change their values, select the current value in the **HelloInterval**, **RtrDeadInterval**, or **PollInterval** boxes, and then type new values.
9. To designate a router priority, in the **DesigRtrPriority** box, type the new value.
10. Select the authentication type in the **AuthType** field.
11. If you chose **simplePassword**, in the **AuthKey** box, type a password of up to eight characters.
12. Select the interface type you want to create.
13. Click **Apply**.

OSPF Field Descriptions

Use the data in the following table to use the **OSPF** tab.

| Name | Description |
|-------------------------|---|
| Enable | Enables or disables OSPF routing on the specified VLAN. The default is false. |
| HelloInterval | Specifies the length of time, in seconds, between the transmission of hello packets. This value must be the same for all routers attached to a common network. The default is 10 seconds. After you change the hello interval values, you must save the configuration file, and then restart the switch. After the switch restarts, it restores the values and checks for consistency. |
| RtrDeadInterval | Specifies the interval used by adjacent routers to determine if the router was removed from the network. This interval must be identical on all routers on the subnet and a minimum of four times the hello interval. To avoid interoperability issues, the RtrDeadInterval value for the OSPF interface needs to match with the RtrDeadInterval value for the OSPF virtual interface. The default is 40 seconds. |
| DesigRtrPriority | Specifies the priority of this VLAN in multiaccess networks to use in the designated router election algorithm. The value 0 indicates the router is not eligible to become the designated router on this particular network. If a tie occurs, routers use their router ID as a tie breaker. The default is 1. |

| Name | Description |
|--------------------------|--|
| Metric | <p>Specifies the metric for this TOS on this VLAN. The value of the TOS metric is $(10^9 / \text{interface speed})$. The default is 1.</p> <ul style="list-style-type: none"> • FFFF—No route exists for this TOS. • IPCP links—Defaults to 0. • 0—Use the interface speed as the metric value when the state of the interface is up. |
| AuthType | <p>Specifies the type of authentication required for the interface.</p> <ul style="list-style-type: none"> • none—Specifies that no authentication required. • simple password—Specifies that all OSPF updates received by the interface must contain the authentication key specified in the interface AuthKey parameter. • MD5 authentication—Specifies that all OSPF updates received by the interface must contain the MD5 key. • sha1—Specifies secure hash algorithm 1 (SHA-1), which is a cryptographic hash function that produces a 160-bit hash value, usually given in a hexadecimal number, 40 digits long. You can only access and enable the SHA-1 authentication type after you enable enhanced secure mode. • sha-2—Specifies SHA-2, which offers the hash function SHA-256. <p>Note:
sha-2, an update of SHA-1, can offer six hash functions that include SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, SHA 512/256, with hash values that are 224, 256, 384, or 512 bits. However, the current release supports only SHA-256.</p> |
| AuthKey | <p>Specifies the key (up to eight characters) when you specify simple password authentication in the VLAN AuthType variable.</p> |
| AreaId | <p>Specifies the OSPF area name in dotted-decimal format. The area name is not related to an IP address. You can use a suitable value for the OSPF area name (for example, 1.1.1.1 or 200.200.200.200).</p> |
| AdvertiseWhenDown | <p>Advertises the network even if the port is down. If true, OSPF advertises the network on this VLAN as up, even if the port is down. The default is false.</p> <p>After you configure a port without a link and enable AdvertiseWhenDown, it does not advertise the route until the port is active. Then, OSPF advertises the route even when the link is down. To disable advertising based on link states, disable AdvertiseWhenDown.</p> |
| IfType | <p>Specifies the type of OSPF interface (broadcast, NBMA, or passive).</p> <p>Before you change an OSPF interface type, you must first disable the interface. If the interface is an NBMA interface, you must also delete all configured neighbors.</p> |
| PollInterval | <p>Specifies the length of time, in seconds, between hello packets sent to an inactive OSPF router. Neighbors must use the same poll interval.</p> |

| Name | Description |
|--------------------|--|
| IfMtuIgnore | Specifies whether the VLAN ignores the MTU configuration. To allow the switch to accept OSPF DD packets with a different MTU size, enable MtuIgnore. The interface drops incoming OSPF DD packets if their MTU is greater than 1500 bytes. |
| BfdEnable | Enables Bidirectional Forwarding Detection (BFD) for OSPF. |

Viewing graphs for OSPF on a VLAN

View graphs for OSPF on a VLAN. The graph formats available are: line chart, area chart, bar chart, and pie chart.

Before You Begin

- OSPF must be enabled.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Click **VLANs**.
3. Click the **Basic** tab.
4. Select a VLAN, and then click **IP**.
5. Click the **OSPF** tab.
6. Click **Graph**.
7. (Optional) To refresh the values in the table, click **Clear Counters**.
8. To specify the polling interval, from the **Poll Interval** drop down menu, select a value. The options are:

| Choice Option | Choice Description |
|---------------|-------------------------------------|
| 5s | The polling interval is 5 seconds. |
| 10s | The polling interval is 10 seconds. |
| 30s | The polling interval is 30 seconds. |
| 1m | The polling interval is 1 minute. |
| 5m | The polling interval is 5 minutes. |
| 30m | The polling interval is 30 minutes. |
| 1h | The polling interval is 1 hour. |

9. Select one or two values.

To select two values, for example, AbsoluteValue and Cumulative. Select the first value, and then press the **Control** key to select the second value. You cannot select more than two values.

10. From the toolbar, click a chart icon. The options are:

Choice Option Choice Description

- Line Chart** Displays a line chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
- Area Chart** Displays an area chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
- Bar Chart** Displays a bar chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale.
- Pie Chart** Displays a pie chart for the values you selected against the polling interval.

The Chart Legend uses different colors to identify the values you selected that are plotted on the graph.

11. To switch the horizontal and vertical axes values, on the chart toolbar, click **Horizontal**.
12. To switch views of the log scale from high to low values, or low to high values, on the chart toolbar, click **Log Scale**.
13. To switch to another chart using the same values, on the chart toolbar, click a chart icon.

OSPF graph field descriptions

Use the data in the following table to use the OSPF graph tab.

| Name | Description |
|-------------------------|---|
| AbsoluteValue | Displays the counter value. |
| Cumulative | Displays the total value since you opened the OSPF-Graph tab. |
| Average/sec | Displays the average value for each second. |
| Minimum/sec | Displays the minimum value for each second. |
| Maximum/sec | Displays the maximum value for each second. |
| LastVal/sec | Displays the last value for each second. |
| VersionMismatches | Displays the number version mismatches received by this interface. |
| AreaMismatches | Displays the number area mismatches received by this interface. |
| AuthTypeMismatches | Displays the number AuthType mismatches received by this interface. |
| AuthFailures | Displays the number Authentication failures. |
| NetMaskMismatches | Displays the number net mask mismatches received by this interface. |
| HelloIntervalMismatches | Displays the number hello interval mismatches received by this interface. |
| DeadIntervalMismatches | Displays the number dead interval mismatches received by this interface. |
| OptionMismatches | Displays the number options mismatches received by this interface. |
| RxHellos | Displays the number hello packets received by this interface. |
| RxDBDescrs | Displays the number database descriptor packets received by this interface. |
| RxLSUpdates | Displays the number Link state update packets received by this interface. |

| Name | Description |
|-------------|---|
| RxLSReqs | Displays the number Link state request packets received by this interface. |
| RxLSAcks | Displays the number Link state acknowledge packets received by this interface. |
| TxHellos | Displays the number hello packets transmitted by this interface. |
| TxDBDescrs | Displays the number database descriptor packets transmitted by this interface. |
| TxLSUpdates | Displays the number Link state update packets transmitted by this interface. |
| TxLSReqs | Displays the number Link state request packets transmitted by this interface. |
| TxLSAcks | Displays the number Link state acknowledge packets transmitted by this interface. |

Creating stubby or not-so-stubby OSPF areas

Import information from other areas to learn their OSPF relationships. Perform this procedure to create normal, stubby, or not-so-stubby areas (NSSA).

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

Place stubby areas or NSSAs at the edge of an OSPF routing domain. Ensure that you configure all routers in the stubby or NSSA as stubby or NSSA, respectively.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Areas** tab.

The backbone ID has an area ID of 0.0.0.0.

4. Click **Insert**.
5. Configure the area ID.
6. Select an option in the ImportAsExtern area.

To add a not-so-stubby (NSSA) area, select **importNssa**. To import external LSAs (create a normal OSPF area), select **importExternal**. To not import external LSAs (create a stubby area), select **importNoExternal**.

7. Click **Apply**.

Areas field descriptions

Use the data in the following table to use the **Areas** tab.

| Name | Description |
|------------------------|---|
| AreaId | Specifies a 32-bit integer that uniquely identifies an area. Area ID 0.0.0.0 is the OSPF backbone. For VLANs, using the default area on the interface causes LSDB inconsistencies. |
| ImportAsExtern | Specifies the method to import ASE link-state advertisements. The value can be importExternal (default), importNoExternal, or importNssa. |
| SpfRuns | Specifies the number of SPF calculations performed by OSPF. |
| AreaBdrRtrCount | Specifies the number of area border routers reachable within this area. Each SPF pass calculates this value, initially zero. |
| AsBdrRtrCount | Specifies the number of autonomous system border routers reachable within this area. Each SPF pass calculates this value, initially zero. |
| AreaLsaCount | Specifies the total number of link state advertisements in this area LSDB, excluding AS-external LSAs. |
| AreaLsaCksumSum | Specifies the number of link-state advertisements. This sum excludes external (LS type 5) link-state advertisements. The sum determines if a change occurred in a router LSDB and compares the LSDB of two routers. |
| AreaSummary | Specifies whether to send summary advertisements in a stub area. |
| ActiveifCount | Specifies the number of active interfaces in this area. |

Configuring stub area metrics advertised by an ABR

Configure metrics to control the use of routes in a routing domain.

Before You Begin

- Enable OSPF globally.
- Ensure that the port uses an IP address.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Stub Area Metrics** tab.
4. Double-click the metric value to edit it and specify a new metric speed for the required stub areas.
5. Click **Apply**.

Stub Area Metrics field descriptions

Use the data in the following table to use the **Stub Area Metrics** tab.

| Name | Description |
|---------------|---|
| AreaID | Specifies the 32-bit identifier for the stub area. |
| TOS | Specifies the type of service associated with the metric. |
| Metric | Specifies the metric value applied at the indicated type of service. By default, the value equals the lowest metric value at the type of service among the interfaces to other areas. |
| Status | Specifies the status of the stub area. This variable is read-only. |

Inserting OSPF area aggregate ranges

Use aggregate area ranges to reduce the number of link-state advertisements required within the area. You can also control advertisements.

Before You Begin

- Enable OSPF globally.
- Ensure that the port uses an IP address.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Area Aggregate** tab.
4. Click **Insert**.
5. Type the area ID.
6. Select the type of link-state database.
7. Type the IP address of the network.
8. Type the subnet mask.
9. Select the effect.
10. In the **AdvertiseMetric** box, type a cost to advertise for the OSPF area range.
11. Click **Insert**.

Area Aggregate Field Descriptions

Use the data in the following table to use the **Area Aggregate** tab.

| Name | Description |
|-----------------|--|
| AreaID | Specifies the area in which the address exists. |
| LsdbType | Specifies the LSDB type: <ul style="list-style-type: none"> • summaryLink—aggregated summary link • nssaExternalLink—not so stubby area link |

| Name | Description |
|------------------------|---|
| IP Address | Specifies the IP address of the network or subnetwork indicated by the range. |
| Mask | Specifies the network mask for the area range. |
| Effect | Specifies advertisement methods: <ul style="list-style-type: none"> • advertiseMatching means advertise the aggregate summary LSA with the same LSID. • doNotAdvertiseMatching means suppress all networks that fall within the entire range. • advertiseDoNotAggregate means advertise individual networks. |
| AdvertiseMetric | Changes the advertised metric cost for the OSPF area range. |

Enabling automatic virtual links

Use automatic virtual links to provide an automatic, dynamic backup link for vital OSPF traffic.

Before You Begin

- Enable OSPF globally.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **General** tab.
4. Select the **AutoVirtLinkEnable** check box.
5. Click **Apply**.

Configuring a manual virtual interface

Use manual virtual links (interfaces) to provide a backup link for vital OSPF traffic with a minimum of resource use.

Before You Begin

- Enable OSPF globally.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Virtual If** tab.
4. Click **Insert**.

5. Specify the area ID of the transit area.
The transit area is the common area between two ABRs.
6. Specify the neighbor ID.
The neighbor ID is the IP router ID of the ABR that the other ABR needs to reach the backbone.
7. Click **Insert**.
8. To verify that the virtual link is active, click **Refresh** and check the **State** column.
If the state is point-to-point, the virtual link is active. If the state is down, the virtual link configuration is incorrect.

Virtual If field descriptions

Use the data in the following table to use the **Virtual If** tab.

| Name | Description |
|------------------------|--|
| AreaId | Specifies the transit area ID that the virtual link traverses. |
| Neighbor | Specifies the router ID of the virtual neighbor. |
| TransitDelay | Specifies the estimated number of seconds required to transmit a link-state update packet over this interface. The default is 1. |
| RetransInterval | Specifies the number of seconds between link-state advertisement, and retransmissions for adjacencies that belong to this interface. This variable also applies to DD and link-state request packets. This value must exceed the expected round-trip time. The default is 5. |
| HelloInterval | Specifies the length of time, in seconds, between the hello packets that the router sends on the interface. This value must be the same for the virtual neighbor. The default is 10. |
| RtrDeadInterval | Specifies the number of seconds that expires before neighbors declare the router down. This value must be a multiple of the hello interval. This value must be the same for the virtual neighbor. The default is 60. |
| State | Specifies the OSPF virtual interface state. |
| Events | Specifies the number of state changes or error events on this virtual Link. |
| AuthType | Specifies the authentication type specified for a virtual interface. You can locally assign additional authentication types. The default is none. |
| AuthKey | Specifies the authentication password.
If AuthType is a simple password, the device adjusts and zeros fill the eight octets.
Unauthenticated interfaces need no authentication key, and simple password authentication cannot use a key with more than eight octets. |

Viewing virtual neighbors

View virtual neighbors to view the area and virtual link configuration for the neighboring device.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Virtual Neighbors** tab.

Virtual Neighbors field descriptions

Use the data in the following table to use the **Virtual Neighbors** tab.

| Name | Description |
|------------------------|--|
| Area | Specifies the subnetwork in which the virtual neighbor resides. |
| RtrId | Specifies the 32-bit integer (represented as an IP address) that uniquely identifies the neighbor router in the autonomous system. |
| IP Address | Specifies the IP address of the virtual neighboring router. |
| Options | Specifies the bit mask that corresponds to the neighbor options parameter. |
| State | Specifies the OSPF interface state. |
| Events | Specifies the number of state changes or error events that occurred between the OSPF router and the neighbor router. |
| LsRetransQLen | Specifies the number of elapsed seconds between advertising retransmissions of the same packet to a neighbor. |
| HelloSuppressed | Specifies whether hello packets from the neighbor are suppressed. |

Configuring host routes

Configure host routes when the switch resides in a network that uses routing protocols other than OSPF. A host route is a more-specific route and is used even if it is higher cost than a network route.

Before You Begin

- Enable OSPF globally.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

You can specify which hosts directly connect to the router and the metrics and types of service to advertise for the hosts.

Use a host route to create a custom route to a specific host to control network traffic.

Procedure

1. In the navigation pane, expand **Configuration > IP**.

2. Click **OSPF**.
3. Click the **Hosts** tab.
4. To insert a new host, click **Insert**.
5. In the **IP Address** box , type the area IP address of the new host.
6. In the **Metric** box, type the metric to advertise.
7. Click **Insert**.
8. Click **Apply**.

Hosts field descriptions

Use the data in the following table to use the **Hosts** tab.

| Name | Description |
|------------------|--|
| IpAddress | Specifies the IP address of the host that represents a point of attachment in a TCP/IP internetwork. |
| TOS | Specifies the type of service of the route. |
| Metric | Specifies the metric advertised to other areas. The value indicates the distance from the OSPF router to a network in the range. |
| AreaID | Specifies the area where the host is found. By default, the area that submits the OSPF interface is in 0.0.0.0. |

Enabling ASBR status

Enable the ASBR status to make the switch an autonomous system boundary router (ASBR). Use ASBRs to advertise nonOSPF routes into OSPF domains so that the routes pass through the domain. A router can function as an ASBR if one or more of its interfaces connects to a non-OSPF network, for example, Routing Information Protocol (RIP), BGP, or Exterior Gateway Protocol (EGP).

Before You Begin

- Enable OSPF globally.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

To conserve resources, you can limit the number of ASBRs on your network or specifically control which routers perform as ASBRs to control traffic flow.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **General** tab.
4. Select the **ASBdrRtrStatus** check box.
5. Click **Apply**.

Managing OSPF neighbors

View or delete OSPF neighbors to control OSPF operations.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

The OSPF Hello protocol initiates and maintains neighbor relationships. The exception is that, in an NBMA network, you must manually configure permanent neighbors on each router eligible to become the DR. You can add neighbors for NBMA interfaces, but all other neighbors are dynamically learned.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Neighbors** tab.
4. To delete a manually configured neighbor, select the neighbors with a value of **permanent** in the **ospfNbmaNbrPermanence** column.
5. Click **Delete**.
6. Click **Apply**.

Viewing the link-state database

View the area advertisements and other information in the LSDB to ensure correct OSPF operations.

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Link State Database** tab.

Link State Database field descriptions

Use the data in the following table to use the **Link State Database** tab.

| Name | Description |
|---------------|--|
| Areald | Identifies the area. The OSPF backbone uses the area ID 0.0.0.0. |
| Type | Specifies the OSPF interface type. Broadcast LANs, such as Ethernet and IEEE 802.5, use broadcast; X.25 and similar technologies use NBMA; and links that are point-to-point use pointToPoint. |
| Lsid | Identifies the piece of the routing domain that the advertisement describes. |

| Name | Description |
|-----------------|--|
| RouterId | Identifies the router in the autonomous system. |
| Sequence | Identifies old and duplicate link-state advertisements. |
| Age | Specifies the age, in seconds, of the link-state advertisement. |
| Checksum | Contains the checksum of the complete contents of the advertisement, except for the age parameter. The checksum does not include the age parameter so that advertisement age increments without updating the checksum. |

Configure Route Redistribution to OSPF

Configure a redistribute entry to announce routes of a certain source protocol type into the OSPF domain, for example, static, RIP, or direct. Optionally, use a route policy to control the redistribution of routes.

Before You Begin

- Enable OSPF globally.
- Ensure that a route policy exists.
- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

Important

Changing the OSPF redistribute context is a process-oriented operation that can affect system performance and network reachability while you perform this procedure. It is recommended that if you want to change default preferences for an OSPF redistribute context, you must do so before you enable the protocols.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **OSPF**.
3. Select the **Redistribute** tab.
4. Select **Insert**.
5. Select an option for the route source.
6. Select **enable**.
7. Select a route policy.
8. Configure the metric type.
9. Configure the subnet.
10. Select **Insert**.

Redistribute field descriptions

Use the data in the following table to use the **Redistribute** tab.

| Name | Description |
|--------------------|---|
| DstVrflid | Specifies the destination virtual router forwarding instance. You cannot configure this variable. |
| Protocol | Specifies the dynamic routing protocol that receives the external routing information. |
| SrcVrflid | Specifies the source VRF instance. You cannot configure this variable. |
| RouteSource | Specifies the route source protocol for the redistribution entry. |
| Enable | Enables (or disables) an OSPF redistribute entry for a specified source type. |
| RoutePolicy | Configures the route policy (by name) to use for detailed redistribution of external routes from a specified source into an OSPF domain.
Click the ellipsis (...) button and choose from the list in the dialog box. |
| Metric | Configures the OSPF route redistribution metric for basic redistribution. The value can be a range from 0–65535. A value of 0 indicates to use the original cost of the route. |
| MetricType | Configures the OSPF route redistribution metric type. The default is type 2.
The cost of a type 2 route is the external cost, regardless of the interior cost. A type 1 cost is the sum of both the internal and external costs. |
| Subnets | Allows or suppresses external subnet route advertisements when routes are redistributed into an OSPF domain. |

Viewing OSPF status

View OSPF status.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Stats** tab.

Viewing OSPF status graphs

View OSPF status graphs. The graph formats available are: line chart, area chart, bar chart, and pie chart.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **OSPF**.
3. Click the **Stats** tab.

4. (Optional) To refresh the values in the table, click **Clear Counters**.
5. To specify the polling interval, from the **Poll Interval** drop down menu, select a value. The options are:

| Option | Description |
|--------|-------------------------------------|
| 5s | The polling interval is 5 seconds. |
| 10s | The polling interval is 10 seconds. |
| 30s | The polling interval is 30 seconds. |
| 1m | The polling interval is 1 minute. |
| 5m | The polling interval is 5 minutes. |
| 30m | The polling interval is 30 minutes. |
| 1h | The polling interval is 1 hour. |

6. Select one value; for example, AbsoluteValue or Cumulative.
 - Or, select two values; for example, AbsoluteValue and Cumulative.

To select a second value, press the **Ctrl** key, then select the second value. You cannot select more than two values.

7. From the toolbar, click a chart icon. The options are:

| Option | Description |
|-------------------|--|
| Line Chart | Displays a line chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale. |
| Area Chart | Displays an area chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale. |
| Bar Chart | Displays a bar chart for the values you selected against the polling interval. The X axis represents time. The vertical axis represents the logging scale. |
| Pie Chart | Displays a pie chart for the values you selected against the polling interval. |

The Chart Legend uses different colors to identify the values you selected that are plotted on the graph.

8. To switch the horizontal and vertical axes values, on the chart toolbar, click **Horizontal**.
9. To switch views of the log scale from high to low values, or low to high values, on the chart toolbar, click **Log Scale**.
10. To switch to another chart using the same values, on the chart toolbar, click a chart icon.

Stats field descriptions

Use the data in the following table to use the OSPF **Stats** tab.

| Name | Description |
|----------------------------|--|
| AbsoluteValue | Displays the counter value. |
| Cumulative | Displays the total value since you opened the Stats tab. |
| Average/sec | Displays the average value for each second. |
| Minimum/sec | Displays the minimum value for each second. |
| Maximum/sec | Displays the maximum value for each second. |
| LastVal/sec | Displays the last value for each second. |
| LsdbTblSize | Displays the number of entries in the link state database table. |
| TxPackets | Displays the number of packets transmitted by OSPF. |
| RxPackets | Displays the number of packets received by OSPF. |
| TxDropPackets | Displays the number of packets dropped before transmitted by OSPF. |
| RxDropPackets | Displays the number of packets dropped before received by OSPF. |
| RxBadPackets | Displays the number of packets received by OSPF that are bad. |
| SpfRuns | Displays the total number of SPF calculations performed by OSPF, which includes the number of partial route table calculation for incremental updates. |
| BuffersAllocated | Displays the number of buffers allocated for OSPF. |
| BuffersFreed | Displays the number of buffers that are freed by the OSPF. |
| BufferAllocFailures | Displays the number of times that OSPF has failed to allocate buffers. |
| BufferFreeFailures | Displays the number of times that OSPF has failed to free buffers. |
| Routes | Displays the number of OSPF routes added to RTM. |
| Adjacencies | Displays how many adjacencies are learned through the interface. |
| Areas | Displays the number of areas configured. |
| Nbrs | Indicates the number of OSPF neighbors. |
| BadLsReqs | Indicates the number of bad link state requests. |
| SeqMismatches | Indicates the number of sequence mismatched packets. |
| NumAllocDDP | Indicates the number of database description (DD) packet buffers allocated for OSPF. |
| NumFreeDDP | Indicates the number of DD packet buffers that are freed by the OSPF. |

Forcing shortest-path calculation updates

Manually initiate an SPF run, or calculation, to immediately update the OSPF LSDB. This configuration is useful if

- you need to immediately restore a deleted OSPF-learned route
- the routing table entries and the LSDBs do not synchronize

Before You Begin

- Change the VRF instance as required to configure OSPF on a specific VRF instance. The VRF must have an RP trigger of OSPF. Not all parameters are configurable on non-default VRFs.

About This Task

This process is computationally intensive. Use this command only if required.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Double-click **OSPF**.
3. Click the **General** tab.
4. In the **OspfAction** area, select the **runSpf** option button.
5. Click **Apply**.
6. Click **Yes** to force an SPF run.

After you initiate an SPF run, wait at least 10 seconds before you initiate another SPF run.

OSPFv3 Configuration using EDM

Use the procedures in this section to configure OSPFv3 using EDM.

Configuring OSPFv3 globally

Configure OSPFv3 globally to enable it on the system and to configure the router ID.

Before You Begin

- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

Note

Non-default VRFs do not support the configuration of the following parameters:

- OSPFv3 interfaces over IPv6 tunnels
- IPsec on OSPFv3 virtual link interfaces

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **Globals** tab.
4. Type the router ID, in the format of an IPv4 address.
5. Select **enabled**.
6. Optionally, select **ASBdrRtrStatus** to make the router an AS boundary router.

Enable the ASBR if the router attaches at the edge of the OSPF network, and has one or more interfaces that run an interdomain routing protocol. The default is disabled.

7. Click **Apply**.

Globals field descriptions

Use the data in the following table to use the **Globals** tab.

**Note**

Different hardware platforms support different port speeds. For more information, see your hardware documentation.

| Name | Description |
|-----------------------------------|---|
| RouterId | Specifies a 32-bit integer that identifies the router in the autonomous system. This value must be unique. The default value will be one of the IPv4 interface addresses. |
| AdminStat | Enables or disables OSPFv3 on the router. If you disable OSPFv3 globally, you disable it on all interfaces. The default is disabled. |
| VersionNumber | Shows the OSPF version number, which for IPv6 is version 3. |
| AreaBdrRtrStatus | Shows if the router is an area border router. |
| ASBdrRtrStatus | Configures the router as an autonomous system boundary router. The default is disabled (clear). |
| HelperModeDisable | Disables Graceful Restart Helper Mode feature. |
| AsScopeLsaCount | Shows the number of AS-external link-state advertisements in the LSDB. |
| AsScopeLsaChecksumSum | Shows the sum of the checksums for the link-scope LSAs in the LSDB. Use the sum to determine if a change in the LSDB occurs, and to compare the LSDBs of the two routers. |
| OriginateNewLsas | Shows the number of new link-state advertisements. The number increases each time the router originates a new LSA. |
| RxNewLsas | Shows the number of new link-state advertisements received. This number does not include new instances of self-originated link-state advertisements. |
| ExtLsaCount | Shows the number of external (LS type 0x4005) LSAs in the LSDB. |
| 10MbpsPortDefaultMetric | Indicates the default cost applied to 10 Mbps interfaces (ports). The default is 100. |
| 100MbpsPortDefaultMetric | Indicates the default cost applied to 100 Mbps interfaces (ports). The default is 10. |
| 1000MbpsPortDefaultMetric | Indicates the default cost applied to 1 Gbps interfaces (ports). The default is 1. |
| 10000MbpsPortDefaultMetric | Indicates the default cost applied to 10 Gbps interfaces (ports). The default is 1. |

| Name | Description |
|------------------------------------|--|
| 25000MbpsPortDefaultMetric | Indicates the default cost applied to 25 Gbps interfaces (channelized 100 Gbps ports). The default is 1. |
| 40000MbpsPortDefaultMetric | Indicates the default cost applied to 40 Gbps interfaces (ports). The default is 1. |
| 100000MbpsPortDefaultMetric | Indicates the default cost applied to 100 Gbps interfaces (ports). The default is 1. |
| vlanDefaultMetric | Indicates the default cost applied to VLAN interfaces. The default is 10. |

Creating an OSPFv3 Area

Create an area to subdivide the autonomous system (AS) into areas that group contiguous networks, routers that connect to these networks, and attached hosts. Subdividing the AS into areas significantly reduces the amount of routing protocol traffic compared to treating the entire AS like a single link-state domain.

About This Task

A stub area does not receive advertisements for external routes, which reduces the size of the link-state database (LSDB). A stub area uses only one area border router (ABR). Any packets destined for outside the area are routed to the area border exit point, examined by the ABR, and forwarded to a destination.

A not so stubby area (NSSA) prevents the flooding of AS-External link-state advertisements into the area by replacing them with a default route. NSSAs also import small stub (non- OSPF) routing domains into OSPF.

Before You Begin

- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

Note

Non-default VRFs do not support the configuration of the following parameters:

- OSPFv3 interfaces over IPv6 tunnels
- IPSec on OSPFv3 virtual link interfaces

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **Areas** tab.
4. Click **Insert**.
5. Type the area ID.
6. Click **Insert**.

Areas field descriptions

Use the data in the following table to use the **Areas** tab.

| Name | Description |
|----------------------------|--|
| Id | Specifies a 32-bit integer to uniquely identify an area. Use 0.0.0.0 for the OSPFv3 backbone. |
| ImportasExtern | <p>Indicates the support for importing AS-external LSAs::</p> <ul style="list-style-type: none"> • importExternal—normal area • importNoExternal—stub area • importNssa—not-so-stubby-area <p>AS-scope LSAs are not imported into stub areas or NSSAs. NSSAs import AS-External data at Type 7 LSAs, which use area scope. importExternal is the default.</p> |
| SpfRuns | Shows the number of times the intra-area route table was calculated using the LSDB of this area. |
| BdrRtrCount | Shows the number of reachable ABRs in this area. The value starts at zero (0). The system calculates this value in each SPF run. |
| AsBdrRtrCount | Shows the number of reachable ASBRs in this area. The value starts at zero (0). The system calculates this value in each SPF run. |
| ScopeLsaCount | Shows the number of area-scope LSAs in the LSDB for this area. |
| ScopeLsaChecksumSum | Shows the sum of the checksums for the area-scope LSAs in the LSDB. Use the sum to determine if a change in the LSDB occurs, and to compare the LSDBs of the two routers. |
| Summary | Controls the import of inter-area LSAs into a stub area. If the value is noAreaSummary , the router does not originate nor propagate inter-area LSAs into the stub area. If the value is sendAreaSummary (the default), the router both summarizes and propagates inter-area LSAs. |
| StubMetric | Configures the metric value advertised for the default route to stub and NSSA areas. |
| NssaTranslatorRole | Indicates if the NSSA border router can perform NSSA translation of Type 7 LSAs to Type 6 LSAs. The possible values are always or candidate. The default is candidate. |

| Name | Description |
|----------------------------|---|
| NssaTranslatorState | Indicates if and how an NSSA border router translates Type 7 LSAs to Type 5 LSAs. The possible values are <ul style="list-style-type: none"> • enabled—The border router always translates the LSAs. • elected—A candidate border router translates the LSAs. • disabled—A candidate border router does not translate the LSAs. |
| StubMetricType | Specifies the type of metric advertised as a default route. The possible values are: <ul style="list-style-type: none"> • ospfv3Metric—OSPF metric • comparableCost—external Type 1 • nonComparable—external Type 2 The default is ospfv3Metric. |

Creating OSPFv3 Area Ranges

Create an area address range on the OSPFv3 router to reduce the number of area border router (ABR) advertisements into other OSPF areas. An area address range is an implied contiguous range of area network addresses for which the ABR advertises a single summary route.

Before You Begin

- You must create the OSPF area.
- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

Note

Non-default VRFs do not support the configuration of the following parameters:

- OSPFv3 interfaces over IPv6 tunnels
- IPsec on OSPFv3 virtual link interfaces

About This Task

If you create two ranges, and one range is a subset of the other, the router uses the most specific match.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **Area Aggregate** tab.
4. Click **Insert**.
5. Select the area ID.
6. Select the type of area.

interAreaPrefixLsa generates an aggregated summary.

nssaExternalLsa generates an NSSA link summary.

7. Type the prefix for the IPv6 area address.
8. Type the number of bits from the IPv6 address that you want to advertise.
9. Click **Insert**.

Area Aggregate Field Descriptions

Use the data in the following table to use the **Area Aggregate** tab.

| Name | Description |
|------------------------|--|
| AreaID | Specifies the area in which the address aggregate exists. Use dotted decimal notation to specify the area name. |
| AreaLsdbType | Specifies the area LSDB type to which the address aggregate applies. interAreaPrefixLsa generates an aggregated summary. nssaExternalLsa generates an NSSA link summary. |
| Prefix | Specifies the IPv6 prefix. The prefix and prefix length define the range. |
| PrefixLength | Specifies the length of the prefix, in bits. The prefix cannot be shorter than 3 bits. The prefix and prefix length define the range. |
| Effect | Specifies the advertisement mode for prefixes in the range. advertiseMatching advertises the aggregate summary LSA with the same link-state ID. doNotAdvertiseMatching does not advertise networks that fall within the range. |
| AdvertiseMetric | Specifies a cost value to advertise for the OSPF area range. This value applies to summary LSAs (Type 3). If the value is 0, OSPF uses the cost to the farthest point in the network that is summarized. |

Creating an OSPFv3 Virtual Link

Create a virtual link if the switch does not connect directly to the backbone. The switch can create automatic virtual links or you can perform this procedure to create virtual links manually. Manual virtual links conserve resources and provide specific control over virtual link placement in your OSPFv3 configuration.

Before You Begin

- The router must be an ABR to create a virtual router interface.
- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

Note

Non-default VRFs do not support the configuration of the following parameters:

- OSPFv3 interfaces over IPv6 tunnels
- IPSec on OSPFv3 virtual link interfaces

About This Task

Virtual linking is similar to backup redundancy. The switch creates a virtual link for vital traffic paths in your OSPFv3 configuration if traffic is interrupted, such as when an interface cable that provides a connection to the backbone (either directly or indirectly) is disconnected from the switch. Automatic virtual linking ensures that a link is created by using another switch.

OSPF routes cannot be learned through an ABR unless it connects to the backbone directly or through a virtual link.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **Virtual If** tab.
4. Click **Insert**.
5. Specify the ID for the transit area.

The transit area is the common area between two ABRs.

6. Specify the router ID for the virtual neighbor.

The neighbor ID is the IP router ID of the ABR through which the other ABR must route traffic destined for the backbone.

7. Click **Insert**.
8. Click **Refresh** to verify that the virtual link is active.

If the state is point-to-point, the virtual link is active. If the state is down, the virtual link is configured incorrectly.

Virtual If field descriptions

Use the data in the following table to use the **Virtual If** tab.

| Name | Description |
|------------------------|---|
| AreaId | Specifies the ID for the transit area that the virtual link traverses. Do not use 0.0.0.0. |
| Neighbor | Specifies the router ID of the virtual neighbor. |
| TransitDelay | Specifies the estimated number of seconds to transmit a link-state update packet over this interface. The default is 1 second. |
| RetransInterval | Specifies the number of seconds between link-state advertisement retransmissions for adjacencies that belong to this interface. This value also applies to the retransmissions of database description and link-state request packets.
The default is 5 seconds. |
| HelloInterval | Specifies the number of seconds between hello packets that the router sends on this interface. Configure the same value on the virtual neighbor.
The default is 10 seconds. |

| Name | Description |
|--------------------------|---|
| RtrDeadInterval | Specifies the number of seconds after which the neighbor declares the router down if it does not receive hello packets. Configure this value as a multiple of the hello interval. You must configure the same value on the virtual neighbor. The default is 60 seconds. |
| State | Shows the state of the virtual interface: either down or pointToPoint. |
| Events | Shows the number of state changes or error events on the virtual link. |
| LinkScopeLsaCount | Shows the number of link-scope LSAs in the LSDB for the virtual link. |
| LinkLsaCksumSum | Shows the sum of the checksums for the link-scope LSAs in the LSDB. Use the sum to determine if a change in the LSDB occurs, and to compare the LSDBs of the two routers. |

Create an OSPF Interface on a Brouter Port

Configure the OSPF protocol on an IPv6 interface to support dynamic routing on the interface. Perform this procedure to create an OSPF interface on a brouter port.

If you want to modify existing OSPFv3 interfaces, see [Modifying an OSPFv3 interface](#) on page 2472. To configure OSPFv3 on an IPv6 VLAN, see [Create an OSPF VLAN Interface](#) on page 2462.

Before You Begin

- The IPv6 interface must exist.

Procedure

- In the Device Physical view, select a port.
- In the navigation pane, expand the **Configuration > Edit > Port** folders.
- Select **IPv6**.
- Select the **IPv6 OSPF Interface** tab.
- Select **Insert**.
- Select the area ID.
- Select **enabled**.
- Select **Insert**.

IPv6 OSPF Interface field descriptions

Use the data in the following table to use the **IPv6 OSPF Interface** tab.

| Name | Description |
|------------------------|---|
| Index | Shows the interface index for the IPv6 interface on which OSPFv3 is configured. |
| Areaid | Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone. |
| Type | Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none"> • broadcast • NBMA • point-to-point • point-to-multipoint • passive |
| AdminStat | Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled. |
| RtrPriority | Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election.
A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router.
The default is 1. |
| TransitDelay | Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1. |
| RetransInterval | Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5. |
| HelloInterval | Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this field to the same value for all routers attached to a common network. The default is 10. |
| RtrDeadInterval | Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this field to the same value for all routers attached to a common network. The default is 40. |
| PollInterval | Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120. |

| Name | Description |
|-------------------------------|--|
| State | Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesginatedRouter • otherDesignatedRouter |
| DesignatedRouter | Shows the router ID for the designated router. |
| BackupDesignatedRouter | Shows the router ID for the backup designated router. |
| MetricValue | Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100.

Note:
If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface. |
| LinkLsaSuppression | Specifies whether Link LSA suppression is enabled. |
| BfdEnable | Enable Bidirectional Forwarding Detection (BFD) for OSPF. |

Create an OSPF VLAN Interface

Configure the OSPF protocol on an IPv6 VLAN to support dynamic routing on the interface.

If you want to modify existing OSPFv3 interfaces, see [Modifying an OSPFv3 interface](#) on page 2472.

Before You Begin

- The IPv6 interface must exist.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN**.
2. Select **VLANs**.
3. Select the **Basic** tab.
4. Select a **VLAN**.
5. Select **IPv6**.
6. Select the **IPv6 OSPF Interface** tab.
7. Select **Insert**.
8. Select the area ID.

9. Select **enabled**.
10. Select **Insert**.

IPv6 OSPF Interface field descriptions

Use the data in the following table to use the **IPv6 OSPF Interface** tab.

| Name | Description |
|------------------------|---|
| Index | Shows the interface index for the IPv6 interface on which OSPFv3 is configured. |
| AreaId | Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone. |
| Type | Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none"> • broadcast • NBMA • point-to-point • point-to-multipoint • passive |
| AdminStat | Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an interal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled. |
| RtrPriority | Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election.
A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router.
The default is 1. |
| TransitDelay | Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1. |
| RetransInterval | Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5. |
| HelloInterval | Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this field to the same value for all routers attached to a common network. The default is 10. |

| Name | Description |
|-------------------------------|--|
| RtrDeadInterval | Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this field to the same value for all routers attached to a common network. The default is 40. |
| PollInterval | Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120. |
| State | Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesginatedRouter • otherDesignatedRouter |
| DesignatedRouter | Shows the router ID for the designated router. |
| BackupDesignatedRouter | Shows the router ID for the backup designated router. |
| MetricValue | Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100.

Note:
If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface. |
| LinkLsaSuppression | Specifies whether Link LSA suppression is enabled. |
| BfdEnable | Enables Bidirectional Forwarding Detection (BFD) for OSPF. |

Create an OSPF Interface on a Tunnel

Configure the OSPF protocol on an IPv6 interface to support dynamic routing on the interface. Perform this procedure to create an OSPF interface on a tunnel.

If you want to modify existing OSPFv3 interfaces, see [Modifying an OSPFv3 interface](#) on page 2472. To configure OSPFv3 on an IPv6 VLAN, see [Create an OSPF VLAN Interface](#) on page 2462.

Before You Begin

- The IPv6 interface must exist.

Procedure

1. In the navigation pane, expand the **Configuration > IPv6** folders.
2. Select **Tunnel**.
3. Select the **Tunnel Config** tab.
4. Select a configured tunnel.
5. Select **IPv6 OSPF**.
6. Select **Insert**.
7. Select the area ID.
8. Select **enabled**.
9. Select **Insert**.

OSPF Interface field descriptions

Use the data in the following table to use the **OSPF Interface** tab.

| Name | Description |
|---------------------|---|
| Index | Shows the interface index for the IPv6 interface on which OSPFv3 is configured. |
| Areald | Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone. |
| Type | Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none"> • broadcast • NBMA • point-to-point • point-to-multipoint |
| AdminStat | Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an interal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled. |
| RtrPriority | Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election.
A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router.
The default is 1. |
| TransitDelay | Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1. |

| Name | Description |
|-------------------------------|--|
| RetransInterval | Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5. |
| HelloInterval | Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this field to the same value for all routers attached to a common network. The default is 10. |
| RtrDeadInterval | Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this field to the same value for all routers attached to a common network. The default is 40. |
| PollInterval | Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120. |
| State | Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesginatedRouter • otherDesignatedRouter |
| DesignatedRouter | Shows the router ID for the designated router. |
| BackupDesignatedRouter | Shows the router ID for the backup designated router. |
| MetricValue | Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100.

Note:
If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface. |
| LinkLsaSuppression | Specifies whether Link LSA suppression is enabled. |

Viewing the AS-scope link-state database

View the AS-scope link-state database (LSDB) to see the LSAs that are flooded through the routing domain. The AS scope is used for AS external-LSAs.

Before You Begin

- Change the VRF instance as required to view OSPFv3 on a specific VRF instance.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **AS-scope LSDB** tab.

AS-scope LSDB field descriptions

Use the data in the following table to use the **AS-scope LSDB** tab.

| Name | Description |
|-----------------|--|
| Type | Shows the type of the link-state advertisement. Each link state type has a separate advertisement format. AS-scope LSAs not recognized by the router may be stored in the database. |
| RouterId | Shows the 32 bit number that uniquely identifies the originating router in the autonomous system. |
| Lsid | Identifies the piece of the routing domain that is being described by the advertisement. |
| Sequence | Shows a signed 32-bit integer that detects old and duplicate link-state advertisements. The larger the sequence number, the more recent the advertisement. |
| Age | Shows the age of the link-state advertisement in seconds. |
| Checksum | Indicates the checksum of the complete contents of the advertisement, except the age field. The age field is not affected so that the advertisement age value increments without updating the checksum. The checksum used is the same for ISO connectionless datagrams, the Fletcher checksum. |

Viewing the area-scope LSDB

View the area-scope LSDB to see the LSAs that are flooded in a single OSPFv3 area. Area scope is used in router LSAs, network LSAs, Inter-Area-Prefix-LSAs, Inter-Area-Router LSAs, and Intra-Area-Prefix-LSAs.

Before You Begin

- Change the VRF instance as required to view OSPFv3 on a specific VRF instance.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **Area-scope LSDB** tab.

Area-scope LSDB field descriptions

Use the data in the following table to use the **Area-scope LSDB** tab.

| Name | Description |
|-----------------|--|
| Areaid | Identifies the area ID from which the LSA is received. Area ID 0.0.0.0 is the OSPF backbone. |
| Type | Identifies the type of the link-state advertisement. Each link-state type has a separate advertisement format. Area-scope LSAs unrecognized by the router are also stored in this database. |
| RouterId | Identifies the originating router in the autonomous system. |
| Lsid | Identifies the piece of the routing domain that is described by the advertisement. |
| Sequence | Shows a signed 32-bit integer that detects old and duplicate link-state advertisements. The larger the sequence number, the more recent the advertisement. |
| Age | Shows the age of the link-state advertisement in seconds. |
| Checksum | Indicates the checksum of the complete contents of the advertisement, except the age field. The age field is not affected so that the advertisement age value increments without updating the checksum. The checksum used is the same for ISO connectionless datagrams, the Fletcher checksum. |

Viewing the link-scope LSDB

View the link-scope LSDB to view the LSAs that are not flooded beyond the local link.

Before You Begin

- Change the VRF instance as required to view OSPFv3 on a specific VRF instance.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **Link-scope LSDB** tab.

Link-scope LSDB field descriptions

Use the data in the following table to use the **Link-scope LSDB** tab.

| Name | Description |
|-----------------|--|
| IfIndex | Shows the identifier of the link from which the LSA was received. |
| Type | Shows the type of the link-state advertisement. Each link state type has a separate advertisement format. Link-scope LSAs not recognized by the router may be stored in the database. |
| RouterId | Shows the 32 bit number that uniquely identifies the originating router in the autonomous system. |
| Lsid | Identifies the piece of the routing domain that is being described by the advertisement. |
| Sequence | Shows a signed 32-bit integer that detects old and duplicate link-state advertisements. The larger the sequence number, the more recent the advertisement. |
| Age | Shows the age of the link-state advertisement in seconds. |
| Checksum | Indicates the checksum of the complete contents of the advertisement, except the age field. The age field is not affected so that the advertisement age value increments without updating the checksum. The checksum used is the same for ISO connectionless datagrams, the Fletcher checksum. |

Adding an NBMA neighbor

Add an NBMA neighbor for each interface that is eligible to become the DR.

An NBMA interface with a positive nonzero router priority is eligible to become the DR for the NBMA network and is configured with the identification of all attached routers, IPv6 addresses, and router priorities.

Before You Begin

- Identify the following information:
 - specific interfaces to include in the NBMA network
 - the IPv6 address for each interface
 - the router priority for each interface
 - the hello interval for the network
 - the router dead interval for the network
 - the poll interval for the network
- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance.

About This Task

In contrast to a broadcast network where switches multicast (send to AllSPFRouters and AllDRouters) certain OSPF protocol packets, switches replicate and send NBMA packets to each neighboring router as unicast. NBMA networks drop all OSPF packets with destination addresses AllSPFRouters and AllDRouters. Because the NBMA network does not broadcast, you must manually configure a list of

neighbors and priorities for all routers in the network that can become the DR. Potential DRs use a positive nonzero router priority.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **NBMA Neighbors** tab.
4. Click **Insert**.
5. Select the IPv6 port or VLAN interface.
6. Specify the IPv6 address for the neighbor.
7. Specify the priority for the neighbor.
8. Click **Insert**.

NBMA Neighbors field descriptions

Use the data in the following table to use the **NBMA Neighbors** tab.

| Name | Description |
|-----------------|--|
| IfIndex | Specifies the link ID for the link over which the switch reaches the neighbor. |
| Address | Specifies the IPv6 address of the neighbor. |
| Priority | Specifies the priority to use for this neighbor in the designated router election process. A value of 0 indicates the neighbor cannot become the designated router. The higher the priority value, the higher chance the switch will win the election process. The default is 1. |
| RtrId | Identifies the neighboring router in the autonomous system. The value is 0.0.0.0 until the switch receives a hello message from the neighbor. |
| State | Identifies the state of the relationship with the neighbor. The state can be one of the following: <ul style="list-style-type: none"> • down • attempt • init • twoWay • exchangeStart • exchange • loading • full |

Configuring Route Redistribution to OSPFv3

Configure a redistribute entry to announce routes of a certain source protocol into the OSPFv3 domain. Optionally, use a route policy to control the redistribution of routes.

About This Task

Important

Changing the OSPFv3 redistribute context is a process-oriented operation that can affect system performance and network reachability while you perform this procedure. As a best practice, change the default preferences for an OSPFv3 redistribute context, you must do so before you enable the protocols.

Before You Begin

- Enable OSPFv3 globally.
- Ensure that a route policy exists if you intend to use a route policy.
- Change the VRF instance as required to configure OSPFv3 on a specific VRF instance. The VRF must have an RP trigger of OSPFv3. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **Redistribute** tab.
4. Click **Insert**.
5. Select an option for the route source.
6. Select the **enable** option button.
7. Select a route policy.
8. Configure the metric type.
9. Click **Insert**.

Redistribute Field Descriptions

Use the data in the following table to use the **Redistribute** tab.

| Name | Description |
|--------------------|--|
| DstVrfId | Specifies the destination virtual router forwarding instance. You cannot configure this variable. |
| Protocol | Specifies the dynamic routing protocol that receives the external routing information. |
| SrcVrfId | Specifies the source VRF instance. You cannot configure this variable. |
| RouteSource | Specifies the route source protocol for the redistribution entry. |
| Enable | Enables (or disables) an OSPF redistribute entry for a specified source type. |
| RoutePolicy | Configures the route policy (by name) to use for detailed redistribution of external routes from a specified source into an OSPF domain. Click the ellipsis (...) button and choose from the list in the dialog box. |

| Name | Description |
|-------------------|--|
| Metric | Configures the OSPF route redistribution metric for basic redistribution. The value can be a range from 0–65535. A value of 0 indicates to use the original cost of the route. |
| MetricType | Configures the OSPF route redistribution metric type. The default is type 2. The cost of a type 2 route is the external cost, regardless of the interior cost. A type 1 cost is the sum of both the internal and external costs. |

Modifying an OSPFv3 interface

Configure the OSPF protocol on IPv6 interface to support dynamic routing on the interface. An IPv6 interface can be a tunnel, port or VLAN.

Before You Begin

- The OSPFv3 interface must exist.

Procedure

- In the navigation pane, expand the following folders: **Configuration > IPv6**.
- Click **OSPFv3**.
- Click the **Interfaces** tab.
- Double-click a cell to edit the value.
- Click **Apply**.

Interfaces field descriptions

Use the data in the following table to use the **Interfaces** tab.

| Name | Description |
|------------------|--|
| Index | Shows the interface index for the IPv6 interface on which OSPFv3 is configured. |
| Areald | Specifies the area ID to which the IPv6 interface connects. Use 0.0.0.0 for the OSPFv3 backbone. |
| Type | Specifies the OSPFv3 interface type as one of the following: <ul style="list-style-type: none"> broadcast NBMA point-to-point point-to-multipoint passive |
| AdminStat | Specifies the administrative status for the OSPFv3 interface. If you enable the status, it is advertised as an internal route to some areas. If you disable the status, the interface is external to OSPFv3. The default is enabled. |

| Name | Description |
|-------------------------------|---|
| RtrPriority | Specifies the priority of this interface. Multiaccess networks use the priority in the designated router election.
A higher priority value increases the chance the router becomes the designated router. A value of zero (0) indicates the router cannot become the designated router for the network. If more than one router uses the same priority value, the router ID determines the designated router.
The default is 1. |
| TransitDelay | Specifies the estimated number of seconds to transmit a link-state-update packet over this interface. The default is 1. |
| RetransInterval | Specifies the number of seconds between retransmission of link-state advertisements for the adjacencies that belong to this interface, and for database description and link-state request packets. The default is 5. |
| HelloInterval | Specifies the number of seconds between the hello packets that the router sends on this interface. You must configure this field to the same value for all routers attached to a common network. The default is 10. |
| RtrDeadInterval | Specifies the number of seconds after which to declare a router down if no hello packets are received. You must configure this field to the same value for all routers attached to a common network. The default is 40. |
| PollInterval | Specifies the number of seconds between hello packets sent to an inactive NBMA neighbor. The default is 120. |
| State | Shows the state of the OSPFv3 interface as one of the following: <ul style="list-style-type: none"> • down • loopback • waiting • pointToPoint • designatedRouter • backupDesginatedRouter • otherDesignatedRouter |
| DesignatedRouter | Shows the router ID for the designated router. |
| BackupDesignatedRouter | Shows the router ID for the backup designated router. |

| Name | Description |
|---------------------------|--|
| MetricValue | Specifies the cost for the interface. The default value for a brouter port or VLAN is 1. The default value for a tunnel is 100.

Note:
If you do not specify a cost for the interface, the switch dynamically updates the interface cost with the configured global OSPF default cost. The global OSPF default cost depends on the speed of the interface. |
| LinkLsaSuppression | Specifies whether Link LSA suppression is enabled. |
| BfdEnable | Enable Bidirectional Forwarding Detection (BFD) for OSPF. |

Viewing OSPFv3 neighbors

View OSPFv3 neighbors to see routers with interfaces to a common network.

The OSPFv3 hello protocol maintains and dynamically discovers neighbor relationships.

The exception is an NBMA network; you manually configure permanent neighbors on each router eligible to become the designated router (DR).

Procedure

1. In the navigation tree, expand the following folders: **Configuration** > **IPv6**.
2. Click **OSPFv3**.
3. Click the **Neighbors** tab.

Neighbors field descriptions

Use the data in the following table to use the **Neighbors** tab.

| Name | Description |
|----------------|---|
| IfIndex | Displays the local-link ID of the link over which the neighbor can be reached. |
| RtrId | Identifies the neighboring router in the Autonomous System.
The value is the router ID of the neighboring router, which in OSPF uses the same format as an IPv6 address but identifies the router independent of IPv6 address. |
| Address | Displays the IPv6 address for the neighbor associated with the local link. |
| Options | Displays the bit mask that corresponds to the options field on the neighbor. |

| Name | Description |
|-------------------|---|
| State | Displays the state of the relationship with the neighbor.
The value can be one of the following: <ul style="list-style-type: none"> • down • attempt • init • twoWay • exchangeStart • exchange • loading • full |
| NbrIfId | Displays the interface ID that the neighbor advertises in its hello packets on this link. |
| DeadIntCnt | Displays the Dead interval Count or TTL (time to live) field that indicates how many seconds remain before the system declares the Neighbor down. The starting value is the Router Dead Interval value and it decrements to 0 if no Hello is received for that neighbor within the interval. If no Hello is received within the interval, then the system declares the neighbor down. When a hello is received for the neighbor, the system resets the value to the Router Dead Interval value. |

Viewing virtual neighbors

View information about the neighbors on the virtual link to the OSPFv3 backbone.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **OSPFv3**.
3. Click the **Virtual Neighbors** tab.

Virtual Neighbors field descriptions

Use the data in the following table to use the **Virtual Neighbors** tab.

| Name | Description |
|---------------------|---|
| Area | Shows the ID for the transit area. |
| RtrId | Shows the ID for the neighboring router in the autonomous system. |
| LocalIfIndex | Shows the local interface ID for the virtual link over which the switch can reach the neighbor. |

| Name | Description |
|--------------------|--|
| AddressType | Shows the type of address as one of the following: <ul style="list-style-type: none"> • ipv4 • ipv6 • ipv4z • ipv6z • dns ipv4z and ipv6z indicate a scope zone. |
| Address | Shows the IPv6 address that this virtual neighbor advertises. This value must be a global scope address. |
| Options | Shows a bit mask that corresponds to the OSPF options field of the neighbor. |
| State | Shows the state of the virtual neighbor relationship. The value can be one of the following: <ul style="list-style-type: none"> • down • attempt • init • twoWay • exchangeStart • exchange • loading • full |

OSPFv3 Configuration Example

This section shows an example of OSPFv3 configuration. The following figure shows the network.

Figure 207: OSPFv3 configuration

To complete the configuration, you must perform the following actions:

- Configure an IPv6 VLAN (VLAN 2) with port member 1/1.
- Configure an IPv6 brouter port (1/2).
- Use IPv6 address 2001:100:102::/64.

Configure VLAN 2 and add port members.

```
vlan create 2 type port-mstprstp 0
vlan mlt 2 4
vlan members 2 1/1 portmember
interface vlan 2
```

```

ipv6 interface
ipv6 interface enable
ipv6 interface address 2001:100:102:202:0:0:0:1/64
exit

```

Enable OSPFv3 on VLAN 2.

```

# IPV6 OSPF VLAN CONFIGURATION
interface vlan 2
ipv6 ospf area 0.0.0.0
ipv6 ospf poll-interval 0
ipv6 ospf enable
exit

```

Create brouter port 1/2 with IPv6 and OSPFv3.

```

interface gigabitethernet 1/2
ipv6 interface vlan 3999
ipv6 interface enable
ipv6 interface address 2001:100:102:201:0:0:0:1/64
ipv6 ospf area 0.0.0.0
ipv6 ospf enable
exit

```

Verification

The following example shows the Global Router example for OSPFv3 Area configuration:

```

Switch:1#show ipv6 ospf area

=====
                        OSPF Area - GlobalRouter
=====

Port Performance Management

[Digital Diagnostic Monitoring](#) on page 2479

[Port Performance Management Using CLI](#) on page 2479

[Port Performance Management using EDM](#) on page 2484

Digital Diagnostic Monitoring

Use Digital Diagnostic Monitoring (DDM) to monitor laser operating characteristics such as temperature, voltage, current, and power. This feature works at any time during active laser operation without affecting data traffic.

The following optical transceivers support DDM:

- 1 Gbps Small Form Factor Pluggable (SFP)
- 10 Gbps Small Form Factor Pluggable plus (SFP+)
- 25 Gbps Small Form Factor Pluggable 28 (SFP28)
- 40 Gbps Quad Small Form Factor Pluggable plus (QSFP+)
- 100 Gbps Quad Small Form Factor Pluggable 28 (QSFP28)

Digital Diagnostic Interface (DDI) is an interface that supports DDM. These devices provide real-time monitoring of individual DDI transceivers. The DDM software provides warnings or alarms after the temperature, voltage, laser bias current, transmitter power or receiver power fall outside of vendor-specified thresholds during initialization.

For information about optical transceivers, see [Extreme Networks Pluggable Transceivers Installation Guide](#)

Port Performance Management Using CLI

This section contains procedures to monitor individual DDI transceivers using the CLI.

Configure DDM

Configure Digital Diagnostic Monitoring to get information concerning the status of the transmitted and received signals to allow better fault isolation and error detection.

About This Task

When you enable DDM, you see the internal performance condition (temperature, voltage, bias, Tx power and Rx power) of the pluggable transceiver. The default is disabled.

For information about how to reset a transceiver for troubleshooting purposes, see [Resetting a QSFP+ or QSFP28 Transceiver](#) on page 3700.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. (Optional) Configure an alarm to occur if the port goes down:

```
pluggable-optical-module ddm-alarm-portdown
```
3. (Optional) Configure the DDM interval:

```
pluggable-optical-module ddm-monitor-interval <5-60>
```
4. (Optional) Enable the sending of trap messages when an alarm occurs:

```
pluggable-optical-module ddm-traps-send
```
5. Enable DDM:

```
pluggable-optical-module ddm-monitor
```

Example

Configure the interval to 10 seconds and enable DDM.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#pluggable-optical-module ddm-monitor-interval 10
Switch:1(config)#pluggable-optical-module ddm-monitor
```

Variable Definitions

Use the data in the following table to use the **pluggable-optical-module** command

| Variable | Value |
|------------------------------------|--|
| <i>ddm-alarm-portdown</i> | When enabled, the port goes down when any alarm occurs. The default is disabled. |
| <i>ddm-monitor</i> | Enables DDM. When enabled, you see the internal performance condition (temperature, voltage, bias, Tx power and Rx power) of the pluggable transceiver. The default is disabled. |
| <i>ddm-monitor-interval</i> <5-60> | Configures the DDM monitor interval. If an alarm occurs, the log message is received within the specific interval. The default value is 5 seconds. |
| <i>ddm-traps-send</i> | Enables or disables the sending of trap messages. When enabled, the trap message is sent to the device manager any time the alarm occurs. The default is enabled. |

View DDI Port Information

Perform this procedure to view basic manufacturing information and characteristics, and the current configuration.

About This Task

This command displays information for DDI transceivers.

Note

Transceiver support differs across hardware platforms. For information about supported parts, see [Extreme Optics](#) website.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View basic manufacturing information and characteristics:
show pluggable-optical-modules basic [{slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]]
3. View configuration information:
show pluggable-optical-modules config
4. View detailed manufacturing information and characteristics:
show pluggable-optical-modules detail [{slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]]

Examples

```
Switch:1#show pluggable-optical-modules config
=====
Pluggable Optical Module Global Configuration
=====
          ddm-monitor : disabled
    ddm-monitor-interval : 5
          ddm-traps-send : enabled
    ddm-alarm-portdown : disabled
```

The following example includes Extreme extended diagnostic information. Not all parts support this information. A value of 254 indicates the part has not been initialized.

```
Switch:1#show pluggable-optical-modules detail 1/29

Variable Definitions

Use the data in the following table to use the **show pluggable-optical-modules basic** and **show pluggable-optical-modules detail** commands.

| Variable | Value |
|--|---|
| <code>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

View DDI Temperature Information

About This Task

This command displays information for DDI transceivers.

Note

Transceiver support differs across hardware platforms. For information about supported parts, see [Extreme Optics](#) website.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View temperatures:

```
show pluggable-optical-modules temperature [{slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]]
```

Example

```
Switch:1#show pluggable-optical-modules temperature
```

```

=====

```

Variable Definitions

Use the data in the following table to use the **show pluggable-optical-modules temperature** command.

| Variable | Value |
|--|---|
| <code>{slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

View DDI Voltage Information

About This Task

This command displays information for DDI transceivers.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View voltages:

```
show pluggable-optical-modules voltage [{slot/port[/sub-port]} [-slot/  
port[/sub-port]] [,...]]
```

Example

```
Switch:1#show pluggable-optical-modules voltage
```

```

=====
                        Pluggable Optical Module Voltage (V)
=====

```

Variable Definitions

Use the data in the following table to use the **show pluggable-optical-modules voltage** command.

| Variable | Value |
|---|---|
| <code>{slot/port[/sub-port]} [-slot/port[/sub-port]] [,...]]</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Port Performance Management using EDM

This section contains procedures to monitor individual DDI transceivers using EDM.

View DDI Information

About This Task

You can view DDI information, for example, port information, temperature, and voltages for DDI transceivers.

Note

Transceiver support differs across hardware platforms. For information about supported parts, see [Extreme Optics](#) website.

Procedure

1. On the Physical Device view, select one or more ports.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **DDI/SFP** tab.

DDI/SFP Field Descriptions

Use the data in the following table to use the **DDI/SFP** tab.

| Name | Description |
|--|--|
| ConnectorType | Indicates the type of connector. |
| SupportsDDM | Indicates if the transceiver supports DDM. |
| DdmStatusMask | Indicates the DDM status. A value other than ddm-ok represents a specific error. |
| CLEI | Indicates the Telcordia register assignment CLEI code. |
| VendorName | Indicates the name of the manufacturer. |
| VendorPartNumber | Indicates the part number for the transceiver. |
| VendorRevNumber | Indicates the manufacturer revision level for the transceiver. |
| VendorSN | Indicates the manufacturer serial number for the transceiver. |
| VendorDateCode | Indicates the manufacturer date code for the transceiver. |
| Wavelength | Indicates the wavelength in nm. This field is valid for optical transceivers only. |
| Calibration | Indicates if the calibration is internal or external. |
| PowerMeasure | Indicates Rx power measurement as average or OMA. |
| Aux1Monitoring | Indicates if auxiliary monitoring is implemented for the transceiver. |
| Aux2Monitoring | Indicates if auxiliary monitoring is implemented for the transceiver. |
| TemperatureLowAlarmThreshold | Indicates the low alarm threshold in degrees Celsius. |
| TemperatureLowWarningThreshold | Indicates the low warning threshold in degrees Celsius. |
| Temperature | Indicates the current temperature in degrees Celsius of the transceiver. |
| TemperatureHighWarningThreshold | Indicates the high warning threshold in degrees Celsius. |
| TemperatureHighAlarmThreshold | Indicates the high alarm threshold in degrees Celsius. |
| TemperatureStatus | Indicates if any temperature thresholds were exceeded. |
| VoltageLowAlarmThreshold | Indicates the low alarm threshold in volts. |
| VoltageLowWarningThreshold | Indicates the low warning threshold in volts. |
| Voltage | Indicates the current voltage in volts. |

| Name | Description |
|------------------------------------|---|
| VoltageHighWarningThreshold | Indicates the high warning threshold in volts. |
| VoltageHighAlarmThreshold | Indicates the high alarm threshold in volts. |
| VoltageStatus | Indicates if any voltage thresholds were exceeded. |
| BiasLowAlarmThreshold | Indicates the bias current low alarm threshold in mA. |
| BiasLowWarningThreshold | Indicates the bias current low warning threshold in mA. |
| Bias | Indicates the laser bias current in mA. |
| BiasHighWarningThreshold | Indicates the bias current high warning threshold in mA. |
| BiasHighAlarmThreshold | Indicates the bias current high alarm threshold in mA. |
| BiasStatus | Indicates if any bias thresholds were exceeded. |
| TxPowerLowAlarmThreshold | Indicates the low alarm threshold in dBm for the Tx power. |
| TxPowerLowWarningThreshold | Indicates the low warning threshold in dBm for the Tx power. |
| TxPower | Indicates the current Tx power in dBm. |
| TxPowerHighWarningThreshold | Indicates the high warning threshold in dBm for the Tx power. |
| TxPowerHighAlarmThreshold | Indicates the high alarm threshold in dBm for the Tx power. |
| TxPowerStatus | Indicates if any Tx power thresholds were exceeded. |
| RxPowerLowAlarmThreshold | Indicates the low alarm threshold in dBm for the Rx power. |
| RxPowerLowWarningThreshold | Indicates the low warning threshold in dBm for the Rx power. |
| RxPower | Indicates the current Rx power in dBm. |
| RxPowerHighWarningThreshold | Indicates the high warning threshold in dBm for the Rx power. |
| RxPowerHighAlarmThreshold | Indicates the high alarm threshold in dBm for the Rx power. |
| RxPowerStatus | Indicates if any Rx power thresholds were exceeded. |
| Aux1LowAlarmThreshold | Indicates the low alarm threshold auxiliary 1 reading. |
| Aux1LowWarningThreshold | Indicates the low warning threshold auxiliary 1 reading. |
| Aux1 | Indicates the current auxiliary 1 reading. |
| Aux1HighWarningThreshold | Indicates the high warning threshold auxiliary 1 reading. |
| Aux1HighAlarmThreshold | Indicates the high alarm threshold auxiliary 1 reading. |
| Aux1Status | Indicates if any auxiliary 1 thresholds were exceeded. |
| Aux2LowAlarmThreshold | Indicates the low alarm threshold auxiliary 2 reading. |
| Aux2LowWarningThreshold | Indicates the low warning threshold auxiliary 2 reading. |
| Aux2 | Indicates the current auxiliary 2 reading. |

| Name | Description |
|---------------------------------|---|
| Aux2HighWarningThreshold | Indicates the high warning threshold auxiliary 2 reading. |
| Aux2HighAlarmThreshold | Indicates the high alarm threshold auxiliary 2 reading. |
| Aux2Status | Indicates if any auxiliary 2 thresholds were exceeded. |
| PowerOnCounter | Tracks the power-on-life of the part. This value increments by 1 every 48 hours of consecutive power. This value is never decremented or cleared. If you remove or reinsert the part, reset or reboot the chassis, reset the slot, or channelize or dechannelize the port, then the 48-hour time period restarts. |
| TxDdmInitial | Indicates the Tx dB from low alarm, which is the difference between the TxPower dBm and the TxPower low alarm. The host provides the value after the first 48 consecutive hours of operation. |
| TxDdmLastGasp | Indicates the last gasp of Tx dB from low alarm. The host updates this value every 48 hours. |
| RxDdmInitial | Indicates the Rx dB from low alarm, which is the difference between the RxPower dBm and the RxPower low alarm. The host provides the value after the first 48 consecutive hours of operation after a power cycle. |
| RxDdmLastGasp | Indicates the last gasp of Rx dB from low alarm. The host updates this value every 48 hours. |
| ExtremeExtraFeatures | Indicates if the device supports the extra Extreme features. |

Note

1. Threshold and actual values for TxBias, TxPower, and RxPower are provided for all 4 channels in QSFP+ and QSFP28 optical transceivers.
2. Auxiliary monitoring does not apply to QSFP+s or QSFP28s.

Power over Ethernet (PoE) is the implementation of IEEE 802.3af, IEEE 802.3at, and IEEE 802.3bt (Type 3 and Type 4), which allows for both data and power to pass over a copper Ethernet LAN cable. Typical power devices include wireless Access Points and VoIP telephones.

Depending on the technology and application requirements, PoE is classified into classes. Depending on the power requirements, the PoE devices are categorized by type. Classes range from Class 0 to 8 whereas types range from Type 1 to 4. Each type associates with an IEEE 802.3 PoE standard. These standards provide signalling between the power sourcing equipment (PSE) and the powered device (PD). PSE devices, such as switches, provide power on the network cable. The devices that PSE provides power to are called PDs, such as VoIP phones, wireless access points, and IP surveillance cameras.

To know which ports support PoE, see the following documents:

- [ExtremeSwitching 5520 Series Hardware Installation Guide](#)
- [Installing the Virtual Services Platform 4450GSX-PWR+](#) or [Installing the Virtual Services Platform 4450GTX-HT-PWR+](#)
- [VSP 4900 Series Switches: Hardware Installation Guide](#)

The switch uses the Dynamic Power Allocation scheme when supplying power to devices. Only the power being consumed by the device is allocated, improving efficiency and enabling support for more number of devices.

You can configure PoE from CLI and Enterprise Device Manager (EDM).

PoE Overview

You can plug any IEEE 802.3af-compliant, 802.3at-compliant, or 802.3bt-compliant (Type 3 and Type 4) for PWR+ powered device into a front-panel port and receive power in that port. Data also can pass simultaneously on that port. This capability is called PoE.

For more information about PoE and power supplies, see your hardware documentation.

The IEEE 802.3af draft standard regulates a maximum of 15.4 W of power for each port; that is, a power device cannot request more than 15.4 W of power. As different network devices require different levels of power, the overall available power budget of the switch depends on your power configuration and the particular connected network devices. If you connect an IP device that requires more than 16 W of power, you see an error on that port notifying you of an overload.

The switch automatically detects each IEEE 802.3af-compliant powered device attached to each front-panel port and immediately sends power to that appliance. The switch also automatically detects how much power each device requires and supply the required DC voltage at a set current based on the load conditions and current availability. The switch supports both PoE and standard LAN devices.

Similarly, the switch automatically detects any IEEE 802.3at-compliant (maximum 25.5 W) or IEEE 802.3bt-compliant (maximum 60W for Type 3, maximum 90W for Type 4) powered device attached to any PoE front panel port and immediately sends power to that appliance.

The power detection function of the switch operates independently of the data link status. A device that is already operating the link for data or a device that is not yet operational can request power. That is, the switch provides power to a requesting device even if the data link for that port is disabled. The switch monitors the connection and automatically disconnects power from a port when you remove or change the device, as well as when a short occurs.

The switch automatically detects devices that require no power connections from them, such as laptop computers or other switching devices, and sends no power to those devices. You control the supply of power to specific ports by setting the maximum allowed power to each port in 1 W increments, from 3 W to 98W.

**Important**

Wait for 30 seconds between unplugging and replugging an IP device to the switch to enable the IP device to discharge. If you attempt to connect earlier, the switch cannot detect the IP device.

The switch provides the capability to set a PoE power threshold, which lets you set a percentage of the total PoE power usage at which the switch sends a warning message. If the power consumption is below the threshold, the switch logs an information message.

**Important**

- After you enable Fast PoE or Perpetual PoE or both, you must save the running configuration file.
- If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings (for example, power limits, or port power priority), you must resave the running configuration file.

PoE Detection Types

The following table identifies product support for the different PoE types.

Table 270: PoE type support

| Product | Highest PoE Standard |
|---------------------|--------------------------|
| 5520-12MW-36W | 802.3bt Type 4 PoE (90W) |
| 5520-24W | 802.3bt Type 4 PoE (90W) |
| 5520-48W | 802.3bt Type 4 PoE (90W) |
| VSP 4450GSX-PWR+ | 802.3at Type 2 PoE (30W) |
| VSP 4450GTX-HT-PWR+ | 802.3at Type 2 PoE (30W) |
| VSP4900-12MXU-12XE | 802.3bt Type 3 PoE (60W) |
| VSP4900-48P | 802.3at Type 2 PoE (30W) |

The global configured detection type specifies the following versions of the IEEE standard to support. Standards are arranged from oldest (top) to newest (bottom).

| Detection Type | Power Mode |
|--------------------|------------|
| 802.3af | Normal |
| 802.3af and legacy | Normal |
| 802.3at | High |
| 802.3at and legacy | High |
| 802.3bt type 3 | Normal |
| 802.3bt type 4 | Normal |
| 802.3bt and legacy | Normal |

By default, 802.3at (including legacy) is the POE PD detection type. In this high power mode, Class 4 PDs receive up to 32 watts of power.

Note

802.3at is backwards compatible with 802.3af. Therefore, both normal power and high power devices are supported in this mode.

802.3af (maximum 15.4 W) and 802.3at (maximum 25.5W) are the older standards.

Note

Changing from a newer IEEE standard to an older IEEE standard is permitted, however power delivery is interrupted during this operation, and all PoE devices are reset. There is no service interruption when changing from an older IEEE standard to a newer IEEE standard.

Power usage threshold

The power usage threshold is a chassis configurable percent of the total power available on the switch. When the POE power consumption exceeds this threshold, a log message is generated to warn such an

event. When power consumption transitions below the threshold, an informational log message is logged. The default threshold is 80%.

Port Power Limit

Each PoE port has a configurable power limit. This configuration attribute limits the amount of power supplied on a particular port and varies across different hardware platforms. If a PD requires more than the configured limit, the device will not connect properly or is forced to run at a lower limit.

The following table lists the power limit for different hardware platforms:

Table 271: Power Limits

| Platform | Power Limit |
|--------------------|-------------|
| 5520 Series | 98 watts |
| VSP 4450 Series | 32 watts |
| VSP4900-48P | 32 watts |
| VSP4900-12MXU-12XE | 64 watts |

Port Power Priority

You can configure the power priority of each port by choosing low, high, or critical power priority settings.

The switch automatically drops low-priority ports when the power requirements exceed the available power budget. When the power requirements become lower than the switch power budget, the power returns to the dropped port. When several ports have the same priority and the power budget is exceeded, the ports with the highest interface number are dropped until the consumption is within the power budget.

The priority methods are:

1. Port configured PoE priority
 - Low: (default) standard priority for standard devices
 - High: higher priority than low for important devices
 - Critical: highest priority for critical devices like wireless APs
2. Port number priority where the lower port numbers have a higher priority.

PD Classification

The PDs are classified during initial connection establishment as defined in IEEE 802.3 standards. The classification defines the amount of power a device is expected to consume.

Table 272: Classification Chart for Various Standards

| Name | Standard | Class | Type | PSE Min Output Power (in W) | PD Min Input Power (in W) | Example of Supported PDs |
|-------|--------------|-------|------|-----------------------------|---------------------------|--|
| PoE | IEEE 802.3af | 0 | 1 | 15.4 | 12.95 | Static surveillance camera, VoIP phones, wireless access points |
| | | 1 | 1 | 4 | 3.84 | IP phones |
| | | 2 | 1 | 7 | 6.49 | IP camera |
| | | 3 | 1 | 15.4 | 12.95 | Wireless access points |
| PoE+ | IEEE 802.3at | 4 | 2 | 30 | 25.5 | High power PD |
| PoE++ | IEEE 802.3bt | 5 | 3 | 45 | 40 | Video conferencing equipment, multi-radio wireless access points |
| | | 6 | 3 | 60 | 51 | |
| PoE++ | IEEE 802.3bt | 7 | 4 | 75 | 62 | Laptops, flat screens |
| | | 8 | 4 | 90 | 73 | |

PoE/PoE+ Allocation Using LLDP

Power over Ethernet/Power over Ethernet Plus allocation using Link Layer Discovery Protocol (LLDP) supports Ethernet switches, which do not support hardware-level power negotiation. With this feature, these switches support IEEE-based PoE and play the role of power sourcing equipment (PSE).

The devices that are powered using PoE, such as IP Phone and Video Surveillance Cameras, are classified as Powered Devices (PD). The maximum allowed continuous output power per cable for each standard is:

- IEEE 802.3af: 15.4 W
- IEEE 802.3at: 25.5 W
- IEEE 802.3bt Type 3: 60 W
- IEEE 802.3bt Type 4: 90 W

The negotiation of actual power supply and demand between a PSE and a PD can be executed at either the physical layer or at the data link layer. After the link is established at the physical layer, the PSE can use the IEEE 802.1AB LLDP protocol to repeatedly query the PD to discover its power needs.

Communication using LLDP allows for a finer control of power allocation, making it possible for the PSE

to dynamically supply the exact power levels needed by individual PDs, and globally for all PDs that are attached. Using LLDP is optional for the PSE, however, it is mandatory for a Type 2 PD that requires more than 12.95 watts of power.

**Important**

LLDP supports PoE discovery and power allocation because some switches do not support hardware-level power negotiation. This allows Type 2 PDs such as PTZ (pan-tilt-zoom) Video Surveillance Cameras to be fully functional when connected to one of these switches. This functionality is enabled by default and is not configurable.

**Note**

Some switches feature a hardware design that supports hardware-level detection. Therefore, they do not require LLDP.

Fast PoE and Perpetual PoE

Fast PoE minimizes the PoE controller recovery time in case of a power failure. With Fast PoE, the PoE controller initializes the moment the switch powers on, which results in a faster recovery period.

Perpetual PoE provides uninterrupted power to all connected devices during a switch reboot.

**Important**

- After you enable Fast PoE or Perpetual PoE or both, you must save the running configuration file.
- If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings, you must resave the running configuration file.

Power over Ethernet Configuration using CLI

This section provides details to configure PoE settings using CLI.

**Important**

- After you enable Fast PoE or Perpetual PoE or both, you must save the running configuration file.
- If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings, you must resave the running configuration file.

Disabling PoE on a port

About This Task

Perform the following procedure to disable PoE on a port. The Ethernet connected device does not receive any power over Ethernet if you shutdown PoE on the port.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable PoE on the port:

```
poe poe-shutdown [port <portlist>]
```

<portlist> is the port on which you want to disable PoE. The default is enable.

What to Do Next

To return power to the port, enter `no poe-shutdown [port <portlist>]`.

Configure PoE Detection Type

Perform the following procedure to configure the PoE powered device (PD) detection type. You can enable either 802.3af and Legacy compliant PD detection methods, or 802.3at and Legacy compliant PD detection methods. The default detection type is 802.3at and legacy.

- 802.3af : normal power mode
- 802.3af and legacy
- 802.3at : high power mode
- 802.3at and legacy
- 802.3bt Type 3 : normal power mode
- 802.3bt Type 4 : normal power mode

802.3at is backwards compatible with 802.3af. Therefore, normal power and high power devices are supported in 802.3at.

Important

Changing from a newer IEEE standard to an older IEEE standard is permitted, however power delivery is interrupted during this operation, and all PoE devices are reset. There is no service interruption when changing from an older IEEE standard to a newer IEEE standard.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure PoE detection type:

```

poe poe-pd-detect-type {802dot3af | 802dot3af_and_legacy | 802dot3at |
802dot3at_and_legacy | 802dot3bt_type3 | 802dot3bt_type4}

```

Variable Definitions

The following table defines parameters for the **poe-pd-detect-type** command.

| Variable | Value |
|---|--|
| {802dot3af 802dot3af_and_legacy 802dot3at 802dot3at_and_legacy 802dot3bt_type3 802dot3bt_type4} | Configures the detection type to one of the following values: <ul style="list-style-type: none"> • 802dot3af: Set PD detection mode in 802.3af • 802dot3af_and_legacy: Set PD detection mode in 802.3af and legacy • 802dot3at: Set PD detection mode in 802.3at • 802dot3at_and_legacy: Set PD detection mode in 802.3at and legacy • 802dot3bt_type3: Set PD detection mode in 802dot3bt Type3 • 802dot3bt_type4: Set PD detection mode in 802dot3bt Type4 |

Configuring PoE Power Usage Threshold

About This Task

Perform the following procedure to configure the PoE power usage threshold limit globally as a percentage on the switch. The switch logs a warning message when a PoE PD power usage exceeds the configured threshold. The switch logs an informational message when a PoE PD power usage is below the configured threshold.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure the power usage threshold:

```
poe poe-power-usage-threshold <1-99>.
```

Variable Definitions

The following table defines parameters for the **poe-power-usage-threshold** command.

| Variable | Value |
|----------|---|
| <1-99> | Specifies the PoE usage threshold in the range of 1–99 percent. |

Configure Power Limits for Channels

About This Task

Perform the following procedure to configure the PoE power limit for specific ports or channels. You can limit the PoE wattage available from an individual port or list of ports.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure PoE channel limits:

```
po e poe-limit [port <portlist>] <power_limit>
```

Variable definitions

The following table defines parameters for the **poe-limit** command.

| Variable | Value |
|----------------------------|---|
| <i><portlist></i> | Identifies the ports on which the limit is set. |
| <i><power_limit></i> | Specifies the configurable power limit, in watts on a particular port. To see the available range for the switch, use the CLI Help. |

Configuring Port Power Priority

About This Task

Perform the following procedure to configure the PoE power priority for a port or list of ports. You can configure the PoE power priority of ports to manage availability of the connected PDs. If the switch needs to shut down PDs because PoE exceeds the power limit threshold, low priority devices are shut down before high priority, and high priority are shut down before critical.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure port power priority:

```
poe poe-priority [port <portlist>] {critical| high| low}
```

Variable Definitions

The following table defines parameters for the **poe-priority** command.

| Variable | Value |
|-------------------------|---|
| <portlist> | Identifies the ports to set priority for. |
| {low high critical} | Identifies the PoE priority. |

Enable Fast PoE Globally

About This Task

Perform this procedure to enable Fast PoE on the switch. After you enable Fast PoE, you must save the running configuration file.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable Fast PoE:

```
poe fast-poe-enable
```

3. Save the configuration file:

```
save config
```

Enable Perpetual PoE Globally

About This Task

Perform this procedure to enable Perpetual PoE on the switch. After you enable Perpetual PoE, you must save the running configuration file.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable Perpetual PoE:

```
poe perpetual-poe-enable
```
3. Save the configuration file:

```
save config
```

Enable Fast PoE on a Port

About This Task

Perform this procedure to enable Fast PoE on a specific copper port of the switch. After you enable Fast PoE, you must save the running configuration file.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
```

```
[,...]}
```
2. Enable Fast PoE on the copper port:

```
poe fast-poe-enable [port {slot/port[/sub-port] [-slot/port[/sub-port]]
```

```
[,...]}]
```
3. Save the configuration file:

```
save config
```

Variable Definitions

The following table defines parameters for the **fast-poe-enable** command.

| Variable | Value |
|---|---|
| <code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code> | Specifies the port or ports to be configured. |

Enable Perpetual PoE on a Port

About This Task

Perform this procedure to enable Perpetual PoE on a specific copper port of the switch. After you enable Perpetual PoE, you must save the running configuration file.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable

configure terminal

interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```
2. Enable Fast PoE on the copper port:

```
poe perpetual-poe-enable [port {slot/port[/sub-port] [-slot/port[/sub-
port]] [,...]}]
```
3. Save the configuration file:

```
save config
```

Variable Definitions

The following table defines parameters for the **fast-poe-enable** command.

| Variable | Value |
|---|---|
| <code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code> | Specifies the port or ports to be configured. |

Display Global PoE Configuration**About This Task**

Perform the following procedure to display the global PoE configuration. You can view the global PoE status, power consumption, power limit threshold, and more.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. View the global configuration:

```
show poe-main-status
```

Example

```
Switch:1#show poe-main-status
=====
                        PoE Main Status - Stand-alone
=====
Available DTE Power      : 1855 Watts
DTE Power Status         : NORMAL
DTE Power Consumption    : 92 Watts
DTE Power Usage Threshold : 80
PD Detect Type           : 802.3at and Legacy
Power Source Present     : AC Only
Primary Power Status     : Present and operational
Redundant Power Status   : Present and Operational
Fast POE Status          : Enabled
```

```
Perpetual POE Status      : Enabled
POE Firmware Version:    : 3.0.0.6
```

Displaying PoE Port Status

About This Task

Perform the following procedure to display the PoE status for each port. You can use this information to view the status, classification, watts, and priority for each PoE port.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the port status:
show poe-port-status

Example

```
Switch:1#show poe-port-status
=====
                        POE Port Status
=====
      ADMIN  CURRENT          LIMIT          FAST PERPETUAL
PORT  STATUS  STATUS          CLASSIFICATION (Watts)  PRIORITY POE      POE
-----
Port mgmt does not support DTE power
-----
1/1   Enable  DeliveringPower Class0          98      Low    Disable  Disable
1/2   Enable  DeliveringPower Class0          98      Low    Disable  Disable
1/3   Enable  DeliveringPower Class0          98      High   Disable  Disable
1/4   Enable  Searching        Class0          98      Low    Disable  Disable
1/5   Enable  Searching        Class0          98      Low    Disable  Disable
1/6   Enable  Searching        Class0          98      Low    Disable  Disable
1/7   Enable  Searching        Class0          98      Low    Disable  Disable
1/8   Enable  Searching        Class0          98      Low    Disable  Disable
1/9   Enable  Searching        Class0          98      Low    Disable  Disable
1/10  Enable  Searching        Class0          98      Low    Disable  Disable
```

Note

The PoE status of all ports is displayed. The preceding output is a sample of the full output.

Displaying Port Power Measurement

About This Task

Perform the following procedure to display the PoE power measurement. You can view the voltage, amperage, and wattage for every PoE port. PoE ports without a PD in use are measured as zeros.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View measurement information:
show poe-power-measurement

Example

```
Switch:1#show poe-power-measurement
=====
                        POE Port Measurement
=====
PORT  Volt (V)  CURRENT (mA)  POWER (Watt)
-----
1/1   34.0      117           6.200
1/2   34.0      94            5.000
1/3   34.0      535           28.500
1/4   0.0       0             0.000
1/5   0.0       0             0.000
1/6   34.0      525           27.900
1/7   34.0      152           8.100
1/8   34.0      49            2.600
```

**Note**

The PoE port measurement for all ports is displayed. The preceding output is a sample of the full output.

Power over Ethernet configuration using EDM

This section provides details to configure PoE settings using EDM.

Configure PoE Globally

About This Task

Configure PoE usage threshold and device type settings, and enable Fast PoE and Perpetual PoE globally on a switch.

**Important**

- After you enable Fast PoE or Perpetual PoE or both, you must save the running configuration file.
- If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings, you must resave the running configuration file.

Procedure

1. In the navigation pane, expand **Configuration > Edit**.
2. Select **Chassis**.
3. Select the **PoE** tab.
4. Configure the fields as required.
5. Select **Apply**.

PoE Field Descriptions

Use the data in the following table to use the PoE tab.

| Name | Description |
|--|--|
| Power(watts) | Specifies the nominal power of the Power Sourcing Entity expressed in Watts. |
| OperStatus | Specifies the operational status of the main Power Sourcing Entity. |
| ConsumptionPower(watts) | Specifies the measured usage power expressed in Watts. |
| UsageThreshold% | Configures the usage threshold in percent for comparing the measured power and initiating an alarm if the threshold is exceeded. |
| PoweredDeviceDetectType | <p>Configures the mechanism used to detect powered ethernet devices attached to a powered ethernet port. The options are:</p> <ul style="list-style-type: none"> • 802.3af • 802.3afAndLegacySupport • 802.3at • 802.3atAndLegacySupport • 802.3bt Type 3 • 802.3bt Type 4 |
| PowerPresent | <p>Specifies the current power source present on the switch. Available power sources are AC and DC. A value of acOnly indicates that the only power supply is AC. A value of dcOnly indicates that the only power supply is DC. A value of acDc indicates that the two power supplies, AC and DC are supplying power.</p> |
| <p>FastPoeEnable</p> <p>Note:
Exception: only supported on 5520 Series and VSP 4900 Series.</p> | <p>Enables Fast PoE on the switch. The default is disabled.</p> |
| <p>PerpetualPoeEnable</p> <p>Note:
Exception: only supported on 5520 Series and VSP 4900 Series.</p> | <p>Enables Perpetual PoE on the switch. The default is disabled.</p> |

Configure PoE on Ports

About This Task

Enable or disable PoE on a port, and configure PoE priority and power limit settings.

Important

If Fast PoE or Perpetual PoE are enabled and you change any other global or port-specific PoE settings, you must resave the running configuration file.

Procedure

1. In the Device Physical View, select one or more ports that support PoE. For information about which ports support PoE, see your hardware documentation.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **PoE** tab.
5. Configure the fields as required.
6. Click **Apply**.

PoE Field Descriptions

Use the data in the following table to configure PoE settings for specific ports.

| Name | Description |
|--|--|
| AdminEnable | Enabled or disables PoE on this port. |
| FastPoeEnable

Note:
Exception: only supported on 5520 Series and VSP 4900 Series. | Enables or disables Fast PoE on this port. The default is disabled. |
| PerpetualPoeEnable

Note:
Exception: only supported on 5520 Series and VSP 4900 Series. | Enables or disables Perpetual PoE on this port. The default is disabled. |
| DetectionStatus | Specifies the operational status of the power device detecting mode on this port: <ul style="list-style-type: none"> • Disabled—detecting function disabled • Searching—detecting function is enabled and the system is searching for a valid powered device on this port • DeliveringPower—detection found a valid powered device and the port is delivering power • Fault (OtherFault)—a power-specific fault has been detected on the port • Test—detecting device is in test mode |

| Name | Description |
|-----------------------------|---|
| PowerClassifications | Specifies the power classification of the device connected to this port. Power classification tags different terminals on the Power over LAN network according to their power consumption. Devices such as IP telephones, WLAN access points, and others can be classified according to their power requirements. |
| PowerPriority | Configures the power priority for this port: <ul data-bbox="792 489 906 583" style="list-style-type: none">• critical• high• low |
| PowerLimit(Watts) | Configures the maximum power that the switch can supply to a port. |
| Voltage(volts) | Specifies the power measured in volts. |
| Current(amps) | Specifies the power measured in amps. |
| Power(Watts) | Specifies the power measured in watts. |

Power Savings

[Power Savings Fundamentals](#) on page 2507

[Power Savings Configuration Using CLI](#) on page 2510

[Power Savings Configuration Using EDM](#) on page 2518

Power savings allow you to reduce network infrastructure power consumption during periods of low data activity without impacting network connectivity.

Depending on the power saving option you choose, you can implement power savings on a switch-wide, or on a per-port basis. The following power saving options are supported:

- Energy Saver (switch-wide or per-port)
- Energy Efficient Ethernet (EEE) (per-port only)

You must choose either Energy Saver, or Energy Efficient Ethernet (EEE)—you cannot use both options together.

The following sections describe the Energy Saver and Energy Efficient Ethernet (EEE) features, and how to configure them.

Power Savings Fundamentals

Energy Saver

Table 273: Energy Saver product support

| Feature | Product | Release introduced |
|--|-----------------|--|
| For configuration details, see VOSS User Guide . | | |
| Energy Saver | 5520 Series | VOSS 8.2.5
All fixed ports on 5520-24T, 5520-24W, 5520-48T, 5520-48W, and 5520-12MW-36W |
| | VSP 4450 Series | VOSS 7.0 |
| | VSP 4900 Series | VOSS 8.1
VSP4900-48P and ports 1/1 to 1/12 on VSP4900-12MXU-12XE only |
| | VSP 7200 Series | VOSS 7.0
VSP 7254XTQ only |
| | VSP 7400 Series | Not Supported |
| | VSP 8200 Series | Not Supported |
| | VSP 8400 Series | VOSS 7.0 |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | Not Supported |

To reduce direct power consumption by up to 40%, Energy Saver uses intelligent-switching capacity reduction in off-peak mode by controlling port link speeds and optionally powering off low priority PoE devices during off-peak periods. You can schedule Energy Saver to activate during multiple specific time periods. These time periods can be as short as one minute, or can last a week, a weekend, or individual days.

Note

- Energy Saver is supported only on copper ports that have auto-negotiation enabled on them.
- If auto-negotiation is disabled on a port and a custom port speed is configured, Energy Saver will not change the speed of that port.

**Important**

- Configuring the port link speed to a low value impacts the overall network performance. The best practice is to use the Energy Saver feature during the hours when the network is not overburdened.
- If a switch is reset while Energy Saver is activated, the PoE power-saving calculation might not accurately reflect the power saving, and in some cases might display zero savings. This problem occurs because the switch did not have sufficient time to record PoE usage between the reset of the switch and the reactivation of Energy Saver. When Energy Saver is next activated, the PoE power saving calculation is correctly updated.
- When Energy Saver is active and you replace a unit, that unit will not be in Energy Saver mode. You must configure Energy Saver directly after replacing a unit.

Interaction with PoE

Energy Saver can use Power over Ethernet (PoE) port-power priority levels to shut down low-priority PoE ports and provide power savings. The power consumption savings of each switch is determined by the number of ports with Energy Saver enabled, and by the power consumption of PoE ports that are powered off. If Energy Saver is disabled on a port, the port is not powered off, irrespective of the PoE configuration. Energy Saver turns off the power to a port only when PoE is enabled globally, the port Energy Saver is enabled, and the PoE priority for the port is configured to Low.

Configuration Fundamentals

To fully configure and use Energy Saver, you must first enable Energy Saver on ports, create a schedule, and then enable Energy Saver globally.

Alternatively, you can configure Energy Saver using the Efficiency Mode quick configuration method, which enables Energy Saver on all ports, creates a default schedule, and enables Energy Saver globally.

You can manually deactivate and reactivate Energy Saver at any time, without affecting the port configurations.

**Note**

- Energy Saver is supported only on copper ports that have auto-negotiation enabled.
- Network Time Protocol (NTP) must be enabled and configured to use Energy Saver.

Energy Efficient Ethernet

Table 274: Energy Efficient Ethernet product support

| Feature | Product | Release introduced |
|--|-----------------|--|
| For configuration details, see VOSS User Guide . | | |
| Energy Efficient Ethernet (EEE) | 5520 Series | VOSS 8.2.5
All fixed ports on 5520-24T, 5520-24W, 5520-48T, 5520-48W, and 5520-12MW-36W |
| | VSP 4450 Series | Not Supported |
| | VSP 4900 Series | VOSS 8.1
All fixed ports on VSP4900-48P and ports 1/1-1/12 on VSP4900-12MXU-12XE |
| | VSP 7200 Series | Not Supported |
| | VSP 7400 Series | Not Supported |
| | VSP 8200 Series | Not Supported |
| | VSP 8400 Series | VOSS 8.1
8424GT |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | Not Supported |

Energy Efficient Ethernet (EEE) supports the IEEE 802.3az standard for power savings in Ethernet networks for a select group of physical layer devices. A physical device that can support low power idle (LPI) mode is considered EEE-capable. Legacy devices that do not support EEE can be made EEE-compliant with an EEE-compliant PHY and an SDK version that allows the MAC device to interact with the PHY EEE functionality.

In a typical configuration, the EEE protocol communicates with the switch and the physical device to determine when to enter LPI mode during a period of inactivity, and to exit LPI mode when data transmission resumes.

Note

EEE is supported only on copper ports that have auto-negotiation enabled on them.

Power Savings Configuration Using CLI

Configure Energy Saver or Energy Efficient Ethernet using the command line interface (CLI).

Enable Energy Saver on Ports

About This Task

Perform this procedure to enable Energy Saver on a specific port or range of ports.

Before You Begin

- If you have previously enabled Energy Saver globally, you must disable it globally before enabling Energy Saver on individual ports.
- If you have previously enabled Efficiency Mode, you must disable it before enabling Energy Saver on individual ports.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable Energy Saver on the specified port:

Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port).

```
energy-saver port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} enable
```

Example

Enable energy savings on slot 1 port 2:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface GigabitEthernet 1/2
Switch:1(config-if)#energy-saver port 1/2 enable
```

What to Do Next

Configure an Energy Saver schedule.

Variable Definitions

The following table defines parameters for the **energy-saver** command.

| Variable | Value |
|--|---|
| <i>enable</i> | Enables energy savings on ports. The default is disabled. |
| <i>{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Create an Energy Saver Schedule

About This Task

Perform this procedure to configure scheduled time intervals during which the switch will operate in low power state. This time interval can be for a week, weekend, or individual days.

Note

You can configure a maximum of 84 entries in the Energy Saver schedule.

Before You Begin

- If you have previously enabled Energy Saver globally, you must disable it globally before creating a schedule.
- If you have previously enabled Efficiency Mode, you must disable it before creating a schedule. You cannot change the default Efficiency Mode schedule entries when Efficiency Mode is enabled.
- You must enable Energy Saver on every port affected by the schedule.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the Energy Saver schedule:

```
energy-saver schedule {friday | monday | saturday | sunday | thursday  
| tuesday | wednesday | weekday | weekend} <hhmm> {activate |  
deactivate}
```

Example

Configure an Energy Saver schedule:

```
Switch:1>enable  
Switch:1# configure terminal  
Switch:1(config)#energy-saver schedule weekend 0735 activate  
Switch:1(config)#energy-saver schedule monday 0600 deactivate
```

What to Do Next

Enable Energy Saver globally.

Variable Definitions

The following table defines parameters for the **energy-saver schedule** command.

| Variable | Value |
|---|--|
| <code>{activate deactivate}</code> | Activates or deactivates the scheduled event. |
| <code><hhmm></code> | Specifies the hour and minutes to enable Energy Saver feature on the switch. |
| <code>{friday monday saturday sunday thursday tuesday wednesday weekday weekend}</code> | Specifies the day(s) to enable Energy Saver feature on the switch. |

Enable Energy Saver Globally

About This Task

Perform this procedure to enable Energy Saver globally on the switch. You can optionally configure PoE power savings, to power off low priority PoE devices during off-peak times.

Before You Begin

- You must enable Energy Saver on individual ports.
- You must create an Energy Saver schedule.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. (Optional) Configure PoE power savings:

```
energy-saver poe-power-saving
```

Note

You must configure PoE power savings before you enable Energy Saver globally.

3. Enable Energy Saver:

```
energy-saver enable
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#energy-saver poe-power-saving
Switch:1(config)#energy-saver enable
```

Variable Definitions

The following table defines parameters for the **energy-saver** command.

| Variable | Value |
|-------------------------|--|
| <i>enable</i> | Enables Energy Saver feature. The default is disabled. |
| <i>poe-power-saving</i> | Enables PoE power saving. The default is disabled. |

Enable and Configure Energy Saver using Quick Configuration

About This Task

Perform this procedure to enable and configure Energy Saver globally using the quick configuration Efficiency Mode. Efficiency Mode automatically configures the following:

- enables Energy Saver on all ports.
- creates a default schedule with a weekday schedule of Energy Saver activated from 6:00 p.m. to 7:30 a.m., and during weekends. You cannot change this default schedule while Efficiency Mode is enabled.
- enables Energy Saver globally.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable efficiency mode:

```
energy-saver efficiency-mode
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#energy-saver efficiency-mode
```

Variable Definitions

The following table defines parameters for the **energy-saver** command.

| Variable | Value |
|------------------------|---|
| <i>efficiency-mode</i> | Enables efficiency mode. The default is disabled. |

Activate or Deactivate Energy Saver Manually

About This Task

Perform this procedure to activate or deactivate Energy Saver on the switch at any time. Energy Saver is deactivated by default.

Activating Energy Saver reduces the port speed to the minimum value supported by the switch and enables PoE power saving, even if PoE is globally disabled. Deactivating Energy Saver restores the previous configuration.

Before You Begin

Before you can change any previously saved Energy Saver settings, you must disable Energy Saver globally.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Activate or deactivate Energy Saver:

```
energy-saver {activate | deactivate}
```

Example

```
Switch:1 enable
```

Activate Energy Saver:

```
Switch:1# energy-saver activate
```

Deactivate Energy Saver:

```
Switch:1# energy-saver deactivate
```

Variable Definitions

The following table defines parameters for the **energy-saver** command.

| Variable | Value |
|-------------------|------------------------------------|
| <i>activate</i> | Activates Energy Saver manually. |
| <i>deactivate</i> | Deactivates Energy Saver manually. |

Energy Saver Show Commands

Use the procedures in this section to display specific information about Energy Saver configuration on the switch.

Display Energy Saver Global Information

About This Task

Perform this procedure to display information about Energy Saver global configuration.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display global configuration:

```
show energy-saver global
```

Example

```
Switch:1#show energy-saver global
Energy Saver: Disabled
Energy Saver PoE Power Saving Mode: Disabled
Energy Saver Efficiency-Mode Mode: Disabled
Day/Time: Wednesday 02:31:12
Current Energy Saver state: Energy Saver is Inactive
```

Display Energy Saver Interface Information

About This Task

Perform this procedure to display information about Energy Saver configuration on the ports.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display information about all ports or specify a particular port:

```
show energy-saver interface [{slot/port[/sub-port] [-slot/port[/sub-
port]] [,...]]
```

Example

```
Switch:1>enable
Switch:1#show energy-saver interface
Port ES State PoE Savings PoE Priority
-----
1/1      Enabled Enabled Enabled Low
1/2      Enabled Enabled Enabled Low
1/3      Enabled Enabled Enabled Low
1/4      Enabled Enabled Enabled Low
1/5      Enabled Enabled Enabled Low
1/6      Enabled Enabled Enabled Low
1/7      Enabled Enabled Enabled Low
1/8      Enabled Enabled Enabled Low
1/9      Enabled Enabled Enabled Low
1/10     Enabled Enabled Enabled Low
1/11     Enabled Enabled Enabled Low
1/12     Enabled Enabled Enabled Low
1/13     Disabled N/A N/A
1/14     Disabled N/A N/A
1/15     Disabled N/A N/A
```

Display Energy Saver Power Savings Information

About This Task

Perform this procedure to display information about Energy Saver power savings on the switch.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. Display information about energy savings:

```
show energy-saver savings
```

Example

```
Switch:1#show energy-saver savings
-----
Unit Model          Switch Capacity      Saving PoE Saving
-----
8404C                0.0 watts           N/A
=====
```

Display Energy Saver Schedule Information

About This Task

Perform this procedure to display information about Energy Saver schedules configured on the switch.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display information about Energy Saver schedules:
show energy-saver schedule

Example

```
Switch:1#show energy-saver schedule
-----
Day      Time  Action
-----
Monday   18:00 Activate
Monday   07:00 Deactivate
```

Enable Energy Efficient Ethernet (EEE)

About This Task

Perform this procedure to enable Energy Efficient Ethernet (EEE) on a port. The default is disabled.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:
enable

configure terminal

interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable Energy Efficient Ethernet:
energy-saver eee enable

Power Savings Configuration Using EDM

Use the following procedures to configure either Energy Saver or Energy Efficient Ethernet EEE using Enterprise Device Manager (EDM).

Enable Energy Saver Globally

About This Task

Perform this procedure to enable Energy Saver globally.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Click **Energy Saver**.
3. Click the **Energy Saver Globals** tab.
4. Configure the fields as required.
5. Click **Apply**.

Energy Saver Globals Field Descriptions

| Name | Description |
|------------------------------|---|
| EnergySaverEnabled | Enables Energy Saver globally on the switch. The default is disabled. |
| PoePowerSavingEnabled | Enables Energy Saver PoE power saving. The default is disabled. |
| EfficiencyModeEnabled | Enables Energy Saver efficiency mode. The default is disabled.
Efficiency mode enables Energy Saver globally and on all ports, it also enables PoE power saving. It also creates a weekday schedule that starts at 6:00 p.m. and ends at 7:30 a.m., and during the weekend Energy Saver is always activated. |
| EnergySaverActive | Activates Energy Saver on the switch. Energy Saver is deactivated by default. |

Configure Energy Saver Schedule

About This Task

Perform this procedure to configure a scheduled time interval during which the switch will operate in low power state. This time interval can be for a week, weekend, or individual days.

Note

- You can configure maximum 84 entries in the Energy Saver schedule.
- If efficiency mode is enabled, you cannot configure any other entries in the Energy Saver schedule.

Before You Begin

- You must disable Energy Saver globally.
- You must enable Energy Saver on every port affected by the schedule.
- You must deactivate Energy Saver efficiency-mode.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Click **Energy Saver**.
3. Click the **Energy Saver Schedules** tab.
4. Click **Insert**.
5. Configure the fields as required.
6. Click **Insert**.
7. Click **Apply**.

Energy Saver Schedules *Field Descriptions*

| Name | Description |
|-----------------------|--|
| ScheduleDay | Specifies the day on which Energy Saver is activated or deactivated. The options are: <ul style="list-style-type: none"> • monday • tuesday • wednesday • thursday • friday • saturday • sunday • weekdays • weekend |
| ScheduleHour | Specifies the hour at which Energy Saver is activated or deactivated. The range is 0 to 23.

Note:
0 is equivalent to 12 a.m., and 12 is equivalent to 12 p.m. |
| ScheduleMinute | Specifies the minute at which Energy Saver is activated or deactivated. The range is 0 to 59. |
| ScheduleAction | Specifies if Energy Saver is activated or deactivated. The options are: <ul style="list-style-type: none"> • activate • deactivate |

Enable Energy Saver or EEE on Ports

You can enable Energy Saver or EEE using the Energy Saver tab accessed by the Edit navigation path, or the Power Management navigation path. Use one of the following procedures to enable either Energy Saver or EEE on ports.

Enable Energy Saver or EEE on Ports

About This Task

Perform this procedure to enable Energy Saver or EEE on one or more ports.

Procedure

1. On the Device Physical View tab, select one or more ports.
2. In the navigation pane, expand **Edit > Port**.
3. Select **General**.
4. Select the **Energy Saver** tab.
5. Enable either Energy Saver or EEE:
 - To enable Energy Saver, select **EnergySaverEnabled**.
 - To enable EEE, select **EnergySaverEEEEEnable**.
6. Select **Apply**.

Energy Saver Field Descriptions

Use the data in the following table to use the **Energy Saver** tab.

| Name | Description |
|------------------------------|--|
| Port | Specifies the port number. |
| EnergySaverEnabled | Configures whether Energy Saver is enabled on the specific port. |
| EnergySavedPoeStatus | Specifies the Energy Saver PoE status for the specific port. |
| EnergySaverEEEEEnable | Configures whether EEE is enabled on the specific port. |

Enable Energy Saver or EEE on Ports

About This Task

Perform this procedure to enable Energy Saver or EEE on one or more ports.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Select **Energy Saver**.
3. Select the **Ports** tab.
4. Enable either Energy Saver or EEE:
 - To enable Energy Saver, in the **EnergySaverEnabled** column, double-click the field associated with the specific ports, and then select **true**.
 - To enable EEE, in the **EnergySaverEEEEEnable** column, double-click the field associated with the specific ports, and then select **true**.
5. Select **Apply**.

Energy Saver Field Descriptions

Use the data in the following table to use the **Energy Saver** tab.

| Name | Description |
|------------------------------|--|
| Port | Specifies the port number. |
| EnergySaverEnabled | Configures whether Energy Saver is enabled on the specific port. |
| EnergySaverPoEStatus | Specifies Energy Saver PoE status for the specific port. |
| EnergySaverEEEEEnable | Configures whether EEE is enabled on the specific port. |

View Energy Savings

About This Task

Perform this procedure to view the amount of switch capacity and PoE power being saved on the units.

Procedure

1. In the navigation pane, expand **Configuration > Power Management**.
2. Click **Energy Saver**.
3. Click the **Energy Savings** tab.

Energy Savings field descriptions

| Name | Description |
|--------------------------------|---|
| UnitIndex | Specifies the unit number. |
| UnitSavings(1/10 watts) | Specifies the amount of switch capacity power being saved on the specific unit. |
| PoeSavings(1/10 watts) | Specifies the amount of PoE power being saved on the specific unit. |

Quality of Service

[QoS fundamentals on page 2522](#)

[Basic DiffServ configuration using CLI on page 2554](#)

[Basic DiffServ configuration using EDM on page 2558](#)

[QoS configuration using CLI on page 2560](#)

[QoS configuration using EDM on page 2581](#)

QoS fundamentals

Use the information in this section to help you understand Quality of Service (QoS).

This section describes a range of features that you can use on the switch to manage traffic flowing through your network. You can configure your network to prioritize specific types of traffic to ensure that the traffic receives the appropriate QoS level. For those cases where traffic levels are so high that congestion occurs despite management, the switch provides additional congestions handling features that are described in this section.

QoS refers to the ability to control network flows either by prioritizing traffic or by guaranteeing performance levels. QoS does not refer to a specifically achieved service quality. To provide QoS, you can use some combination of the switch's traffic management tools to help deliver provisioned network QoS. It is up to the network administrator to accurately analyze a given situation and select the proper tool(s) for the task.

Introduction to QoS

The switch comes with a set of traffic management tools that you can use to provide QoS for Layer 2 (bridged) or Layer 3 (routed) traffic flows. Many of these flows are multiplexed across a set of network switches and compete for network resources at convergence points. Without traffic management, the congested data flows compete for resources and the result is unpredictable. The resulting QoS can only be described as best-effort. The opposite is also true, without congestion there are sufficient network resources for all traffic to pass without competition. Without congestion, traffic management is not required. In this sense, you cannot separate discussions about QoS and traffic management from those on congestion. The switch provides a set of tools that you can use to provide network services that are far superior to best-effort thereby enabling the delivery of provisioned QoS.

To deliver QoS, the switch uses two types of traffic management tools:

- Congestion management
- Congestion handling

Congestion management acts to prevent congestion by prioritizing traffic flows through priority queuing and priority-aware servicing methods. Other functions, such as policing, are also considered congestion management. Policing indirectly prioritizes some traffic by limiting the rates of other traffic.

Congestion handling alleviates existing congestion by dropping lower priority traffic before higher priority traffic. The switch handles the congestion by queue-specific tail dropping. The basic QoS architecture of the switch identifies three primary functional areas:

- Ingress QoS identification and classification
- the switch's internals and queuing architecture
- QoS marking/remarking for downstream use

Important

Remarking packets with an ACL filter does not change the internal QoS level of the packets. You must add the **permit internal-qos [value]** statement to the ACL filter.

The QoS architecture is coherent end-to-end across a network. The QoS at any particular network element can be marked in the relevant Layer 2 or Layer 3 protocol fields and provided to the next hop. The receiving next hop can then use this information to classify its own ingress traffic, apply its specific internal traffic management features, and remark the results for subsequent hops.

Depending on the product, the QoS implementation on the switch can support the following options:

1. Ingress priority mappings including: DSCP to internal QoS, 802.1p-bits to internal QoS, and port-level QoS configuration.
2. Egress priority mappings including: internal QoS to DSCP and internal QoS to 802.1p-bits.
3. Automatic QoS
4. Port-based rate limiting or ingress policers
5. Port-based broadcast and multicast rate limiting
6. Port-based egress shaping
7. Egress queue rate limiting

Note

The VSP 7400 Series does not support port-based rate limiting or ingress policers.

Traffic management

Prioritized traffic handling requires QoS classification first. The switch typically classifies traffic by using the endpoint switch configuration in conjunction with the protocol elements of the incoming frame such as *priority*. You can add additional classification by using access control lists (ACLs) and other filtering functionality.

The switch's internal traffic management functions use the results of classification to determine the prioritization of traffic. Examples of internal functions that prioritize traffic would be both strict and weighted round robin (WRR) queue scheduling. These mechanisms prioritize data by favorable scheduling or weighting.

The disposition of a particular data frame is not necessarily fully determined as a result of classification. You can apply additional traffic management functions such as Ingress Port Rate Limiting or Policing depending on your switch features. Ingress Port Rate Limiting is a congestion management mechanism

to limit the traffic rate accepted by the specified ingress port. Policing is a congestion management method that limits incoming traffic at the ingress that could cause congestion at the egress. While queuing strategies affect prioritization by favoring some traffic; policing is essentially the opposite. Policing works not by favoring some traffic, but by penalizing the bursty traffic. Queue scheduling and policing are only two of the available tools for congestion management. Additional details are presented in subsequent sections of this document.

In addition to the traffic management tools which aid in the prevention of congestion, tools are also provided to handle congestion as it occurs. Congestion handling tools monitor congestion levels at convergence points in the switch and selectively discard frames if congestion begins to increase. Per queue tail dropping is the primary congestion handling function of the switch. You can also use ACLs and filtering as congestion handling tools.

Differentiated Services (DiffServ)

Table 275: Differentiated Services product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| Differentiated Services (DiffServ) including Per-Hop Behavior | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VSP 4000 4.0 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 4.2.1 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VSP 8200 4.0 |
| | VSP 8400 Series | VOSS 4.2 |
| | VSP 8600 Series | VSP 8600 4.5 |
| | XA1400 Series | VOSS 8.0.50 |

Differentiated Services (DiffServ) is a traffic management tool that classifies network traffic into eight traffic classes, and then gives each class differentiated treatment. DiffServ networks map the traffic's class into a set of packet forwarding behavior, referred to as a *Per-Hop Behavior (PHB)*. A PHB could specify which egress queue to use. For example, a switch may classify a packet by determining its protocol to be IPv4, subsequently extract the DSCP value, and apply a PHB by directing the packet to a specific queue. DiffServ does not prescribe a set of traffic classes and does not predetermine which types of traffic should be handled by a given class. DiffServ simply provides a generic means of classifying packets so they may be treated differently.

DiffServ applies to IP packets only.

DiffServ Access and DiffServ Core

A fundamental characteristic of DiffServ networks is the distinction made between switches at the network edges and those residing in the network interior. The switch refers to this distinction as DiffServ Access (edge) and DiffServ Core (interior), respectively.

It is important to note that the switch operates simultaneously as both a DiffServ Access switch and a DiffServ Core switch. The architectural premise is that the edge or access nodes perform the bulk of the

work (classification, policing, etc.) and mark the packet for downstream processing. In theory this would permit the interior or core switches to bypass much of the edge processing as they would “trust” the classification and marking performed by the access switch. The notion of trust is key to the access/core switch distinction.

- If you configure a port as an access port, the system does not trust packet markings.
- If you configure a port as a core port, the system trusts packet markings.

On the access side, malicious users can send packets into a network with intent to cause serious harm (e.g., denial of service attacks). However, on core switches, the only traffic sources are one’s own upstream switches. As such, a core switch has the opportunity to trust the classification, markings (and implied PHB) determined by the previous hop.

The following figure shows DiffServ network operations. The devices are on the network edge where they perform classification, marking, policing, and shaping functions.

Figure 208: DiffServ network core and edge devices

Use a DiffServ Access port at the edge of a DiffServ network. The access port classifies traffic according to port QoS. Outgoing packet DSCP and 802.1p values are derived from port QoS and QoS maps. The system strips Dot1Q headers at ingress, and adds them back at egress only if you configure the egress port as a tagged or trunk port.

A DiffServ Core port does not change packet classification or markings; the port trusts the incoming traffic markings. A core port preserves the DSCP marking of all incoming packets, and uses these markings to assign the packet to an internal QoS level. For tagged packets, the port honors the 802.1p bits within a Dot1Q header, and uses these bits to classify ingress traffic. You can control the honoring (or not) of 802.1p bits by configuring the 802.1p override in CLI or Enterprise Device Manager (EDM).

Per-Hop Behavior (PHB)

Traffic entering the DiffServ network enter a queue according to their marking, which determines the PHB of the packets. For example, if the system marks a video stream to receive the highest priority, it enters a high-priority queue. As these packets traverse the DiffServ network, the system forwards the video stream before other packets.

As a standard, DiffServ is described in the context of Layer 3. Classification is accomplished by mapping a packet priority field from the packet and then applying a per-hop behavior. DiffServ standards define the IPv4 header’s Differentiated Services Code Point (DSCP) field to determine classification and subsequent per-hop behavior.

The RFC2598 standard provides only the following four fundamental per-hop behaviors:

- Default (DF) — This PHB provides best-effort forwarding behavior.
- Expedited Forwarding (EF) — This PHB provides performance-critical forwarding.
- Assured Forwarding (AF) — This PHB classifies traffic based upon **class** (priority) only.

Important

The switch never classifies nor takes action based upon drop precedence. In response to congestion, the only drops available for a given traffic class are tail drops.

- Class Selector (CS) — This PHB provides a simple mapping of a DSCP to one of eight traffic classes. While the switch provides all four PHBs, the CS PHB is most analogous to the switch's internal processing – classification occurs to derive priority, which subsequently determine the per-hop behavior (e.g., queuing).

DiffServ and filters

QoS (DiffServ) and filters operate independently; you do not have to use filters to provide QoS. However, filters can override QoS operations. For more information, see [Traffic filtering fundamentals](#) on page 3386.

DiffServ and VXLAN Gateway

DSCP bits in the outer IP header of VXLAN-encapsulated packets are always derived from the internal QoS, irrespective of the ingress port DiffServ configuration. Customer packet IP DSCP bits are not modified as part of VXLAN encapsulation. For more information about VXLAN, see [VXLAN Gateway](#) on page 3963.

Traffic traversing the switch

The switch's traffic management capabilities are best understood by examining the functionality that is invoked as packets flow from ingress ports, through the switch, to egress ports. The following list includes the set of features and processing that the switch performs as flows traverse the switch:

- Classification and ingress mapping
- Filtering
- Rate Limiting or Policing
- Queueing
- Remarking
- Shaping

The switch classifies packets to determine their priority. While DiffServ is traditionally defined as Layer 3 functionality, the switch extends the logical concept to Layer 2. The switch can, based upon user configuration, determine a packet's priority from either its Layer 2 (p-bits) or Layer 3 (DSCP) information.

- If the packet arrives on an untrusted port (DiffServ Access), then the packet's priority comes from user-configured parameters such as port priority.
- If the packet arrives on a trusted port, priority comes from information contained in the packet's header (p-bits or DSCP).

After the switch determines the packet's configured or marked priority, it maps that value to be used internally. The QoS level used by the switch is referred to as the **Internal QoS Level (IQL)**. The IQL is the

internal numerical value that the switch uses to determine the packets per-hop behaviors such as queue selection and bandwidth guarantee.

The following list identifies the order of DiffServ operations for a packet:

- Packet classification: IEEE 802.1p and DSCP markings classify (map) the packet to its appropriate PHB and QoS level.
- Remarking: The switch can remark packets according to QoS actions you configure on the switch (internal QoS mappings).
- Shaping: The switch provides port-based shaping. Port-based shaping shapes all outgoing traffic to a specific rate.

Classification and mapping

Traffic classification includes functions that examine a packet to determine further actions according to defined rules. Classification involves identifying flows so that the router can modify the packet contents or Per-Hop Behavior (PHB), apply conditioning treatments to the packet, and determine how to forward the packet to the egress interface. Packet classification depends on the service type of the packet and the point in the traffic management process where the classification occurs.

The device classifies traffic as it enters the DiffServ network, and assigns appropriate PHB based on the classification. To differentiate between classes of service, the device marks the DiffServ (DS) parameter in the IP packet header, as defined in RFC2474 and RFC2475. The DSCP marking defines the forwarding treatment of the packet at each network hop. This marking (or classification) occurs at the edge of the DiffServ domain, and is based on the policy (or filter) associated with the particular microflow or aggregate flow.

You can configure the mapping of DSCP-to-forwarding behaviors and DSCP re-markings. Re-marking the DSCP resets the treatment of packets based on new network specifications or desired levels of service.

Layer 3 marking uses the DSCP parameter. Layer 2 (Ethernet) marking involves the 802.1p-bits parameter.

For Layer 2 packets, priority bits (or 802.1p bits) define the traffic priority of the Ethernet packet. You can configure an interface to map DSCP or 802.1p bits to internal QoS levels on ingress. You can configure an interface to map internal QoS levels to DSCP or 802.1p bits at egress. 802.1p bit mapping provides the Ethernet VLAN QoS requirements.

Within the network, a packet PHB associated with the DSCP determines how a device forwards the packet to the next hop—if at all. Consequently, nodes can allocate buffer and bandwidth resources to each competing traffic stream. The initial DSCP value is based on network policies for the type of service required. The objective of DSCP-to-Service Class mapping is to translate the QoS characteristics defined by the packet DSCP marker to a Service Class. The DSCP-to-Service Class mapping occurs at ingress. For each received packet, the mapping function assigns a Service Class.

The switch maintains four mapping tables. These tables translate the ingress 802.1p-bits or DSCP markings to an internal QoS level, and then retranslate the internal QoS level to an egress DSCP or 802.1p-bits marking as follows:

- ingress 802.1p-bits to QoS level
- ingress DSCP to QoS level
- QoS level to egress 802.1p-bits
- QoS level to egress DSCP

Service classes

Service classes define a standard architecture to provide end-to-end QoS on a broad range of Ethernet switching and voice products. They function as default QoS policies built into the product. They incorporate the various QoS technologies to provide a complete end-to-end QoS behavioral treatment. The switch includes a built-in QoS implementation for service classes.

The switch includes eight preconfigured queues (corresponding to the eight service classes) on each port of an interface module.

A service class domain classifies traffic as one of the following:

- Network control traffic (Critical/Network)
- Subscriber traffic (Premium, Metal, or Standard)

Queue 7 — Critical/Network Service Class (PHB of CS6/CS7)

The switch uses the Critical/Network Service Class for traffic within a single administrative network domain. If such traffic does not get through, the network cannot function.

Queue 6 — Premium Service Class (PHB of CS5/EF)

The switch uses the Premium Service Class for IP telephony services, and provides the low latency and low jitter required to support such services. IP telephony services include Voice over IP (VoIP), voice signaling, Fax over IP (FoIP), and voice-band data services over IP (for example, analog modem). The switch can also use the Premium Service Class for Circuit Emulation Services over IP (CESoIP).

Metal Service Classes

The Platinum, Gold, Silver, and Bronze Service Classes are collectively referred to as the metal classes. The metal Service Classes provide a minimum bandwidth guarantee and are for variable bit rate or bursty types of traffic. Applications that use the metal Service Class support mechanisms that dynamically adjust their transmit rate and burst size based on congestion (packet loss) detected in the network. The following list describes the individual metal classes:

- Queue 5 — Platinum Service Class (PHB of CS4/AF41)

The switch uses the Platinum Service Class for applications that require low latency, for example, real-time services such as video conferencing and interactive gaming. Platinum Service Class traffic provides the low latency required for interhuman (interactive) communications. The Platinum Service Class provides a minimum bandwidth assurance for Assured Forwarding (AF) 41 and Class Selector (CS) 4-marked flows.

- Queue 4 — Gold Service Class (PHB of CS3/AF31)

The switch uses the Gold Service Class for applications that require near-real-time service and are not as delay-sensitive as applications that use the Platinum service. Such applications include streaming audio and video, video on demand, and surveillance video.

The Gold Service Class assumes that traffic buffers at the source and destination and, therefore, the traffic is less sensitive to delay and jitter. By default, the Gold Service Class provides a minimum bandwidth assurance for AF31, AF32, AF33 and CS3-marked flows.

- Queue 3— Silver Service Class (PHB of CS2/AF21)

The switch uses the Silver Service Class for responsive (typically client- and server-based) applications. Such applications include Systems Network Architecture (SNA) terminals (for example, a PC or Automatic Teller Machine) to mainframe (host) transactions that use Data Link Switching (SNA over IP), Telnet sessions, web-based ordering and credit card processing, financial wire transfers, and Enterprise Resource Planning applications.

Silver Service Class applications require a fast response and have asymmetrical bandwidth needs. The client sends a short message to the server and the server responds with a much larger data flow back to the client. For example, after a user clicks a hyperlink (that sends a few dozen bytes) on a webpage, a new webpage appears (that downloads kilobytes of data). The Silver Service Class provides a minimum bandwidth assurance for AF21 and CS2-marked flows.

The Silver Service Class favors short-lived, low-bandwidth TCP-based flows.

- Queue 2 — Bronze Service Class (PHB of CS1/AF11)

The switch uses the Bronze Service Class for longer-lived TCP-based flows, such as file transfers, e-mail, or noncritical Operation, Administration, and Maintenance (OAM) traffic. The Bronze Service Class provides a minimum bandwidth assurance for AF11 and CS1-marked flows. As a best practice, use the Bronze Service Class for noncritical OAM traffic with the CS1 DSCP marking.

Queue 1 and 0 — Standard (PHB of CS0/DF) and Custom Service Classes

The switch uses the Standard and Custom Service Classes for best-effort services. Delays, loss, or jitter guarantees for these service classes are not specified. However, the Standard Service Class has more forwarding resources than the custom service classes.

Internal QoS level

The internal QoS level or effective QoS level is a key element in the switch QoS architecture. The internal QoS level specifies the kind of treatment a packet receives. The switch classifies every packet that enters and assigns it an internal QoS level.

Internal QoS levels map to the queues on a port. For example, for an access port the internal QoS level is derived from the port QoS level. For Layer 3 trusted (core) ports, the system honors incoming DSCP or type of service (TOS) bits. The system assigns the internal QoS level using the ingress DSCP to QoS level map.

Important

Remarking packets with an ACL filter does not change the internal QoS level of the packets. You must add the **permit internal-qos [value]** statement to the ACL filter. For more information, see [Internal QoS Level and Remarking](#) on page 3399.

Ingress mappings

The system uses ingress maps to translate incoming packet QoS markings to the internal QoS level. The system uses the internal QoS level to classify packets.

Ingress mappings include

- 802.1p to (internal) QoS level
- DSCP to (internal) QoS level

The following logical table shows how the system performs ingress mappings for data packets and for control packets not destined for the Control Processor (CP).

Table 276: Data packet ingress mapping

| DSCP | Layer 2 trusted | Layer 3 trusted (DiffServ enabled and Access-diffserv disabled) | IP packet | Routed packet | Ingress tagged | Internal QoS |
|------|-----------------|---|-----------|---------------|----------------|----------------------------|
| x | No | x | No | x | x | Use port QoS |
| x | Yes | x | No | x | No | Use port QoS |
| x | Yes | x | No | x | Yes | Use ingress p-bits mapping |
| 0x1B | x | x | Yes | x | x | 4 |
| 0x23 | x | x | Yes | x | x | 5 |
| 0x29 | x | x | Yes | x | x | 5 |
| 0x2F | x | x | Yes | x | x | 6 |
| x | No | No | x | x | x | Use port QoS |
| x | No | Yes | Yes | x | x | Use ingress DSCP mapping |
| x | Yes | No | Yes | x | No | Use port QoS |
| x | Yes | No | Yes | x | Yes | Use ingress p-bits mapping |
| x | Yes | Yes | Yes | No | No | Use ingress DSCP mapping |

Table 276: Data packet ingress mapping (continued)

| DSCP | Layer 2 trusted | Layer 3 trusted (DiffServ enabled and Access-diffserv disabled) | IP packet | Routed packet | Ingress tagged | Internal QoS |
|------|-----------------|---|-----------|---------------|----------------|----------------------------|
| x | Yes | Yes | Yes | No | Yes | Use ingress p-bits mapping |
| x | Yes | Yes | Yes | Yes | Yes | Use ingress DSCP mapping |

**Important**

On a tagged port that is Layer-2 trusted, Layer-3 trusted and DiffServ enabled, all multicast packets honor the ingress DSCP value.

The QoS level for control packets destined for the CPU is assigned internally to ensure timely packet processing and scaling numbers. You cannot configure the QoS level for these control packets. The system assigns the highest QoS-level to time-critical protocols.

The following table shows ingress IEEE 802.1p to QoS level mappings.

Table 277: Default ingress 802.1p to QoS mappings

| Ingress IEEE 802.1p | PHB | QoS Level | Network Service Class (NSC) |
|---------------------|----------|-----------|-----------------------------|
| 0 | CS0/DF | 1 | Standard |
| 1 | Custom | 0 | Custom |
| 2 | CS1/AF11 | 2 | Bronze |
| 3 | CS2/AF21 | 3 | Silver |
| 4 | CS3/AF31 | 4 | Gold |
| 5 | CS4/AF41 | 5 | Platinum |
| 6 | CS5/EF | 6 | Premium/EF |
| 7 | CS6/CS7 | 7 | Network/Critical |

The following table shows DSCP to internal QoS level mappings.

Table 278: Default ingress DSCP to QoS mapping

| Ingress | | | | Internal QoS level | PHB level |
|----------------|---------------|--------------------|-------------------|--------------------|-----------|
| DSCP (decimal) | DSCP (binary) | DSCP (hexadecimal) | TOS (hexadecimal) | | |
| 00 | 000000 | 00 | 00 | 1 | CS0/DF |

| DSCP (decimal) | DSCP (binary) | DSCP (hexadecimal) | TOS (hexadecimal) | | |
| 62 | 111110 | 3E | F8 | 1 | CS0 |
| 63 | 111111 | 3F | FC | 1 | CS0 |

Egress mappings

Egress mappings include:

- QoS level to IEEE 802.1p mappings
- QoS level to DSCP mappings

When a packet is forwarded by the switch, the software does the following:

- Always performs 802.1p remarking before the packet egresses.
- If the ingress port has **enable-diffserv** and **access-diffserv** enabled, then the IP packet is DSCP remarked before the packet egresses.

If the ingress port is not configured this way, the packets are not DSCP remarked.

The following table shows egress QoS level to IEEE 802.1p mappings.

Table 279: Default egress QoS level to IEEE 802.1p mappings

| QoS level | PHB | Default 1p remarking on egress | Network Service Class (NSC) |
|-----------|----------|--------------------------------|-----------------------------|
| 0 | Custom | 1 | Custom |
| 1 | CS0/DF | 0 | Standard |
| 2 | CS1/AF11 | 2 | Bronze |
| 3 | CS2/AF21 | 3 | Silver |
| 4 | CS3/AF31 | 4 | Gold |
| 5 | CS4/AF41 | 5 | Platinum |
| 6 | CS5/EF | 6 | Premium/EF |
| 7 | CS6/CS7 | 7 | Network/Critical |

The following table shows QoS level to DSCP mappings.

Table 280: Default egress QoS level to DSCP mappings

| Egress | | | |
|-----------|---------------|--------------------|------|
| QoS level | DSCP (binary) | DSCP (hexadecimal) | DSCP |
| 0 | 000000 | 00 | 0 |

The switch QoS implementation supports the following two features for bandwidth management and traffic control:

- ingress port-rate limiting—a mechanism to limit the traffic rate accepted by the specified ingress port
- egress port-rate shaping—the process by which the system delays and transmits packets to produce an even and predictable flow rate

Each port has eight unicast and multicast queues, Class of Service (CoS) 0 to CoS 7. Traffic shaping exists on the egress CoS 6 and CoS 7, but you cannot change the configuration. CoS 6 and CoS 7 are strict priority queues, with traffic shaping for CoS 6 at 50 percent and CoS 7 to five percent of line rate.

Some VOSS hardware platforms allow you to configure an egress shaping rate for each port manually. For XA1400 Series, the egress shaping rate for each front panel port dynamically adjusts to the auto-negotiated link speed, up to the maximum link speed of the port.

The VSP 4450 Series switch QoS implementation supports the following two features for bandwidth management and traffic control:

- ingress traffic policing—a mechanism to limit the number of packets in a stream that matches a particular classification
- egress traffic shaping—the process by which the system delays (or drops) and transmits packets to produce an even and predictable flow rate

Each feature is important to deliver DiffServ within a QoS network domain.

Token buckets

Tokens are a key concept in traffic control. A port-rate limiter, policer, or shaper calculates the number of packets that passed, and at what data rate. Each packet corresponds to a token, and the port-rate limiter, policer, or shaper transmits or passes the packet if the token is available. For more information, see [Figure 209](#).

The token container is like a bucket. In this view, the bucket represents both the number of tokens that a port-rate limiter, policer, or shaper can use instantaneously (the depth of the bucket) and the rate at which the tokens replenish (how fast the bucket refills).

Each policer has two token buckets: one for the peak rate and the other for the service rate. The following figure shows the flow of tokens.

Figure 209: Token flow

Ingress port-rate limiter

Ingress port-rate limiter limits the traffic rate accepted by the specified ingress port. The port drops or re-marks violating traffic. The line rate of the port is the maximum rate that can be set.

For more information on ingress port-rate limiter, see:

- [View the Ingress Port-Rate Limit Information](#) on page 2565
- [Configuring the ingress port-rate limiter](#) on page 2564

Queuing

Queuing is a congestion-avoidance function that prioritizes packet delivery. Queuing ensures discriminate packet discard during network congestion, and can delay a packet in memory until the scheduled transmission.

You can use queuing to manage congestion. Congestion management involves the creation of queues, assignment of packets to the queues based on the classification of the packet, and scheduling of the packets in a queue for transmission.

The system schedules packets for transmission according to their assigned priority and the queuing mechanism configured for the interface. The scheduler determines the order of packet transmission by controlling how the system services queues with respect to each other. The switch uses 16 CPU queues

(used by traffic destined to the CPU), and eight unicast and eight multicast queues for each port. The deepest queue does not go beyond 60,000 packets.

A scheduler services the eight queues for each port, using a combination of strict priority and round-robin. Queue zero through five use round robin, and queues six and seven drain completely, or up to certain rate limits.

There are eight priorities on each egress port. Each Weighted Round Robin (WRR) queue has a minimum guaranteed weight to ensure fair bandwidth allocation for each queue in case all QoS queues are utilized and there is congestion. With the default profile, Class of Service (CoS) 0 to CoS 5 are WRR, and the default weights are 10, 20, 30, 40, 50, and 50 respectively. CoS 6 and CoS 7 are strict priority queues. The switch subjects CoS 6 and CoS 7 to traffic shaping at 50 per cent and five per cent of line rate respectively.

Note

VSP 4450 Series switches use Weighted Deficit Round Robin (WDRR). The priorities and default weights are the same as WRR.

For the VSP 8600 Series, 8 CPU queues are implemented. The highest priority packets, such as VLACP, are routed to the highest priority CPU queue (COS 7). The least time critical packets are routed to the lowest CPU queue (COS 0). Statistics for the CPU port are displayed using the CLI command **show qos cosq-stats cpu-port**.

All packets destined for the CPU are sent as unicast packets.

Front panel ports also have 8 queues. When a front panel port is oversubscribed with both unicast and multicast packets, the bandwidth is divided so that the unicast packets receive 80% of the bandwidth and multicast packets 20% of the bandwidth.

If there are no multicast packets using the reserved 20%, the bandwidth is evenly distributed between COS levels 0 to 6. This results in approximately 3.3% more bandwidth for each level. If a specific COS level is not oversubscribed, the unused bandwidth is evenly distributed between the other COS levels. The CLI provides commands to map ingress packets to specific COS levels.

Note

Unicast packets will be tail dropped on the ingress card. Multicast packets will be dropped at egress card.

Among the WRR queues, the approximate bandwidth percentage is relative to the remaining bandwidth after subtracting the Strict Priority queues. The following tables provide the approximate bandwidth percentage based on queue congestion.

Table 282: Bandwidth for Queue 0 to 5 congestion

| Queue | Approximate bandwidth percentage* |
|-------|-----------------------------------|
| 0 | 5% |
| 1 | 10% |
| 2 | 15% |
| 3 | 20% |

Table 282: Bandwidth for Queue 0 to 5 congestion (continued)

| Queue | Approximate bandwidth percentage* |
|---|-----------------------------------|
| 4 | 25% |
| 5 | 25% |
| * The approximate value assumes that all queues 0 to 5 are congested and similar packet sizes. Any queue that does not require bandwidth results in adding more bandwidth to the WRR queues. Percentage is relative to the total bandwidth minus the bandwidth consumed by Cos 6 and 7 (strict queues). | |

Table 283: Bandwidth for Queue 0 to 7 congestion

| Queue | Approximate bandwidth percentage* |
|--|-----------------------------------|
| 0 | 2.25% |
| 1 | 4.5% |
| 2 | 6.75% |
| 3 | 9% |
| 4 | 11.25% |
| 5 | 11.25% |
| 6 | 50% |
| 7 | 5% |
| * The approximate value assumes that all queues 0 to 7 are congested and similar packet sizes. | |

CPU Queues

This section provides information about CPU traffic and queues for different hardware platforms.

Note

To view the CPU traffic and queue information for the VSP 8600 Series use the command `show qos cosq-stats cpu-port`.

The following table outlines the CPU traffic, and which queue it uses, for the VSP 4450 Series.

| Queue description | Queue ID | Queue pps, burst size | Traffic type |
|-------------------|----------|-----------------------|-------------------|
| Other | 0 | 125 pps, 1500 kbps | Data Exception |
| BC_Other | 1 | 4000 pps, 1400 kbps | Broadcast |
| HI_CPU looper | 2 | 4000 pps, 1000 kbps | RIP |
| HI_CPU | 3 | 4000 pps, 1000 kbps | PIM Unicast, IGMP |
| HI_CPU | 4 | 4000 pps, 1000 kbps | OSPF Unicast, BGP |
| HI_CPU | 5 | 4000 pps, 1000 kbps | Multicast Data |
| HI_CPU | 6 | 4000 pps, 12000 kbps | ISIS |

| Queue description | Queue ID | Queue pps, burst size | Traffic type |
|--|----------|-----------------------|---|
| HI_CPU | 7 | 4000 pps, 6000 kbps | OSPF Multicast, PIM Multicast |
| mgmt
Note:
Exception: rlogin and RSH are only supported on VSP 8600 Series. | 8 | 4000 pps, 2000 kbps | Telnet, RSH, SSH, rlogin, DNS, HTTP, TFTP, FTP, SNMP |
| Low rate looper | 9 | 4000 pps, 5000 kbps | ICMP Broadcast, DHCP, ARP, ND Multicast and Unicast |
| Low rate 1 | 10 | 4000 pps, 1000 kbps | ISIS Hello, RADIUS, EAP, NTP, LLDP, ICMP Unicast, IST Control |
| Low latency | 11 | 250 pps, 20 kbps | CFM, VRRP |
| Low latency | 12 | 250 pps, 20 kbps | LACP |

| HI_CPU | 6 | 4000 pps, 100 kbps | ARP, RARP, ND Multicast and Unicast, MLD |
| HI_CPU | 7 | 4000 pps, 100 kbps | IP_COS6, Telnet, SSH |
| mgmt | 8 | 4000 pps, 200 kbps | IP_COS7, OSPF |
| Low rate looper | 9 | 4000 pps, 6000 kbps | OSPF Multicast, PIM Multicast, RIP_v1, RIP_v2 |
| Low rate 1 | 10 | 4000 pps, 12000 kbps | ISIS |
| Low latency | 11 | 4000 pps, 1000 kbps | ISIS Hello, LLDP, EAP, IST Control |

| Queue description | Queue ID | Queue pps, burst size | Traffic type |
|-------------------|----------|-----------------------|---------------------------|
| Low latency | 12 | 500 pps, 32 kbps | VRRP, CFM |
| Low latency | 13 | 256 pps, 32 kbps | SLPP |
| Low latency | 14 | 100 pps, 32 kbps | BPDU |
| Low latency | 15 | 250 pps, 32 kbps | LACP, VLACP, TUNI-extract |

The XA1400 Series uses filters to rate limit packets to the CPU.

| Packet Type | Rate (PPS) | Packet Size (Bytes) |
|---|------------------|---------------------|
| CFM, VLACP, RIPv2, SONMP, RIPv1, VRRP, ARP. | 100 | 64 |
| DHCP | 50 | 1400 |
| ISIS, OSPF | 100 | 1400 |
| Other Packets | Not rate limited | Not Applicable |

Queue profiles

Table 284: Queue Profiles product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| QoS per queue rate limiting | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VOSS 5.1 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 5.1.1 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VOSS 5.1.1 |
| | VSP 8400 Series | VOSS 5.1.1 |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | Not Supported |

This section identifies optional ways to customize the egress queues and scheduling depending on your need to override the default configuration. You can also enable egress queue rate limiting, if desired.

Use a queue profile to apply configured egress queue parameters and modify each queue individually. You can use the queue profile to configure a minimum weight for the queue and to enable rate limiting for the queue. The queue profile applies to all ports in the switch.

Note

If you enable rate limiting for all queues, the scheduler treats all queues as strict priority queues. If all queues are strict priority, the scheduler services the highest priority queue first until the maximum bandwidth is met, and then it services the next highest priority queue. Queue 0 is the lowest priority queue, which means that when over-subscribed, the lower priority queues are serviced last, or not at all.

The switch supports six queue profiles. The default queue profile, with the name default and ID 1, is automatically created during system startup and cannot be deleted.

Note

The egress queues with rate limiting enabled must be contiguous. For example, you can configure queues 3–6, but you cannot configure 3 and 6.

After you make a configuration change to a queue profile, you must apply the profile before the changes take effect.

Configuration considerations

If you modify the QoS configuration for a port that is a member of MultiLink Trunking (MLT), all ports in the MLT inherit the same configuration. If you remove the port from the MLT, it keeps the QoS configuration it inherited from the MLT.

QoS support for 10 GbE interface in 1GbE mode

If you use QoS with a 10 gigabit Ethernet (GbE) interface and re-purpose the interface as a 1 GbE interface, you must make the necessary configuration changes to accommodate the new link speed.

Check your rate limiting and shaping settings, if you choose to change the port link speed from 10 GbE to 1 GbE.

Review the following commands to ensure proper configuration for the port speed you use.

| Command | Description |
|---|---|
| <code>qos if-rate-limiting [port {slot/port}] rate <1000-40000000></code> | Configures ingress port rate limiting in kbps.

Note:
The range can vary depending on your hardware platform. |
| <code>rate-limit broadcast {<1-65535> <50-65000000>}</code> | Configures ingress port broadcast rate limiting in packets/second.

Note:
The range can vary depending on your hardware platform. |

| Command | Description |
|--|---|
| <code>rate-limit multicast
{<1-65535>
<50-65000000>}</code> | Configures ingress port multicast rate limiting in packets/second.

Note:
The range can vary depending on your hardware platform. |
| <code>qos if-shaper [port {slot/
port[/sub-port] [-slot/
port[/sub-port]] [, ...] }]
shape-rate <shape-rate></code> | Specifies the shaping rate in Kb/s. Different hardware platforms support different egress rate limits, depending on the port with the highest speed available on the platform. If you try to configure a limit that is too high for the port speed, the switch displays the following message: <code>Error: port slot/port, The QoS Egress shaper rate can not exceed the port capability.</code> |

802.1p and 802.1Q Best Practices

In a network, to map the 802.1p user priority bits, use 802.1Q-tagged encapsulation on customer-premises equipment (CPE). You require encapsulation because the switch does not provide classification when it operates in bridging mode.

To ensure consistent Layer 2 QoS boundaries within the service provider network, you must use 802.1Q encapsulation to connect a CPE directly to the switch access node. If you do not require packet classification, use Ethernet Routing Switch 5600 to connect to the access node. In this case, configure the traffic classification functions in the Ethernet Routing Switch 5600.

At the egress access node, packets are examined to determine if their IEEE 802.1p or DSCP values must be re-marked before leaving the network. Upon examination, if the packet is a tagged packet, the IEEE 802.1p tag is configured based on the QoS level-to-IEEE 802.1p-bit mapping. For bridged packets, the DSCP is re-marked based on the QoS level.

Network congestion and QoS design

When you provide QoS in a network, one of the major elements you must consider is congestion, and the traffic management behavior during congestion. Congestion in a network is caused by many different conditions and events, including node failures, link outages, broadcast storms, and user traffic bursts.

At a high level, three main types or stages of congestion exist:

1. No congestion
2. Bursty congestion
3. Severe congestion

In a noncongested network, QoS actions ensure that delay-sensitive applications, such as real-time voice and video traffic, are sent before lower-priority traffic. The prioritization of delay-sensitive traffic is essential to minimize delay and reduce or eliminate jitter, which has a detrimental impact on these applications.

A network can experience momentary bursts of congestion for various reasons, such as network failures, rerouting, and broadcast storms. The switch has sufficient capacity to handle bursts of congestion in a seamless and transparent manner. If the burst is not sustained, the traffic management and buffering process on the switch allows all the traffic to pass without loss.

Severe congestion is defined as a condition where the network or certain elements of the network experience a prolonged period of sustained congestion. Under such congestion conditions, congestion thresholds are reached, buffers overflow, and a substantial amount of traffic is lost.

When you perform traffic engineering and link capacity analysis for a network, the standard design rule is to design the network links and trunks for a maximum average-peak utilization of no more than 80%. This value means that the network peaks to up to 100% capacity, but the average-peak utilization does not exceed 80%. The network is expected to handle momentary peaks above 100% capacity.

Layer 2 and Layer 3 trusted and untrusted ports

You can configure interface module ports as trusted or untrusted at both Layer 2 (802.1p) or Layer 3 (DSCP) for ingress packet classification.

The switch provides eight internal QoS levels. These eight levels, numbered zero to seven, map to the queues through

- the ingress 802.1p to (internal) QoS mapping table
- the ingress DSCP to (internal) QoS mapping table

To configure a port as trusted or untrusted, use the commands and the parameter values as shown in the following tables:

| Layer 2 Trusted | Layer 2 Untrusted |
|------------------------|------------------------|
| 802.1p-override | 802.1p-override |
| disable | enable |

| Layer 3 Trusted | | Layer 3 Untrusted | |
|------------------------|--------------------------|------------------------|--------------------------|
| enable-diffserv | access-diffserv * | enable-diffserv | access-diffserv * |
| enable | disable | disable | disable |
| | | disable | enable |
| | | enable | enable ** |

* Configure **access-diffserv** as either a core or access port. If enabled, this command specifies an access port and overrides incoming DSCP bits. If disabled, it specifies a core port that honors and services incoming DSCP bits.

** If the ingress port has **enable-diffserv** and **access-diffserv** enabled, then the packet is DSCP remarked at egress.

Layer 2 untrusted and Layer 3 untrusted

To configure a port as Layer 2 untrusted and Layer 3 untrusted, refer to the tables above and assign the parameter values accordingly.

For more information, see [Table 276](#) on page 2530.

Layer 2 untrusted and Layer 3 trusted

To configure a port as Layer 2 untrusted and Layer 3 trusted, refer to the tables above and assign the parameter values accordingly.

Use these configuration options to classify packet QoS through the DSCP parameter for all IP packets, whether tagged or untagged. Use this configuration when another QoS or DiffServ enabled and configured switch marks the IP packets at the edge. These already-marked packets arrive Layer 3 trusted, and the switch continues with the trust (DiffServ core port operation). For tagged packets, the system does not examine the 802.1p bits. For non-IP packets, this configuration causes classification by port QoS settings.

Note

For IP switched and tagged packets, use the 802.1p bits to derive the internal QoS. For untagged or routed packets, use the DSCP to derive the internal QoS.

For more information, see [Table 276](#) on page 2530.

Layer 2 trusted and Layer 3 trusted

To configure a port as Layer 2 trusted and Layer 3 trusted, refer to the tables above and assign the parameter values accordingly.

Use these configuration options to classify packet QoS through DSCP for all IP packets, and through 802.1p for all tagged non IP packets. If it is an IP packet, DSCP is used. If it is a tagged non IP packet, 802.1p bits are used. If it is an untagged non IP packet, the port QoS is used.

For more information, see [Table 276](#) on page 2530.

Layer 2 trusted and Layer 3 untrusted

To configure a port as Layer 2 trusted and Layer 3 untrusted, refer to the tables above and assign the parameter values accordingly.

Use these configuration options to classify packet QoS through 802.1p for all tagged packets, and port QoS levels for all untagged (IP or non-IP) packets. If the packet is an IP packet, the system does not modify or examine the DSCP parameter bits.

For more information, see [Table 276](#) on page 2530.

DiffServ disabled

If you disable the DiffServ parameter, the system ignores the Layer 3 DSCP parameter. For more information, see [Table 276](#) on page 2530.

Broadcast and multicast traffic bandwidth limiters per ingress port

Interface modules support bandwidth limiters for ingress broadcast and multicast traffic. The system drops traffic that violates the bandwidth limit. Enable this feature and configure the rate limit on an individual port basis.

QoS and VoIP

Table 285: QoS and VoIP product support

| Feature | Product | Release introduced |
|---|-----------------|---|
| For configuration details, see VOSS User Guide .
Platform specific considerations for QoS behavior are documented in QoS Behavior Differences, which is in VOSS User Guide . | | |
| Automatic QoS | 5520 Series | Not Supported
Use Auto-sense with IP Phone support instead |
| | VSP 4450 Series | VSP 4000 4.0 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 4.2.1 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VSP 8200 4.0 |
| | VSP 8400 Series | VOSS 4.2 |
| | VSP 8600 Series | VSP 8600 4.5 |
| XA1400 Series | VOSS 8.0.50 | |

VoIP traffic requires low latency and jitter.

If you use edge routers, configure ingress ports as core ports to treat VoIP traffic appropriately. In this case, the system trusts QoS markings that apply to VoIP traffic, and the system does not re-mark QoS settings. However, if this configuration is not sufficient, you can also apply filters, route policies, or re-mark traffic.

Automatic QoS

Automatic QoS specifically supports converged voice deployments. Automatic QoS automatically recognizes the DSCP value voice applications can use, and associates these DSCP values with the proper queue.

When you use Automatic QoS, the system recognizes application traffic and prioritizes the traffic through the system. Automatic QoS offers a simplified and resource-efficient mechanism to prioritize application traffic within the network. Automatic QoS supersedes DiffServ mode configuration.

The following table shows the traffic types, the standard DSCP value, the specific Automatic QoS DSCP values, and the queue mappings for the Automatic QoS DSCP values.

Table 286: Automatic QoS DSCP values

| Traffic type | Automatic QoS DSCP value | Queue |
|---------------------------|--------------------------|-------|
| VoIP data (Premium) | 0x2F (47) | 6 |
| VoIP signaling (Platinum) | 0x29 (41) | 5 |
| Video (Platinum) | 0x23 (35) | 5 |
| Streaming (Gold) | 0x1B (27) | 4 |

The traffic that the system identifies, based on these DSCP values, receives preferential queuing treatment within the system and is re-marked for preferential downstream processing

The system associates additional filtering (ACL filters) to ensure that Auto-QoS DSCP values are honored no matter what the QoS configuration of the ingress is.

These additional filtering components target ingress traffic with the designated private DSCP values. After a match occurs, the system re-marks the traffic based on the application mode. Ingress traffic that is not marked with a recognized private DSCP value receives the same treatment as it receives without the Automatic QoS feature.

The switch activates Automatic QoS automatically; you cannot deactivate this feature but you can remap these DSCP values to use a different queue. The system displays a warning that these values should not be modified.

```
Switch:1(config)#qos ingressmap ds 47 2
DSCP values should not be modified.
Do you want to continue ? (y/n) ? y
```

You do not need to configure individual QoS components across a variety of platforms. Automatic QoS applies end-to-end.

Important

For VSP 8600 Series switches, automatic QoS derives internal QoS based on DSCP and is honored for routed traffic *only*. For switched traffic, Automatic QoS does not work and falls back to deriving internal QoS based on VLAN .1p bits or uses the port's default QoS level.

QoS re-marking on a Transparent Port UNI

A Transparent Port UNI port is normally configured as a Layer 2 trusted port. The T-UNI port honors incoming customer 802.1p bits and derives an internal QoS level. The 802.1p bit marking of the Backbone VLAN (BVLAN) is derived from the internal QoS level. If the T-UNI port is set as a Layer 2 untrusted port, a best-effort queue is assigned. Customer packet headers are not modified.

The T-UNI port QoS configurations are:

- DiffServ = disable
- Layer3Trusted = access (for EDM configuration)
- access-diffserv enable (for CLI configuration)

QoS considerations when a port is associated with a T-UNI I-SID

- You cannot configure `access-diffserv` and `enable diffserv` on a T-UNI port.
- When a port is associated with a T-UNI ISID, the T-UNI QoS configuration automatically takes effect.
- When the port is removed from the T-UNI ISID, the default port QoS configuration takes effect.

QoS considerations when an MLT is associated with a T-UNI I-SID

- When an MLT, static or LACP, is added to a T-UNI ISID, the T-UNI QoS configuration take effect on all the ports of the MLT.
- When an MLT, static or LACP, is removed from a T-UNI ISID, the port default QoS configuration is configured on all the member ports of the MLT.

- If a port is added dynamically to a T-UNI MLT, static or LACP, the port inherits the QoS properties of the T-UNI MLT ports.
- If a port is dynamically removed from a T-UNI MLT, static or LACP, the port retains the QoS configuration inherited from the MLT.

QoS and channelization

Use channelization to configure a single port to operate as four subports. By default, the ports are not channelized.

You can enable or disable channelization on a channelization-capable port. Enabling or disabling channelization on a port resets the port QoS configuration to default values. For more information on channelization, see [Enable Channelization](#) on page 556.

QoS examples and Best Practices

The sections that follow present QoS network scenarios for bridged and routed traffic over the core network.

Bridged traffic

If you bridge traffic over the core network, you keep customer VLANs separate (similar to a Virtual Private Network). Normally, a service provider implements VLAN bridging (Layer 2) and no routing. In this case, the 802.1p-bit marking determines the QoS level assigned to each packet. If DiffServ is active on core ports, the level of service received is based on the highest of the DiffServ or 802.1p settings.

The following cases provide sample QoS design guidelines you can use to provide and maintain high service quality in a network.

If you configure a core port, you assume that, for all incoming traffic, the QoS value is properly marked. All core switch ports simply read and forward packets; they are not re-marked or reclassified. All initial QoS markings are performed at the customer device or on the edge devices.

The following figure illustrates the actions performed on three different bridged traffic flows (that is VoIP, video conference, and email) at access and core ports throughout the network.

Figure 210: Trusted bridged traffic

For bridged, untrusted traffic, if you configure the port to access, mark and prioritize traffic on the access node using global filters. Reclassify the traffic to ensure it complies with the class of service specified in the SLA.

For Resilient Packet Ring (RPR) interworking, you can assume that, for all incoming traffic, the QoS configuration is properly marked by the access nodes. The core switch ports, configured as core or trunk ports, perform the RPR interworking. These ports preserve the DSCP marking and re-mark the 802.1p bit to match the 802.1p bit of the RPR. The following figure shows the actions performed on three different traffic flows (VoIP, video conference, and email) over an RPR core network.

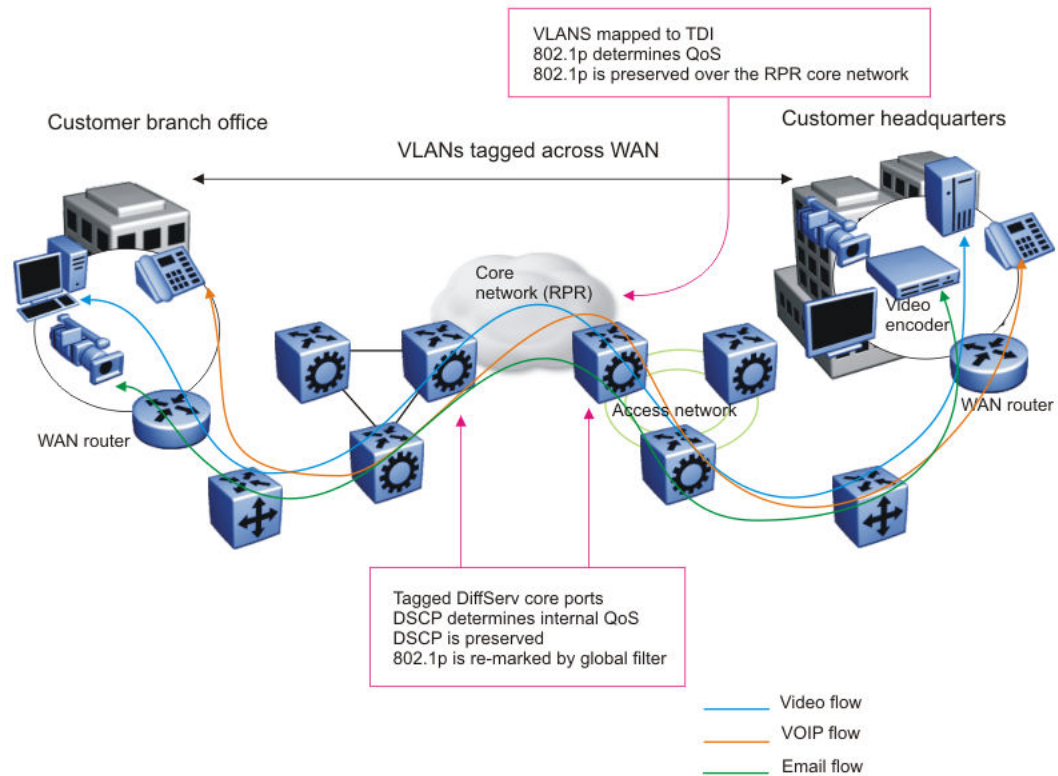

Figure 211: RPR QoS internetworking

Routed traffic

If you route traffic over the core network, VLANs are not kept separate.

If you configure the port to core, you assume that, for all incoming traffic, the QoS configuration is properly marked. All core switch ports simply read and forward packets. The switch does not re-mark or classify the packets. The customer device or the edge devices perform all initial QoS markings.

The following figure shows the actions performed on three different routed traffic flows (that is VoIP, video conference, and email) at access and core ports throughout the network.

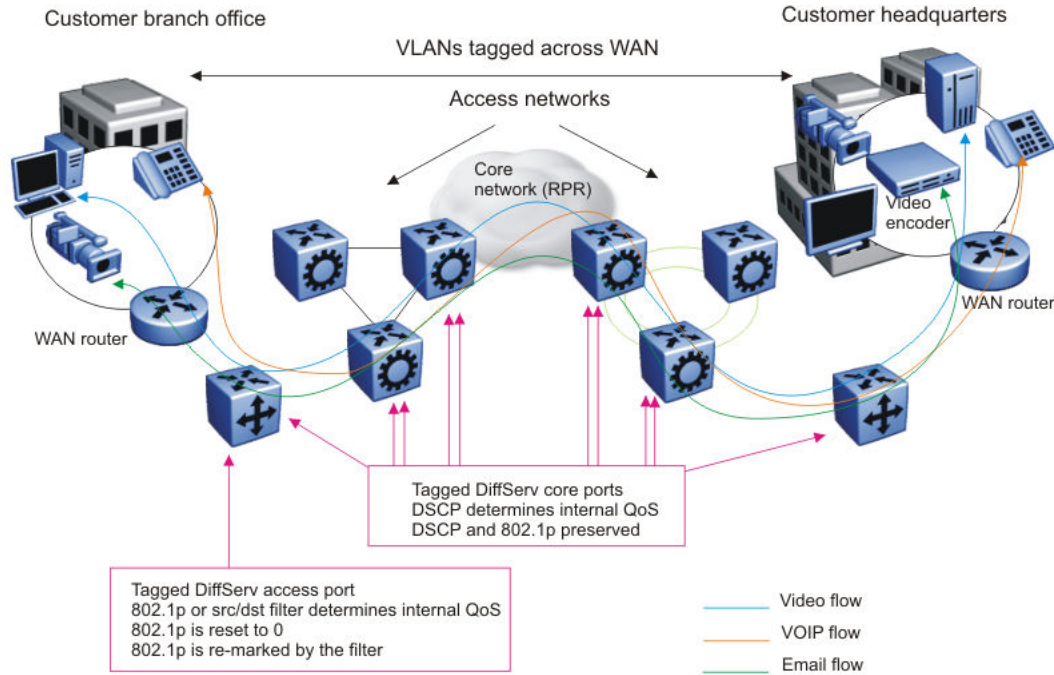

Figure 212: Trusted routed traffic

For routed, untrusted traffic, in an access node, packets that enter through a tagged or untagged access port exit through a tagged or untagged core port.

QoS Behavior Differences

The implementation of QoS is similar in all VOSS switches but there are some differences as summarized in the following table.

| QoS | VSP 4450 Series | VSP 7200 Series/VSP 8000 Series/VSP 4900 Series | 5520 Series/VSP 7400 Series | VSP 8600 Series | XA1400 Series |
|------------------------|------------------------------|---|---------------------------------|---------------------------------|---------------------------------------|
| Ingress traffic | Policing | Port-rate limiting | Not available | Port-rate limiting | Not available |
| Egress traffic | Shaping | Shaping | Shaping | Shaping | Follows default queue profile weights |
| Egress queuing CoS 0-5 | WDRR | WRR | WRR | WRR | Heirarchy Token Bucket (HTB) |
| Classification | Routed packet classification | No routed packet classification | No routed packet classification | No routed packet classification | No routed packet classification |

| QoS | VSP 4450 Series | VSP 7200 Series/VSP 8000 Series/VSP 4900 Series | 5520 Series/VSP 7400 Series | VSP 8600 Series | XA1400 Series |
|--|--|---|--|--|--------------------------|
| Internal QoS derivation for ingress Layer 3 trusted port | <ul style="list-style-type: none"> Routed IP packet-derived from DSCP Switched IP packet-derived from 802.1p | Always derived from DSCP | Always derived from DSCP | Always derived from DSCP | Always derived from DSCP |
| Automatic QoS | Always derived from DSCP | Always derived from DSCP | Always derived from DSCP
Not Supported on 5520 Series | Derived from DSCP for routed traffic only.
Automatic QoS is not available for switched traffic. | Always derived from DSCP |

For QoS scaling and filter scaling information, see [Release Notes for VOSS](#).

Egress Tunnel Shaping

Table 287: Egress Tunnel Shaping product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| Egress Tunnel Shaping | 5520 Series | Not Supported |
| | VSP 4450 Series | Not Supported |
| | VSP 4900 Series | Not Supported |
| | VSP 7200 Series | Not Supported |
| | VSP 7400 Series | Not Supported |
| | VSP 8200 Series | Not Supported |
| | VSP 8400 Series | Not Supported |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | VOSS 8.1 |

Egress Tunnel Shaping shapes traffic on a Fabric Extend (FE) tunnel. Egress Tunnel Shaping limits transmission rate by shaping the output load. Egress Tunnel Shaping differs from Port Egress Shaping. Port Egress Shaping limits transmission rate by port and by queue. Egress Tunnel Shaping operates on VXLAN virtual ports.

On XA1400 Series the default egress tunnel shaper is 1 Gbps on all FE tunnels and has only one QoS queue.

When you enable Egress Tunnel Shaping, it shapes unicast, multicast, and unknown unicast egress traffic according to the feature configuration. Shapers you configure shape all traffic on the tunnel. Shapers you configure can have between 1 Mbps and 1 Gbps of bandwidth allocated to them.

Eight traffic queues are created for the tunnel traffic when a new shaper is configured. Packets are mapped to any of these queues based on the internal Class of Service (CoS) of the packets. When multiple tunnels use the common shaper value, an internally unique shaper is associated for each tunnel. The following table shows the default minimum weight for each queue.

| Queue | Default Minimum Weight |
|-------|---|
| 0 | 5 |
| 1 | 20 |
| 2 | 30 |
| 3 | 40 |
| 4 | 50 |
| 5 | 50 |
| 6 | Rate limited to 50% of configured shaper rate |
| 7 | Rate limited to 5% of configured shaper rate |

Queues 6 and 7 are rate limited and have a higher priority. The maximum traffic allowed out of queue 6 and queue 7 would be shape rate/2 (50% bandwidth) and shape rate/20 (5% bandwidth).

The XA1400 Series uses a Hierarchical Token Bucket (HTB) scheduling algorithm. HTB controls the use of the outbound bandwidth on a link, allowing the use of one physical link or virtual link to simulate several slower links and to send different kinds of traffic on different simulated links. HTB shapes traffic based on the Token Bucket Filter algorithm which does not depend on interface characteristics, or the underlying bandwidth of the outgoing interface.

The configured bandwidth sum of all shaped FE tunnels is higher than the total amount of available head-end bandwidth. Egress Tunnel Shaping is oversubscribed so that all the available and unused bandwidth is allotted to a branch node if other branch nodes are not using it.

Buffer allocation and burst rate are fixed and cannot be configured.

Note

Tunnel shaping granularity may not be accurate, and differ from the user configured values, when packets are fragmented if the packet size is greater than the FE tunnel MTU. This is because when packet fragmentation happens there is a higher packet header overhead.

Configuration of Egress Tunnel Shaping requires supporting SPBM and Fabric Extend configurations. For more information on these configurations, see the following sections:

- [Fabric Basics and Layer 2 Services](#) on page 876
- [Fabric Layer 3 Services](#) on page 1226

- [IP Multicast over Fabric Connect](#) on page 1579

Basic DiffServ configuration using CLI

Use Differentiated Services (DiffServ) to provide appropriate Quality of Service (QoS) to specific traffic types.

Enabling DiffServ on a port

Enable DiffServ so that the system provides DiffServ-based QoS on the port. By default, DiffServ is enabled.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable DiffServ:

```
enable-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] [enable]
```

3. Disable DiffServ:

```
no enable-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] [enable]
```

Variable definitions

Use the data in the following table to use the **enable-diffserv** command.

| Variable | Value |
|---|---|
| <i>enable</i> | Enables DiffServ for the specified port. The default is enabled. |
| <i>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Configuring Layer 3 trusted or untrusted ports

Configure a port as trusted or untrusted to determine the Layer 3 QoS actions the switch performs. A trusted (core) port honors incoming Differentiated Services Code Point (DSCP) markings. An untrusted (access) port overrides DSCP markings. The default configuration is trusted.

Before You Begin

Enable DiffServ.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the port as an access port, use one of the following options:

```
no enable-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]] [enable]
```

OR configure both parameters:

```
enable-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]] [enable]
```

```
access-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]] [enable]
```

3. Configure the port as a core port:

```
no access-diffserv [port {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]] [enable]
```

Variable definitions

Use the data in the following table to use the **access-diffserv** commands.

| Variable | Value |
|---|---|
| <i>enable</i> | If enabled, specifies an access port and overrides incoming DSCP bits. If disabled, specifies a core port that honors and services incoming DSCP bits. |
| <i>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Configuring Layer 2 trusted or untrusted ports

Configure a port as trusted or untrusted to determine the Layer 2 QoS actions the switch performs. A trusted port (override disabled) honors incoming 802.1p bit markings. An untrusted port (override enabled) overrides 802.1p bit markings.

Before You Begin

Enable DiffServ.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the port as Layer 2 untrusted:

```
qos 802.1p-override [enable]
```

3. Configure the port as Layer 2 trusted:

```
no qos 802.1p-override [enable]
```

Variable definitions

Use the data in the following table to use the `qos 802.1p-override` command.

Table 288: Variable definitions

| Variable | Value |
|---------------|--|
| <i>enable</i> | If you use this variable, the port overrides incoming 802.1p bits; if you do not use this variable, the port honors and services incoming 802.1p bits. The default is disable (Layer 2 trusted). |

Viewing the port 802.1p override status

Use this procedure to view the port 802.1p override status. The system displays the port and 801.1p override status.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. View the port 802.1p override status:

```
show qos 802.1p-override
```

Example

```
Switch:1# show qos 802.1p-override
```

```

=====
                        Port 802.1p-Override Status
=====
-----
PORT      802.1P OVERRIDE
-----
1/1       DISABLED
1/2       DISABLED
1/3       DISABLED
1/4       DISABLED
1/5       DISABLED
1/6       DISABLED
1/7       DISABLED
1/8       DISABLED
1/9       DISABLED
1/10      DISABLED
1/11      DISABLED
1/12      DISABLED
1/13      DISABLED
1/14      DISABLED
1/15      DISABLED
1/16      DISABLED

```

Configuring the port QoS level

Configure the port QoS level to assign a default QoS level for all traffic if the packet does not match an access control list (ACL) that re-marks the packet. If you configure port QoS levels, Layer 2 and Layer 3 traffic from the same port use the same QoS level. The default value is 1.

About This Task

For VoIP traffic, as a best practice, use QoS level 6.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]  
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the port QoS level:

```
qos level [port {slot/port[sub-port]}] <0-6>
```

Variable definitions

Use the data in the following table to use the **qos level** command.

| Variable | Value |
|------------------------------------|--|
| <0-6> | Specifies the default QoS level for the port traffic. The system reserves QoS level 7 for network control traffic. The default is 1. |
| <i>port {slot/port[/sub-port]}</i> | Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Basic DiffServ configuration using EDM

Use DiffServ to implement classification and mapping functions at the network boundary or access points to regulate packet behavior. You can configure a port as a trusted (core) or an untrusted (access) port at both Layer 2 and Layer 3.

You can also perform many of the procedures in this section on the Interface tab for the selected port. The procedures in this section show only one configuration method.

Enabling DiffServ for a port

Enable DiffServ so that the switch provides DiffServ-based Quality of Service (QoS) on the port.

About This Task

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QoS**.
2. Click **Port QoS Config**.
3. In the row for the port, double-click the cell in the **DiffServ** column.
4. Select **true**.
5. Click **Apply**.

QoS Port Config field descriptions

Use the data in the following table to use the **Port QoS Config** tab.

| Name | Description |
|----------------------------|--|
| Index | Specifies an index value that uniquely identifies a port. |
| DiffServ | Specifies whether DiffServ is enabled (true) or disabled (false) on the port. The default is true. This variable works in conjunction with Layer3Trust. The DiffServ variable is a global parameter that affects QoS DSCP operations. If the DiffServ parameter is false (DiffServ disabled), the system does not use the DSCP parameter for classification or modify it. If this variable is true, it activates the Layer3Trust parameter. |
| Layer3Trust | Configures the Layer 3 trusted port as an access or core port. The default is core. Core configures the port to a trusted state and access configures the port to an untrusted state. The DiffServ parameter determines the operation of this variable. If DiffServ is false, Layer3Trust has no effect; no modification of the DSCP or TOS bits occurs. If DiffServ is true, the core and access configuration take effect. |
| Layer2Override8021p | Specifies whether Layer 2 802.1p override is enabled (true) or disabled (false) on the port. The default is false. This variable primarily affects tagged packet treatment. If Layer2Override8021p is false, the port trusts the 802.1p-bits portion of a Q-tagged packet. The port trusts the 802.1p-bits marking regardless of the port setting (tagged or untagged); however, if the discard tagged packets parameter (DiscardTaggedFrames) on an untagged port is true, the system discards the packet. If Layer2Override8021p is true, the port does not trust the 802.1p bit marking. In this case, the QoS operation depends on other parameters, such as the port QoS level. |
| QoSLevel | Specifies the QoS level to use when the system processes packets carried on this port. Values range from level 0–6 (the system reserves 7 for network control traffic). The default is 1. |

Configuring Layer 3 trusted or untrusted ports

Configure a port as trusted or untrusted to determine the Layer 3 QoS actions the switch performs. A trusted port honors incoming DSCP markings. An untrusted port overrides DSCP markings. The default is trusted.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QOS**.
2. Click **Port QoS Config**.
3. In the row for the port, double-click the cell in the **Layer3Trust** column.
4. Select **core** (trusted) or **access** (untrusted) as the port setting.
5. Click **Apply**.

Configuring Layer 2 trusted or untrusted ports

Configure a port as trusted or untrusted to determine the Layer 2 QoS actions the switch performs. A trusted port (override false) honors incoming 802.1p bit markings. An untrusted port (override true) overrides 802.1p bit markings.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QOS**.
2. Click **Port QoS Config**.
3. In the row for the port, double-click the cell in the **Layer2 Override 8021p** column.
4. To configure the port as a Layer 2 untrusted port, select **true**. To configure it as a Layer 2 trusted port, select **false**.
By default, all ports are Layer 2 trusted (Layer2 Override 8021p is false).
5. Click **Apply**.

Configuring the port QoS level

Use the default port QoS level to assign a default QoS level for all traffic, if the packet does not match an access control list (ACL) to remark the packet.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QOS**.
2. Click **Port QoS Config**.
3. In the row for the port, double-click the cell in the **QoSLevel** column.
4. Select the new level.
5. Click **Apply**.

QoS configuration using CLI

Use the procedures in this section to configure Quality of Service (QoS) on the switch.

Configuring broadcast and multicast bandwidth limiting

Configure broadcast and multicast bandwidth limiting to limit the amount of ingress broadcast and multicast traffic on a port. The switch drops traffic that violates the bandwidth limit.

You can configure broadcast and multicast bandwidth limiting through CLI only; you cannot use Enterprise Device Manager (EDM).

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure broadcast bandwidth limiting:

```
rate-limit [port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}]
broadcast <1-65535>
```

3. Configure multicast bandwidth limiting:

```
rate-limit [port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}]
multicast <1-65535>
```

Variable definitions

Use the data in the following table to use the **rate-limit** command.

| Variable | Value |
|---|---|
| <1-65535> | Specifies the bandwidth limit for broadcast and multicast traffic from 1-65535 packets per second. |
| <i>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Viewing the port-based shaper information

About This Task

Use this procedure to view the port-based shaper information. The system displays the port, egress rate limit in Kbps, and the rate limit status.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View the ingress port-rate limit information:

```
show qos shaper interface gigabitEthernet [{slot/port[/sub-port] [-
slot/port[/sub-port]] [,...]}
```

Example

```
Switch:1# show qos shaper interface gigabitEthernet 1/1
```

| Port Egress Rate-Limiting (Shape) | | |
|-----------------------------------|--------------------------|------------------|
| PORT | EGRESS RATE-LIMIT (kbps) | ENABLED/DISABLED |
| 1/1 | 0 | DISABLED |

Configuring the port-based shaper

Use port-based shaping to rate-limit all outgoing traffic to a specific rate.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure port-based shaping:

```
qos if-shaper [port {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]] shape-rate <shape-rate>
```

Variable definitions

Use the data in the following table to use the **qos if-shaper** command.

| Variable | Value |
|---|--|
| <code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code> | Specifies the slot and port number to which to apply shaping. This variable is optional.
Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <code>shape-rate <shape-rate></code> | Specifies the shaping rate in Kb/s. Different hardware platforms support different egress rate limits, depending on the port with the highest speed available on the platform. If you try to configure a limit that is too high for the port speed, the switch displays the following message:
<code>Error: port slot/port, The QOS Egress shaper rate can not exceed the port capability.</code>
The default is 0, which means shaping is disabled on the port. |

Configuring a port-based policer

Use a port policer to bandwidth-limit incoming traffic. The port drops or re-marks violating traffic.

Note

This command does not appear on all hardware platforms.

About This Task

The interface policer has two configurable rates: peak rate (PIR) and service or committed rate (CIR). Traffic above PIR is marked as red. Traffic above CIR is qualified as yellow. Normally, CIR is lower than PIR. However, in CLI you can configure these rates to equal values. Each rate has a maximum burst size associated with it, peak burst size (PBS) and committed burst size (CBS) respectively. You cannot configure the burst sizes. These values ensure maximum traffic fairness between the ports; the CBS value is lower than the PBS value. Depending on the traffic pattern, this configuration can result in a small percentage of traffic qualified as yellow or above CIR, but not red or above PIR, even if the rates are equal.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the policing limit:

```
qos if-policer [port {slot/port[-slot/port] [,...]}] peak-rate
<64-100000000> svc-rate <64-100000000>
```

Example

Configure the policing limit to a peak-rate of 10000 and the service rate limit to 5000 for port 4/10:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabitethernet 4/10
Switch:1(config-if)#qos if-policer port 4/10 peak-rate 10000 svc-rate 5000
```

Variable definitions

Use the data in the following table to use the **qos if-policer** command.

Table 289: Variable definitions

| Variable | Value |
|---|---|
| <i>peak-rate</i> <64-100000000> | Specifies the peak rate limit in Kbps. |
| <i>port</i> { <i>slot/port</i> [- <i>slot/port</i>]
<i>port</i>] [,...]} | Identifies the slot and the port. |
| <i>svc-rate</i> <64-100000000> | Specifies the service rate limit in Kbps. |

Configuring the ingress port-rate limiter

Use the ingress port-rate limiter to limit the traffic rate accepted by the specified ingress port. The port drops or re-marks violating traffic.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure the ingress port-rate limit:

```
qos if-rate-limiting [port {slot/port[/sub-port] [-slot/port[/sub-
port]] [,...]]] rate <1000-40000000>
```

3. Disable the ingress port-rate limit:

```
no qos if-rate-limiting [port {slot/port[/sub-port] [-slot/port[/sub-
port]] [,...]]]
```

Variable definitions

Use the data in the following table to use the **qos if-rate-limiting** command.

| Variable | Value |
|---|---|
| <i>1000-40000000</i> | Specifies the ingress rate limit in Kbps. The range is 1000-40000000. |
| <i>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</i> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

View the Ingress Port-Rate Limit Information

Use this procedure to view the ingress port-rate limit information. The system displays the port, rate limit in Kbps, and rate limit status.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View the ingress port-rate limit information:

```
show qos rate-limiting interface gigabitEthernet [{slot/port[/sub-
port] [-slot/port[/sub-port]] [,...]]]
```

Example

```
Switch:1# show qos rate-limiting interface gigabitEthernet 1/1
```

```

=====
                        Port Ingress Rate-Limiting
=====
-----
PORT      RATE (kbps)      ENABLED/DISABLED
-----
1/1       0                 DISABLED

```

Variable definitions

Use the data in the following table to use the **show qos rate-limiting interface gigabitEthernet** command.

| Variable | Value |
|---|---|
| <i>port</i> { <i>slot/port</i> [/ <i>sub-port</i>] [- <i>slot/port</i> [/ <i>sub-port</i>]] [,...]} | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Configuring ingress mappings

You can modify the ingress mappings to change traffic priorities. However, as a best practice, use the default mappings.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Configure 802.1p bit to QoS ingress mappings:

```
qos ingressmap 1p <0-7> <0-6>
```
3. Configure DSCP to QoS ingress mappings:

```
qos ingressmap ds <0-63> <0-6>
```
4. Ensure the configuration is correct:

```
show qos ingressmap [1p <0-7>]

show qos ingressmap [ds <0-63>]
```

Variable definitions

Use the data in the following table to use the `qos ingressmap` command.

Table 290: Variable definitions

| Variable | Value |
|--|--|
| <code>1p <0-7> <0-6></code> | <p>Maps the IEEE 802.1p bit to QoS level. Each QoS level has a default IEEE 1P value:</p> <ul style="list-style-type: none"> • level 0—1 • level 1—0 • level 2—2 • level 3—3 • level 4—4 • level 5—5 • level 6—6 <p>The system reserves level 7 for Network Control. To use the default configuration, use the default option in the command:
 <code>default qos ingressmap 1p</code></p> |
| <code>ds <0-63> <0-6></code> | <p>Maps the DS byte to QoS level. The system reserves level 7 for Network Control. To use the default configuration, use the default option in the command:
 <code>default qos ingressmap ds</code></p> |

Configuring egress mappings

You can modify the egress mappings to change traffic priorities. However, as a best practice, use the default mappings.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Configure QoS to 802.1p bit egress mappings:

```
qos egressmap 1p <0-6> <0-7>
```
3. Configure QoS to DSCP egress mappings:

```
qos egressmap ds <0-7> WORD<1-6>
```
4. Ensure the configuration is correct:

```
show qos egressmap [1p <0-7>]

show qos egressmap [ds <0-7>]
```

Variable definitions

Use the data in the following table to use the `qos egressmap` command.

Table 291: Variable definitions

| Variable | Value |
|---|--|
| <code>1p <0-6> <0-7></code> | <p>Maps the QoS level to IEEE 802.1p bit. Each QoS level has a default IEEE 1P value:</p> <ul style="list-style-type: none"> level 0—1 level 1—0 level 2—2 level 3—3 level 4—4 level 5—5 level 6—6 <p>The system reserves level 7 for Network Control. To use the default configuration, use the default option in the command:
<code>default qos egressmap 1p</code></p> |
| <code>ds <0-7> WORD<1-6></code> | <p>Maps the QoS level to DS byte. You can specify the DSCP in either hexadecimal, binary, or decimal format. To use the default configuration, use the default option in the command:
<code>default qos egressmap ds</code></p> |

View Port Egress CoS Queue Statistics

View the port egress CoS queue statistics. The system displays the statistics of the forwarded packets and bytes, and the dropped packets and bytes.

About This Task

**Note**

If you disable rate limiting on queue 6, bandwidth is shared based on the weights from queues 0 through 6. Based on equal weights assigned for queues 4 through 6, equal amounts of traffic egress queues 4 through 6. Queue 6 therefore appears to provide much lower throughput than 50% of port bandwidth.

Procedure

1. Enter Privileged EXEC mode:
`enable`

- View the port egress CoS queue statistics:

```
show qos cosq-stats interface <PT_PORT>
```

Note

The show command output varies based on your hardware platform. On all VSP platforms except the VSP 8600 Series, the show command output displays Out Packets and Out Bytes per interface which shows the number of unicast packets sent out on each queue for an egress port. VSP 8600 Series uses VoQ queuing architecture which enables to read the Accepted Packets and Accepted Bytes on each queue. The Accepted Packets and Accepted Bytes show the number of packets and bytes that enter the VoQ for a particular queue on the egress port. The Drop Packets and Drop Bytes show the number of packets and bytes that are dropped when the VoQ is full.

Variable definitions

Use the data in the following table to use the `show qos cosq-stats interface <PT_PORT>` command.

Table 292: Variable definitions

| Variable | Value |
|-----------|---|
| <PT_PORT> | PT indicates the slot number; PORT indicates the port number. |

The following table describes the column headings in the command output for `show qos cosq-stats interface <PT_PORT>`.

Note

The Variables can differ depending on your hardware platform.

Table 293: Variable definitions

| Variable | Value |
|------------------|---|
| Cos | Indicates the Cos queue. |
| Out Packets | Indicates the out packets for the Cos queue. |
| Accepted Packets | Indicates the accepted packets for the Cos queue. |
| Out Bytes | Indicates the out bytes for the Cos queue. |
| Accepted Bytes | Indicates the accepted bytes for the Cos queue. |
| Drop Packets | Indicates the drop packets for the Cos queue. |
| Drop Bytes | Indicates the drop bytes for the Cos queue. |

Clearing port egress CoS queue statistics

Clear the port egress CoS queue statistics in the hardware.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Clear the port egress CoS queue statistics:

```
clear qos cosq-stats interface <PT_PORT>
```

Variable definitions

Use the data in the following table to use the `clear qos cosq-stats interface <PT_PORT>` command.

Table 294: Variable definitions

| Variable | Definition |
|-----------|---|
| <PT_PORT> | PT indicates the slot number; PORT indicates the port number. |

View CPU Queue Statistics

View the statistics of the forwarded packets and bytes, and the dropped packets and bytes for the traffic sent toward CP. The queue assignment is based on the protocol types, not on the internal CoS value. These statistics are useful for debugging purposes.

Note

When a neighbor transitions to the STALE state, to initiate Neighbor Unreachability detection (NUD), a duplicate copy of the traffic destined to this neighbor is sent to the switch Control Processor (CP) on a low priority queue (queue 0). The original packet is forwarded to this neighbor. Once NUD is initiated, the hardware records are updated and the traffic is no longer sent to the CP. When a high rate of such traffic is sent to CP, the switch can drop some of these packets due to the in built CP rate limiting feature, which protects the CP from DOS attacks.

Use the command **show qos cosq-stats cpu-port** to view drop statistics on the CPU queue. This design does not result in loss of traffic.

Use the command **ipv6 nd reachable-time <0-3600000>** to increase the default value of 3000 milliseconds which in turn delays the scenario of data path sending STALE neighbor destined packets to the CP.

About This Task

Note

If you disable rate limiting on queue 6, bandwidth is shared based on the weights from queues 0 through 6. Based on equal weights assigned for queues 4 through 6, equal amounts of traffic egress queues 4 through 6. Queue 6 therefore appears to provide much lower throughput than 50% of port bandwidth.

Procedure

1. Enter Privileged EXEC mode:
`enable`
2. View the CPU queue statistics:
`show qos cosq-stats cpu-port`

**Note**

Product Notice: The show command output varies based on your hardware platform. On all platforms except VSP 8600 Series, the show command output displays Out Packets and Out Bytes per interface which shows the number of unicast packets sent out on each queue for an egress port. VSP 8600 Series uses VoQ queuing architecture which supports an increased number of available queues, hence the output displays the number of packets accepted and dropped on each protocol type going to the CPU.

Clearing CPU queue statistics

Clear the CPU queue statistics.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Clear CPU queue statistics:
`clear qos cosq-stats cpu-port`

Configure an Egress QoS Queue Profile

Configure a queue profile to apply the configured egress queue parameters to queues and ports.

About This Task

After you make a configuration change to a queue profile, you must apply the profile before the changes take effect.

**Note**

The switch supports six queue profiles. The default queue profile, with the name default and ID 1, is automatically created during system startup and cannot be deleted.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Configure the minimum weight for a specific queue:
`qos queue-profile queue <1-6> <0-7> min-weight <1-100>`

3. Enable rate limiting on a weighted queue:

```
qos queue-profile queue <1-6> <0-7> rate-limit-enable
```
4. Add a queue-profile port member:

```
qos queue-profile <1-6> member add {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}
```
5. Add a queue-profile name:

```
qos queue-profile <1-6> name WORD<0-64>
```
6. Apply the queue profile:

```
qos queue-profile <1-6> apply
```
7. Verify the egress queue configuration:

```
show qos queue-profile [<1-6> queue <0-7>|all]
```
8. (Optional) Configure the default settings for an egress queue:
 - Configure the default minimum weight using one of the following commands:

```
default qos queue-profile queue <1-6> <0-7> min-weight
```

```
no qos queue-profile queue <1-6> <0-7> min-weight
```
 - Configure the default rate limiting on a weighted queue using one of the following commands:

```
default qos queue-profile queue <1-6> <0-7> rate-limit-enable
```

```
no qos queue-profile queue <1-6> <0-7> rate-limit-enable
```

Examples

Configure the queue profile for queue 6 to use a weight of 20.

```
Switch:1(config)#qos queue-profile 6
Switch:1(config)#qos queue-profile queue 6 1 min-weight 20
Switch:1(config)#qos queue-profile 6 apply
```

View the queue profile configuration.

```
Switch:1#show qos queue-profile
```

```
=====
                        Qos Queue Profile
=====
```

| Profile ID | Profile Name | Profile Port List |
|------------|--------------|-------------------|
| 1 | default | 1/1-1/42,2/1-2/42 |
| 6 | profile-6 | |

The value in the `Weight Applied` column is the maximum bandwidth for Strict Priority queues (Rate Limit Enabled) and the weight in the WRR scheduling algorithm applied per queue. Strict Priority queues are serviced first and limited to the configured percentage of bandwidth. WRR queues (no rate limit applied) have no upper boundary, other than the delta between the available bandwidth per port and the one consumed by Strict Priority queues. For WRR queues, there is no association with the

bandwidth percentage servicing this queue; the bandwidth that can be served is relative to the available bandwidth at a certain moment and the load of other queues.

```
Switch:1(config)#show qos queue-profile 1 queue 1
```

```

```

| Profile ID | Profile Name | Queue ID | Weight Applied | Weight Configured | Rate-limit Applied | Rate-limit Configured |
|------------|--------------|----------|----------------|-------------------|--------------------|-----------------------|
| 1 | default | 0 | 10 | 10 | DISABLE | DISABLE |
| 1 | default | 1 | 20 | 20 | DISABLE | DISABLE |
| 1 | default | 2 | 30 | 30 | DISABLE | DISABLE |
| 1 | default | 3 | 40 | 40 | DISABLE | DISABLE |
| 1 | default | 4 | 50 | 50 | DISABLE | DISABLE |
| 1 | default | 5 | 50 | 50 | DISABLE | DISABLE |
| 1 | default | 6 | 50 | 50 | DISABLE | ENABLE |
| 1 | default | 7 | 5 | 5 | ENABLE | ENABLE |

Variable Definitions

The following table defines parameters for the **qos queue-profile queue** command.

| Variable | Value |
|----------|--|
| <1-6> | Specifies the queue profile ID.

Note:
The switch supports six queue profiles. The default queue is 1. |
| <0-7> | Specifies the egress queue to configure. |

| Variable | Value |
|--|--|
| <code>min-weight</code>
<1-100> | Configures the queue weight for weighted round robin (WRR), or the rate-limit in percentage of the link rate for queue shaping enabled on the queue. For rate-limit-enabled queues, 50 indicates 50% bandwidth. The overall rate-limit-enabled queues cannot sum higher than 100 min-weight. If rate-limiting is not enabled, this parameter configures the weight in the WRR scheduler. These values are not associated with bandwidth percentage. The following list identifies the default minimum weight for each queue: <ul style="list-style-type: none"> • Queue 0 – 10 • Queue 1 – 20 • Queue 2 – 30 • Queue 3 – 40 • Queue 4 – 50 • Queue 5 – 50 • Queue 6 – Rate limited to 50% of configured shaper rate • Queue 7 – Rate limited to 5% of configured shaper rate |
| <code>member add</code>
{slot/port[/sub-port] [-slot/port[/sub-port]] [,...]} | Specifies a port member of the queue-profile to add or remove. |
| <code>name</code> WORD<0-64> | Specifies a profile name. |
| <code>rate-limit-enable</code> | Enables rate limiting on the queue. By default, rate limiting is enabled for queues 6 and 7 only; it is disabled for queues 0 through 5. |

The following table defines parameters for the **show qos queue-profile** command.

| Variable | Value |
|------------------|---|
| <1-6> | Specifies the queue profile ID. If you do not include a queue profile ID, the command output displays all configured profiles.

Note:
The switch supports six queue profiles. The default queue is 1. |
| <0-7> | Specifies the egress queue.
Displays configuration settings of the specified egress queue. |
| <code>all</code> | The command output displays the configuration settings of all eight egress queues of the queue profile. |

Configure Egress Tunnel Shaping

About This Task

Perform this procedure to configure Egress Tunnel Shaping on a logical interface.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. Enter Global Configuration mode:
`enable`
`configure terminal`
3. Enable SPBM globally:
`spbm`
4. Enter IS-IS Router Configuration mode:
`router isis`
5. Create a global SPBM instance:
`spbm <1-100>`
6. Create a nickname for the global SPBM instance:
`spbm <1-100> nick-name x.xx.xx`
7. Add the backbone VLANs to the SPBM instance and set the primary VLAN:
`spbm <1-100> b-vid {vlan-id[-vlan-id][, ...]} primary <1-4059>`
8. Exit IS-IS Router Configuration mode:
`exit`
9. Enter IS-IS Router Configuration mode:
`router isis`
10. Configure the system name:
`sys-name WORD<0-255>`
11. Configure the global router type:
`is-type l1`
12. Configure the manual area:
`manual-area xx.xxx.xxx...xxxx`
13. Exit IS-IS Router Configuration mode:
`exit`
14. Create two SPBM Backbone VLANs that correspond to those configured in the previous step using the following command twice:
`vlan create <1-4059> type spbm-bvlan`
15. Enable IS-IS globally:
`router isis enable`
16. Remove the brouter port from all VLANs:
`vlan members remove <1-4059> {slot/port[/sub-port] [-slot/port[/sub-port]][, ...]} {`
17. Enter Interface Configuration mode:
`interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]][, ...]}`
18. Configure a brouter port:
`brouter port {slot/port[/sub-port]} vlan <1-4059> subnet {A.B.C.D/X}
mac-offset <MAC-offset>`
19. Exit Interface Configuration mode:
`exit`

20. Enter IS-IS Router Configuration mode:

```
router isis
```

21. Configure the IP tunnel source address:

```
ip-tunnel-source-address {A.B.C.D}
```

22. Exit IS-IS Router Configuration mode:

```
exit
```

23. Create a logical IS-IS interface and enter Logical Interface Configuration mode:

```
logical-intf isis <1-255> dest-ip {A.B.C.D} name WORD <1-64> [mtu <750-9000>]
```

24. Create an IS-IS circuit and interface:

```
isis
```

25. Enable the SPBM instance:

```
isis spbm <1-100>
```

26. Enable the IS-IS circuit and interface:

```
isis enable
```

27. Configure the Egress Tunnel Shaper:

```
egress-shaping-rate <1-1000>
```

28. Exit Logical Interface Configuration mode:

```
exit
```

Variable Definitions

Use the data in the following table to use the **vlan members** command.

| Variable | Value |
|---|--|
| remove
<1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]} | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Use the data in the following table to use the **spbm** command.

| Variable | Value |
|----------|--|
| <1-100> | Specifies the Shortest Path Bridging MAC (SPBM) instance ID. Creates the SPBM instance. Only one SPBM instance is supported. |

Use the data in the following table to use the **spbm** command to create a system nickname for an SPBM instance.

| Variable | Value |
|--------------------------------|--|
| <code><1-100></code> | Specifies the Shortest Path Bridging MAC (SPBM) instance ID. Creates the SPBM instance. Only one SPBM instance is supported. |
| <code>nick-name x.xx.xx</code> | Specifies the system nickname (2.5 bytes in the format). |

Use the data in the following table to use the **spbm** command to assign Backbone VLANs to the SPBM instance.

| Variable | Value |
|---|--|
| <code><1-100></code> | Specifies the Shortest Path Bridging MAC (SPBM) instance ID. Creates the SPBM instance. Only one SPBM instance is supported. |
| <code>b-vid {vlan-id[-vlan-id][, ...]}</code> | Specifies the VLANs to add to the Shortest Path Bridging MAC (SPBM) instance as Backbone VLANs (B-VLANs). Sets the IS-IS SPBM instance data VLANs. |
| <code>primary <1-4059></code> | Specifies the primary BVLAN by VLAN ID. |

Use the data in the following table to use the **sys-name** command.

| Variable | Value |
|--------------------------------|----------------------------|
| <code>WORD<0-255></code> | Specifies the system name. |

Use the data in the following table to use the **is-type** command.

| Variable | Value |
|-----------------|---|
| <code>11</code> | Configures the router type as Level 1 Intermediate-System-to-Intermediate-System (IS-IS). |

Use the data in the following table to use the **manual-area** command.

| Variable | Value |
|----------------------------------|--|
| <code>xx.xxxx.xxxx...xxxx</code> | Configures the manual area in a size up to 13 octets. The current release supports one area. For Intermediate-System-toIntermediate-System (IS-IS) to operate, you must configure at least one area. |

Use the data in the following table to use the **vlan create** command.

| Variable | Value |
|------------------------------|--|
| <code><1-4059></code> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| <code>type spbm-bvlan</code> | Specifies the VLAN type as the backbone VLAN (B-VLAN) for Shortest Path Bridging MAC (SPBM). |

Use the data in the following table to use the **interface GigabitEthernet** command.

| Variable | Value |
|---|---|
| <code>{slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]}</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Use the data in the following table to use the **router port** command.

| Variable | Value |
|-------------------------------------|--|
| <code>{slot/port[/sub-port]}</code> | Identifies a single slot and port. If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <code>vlan <1-4059></code> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |

| Variable | Value |
|--------------------------------|--|
| <i>subnet</i> <A.B.C.D/X> | Assigns an IP address and mask for the management port. |
| <i>mac-offset</i> <MAC-offset> | Specifies a number by which to offset the MAC address from the chassis MAC address. This ensures that each IP address has a different MAC address. If you omit this variable, a unique MAC offset is automatically generated. Different hardware platforms support different ranges. To see which range is available on the switch, use the CLI command completion Help. |

Use the data in the following table to use the **ip-tunnel-source-address** command.

| Variable | Value |
|-----------|---|
| {A.B.C.D} | Specifies the IS-IS IPv4 tunnel source address. |

Use the following table to use the **logical-intf** command.

| Variable | Value |
|---|---|
| <i>isis</i> <1-255> | Specifies the ISIS logical interface ID. |
| <i>dest-ip</i> {A.B.C.D} | Specifies the destination IP address for the logical interface. |
| <i>name</i> WORD <1-64> | Specifies the administratively-assigned name of this logical interface, which can be up to 64 characters. |
| <i>mtu</i> <750-9000>
Note: Exception: only supported onXA1400 Series | Specifies the Maximum Transmission Unit (MTU) size for each packet. Default mtu value is 1950. |

Use the data in the following table to use the **egress-shaping-rate** command.

| Variable | Value |
|----------|---|
| <1-1000> | Specifies the shaper bandwidth in Mbps. |

Egress Tunnel Shaping Configuration Example

The following is an example of an Egress Tunnel Shaping configuration.

SPBM Configuration

```
Switch> enable
Switch# config terminal
Switch(config)# vlan members remove 1 1/8
Switch(config)# spbm
Switch(config-isis)# router isis
Switch(config-isis)# spbm 1
Switch(config-isis)# spbm 1 nick-name 1.11.40
```

```
Switch(config-isis)# spbm 1 b-vid 2,3 primary 2
Switch(config-isis)# exit
Switch(config)# router isis
Switch(config-isis)# sys-name XA1400
Switch(config-isis)# is-type l1
Switch(config-isis)# manual-area c0.2000.0000.00
Switch(config-isis)# exit
Switch(config)# vlan create 2 type spbm-bvlan
Switch(config)# vlan create 3 type spbm-bvlan
```

Fabric Extend Configuration

```
Switch(config)# router isis enable
Switch(config)# interface GigabitEthernet 1/8
Switch(config-if)# brouter port 1/8 vlan 2500 subnet 192.0.2.1/255.255.255.0 mac-offset 0
Switch(config-if)# exit
Switch(config)# router isis
Switch(config-isis)# ip-tunnel 192.0.2.1
Switch(config-isis)# exit
```

Egress Tunnel Shaping Configuration

```
Switch(config)# logical-intf isis 1 dest-ip 192.0.2.2 name "bang"
Switch(config-isis-1)# isis
Switch(config-isis-1)# isis spbm 1
Switch(config-isis-1)# isis enable
Switch(config-isis-1)# egress-shaping-rate 500
Switch(config-isis-1)# exit
```

Viewing Logical Interface CoS Queue Statistics

View the QoS CoS queue statistics for IS-IS logical interfaces. These statistics are useful for debugging purposes.

Procedure

1. Enter Privileged EXEC mode:
enable
2. View the logical interface queue statistics:
show qos cosq-stats logical-intf [isis <1-255>]

Clearing Logical Interface CoS Queue Statistics

Clear the QoS CoS queue statistics for IS-IS logical interfaces.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Clear the logical interface queue statistics:
clear qos cosq-stats logical-intf [isis <1-255>]

QoS configuration using EDM

Configure Quality of Service (QoS) to allocate network resources where you need them most.

Configuring port-based shaping

Configure egress port-based shaping to bind the maximum rate at which traffic leaves the port.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand the **Configuration > Edit > Port** folders.
3. Click **General**.
4. Click the **Interface** tab.
5. From **EgressRateLimitState**, select **enable**.
6. In the **EgressRateLimit** box, type an egress rate limit in kilobits per second (Kb/s).
7. Click **Apply**.

Configure Port-Based Policing

Use a port-based policer to bandwidth-limit ingress traffic. The system drops or re-marks violating traffic.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation tree, expand **Configuration > Edit > Port**.
3. Select **General**.
4. Select the **Interface** tab.
5. From **IngressRatePeak**, type the value for the peak rate in Kbps.
The peak rate must be greater than or equal to the service rate.
6. From **IngressRateSvc**, type the value for the service rate in Kbps.
7. Select **Apply**.

Configuring ingress port-rate limiter

Use the ingress port-rate limiter to limit the traffic rate accepted by the specified ingress port. The system drops or re-marks violating traffic.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand the **Configuration > Edit > Port** folders.
3. Click **General**.
4. Click the **Interface** tab.
5. From **IngressRateLimit**, type the value in Kbps to set the traffic rate limit.
The ingress rate limit must be between 1000 and 40000000.
6. Click **Apply**.

Modifying ingress 802.1p to QoS mappings

Modify the ingress mappings to change traffic priorities. As a best practice, use the default mappings.

About This Task

Do not change the default values. If you change the values, make sure that the values are consistent on all other devices in the network. Inconsistent mapping of table values can result in unpredictable service levels.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QoS**.
2. Click **Mapping Tables**.
3. Click the **Ingress 8021p to QoS** tab.
4. Double-click a QosLevel field to change the value.
5. Click **Apply**.

Ingress 8021p To QoS field descriptions

Use the data in the following table to use the **Ingress 8021p to QoS** tab.

| Name | Description |
|-------------|--|
| Inleee8021P | Specifies the value of the IEEE 802.1p bit of the incoming packet. |
| QosLevel | Specifies the equivalent egress QoS level (0–7). |

Modifying ingress DSCP to QoS mappings

Modify the ingress Differentiated Services Code Point (DSCP) to QoS mappings to change traffic priorities. As a best practice, use the default mappings. Changes to the mapping table take effect after you restart the system.

About This Task

Do not change the default values. If you change the values, make sure that the values are consistent on all other devices in the network. Inconsistent mapping of table values can result in unpredictable service levels.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QoS**.
2. Click **Mapping Tables**.
3. Click the **Ingress Dscp To QoS** tab.
4. Double-click a QosLevel field to change the value.
5. Click **Apply**.

Ingress Dscp To QoS field descriptions

Use the data in the following table to use the **Ingress Dscp To QoS** tab.

| Name | Description |
|---------------------------|--|
| InDscp | Specifies the value of the DiffServ codepoint (in decimal format) in the IP header of the incoming packet. |
| InDscpBinaryFormat | Specifies the value of the DiffServ codepoint (in binary format) in the IP header of the incoming packet. |
| QoSLevel | Specifies the equivalent QoS level. |

Modifying egress QoS to 802.1p mappings

Modify the egress mappings to change the mappings between the QoS levels and the IEEE 802.1p bits.

About This Task

Do not change the default values. If you change the values, make sure that the values are consistent on all other devices in the network. Inconsistent mapping of table values can result in unpredictable service levels.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QOS**.
2. Click **Mapping Tables**.
3. Click the **Egress QoS to 8021p** tab.
4. Double-click the **Outleee8021P** field to change the value.
5. Click **Apply**.

Egress QoS to 8021p field descriptions

Use the data in the following table to use the **Egress QoS to 8021p** tab.

| Name | Description |
|---------------------|--|
| QoSLevel | Specifies the QoS level of the outgoing packet. |
| Outleee8021P | Specifies the equivalent value of the IEEE 802.1p bit. |

Modifying egress QoS to DSCP mappings

Modify the egress QoS to DSCP mappings to change traffic priorities. As a best practice, use the default mappings.

About This Task

Do not change the default values. If you change the values, make sure that the values are consistent on all other devices in the network. Inconsistent mapping of table values can result in unpredictable service levels.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QoS**.
2. Click **Mapping Tables**.
3. Click the **Egress QoS To Dscp** tab.
4. Double-click the OutDscp file to change the value.
5. Click **Apply**.

Egress QoS To Dscp field descriptions

Use the data in the following table to use the **Egress QoS To Dscp** tab.

| Name | Description |
|----------------------------|--|
| QoSLevel | Specifies the QoS level of the outgoing packet. |
| OutDscp | Specifies the equivalent value of the DiffServ code point (in decimal format). |
| OutDscpBinaryFormat | Specifies the equivalent value of the DiffServ code point (in binary format). |

Viewing port egress CoS queue statistics

Use the following procedure to retrieve the port egress CoS queue statistics. The system displays the statistics of the forwarded packets and bytes, and the dropped packets and bytes.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QoS**.
2. Click **CoS Queue Stats**.
3. Select the **Interface** tab.

Interface Field Descriptions

The following table describes the fields from the CoS Queue Stats **Interface** tab.

| Name | Description |
|---------------------------------|--|
| Index | Indicates the loopback port number from 192(1/1) to 241(1/50). |
| ClearStat | Clears the port egress statistics. |
| Que<0-7>OutPackets | Indicates the out packets by CoS queue number 0-7. |
| Que<0-7>OutBytes | Indicates the out bytes by CoS queue number 0-7. |

| Name | Description |
|----------------------------------|---|
| Que<0-7>DropPackets | Indicates the drop packets by CoS queue number 0-7. |
| Que<0-7>DropBytes | Indicates the drop bytes by CoS queue number 0-7. |

Clearing CPU statistics for the chassis

Use the following procedure to clear the CPU statistics for the chassis.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QOS**.
2. Click **CoS Queue Stats**.
3. Select the **CPU-Stats-Clear** tab.
4. Select the **CpuStatsClear** check box.
5. Click **Apply**.

Viewing CPU queue statistics

Use the following procedure to retrieve the statistics of the forwarded packets and bytes, and the dropped packets and bytes for the traffic sent toward CP. The queue assignment is based on the protocol types, not on the internal CoS value These statistics are useful for debugging purposes.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > QOS**.
2. Click **CoS Queue Stats**.
3. Select the **CPU-Port** tab.

CPU-Port Field Descriptions

Use the data in the following table to use the **CPU-Port** tab.

| Name | Description |
|-------------|--|
| Index | Indicates the CoS queue number. |
| OutPackets | Indicates the out packets for the CPU port. |
| OutBytes | Indicates the out bytes for the CPU port. |
| DropPackets | Indicates the drop packets for the CPU port. |
| DropBytes | Indicates the drop bytes for the CPU port. |

View Tunnel CoS Queue Statistics

Note

This procedure only applies to XA1400 Series.

Use the following procedure to retrieve the tunnel CoS queue statistics. The system opens the statistics of the forwarded packets and bytes and the dropped packets and bytes.

Procedure

1. In the navigation tree, expand: **Configuration > QoS**.
2. Select **CoS Queue Stats**.
3. Select the **Tunnel** tab.

Tunnel Field Descriptions

The following table describes the fields from the CoS Queue Stats **Tunnel** tab.

| Name | Description |
|----------------------------------|--|
| Index | Indicates the loopback port number from 192(1/1) to 241(1/50). |
| Que<0-7>OutPackets | Indicates the out packets by CoS queue number 0-7. |
| Que<0-7>OutBytes | Indicates the out bytes by CoS queue number 0-7. |
| Que<0-7>DropPackets | Indicates the drop packets by CoS queue number 0-7. |
| Que<0-7>DropBytes | Indicates the drop bytes by CoS queue number 0-7. |

Configuring an egress QoS queue profile

Configure a queue profile to apply the configured egress queue parameters to queues and ports. You must apply the profile before the changes take effect.

About This Task

The switch supports six queue profiles. The default queue profile, with the name default and ID 1, is automatically created during system startup and cannot be deleted.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > QoS**.
2. Click **Queue Profile**.
3. Click the **Queue Profile** tab.
4. Click **Insert**.
5. In the **Id** field, type the queue profile value.
6. In the **Name** field, specify a name for the queue profile.
7. To add a port to this queue, click the **PortList** ellipsis (...), choose a port or ports, and then click **Ok**.
8. Select the **Apply** check box.
9. Click **Insert**.

Queue Profile field descriptions

Use the data in the following table to use the **Queue Profile** tab.

| Field | Description |
|-----------------|--|
| Id | Specifies the ID for the queue profile. |
| Name | Specifies the queue profile name. |
| Apply | Applies the queue profile. |
| PortList | Indicates the port members of the queue profile. |

Editing queue profile information

About This Task

Use the following procedure to edit queues of a queue profile, to configure a queue weight or enable rate limiting on the queue.

Note

After you make the configuration changes, you must apply the queue profile before the changes take effect.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > QoS**.
2. Click **Queue Profile**.
3. Update a queue to configure queue weight or rate limiting.
 - a. Click the **Queue** tab.
 - b. Edit the **AdminWeight** and **AdminRateLimitStatus** fields by double-clicking on them, and then selecting or typing the new value.
 - c. Click **Apply**.
4. Apply the queue profile for the queue configuration to take effect.
 - a. Click the **Queue Profile** tab.
 - b. In the **Apply** field, double-click and select **true**.
 - c. Click **Apply**.
5. Click the **Queue** tab again, to verify updates to the **OperWeight** and the **OperRateLimitStatus** fields, for the respective queue.

Queue field descriptions

Use the data in the following table to use the **Queue** tab.

| Field | Description |
|-------|--------------------------------|
| PId | Displays the queue profile ID. |
| Id | Displays the queue ID. |

| Field | Description |
|----------------------|---|
| AdminWeight | <p>Configures the queue weight for weighted round robin (WRR), or the rate-limit in percentage of the link rate for queue shaping enabled on the queue. For rate-limit-enabled queues, 50 indicates 50% bandwidth. The overall rate-limit-enabled queues cannot sum higher than 100 min-weight. If rate-limiting is not enabled, this field configures the weight in the WRR scheduler. These values are not associated with bandwidth percentage. The following list identifies the default minimum weight for each queue:</p> <ul style="list-style-type: none"> • Queue 0 – 10 • Queue 1 – 20 • Queue 2 – 30 • Queue 3 – 40 • Queue 4 – 50 • Queue 5 – 50 • Queue 6 – Rate limited to 50% of configured shaper rate • Queue 7 – Rate limited to 5% of configured shaper rate |
| OperWeight | Displays the operational weight of the profile, described as a percentage. |
| AdminRateLimitStatus | Enables rate limiting on the queue. By default, rate limiting is enabled (true) for queues 6 and 7 only; it is disabled (false) for queues 0 through 5. |
| OperRateLimitStatus | Displays the operational status of the queue rate limit. |

Configuring Rate Limits

About This Task

Configure the rate limit of broadcast or multicast packets to determine the total bandwidth limit on the port.

Procedure

1. On the Device Physical View, select a port or multiple ports.
2. In the navigation pane, expand the **Configuration > Edit > Port** folders.
3. Click **General**.
4. Click the **Rate Limiting** tab.
5. Configure the parameters as required.
6. Click **Apply**.

Rate Limiting Field Descriptions

Use the data in the following table to use the **Rate Limiting** tab.

| Name | Description |
|-----------------------|---|
| Index | The port number. |
| TrafficType | The type of traffic being rate limited, either broadcast or multicast traffic. The default is broadcast. |
| AllowedRatePps | This variable is the allowed traffic rate limit for the port in packets per second.
1 to 25 configures the limit in a percentage of the total bandwidth on the port from 1-25 percent.
On gigabit ports and MDAs, there can be up to a 2 percent difference between the configured and actual rate limiting values.
1-65535 configures the limit in packets for each second. |
| Enable | Double-click in the field and select to enable (True) or disable (False) rate limiting. The default is false. |

Configuring Rate Limits on an Extreme Integrated Application Hosting Port

About This Task

Perform this procedure to configure the rate limit of broadcast or multicast packets and determine the total bandwidth limit on the Extreme Integrated Application Hosting (IAH) port.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > Edit > Insight Port**.
2. Select the IAH port you want to configure.
3. Select the **Rate Limiting** tab.
4. In the **AllowedRatePps** column, enter a time duration for the specific Extreme Integrated Application Hosting port.
5. In the **Enable** column, select **true** to enable rate limiting for the specific IAH port.
6. Select **Apply**.

Rate Limiting Field Descriptions

| Name | Description |
|-----------------------|---|
| Index | Specifies the Extreme Integrated Application Hosting (IAH) port. |
| TrafficType | Shows the traffic type. The default is broadcast. |
| AllowedRatePps | Specifies the allowed traffic rate limit for the IAH port in packets per second (pps). |
| Enable | Enables or disables rate limiting for the specific IAH port. The default is false (disabled). |

**Note**

DEMO FEATURE - Secure AAA server communication, which includes RADIUS secure communication using IPSec for IPv4 and IPv6, is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

RADIUS Fundamentals

Remote Access Dial-In User Services (RADIUS) is a distributed client/server system that assists in securing networks against unauthorized access, allowing a number of communication servers and clients to authenticate users identity through a central database. The database within the RADIUS server stores information about clients, users, passwords, and access privileges including the use of shared secret.

RADIUS is a fully open and standard protocol, defined by two Requests for Comments (RFC) (Authentication: RFC2865, Accounting: RFC2866). You use RADIUS authentication to get secure access to the system (console/Telnet/SSH/EDM), and RADIUS accounting to track the management sessions (CLI only).

RADIUS Server Support for IPv6

RADIUS supports both IPv4 and IPv6 with no differences in functionality or configuration in all but the following case. When you add or update a RADIUS server in Enterprise Device Manager (EDM) you must specify if the address type is an IPv4 or an IPv6 address.

How RADIUS Works

A RADIUS application has two components:

| | |
|---|--|
| <ul style="list-style-type: none"> • RADIUS server | <p>A computer equipped with server software (for example, a UNIX workstation) that is located at a central office or campus. The server has authentication and access information in a form that is compatible with the client. Typically, the database in the RADIUS server stores client information, user information, password, and access privileges, including the use of a shared secret. A network can have one server for both authentication and accounting, or one server for each service.</p> |
| <ul style="list-style-type: none"> • RADIUS client | <p>A device, router, or a remote access server, equipped with client software, that typically resides on the same local area network (LAN) segment as the server. The client is the network access point between the remote users and the server.</p> |

The two RADIUS processes are

- RADIUS authentication—Identifies remote users before you give them access to a central network site.
- RADIUS accounting—Performs data collection on the server during a remote user's dial-in session with the client.

Configuration of the RADIUS Server and Client

For more information about how to configure a RADIUS server, see the documentation that came with the server software.

The switch software supports BaySecure Access Control (BSAC) and the Merit Network servers. To use these servers, you must first obtain the software for the server you will use. Also, you must make changes to one or more configuration files for these servers.

RADIUS Authentication

You can use RADIUS authentication to use a remote server to authenticate logons. The RADIUS server also provides access authority. RADIUS assists network security and authorization by managing a database of users. The device uses this database to verify user names and passwords as well as information about the type of access priority available to the user.

When the RADIUS client sends an authentication request requesting additional information such as a SecurID number, it sends it as a challenge-response. Along with the challenge-response, it sends a reply-message attribute. The reply-message is a text string, such as `Please enter the next number on your SecurID card:.` The RFC defined maximum length of each reply-message attribute is 253 characters. If you have multiple instances of reply-message attributes that together form a large message that displays to the user, the maximum length is 2000 characters.

You can use additional user names to access the device, in addition to the six existing user names of ro, L1, L2, L3, rw, and rwa. The RADIUS server authenticates the user name and assigns one of the existing access priorities to that name. Unauthenticated user names are denied access to the device. You must add user names ro, L1, L2, L3, rw, and rwa to the RADIUS server if you enable authentication. Users not added to the server are denied access.

The limitation on the number of characters in a username for users logging into CLI or EDM configured with RADIUS authentication is 64 characters.

Note

RADIUS server used-by snmp does not support authentication.

The following list shows the user configurable options of the RADIUS feature:

- Up to 10 RADIUS servers in each device for fault tolerance (each server is assigned a priority and is contacted in that order).
- A secret key for each server to authenticate the RADIUS client
- The server UDP port

- Maximum retries allowed
- Time-out period for each attempt

**Note**

If you enable enhanced secure mode with the **boot config flags enhancedsecure-mode** command, you enable different access levels, along with stronger password complexity, length, and minimum change intervals. With enhanced secure mode enabled, the switch supports the following access levels for RADIUS authentication:

- Administrator
- Privilege
- Operator
- Auditor
- Security

The switch associates each username with a certain role and appropriate authorization rights to view and configure commands. For more information on system access fundamentals and configuration, see [System Access](#) on page 3306.

Use of RADIUS to Modify User Access to CLI Commands

The switch provides CLI command access based on the configured access level of a user. However, you can use RADIUS to override CLI command access provided by the switch.

To override user access to CLI commands, you must configure the `command-access-attribute` on the switch and on the RADIUS server. (The switch uses decimal value 194 as the default for this parameter.) On the RADIUS server, you can then define the commands that the user can or cannot access.

**Important**

When you enable RADIUS on the switch and configure a RADIUS server to be used by CLI or EDM, the server authenticates the connection, whether it is FTP, HTTPs, SSH, or TELNET. However, in the event that the RADIUS server is unresponsive or is unreachable, the switch falls back to the local authentication, so that you can access the switch using your local login credentials.

Regardless of the RADIUS server configuration, you must configure the user's access on the switch based on the six platform access levels.

RADIUS Accounting

RADIUS accounting logs all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Session-IDs for each RADIUS account generate as 12-character strings. The first four characters in the string form a random number in hexadecimal format. The last eight characters in the string indicate the number of user sessions started since the last restart, in hexadecimal format.

The Network Address Server (NAS) IP address for a session is the address of the device interface to which the remote session is connected over the network. For a console session, modem session, and sessions running on debug ports, this value is set to 0.0.0.0, as is the case with RADIUS authentication.

The following table summarizes the events and associated accounting information logged at the RADIUS accounting server.

Table 296: Accounting Events and Logged Information

| Event | Accounting information logged at server |
|--|--|
| Accounting is turned on at router | <ul style="list-style-type: none"> Accounting on request: NAS IP address |
| Accounting is turned off at router | <ul style="list-style-type: none"> Accounting off request: NAS IP address |
| User logs on | <ul style="list-style-type: none"> Accounting start request: NAS IP address Session ID User name |
| More than 40 CLI commands are executed | <ul style="list-style-type: none"> Accounting interim request: NAS IP address Session ID CLI commands User name |
| User logs off | <ul style="list-style-type: none"> Accounting stop request: NAS IP address Session ID Session duration User name Number of input octets for session Number of octets output for session Number of packets input for session Number of packets output for session CLI commands |

When the device communicates with the RADIUS accounting server, the following actions occur:

1. If the server sends an invalid response, the response is silently discarded and the server does not make an attempt to resend the request.
2. User-specified number of attempts are made if the server does not respond within the user-configured timeout interval. If a server does not respond to any of the retries, requests are sent to the next priority server (if configured). You can configure up to 10 RADIUS servers for redundancy.

Note

RADIUS server used-by endpoint-tracking does not support accounting.

RFC 4675 RADIUS Attributes: Egress VLAN

Egress VLAN controls egress traffic. Egress VLAN supports two standard RADIUS attributes as defined in RFC 4675:

- Egress-VLANID

- Egress-VLAN-Name

RADIUS attributes control the 802.1Q tagging for traffic egressing a port where RADIUS authentication is performed for a connected EAP or NEAP client.

Egress VLANs are standard attributes, therefore the RADIUS server supports the attributes by default and offer the ability to configure the attributes. Each attribute has two parts:

1. Indicates if the frames on the VLAN egress must be tagged or untagged
2. Specifies the VLAN name or VLAN ID

The switch applies the VLAN received in the Egress-VLAN attributes to the port where the client is authenticated through RADIUS and then sets the tagging rules (tagged or untagged) accordingly.

The switch processes the Egress-VLAN attributes when decoding the RADIUS packet, therefore the switch adds the port to the VLANs first and then sets the proper tagging for the VLANs. You must create VLANs in advance on the switch.

In the MultiVlan operation mode, the EAP applies ingress hardware rules to ensure untagged traffic from each authenticated client goes into its own VLAN. The unauthenticated clients send traffic to the Guest VLAN, which matches the default VLAN ID.

For more information, see [RADIUS Attributes](#) on page 750.

RADIUS Server Reachability

Configure up to 10 EAP RADIUS servers on the switch to manage fault tolerance. Each server is assigned a priority and is contacted in the priority order. If the first server is unavailable, the switch tries the second server, and so on, until the switch establishes a successful connection. Higher priority means lower integer value.

RADIUS server reachability prevents clients from trying to establish a connection with non reachable servers. RADIUS server reachability runs a periodic check in the background to identify the available servers. The switch is aware of the first available EAP RADIUS server without going through each of the servers and wait for time-outs.

Use RADIUS server reachability to configure the switch to use RADIUS requests to determine the reachability of the RADIUS server. The switch regularly performs the reachability test to determine if the switch should fail over to the secondary RADIUS server or activate the Fail Open VLAN, if configured on the switch.

Use one of the following modes to configure RADIUS reachability:

- status-server mode: Status-Server packets provide a standard-compliant alternative to configuring dummy RADIUS requests. You can configure the switch to send status-server packets when the keep-alive timer or the unreachable timer expires. In order to use status-server mode, the configured RADIUS servers must support RFC5997.
- use-radius mode: Configure user-radius mode if any of the RADIUS servers do not support RFC5997. In user-radius mode, the switch regularly generates a dummy RADIUS request with the username `reachme` and password `reachme`. The switch interprets either Request Accept or Request Reject responses as a confirmation for server reachability, therefore it is not necessary to add the

credentials on the server to test server reachability. You can configure the username and password for the dummy account through CLI. Use-radius is the default mode for RADIUS reachability.

You can configure the RADIUS reachability mode in either CLI or EDM.

Note

RADIUS server reachability is enabled on the switch and is not a configurable option. The reachability process starts when at least one RADIUS server used by EAP is configured, and RADIUS is enabled globally.

Based on the number of EAP RADIUS servers configured, the switch performs the following:

- If the highest priority EAP RADIUS server is reachable, the server status is updated to reachable and further authentication will use this server. As long as the highest priority EAP RADIUS server is reachable, the rest of the EAP RADIUS servers are not tested for reachability.
- If the highest priority EAP RADIUS server is not reachable, then the switch tests the rest of the EAP RADIUS servers for reachability. The servers are checked one by one for reachability based on their priority from highest to lowest. The first server that is reachable is used for authentication and the rest of the lower priority EAP RADIUS servers if any, are skipped from the reachability test.
- If all the EAP RADIUS servers are unreachable, then no further authentication occurs until the next successful reachability check.

The intervals between two consecutive reachability checks can be configured. The default values are as follows:

- one minute, if the last check result was unreachable
- three minutes, if the last check result was reachable

A server is marked as unreachable after a number of retries and time-outs. The default number of retries is 1 and the default time-out value is 8 seconds, but you can also configure these values in CLI.

RFC 3580 RADIUS Attributes: IEEE 802.1X Remote Authentication Dial In User Service

RFC 3580 provides support for EAP and NEAP clients for the following RADIUS attributes:

- Called-Station ID attribute: For IEEE 802.1X authenticators, the Called-Station ID stores the bridge or access point MAC address in upper case ASCII format, with octet values separated by a hyphen (-). For example: 00-10-A4-23-19-C0.

In IEEE 802.11, where the SSID is known, the SSID must be appended to the access point MAC address and separated from the MAC address with a colon (:). For example: 00-10-A4-23-19-C0:AP1.

- Calling-Station ID: For IEEE 802.1X authenticators, the Calling-Station ID is used to store the supplicant MAC address in upper case ASCII format, with octet values separated by a hyphen (-). For example: 00-10-A4-23-19-C0.
- NAS-Port ID: The NAS-Port ID is used to identify the IEEE 802.1X Authenticator port which authenticates the Supplicant. The NAS-Port-Id differs from the NAS-Port in that it is a string of variable length whereas the NAS-Port is a 4 octet value.

RFC 5176 — Dynamic Session Change

RFC 5176 allows you to dynamically change the following user session characteristics:

- You can disconnect an authenticated user on a port and remove all associated session context.

If the RADIUS server issues a disconnect command to the switch and the switch identifies a user (that satisfies all attributes of the RADIUS server request) on a port that has enabled RADIUS dynamic extensions commands, the switch performs the following actions:

- Notify the user of the disconnect by sending an 802.1x disconnect message to the client.
 - Remove all session context from the port.
 - Remove the port from the RADIUS-assigned VLAN, if applicable.
 - Send the disconnect response Disconnect-ACK to the RADIUS server if the user session is disconnected and all steps successfully performed.
 - Send the Disconnect-NAK response to the RADIUS server if the user session is not found or if the Network Access Server (NAS) cannot disconnect the session and discard the session context.
- You can use the Change of Authorization command to dynamically change the VLAN used by the RADIUS server.

If the RADIUS server issues a Change of Authorization command to the switch and the switch identifies a user (that satisfies all attributes of the RADIUS server request) on a port that has enabled RADIUS dynamic extensions commands, the switch performs the following actions:

- If the Change of Authorization command specifies a valid VLAN ID for a port, the port is removed from the VLAN specified by RADIUS and added to the VLAN specified in the request.
 - A CoA-ACK response is sent to the RADIUS server.
 - If the user session is not found or an error is encountered in processing the Change of Authorization command, then a CoA-NAK response is sent to the RADIUS server.
 - If the Change of Authorization request specifies a VLAN that is not port-based, a CoA-NAK response is sent to the RADIUS server.
- You can dynamically initiate client re-authentication.

Re-authenticate requests can be made with Change of Authorization or Disconnect packet IDs, but they must have the Re-authentication Request Vendor-Specific Attributes (VSA) set to True.

Dynamic session changes are directed to specific user sessions, as identified by RADIUS attributes.

To enable dynamic session changes, configure the following:

- You must enable EAP or Endpoint Tracking globally and at the port level.
- You must enable RADIUS dynamic extensions commands at the port level.

You can use the **show radius dynamic-server statistics** command to view statistics about dynamic session changes.

```
Switch:1#enable
Switch:1#show radius dynamic-server statistics

=====
                        RADIUS Dynamic Authorization Global Statistics
=====
Disconnects From Invalid Client Addresses:      0
```

```
CoAs From Invalid Client Addresses:          0
-----
```

RADSec

Remote Access Dial-In User Services (RADIUS) Security (RADSec) provides secure communication between RADIUS peers using Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP), or Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP).

RADSec peers use certificates to establish trust relationships. Certificates are specified in the RADSec profile on the switch, which can be the default profile or a profile that you configure. You must configure the client and secure server with the same certificate authority (CA) certificate file, server certificate, certificate key file and password to establish a RADSec connection. The password is used for packet encryption and decryption.

You can configure the RADSec security mode to use TLS protocol or DTLS protocol. Both TLS and DTLS modes support IPv4 addresses, but IPv6 addresses are supported only by TLS mode.

RADSec uses radsecproxy to encrypt packets sent between RADIUS clients and a secure server. A radsecproxy process starts when radius and secure-mode are enabled both globally and for the current server. Radsecproxy uses multiple instances on the switch, one for each one for each security-configured RADIUS server. The maximum number of radsecproxy instances is 10, which is equivalent to the maximum number of radius servers you can configure on the switch.

Note

You must use radsecproxy version 1.8.1 or later. Using an earlier version of radsecproxy can result in authentication failures.

The following events cause all radsecproxy processes to restart:

- A Segmented Management Instance interface is deleted, enabled, or disabled.
- An IPv4 address or route is changed.
- An IPv6 address or route is changed.
- RADIUS global enable and secure-enable change.

The following changes only affect a radsecproxy instance and result only in the associated process restarting:

- Enabling or disabling the RADIUS server state or secure state.
- Modifying the RADIUS server secure mode, associated profile, or secure log level.

A RADSec profile configuration change causes all processes associated with the profile to restart.

A RADSec process automatically stops when the corresponding RADIUS server entry is deleted, or if RADIUS or secure mode is disabled for the server.

If one of the global radius flags (radius state, radius secure state) is disabled, all radsecproxy instances stop.

RADIUS configuration using CLI

You can configure Remote Access Dial-In User Services (RADIUS) to secure networks against unauthorized access, and allow communication servers and clients to authenticate users identity through a central database.

The database within the RADIUS server stores client information, user information, password, and access privileges, including the use of shared secret.

RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration using CLI.

RADIUS is a fully open and standard protocol, defined by RFCs (Authentication: RFC2865, accounting RFC2866). With the switch, you use RADIUS authentication to secure access to the device (console/Telnet/SSH), and RADIUS accounting to track the management sessions for Command Line Interface (CLI) only.

RADIUS authentication allows the remote server to authenticate logons. RADIUS accounting logs all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Configure RADIUS Attributes

Configure RADIUS to authenticate user identity through a central database.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Configure RADIUS access priority:
`radius access-priority-attribute <192-240>`
3. Configure RADIUS accounting:
`radius accounting {attribute-value <192-240>|enable|include-cli-commands}`
4. Configure the RADIUS authentication info attribute value:
`radius auth-info-attr-value <0-255>`
5. Clear RADIUS statistics:
`radius clear-stat`
6. Configure the value of the CLI commands:
`radius cli-commands-attribute <192-240>`
7. Configure the value of the command access attribute:
`radius command-access-attribute <192-240>`
8. Configure the maximum number of servers allowed:
`radius maxserver <1-10>`
9. Configure the multicast address attribute:
`radius mcast-addr-attr-value <0-255>`

10. Enable RADSec globally:

```
radius secure-flag
```

Note

RADSec is not supported on the VSP 8600 Series.

11. Configure the RADSec profile:

```
radius secure-profile WORD<1-16> [ca-cert-file | cert-file | key-file  
| key-pwd]
```

Note

RADSec is not supported on the VSP 8600 Series.

Example

```
Switch:1>enable
```

```
Switch:1#configure terminal
```

Configure RADIUS access priority:

```
Switch:1(config)#radius access-priority-attribute 192
```

Configure RADIUS accounting to include CLI commands:

```
Switch:1(config)#radius accounting include-cli-commands
```

Variable Definitions

The following table defines parameters for the **radius** command.

| Variable | Value |
|---|---|
| <i>access-priority-attribute</i> <192-240> | Specifies the value of the access priority attribute in the range of 192 to 240. The default is 192. |
| <i>accounting {attribute-value</i> <192-240> <i>enable</i> <i>include-cli-commands</i> } | Configures the accounting attribute value, enable accounting, or configure if accounting includes CLI commands. The default is false. Use the no option to disable the accounting attribute value: no radius accounting enable . |
| <i>auth-info-attr-value</i> <0-255> | Specifies the value of the authentication information attribute in the range of 0 to 255. The default is 91. |
| <i>clear-stat</i> | Clears RADIUS statistics. |
| <i>cli-cmd-count</i> <1-40> | Specifies how many CLI commands, from 1 to 40, before the system sends a RADIUS accounting interim request. The default value is 40. |
| <i>cli-commands-attribute</i> <192-240> | Specifies the value of CLI commands attribute in the range of 192 to 240. The default is 195. |

| Variable | Value |
|---|---|
| <i>cli-profile</i> | Enable RADIUS CLI profiling. CLI profiling grants or denies access to users being authenticated by way of the RADIUS server. You can add a set of CLI commands to the configuration on the RADIUS server, and you can specify the command-access more for these commands. The default is false. |
| <i>command-access-attribute</i>
<192-240> | Specifies the value of the command access attribute in the range of 192 to 240. The default is 194. |
| <i>enable</i> | Enable RADIUS authentication globally on the switch. |
| <i>maxserver</i> <1-10> | Specific to RADIUS authentication, configures the maximum number of servers allowed for the device. The range is between 1 and 10. The default is 10. |
| <i>mcast-addr-attr-value</i>
<0-255> | Specifies the value of the multicast address attribute in the range of 0 to 255. The default is 90. |
| <i>secure-flag</i>

Note:
Exception: not supported on VSP 8600 Series. | Specifies whether RADIUS Security (RADSec) is globally enabled. The default is disabled. |
| <i>secure-profile</i>

Note:
Exception: not supported on VSP 8600 Series. | Specifies the RADSec profile name. |

| Variable | Value |
|---|---|
| <pre>server host WORD<0-46> key WORD<0-32> [used-by {cli snmp web} [acct-enable] [acct-port <1-65536>] [enable] [port <1-65536>] [priority <1-10>] [retry <0- 6>secure-enablesecure-log- level {critical debug error info warning}secure-mode{dtls tls}secure- profileWORD<1-16>] [source- ip WORD<0-46>] [timeout <1- 60>]</pre> | <ul style="list-style-type: none"> • <i>host WORD<0-46></i>
Creates a host server. WORD<0-46> signifies an IP address. • <i>key WORD<0-32></i>
Specifies a secret key in the range of 0-32 characters. • <i>used-by {cli eapol endpoint-tracking snmp web}</i>
Specifies how the server functions. Configures the server for: <ul style="list-style-type: none"> ◦ cli authentication ◦ eapol authentication ◦ endpoint-tracking authentication ◦ snmp accounting ◦ web authentication • <i>acct-enable</i>
Enables RADIUS accounting on this server. The system enables RADIUS accounting by default. • <i>acct-port <1-65536></i>
Specifies a UDP port of the RADIUS accounting server (1 to 65536). The default value is 1816. The UDP port value set for the client must match the UDP value set for the RADIUS server. • <i>enable</i>
Enables the server. The default is true. • <i>port <1-65536></i>
Specifies a UDP port of the RADIUS server. The default value is 1812. • <i>priority <1-10></i>
Specifies the priority value for this server. The default is 10. • <i>retry <0-6></i>
Specifies the maximum number of authentication retries. The default is 3. • <i>secure-enable</i>
Enable secure mode on the server.

Note:
Exception: not supported on VSP 8600 Series. • <i>secure-log-level {critical debug error info warning}</i>
Specifies the RADIUS secure server log severity level. |

| Variable | Value |
|---|--|
| | <p>Note:
Exception: not supported on VSP 8600 Series.</p> <ul style="list-style-type: none"> <code>secure-mode{dtls tls}</code> <p>Specifies the protocol for establishing the secure connection with the server. IPv4 supports both dtls and tls modes. IPv6 only supports tls mode.</p> <p>Note:
Exception: not supported on VSP 8600 Series.</p> <ul style="list-style-type: none"> <code>secure-profileWORD<1-16></code> <p>Specifies the secure profile name.</p> <p>Note:
Exception: not supported on VSP 8600 Series.</p> <ul style="list-style-type: none"> <code>source-ip WORD<0-46></code> <p>Specifies a configured IP address as the source address when transmitting RADIUS packets. WORD<0-46> signifies an IP address.</p> <p>Note:
Exception: Only supported on VSP 8600 Series.</p> <ul style="list-style-type: none"> <code>timeout <1-60></code> <p>Specifies the number of seconds before the authentication request times out. The default is 3.</p> |
| <p><code>sourceip-flag</code></p> <p>Note:
Exception: only supported on VSP 8600 Series.</p> | <p>Enable the source IP so the switch uses a configured source IP address. If the outgoing interface on the switch fails, a different source IP address is used — requiring that you make configuration changes to define the new RADIUS client on the RADIUS server. To simplify RADIUS server configuration, you can configure the switch to use a Circuitless IP (CLIP) address as the source IP and NAS IP address when transmitting RADIUS packets. A CLIP is not associated with a physical interface and is always in an active and operational state. You can configure the switch with multiple CLIP interfaces.</p> <p>By default, the switch uses the IP address of the outgoing interface as the source IP, and the NAS Ip address for RADIUS packets that it transmits.</p> |

Configuring RADIUS profile

Use RADIUS CLI profiling to grant or deny CLI command access to users being authenticated by way of the RADIUS server. You can add a set of CLI commands to the configuration file on the radius server, and you can specify the command-access mode for these commands. The default is false.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enable RADIUS CLI profiling:
`radius cli-profile`

Example

```
Switch:1> enable

Switch:1# configure terminal

Switch:1(config)# radius cli-profile
```

Enabling RADIUS authentication

About This Task

Enable or disable RADIUS authentication globally on the device to allow further configuration to take place. Use the no option to disable RADIUS authentication globally. The default is false or disabled.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enable RADIUS authentication globally on the switch:
`radius enable`

Enable the Source IP Flag for the RADIUS Server

**Note**

This procedure only applies to VSP 8600 Series.

Before You Begin

- To configure the CLIP as the source IP address, you must enable the global RADIUS sourceip-flag. You can then configure the source-ip address parameter while defining the RADIUS server on the switch. The source IP address must be a CLIP address, and that you can configure a different CLIP address for each RADIUS server.

**Important**

Use the source IP option only for the RADIUS servers connected to the in-band network.

About This Task

By default, the switch uses the IP address of the outgoing interface as the source IP, and the NAS IP address for RADIUS packets that it transmits. Enable the source IP so the switch uses a configured

source IP address instead. Therefore, if the outgoing interface on the switch fails, a different source IP address is used—requiring that you make configuration changes to define the new RADIUS Client on the RADIUS server.

RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration in CLI.

To simplify RADIUS Server configuration, you can configure the switch to use a Circuitless IP Address (CLIP) as the source IP and NAS IP address when transmitting RADIUS packets. A CLIP is not associated with a physical interface and is always in an active and operational state. You can configure the switch with multiple CLIP interfaces.

The default for **radius sourceip-flag** is false.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable the RADIUS packet source IP flag:
`radius sourceip-flag`

Enabling RADIUS accounting

Before You Begin

- You must configure a RADIUS server before you can enable RADIUS accounting.

About This Task

Enable Remote Access Dial-in User Services (RADIUS) accounting to log all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Enable RADIUS accounting globally:
`radius accounting enable`
3. Include or exclude CLI commands in RADIUS accounting updates:
`radius accounting include-cli-commands`
4. Specify the integer value of the CLI commands attribute:
`radius accounting attribute-value <192-240>`

Example

```
Switch:1> enable
```

```
Switch:1# configure terminal
```

```
Switch:1(config)# radius accounting enable

Switch:1(config)# radius accounting include-cli-commands
```

Variable Definitions

The following table defines parameters for the **radius accounting** command.

| Variable | Value |
|-------------------------------------|--|
| <i>enable</i> | Enable RADIUS globally. |
| <i>include-cli-commands</i> | Include CLI commands in RADIUS accounting updates. |
| <i>attribute-value</i>
<192-240> | Specify the integer value of the CLI commands attribute. |

Enabling RADIUS-SNMP accounting

Before You Begin

- You must configure a RADIUS server before you can enable RADIUS-SNMP accounting.

About This Task

Enable Remote Access Dial-in User Services (RADIUS) Simple Network Managing Protocol (SNMP) accounting globally. Use SNMP to remotely collect management data. An SNMP agent is a software process that monitors the UDP port 161 for SNMP messages. Each SNMP message sent to the agent contains a list of management objects.

Procedure

- Enter Global Configuration mode:

```
enable

configure terminal
```
- Enable RADIUS Simple Network Management Protocol (SNMP) accounting globally:

```
radius-snmp acct-enable
```
- Set a timer to send a stop accounting message for RADIUS Simple Network Management Protocol (SNMP):

```
radius-snmp abort-session-timer <30-65535>
```
- Set the timer for re-authentication of the SNMP session:

```
radius-snmp re-auth-timer <30-65535>
```
- Specify the user name for SNMP access:

```
radius-snmp user WORD <0-20>
```

Example

```
Switch:1> enable

Switch:1# configure terminal
```

```
Switch:1 (config) # radius-snmp acct-enable
```

```
Switch:1 (config) # radius-snmp abort-session-timer 30
```

Variable Definitions

The following table defines parameters for the `radius-snmp` command.

Table 297: Variable definitions

| Variable | Value |
|---|--|
| <code>acct-enable</code> | Enables RADIUS accounting globally. You cannot enable RADIUS accounting before you configure a valid server. The system disables RADIUS accounting by default. The default is false. Use the <code>no</code> option to disable RADIUS accounting globally: no radius-snmp acct-enable |
| <code>abort-session-timer <30-65535></code> | Set the timer, in seconds, to send a stop accounting message. The default is 180. |
| <code>re-auth-timer <30-65535></code> | Sets timer for re-authentication of the SNMP session. The timer value ranges from 30 to 65535 seconds. The default is 180. |
| <code>user WORD <0-20></code> | Specifies the user name for SNMP access. WORD <0-20> specifies the user name in a range of 0 to 20 characters. The default is <code>snmp_user</code> . |

Configuring RADIUS accounting interim request

About This Task

Configure RADIUS accounting interim requests to create a log whenever a user executes more than the number of CLI commands you specify.

If the packet size equals or exceeds 1.8 KB, an interim request packet is sent even if the configured limit is not reached. Therefore, the trigger to send out the interim request is either the configured value or a packet size greater than, or equal to 1.8 KB, whichever happens first.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Configure RADIUS accounting interim requests:

```
radius cli-cmd-count <1-40>
```
3. Include or exclude CLI commands in RADIUS accounting:

```
radius accounting include-cli-commands
```

Important

You must configure the **radius accounting include-cli-commands** command for accounting interim requests to function.

Example

```
Switch:1> enable

Switch:1# configure terminal

Switch:1(config)# radius cli-cmd-count 30

Switch:1(config)# radius accounting include-cli-commands
```

Variable Definitions

The following table defines parameters for the **radius cli-cmd-count** command.

| Variable | Value |
|----------|--|
| <1-40> | Specifies how many CLI commands, from 1 to 40, before the system sends a RADIUS accounting interim request. The default value is 40. |

Configure RADIUS Authentication and RADIUS Accounting Attributes

About This Task

Configure RADIUS authentication and RADIUS accounting attributes to determine the size of the packets received.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Configure the RADIUS authentication attribute value:

```
radius command-access-attribute <192-240>
```
3. Configure the RADIUS accounting attribute value:

```
radius accounting attribute-value <192-240>
```

Example

```
Switch:1>enable

Switch:1#configure terminal

Switch:1(config)#radius command-access-attribute 192

Switch:1(config)#radius accounting attribute-value 192
```

Variable Definitions

The following table defines parameters for the **radius** command.

| Variable | Value |
|---|---|
| <i>access-priority-attribute</i>
<192-240> | Specifies the value of the access priority attribute in the range of 192 to 240. The default is 192. |
| <i>accounting {attribute-value</i>
<192-240> <i>enable</i> <i>include-</i>
<i>cli-commands</i> } | Configures the accounting attribute value, enable accounting, or configure if accounting includes CLI commands. The default is false. Use the no option to disable the accounting attribute value: no radius accounting enable . |
| <i>auth-info-attr-value</i> <0-255> | Specifies the value of the authentication information attribute in the range of 0 to 255. The default is 91. |
| <i>clear-stat</i> | Clears RADIUS statistics. |
| <i>cli-cmd-count</i> <1-40> | Specifies how many CLI commands, from 1 to 40, before the system sends a RADIUS accounting interim request. The default value is 40. |
| <i>cli-commands-attribute</i>
<192-240> | Specifies the value of CLI commands attribute in the range of 192 to 240. The default is 195. |
| <i>cli-profile</i> | Enable RADIUS CLI profiling. CLI profiling grants or denies access to users being authenticated by way of the RADIUS server. You can add a set of CLI commands to the configuration on the RADIUS server, and you can specify the command-access more for these commands. The default is false. |
| <i>command-access-attribute</i>
<192-240> | Specifies the value of the command access attribute in the range of 192 to 240. The default is 194. |
| <i>enable</i> | Enable RADIUS authentication globally on the switch. |
| <i>maxserver</i> <1-10> | Specific to RADIUS authentication, configures the maximum number of servers allowed for the device. The range is between 1 and 10. The default is 10. |
| <i>mcast-addr-attr-value</i>
<0-255> | Specifies the value of the multicast address attribute in the range of 0 to 255. The default is 90. |
| <i>secure-flag</i>

Note:
Exception: not supported on VSP 8600 Series. | Specifies whether RADIUS Security (RADSec) is globally enabled. The default is disabled. |
| <i>secure-profile</i>

Note:
Exception: not supported on VSP 8600 Series. | Specifies the RADSec profile name. |

| Variable | Value |
|---|---|
| <pre>server host WORD<0-46> key WORD<0-32> [used-by {cli snmp web} [acct-enable] [acct-port <1-65536>] [enable] [port <1-65536>] [priority <1-10>] [retry <0- 6>secure-enablesecure-log- level {critical debug error info warning}secure-mode{dtls tls}secure- profileWORD<1-16>] [source- ip WORD<0-46>] [timeout <1- 60>]</pre> | <ul style="list-style-type: none"> • <i>host WORD<0-46></i>
Creates a host server. WORD<0-46> signifies an IP address. • <i>key WORD<0-32></i>
Specifies a secret key in the range of 0-32 characters. • <i>used-by {cli eapol endpoint-tracking snmp web}</i>
Specifies how the server functions. Configures the server for: <ul style="list-style-type: none"> ◦ cli authentication ◦ eapol authentication ◦ endpoint-tracking authentication ◦ snmp accounting ◦ web authentication • <i>acct-enable</i>
Enables RADIUS accounting on this server. The system enables RADIUS accounting by default. • <i>acct-port <1-65536></i>
Specifies a UDP port of the RADIUS accounting server (1 to 65536). The default value is 1816. The UDP port value set for the client must match the UDP value set for the RADIUS server. • <i>enable</i>
Enables the server. The default is true. • <i>port <1-65536></i>
Specifies a UDP port of the RADIUS server. The default value is 1812. • <i>priority <1-10></i>
Specifies the priority value for this server. The default is 10. • <i>retry <0-6></i>
Specifies the maximum number of authentication retries. The default is 3. • <i>secure-enable</i>
Enable secure mode on the server.

Note:
Exception: not supported on VSP 8600 Series. • <i>secure-log-level {critical debug error info warning}</i>
Specifies the RADIUS secure server log severity level. |

| Variable | Value |
|---|--|
| | <p>Note:
Exception: not supported on VSP 8600 Series.</p> <ul style="list-style-type: none"> <code>secure-mode{dtls tls}</code> <p>Specifies the protocol for establishing the secure connection with the server. IPv4 supports both dtls and tls modes. IPv6 only supports tls mode.</p> <p>Note:

A CLIP is not associated with a physical interface and is always in an active and operational state. You can configure the switch with multiple CLIP interfaces.</p> <p>By default, the switch uses the IP address of the outgoing interface as the source IP, and the NAS Ip address for RADIUS packets that it transmits.</p> |

Add a RADIUS Server

About This Task

Add a RADIUS server to allow RADIUS service on the switch.

RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration using CLI.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Add a RADIUS server:

```
radius server host WORD <0-46> key WORD<0-32> [used-by {cli|eapol|
endpoint-tracking|snmp|web}] [acct-enable][acct-port <1-65536>]
[enable] [port <1-65536>][priority <1-10>][retry <0-6>] [secure-
enable] [secure-log-level] [secure-mode] [secure-profile] [source-ip
WORD <0-46>] [timeout <1-60>]
```

Example

```
Switch:1>enable
```

```
Switch:1#configure terminal
```

Add a RADIUS server:

```
Switch:1(config)#radius server host
4717:0000:0000:0000:0000:0000:7933:0001 key testkey1 used-by snmp port
12 retry 5 timeout 10 enable
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

| Variable | Value |
|---|---|
| <i>used-by {cli eapol endpoint-tracking snmp web}</i> | <p>Configures how the server functions:</p> <ul style="list-style-type: none"> • cli—configure the server for CLI authentication. • eapol—configure the server for EAPoL authentication. • endpoint-tracking—configure the server for Endpoint Tracking authentication. • snmp—configure the server for SNMP accounting. • web—configure the server for HTTP(s) authentication. <p>Use the no option to remove a host server: no radius server host WORD<0-46> used-by {cli eapol endpoint-tracking snmp web}. The default is cli. The default command is: default radius server host WORD<0-46> used-by {cli eapol endpoint-tracking snmp web}.</p> |
| <i>host WORD <0-46></i> | <p>Configures a host server. WORD <0-46> signifies an IPv4 address in the format A.B.C.D or an IPv6 address in the format x:x:x:x:x:x. RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration using CLI.</p> |

| Variable | Value |
|--|--|
| <i>acct-enable</i> | Enables RADIUS accounting on this server. The system enables RADIUS accounting by default. |
| <i>acct-port</i> <1-65536> | Configures the UDP port of the RADIUS accounting server (1 to 65536). The default value is 1813.

Important:
The UDP port value set for the client must match the UDP value set for the RADIUS server. |
| <i>enable</i> | Enables the RADIUS server. The default is true. |
| <i>key</i> <i>WORD</i> <0-20> | Configures the secret key of the authentication client. |
| <i>port</i> <1-65536> | Configures the UDP port of the RADIUS authentication server. The default value is 1812. |
| <i>priority</i> <1-10> | Configures the priority value for this server. The default is 10. |
| <i>retry</i> <0-6> | Configures the number of authentication retries the server will accept. The default is 3. |
| <i>secure-enable</i>

Note:
Exception: not supported on VSP 8600 Series. | Enable RADIUS Security (RADSec). |
| <i>secure-log-level</i>

Note:
Exception: not supported on VSP 8600 Series. | Specifies the log severity level. Possible values are :
<ul style="list-style-type: none"> • critical • debug • error • info • warning |
| <i>secure-mode</i>

Note:
Exception: not supported on VSP 8600 Series. | Specifies the protocol used for secure connection to the server. |
| <i>secure-profile</i>

Note:
Exception: not supported on VSP 8600 Series. | Configures the secure profile for the server. |
| <i>source-ip</i> <i>WORD</i> <0-46>

Note:
Exception: only supported on VSP 8600 Series. | Configures an IP address as the source address when transmitting RADIUS packets. To use this option, you must have the global RADIUS sourceip-flag set to true. RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration using CLI. |
| <i>timeout</i> <1-180> | Configures the number of seconds before the authentication request times out. The default is 8. |

Modify RADIUS Server Settings

About This Task

Change a specified RADIUS server value without having to delete the server and recreate it again.

RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration using CLI.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Modify a RADIUS server:

```
radius server host WORD <0-46> {[used-by {cli|eapol|endpoint-tracking|  
snmp|web}}] [key WORD<0-20>]} [port 1-65536] [priority <1-10>] [retry  
<0-6>] [timeout <1-180>] [enable] [acct-port <1-65536>] [acct-enable]  
[source-ip WORD <0-46>]
```

Example

```
Switch:1>enable
```

```
Switch:1#configure terminal
```

Modify a RADIUS server:

```
Switch:1(config)#radius server host  
4717:0000:0000:0000:0000:0000:7933:0001 used-by snmp port 12 retry 5  
timeout 10 enable
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

| Variable | Value |
|--|---|
| <i>used-by</i> {cli eapol endpoint-tracking snmp web} | <p>Configures how the server functions:</p> <ul style="list-style-type: none"> cli—configure the server for CLI authentication. eapol—configure the server for EAPoL authentication. endpoint-tracking—configure the server for Endpoint Tracking authentication. snmp—configure the server for SNMP accounting. web—configure the server for HTTP(s) authentication. <p>Use the no option to remove a host server: no radius server host WORD<0-46> used-by {cli eapol endpoint-tracking snmp web}. The default is cli. The default command is: default radius server host WORD<0-46> used-by {cli eapol endpoint-tracking snmp web}.</p> |
| <i>host</i> WORD <0-46> | Configures a host server. WORD <0-46> signifies an IPv4 address in the format A.B.C.D or an IPv6 address in the format x:x:x:x:x:x. RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration using CLI. |
| <i>acct-enable</i> | Enables RADIUS accounting on this server. The system enables RADIUS accounting by default. |
| <i>acct-port</i> <1-65536> | <p>Configures the UDP port of the RADIUS accounting server (1 to 65536). The default value is 1813.</p> <p>Important:
The UDP port value set for the client must match the UDP value set for the RADIUS server.</p> |
| <i>enable</i> | Enables the RADIUS server. The default is true. |
| <i>key</i> WORD <0-20> | Configures the secret key of the authentication client. |
| <i>port</i> <1-65536> | Configures the UDP port of the RADIUS authentication server. The default value is 1812. |
| <i>priority</i> <1-10> | Configures the priority value for this server. The default is 10. |
| <i>retry</i> <0-6> | Configures the number of authentication retries the server will accept. The default is 3. |
| <i>secure-enable</i> | Enable RADIUS Security (RADSec). |
| Note:
Exception: not supported on VSP 8600 Series. | |

| Variable | Value |
|---|--|
| <i>secure-log-level</i>
Note:
Exception: not supported on VSP 8600 Series. | Specifies the log severity level. Possible values are : <ul style="list-style-type: none"> critical debug error info warning |
| <i>secure-mode</i>
Note:
Exception: not supported on VSP 8600 Series. | Specifies the protocol used for secure connection to the server. |
| <i>secure-profile</i>
Note:
Exception: not supported on VSP 8600 Series. | Configures the secure profile for the server. |
| <i>source-ip WORD <0-46></i>
Note:
Exception: only supported on VSP 8600 Series. | Configures an IP address as the source address when transmitting RADIUS packets. To use this option, you must have the global RADIUS sourceip-flag set to true. RADIUS supports IPv4 and IPv6 addresses, with no difference in functionality or configuration using CLI. |
| <i>timeout <1-180></i> | Configures the number of seconds before the authentication request times out. The default is 8. |

View RADIUS Information

View the global status of RADIUS information to ensure you configured the RADIUS feature according to the needs of the network.

Procedure

- To enter User EXEC mode, log on to the switch.
- View the global status of RADIUS information:

```
show radius
```

Example

```
Switch:1>show radius
  acct-attribute-value : 193
    acct-enable       : false
  acct-include-cli-commands : false
  access-priority-attribute : 192
    auth-info-attr-value : 91
  command-access-attribute : 194
  cli-commands-attribute : 195
    cli-cmd-count      : 40
  cli-profile-enable : false
    enable             : false
  igap-passwd-attr : standard
```

```
igap-timeout-log-fsize : 512
maxserver : 10
mcast-addr-attr-value : 90
sourceip-flag : false
supported-vendor-ids : 1584, 562, 1916
secure-flag : false
```

Note

The *sourceip-flag* only applies to VSP 8600 Series.
 The *secure-flag* field does not apply to VSP 8600 Series.
 The Extreme Networks vendor ID 1916 in the *supported-vendor-ids* field does not apply to VSP 4450 Series, VSP 8600 Series, and XA1400 Series.

View RADIUS Server Information

If your system is configured with a RADIUS server you can display the RADIUS server information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. To view the RADIUS server information enter the following command:

```
show radius-server
```

Note

If no RADIUS server is configured, the system displays the following message:
 no RADIUS server configured

Example

```
=====
                        Radius Server Entries
=====
```

| NAME | USED BY | SECRET | PORT | PRIO | RETRY | TIMEOUT | ENABLED | ENABLED | MODE | INSTANCE | PROFILE | LOG-LEVEL | ACCT PORT | ACCT ENABLED |
|------------|---------|--------|------|------|-------|---------|---------|---------|------|----------|---------|-----------|-----------|--------------|
| --- | | | | | | | | | | | | | | |
| 192.0.2.14 | cli | ***** | 1812 | 10 | 1 | 8 | true | true | tls | 0 | radsecp | error | 1813 | true |
| 192.0.2.15 | cli | ***** | 1812 | 10 | 1 | 8 | true | false | tls | -1 | default | error | 1813 | true |

Configuring RADIUS server reachability

About This Task

Use this procedure to configure the RADIUS server reachability settings.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the RADIUS keep-alive timer:

```
radius reachability keep-alive-timer <30-600>
```
3. Configure the RADIUS reachability mode:

```
radius reachability mode <status-server | use-radius>
```
4. If you selected `use-radius` as the RADIUS reachability mode, configure the RADIUS request username and password:

```
radius reachability username WORD<1-16> password WORD<1-16>
```
5. Configure the RADIUS reachability unreachable timer:

```
radius reachability unreachable-timer <30-600>
```

Example

Configure values for RADIUS server reachability:

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

Configure the RADIUS keep-alive timer:

```
Switch:1(config)#radius reachability keep-alive-timer 30
```

Configure the RADIUS reachability mode:

```
Switch:1(config)#radius reachability mode status-server
```

Configure the RADIUS reachability unreachable timer:

```
Switch:1(config)#radius reachability unreachable-timer 30
```

Variable Definitions

The following table defines parameters for the **radius reachability** command.

| Variable | Value |
|-----------------------------------|--|
| keep-alive-timer <30-600> | Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds. |
| mode <status-server use-radius> | Specifies status-server mode or use-radius mode. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode. |
| password WORD<1-16> | Configures the RADIUS request password. The default is extremenetworks. |
| unreachable-timer <30-600> | Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds. |
| username WORD<1-16> | Configures the RADIUS request username. The default is extremenetworks. |

Displaying RADIUS server reachability

About This Task

Use this procedure to display the RADIUS server reachability settings.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the RADIUS server reachability settings:

```
show radius reachability
```

Example

Display the RADIUS server reachability settings.

```
Switch:1#show radius reachability
EAP RADIUS reachability mode      : use-radius
EAP RADIUS reachability status    : RADIUS is disabled globally
EAP RADIUS reachable server      : none
Time until next check            : N/A
RADIUS username                   : reachme
RADIUS password                   : reachme
RADIUS keep-alive-timer           : 180
RADIUS unreachable-timer         : 60
```

Showing RADIUS SNMP configurations

Display current RADIUS SNMP configurations.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Display the current RADIUS server SNMP configurations:

```
show radius snmp
```

Example

```
Switch:1>show radius snmp
      abort-session-timer : 180
      acct-enable        : false
      user                : snmp_user
      enable              : false
      re-auth-timer      : 180
```

Displaying RADIUS dynamic server information

About This Task

Use the following procedure to display information about the configuration of RADIUS dynamic session changes.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. Display information about dynamic change configuration:

```
show radius dynamic-server [client | statistics]
```

Example

```
Switch:1#show radius dynamic-server
```

```
=====
                        RADIUS Dynamic Authorization General Info
=====
CLIENT                UDP        CLIENT    SECRET
ADDRESS               PORT      ENABLED   KEY
-----
192.0.2.15            1026     Disabled  *****
192.0.2.16            1027     Disabled  *****
-----

All 2 out of 2 Total Num of RADIUS Dynamic Authorization clients displayed
```

- Display dynamic server statistics:

```
Switch:1#show radius dynamic-server statistics
```

```
=====
                        RADIUS Dynamic Authorization Global Statistics
=====
Disconnects From Invalid Client Addresses:    0
CoAs From Invalid Client Addresses:           0
-----
```

Variable Definitions

The following table defines parameters for the **show radius dynamic-server** command.

| Variable | Value |
|-------------------|---|
| client WORD<0-46> | Display RADIUS Dynamic Authorization configuration values for the specified client. |
| statistics | Display statistics for RADIUS Dynamic Authorization clients. |

Configuring a RADIUS dynamic-server client

About This Task

Configure a client to allow processing of dynamic session changes.

Before You Begin

You must enable EAPOL globally and at the port level.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure values for client IP address, port, and secret key:

```
Switch:1(config)#radius dynamic-server client WORD<0-46> port
<1024-65535> secret WORD<0-32> enable
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#radius dynamic-server client 192.0.2.15 port 1025 secret 123 enable
```

Variable Definitions

The following table defines parameters for the **radius dynamic-server** command.

| Variable | Value |
|-------------------|---|
| client WORD<0-46> | Specifies the client address. |
| enable | Enable processing of dynamic session changes. |
| port <1024-65535> | Specifies the port value. |
| secret WORD<0-32> | Specifies a value for secret key. |

Enable RADSec

About This Task

Note

This procedure does not apply to VSP 8600 Series.

You must enable RADSec globally and at the RADIUS server level in order for RADSec to be enabled for a RADIUS server.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable RADSec globally:

```
radius secure-flag
```

3. Enable RADSec on the RADIUS server:

```
radius server host WORD<0-46> used-by {cli | eapol | endpoint-tracking
| snmp | web} secure-enable
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

Table 298:

| Variable | Value |
|---------------|---|
| WORD<0-46> | Specifies the IPv4 address or the IPv6 address of the RADIUS server. |
| used-by | Specifies how the server functions. Configures the server for one of the following: <ul style="list-style-type: none"> cli authentication eapol authentication endpoint-tracking authentication snmp accounting web authentication |
| secure-enable | Enables RADSec on the RADIUS server. |

Create and Configure a RADIUS Secure Profile

About This Task

Note

This procedure does not apply to VSP 8600 Series.

You configure RADIUS secure profiles with certificate information, certificate key information, and password information, which enables RADSec peers to establish connections.

Procedure

- Enter Global Configuration mode:

```
enable

configure terminal
```
- Configure a name for the RADIUS profile:

```
radius secure-profile WORD<1-16>
```
- Configure the full file path of the certificate authority (CA) certificate for the RADIUS secure profile:

```
radius secure-profile WORD<1-16> CA-cert-file WORD<0-128>
[WORD<1-128>]
```
- Configure the full path of the server certificate for the RADIUS secure profile:

```
radius secure-profile WORD<1-16> cert-file WORD<0-128> [WORD<1-128>]
```
- Configure the full path of the private key file for the RADIUS secure profile:

```
radius secure-profile WORD<1-16> key-file WORD<0-128> [WORD<1-128>]
```
- Configure the private key password for the RADIUS secure profile:

```
radius secure-profile WORD<1-16> key-pwd WORD<0-255>
```

Variable Definitions

The following table defines parameters for the **radius secure-profile** command.

| Variable | Value |
|--------------------------|---|
| WORD<1-16> | Specifies the RADIUS secure profile name. |
| CA-cert-file WORD<0-128> | Specifies the full file path of the certificate authority (CA) certificate. |
| cert-file WORD<0-128> | Specifies the full file path of the server certificate. |
| key-file WORD<0-128> | Specifies the full file path of the private key file. |
| WORD<1-128> | Specifies the file name. |
| key-pwd WORD<0-255> | Specifies the private key password. |

Display RADIUS Secure Profile information

About This Task

Use the following procedure to display information about the configuration of RADIUS secure profiles.

Note

This procedure does not apply to VSP 8600 Series.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display information about RADIUS secure profile configuration:
show radius secure-profile

Example

```
Switch:1>enable
Switch:1#show radius secure-profile
```

```
=====
                        Secure RADIUS profile
=====
Profile default:
  Name : default
  RootCert : n/a
  Cert : n/a
  Key : n/a
  Password : *****
```

Associate a RADSec Profile with a RADIUS Server

About This Task

RADSec peers use certificates to establish trust relationships. You must associate a RADSec profile with a RADIUS server in order to use certificates.

Note

This procedure does not apply to VSP 8600 Series.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Associate a RADSec profile with a RADIUS server:

```
radius server host WORD<0-46> used-by {cli | eapol | endpoint-tracking  
| snmp | web} secure-profile WORD<1-16>
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

| Variable | Value |
|------------------------------|---|
| WORD<0-46> | Specifies the IPv4 address or the IPv6 address. |
| used-by | Specifies how the server functions. Configures the server for one of the following: <ul style="list-style-type: none"> • cli authentication • eapol authentication • endpoint-tracking authentication • snmp accounting • web authentication |
| secure-profile
WORD<1-16> | Specifies the name of the secure profile. |

Configure RADSec Secure Mode

About This Task

Configure the secure mode for RADSec as either Transport Layer Security (TLS) protocol or Datagram Transport Layer Security (DTLS) protocol.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

- Configure the secure mode:

```
radius server host WORD<0-46> used-by {cli | eapol | endpoint-tracking
| snmp | web} secure-mode {tls | dtls}
```

Variable Definitions

The following table defines parameters for the **radius server host** command.

| Variable | Value |
|-------------------------|---|
| <i>WORD<0-46></i> | Specifies the IPv4 address or the IPv6 address. |
| <i>used-by</i> | Specifies how the server functions. Configures the server for one of the following: <ul style="list-style-type: none"> cli authentication eapol authentication endpoint-tracking authentication snmp accounting web authentication |
| <i>secure-mode</i> | Specifies the RADSec security mode. Possible values are: <ul style="list-style-type: none"> tls - Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP) dtls - Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP) The default is tls. |

Display Log Information for Secure RADIUS Instance

About This Task

Use the following procedure to display log information for secure instance of RADIUS.

Procedure

- Enter Privileged EXEC mode:

```
enable
```
- Display log information for a secure instance of RADIUS:

```
show radius secure-server log <0-9>.
```

Variable Definitions

The following table defines parameters for the **show radius secure-server** command.

| Variable | Value |
|-----------------------|---|
| <i>log<0-9></i> | Specifies the log for a secure RADIUS instance. |

RADIUS configuration using Enterprise Device Manager

You can configure Remote Access Dial-In User Services (RADIUS) to assist in securing networks against unauthorized access, and allow communication servers and clients to authenticate the identity of users through a central database.

The database within the RADIUS server stores client information, user information, password, and access privileges, including the use of shared secret.

RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration in all but the following case. When adding a RADIUS server in Enterprise Device Manager (EDM) or modifying a RADIUS configuration in EDM, you must specify if the address type is an IPv4 or an IPv6 address.

RADIUS is a fully open and standard protocol, defined by RFCs (Authentication: RFC2865, accounting RFC2866). With the switch, you use RADIUS authentication to secure access to the device (console/Telnet/SSH), and RADIUS accounting to track the management sessions for Command Line Interface (CLI) only.

RADIUS authentication allows the remote server to authenticate logons. RADIUS accounting logs all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Enable RADIUS Authentication

About This Task

Enable RADIUS authentication globally to allow all features and functions of RADIUS to operate with the RADIUS server.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS**.
3. In the **RADIUS Global** tab, select the **Enable** check box.
4. In the **MaxNumberServer** field, type a value for the maximum number of servers.
5. In the **AccessPriorityAttrValue** field, type an access policy value (by default, this value is 192).
6. Configure the rest of the parameters in the RADIUS global tab.
7. Click **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

| Name | Description |
|--------------------------------|--|
| Enable | Enables the RADIUS authentication feature globally. |
| MaxNumberServer | Specifies the maximum number of servers to be used, between 1 and 10, inclusive. |
| AccessPriorityAttrValue | Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The valid values are 192 through 240. The default is 192. |

| Name | Description |
|--|---|
| AcctEnable | Enables RADIUS accounting. |
| AcctAttriValue | Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The valid values are 192 through 240. The default value is 193. |
| AcctIncludeCli | Specifies whether you want CLI commands included in RADIUS accounting requests. |
| ClearStat | Clears RADIUS statistics from the device. |
| McastAttributeValue | Specifies the value of the Mcast attribute. The valid values are 0 through 255. The default value is 90. |
| AuthInfoAttrValue | Specifies the value of the authentication information attribute. The valid values are 0 through 255. The default value is 91. |
| CommandAccessAttrValue | Specifies the value of the command access attribute. The valid values are 192 through 240. The default value is 194. |
| CliCommandAttrValue | Specifies the value of the CLI command attribute. The valid values are 192 through 240. The default value is 195. |
| AuthInvalidServerAddress | Displays the number of access responses from unknown or invalid RADIUS servers. |
| SourceIpFlag

Note:
Exception: only supported on VSP 8600 Series. | Includes a configured IP address as the source address in RADIUS packets. The default is false. RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration. |
| CliCmdCount | Gives the value for the CLI command count. Specify an integer from 1 to 40. The default is 40. |
| CliProfEnable | Enables RADIUS CLI profiling. |
| SupportedVendorIds | Shows the vendor IDs that the software supports for RADIUS. |
| RadiusReachability | Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode. |
| SecureEnable | Enable RADIUS Security (RADSec). |
| UserName | Specifies the username for RADIUS server reachability. The default is extremenetworks. |
| Password | Specifies the password for RADIUS server reachability. The default is extremenetworks. |
| Confirm Password | Confirms the password for RADIUS server reachability. |
| Unreachable Timer | Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds. |
| Keep Alive Timer | Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds. |

Enable RADIUS Accounting

Before You Begin

- You must set up a RADIUS server and add it to the configuration file of the device before you can enable RADIUS accounting on the device. Otherwise, the system displays an error message.

About This Task

Enable RADIUS accounting to log all of the activity of each remote user in a session on the centralized RADIUS accounting server.

Procedure

- In the navigation pane, expand **Configuration > Security > Control Path**.
- Click **RADIUS**.
- In the **RADIUS Global** tab, select the **AcctEnable** check box.
- In the **AcctAttrValue** field, type an access policy value (by default, this value is 193).
- Click **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

| Name | Description |
|--------------------------------|---|
| Enable | Enables the RADIUS authentication feature globally. |
| MaxNumberServer | Specifies the maximum number of servers to be used, between 1 and 10, inclusive. |
| AccessPriorityAttrValue | Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The valid values are 192 through 240. The default is 192. |
| AcctEnable | Enables RADIUS accounting. |
| AcctAttrValue | Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The valid values are 192 through 240. The default value is 193. |
| AcctIncludeCli | Specifies whether you want CLI commands included in RADIUS accounting requests. |
| ClearStat | Clears RADIUS statistics from the device. |
| McastAttributeValue | Specifies the value of the Mcast attribute. The valid values are 0 through 255. The default value is 90. |
| AuthInfoAttrValue | Specifies the value of the authentication information attribute. The valid values are 0 through 255. The default value is 91. |
| CommandAccessAttrValue | Specifies the value of the command access attribute. The valid values are 192 through 240. The default value is 194. |
| CliCommandAttrValue | Specifies the value of the CLI command attribute. The valid values are 192 through 240. The default value is 195. |

| Name | Description |
|--|---|
| AuthInvalidServerAddress | Displays the number of access responses from unknown or invalid RADIUS servers. |
| SourceIpFlag
Note:
Exception: only supported on VSP 8600 Series. | Includes a configured IP address as the source address in RADIUS packets. The default is false. RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration. |
| CliCmdCount | Gives the value for the CLI command count. Specify an integer from 1 to 40. The default is 40. |
| CliProfEnable | Enables RADIUS CLI profiling. |
| SupportedVendorIds | Shows the vendor IDs that the software supports for RADIUS. |
| RadiusReachability | Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode. |
| SecureEnable | Enable RADIUS Security (RADSec). |
| UserName | Specifies the username for RADIUS server reachability. The default is extremenetworks. |
| Password | Specifies the password for RADIUS server reachability. The default is extremenetworks. |
| Confirm Password | Confirms the password for RADIUS server reachability. |
| Unreachable Timer | Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds. |
| Keep Alive Timer | Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds. |

Disable RADIUS Accounting

Before You Begin

- You cannot globally disable RADIUS accounting unless a server entry exists.

About This Task

Disabling RADIUS accounting removes the accounting function from the RADIUS server.

Procedure

- In the navigation pane, expand **Configuration > Security > Control Path**.
- Click **RADIUS**.
- In the **RADIUS Global** tab, disable RADIUS accounting by clearing the **AcctEnable** check box.
- Click **Apply**.

Enable RADIUS Accounting Interim Request

About This Task

Enable the RADIUS accounting interim request feature to create a log whenever more than the specified number of CLI commands are executed.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS**.
3. In the **RADIUS Global** tab, type the number of CLI commands in the **CliCmdCount** field.
4. Click **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

| Name | Description |
|---------------------------------|---|
| Enable | Enables the RADIUS authentication feature globally. |
| MaxNumberServer | Specifies the maximum number of servers to be used, between 1 and 10, inclusive. |
| AccessPriorityAttrValue | Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The valid values are 192 through 240. The default is 192. |
| AcctEnable | Enables RADIUS accounting. |
| AcctAttriValue | Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The valid values are 192 through 240. The default value is 193. |
| AcctIncludeCli | Specifies whether you want CLI commands included in RADIUS accounting requests. |
| ClearStat | Clears RADIUS statistics from the device. |
| McastAttributeValue | Specifies the value of the Mcast attribute. The valid values are 0 through 255. The default value is 90. |
| AuthInfoAttrValue | Specifies the value of the authentication information attribute. The valid values are 0 through 255. The default value is 91. |
| CommandAccessAttrValue | Specifies the value of the command access attribute. The valid values are 192 through 240. The default value is 194. |
| CliCommandAttrValue | Specifies the value of the CLI command attribute. The valid values are 192 through 240. The default value is 195. |
| AuthInvalidServerAddress | Displays the number of access responses from unknown or invalid RADIUS servers. |

| Name | Description |
|--|---|
| SourceIpFlag
Note:
Exception: only supported on VSP 8600 Series. | Includes a configured IP address as the source address in RADIUS packets. The default is false. RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration. |
| CliCmdCount | Gives the value for the CLI command count. Specify an integer from 1 to 40. The default is 40. |
| CliProfEnable | Enables RADIUS CLI profiling. |
| SupportedVendorIds | Shows the vendor IDs that the software supports for RADIUS. |
| RadiusReachability | Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode. |
| SecureEnable | Enable RADIUS Security (RADSec). |
| UserName | Specifies the username for RADIUS server reachability. The default is extremenetworks. |
| Password | Specifies the password for RADIUS server reachability. The default is extremenetworks. |
| Confirm Password | Confirms the password for RADIUS server reachability. |
| Unreachable Timer | Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds. |
| Keep Alive Timer | Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds. |

Configure the Source IP Option for the RADIUS Server

Note

This procedure only applies to VSP 8600 Series.

Before You Begin

- To configure the CLIP as the source IP address, you must configure the global RADIUS **sourceip-flag** parameter as true. You can configure the **source-ip** address parameter while you define the RADIUS Server on the switch. The source IP address must be a CLIP address, and you can configure a different CLIP address for each RADIUS server. For more information about configuring the source IP address, see [Add a RADIUS Server](#) on page 2635.

Important

Use the source IP option only for the RADIUS servers connected to the in-band network.

About This Task

By default, the switch uses the IP address of the outgoing interface as the source IP and NAS IP address for RADIUS packets that it transmits. When you configure the RADIUS server, this IP address is used when defining the RADIUS Clients that communicate with it. Therefore, if the outgoing interface on the

switch fails, a different source IP address is used—requiring that you make configuration changes to define the new RADIUS client on the RADIUS server.

To simplify RADIUS Server configuration, you can configure the switch to use a Circuitless IP Address (CLIP) as the source IP and NAS IP address when transmitting RADIUS packets. A CLIP is not associated with a physical interface and is always in an active and operational state. You can configure the switch with multiple CLIP interfaces.

RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration in all but the following case. When adding a RADIUS server in Enterprise Device Manager (EDM) or modifying a RADIUS configuration in EDM, you must specify if the address type is an IPv4 or an IPv6 address.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. In the **RADIUS Global** tab, select **SourceIpFlag**.
4. Select **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

| Name | Description |
|--------------------------------|---|
| Enable | Enables the RADIUS authentication feature globally. |
| MaxNumberServer | Specifies the maximum number of servers to be used, between 1 and 10, inclusive. |
| AccessPriorityAttrValue | Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The valid values are 192 through 240. The default is 192. |
| AcctEnable | Enables RADIUS accounting. |
| AcctAttrValue | Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The valid values are 192 through 240. The default value is 193. |
| AcctIncludeCli | Specifies whether you want CLI commands included in RADIUS accounting requests. |
| ClearStat | Clears RADIUS statistics from the device. |
| McastAttributeValue | Specifies the value of the Mcast attribute. The valid values are 0 through 255. The default value is 90. |
| AuthInfoAttrValue | Specifies the value of the authentication information attribute. The valid values are 0 through 255. The default value is 91. |
| CommandAccessAttrValue | Specifies the value of the command access attribute. The valid values are 192 through 240. The default value is 194. |
| CliCommandAttrValue | Specifies the value of the CLI command attribute. The valid values are 192 through 240. The default value is 195. |

| Name | Description |
|--|---|
| AuthInvalidServerAddress | Displays the number of access responses from unknown or invalid RADIUS servers. |
| SourceIpFlag
Note:
Exception: only supported on VSP 8600 Series. | Includes a configured IP address as the source address in RADIUS packets. The default is false. RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration. |
| CliCmdCount | Gives the value for the CLI command count. Specify an integer from 1 to 40. The default is 40. |
| CliProfEnable | Enables RADIUS CLI profiling. |
| SupportedVendorIds | Shows the vendor IDs that the software supports for RADIUS. |
| RadiusReachability | Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode. |
| SecureEnable | Enable RADIUS Security (RADSec). |
| UserName | Specifies the username for RADIUS server reachability. The default is extremenetworks. |
| Password | Specifies the password for RADIUS server reachability. The default is extremenetworks. |
| Confirm Password | Confirms the password for RADIUS server reachability. |
| Unreachable Timer | Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds. |
| Keep Alive Timer | Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds. |

Add a RADIUS Server

About This Task

Add a RADIUS server to allow RADIUS service on the switch.

Remote Dial-In User Services (RADIUS) supports both IPv4 and IPv6 addresses, with no differences in functionality or configuration in all but the following case. When adding a RADIUS server or updating a RADIUS server in Enterprise Device Manager (EDM) you must specify if the address type is an IPv4 or an IPv6 address.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS**.
3. Click the **RADIUS Servers** tab.
4. Click **Insert**.
5. Configure the server as required.
6. Click **Insert**.

RADIUS Servers Field Descriptions

Use the data in the following table to use the **RADIUS Servers** tab.

| Name | Description |
|--|--|
| AddressType | Specifies either an IPv4 or an IPv6 address. RADIUS supports IPv4 and IPv6 addresses. |
| Address | Specifies the IP address of the RADIUS server. RADIUS supports IPv4 and IPv6 addresses. |
| UsedBy | Configures how the server functions: <ul style="list-style-type: none"> cli—configure the server for CLI authentication. eapol—configure the server for EAPoL authentication. endpointTracking—configure the server for Endpoint Tracking authentication. snmp—configure the server for SNMP accounting. web—configure the server for HTTP(s) authentication. The default is cli. |
| Priority | Specifies the priority of each server, or the order of servers to send authentication. The default is 10. |
| TimeOut | Specifies the time interval in seconds before the client retransmits the packet. The default is 8. |
| Enable | Enables or disables authentication on the server. The default is true. |
| MaxRetries | Specifies the maximum number of retransmissions allowed. The default is 1. |
| UdpPort | Specifies the UDP port that the client uses to send requests to the server. The default value is 1812.
The UDP port value set for the client must match the UDP value set for the RADIUS server. |
| SecretKey | Specifies the RADIUS server secret key, which is the password used by the client to be validated by the server. |
| AcctEnable | Enables or disable RADIUS accounting. The default is true. |
| AcctUdpPort | Specifies the UDP port of the RADIUS accounting server. The default value is 1813.
The UDP port value configured for the client must match the UDP value configured for the RADIUS server. |
| SecureEnable | Enable RADIUS Security (RADSec). |
| Note:
Exception: not supported on VSP 8600 Series. | |
| SecureMode | Specifies the RADSec security mode. Possible values are: <ul style="list-style-type: none"> tls - Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP) dtls - Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP) The default is tls. |
| Note:
Exception: not supported on VSP 8600 Series. | |

| Name | Description |
|---|--|
| SecureProfile
Note:
Exception: not supported on VSP 8600 Series. | Specifies the name of the secure profile. |
| SecureLogLevel
Note:
Exception: not supported on VSP 8600 Series. | Specifies the log severity level. Possible values are : <ul style="list-style-type: none"> • critical • error • warning • info • debug |
| SourceIpAddr | Specifies the IP address to use as the source address in RADIUS packets. To use this option, you must set the global RADIUS SourceIpFlag to true. RADIUS supports IPv4 and IPv6 addresses. |

Reauthenticatie the RADIUS SNMP Server Session

About This Task

Specify the number of challenges that you want the RADIUS SNMP server to send to authenticate a given session.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS**.
3. Click the **RADIUS SNMP** tab.
The RADIUS SNMP tab appears.
4. Select the **Enable** check box.
5. In the **ReauthenticateTimer** field, enter a value to specify the interval between RADIUS SNMP server reauthentications.

The timer for reauthentication of the RADIUS SNMP server session is enabled.

Important

To end the RADIUS SNMP server session, enter a value for the AbortSessionTimer, and then select Enable.

6. Select the **AcctEnable** check box if desired.
7. Select **Apply**.

RADIUS SNMP field descriptions

Use the data in the following table to use the **RADIUS SNMP** tab.

| Name | Description |
|----------------------------|---|
| Enable | Enables or disables timer authentication on the server. The default is true. |
| AbortSessionTimer | Specifies the allowable time, in seconds, before aborting the RADIUS SNMP server session (30 to 65535). The default is 180. |
| ReAuthenticateTimer | Specifies the time, in seconds, between reauthentications of the RADIUS SNMP server (30 to 65535). The default is 180. |
| AcctEnable | Enables or disables the RADIUS SNMP session timer. |
| UserName | Specifies the user name for the RADIUS SNMP accounting. |

Configure RADIUS SNMP

About This Task

Configure RADIUS SNMP parameters for authentication and session times.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS**.
3. Select the **RADIUS SNMP** tab.
4. Select the **Enable** check box to enable RADIUS SNMP.
5. In the **AbortSessionTimer** field, enter the period after which the session expires in seconds.
6. In the **ReAuthenticateTimer** field, enter the period of time the system waits before reauthenticating in seconds.
7. Select the **AcctEnable** check box to enable RADIUS accounting for SNMP.
8. In the **UserName** field, type the RADIUS SNMP user name.
9. Click **Apply**.

RADIUS SNMP field descriptions

Use the data in the following table to use the **RADIUS SNMP** tab.

| Name | Description |
|----------------------------|---|
| Enable | Enables or disables timer authentication on the server. The default is true. |
| AbortSessionTimer | Specifies the allowable time, in seconds, before aborting the RADIUS SNMP server session (30 to 65535). The default is 180. |
| ReAuthenticateTimer | Specifies the time, in seconds, between reauthentications of the RADIUS SNMP server (30 to 65535). The default is 180. |
| AcctEnable | Enables or disables the RADIUS SNMP session timer. |
| UserName | Specifies the user name for the RADIUS SNMP accounting. |

Modify a RADIUS Configuration

About This Task

Use this procedure to modify an existing RADIUS configuration or single function such as retransmissions and RADIUS accounting.

RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration in all except the following case. When modifying a RADIUS configuration in Enterprise Device Manager (EDM), you must specify if the address type is an IPv4 or an IPv6 address.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS**.
3. Click the **RADIUS Servers** tab.
4. In the row and field to modify, type the information or use the lists to make a selection. Access the lists by double-clicking in a field.
5. When you are done with modifying the RADIUS configuration, click **Apply**.

RADIUS Servers Field Descriptions

Use the data in the following table to use the **RADIUS Servers** tab.

| Name | Description |
|--------------------|--|
| AddressType | Specifies either an IPv4 or an IPv6 address. RADIUS supports IPv4 and IPv6 addresses. |
| Address | Specifies the IP address of the RADIUS server. RADIUS supports IPv4 and IPv6 addresses. |
| UsedBy | Configures how the server functions: <ul style="list-style-type: none"> • cli—configure the server for CLI authentication. • eapol—configure the server for EAPoL authentication. • endpointTracking—configure the server for Endpoint Tracking authentication. • snmp—configure the server for SNMP accounting. • web—configure the server for HTTP(s) authentication. The default is cli. |
| Priority | Specifies the priority of each server, or the order of servers to send authentication. The default is 10. |
| TimeOut | Specifies the time interval in seconds before the client retransmits the packet. The default is 8. |
| Enable | Enables or disables authentication on the server. The default is true. |
| MaxRetries | Specifies the maximum number of retransmissions allowed. The default is 1. |
| UdpPort | Specifies the UDP port that the client uses to send requests to the server. The default value is 1812.
The UDP port value set for the client must match the UDP value set for the RADIUS server. |

| Name | Description |
|---|---|
| SecretKey | Specifies the RADIUS server secret key, which is the password used by the client to be validated by the server. |
| AcctEnable | Enables or disable RADIUS accounting. The default is true. |
| AcctUdpPort | Specifies the UDP port of the RADIUS accounting server. The default value is 1813.
The UDP port value configured for the client must match the UDP value configured for the RADIUS server. |
| SecureEnable

Note:
Exception: not supported on VSP 8600 Series. | Enable RADIUS Security (RADSec). |
| SecureMode

Note:
Exception: not supported on VSP 8600 Series. | Specifies the RADSec security mode. Possible values are: <ul style="list-style-type: none"> • tls - Transport Layer Security (TLS) encryption over Transmission Control Protocol (TCP) • dtls - Datagram Transport Layer Security (DTLS) encryption over User Datagram Protocol (UDP) The default is tls . |
| SecureProfile

Note:
Exception: not supported on VSP 8600 Series. | Specifies the name of the secure profile. |
| SecureLogLevel

Note:
Exception: not supported on VSP 8600 Series. | Specifies the log severity level. Possible values are : <ul style="list-style-type: none"> • critical • error • warning • info • debug |
| SourceIpAddr | Specifies the IP address to use as the source address in RADIUS packets. To use this option, you must set the global RADIUS SourceIpFlag to true. RADIUS supports IPv4 and IPv6 addresses. |

Delete a RADIUS Configuration

About This Task

Delete an existing RADIUS configuration.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS**.
3. Click the **RADIUS Servers** tab.
4. Identify the configuration to delete by clicking anywhere in the row.

5. Click **Delete**.

Configure RADIUS Server Reachability

About This Task

Use this procedure to configure the RADIUS server reachability settings.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS**.
3. Click the **RADIUS Global** tab.
4. In **RadiusReachability**, select either **useStatusServerPackets** or **useDummyRadiusRequests**.
5. In the **UserName** field, type the reachability user name.
6. In the **Password** field, type the reachability password.
7. In the **Confirm Password** field, retype the reachability password.
8. In the **Unreachable Timer** field, type the interval in seconds between checks when the RADIUS server is unreachable.
9. In the **KeepAlive Timer** field, type the interval in seconds between checks when the RADIUS server is reachable.
10. Click the **Apply**.

RADIUS Global Field Descriptions

Use the data in the following table to use the **RADIUS Global** tab.

| Name | Description |
|--------------------------------|---|
| Enable | Enables the RADIUS authentication feature globally. |
| MaxNumberServer | Specifies the maximum number of servers to be used, between 1 and 10, inclusive. |
| AccessPriorityAttrValue | Specific to RADIUS authentication. Specifies the vendor-specific attribute value of the access-priority attribute to match the type value set in the dictionary file on the RADIUS server. The valid values are 192 through 240. The default is 192. |
| AcctEnable | Enables RADIUS accounting. |
| AcctAttriValue | Specific to RADIUS accounting. Specifies the vendor-specific attribute value of the CLI-command attribute to match the type value set in the dictionary file on the RADIUS server. This value must be different from the access-priority attribute value configured for authentication. The valid values are 192 through 240. The default value is 193. |
| AcctIncludeCli | Specifies whether you want CLI commands included in RADIUS accounting requests. |
| ClearStat | Clears RADIUS statistics from the device. |
| McastAttributeValue | Specifies the value of the Mcast attribute. The valid values are 0 through 255. The default value is 90. |

| Name | Description |
|--|---|
| AuthInfoAttrValue | Specifies the value of the authentication information attribute. The valid values are 0 through 255. The default value is 91. |
| CommandAccessAttrValue | Specifies the value of the command access attribute. The valid values are 192 through 240. The default value is 194. |
| CliCommandAttrValue | Specifies the value of the CLI command attribute. The valid values are 192 through 240. The default value is 195. |
| AuthInvalidServerAddress | Displays the number of access responses from unknown or invalid RADIUS servers. |
| SourceIpFlag

Note:
Exception: only supported on VSP 8600 Series. | Includes a configured IP address as the source address in RADIUS packets. The default is false. RADIUS supports IPv4 and IPv6 addresses with no difference in functionality or configuration. |
| CliCmdCount | Gives the value for the CLI command count. Specify an integer from 1 to 40. The default is 40. |
| CliProfEnable | Enables RADIUS CLI profiling. |
| SupportedVendorIds | Shows the vendor IDs that the software supports for RADIUS. |
| RadiusReachability | Specifies the mode for RADIUS reachability. Status-server mode provides a standard-compliant method for RADIUS reachability. Use-radius mode requires the configuration of dummy packets that are sent to RADIUS servers. The default is use-radius mode. |
| SecureEnable | Enable RADIUS Security (RADSec). |
| UserName | Specifies the username for RADIUS server reachability. The default is extremenetworks. |
| Password | Specifies the password for RADIUS server reachability. The default is extremenetworks. |
| Confirm Password | Confirms the password for RADIUS server reachability. |
| Unreachable Timer | Specifies, in seconds, the interval between checks when radius server is unreachable. The default is 60 seconds. |
| Keep Alive Timer | Specifies, in seconds, the interval between checks when radius server is reachable. The default is 180 seconds. |

Configure a RADIUS Dynamic-server Client

About This Task

Use this procedure to configure a client to allow processing of dynamic session changes.

Before You Begin

You must enable EAPOL globally and at the port level.

You must enable RADIUS dynamic extensions commands processing at the port level.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **RADIUS CoA**.
3. Click **Global**.
4. Click **Insert**.
5. In the **Address** field type a client address.
6. (Optional) In the **UdpPort** field, type a value for client port.
7. (Optional) In the **Secret** field, type a value for the secret key.
8. Select the **Enable** checkbox to enable dynamic session processing for the client.
9. Click **Insert**.

Global field descriptions

Use the data in the following table to use the **Global** tab.

| Name | Description |
|--------------------|--|
| AddressType | Specifies the type of address contained in the corresponding instance of a RADIUS Dynamic Authorization Client configured in this entry. |
| Address | Specifies the internet address of a RADIUS Dynamic Authorization Client configured in this entry. |
| UdpPort | Specifies the UDP port number the server/NAS listens on for requests from the RADIUS Dynamic Authorization Client configured in this entry. |
| Secret | Specifies the secret key shared between the RADIUS Dynamic Authorization Client and Server. Note that when this object is retrieved, it's value will always be a zero-length octet string. |
| Enable | Enable processing of dynamic session changes. |

Configure a RADIUS Secure Profile

About This Task

Configure a RADIUS Security (RADSec) profile to specify certificate information used by RADSec to develop trust between peers. You can also specify a password used for RADSec encryption.

Note
Secure profile is not supported on VSP 8600 Series.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Select **RADIUS**.
3. Select the **Secure Certificate Profile**
4. Select **Insert**.

5. For **Name**, enter the name for the profile.
6. For **RootCert**, enter the full path for the profile root certificate.
7. For **Cert**, enter the full path for the profile certificate.
8. For **Key**, enter the full path for the profile private key.
9. For **Password**, enter the full path to decrypt the profile private key.
10. For **RootCertDestFile**, enter the file name to use when installing the root certificate.
11. For **CertDestFile**, enter the file name to use when installing the certificate.
12. For **KeyDestFile**, enter the file name to use when installing the key.
13. Select **Insert**.

Secure Certificate Profile Field Descriptions

Use the data in the following table to use the **Secure Certificate Profile** tab.

| Name | Description |
|-------------------------|--|
| Name | Specifies the profile name. |
| RootCert | Specifies the full path of the profile root certificate. |
| Cert | Specifies the full path of the profile certificate. |
| Key | Specifies the full path of the profile private key. |
| Password | Specifies the password used to decrypt the profile private key. |
| RootCertDestFile | Specifies the file name to use when installing the root certificate. |
| CertDestFile | Specifies the file name to use when installing the certificate. |
| KeyDestFile | Specifies the file name to use when installing the key. |

Representational State Transfer Configuration Protocol (RESTCONF)

[Representational State Transfer Configuration Protocol \(RESTCONF\) Fundamentals](#) on page 2645

[RESTCONF configuration using CLI](#) on page 2647

[RESTCONF Configuration using EDM](#) on page 2652

[Use Representational State Transfer Configuration Protocol \(RESTCONF\) to Configure a Switch](#) on page 2653

Table 299: Representational State Transfer Configuration Protocol (RESTCONF) product support

| Feature | Product | Release introduced |
|---|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| Representational State Transfer Configuration Protocol (RESTCONF) | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VOSS 8.0 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 8.0 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VOSS 8.0 |
| | VSP 8400 Series | VOSS 8.0 |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | Not Supported |

Note

Product Notice: Using RESTCONF on VSP4900-48P or VSP4900-24S reduces the number of supported port-based VLANs on those platforms. For known issues, see [Release Notes for VOSS](#).

Representational State Transfer Configuration Protocol (RESTCONF) Fundamentals

Representational State Transfer Configuration Protocol (RESTCONF) is a next generation northbound interface that provides an additional way to configure and monitor the switch. RESTCONF is an HTTP-

based protocol that provides a programmatic interface to access data defined in a YANG model using the datastore concepts defined in NETCONF. RESTCONF uses a client-server model. The server acts as an entry point to a datastore, a conceptual place to store and access information. Clients use HTTP or HTTPS to interface with the server to configure and monitor devices.

RESTCONF Client and Server

A typical RESTCONF interaction consists of an HTTP/HTTPS request sent by a RESTCONF client and an HTTP/HTTPS response sent by the server. The HTTP/HTTPS request and response contain a required set of expected HTTP headers and may contain a request or response message body. The message body is encoded in JSON.

An HTTP request consists of the HTTP method (such as GET or POST) identifier, resource identifier, HTTP protocol version, HTTP headers, and HTTP body. The HTTP resource identifier is the string that identifies a service or resource that the server makes available to the client. The RESTCONF request contains the Universal Resource Identifier or URI which starts with `/rest/restconf/data/` or `/rest/restconf/operations/`.

YANG Model

YANG is the data modeling language used for modeling configuration and state data for manipulation by using remote procedure calls (RPCs). The RESTCONF interface is generated with YANG Data Model. The YANG model is based on Open config model, which is a non vendor specific model that captures the key components found in multiple vendor solutions. RESTCONF is described by the Internet Engineering Task Force (IETF) in RFC 8040.

RESTCONF Authentication

RESTCONF uses the CLI user account and supports both local and remote authentication. Local authentication uses the local CLI user account while remote authentication can use either a RADIUS or TACACS+ server.

You can only use a CLI account with the RWA access level.

With RADIUS or TACACS+ enabled, if the remote server is not available, authentication falls back to local authentication and uses the local CLI user on the switch.

When the RESTCONF client posts for authentication, the HTTP server validates the login username and password if you have not enabled CLI remote authentication. If the remote server is not reachable, the HTTP server uses the local user for login validation.

For HTTPs access to the RESTCONF server, you must enable TLS and install a certificate.

RESTCONF APIs

You can access the RESTCONF API documentation on your switch using the following URL:

http(s)://<IP>:<tcp-port>/apps/restconfdoc/

Replace <IP> with the management IP address of your switch and <tcp-port> with the TCP port configured for RESTCONF. For example, <http://192.0.2.16:8080/apps/restconfdoc/>.

The on-switch URL works only if the RESTCONF feature is enabled on the switch.

You can also access the RESTCONF API documentation online at www.extremenetworks.com/support/documentation-api/.

VOSS Support

VOSS RESTCONF server supports the following actions:

| HTTP Action | VOSS Instrumentation |
|-------------|-------------------------------------|
| GET | Corresponds to SHOW |
| POST | Corresponds to SET for creation |
| PATCH | Corresponds to SET for modification |
| DELETE | Maps to SET for deletion |

VOSS RESTCONF supports the following features:

- System (authorization, authentication, and accounting)
- Link Layer Discovery Protocol (LLDP)
- Interfaces (IPv4, Ethernet, and LAG)
- VLAN (under network instance)
- Virtual Service (Extreme YANG model)

The RESTCONF feature is disabled by default. The RESTCONF server uses the same management IP address as the other applications and TCP port. The default TCP port that RESTCONF server listens to is port 8080. The TCP port delivers the message to the HTTP server for RESTCONF.

RESTCONF configuration using CLI

Enable the RESTCONF Server

About This Task

Use the following procedure to enable the RESTCONF server.

Before You Begin

Run the **show application restconf conflict-ifname** command to see if any conflict in interface names exist. To enable RESTCONF, the interface names (VLAN name, MLT name, and Port interface name) must be unique.

Run the **show application restconf invalid-name mlt** and **show application restconf invalid-name vlan** commands to see if any MLT or VLAN names contain special characters. To enable RESTCONF, VLAN and MLT names cannot contain special characters other than underscore (_) and en dash (-).

Procedure

1. Enter Application Configuration mode:

```
enable
```

```
configure terminal
```

```
application
```

2. Enable the RESTCONF server:

```
restconf enable
```

**Note**

If the interface names (VLAN, MLT, and Port) are not unique, or if VLAN or MLT names contain prohibited special characters, an error occurs indicating that you cannot enable RESTCONF. You must change the interface names before you enable RESTCONF.

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch:1(config)#application
Switch:1(config-app)#restconf enable
```

Configure HTTPS Access to the RESTCONF Server

About This Task

By default, the RESTCONF server uses HTTP. If you need to use HTTPS, generate a certificate file and transfer the certificate file to the `/intflash` directory on the switch.

For more information on generating certificate files, see [Manage an SSL Certificate](#) on page 2853.

Before You Begin

Ensure that you have the certificate file in the `/intflash` directory on the switch.

Procedure

1. Enter Application Configuration mode:

```
enable
```

```
configure terminal
```

```
application
```

2. If RESTCONF is enabled, disable RESTCONF:

```
no restconf enable
```

3. Install the certificate file for the RESTCONF server:

```
restconf install-cert-file WORD<1-128>
```

4. Enable HTTPS:

```
restconf tls
```

5. Enable RESTCONF:

```
restconf enable
```

Example

```
Switch:1>enable
Switch:1# configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch:1(config)#application
Switch:1(config-app)#no restconf enable
Switch:1(config-app)#restconf install-cert-file /intflash/.cert/restconf-cert.pem
Switch:1(config-app)#restconf tls
Switch:1(config-app)#restconf enable
```

Variable Definitions

The following table defines parameters for the **restconf** command.

| Variable | Value |
|--|---|
| <i>enable</i> | Enables the RESTCONF Server. |
| <i>install-cert-file WORD<1-128></i> | Installs the certificate file for the RESTCONF server. |
| <i>tcp-port <1-49151></i> | Set RESTCONF Server TCP port number. |
| <i>tls</i> | Enables TLS for the RESTCONF server. The default is disabled. |
| <i>trap-notification</i> | Enables trap notification. |

Modifying the RESTCONF Server Settings

About This Task

Use this procedure to modify the RESTCONF server settings.

Note

These steps are considered optional and RESTCONF can operate with the default configuration of these values.

Procedure

1. Enter Application Configuration mode:

```
enable
```

```
configure terminal
```

```
application
```
2. Disable trap notification when the RESTCONF server is not available:

```
no restconf trap-notification
```
3. Modify the TCP port number for the RESTCONF server:
 - a. Disable RESTCONF:

```
no restconf enable
```
 - b. Change the value of the TCP port:

```
restconf tcp-port <1-49151>
```

- c. Enable RESTCONF: `restconf enable`
- 4. Disable TLS for the RESTCONF server:
 - a. Disable RESTCONF: `no restconf enable`
 - b. Disable TLS: `no restconf tls`
 - c. Enable RESTCONF: `restconf enable`

Variable Definitions

Use the data in the following table to modify the RESTCONF server settings.

| Variable | Value |
|---------------------------------------|--|
| <code>enable</code> | Enables or disables the RESTCONF server. The default is disabled. |
| <code>tcp-port <1-49151></code> | Specifies the TCP port to use for the RESTCONF server. The default is 8080. |
| <code>trap-notification</code> | Enables or disables trap notification when the RESTCONF server is not available. The default is enabled. |

Showing the RESTCONF Configuration Information

About This Task

Use this procedure to show the RESTCONF configuration information and operation status.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show the RESTCONF configuration:

```
show application restconf
```

Example

```
Switch:1>show application restconf
=====
                                RESTCONF Info
=====
Admin State           : true
TCP Port              : 8080
Certificate File Status : install
TLS Enable            : false
Trap Notification     : true
Oper State            : up
Web Server Version    : 1.0.1.11
RESTCONF Server Version : 1.0.1.39
=====
```

Showing Conflicting Interface Name Information

About This Task

To enable RESTCONF, the interface name (VLAN name, MLT name, and Port interface name) must be unique. Use this procedure to display conflicting interface name information.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show the RESTCONF conflicting interface name information:

```
show application restconf conflict-ifname
```

Example

```
Switch:1>show application restconf conflict-ifname
-----
Conflicting Interface IfName - Port, VLAN Name and MLT Name
-----
Mlt 1 name is same as Vlan 1001 name - "Interface-1"
Mlt 2 name is same as Vlan 1002 name - "VLAN-1002"
Vlan 1003 name is Mlt 1 Default Name - "MLT-1"
-----
Total Conflict Count: 3
```

What to Do Next

If a conflict exists, change the conflicting interface name to a unique name.

Show Special Characters in VLAN or MLT Names

About This Task

To enable RESTCONF, VLAN and MLT names cannot contain special characters other than underscore (_) and en dash (-). Use this procedure to display VLAN or MLT names that contain prohibited special characters.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Show the RESTCONF VLAN or MLT names that contain prohibited special characters:

```
show application restconf invalid-name vlan

show application restconf invalid-name mlt
```

Example

```
Switch:1>show application restconf invalid-name mlt
-----
Invalid MLT names - Only "-" and "_" special characters are allowed
-----
Mlt 3 name has special characters - "gigi#g"
Mlt 4 name has special characters - "my%mlt"
Mlt 5 name has special characters - "isa.text"
-----
Total Invalid Names Count: 3
```

What to Do Next

If any of the names contain prohibited special characters, change the names to remove the special characters.

RESTCONF Configuration using EDM

This section contains procedures for configuring RESTCONF with Enterprise Device Manager (EDM).

Configuring the RESTCONF Server**About This Task**

To configure the server, you must enable RESTCONF. RESTCONF is disabled by default.

After RESTCONF is enabled, you must disable RESTCONF to modify some of the RESTCONF parameters.

Procedure

1. In the navigation pane, expand **Configuration > Serviceability**.
2. Click **RESTCONF**.
3. Click the **RESTCONF** tab.
4. Select the **GlobalEnable** check box to enable the RESTCONF server.
5. Configure optional parameters as required.
6. Click **Apply**.

RESTCONF Field Descriptions

Use the data in the following table to use the RESTCONF tab.

| Name | Description |
|----------------------------|---|
| GlobalEnable | Enables or disables the RESTCONF server. The default is disabled (cleared). |
| TcpPort | Specifies the TCP port to use for the RESTCONF server. The default is 8080. The RESTCONF status must be disabled before you can modify this field. |
| TlsEnable | Enables or disables TLS/SSL if you require HTTPS access to the RESTCONF server. The default is disabled. The RESTCONF status must be disabled before you can modify this field. |
| CertificateFilename | If HTTPS access is required, specifies the file name and path of the TLS/SSL certificate. The certificate file must be in the <code>/intflash</code> directory on the switch. |
| CertificateAction | Installs or uninstalls the TLS/SSL certificate file. It also shows the current status of the certificate installation. |

| Name | Description |
|------------------------------|--|
| NotificationEnable | Enables or disables trap notification when the RESTCONF server is not available. The default is enabled. |
| OperStatus | Shows the operational status of the RESTCONF server. |
| WebServerVersion | Shows the RESTCONF web server version that is running on the server. |
| RestConfServerVersion | Shows the RESTCONF server version that is running on the server. |

Use Representational State Transfer Configuration Protocol (RESTCONF) to Configure a Switch

The documentation does not include information about how to use RESTCONF clients. This example documents some common tasks using Python.

Before You Begin

Configure the RESTCONF server on the switch.

Procedure

1. Import classes, define variables, and prepare the session object:

```
#!/usr/bin/env python
import sys
import json
import requests
from requests import Request, Session
from requests.auth import HTTPBasicAuth
from requests.packages.urllib3.exceptions import InsecureRequestWarning
requests.packages.urllib3.disable_warnings(InsecureRequestWarning)
#####
Host = '192.0.2.1'
TcpPort = '8080'
UserName = 'rwa'
PassWord = 'rwa'
LoginUrl = 'https://%s:%s/auth/token' % (Host, TcpPort)
QueryUrl = 'https://%s:%s/rest/restconf/data/' % (Host, TcpPort)
vlan = 123
#####
session = Session()
session.verify = False
session.timeout = 5

session.headers.update({
    'Accept': 'application/json',
    'Accept-Encoding': 'gzip, deflate, br',
    'Connection': 'keep-alive',
    'Cache-Control': 'no-cache',
    'Pragma': 'no-cache', })
```

2. Learn the authentication token:

Note

The token expires after 24 hours.

```

body = '{"username": "%s", "password" : "%s" }' % (UserName,PassWord)

response = session.put( LoginUrl, body )

if response.status_code != 200:
    print "ERROR: Login failed"
    sys.exit(1)
else:
    session.headers.update({
        'X-Auth-Token': response.headers['X-Auth-Token']
    })
    print "INFO: login passed"

```

3. Query all VLANs:

```

response = session.get( QueryUrl + 'openconfig-vlan:vlan' )
if response.status_code != 200:
    print 'ERROR: can't fetch VLANs'

```

4. Query specific VLANs:

```

response = session.get( QueryUrl + 'openconfig-vlan:vlan/vlan=%s' % vlan )

if response.status_code != 200:
    print 'INFO: VLAN %s doesn't exists' % vlan
else:
    print 'INFO: VLAN %s exists' % vlan

```

5. Access data:

```

inbound_data = json.loads( response.text )

for vlan in inbound_data['openconfig-vlan:vlan']['vlan']:
    print 'VLAN: %s [%s]' % ( vlan['state']['name'], vlan['vlan-id'] )

```

6. Present data:

```

inbound_data = json.loads( response.text )

for dataVlan in inbound_data[ dataObject ]['vlan']:
    print ''
    print 'VLAN: ' + dataVlan['state']['name'] + '[' + dataVlan['vlan-id'] + ']'
    interfaces = ''
    if 'members' in dataVlan :
        for interface in dataVlan['members']['member ']:
            interfaces = interfaces + interface['interface-ref']['state']['interface']
    + ','

    print interfaces

```

7. Add a VLAN:

```

dataObject = 'openconfig-vlan:vlan'

data = { "openconfig-vlan:vlan": [
    { "config":
        { "name": "Test-VLAN",
          "extreme-mod-oc-vlan:stg-id": 1,
          "vlan-id": vlan
        }
    }
]
}

response = session.post( QueryUrl + dataObject, json=data )

if response.status_code != 201:
    print "ERROR: add VLAN %s failed" % vlan

```

```
else:  
    print "INFO: VLAN %s added " % vlan
```

8. Update a VLAN:

```
dataObject = 'openconfig-vlan:vlans/vlan=%s/config' % vlan  
  
data = { "openconfig-vlan:config":  
        { "name": "New-VLAN-Name" }  
        }  
  
response = session.patch( QueryUrl + dataObject )  
  
if response.status_code != 204:  
    print "ERROR: update VLAN %s fails" % vlan  
else:  
    print "INFO: VLAN %s updated" % vlan
```

9. Delete a VLAN:

```
dataObject = 'openconfig-vlan:vlans/vlan=%s' % vlan  
  
response = session.delete( QueryUrl + dataObject )  
  
if response.status_code != 204:  
    print "ERROR: delete VLAN %s fails" % vlan  
else:  
    print "INFO: VLAN %s deleted" % vlan
```

RIP fundamentals

Use the information in these sections to help you understand the Routing Information Protocol (RIP). For more information about the Border Gateway Protocol (BGP), see [BGP](#) on page 390.

Routing Information Protocol

In routed environments, routers communicate with one another to track available routes. Routers can dynamically learn about available routes using the RIP. The switch software implements standard RIP to exchange IP route information with other routers.

RIP uses broadcast User Datagram Protocol (UDP) data packets to exchange routing information. Each router advertises routing information by sending a routing information update every 30 seconds (one interval). If RIP does not receive information about a network for 180 seconds, the metric associated with the network rises to infinity (U); that is, the metric resets to 16, which means the network becomes unreachable. If RIP does not receive information about a network for 120 seconds, it removes the network from the routing table.

RIP is a distance vector protocol. The vector is the network number and next hop, and the distance is the cost associated with the network number. RIP identifies network reachability based on cost, and cost is defined as hop count. One hop is the distance from one router to the next. This cost or hop count is the metric (see the following figure).

Figure 213: Hop count or metric in RIP

RIP version 1 (RIPv1) advertises default class addresses without subnet masking. RIP version 2 (RIPv2) advertises class addresses explicitly, based on the subnet mask.

The switch supports RIPv2, which supports variable length subnet masks (VLSM) and triggered router updates. RIPv2 sends mask information. If RIP does not receive information about a network for 90 seconds, the metric associated with the network rises to infinity (U); that is, the metric resets to 16, which means the network becomes unreachable. If RIP does not receive information about a network for 180 seconds (six update intervals), it removes the network from the routing table. You can change the default timers by configuring the RIP interface timeout timer and the holddown timer.

A directly connected network has a metric of zero. An unreachable network has a metric of 16. Therefore, the highest metric between two networks can be 15 hops or 15 routers.

RIP and route redistribution

Redistribution imports routes from one protocol to another. Redistribution sends route updates for a protocol-based route through another protocol. For example, if RIP routes exist in a router and they must travel through a BGP network, configure redistribution of RIP routes through BGP. Redistribution sends RIP routes to a router that uses BGP.

You can redistribute routes

- on an interface basis
- on a global basis between protocols on a single VRF instance (intraVRF)
- between the same or different protocols on different VRF instances (interVRF)

To configure interface-based redistribution, configure a route policy, and then apply it to the interface. Configure the match parameter to the protocol from which to learn routes.

You can redistribute routes on a global basis, rather than for every interface. The switch adds support for global RIP redistribution. Use the **ip rip redistribute** command to accomplish the (intraVRF) redistribution of routes through RIP, so that RIP redistribution occurs globally on all RIP-enabled interfaces. This redistribution does not require a route policy, but you can use one for more control.

If you configure redistribution globally and on an interface, redistribution through the route policy takes precedence.

You can redistribute routes from a protocol in one VRF to RIP in another VRF. You can use a route policy for redistribution control. If you enable route redistribution between VRF instances, ensure that IP addresses do not overlap.

RIPng fundamentals

Routing Information Protocol next generation (RIPng) allows routers to exchange information for computing routes through an IPv6-based network. You should implement RIPng only on routers. IPv6 provides neighbor router information required by RIPng protocol to function as intended. A RIPng router is assumed to have interfaces in several networks and the protocol relies primarily on the metric of each network to compute routes using the distance vector algorithm.

RIP identifies network reachability based on cost, and cost is defined as hop count. One hop is the distance from one router to the next. This cost, or hop count, is the metric.

RIPng-enabled routers use UDP port 521 (the RIPng port) to exchange routing information. RIPng responds to a request by sending a message to the port from which the request originates. Specific queries can be sent from ports other than the RIPng port, but they must be directed to the RIPng port on the target machine.

Each router advertises routing information by sending an update every 30 seconds (one interval). If RIPng does not receive information about a network for 180 seconds, the metric associated with the network rises to infinity (U); that is, the metric resets to 16, which means the network becomes unreachable. If RIP does not receive information about a network for 120 seconds, it removes the network from the routing table.

Note

These time interval values are default values which are configurable by the user.

Each router that implements RIPng contains a routing table. This table contains one entry for every destination that is reachable throughout the system operating RIPng. At a minimum, each routing table entry contains the following information:

- The IPv6 prefix of the destination.
- A metric that represents the total cost of getting a datagram from the router to that destination. The metric is the sum of the costs of traversing the networks to arrive at the destination.
- The IPv6 address of the next router in the path to the destination (the next hop). The next-hop IPv6 address is a linklocal address.
- The VLAN or brouter port on which the RIPng routes were learned.
- The age of the RIPng route.

RIPng protocol implementation is specified in IETF document RFC 2080.

RIPng messages and packet format

RIPng-enabled routers use UDP port 521 (the RIPng port) to send and receive datagrams.

The following figure shows the RIPng packet format:

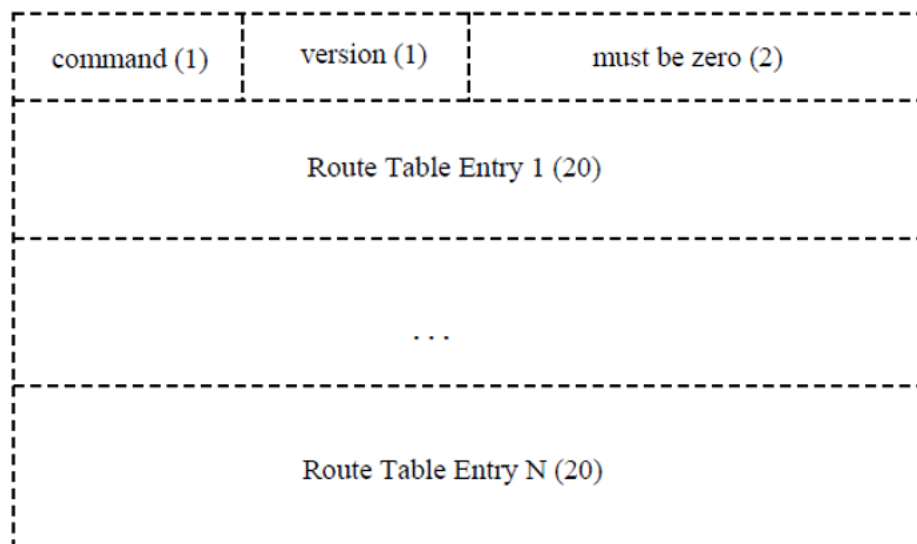

Figure 214: RIPng packet format

A RIPng packet header consists of the following components:

- **command:** Specifies the purpose of the message.
- **version:** The version of RIPng.

Originate Default route

Generally you use a default route when it is not convenient to list every possible network in RIPng updates, and one or more routers in the system are able to handle traffic to networks that RIPng does not explicitly list.

RIPng is enabled with the default route only option. When you enable default route only on an interface, it suppresses all other routes in the update sent for the interface, and advertises only the default route.

Timers

RIPng states four different timer intervals for protocol operation:

- **Update timer:** The RIPng process sends a complete routing table to each neighboring router every 30 seconds. To prevent collisions on broadcast networks, the process adds an offset value to the timer.
- **Timeout time interval:** This is a 180 second time interval associated with every route. If the time interval expires, the metric for this route updates to the value of infinity (16) and the route is no longer valid. However, the routing table retains the value for another 120 seconds.
- **Garbage collection time interval:** After the timeout time interval expires and the route becomes invalid, it remains in the routing table until the garbage collection time interval expires. The garbage collection time interval is 120 seconds. Until the garbage collection time interval expires all updates sent by this router include the invalid route. When the garbage collection timer expires, the process removes the route from the routing table.
- **Triggered update time interval:** The triggered update time interval is set to a random value between 1 and 5 seconds after a triggered update is sent. A single update is sent even if multiple triggered updates occur before the timer expires.

Configuration of timers or time intervals is supported only at the CLI/SNMP/EDM level. Configuration of timers or time intervals is not supported at the interface/port level.

RIP configuration using CLI

Use Routing Information Protocol (RIP) to perform dynamic routing within an autonomous system. This section describes how you use the command line interface (CLI) to configure and manage RIP.

Configuring RIP globally

Configure RIP parameters on the switch so you can control RIP behavior on the system.

Before You Begin

- You configure RIP on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode and the prefix **ip rip**. The VRF must have an RP Trigger of RIP. Not all parameters are configurable on non0 VRFs.

About This Task

All router interfaces that use RIP use the RIP global parameters. Both brouter ports and VLAN virtual routing interfaces use the same RIP global parameters.

You can configure RIP on interfaces while RIP is globally disabled. This way, you can configure all interfaces before you enable RIP for the switch.

Procedure

1. Enter RIP Router Configuration mode:

```
enable  
  
configure terminal  
  
router rip
```

2. Define the default-import-metric for the switch:
`default-metric <0-15>`
3. (Optional) Configure one or more timer values:
`timers basic timeout <15-259200> [holddown <0-360>] [update <1-360>]`
4. Enable RIP on an IP network:
`network {A.B.C.D}`
5. Exit to Global Configuration mode:
`exit`
6. After the configuration is complete, enable RIP globally:
`router rip enable`
- 7.
8. Check that your configuration is correct:
`show ip rip [vrf WORD<1-16>] [vrfs WORD<0-512>]`

Example

Define the default-import-metric as 1, the timeout interval as 180, the holddown time as 120, and the update time as 30. Enable RIP on an IP network, and ensure your configuration is correct.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1#router rip
Switch:1(config-rip)#default-metric 1
Switch:1(config-rip)#timers basic timeout 180 holddown 120 update 30
Switch:1(config-rip)#network 192.0.2.11
Switch:1(config-rip)#exit
Switch:1(config)#router rip enable
Switch:1(config)#show ip rip
=====
                        RIP Global - GlobalRouter
=====
Default Import Metric : 1
      HoldDown Time   : 120
          Queries     : 0
              Rip      : Enabled
      Route Changes   : 0
      Timeout Interval : 180
          Update Time  : 30
```

Variable definitions

The following table defines parameters for the RIP commands.

| Variable | Value |
|--|---|
| <code>default-metric <0-15></code> | Configures the value of default import metric to import a route into a RIP domain. To announce OSPF internal routes into RIP domain, if the policy does not specify a metric value, the default is used. For OSPF external routes, the external cost is used. The default is 8. |
| <code>domain <0-39321></code> | Specifies the RIP domain from 0-39321. The default is 0. |

| Variable | Value |
|--|--|
| <code>holddown <0-360></code> | Configures the RIP hold-down timer value, the length of time (in seconds) that RIP continues to advertise a network after it determines that the network is unreachable. The default is 120. |
| <code>network {A.B.C.D}</code> | Enables RIP on an IP network. |
| <code>timeout <15-259200></code> | Configures the RIP timeout interval. The default is 180. |
| <code>update <1-360></code> | Configures the RIP update timer. The update time is the time interval, in seconds, between RIP updates. The default is 30. |

The following table defines parameters for the **show ip rip** command.

| Variable | Value |
|---------------------------------------|-------------------------------|
| <code>vrf WORD<1-16></code> | Specifies a VRF by name. |
| <code>vrfids WORD<0-512></code> | Specifies a range of VRF IDs. |

Configuring RIP on an interface

Configure RIP on Ethernet ports and VLANs so that they can participate in RIP routing.

Before You Begin

- Assign an IP address to the port or VLAN.
- Configure RIP and enable it globally.
- Configure in and out policies.

About This Task

RIP does not operate on a port or VLAN until you enable it both globally and on the port or VLAN.

To configure RIP on a VRF instance for a port or VLAN, you configure RIP on the port or VLAN, and then associate the port or VLAN with the VRF.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Define the cost:

```
ip rip cost <1-15>
```

3. Specify an in policy for filtering inbound RIP packets:
`ip rip in-policy WORD<0-64>`
4. Specify an out policy for filtering outbound RIP packets:
`ip rip out-policy WORD<0-64>`
5. Enable RIP:
`ip rip enable`
6. Specify the send mode:
`ip rip send version <notsend|rip1|rip1comp|rip2>`
7. Specify the receive mode:
`ip rip receive version <rip1|rip2|rip1orrip2>`
8. Change other RIP parameters from their default values as required.

Example

The following configuration example shows how to configure the switch (labeled R1) to operate only in RIP version 2 mode.

Figure 215: Configuration example-RIPv2 only

Enable RIPv2 send mode on VLAN 2:

```
Switch:1(config-if)# ip rip send version rip2
```

Enable RIPv2 receive mode on VLAN 2:

```
Switch:1(config-if)# ip rip receive version rip2
```

Repeat these commands on VLAN 3 and the port interfaces.

Variable definitions

The following table defines parameters for the **ip rip** command.

| Variable | Value |
|------------------------------------|---|
| <i>advertise-when-down enable</i> | Enables or disables AdvertiseWhenDown. If enabled, RIP advertises the network on this interface as up, even if the port is down. The default is disabled.
If you configure a port with no link and enable advertise-when-down, it does not advertise the route until the port is active. RIP advertises the route even when the link is down. To disable advertising based on link status, you must disable this parameter. |
| <i>auto-aggregation enable</i> | Enables or disables automatic route aggregation on the port. If enabled, the switch automatically aggregates routes to their natural mask when an interface in a different class network advertises them. The default is disable. |
| <i>cost <1-15></i> | Configures the RIP cost for this port (link). |
| <i>default-listen enable</i> | Enables DefaultListen. The switch accepts the default route learned through RIP on this interface. The default is disabled. |
| <i>default-supply enable</i> | Enables DefaultSupply. If enabled, this interface must advertise a default route. The default is false.
RIP advertises the default route only if it exists in the routing table. |
| <i>enable</i> | Enables RIP routing on the port. |
| <i>holddown <0-360></i> | Configures the RIP holddown timer value, the length of time (in seconds) that RIP continues to advertise a network after it determines that the network is unreachable. The default is 120. |
| <i>in-policy WORD<0-64></i> | Configures the policy name for inbound filtering on this RIP interface. This policy determines whether to learn a route on this interface and specifies the parameters of the route when RIP adds it to the routing table. |
| <i>listen enable</i> | Specifies that the routing switch learns RIP routes through this interface. If enabled, the switch listens for a default route without listening for all routes. The default is enable. |
| <i>out-policy WORD<0-64></i> | Configures the policy name for outbound filtering on this RIP interface.
This policy determines whether to advertise a route from the routing table on this interface. This policy also specifies the parameters of the advertisement. <i>WORD<0-64></i> is a string of length 0-64 characters. |
| <i>poison enable</i> | Enables Poison Reverse. If you disable Poison Reverse (<i>no poison enable</i>), Split Horizon is enabled.
By default, Split Horizon is enabled. If you enable Split Horizon, the interface does not advertise IP routes learned from an immediate neighbor back to the neighbor. If you enable Poison Reverse, the RIP updates sent to a neighbor from which a route is learned are poisoned with a metric of 16. Therefore, the receiver neighbor ignores this route because the metric 16 indicates infinite hops in the network. These mechanisms prevent routing loops. |

| Variable | Value |
|---|---|
| <code>port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]}</code> | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| <code>receive version <rip1 rip2 rip1orrip2></code> | Indicates which RIP update version to accept on this interface. The default is rip1orrip2. |
| <code>send version <notsend rip1 rip1comp rip2></code> | Indicates which RIP update version the router sends from this interface. ripVersion1 implies sending RIP updates that comply with RFC1058. rip1comp implies broadcasting RIP2 updates using RFC1058 route subassumption rules. The default is rip1Compatible. |
| <code>supply enable</code> | Specifies that the switch advertises RIP routes through the port. The default is enable. |
| <code>timeout <15-259200></code> | Configures the RIP timeout interval in seconds. The default is 180. |
| <code>triggered enable</code> | Enables automatic triggered updates for RIP. |

Configuring route redistribution to RIP

Configure a redistribute entry to announce certain routes into the RIP domain, including static routes, direct routes, RIP, Open Shortest Path First (OSPF), IS-IS, or Border Gateway Protocol (BGP). Optionally, use a route policy to control the redistribution of routes.

Before You Begin

- Enable RIP globally.
- Configure a route policy.

Procedure

1. Enter RIP Router Configuration mode:

```
enable

configure terminal
```

```
router rip
```

2. Create the redistribution instance:

```
redistribute <bgp|direct|isis|ospf|rip|static> [vrf-src WORD<0-16>]
```

3. Apply a route policy, if required:

```
redistribute <bgp|direct|isis|ospf|rip|static> route-map WORD<0-64>
[vrf-src WORD<0-16>]
```

4. Configure other parameters.

5. Enable the redistribution:

```
redistribute <bgp|direct|isis|ospf|rip|static> enable [vrf-src
WORD<0-16>]
```

6. Ensure that the configuration is correct:

```
show ip rip redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

7. Exit to Global Configuration mode:

```
exit
```

8. Apply the redistribution:

```
ip rip apply redistribute <bgp|direct|isis|ospf|rip|static> [vrf
WORD<1-16>] [vrf-src WORD<0-16>]
```

Example

Create the redistribution instance, apply a route policy, enable the redistribution, and apply the redistribution.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router rip
Switch:1(config-rip)#redistribute rip
Switch:1(config-rip)#redistribute rip route-map test1
Switch:1(config-rip)#redistribute rip enable
Switch:1(config-rip)#exit
Switch:1(config)#ip rip apply redistribute rip
```

Variable definitions

The following table defines parameters for the **redistribute** command.

| Variable | Value |
|------------------------------|--|
| <i>metric</i> <0-65535> | Configures the metric to apply to redistributed routes. |
| <i>route-map</i> WORD<0-64> | Configures the route policy to apply to redistributed routes. |
| [<i>vrf-src</i> WORD<0-16>] | Specifies the optional source VRF instance. You can use this variable with the other command variables. |
| WORD<0-32> | Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static. |

The following table defines parameters for the **show ip rip redistribute** command.

| Variable | Value |
|---------------------------|-------------------------------|
| <i>vrf</i> WORD<1-16> | Specifies the VRF instance. |
| <i>vrfids</i> WORD<1-512> | Specifies a range of VRF IDs. |

The following table defines parameters for the **ip rip apply redistribute** command.

| Variable | Value |
|--|--|
| <i>vrf</i> WORD<1-16> | Specifies the VRF instance. |
| <i>vrf-src</i> WORD<0-16> | Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF. |
| < <i>bgp direct isis ospf rip static</i> > | Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static. |

Configuring interVRF route redistribution for RIP

Configure a redistribute entry to announce certain routes into the RIP domain, including static routes, direct routes, RIP, OSPF, IS-IS, or BGP. Use a route policy to control the redistribution of routes.

Before You Begin

- Enable RIP globally.
- Configure a route policy.
- Configure the VRFs.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

2. Create the redistribution instance:

```
ip rip redistribute <bgp|direct|isis|ospf|rip|static>
```

3. Apply a route policy, if required:

```
ip rip redistribute <bgp|direct|isis|ospf|rip|static> route-map  
WORD<0-64> [vrf-src WORD<0-16>]
```

4. Configure other parameters.

5. Enable the redistribution:

```
ip rip redistribute <bgp|direct|isis|ospf|rip|static> enable [vrf-src  
WORD<0-16>]
```

6. Ensure that the configuration is correct:

```
show ip rip redistribute [vrf WORD<1-16>] [vrfids WORD<1-512>]
```

7. Exit to Global Configuration mode:

```
exit
```

8. Apply the redistribution:

```
ip rip apply redistribute <bgp|direct|isis|ospf|rip|static> [vrf  
WORD<1-16>] [vrf-src WORD<0-16>]
```

Example

Create the redistribution instance, apply a route policy, enable the redistribution, and apply the redistribution.

```
Switch:1>enable  
Switch:1#configure terminal  
Switch:1#router vrf red  
Switch:1(router-vrf)#ip rip redistribute ospf  
Switch:1(router-vrf)#ip rip redistribute ospf route-map test1  
Switch:1(router-vrf)#ip rip redistribute ospf enable  
Switch:1(router-vrf)#exit  
Switch:1(config)#ip rip apply redistribute ospf
```

Variable definitions

The following table defines parameters for the **ip rip redistribute** `<bgp|isis|ospf|static|direct|rip>` command.

| Variable | Value |
|--|--|
| <code><bgp direct isis ospf rip static></code> | Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static. |
| <code>vrf-src WORD<0-16></code> | Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF. |
| <code>metric <0-65535></code> | Configures the metric to apply to redistributed routes. |
| <code>route-map WORD<0-64></code> | Configures the route policy to apply to redistributed routes. |

The following table defines parameters for the **show ip rip redistribute** command.

| Variable | Value |
|---------------------------------------|-------------------------------|
| <code>vrf WORD<1-16></code> | Specifies the VRF instance. |
| <code>vrfids WORD<1-512></code> | Specifies a range of VRF IDs. |

The following table defines parameters for the **ip rip apply redistribute** command.

| Variable | Value |
|--|--|
| <code>vrf WORD<1-16></code> | Specifies the VRF instance. |
| <code>vrf-src WORD<0-16></code> | Specifies the source VRF instance. You do not need to configure this parameter for redistribution within the same VRF. |
| <code><bgp direct isis ospf rip static></code> | Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, rip, ospf, or static. |

Forcing a RIP Update for a Port or VLAN

Force RIP to update the routing table so that the port or VLAN uses the latest routing information.

About This Task

If you perform this procedure, you also update the tables for all VRFs associated with the port or VLAN.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

**Note**

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable the triggered-update flag:

```
ip rip triggered enable
```

**Note**

You can enable this flag in either the GigabitEthernet or VLAN Interface Configuration mode. However, you can update the RIP routes in the GigabitEthernet Interface Configuration mode only.

3. Update the routing table:

```
action triggerRipUpdate
```

Example

Update the routing table:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 1
Switch:1(config-if)#ip rip triggered enable
```

Viewing the RIP redistribution configuration information

Displays the RIP redistribution configuration information.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```

2. View the RIP redistribution configuration information:

```
show ip rip redistribute [vrf WORD<1-16>] [vrfids WORD<0-512>]
```

Example

View the RIP redistribution configuration information:

```
Switch(config-ospf)#show ip rip redistribute
```

```
=====
RIP Redistribute List - GlobalRouter
=====
```

| SRC-VRF | SRC | MET | ENABLE | RPOLICY |
|--------------|------|-----|--------|---------|
| GlobalRouter | ISIS | 0 | FALSE | |

Variable definitions

The following table defines parameters for the **show ip rip redistribute** command or the **show ipv6 rip redistribute** command.

| Variable | Value |
|---------------------------------------|-------------------------------|
| <code>vrf WORD<1-16></code> | Specifies a VRF by name. |
| <code>vrfids WORD<0-512></code> | Specifies a range of VRF IDs. |

RIPng Configuration using CLI

Use the procedures in this section to configure RIPng using CLI.

Configuring RIPng globally

Configure RIPng parameters on the router so you can control RIPng behavior on the system.

Before You Begin

You can configure RIPng only on a global router. You cannot configure RIPng on a VRF instance.

Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```
2. Enable RIPng globally:

```
router rip ipv6-enable
```

Configuring RIPng on an interface

Configure RIPng on Ethernet ports and VLANs so that they can participate in RIPng routing.

About This Task

RIPng does not operate on a port or VLAN until you enable it both globally and on the port or VLAN.

Before You Begin

- Assign an IP address to the port or VLAN.
- Configure RIPng and enable it globally.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Create a RIPng interface:

```
ipv6 rip
```

3. Enable the RIPng interface:

```
ipv6 rip enable
```

4. Verify the operational status of the RIPng interface:

```
show ipv6 rip interface
```

Example

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#interface vlan 22
Switch:1(config-if)#ipv6 rip
Switch:1(config-if)#ipv6 rip enable
Switch:1(config-if)#show ipv6 rip interface
```

```
Total RIPng interfaces: 2
```

```
=====
                        RIPng Interface - GlobalRouter
=====
```

| IFINDX | COST | POISON
STATUS | SEND
DEFAULT | ADMIN
STATUS | OPER
STATUS |
|------------|------|------------------|-----------------|-----------------|----------------|
| 257 (2/2) | 2 | disable | disable | enable | enable |
| 2070 (22) | 5 | disable | disable | enable | disable |

```
-----
2 out of 2 Total Num of RIPng interfaces displayed
```

Variable Definitions

The following table defines parameters for the **ipv6 rip** command.

| Variable | Value |
|---|---|
| <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
This variable applies only to VLAN interfaces, not ports. |
| {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]} | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |

Configuring RIPng custom values

Configure custom values for RIPng parameters to replace default values.

Before You Begin

- Configure RIPng and enable it globally.

Procedure

1. Enter Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]} or interface vlan <1-4059>
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable RIPng poison:

```
ipv6 rip poison enable
```

3. Specify the RIPng cost:

```
ipv6 rip cost <1-15 Cost>
```

4. Access router RIPng configuration mode:

```
router rip
```

5. Specify the RIPng holddown timer value:

```
ipv6 timers basic holddown <0-360>
```

6. Specify the RIPng timeout timer value:
`ipv6 timers basic timeout <15-259200>`
7. Specify the RIPng update timer value:
`ipv6 timers basic update <1-360>`
8. Specify the default route metric value:
`ipv6 default-information metric <1-15>`
9. Enable default information globally:
`ipv6 default-information enable`
10. Ensure the configuration is correct:
`show ipv6 rip`

Example

Configure custom values for RIPng.

```
Switch:1>enable
Switch:1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch:1(config)#router rip
Switch:1(config-rip)#ipv6 default-information metric 1
Switch:1(config-rip)#ipv6 default-information enable
Switch:1(config-rip)#ipv6 timers basic update 30
Switch:1(config-rip)#ipv6 timers basic timeout 180
Switch:1(config-rip)#ipv6 timers basic holddown 120
Switch:1(config-rip)#router rip ipv6-enable
Switch:1(config)#show ipv6 rip

=====
                        RIPng Global - GlobalRouter
=====

                Rip : Enabled
                HoldDown Time : 120
                Timeout Interval : 180
                Update Time : 30
                Default Info Metric : 1
                Default Info State : Enabled
                Default Import Metric : 1
```

Variable definitions

Use the data in the following table to use the **ipv6 rip poison**, **ipv6 default-information** and **ipv6 timers basic** commands.

| Variable | Value |
|--|---|
| <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.
This variable applies only to VLAN interfaces, not ports. |
| port {slot/port[/sub-port] [-slot/port[/sub-port]] [,...]} | Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| poison enable | Enables Poison Reverse. If you disable Poison Reverse (no poison enable), Split Horizon is enabled. By default, Split Horizon is enabled. If you enable Split Horizon, the interface does not advertise IP routes learned from an immediate neighbor back to the neighbor. If you enable Poison Reverse, the RIP updates sent to a neighbor from which a route is learned are poisoned with a metric of 16. Therefore, the receiver neighbor ignores this route because the metric 16 indicates infinite hops in the network. These mechanisms prevent routing loops. |
| <1-15 Cost> | Configures the RIPng cost for this port (link). |
| holddown <0-360> | Configures the RIPng holddown timer value, the length of time (in seconds) that RIPng continues to advertise a network after it determines that the network is unreachable. The default is 120. |
| timeout <15-259200> | Configures the RIPng timeout interval. The default is 180. |
| update <1-360> | Configure the RIPng update timer. The update time is the time interval between RIPng updates. |
| default-information <1-15> | Configure the default route metric value. |

Configuring RIPng route distribution

Configure a redistribute entry to announce certain routes into the RIPng domain, including static routes, direct routes, Open Shortest Path First (OSPFv3), IS-IS, or Border Gateway Protocol (BGP+).

Before You Begin

- Enable RIPng globally.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Access router RIP configuration mode:

```
router rip
```
3. Enable the redistribution:

```
ipv6 redistribute {direct|isis|static|ospf|bgp} enable
```
4. Ensure the configuration is correct:

```
show ipv6 rip redistribute
```

Example

Enable the redistribution instance.

```
Switch:1#enable
Switch:1#configure terminal
Switch:1(config)#router rip
Switch:1(config-rip)#ipv6 redistribute bgp enable
Switch:1(config-rip)#ipv6 redistribute direct enable
Switch:1(config-rip)#ipv6 redistribute isis enable
Switch:1(config-rip)#ipv6 redistribute ospf enable
Switch:1(config-rip)#ipv6 redistribute static enable
Switch:1(config-rip)#show ipv6 rip redistribute
```

RIPng Redistribute List

```
=====
direct                : enabled
static                : enabled
ospf                  : enabled
bgp                   : enabled
isis                  : enabled
=====
```

Variable definitions

Use the data in the following table to use the **ipv6 redistribute** command.

| Variable | Value |
|-------------------------------|---|
| <bgp direct isis ospf static> | Specifies the type of routes to redistribute (the protocol source). Valid options are bgp, isis, direct, ospf, or static. |

RIP configuration using EDM

Use Routing Information Protocol (RIP) to perform dynamic routing within an autonomous system. This section describes how you use Enterprise Device Manager (EDM) to configure and manage RIP.

Configuring RIP globally

Configure RIP global parameters on the switch so you can control RIP behavior on the system.

Before You Begin

- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

About This Task

All router interfaces that use RIP use the RIP global parameters. Both brouter ports and VLAN virtual routing interfaces use the same RIP global parameters.

You can configure RIP on interfaces while RIP is globally disabled. This way, you can configure all interfaces before you enable RIP for the switch.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **RIP**.
3. Click the **Globals** tab.
4. Select the **enable** option button.
5. Configure other global RIP parameters as required.
6. Click **Apply**.

Globals field descriptions

Use the data in the following table to use the **Globals** tab.

| Name | Description |
|------------------------|---|
| Operation | Enables or disables RIP on all interfaces. The default is disabled. |
| UpdateTime | Specifies the time interval between RIP updates for all interfaces. The default is 30 seconds, and the range is 0–360. |
| RouteChanges | Specifies the number of route changes RIP made to the IP route database. RouteChanges does not include the refresh of a route age. |
| Queries | Specifies the number of responses sent to RIP queries received from other systems. |
| HoldDownTime | Configures the length of time that RIP continues to advertise a network after the network is unreachable. The range is 0–360 seconds. The default is 120 seconds. |
| TimeOutInterval | Configures the RIP timeout interval. The range is 15–259200 seconds. The default is 180 seconds. |
| DefImportMetric | Configures the default import metric used to import a route into a RIP domain. To announce OSPF internal routes into a RIP domain, if the policy does not specify a metric, you must use the default import metric. OSPF external routes use the external cost. The range is 0–15 and the default is 8. |

Viewing RIP status

View RIP status.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **RIP**.
3. Click the **Status** tab.

Status field description

Use the following table to use the RIP Status tab.

| Name | Description |
|----------------------|--|
| Address | Specifies the IP address of the router interface. |
| RcvBadPackets | Specifies the number of RIP response packets received by the RIP process which were subsequently discarded; for example, version 0 packet, or an unknown command type. |
| RcvBadRoutes | Specifies the number of routes, in valid RIP packets, that are ignored; for example, unknown address family, or invalid metric. |
| SentUpdates | Specifies the number of triggered RIP updates sent on this interface, that do not include full updates sent containing new information. |

Configuring RIP interface compatibility

Configure RIP parameters on an interface so you can control RIP behavior on the interface. You can specify the RIP version to use on interfaces that you configure to send (supply) or receive (listen to) RIP updates.

Before You Begin

- Configure a routing interface (either a router port or a virtual routing interface).
- Assign an IP address to the interface.
- Enable RIP globally.
- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

About This Task

On an interface, RIP does not operate until you enable it globally and on the interface.

Although visible, the switch does not support the AuthType and AuthKey parameters.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **RIP**.
3. Click the **Interface** tab.
4. Double-click the **Send** value to edit it, and then select the RIP version datagrams the router sends.
5. Double-click the **Receive** value to edit it, and then select the RIP version datagrams for which the router listens.
6. Click **Apply**.

Interface Field Descriptions

Use the data in the following table to use the **Interface** tab.

| Name | Description |
|-----------------|--|
| Address | Specifies the IP address of the router interface. |
| Domain | Specifies the value inserted into the routing domain parameter of all RIP packets sent on this interface. |
| AuthType | Specifies the type of authentication to use on this interface. |
| AuthKey | Specifies the authentication key whenever AuthType is not noAuthentication. |
| Send | Specifies the update version the router sends on this interface: <ul style="list-style-type: none"> • DoNotSend—no RIP updates sent on this interface • ripVersion1—RIP updates compliant with RFC1058 • rip1Compatible—broadcast RIPv2 updates using RFC1058 route subassumption rules • ripVersion2—multicast RIPv2 updates The default is rip1compatible. |
| Receive | Indicates which versions of RIP updates to accept: <ul style="list-style-type: none"> • rip1 • rip2 • rip1OrRip2 The default is rip1OrRip2. Rip2 and rip1OrRip2 imply receipt of multicast packets. |

Job Aid

Choose one of three options for receiving RIP updates:

- rip1OrRip2—accepts RIPv1 or RIPv2 updates
- rip1—accepts RIPv1 updates only
- rip2—accepts RIPv2 updates only

The following table describes the four RIP send modes that the switch supports. You can configure RIP send modes on all router interfaces.

Table 302: RIP send modes

| Send mode | Description | Result |
|----------------|---|---|
| rip1Compatible | Broadcasts RIPv2 updates using RFC1058 route consumption rules. This is the default mode. | <ul style="list-style-type: none"> Destination MAC is a broadcast, ff-ff-ff-ff-ff Destination IP is a broadcast for the network (for example, 192.0.2.255) RIP update is formed as a RIP-2 update, including network mask RIP version = 2 |
| ripVersion1 | Broadcasts RIP updates that are compliant with RFC1058 | <ul style="list-style-type: none"> Destination MAC is a broadcast, ff-ff-ff-ff-ff Destination IP is a broadcast for the network (for example, 198.0.2.255) RIP update is formed as a RIP-1 update, no network mask included RIP version = 1 |
| ripVersion2 | Broadcasts multicast RIPv2 updates | <ul style="list-style-type: none"> Destination MAC is a multicast, 01-00-5e-00-00-09 Destination IP is the RIP-2 multicast address, 224.0.0.9 RIP update is formed as a RIP-2 update including network mask RIP version = 2 |
| doNotSend | Does not send RIP updates on the interface | None |

Configuring RIP on an interface

Configure RIP parameters to control and optimize RIP routing for the interface.

Before You Begin

- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

Procedure

- In the navigation pane, expand **Configuration > IP**.
- Click **RIP**.
- Click the **Interface Advance** tab.
- Double-click a RIP parameter to edit it, as required.
- Click **Apply**.

Interface Advance field descriptions

Use the data in the following table to use the RIP **Interface Advance** tab.

| Name | Description |
|------------------------|---|
| Address | Shows the address of the entry in the IP RIP interface table. |
| Interface | Indicates the index of the RIP interface. |
| Enable | Shows if the RIP interface is enabled or disabled. |
| Supply | Enables (true) or disables (false) the ability to send RIP updates on this interface. |
| Listen | Configures whether the switch learns routes on this interface. |
| Poison | Configures whether to advertise RIP routes learned from a neighbor back to the neighbor. If disabled, the interface invokes Split Horizon and does not advertise IP routes learned from an immediate neighbor back to the neighbor. If enabled, RIP poisons the RIP updates, sent to the neighbor from which a route is learned, with a metric of 16. Therefore, the receiver neighbor ignores this route because the metric 16 indicates infinite hops in the network. |
| DefaultSupply | Enables (true) or disables (false) an advertisement of a default route on this interface. This command takes effect only if a default route exists in the routing table. |
| DefaultListen | Enables (true) or disables (false) the switch to accept the default route learned through RIP on this interface. The default is disabled. Enable DefaultListen to add a default route to the route table if another route advertises it. |
| TriggeredUpdate | Enables (true) or disables (false) the switch to send RIP updates from this interface. |
| AutoAggregate | Enables (true) or disables (false) automatic route aggregation on this interface. If enabled, the switch automatically aggregates routes to their natural mask when an interface advertises them. The default is disabled. |
| InPolicy | Determines if RIP can learn routes on this interface. This variable also specifies the parameters of the route when RIP adds it to the routing table. |
| OutPolicy | Determines if RIP advertises a route from the routing table on this interface. This policy also specifies the parameters of the advertisement. |
| Cost | Indicates the RIP cost for this interface. The range is 1-15. The default is 1. |

Job aid

The following table indicates the relationship between switch action and the RIP supply and listen settings.

Table 303: RIP supply and listen settings and switch action

| RIP supply settings | | RIP listen settings | | Switch action |
|---------------------|------------------|---------------------|------------------|---|
| Supply | Default supply | Listen | Default listen | |
| Disabled (false) | Disabled (false) | | | Sends no RIP updates. |
| Enabled (true) | Disabled (false) | | | Sends RIP updates except the default. |
| Disabled (false) | Disabled (false) | | | Sends only the default (default route must exist in routing table). |
| Enabled (true) | Enabled (true) | | | Sends RIP updates including the default route (if it exists). |
| | | Disabled (false) | Disabled (false) | Does not listen to RIP updates. |
| | | Enabled (true) | Disabled (false) | Listens to all RIP updates except the default. |
| | | Disabled (false) | Enabled (true) | Listens only to the default. |
| | | Enabled (true) | Enabled (true) | Listens to RIP updates including the default route (if it exists). |

Configuring RIP on a port

Configure RIP on a port so that the port can participate in RIP routing.

Before You Begin

- Assign an IP address to the port.
- Configure RIP and enable it globally.

Both brouter ports and VLAN virtual routing interfaces use the same RIP global parameters.

- Enable RIP on the interface.

About This Task

On an interface, RIP does not operate until you enable it globally and on the interface.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand **Configuration > Edit > Port**.
3. Click **IP**.
4. Click the **RIP** tab.

5. Configure the RIP parameters as required.
6. Click **Apply**.

RIP field descriptions

Use the data in the following table to use the **RIP** tab.

| Name | Description |
|------------------------------|--|
| Enable | Enables or disables RIP on the port. |
| Supply | Specifies that the routing switch advertises RIP routes through the interface. The default is enable. |
| Listen | Specifies that the routing switch learns RIP routes through this interface. The default is enable. |
| Poison | If disabled, the interface invokes Split Horizon and does not advertise IP routes learned from an immediate neighbor back to the neighbor. If enabled, the RIP update sent to a neighbor from which a route is learned is poisoned with a metric of 16. In this manner, the route entry is not passed to the neighbor, because 16 is infinity in terms of hops on a network. The default is disable. |
| DefaultSupply | Enables or disables DefaultSupply. Enable DefaultSupply if a default route exists in the routing table. The default is false. RIP advertises the default route only if it exists in the routing table. |
| DefaultListen | Enables or disables DefaultListen. Enable DefaultListen if this interface must learn a default route after another router that connects to the interface advertises it. The default is false (disabled).
Enable DefaultListen to add a default route to the route table if another router advertises it. |
| TriggeredUpdateEnable | Enables or disables triggered RIP updates. The default is false (disabled). |
| AutoAggregateEnable | Enables or disables RIP automatic aggregation. RIPv2 automatically aggregates routes to their natural mask. You can enable automatic aggregation only in RIPv2 mode or RIPv1 compatibility mode. The default is false. |
| AdvertiseWhenDown | Enables or disables AdvertiseWhenDown. If true, RIP advertises the network on this interface as up, even if the port is down. The default is false.
If you configure a port with no link and enable AdvertiseWhenDown, the port does not advertise the route until the port is active. RIP advertises the route even when the link is down. To disable advertising based on link-states, disable AdvertiseWhenDown. |
| InPolicy | Determines whether the RIP can learn a route on this interface. This variable also specifies the parameters of the route when RIP adds it to the routing table. |
| OutPolicy | Determines if this interface advertises a route from the routing table on this interface. This policy also specifies the parameters of the advertisement. |
| Cost | Indicates the RIP cost for this interface. The default is 1, and the range is 1–15. |

| Name | Description |
|------------------------|---|
| HolddownTime | Configures the length of time that RIP continues to advertise a network after determining it is unreachable. The range is 0–360 seconds. The default is 120 seconds |
| TimeOutInterval | Configures the RIP timeout interval in seconds. The range is 15–259200 seconds. The default is 180 seconds. |

Configuring RIP on a VLAN

Configure RIP on a VLAN so that the VLAN acts as a routed VLAN (a virtual router).

Before You Begin

- Configure the VLAN.
- Assign an IP address to the VLAN.
- Enable RIP globally.
- Enable RIP on the interface.
- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

Procedure

1. In the navigation pane, expand **Configuration > VLAN**.
2. Click **VLANs**.
3. Click the **Basic** tab.
4. Select a VLAN.
5. Click **IP**.
6. Click the **RIP** tab.
7. Configure the VLAN RIP parameters as required.
8. Click **Apply**.

RIP field descriptions

Use the data in the following table to use the **RIP** tab.

| Name | Description |
|---------------|--|
| Enable | Enables or disables RIP on the VLAN. |
| Supply | Specifies that the routing switch advertises RIP routes through the interface. The default is enable. |
| Listen | Specifies that the routing switch learns RIP routes through this interface. The default is enable. |
| Poison | If disabled, the interface invokes Split Horizon and does not advertise IP routes learned from an immediate neighbor back to the neighbor. If enabled, the RIP update sent to a neighbor from which a route is learned is poisoned with a metric of 16. In this manner, the route entry is not passed to the neighbor, because 16 is infinity in terms of hops on a network. The default is disable. |

| Name | Description |
|------------------------------|---|
| DefaultSupply | Enables or disables DefaultSupply. Enable DefaultSupply if a default route exists in the routing table. The default is false. RIP advertises the default route only if it exists in the routing table. |
| DefaultListen | Enables or disables DefaultListen. Enable DefaultListen if this interface must learn a default route after another router that connects to the interface advertises it. The default is false (disabled).
Enable DefaultListen to add a default route to the route table if another router advertises it. |
| TriggeredUpdateEnable | Enables or disables triggered RIP updates. The default is false (disabled). |
| AutoAggregateEnable | Enables or disables RIP automatic aggregation. RIPv2 automatically aggregates routes to their natural mask. You can enable automatic aggregation only in RIPv2 mode or RIPv1 compatibility mode. The default is false. |
| AdvertiseWhenDown | Enables or disables AdvertiseWhenDown. If true, RIP advertises the network on this interface as up, even if the interface is down. The default is false.
If you configure a VLAN with no link and enable AdvertiseWhenDown, the VLAN does not advertise the route until the VLAN is active. RIP advertises the route even when the link is down. To disable advertising based on link-states, disable AdvertiseWhenDown. |
| InPolicy | Determines whether the RIP can learn a route on this interface. This variable also specifies the parameters of the route when RIP adds it to the routing table. |
| OutPolicy | Determines if this interface advertises a route from the routing table. This policy also specifies the parameters of the advertisement. |
| Cost | Indicates the RIP cost for this interface. The default is 1, and the range is 1–15. |
| HolddownTime | Configures the length of time that RIP continues to advertise a network after determining it is unreachable. The range is 0–360 seconds. The default is 120 seconds |
| TimeOutInterval | Configures the RIP timeout interval in seconds. The range is 15–259200 seconds. The default is 180 seconds. |

Configuring route redistribution to RIP

Configure a redistribute entry to announce routes of a certain source protocol type into the RIP domain, for example, static, RIP, or direct. Use a route policy to control the redistribution of routes.

Before You Begin

- Enable RIP globally.
- Configure a route policy.
- Change the VRF instance as required to configure RIP on a specific VRF instance. The VRF must have an RP trigger of RIP. Not all parameters are configurable on non-default VRFs.

About This Task

Important

Changing the RIP redistribute context is a process-oriented operation that can affect system performance and network reachability while you perform the procedures. As a best practice, change default preferences for a RIP redistribute context, you must do so before you enable the protocols.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Click **RIP**.
3. Click the **Redistribute** tab.
4. Click **Insert**.
5. Configure the source of the routes to redistribute.
6. Select **enable**.
7. Select the route policy to apply to redistributed routes.
8. Configure a metric value.
9. Click **Insert**.

Redistribute field descriptions

Use the data in the following table to use the **Redistribute** tab.

| Name | Description |
|--------------------|---|
| DstVrfId | Specifies the destination VRF instance. You cannot configure this variable. |
| Protocol | Specifies the dynamic routing protocol that receives the external routing information. |
| SrcVrfId | Specifies the source VRF instance. You cannot configure this variable. |
| RouteSource | Specifies the route source protocol for the redistribution entry. |
| Enable | Enables (or disables) a RIP redistribute entry for a specified source type. |
| RoutePolicy | Configures the route policy (by name) that redistributes external routes from a specified source into an RIP domain. Click the ellipsis (...) button and choose from the list in the Route Policy dialog box. |
| Metric | Configures the RIP route redistribution metric for basic redistribution. The value can be in the range 0–65535. A value of 0 indicates to use the original cost of the route. |

RIPng Configuration using EDM

Use the procedures in this section to configure RIPng using EDM.

Configuring RIPng globally

Configure RIPng global parameters on the switch so you can control RIPng behavior on the system.

About This Task

All router interfaces that use RIPng use the RIPng global parameters. Both brouter ports and VLAN virtual routing interfaces use the same RIPng global parameters.

You can configure RIPng on interfaces while RIPng is globally disabled. This way, you can configure all interfaces before you enable RIPng for the switch

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6 RIPng**.
3. Click the **Globals** tab.
4. Select the **enable** option button.
5. Configure other global RIPng parameters as required.
6. Click **Apply**.

Globals field descriptions

Use the data in the following table to use the **Globals** tab.

| Name | Description |
|------------------------------|---|
| AdminState | Enables or disables RIPng globally. The default is disabled. |
| UpdateTime | Specifies the time interval between RIPng updates for all interfaces. The default is 30 seconds, and the range is 1-360. |
| GlobalHoldDownTime | Configures the length of time that RIPng continues to advertise a network after the network is unreachable. The range is 0-360 seconds. The default is 120 seconds. |
| GlobalTimeOutInterval | Configures the RIPng timeout interval. The range is 15-259200 seconds. The default is 180 seconds. |
| DefaultInfoMetric | RIPng default-information metric. |
| DefaultInfoState | Default-information enable or disable at the global level |
| DefaultImportMetric | Specifies the RIPng default import metric. |

Configuring an IPv6 RIPng interface

Configure RIPng parameters on an interface so you can control RIPng behavior on the interface.

About This Task

RIPng does not operate on an interface until you enable it globally and on the interface.

You can also configure an IPv6 RIPng interface for a brouter port by selecting **Device Physical View** , selecting a port, and following the **Edit > Port > IPv6** navigation path. You can configure an IPv6 RIPng interface for a VLAN through the **VLAN > VLANs > Basic > IPv6** navigation path. This procedure uses the main IPv6 RIPng navigation path where you can create both types of interfaces.

Before You Begin

- Configure a routing interface (either a brouter port or a virtual routing interface).
- Assign an IP address to the interface.
- Enable RIPng globally.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6 RIPng**.
3. Click the **Interfaces** tab.
4. Click **Insert**.
5. In the **IfIndex** box, type a value to identify the IPv6 interface.
6. In the **RipAdminStatus** option box, select **enable**.
7. Configure other parameters as required.
8. Click **Insert**.

Interfaces field descriptions

Use the data in the following table to use the **Interfaces** tab.

| Name | Description |
|-------------------------|--|
| IfIndex | RIPng interface index. |
| RipAdminStatus | Enable or disable RIPng on an interface. |
| DefaultInfoState | Enable or disable default information at the interface level. |
| Cost | Specifies the RIPng metric cost. |
| Poison | Enable or disable poison reverse on an RIPng interface. |
| RipOperStatus | Enable or disable the RIPng operational state on an interface. |

Configuring an IPv6 RIPng VLAN interface

Configure RIPng parameters on a VLAN interface so you can control RIPng behavior on the interface.

About This Task

RIPng does not operate on an interface until you enable it globally and on the interface.

You can also configure an IPv6 RIPng interface for a brouter port by selecting **Device Physical View**, selecting a port, and following the **Edit > Port > IPv6** navigation path.

Before You Begin

- Configure a routing interface (either a brouter port or a virtual routing interface).
- Assign an IP address to the interface.
- Enable RIPng globally.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN**.

2. Click **VLANs**.
3. Click the **Basic** tab.
4. Select a row, and click **IPv6**.
5. Click **Insert**.
6. Configure other parameters, as required.
7. Click **Insert**.
8. Click **Apply**.

IPv6 Interfaces *VLAN field descriptions*

Use the data in the following table to use the **IPv6 Interfaces** tab.

| Name | Description |
|-----------------------------|---|
| Interface | Specifies the port or VLAN. |
| Identifier | Shows the IPv6 address interface identifiers. This value is a binary string of up to 8 octets in network byte-order. |
| IdentifierLength | Shows the length of the identifier, in bits. |
| Descr | Specifies a description of the interface. The network management system also configures this string. |
| VlanId | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. This value corresponds to the lower 12 bits of the IEEE 802.1Q VLAN tag. |
| Type | Shows the interface type. |
| ReasmMaxSize(MTU) | Specifies the maximum size of the MTU of this IPv6 interface. This value must be the same for all the IP addresses defined on this interface. The default value is 1500. |
| PhysAddress | Specifies the media-dependent physical address. For Ethernet, this is a MAC address. |
| AdminStatus | Specifies if IPv6 is active on this interface. The default is false (disabled). |
| OperStatus | Specifies the current operational status of the interface. |
| ReachableTime | Specifies the time, in milliseconds, that a neighbor is considered reachable after receiving a reachability confirmation. The default is 30000. |
| RetransmitTimer | Specifies the time, in milliseconds, between retransmissions of neighbor solicitation messages to a neighbor when resolving the address, or when probing the reachability of a neighbor. The default is 1000. |
| CurHopLimit | Specifies the current hop limit field sent in router advertisements from this interface. The value must be the current diameter of the Internet. A value of zero indicates that the advertisement does not specify a value for CurHopLimit. The default is 64. |
| MulticastAdminStatus | The option to select MulticastAdminStatus is disabled. You cannot configure the administrative status for multicast in this context. |

| Name | Description |
|--------------------------|---|
| MacOffset | Requests a particular MAC for an IPv6 VLAN. You can specify a MAC offset when you configure IPv6 on a VLAN, or the system can assign a MAC address from within the available range. Different hardware platforms support different MAC offset ranges. |
| ForwardingEnabled | Indicates whether IPv6 forwarding is enabled. The default is enabled. |
| RSMLTEnable | Shows whether RSMLT is enabled on the interface. The default value is disabled (false). |

Configuring an IPv6 RIPng brouter port interface

Configure RIPng parameters on an interface so you can control RIPng behavior on the interface.

About This Task

RIPng does not operate on an interface until you enable it globally and on the interface.

Before You Begin

- Configure a routing interface (either a brouter port or a virtual routing interface).
- Assign an IP address to the interface.
- Enable RIPng globally and on the interface.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand the **Configuration >EditPort** folders.
3. Click **IPv6**.
4. Click the **RIPng** tab.
5. In the **RipAdminStatus** option box, select **enable**.
6. Configure other parameters as required.
7. Click **Apply**.

RIPng field descriptions

Use the data in the following table to use the **RIPng** tab.

| Name | Description |
|-------------------------|---|
| RipAdminStatus | Enable or disable RIPng on an interface. |
| DefaultInfoState | Enable or disable default information at the interface level. The default is disable. |
| Cost | Specifies the RIPng metric cost. The default is 1. |
| Poison | Enable or disable poison reverse on an RIPng interface. The default is disable. |
| RipOperStatus | Shows the RIPng operational state on an interface. |

Graphing IPv6 RIPng statistics

Use the following procedure to graph RIPng statistics for monitoring RIPng behavior on the interface.

About This Task

RIPng does not operate on an interface until you enable it globally and on the interface.

Before You Begin

- Configure a routing interface (either a brouter port or a virtual routing interface).
- Assign an IP address to the interface.
- Enable RIPng globally and on the interface.

Procedure

1. In the navigation pane, expand the **Configuration >Ipv6** folders.
2. Click the **IPv6 RIPng**.
3. Click the **Stats** tab.
4. Select an interface row.
5. Click **Graph**.
6. Click **Apply**.

Configuring route redistribution to RIPng

Configure a redistribute entry to announce routes of a certain source protocol type into the RIPng domain, for example, static, RIP, or direct. Use a route policy to control the redistribution of routes.

Before You Begin

- Enable RIP globally.
- Configure a route policy.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6 RIPng**.
3. Click the **Redistribute** tab.
4. Double-click the value in the **Enable** column that corresponds with the source protocol type you want to enable or disable.
5. Select **enable** or **disable** from the list.
6. Click **Apply**.

Redistribute field descriptions

Use the data in the following table to use the **Redistribute** tab.

| Name | Description |
|-----------------|--|
| DstVrfid | Specifies the destination VRF ID used in the redistribution. |
| Protocol | Specifies the dynamic routing protocol that receives the external routing information. |

| Name | Description |
|--------------------|---|
| SrcVrfId | Specifies the source VRF ID used in the redistribution. |
| RouteSource | Specifies the route source protocol for the redistribution entry. |
| Enable | Enables (or disables) a RIPng redistribute entry for a specified source type. |

Viewing stats for RIPng interfaces

View statistics for RIPng interfaces.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > IPv6**.
2. Click **IPv6 RIPng**.
3. Click the **Stats** tab.

Stats field descriptions

Use the data in the following table to use the **Stats** tab.

| Name | Description |
|----------------------|---|
| IfIndex | Shows the unique value to identify an IPv6 interface. |
| RcvBadPackets | The number of RIPng response packets received by the RIP process that were subsequently discarded for any reason (examples: a version 0 packet or an unknown command type). |
| RcvBadRoutes | The number of routes, in valid RIPng packets, that were ignored for any reason (examples: unknown address family or invalid metric). |
| SentUpdates | The number of triggered RIPng updates actually sent on this interface. |
| RcvUpdates | The number of triggered RIPng updates actually received on this interface. This explicitly does not include full updates received containing new information. |

Remote Monitoring

Remote Monitoring (RMON) is a management information base (MIB) or a group of management objects that you use to obtain or configure values using the Simple Network Management Protocol (SNMP). Use CLI, or EDM, to globally enable RMON on the system. After you globally enable RMON, you enable monitoring for individual devices on a port-by-port basis.

RMON1 is the original version of the protocol, which collects information for OSI Layer 1 and Layer 2 in Ethernet networks. RMON1 provides traffic statistics at the MAC layer, and provides statistics on Ethernet segments for packets and bytes received and transmitted.

You can use RMON1 to:

- Configure alarms for user-defined events.
- Collect Ethernet statistics.
- Log events.
- Send traps for events.

Within EDM, you can configure RMON1 alarms that relate to specific events or variables. You can also specify events associated with alarms to trap or log-and-trap. In turn, the system traps or logs tripped alarms.

You can view all RMON1 information using CLI or EDM. Alternatively, you can use any management application that supports SNMP traps to view RMON1 trap information.

This section describes RMON1 alarms, RMON1 history, RMON1 events, and RMON1 statistics.

RMON1 alarms

You can configure alarms to alert you if the value of a variable goes out of range. You can define RMON1 alarms on any MIB variable that resolves to an integer value. You cannot use string variables (such as system description) as alarm variables.

You can use RMON1 alarm to monitor anything that has a MIB OID associated with it and a valid instance.

All alarms share the following characteristics:

- A defined upper and lower threshold value.
- A corresponding rising and falling event.
- An alarm interval or polling period.

After you activate alarms, you can:

- View the activity in a log and/or a trap.
- Create a script directing the system to sound an audible alert at a console.
- Create a script directing the system to send an e-mail.
- Create a script directing the system to call a pager.

The system polls the alarm variable and the system compares the result against upper and lower limit values you select when you create the alarm. If the system reaches or crosses the alarm variable during the polling period, the alarm fires and generates an event that you can view in the event log or the trap

log. You can configure the alarm to either create a log, or have the alarm send a Simple Network Management Protocol (SNMP) trap to a Network Management System (NMS). You can view the activity in a log or a trap log, or you can create a script to cause a console to beep, send an e-mail, or call a pager.

The upper limit of the alarm is the rising value, and the lower limit is the falling value. RMON1 periodically samples data based upon the alarm interval. During the first interval that the data passes above the rising value, the alarm fires as a rising event. During the first interval that the data drops below the falling value, the alarm fires as a falling event.

The following figure shows how alarms fire:

Figure 216: How alarms fire

The alarm fires during the first interval that the sample goes out of range. No additional events generate for that threshold until the system crosses the opposite threshold. Therefore, you must carefully define the rising and falling threshold values for alarms. Incorrect thresholds cause an alarm to fire at every alarm interval, or never at all.

You can define one threshold value to an expected, baseline value, and then define the opposite threshold as the out-of-bounds limit. Because of sample averaging, the value is equal to ± 1 baseline unit. For example, assume you define an alarm with octets leaving a port as the variable. The intent of the alarm is to notify you if excessive traffic occurs on that port. You enable spanning tree, and then 52 octets transmit from the port every 2 seconds, which is equivalent to baseline traffic of 260 octets every 10 seconds. This alarm notifies you if you define the lower limit of exiting octets at 260 and you define the upper limit at 320 (or at any value greater than $260 + 52 = 312$).

The rising alarm fires the first time outbound traffic, other than spanning tree Bridge Protocol Data Units (BPDUs), occurs. The falling alarm fires after outbound traffic, other than spanning tree, ceases. This process provides the time intervals of any nonbaseline outbound traffic.

If you define the alarm with a falling threshold of less than 260 and the alarm polling interval is at 10 seconds, for example, 250, then the rising alarm can fire only once, as shown in the following example. The falling alarm (the opposite threshold) must fire for the rising alarm to fire a second time. The falling alarm cannot fire unless the port becomes inactive or you disable spanning tree, which causes the value for outbound octets to drop to zero, because the baseline traffic is always greater than the value of the falling threshold. By definition, the failure of the falling alarm to fire prevents the rising alarm from firing a second time.

The following figure shows an example of the alarm threshold:

Figure 217: Alarm example, threshold less than 260

When you create an alarm, you select a variable from the variable list and a port, or another system component to which it connects. Some variables require port IDs, card IDs, or other indexes, for example, spanning tree group IDs. You then select a rising and a falling threshold value. The rising and falling values compare to the actual value of the variable that you choose. If the variable falls outside of the rising or falling value range, an alarm triggers, and the system logs an event or trap.

When you create an alarm, you also select a sample type, which can be either absolute or delta. Define absolute alarms for alarms based on the cumulative value of the alarm variable. An example of an absolute alarm value is card operating status. Because this value is not cumulative, but instead represents states, such as card up (value 1) and card down (value 2), you configure the value as the absolute value. Therefore, you can create an alarm with a rising value of 2 and a falling value of 1 to alert you whether the card is up or down.

Configure most alarm variables related to Ethernet traffic as a delta value. Define delta alarms for alarms based on the difference in the value of the alarm variable between the start of the polling period and the end of the polling period.

Note

If you create an alarm that monitors a variable that does not exist, you will receive an error message and the creation will fail. Also, if the variable you are monitoring is no longer valid at the time of sampling, the switch removes the alarm automatically. For example, if you create an alarm that monitors some information about a VLAN, and that VLAN is later removed, then the switch silently removes the associated alarm at the next sampling interval.

RMON1 history

The RMON1 history group records periodic statistical samples from a network. A sample is a history and the system gathers the sample in time intervals referred to as buckets.

You can use RMON1 history for the MAC layer in the network. You cannot use RMON1 history for application and network layer protocols.

You enable and create histories to establish a time-dependent method to gather RMON1 statistics on a port. The following are the default values for history:

- Buckets are gathered at 30-minute intervals.
- The number of buckets gathered is 50.

You can configure both the time interval and the number of buckets. However, after the system reaches the last bucket, the system dumps bucket 1 and recycles the bucket to hold a new bucket of statistics. Then the system dumps bucket 2, and so forth.

RMON1 events

RMON1 events and alarms work together to notify you when values in your network go out of a specified range. After a value passes the specified range, the alarm fires. The event specifies how the system records the activity.

You can use RMON1 events to monitor anything that has a MIB OID associated with it and a valid instance.

An event specifies whether a trap, a log, or both a trap and a log generates to view alarm activity.

You must create an event before associating it with an alarm, otherwise an error occurs. Also, you cannot delete an event as long as there are alarms associated with it. If you try to do so, an error message displays.

RMON1 statistics

You can use EDM to gather and graph statistics in a variety of formats, or you can save the statistics to a file and export the statistics to a third-party presentation or graphing application.

RMON1 scaling limits

The following tables shows the scaling limits for RMON1 elements.

Note

When the log table reaches the maximum 500 log limit, the oldest third of the logs per event is removed to make room for new events. For all other elements, a message displays when you reach the maximum limit and no other element can be added.

| | |
|---|-----|
| Alarms | 100 |
| Events | 100 |
| History
(entries in the history control table with 2000 buckets shared between them) | 20 |
| Logs | 500 |
| Statistics (entries in stats table) | 100 |

RMON 2

Remote Monitoring (RMON) is a management information base (MIB) or a group of management objects that you use to obtain or configure values using the Simple Network Management Protocol (SNMP).

Use CLI or EDM to globally enable RMON on the system.

After you globally enable RMON, you enable monitoring for individual devices on a port-by-port basis.

RMON1 is the original version of the protocol, which collects information for OSI Layer 1 and Layer 2 in Ethernet networks. RMON1 provides traffic statistics at the MAC layer, and provides statistics on Ethernet segments for packets and bytes received and transmitted.

RMON2 monitors and counts network layer and application layer protocol packets on configured network hosts, either VLAN or port interfaces, that you enable for monitoring. RMON2 monitors Segmented Management Instances at the mgmt configuration level for out-of-band (OOB), circuitless IP (CLIP), and VLAN interfaces.

Note

RMON2 monitoring of Segmented Management Instances at the mgmt configuration level is not supported on VSP 8600 Series.

Note

RMON2 counters on Segmented Management Instance interfaces are cleared only when a Segmented Management Instance interface is newly enabled, or when RMON2 is newly enabled on a previously enabled Segmented Management Instance interface.

The following figure shows which form of RMON monitors which layers in the OSI model:

Figure 218: OSI model and RMON

The RMON2 feature is a management information base (MIB) or a group of management objects that you use to obtain or configure values using the Simple Network Management Protocol (SNMP). The switch supports a partial implementation of RMON2. The RMON2 feature adds the following MIBS: protocol directory, protocol distribution, address map, network-layer host and application layer host for the traffic passing through the (Control Processor) CP for these MIB tables.

The system only collects statistics for IP packets that pass through the CP. RMON2 does not monitor packets on other interfaces processed on the switch that do not pass through the CP. However, RMON2 monitors packets for applications listed in the RMON2 MIB, whether or not the application is enabled or supported on the switch.

After you globally enable RMON2, enable monitoring for individual devices. Identify the network hosts for the system to monitor with a manual configuration on the interfaces you want to monitor.

The RMON2 feature monitors a list of predefined protocols. The system begins to collect protocol statistics immediately after you enable RMON.

The RMON2 feature collects statistics on:

- Protocols predefined by the system.
- Address mapping between physical and network address on particular network hosts that you configure for monitoring.
- Network host statistics for particular hosts on a network layer protocol (IP) that you configure for monitoring.
- Application host statistics for a particular host on an application layer protocol that you configure for monitoring.

RMON2 MIBs

This section describes the following MIBs, on which RMON2 can collect statistics: protocol directory, protocol distribution, address map, network-layer host, and application layer host.

Protocol Directory MIB

The protocol directory is a master directory that lists all of the protocols RMON2 can monitor. The protocols include network layer, transport layer, and application layer protocols, under the OSI model. The system only monitors statistics for the predefined protocols. You cannot delete or add additional protocols to this table. The protocol directory MIB is enabled by default for the predefined protocols.

The predefined protocols include:

- Internet Protocol (IP)
- Secure Shell version 2 (SSHv2)
- Transmission Control Protocol (TCP)
- User Datagram Protocol (UDP)
- File Transfer Protocol (FTP)
- Hypertext Transfer Protocol (HTTP)
- Telnet
- Remote login (rlogin)

Note

Rlogin application is only supported on VSP 8600 Series.

- Trivial File Transfer Protocol (TFTP)
- Simple Network Management Protocol (SNMP)

Protocol distribution MIB

The protocol distribution MIB collects traffic statistics that each protocol generates by local area network (LAN) segment. The switch acts as the probe and the system collects protocol statistics for the entire switch as part of the group for all of the protocols predefined in the protocol directory table. The protocol distribution control table is part of this group. The protocol distribution control table is predefined with an entry for the management IP for the switch to represent the network segment where the system collects the statistics.

No CLI or EDM support exists to add or delete entries in this table.

Address map MIB

The address map MIB maps the network layer IP to the MAC layer address.

The system populates the address map control table MIB with an entry for each host interface that you enable for monitoring on the switch.

Network layer host MIB

The network layer host MIB monitors the Layer 3 traffic statistics for each host. The network layer host MIB monitors traffic packets in and out of hosts based on the network layer address. The network layer host controls the network and application layer host tables.

The system populates an entry for the management IP of the switch to represent the network segment where the system collects the statistics. You have to enable each host interface that you want to monitor on the switch.

The system only collects statistics for this group from packets that go to the CP.

Application layer host MIB

The application layer host MIB monitors traffic statistics by application protocol for each host.

The system populates an entry for the management IP of the switch to represent the network segment where the system collects the statistics. You have to enable each host interface that you want to monitor on the switch.

The system only collects statistics for this group from packets that go to the CP.

RMON2 Considerations

The following considerations apply to RMON2:

- You must enable RMON globally before you enable RMON2 monitoring for a Segmented Management Instance interface.
- You must configure an IPv4 address for the Segmented Management Instance management interface before you enable RMON2 monitoring.
- You can enable RMON on a maximum of 30 IP interfaces on a host.

- You cannot directly configure RMON for a VOSS VLAN that is an underlying management VLAN. In this case, RMON must be configured at the mgmt vlan configuration level.
- RMON2 is not available if DHCP Client is configured on a Management Instance. DHCP Client is not available if RMON2 is configured on a Management Instance.
- You cannot delete the IPv4 manual address from a Segmented Management Instance management interface that is RMON enabled. If the only IPv4 address is deleted outside of the normal configuration process, RMON is administratively disabled on the Segmented Management Instance management interface.

RMON Configuration Using CLI

This section contains procedures to configure RMON using Command Line Interface (CLI).

For information about RMON statistics, see the following sections:

- [Displaying RMON Statistics for Specific Ports](#) on page 3182
- [Viewing RMON Statistics](#) on page 3200

Configuring RMON

Enable RMON1 and RMON2 globally, and configure RMON1 alarms, events, history, statistics, and whether port utilization is calculated in half or full duplex. By default, RMON1 and RMON2 are disabled globally.

For RMON1, you enable RMON globally, and then you can use RMON1 alarm, history, events, and statistics for the MAC layer in the network. You cannot use RMON1 history or statistics for application and network layer protocols.

For RMON2, you enable RMON globally, and then you enable RMON on the host interfaces you want to monitor.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable RMON1 and RMON2 globally:

```
rmon
```
3. Configure an RMON1 alarm:

```
rmon alarm <1-65535> WORD <1-1536> <1-3600> {absolute|delta} [falling-  
threshold <-2147483647-2147483647> event <1-65535>] [owner WORD<1-  
127>] [rising-threshold <-2147483647-2147483647> event <1-65535>]
```
4. Configure an RMON1 event:

```
rmon event <1-65535> [community WORD<1-127>] [description WORD<0-127>]  
[log] [owner WORD<1-127>] [trap] [trap_dest [{A.B.C.D}]] [trap_src  
[{A.B.C.D}]]
```
5. Configure RMON1 history:

```
rmon history <1-65535> {slot/port [/sub-port] [-slot/port [/sub-port]  
[,...]} [buckets <1-65535>] [interval <1-3600>] [owner WORD<1-127>]
```

6. Configure RMON1 statistics:

```
rmon stats <1-65535> {slot/port [/sub-port] [-slot/port[/sub-port]
[,...]} [owner <1-127>]
```

7. Configure whether the system calculates port utilization in half or full duplex:

```
rmon util-method [half|full]
```

Example

Configure RMON globally, an RMON1 alarm, and RMON1 event:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#rmon
Switch:1(config)#rmon event 60534 community public description "Rising Event" log trap
Switch:1(config)#rmon alarm 4 rcCliNumAccessViolations.0 10 absolute rising-threshold 2
event 60000
```

Variable Definitions

Use the data in this table to use the **rmon** command.

| Variable | Value |
|--|--|
| <pre>alarm <1-65535> WORD <1-1536> <1-3600> {absolute delta} [falling-threshold <-2147483647-2147483647> event <1-65535>] [owner WORD<1-127>] [rising- threshold <- 2147483647-2147483647> event <1-65535>]</pre> | <p>Creates an alarm interface.</p> <ul style="list-style-type: none"> • <i><1-65535></i>— Specifies the interface index number from 1 to 65535. Each entry defines a diagnostics sample at a particular interval for an object on the device. The default is 1. • <i>WORD <1-1536></i>— Specifies the variable name or OID. The entry is case sensitive and can have a string length of 1 to 1536. • <i>{absolute delta}</i>— Specifies the sample type. • <i>rising-threshold <-2147483648-2147483647></i>
 <i>[<event:1-65535>]</i>— Specifies the rising threshold from -2147483648 to 2147483647, which is a threshold for the sampled statistic. After the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, the system generates a single event. The system also generates a single event if the first sample after this entry that becomes valid is greater than or equal to the rising alarm, or the rising or falling alarm. After the system generates a rising event, the system does not generate another such event until the sampled value falls below this threshold and reaches the alarm falling threshold. You cannot modify this object if the associated alarm status is equal to valid. <p><i><1-65535></i>— Specifies the rising event index, which the system uses after the system crosses a rising threshold. The event entry identified by a particular value of this index is the same as identified by the same value of the event index object. If no corresponding entry exists in the event table, no association exists. In particular, if this value is zero, the system does not generate an associated event, as zero is not a valid event index. You cannot modify this object if the associated alarm status is equal to valid.</p> <ul style="list-style-type: none"> • <i>falling-threshold <-2147483648-2147483647></i>
 <i>[<event:1-65535>]</i>— Specifies the falling threshold from -2147483648 to 2147483647, which specifies a threshold for the sampled statistic. If the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, the system generates a single event. The system also generates a single event if the first sample after this entry that becomes valid is less than or equal to this threshold and the associated alarm startup alarm is equal to falling alarm or rising or falling alarm. After the system generates a falling event, the system does not generate another such event until the sampled value rises above this threshold, and reaches the alarm rising threshold. You cannot modify this object if the associated alarm status is equal to valid. |

| Variable | Value |
|--|--|
| | <p><1-65535> - Specifies the index of the event entry that the system uses after a falling threshold is crossed. The event entry identified by a particular value of this index is the same as identified by the same value of the event index object. If no corresponding entry in the event table exists, no association exists. In particular, if this value is zero, the system does not generate an event, as zero is not a valid event index. You cannot modify this object if the associated alarm status is equal to valid. The default is 60535.</p> <ul style="list-style-type: none"> • <i>owner WORD<1-127></i> - Specifies the name of the owner, with a string length 1 to 127. <p>Use the default operator to reset the RMON alarms to their default configuration: <code>default rmon alarm <65535></code></p> <p>Note:
When configuring from CLI, the default owner is cli; when configuring with SNMP, the default owner is snmp. The default command only sets the owner to default. No other parameters can be changed after you create the alarm.</p> <p>Use the no operator to disable RMON alarms: <code>no rmon alarm [<1-65535>]</code></p> |
| <p><i>event <1-65535> [community WORD<1-127>] [description WORD<0-127>] [log] [owner WORD<1-127>] [trap]</i></p> | <p>Create an event.</p> <ul style="list-style-type: none"> • <1-65535> - Specifies the event index number. Each entry defines one event that the system generates after the appropriate conditions occur. The default is 1. • <i>log</i> - Specifies if this event stores a log when the event is triggered by the alarm. • <i>trap</i> - Specifies if this event sends a trap when the event is triggered by the alarm. The trap will be sent to all the snmp-server hosts configured in the snmp table. • <i>description WORD<0-127></i> - Specifies the event description, with a string length of 0 to 127. • <i>owner WORD<1-127></i> - Specifies the name of the owner, with a string length of 1 to 127. • <i>community WORD<1-127></i> - Specifies the SNMP community where you can send SNMP traps, with a string length 1 to 127. <p>You can set the community, but the trap is not filtered out. The trap is sent to all configured snmp-server hosts, regardless of the value of this field.</p> <p>Use the no operator to delete a RMON event: <code>no rmon event [<1-65535>] [log]</code></p> |

| Variable | Value |
|--|--|
| <pre>history <1-65535> {slot/port [/sub-port] [-slot/port[/ sub-port] [,...]} [buckets <1- 65535>] [interval <1-3600>] [owner WORD<1-127>]</pre> | <p>Configures RMON history.</p> <ul style="list-style-type: none"> • <i><1-65535></i> – Specifies the history index number that uniquely identifies an entry in the history control table. Each entry defines a set of samples at a particular interval for an interface on the default. The default value is 1. • <i>{slot/port [/sub-port] [-slot/port[/sub-port] [,...]}</i> – Specifies the single port interface. Identifies the source for which the system collects and places historical data in a media-specific table on behalf of this history control entry. The source is an interface on this device. The statistics in this group reflect all packets on the local network segment that attaches to the identified interface. • <i>buckets <1-65535></i>– Specifies the requested number of discrete time intervals where the system saves data in the part of the media-specific table associated with this history control entry. The default value is 50. • <i>interval <1-3600></i>– Specifies the time interval in seconds over which the system samples the data for each bucket in the part of the media-specific table associated with this history control entry. Because the counters in a bucket can overflow at their maximum value with no indication, you must take into account the possibility of overflow in all the associated counters. Consider the minimum time in which a counter can overflow on a particular media type, and then set the history control interval to a value less than this interval, which is typically most important for the octets counter in a media-specific table. The default value is 1800. • <i>owner WORD<1-127></i>– Specifies the name of the owner. |

| Variable | Value |
|--|--|
| <code>stats <1-65535> {slot/port [/sub-port] [-slot/port [/sub-port] [, ...]} owner WORD<1-127></code> | <p>Configures RMON statistics.</p> <ul style="list-style-type: none"> <code><1-65535></code>— Specifies the control Ether statistics entry index number. <code>{slot/port [/sub-port] [-slot/port [/sub-port] [, ...]}</code>— Specifies the single port interface. <code>owner WORD<1-127></code>— Specifies the name of the owner. <p>Use the no operator to delete a RMON Ether stats control interface: <code>no rmon stats [<1-65535>]</code></p> |
| <code>util-method [half full]</code> | <p>Configures whether port utilization is calculated in half or full duplex to calculate port usage.</p> <ul style="list-style-type: none"> <code>half</code>—Configures the string to half duplex. <code>full</code>—Configures the string to full duplex. <p>After you select <code>half</code> for half duplex, RMON uses InOctets and the speed of the port to calculate port usage (this is the standard RMON RFC 1271 convention). After you select <code>full</code> for full duplex, RMON uses InOctets and OutOctets, and 2X the speed of the port to calculate port usage. If you select <code>full</code>, but the port operates in half-duplex mode, the calculation defaults to the RFC1271 convention. The default is <code>half</code>.</p> |

Enabling Remote Monitoring on an Interface

Use the following procedure to enable Remote Monitoring (RMON) on an interface.

Before You Begin

- Enable RMON globally.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Enable RMON on a particular VLAN:

```
vlan rmon <1-4059>
```

3. Enter GigabitEthernet Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface GigabitEthernet {slot/port [/sub-port] [-slot/port [/sub-port] [, ...]}
```

Note

If the platform supports channelization and the port is channelized, you must also specify the sub-port in the format `slot/port/sub-port`.

4. Enable RMON on a particular port:

```
rmon
```

Example

Enable RMON on VLAN 2:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#vlan rmon 2
```

Enable RMON on port 3/8:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface gigabitethernet 3/8
Switch:1(config-if)#rmon
```

Variable Definitions

Use the data in this table to use the **vlan rmon** command.

| Variable | Value |
|----------|---|
| <1-4059> | Specifies the VLAN ID on which to configure RMON. |

Enable RMON2 on a Segmented Management Instance Interface

Before You Begin

Note

This procedure does not apply to VSP 8600 Series.

You must enable RMON globally before you enable RMON2 monitoring for a Segmented Management Instance interface.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Enter the configuration mode for the Management Instance:

```
mgmt <clip | oob | vlan>
```
3. Enable RMON2 on the Segmented Management Interface:

```
(mgmt:oob) rmon
```

View RMON Information

View RMON1 and RMON2 information on the switch. You can view information about RMON1 alarms, events, history, logs, and statistics. You can also view RMON2 information about application host statistics, control tables, network host statistics, and protocol distribution statistics.

Procedure

- View RMON1 information:

```
show rmon {alarm|event|history|log|stats}
```
- View RMON2 information:

```
show rmon {address-map|application-host-stats WORD<1-64>|application protocols|ctl-table|protocol-dist-stats|network-host-stats}
```

Example

View RMON event, log, and statistics information:

```
Switch:1(config)#show rmon event

=====
                                Rmon Event
=====

INDEX DESCRIPTION          TYPE          COMMUNITY OWNER          LAST_TIME_SENT
-----
60534 Rising Event        log-and-trap public         192.0.2.155 none
60535 Falling Event      log-and-trap public         192.0.2.155 8 day(s), 19:14:32

Switch:1(config)#show rmon log

=====
                                Rmon Log
=====

```

Variable Definitions

The following table defines parameters for the **show rmon** command.

| Variable | Value |
|--------------------|--|
| <i>address-map</i> | Displays the RMON2 address map. This RMON2 parameter expands RMON capacity to display information on network, transport, and application layers. |
| <i>alarm</i> | Displays the RMON1 alarm table. |

| Variable | Value |
|--|---|
| <i>application-host-stats</i> WORD<1-64>

Note:
Exception: rlogin application is only supported on VSP 8600 Series. However, RMON2 counts application packets received on any platform on which the application is not enabled or supported, before dropping them. | Displays RMON2 application host statistics from one of the following protocols: TCP, UDP, FTP, Telnet HTTP, rlogin, SSHv2, TFTP, SNMP, HTTPS. This RMON2 parameter expands RMON capacity to display network, transport, and application layers. |
| <i>ctl-table</i> | Displays the RMON2 control tables. This RMON2 parameter expands RMON capacity to display network, transport, and application layers. |
| <i>event</i> | Displays the RMON1 event table. |
| <i>history</i> | Displays the RMON1 history table. This RMON1 parameter displays and is limited to link layer information, including as MAC information. |
| <i>log</i> | Displays the RMON1 log table. |
| <i>network-host-stats</i> | Displays RMON2 network-host statistics. This RMON2 parameter expands RMON capacity to display network, transport, and application layers. |
| <i>protocol-dist-stats</i> | Displays RMON2 protocol distribution statistics. This RMON2 parameter expands RMON capacity to display network, transport, and application layers. |
| <i>stats</i> | Displays the RMON1 statistics table. This RMON1 parameter displays and is limited to link layer information, including as MAC information. |

Displaying RMON Address Maps

View the maps of network layer address to physical address to interface.

The probe adds entries based on the source MAC and network addresses in packets without MAC-level errors.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON address maps:

```
show rmon address-map
```

Example

```
Switch:1# show rmon address-map
=====
                        Rmon Address Map Table
=====
PROTOIDX  HOSTADDR      SOURCE  PHYADDR      LASTCHANGE
-----
1         192.0.2.11   2060   b0:ad:aa:42:a5:03  10/09/15 17:30:41
```

Job Aid

The following table describes the fields in the output for the **show rmon address-map** command.

| Parameter | Description |
|------------|---|
| PROTOIDX | Shows a unique identifier for the entry in the table. |
| HOSTADDR | Shows the network address for this entry. The format of the value depends on the protocol portion of the local index. |
| SOURCE | Shows the interface or port on which the network address was most recently seen. |
| PHYADDR | Shows the physical address on which the network address was most recently seen. |
| LASTCHANGE | Shows when the entry was created or last changed. If this value changes frequently, it can indicate duplicate address problems. |

View RMON Application Host Statistics

View application host statistics to see traffic statistics by application protocol for each host.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON application host statistics:

```
show rmon application-host-stats WORD<1-64>
```

Example

```
Switch:1# show rmon application-host-stats ?
WORD<1-64> Select one of these application protocols
{TCP|UDP|FTP|TELNET|HTTP|RLOGIN|SSH|TFTP|SNMP|HTTPS}
Switch:1# show rmon application-host-stats FTP
```

```
=====
                        Rmon Application Host Stats
=====
HOSTADDR      INPKT      OUTPKT      INOCT      OUTOCT      CREATETIME
-----
192.0.2.10    0           0           0           0           10/09/15 17:29:54
```

Note

Protocol support can vary across platforms.

Variable Definitions

The following table defines parameters for the **show rmon application-host-stats** command.

| Variable | Value |
|--|--|
| WORD<1-64>

Note:
Exception: the rlogin application is only supported on VSP 8600 Series. However, RMON2 counts application packets received on any platform on which the application is not enabled or supported, before dropping them. | Specifies one of the following application protocols: TCP, UDP, FTP, TELNET, HTTP, rlogin, SSH, TFTP, SNMP, HTTPS. |

Job Aid

The following table describes the fields in the output for the **show rmon application-host-stats** command.

| Parameter | Description |
|------------|---|
| HOSTADDR | Shows the network address for this entry. The format of the value depends on the protocol portion of the local index. |
| INPKT | Shows the number of packets for this protocol type, without errors, transmitted to this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| OUTPKT | Shows the number of packets for this protocol type, without errors, transmitted by this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| INOCT | Shows the number of octets transmitted to this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |
| OUTOCT | Shows the number of octets transmitted by this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |
| CREATETIME | Shows when the entry was last activated. |

View RMON Control Tables

View RMON control tables to see the data source for both network layer and application layer host statistics.

Procedure

1. To enter User EXEC mode, log on to the switch.

2. View RMON control tables:

```
show rmon ctl-table
```

Example

```
Switch:1# show rmon ctl-table
```

```

**Note**

Protocol support can vary across platforms.

Job Aid

The following table describes the fields in the output for the `show rmon ctl-tab1` command.

| Parameter | Description |
|---------------|---|
| ADDRMAPCFG | <p>Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following:</p> <ul style="list-style-type: none"> • NOT SUPPORTED • SUPPORTED OFF • SUPPORTED ON <p>If the value is SUPPORTED ON, the probe adds entries to the address map table that maps the network layer address to the MAC layer address.</p> |
| AHDROPPFRAMES | Shows the total number of application layer host frames that the probe receives and drops. This value does not include packets that were not counted because they had MAC-layer errors. |
| CREATETIME | Shows when the entry was last activated. |
| DATASOURCE | Shows the source of data for the entry. |
| DROPPFRAMES | Shows the total number of frames that the probe receives and drops. This value does not include packets that were not counted because they had MAC-layer errors. |
| HOSTCFG | <p>Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following:</p> <ul style="list-style-type: none"> • NOT SUPPORTED • SUPPORTED OFF • SUPPORTED ON <p>If the value is SUPPORTED ON, the probe adds entries to the Host Control table to collect statistics for network layer and application layer hosts.</p> |
| IDX | Shows a unique identifier for the entry in the table. |
| MATRIXCFG | <p>Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following:</p> <ul style="list-style-type: none"> • NOT SUPPORTED • SUPPORTED OFF • SUPPORTED ON |
| NHDROPPFRAMES | Shows the total number of network host frames that the probe receives and drops. This value does not include packets that were not counted because they had MAC-layer errors. |

| Parameter | Description |
|---|--|
| OWNER | Shows the entity that configured this entry. |
| PROTOCOL
Protocol support can vary across hardware models. | Shows the protocols RMON2 can monitor: <ul style="list-style-type: none"> • Internet Protocol (IP) • Transmission Control Protocol (TCP) • User Datagram Protocol (UDP) • File Transfer Protocol (FTP) • Secure Shell version 2 (SSHv2) • Telnet • Hypertext Transfer Protocol (HTTP) • Remote login (RLOGIN) • Trivial File Transfer Protocol (TFTP) • Simple Networking Management Protocol (SNMP) • Hypertext Transfer Protocol Secure (HTTPS) |

Displaying RMON Network Host Statistics

View network host statistics to see Layer 3 traffic statistics for each host. The network layer host MIB monitors traffic packets in and out of hosts based on the network layer address.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON network host statistics:

```
show rmon network-host-stats
```

Job Aid

The following table describes the fields in the output for the **show rmon network-host-stats** command.

| Parameter | Description |
|-----------|--|
| HOSTADDR | Shows the host address for this entry. |
| INPKT | Shows the number of packets without errors transmitted to this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| OUTPKT | Shows the number of packets without errors transmitted by this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| INOCT | Shows the number of octets transmitted to this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |

| Parameter | Description |
|------------|--|
| OUTOCT | Shows the number of octets transmitted by this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |
| CREATETIME | Shows when the entry was last activated. |

View RMON Protocol Distribution Statistics

View protocol distribution statistics to see traffic statistics that each protocol generates by local area network (LAN) segment.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON protocol distribution statistics:

```
show rmon protocol-dist-stats
```

Example

```
Switch:1# show rmon protocol-dist-stats
```

```

=====
                                Rmon Protocol Dist Stats
=====
PROTOCOL  PKTS      OCTETS
-----
IP         0          0
TCP        0          0
UDP        0          0
FTP        0          0
SSH        0          0
TELNET    0          0
HTTP       0          0
RLOGIN    0          0
TFTP       0          0
SNMP       0          0
HTTPS      0          0

```

Note

Protocol support can vary across platforms.

Displaying RMON Status

View the current RMON status on the switch.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View RMON status:

```
show rmon
```

Example

```
Switch:1# show rmon

RMON Info :
Status      : enable
```

View the RMON2 Configuration State of Management Interfaces

About This Task**Note**

This procedure does not apply to VSP 8600 Series.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. View information about the RMON2 configuration state:

```
show mgmt rmon
```

Example

```
Switch:1>show mgmt rmon
=====
Mgmt Rmon Information
=====
INST  DESCR  RMON-ADMIN-ENABLE  RMON-OPER-ENABLE  RMON-IP-ADDR
-----
1  Mgmt-oob1  disable  disable  0.0.0.0
3  Mgmt-clip  enable  enable  192.0.2.72
4  Mgmt-vlan  enable  enable  198.51.100.72
```

RMON Configuration Using EDM

This section contains procedures to configure RMON using Enterprise Device Manager (EDM).

For information about RMON statistics, see the following sections:

- [Enabling RMON Statistics](#) on page 3278
- [Viewing RMON Statistics](#) on page 3278

Enabling RMON Globally

About This Task

You must globally enable RMON before you can use RMON2 functions. If you attempt to enable an RMON2 function before the global flag is disabled, EDM informs you that the flag is disabled and prompts you to enable the flag. You can configure RMON1 while RMON is globally disabled.

If you want to use nondefault RMON parameter values, you can configure them before you enable RMON, or as you configure the RMON functions.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.

2. Click **Options**.
3. Click the **Options** tab.
4. Select the **Enable** check box.
5. In the **UtilizationMethod** option, select a utilization method.
6. Click **Apply**.

Options Field Descriptions

Use the data in the following table to use the **Options** tab.

| Name | Description |
|--------------------------|--|
| Enable | Enables RMON. If you select the Enable check box, the RMON agent starts immediately. To disable RMON, clear the Enable check box and click Apply to save the new setting to NVRAM, and then restart the device. The default is disabled. |
| UtilizationMethod | Controls whether RMON uses a half-duplex or full-duplex formula to calculate port usage. After you select halfDuplex, RMON uses InOctets and the speed of the port to calculate port usage (this is the standard RMON RFC1271 convention). After you select fullDuplex, RMON uses InOctets and OutOctets and 2X the speed of the port to calculate port usage. If you select fullDuplex, but the port operates in half-duplex mode, the calculation defaults to the RFC1271 convention. The default is halfDuplex. |

Enabling RMON on a Port or VLAN

Use the following procedure to enable RMON on an interface.

Before You Begin

- Enable RMON globally.

Procedure

1. Enable RMON on a VLAN:
 - a. In the navigation pane, expand the **Configuration > VLAN** folders.
 - b. Click **VLANs**.
 - c. Click the **Advanced** tab.
 - d. In the row for the VLAN, double-click the **RmonEnable** field, and then select **enable**.
 - e. Click **Apply**.
2. Enable RMON on a port:
 - a. In the Device Physical View, select a port.
 - b. In the navigation pane, expand the **Configuration > Edit > Port** folders.
 - c. Click **General**.
 - d. Click the **Interface** tab.
 - e. For the **RmonEnable** field, select **enable**.
 - f. Click **Apply**.

Enabling RMON1 History

About This Task

Use RMON1 to establish a history for a port and configure the bucket interval. For example, to gather RMON statistics over the weekend, you must have enough buckets to cover two days. Configure the history to gather one bucket every hour, and cover a 48-hour period. After you configure the history characteristics, you cannot modify them; you must delete the history and create another one.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Control**.
3. In the **History** tab, click **Insert**.
4. In the **Port** box, click the ellipsis (...) button.
5. Select a port.
6. Click **OK**.
7. In the **Buckets Requested** box, type the number of discrete time intervals to save data.
8. In the **Interval** box, type the interval in seconds.
9. In the **Owner** box, type the owner information.
10. Click **Insert**.

History Field Descriptions

Use the data in the following table to use the **History** tab.

| Name | Description |
|-------------------------|---|
| Index | Specifies an index that uniquely identifies an entry in the historyControl table. Each entry defines a set of samples at a particular interval for an interface on the device. Index value ranges from 1–65535. The default value is 1. |
| Port | Identifies the source for which the system collects and places historical data in a media-specific table on behalf of this historyControlEntry. The source is an interface on this device. To identify a particular interface, the object identifies the instance of the ifIndex object, defined in (4,6), for the desired interface. For example, if an entry receives data from interface 1, the object is ifIndex 1. The statistics in this group reflect all packets on the local network segment attached to the identified interface. You cannot modify this object if the associated historyControlStatus object is equal to valid(1). |
| BucketsRequested | Specifies the requested number of discrete time intervals over which the system save data in the part of the media-specific table associated with this historyControlEntry. After this object is created or modified, the probe configures historyControlBucketsGranted as closely to this object as possible for the particular probe implementation and available resources. Values range from 1–65535. The default value is 50. |

| Name | Description |
|-----------------------|---|
| BucketsGranted | Specifies the number of discrete sampling intervals over which the system save data in the part of the media-specific table associated with this historyControlEntry. After the associated BucketsRequested object is created or modified, the probe sets this object as closely to the requested value as possible for the particular probe implementation and available resources. The probe must not lower this value except as a result of a modification to the associated BucketsRequested object. Occasionally, the actual number of buckets associated with this entry is less than the value of this object. In this case, at the end of each sampling interval, the system adds a new bucket to the media-specific table. After the number of buckets reaches the value of this object and the system is going to add a new bucket to the media-specific table, the agent deletes the oldest bucket associated with this entry so the system can added the new bucket. After the value of this object changes to a value less than the current value, entries are deleted from the media-specific table associated with this entry. The agent deletes the oldest of these entries so that their number remains less than or equal to the new value of this object. After the value of this object changes to a value greater than the current value, the system allows the number of associated media-specific entries to grow. |
| Interval | Specifies the interval in seconds over which the system samples data for each bucket in the part of the media-specific table associated with this historyControlEntry. You can set this interval between 1-3600 seconds (1 hour). Because the counters in a bucket can overflow at their maximum value with no indication, you must take into account the possibility of overflow in all of the associated counters. Consider the minimum time in which a counter can overflow on a particular media type, and then set the historyControllInterval object to a value less than this interval, which is typically most important for the octets counter in a media-specific table. For example, on an Ethernet network, the etherHistoryOctets counter can overflow in approximately 1 hour at the maximum utilization. You cannot modify this object if the associated historyControlStatus object is equal to valid. The default value is 1800. |
| Owner | Specifies the entity that configured this entry and uses the assigned resources. |

Disabling RMON1 History

About This Task

Disable RMON1 history on a port if you do not want to record a statistical sample from that port.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Control**.
3. In the **History** tab, select the row that contains the port ID to delete.
4. Click **Delete**.

Viewing RMON1 History Statistics

View RMON1 history statistics when you want to see a statistical sample from the switch. You can create a graph of the statistics in a bar, pie, chart, or line format.

Procedure

1. In the Device Physical View, select a port.
2. In the navigation pane, expand the **Configuration > Graph** folders.
3. Click **Port**.
4. Click the **RMON History** tab.
5. Select the statistics you want to graph.
6. Click the button for the type of graph you require (bar, pie, chart, or line).

RMON History Field Descriptions

Use the data in the following table to use the **RMON History** tab.

Table 305: Variable definitions

| Parameter | Description |
|------------------------|---|
| SampleIndex | Identifies the particular sample this entry represents among all samples associated with the same history control entry. This index starts at one and increases by one as each new sample is taken. |
| Utilization | Specifies the best estimate of the mean physical layer network utilization on this interface during the sampling interval, in hundredths of a percent. |
| Octets | Specifies the total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets) |
| Pkts | Specifies the number of packets (including bad packets) received during this sampling interval. |
| BroadcastPkts | Specifies the number of good packets received during this sampling interval that were directed to the broadcast address. |
| MulticastPkts | Specifies the number of good packets received during this sampling interval that the system directs to a multicast address. This number does not include packets addressed to the broadcast address. |
| DropEvents | Specifies the total number of events in which the probe dropped packets due to lack of resources during this sampling interval. This number is not necessarily the number of packets dropped; it is only the number of times the system detects this condition. |
| CRCAAlignErrors | The number of packets the system receives during this sampling interval that had a length (excluding framing bits but including FCS octets) from 64–1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). |
| UndersizePkts | Specifies the number of packets the system receives during this sampling interval that were less than 64 octets (excluding framing bits but including FCS octets), and were otherwise well formed. |

Table 305: Variable definitions (continued)

| Parameter | Description |
|---------------------|---|
| OversizePkts | Specifies the number of packets the system receives during this sampling interval that were longer than 1518 octets (excluding framing bits but including FCS octets), but were otherwise well formed. |
| Fragments | Specifies the total number of packets received during this sampling interval that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
It is entirely normal for Fragments to increment because it counts both runs (which are normal occurrences due to collisions) and noise hits. |
| Collisions | Specifies the best estimate of the total number of collisions on this Ethernet segment during this sampling interval. The value returned depends on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision in the receive mode if three or more stations transmit simultaneously. A repeater port must detect a collision when two or more stations transmit simultaneously. Thus, a probe placed on a repeater port can record more collisions than a probe connected to a station on the same segment.
Probe location plays a small role when 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can detect only collisions when it transmits. Thus, probes placed on a station and a repeater can report the same number of collisions.
An RMON probe inside a repeater can ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected. |

Creating an RMON1 Alarm

After you enable RMON1 globally, you also create a default rising and falling event. The default for the events is log-and-trap, which means that you receive notification through a trap as well as through a log entry.

Before You Begin

- You must globally enable RMON.

Procedure

- In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
- Click **Alarms**.
- Click the **Alarms** tab.
- Click **Insert**.
- In the **Variable** option, select a variable for the alarm.

If you select some variables, the system will prompt you for a port (or other object) on which you want to set an alarm.

6. In the **SampleType** option, select a sample type.
7. In the **Interval** box, type a sample interval in seconds.
8. In the **Index** box, type an index number.
9. In the **RisingThreshold** box, type a rising threshold value.
10. In the **RisingEventIndex** box, type a rising threshold event index.
11. In the **FallingThreshold** box, type a falling threshold value.
12. In the **FallingEventIndex** box, type a falling threshold event index.
13. In the **Owner** box, type the owner of the alarm.
14. Click **Insert**.

Alarms Field Descriptions

Use the data in the following table to use the **Alarms** tab.

| Name | Description |
|-----------------|---|
| Index | Uniquely identifies an entry in the alarm table. Each entry defines a diagnostic sample at a particular interval for an object on the device. The default is 1. |
| Interval | Specifies the interval, in seconds, over which the data is sampled and compared with the rising and falling thresholds. deltaValue sampling—Configures the interval short enough that the sampled variable is unlikely to increase or decrease by more than $2^{31}-1$ during a single sampling interval. |
| Variable | <p>Specifies the object identifier of the particular variable to be sampled. Only variables that resolve to an ASN.1 primitive type of INTEGER (INTEGER, Counter, Gauge, or TimeTicks) can be sampled.</p> <p>Alarm variables exist in three formats, depending on the type:</p> <ul style="list-style-type: none"> • A chassis, power supply, or fan-related alarm ends in x where the x index is hard-coded. No further information is required. • A card, spanning tree group (STG), or EtherStat alarm ends with a dot (.). You must enter a card number, STG ID, IP address, or EtherStat information. • A port alarm ends with no dot or index and requires that you use the port shortcut menu. An example of a port alarm is ifInOctets (interface incoming octet count). <p>Because the system articulates SNMP access control entirely in terms of the contents of MIB views, no access control mechanism exists to restrict the value of this object to identify only those objects that exist in a particular MIB view. Because no acceptable means of restricting the read access that is obtained through the alarm mechanism exists, the probe must grant only write access to this object in those views that have read access to all objects on the probe.</p> <p>After you configure a variable, if the supplied variable name is not available in the selected MIB view, the system returns a badValue error. After the variable name of an established alarmEntry is no longer available in the selected MIB view, the probe changes the status of this alarmEntry to invalid. You cannot modify this object if the associated alarmStatus object is equal to valid.</p> |

| Name | Description |
|-------------------------|---|
| SampleType | Specifies the method of sampling the selected variable and calculating the value to be compared against the thresholds. If the value of this object is <code>absoluteValue</code> , the value of the system compares the selected variable directly with the thresholds at the end of the sampling interval. If the value of this object is <code>deltaValue</code> , the system subtracts the value of the selected variable at the last sample from the current value, and the system compares the difference with the thresholds. You cannot modify this object if the associated <code>alarmStatus</code> object is equal to <code>valid</code> . The default is <code>deltaValue</code> . |
| Value | Specifies the value of the statistic during the last sampling period. For example, if the sample type is <code>deltaValue</code> , this value is the difference between the samples at the beginning and end of the period. If the sample type is <code>absoluteValue</code> , this value is the sampled value at the end of the period. This system compares the value with the rising and falling thresholds. The value during the current sampling period is not made available until the period is completed and remains available until the next period is complete. |
| StartupAlarm | Specifies the alarm that is sent after this entry is first set to <code>valid</code> . If the first sample after this entry becomes <code>valid</code> is greater than or equal to the <code>risingThreshold</code> and <code>alarmStartupAlarm</code> is equal to the <code>risingAlarm</code> or the <code>risingOrFallingAlarm</code> , then the system generates a single rising alarm. If the first sample after this entry becomes <code>valid</code> is less than or equal to the <code>fallingThreshold</code> and <code>alarmStartupAlarm</code> is equal to the <code>fallingAlarm</code> or the <code>risingOrFallingAlarm</code> , then the system generates a single falling alarm. You cannot modify this object if the associated <code>alarmStatus</code> object is equal to <code>valid</code> . |
| RisingThreshold | Specifies a threshold for the sampled statistic. After the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, the system generates a single event. The system also generates a single event if the first sample after this entry becomes <code>valid</code> is greater than or equal to this threshold and the associated <code>alarmStartupAlarm</code> is equal to <code>risingAlarm</code> or <code>risingOrFallingAlarm</code> . After a rising event is generated, another such event is not generated until the sampled value falls below this threshold and reaches the <code>alarmFallingThreshold</code> . You cannot modify this object if the associated <code>alarmStatus</code> object is equal to <code>valid</code> . |
| RisingEventIndex | Specifies the index of the <code>eventEntry</code> that is used after a rising threshold is crossed. The <code>eventEntry</code> identified by a particular value of this index is the same as identified by the same value of the <code>eventIndex</code> object. If no corresponding entry exists in the <code>eventTable</code> , no association exists. In particular, if this value is zero, the system generates no associated event, as zero is not a valid event index. You cannot modify this object if the associated <code>alarmStatus</code> object is equal to <code>valid</code> .

Note:
You must create the event prior to associating it to an alarm. |

| Name | Description |
|--------------------------|---|
| FallingThreshold | Specifies a threshold for the sampled statistic. If the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, the system generates a single event. The system also generates a single event if the first sample after this entry becomes valid is less than or equal to this threshold and the associated alarmStartupAlarm is equal to fallingAlarm or risingOrFallingAlarm. After the system generates a falling event, the system does not generate another similar event until the sampled value rises above this threshold and reaches the alarmRisingThreshold. You cannot modify this object if the associated alarmStatus object is equal to valid. |
| FallingEventIndex | Specifies the index of the eventEntry that the system uses after a falling threshold is crossed. The eventEntry identified by a particular value of this index is the same as identified by the same value of the eventIndex object. If there is no corresponding entry in the eventTable, no association exists. In particular, if this value is zero, the system generates no associated event, as zero is not a valid event index. You cannot modify this object if the associated alarmStatus object is equal to valid.

Note:
You must create the event prior to associating it to an alarm. |
| Owner | Specifies the entity that configured this entry and is therefore using the resources assigned to it. |
| Status | Specifies the status of this alarm entry. |

Viewing RMON1 Alarms

View the RMON1 alarm information to see alarm activity.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Alarms**.
3. Click the **Alarm** tab.

Deleting an RMON1 Alarm

Delete an RMON1 alarm if you no longer want it to appear in the log.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Alarms**.
3. Select the alarm you must delete.
4. Click **Delete**.

Creating an RMON1 Event

Create a custom rising and falling RMON1 event to specify if alarm information is sent to a trap, a log, or both.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Alarms**.
3. Click the **Events** tab.
4. Click **Insert**.
5. In the **Description** box, type an event name.
6. In the **Type** option, select an event type.

The default configuration is log-and-trap. To save memory, configure the event type to log. To reduce traffic from the system, configure the event type to snmp-log.

If you select snmp-trap or log, you must configure trap receivers.

7. In the **Community** box, type an SNMP community.
8. In the **Owner** box, type the owner of this event.
9. Click **Insert**.

Events Field Descriptions

Use the data in the following table to use the **Events** tab.

| Name | Description |
|---------------------|---|
| Index | Uniquely identifies an entry in the event table. Each entry defines one event that the system generates after the appropriate conditions occur. The default is 1. |
| Description | Specifies a comment that describes this event entry. |
| Type | Specifies the type of notification that the probe makes about this event. In the case of a log, the system makes an entry in the log table for each event. In the case of SNMP traps, the system sends an SNMP trap to one or more management stations. |
| Community | Specifies the SNMP community where you can send SNMP traps. |
| LastTimeSent | Specifies the value of sysUpTime at the time this event entry last generated an event. If this entry has not generated events, this value is zero. |
| Owner | Specifies the entity that configured this entry and is therefore using the assigned resources. If this object contains a string starting with monitor and has associated entries in the log table, all connected management stations retrieve those log entries, as they have significance to all management stations connected to this device. |

Viewing RMON1 Events

View RMON1 events to see how many events occurred.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.

2. Click **Alarms**.
3. Click the **Events** tab.

Events Field Descriptions

Use the data in the following table to use the **Events** tab.

| Name | Description |
|---------------------|---|
| Index | Uniquely identifies an entry in the event table. Each entry defines one event that the system generates after the appropriate conditions occur. The default is 1. |
| Description | Specifies a comment that describes this event entry. |
| Type | Specifies the type of notification that the probe makes about this event. In the case of a log, the system makes an entry in the log table for each event. In the case of SNMP traps, the system sends an SNMP trap to one or more management stations. |
| Community | Specifies the SNMP community where you can send SNMP traps. |
| LastTimeSent | Specifies the value of sysUpTime at the time this event entry last generated an event. If this entry has not generated events, this value is zero. |
| Owner | Specifies the entity that configured this entry and is therefore using the assigned resources. If this object contains a string starting with monitor and has associated entries in the log table, all connected management stations retrieve those log entries, as they have significance to all management stations connected to this device. |

Deleting an Event

Delete an event after you no longer require the alarm information.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Alarms**.
3. Click the **Events** tab.
4. Select the event you must delete.
5. Click **Delete**.

Viewing the RMON Log

About This Task

View the trap log to see which activity occurred.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Alarms**.
3. Click the **Log** tab.

Log Field Descriptions

Use the data in the following table to use the **Log** tab.

| Name | Description |
|--------------------|---|
| EventIndex | Specifies an index that uniquely identifies an entry in the event table. Each entry defines one event that is generated under appropriate conditions. |
| Index | Specifies an index that uniquely identifies an entry in the log table generated by the same event entries. |
| Time | Specifies the creation time for this log entry. |
| Description | Specifies an implementation dependent description of the event that activated this log entry. |

View the Protocol Directory

View the protocol directory to see the list of protocols that RMON2 can monitor. You cannot change the list of protocols.

About This Task

The protocol directory MIB is enabled by default for the predefined protocols.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Protocol Directory**.
3. Click the **Protocol Directories** tab.

Protocol Directories Field Descriptions

The following table defines parameters for the **Protocol Directories** tab.

| Name | Description |
|---|--|
| Index | Shows a unique identifier for the entry in the table. |
| Protocol

Note:
Exception: rlogin application is only supported on VSP 8600 Series. However, RMON2 counts application packets received on any platform on which the application is not enabled or supported, before dropping them. | Shows the protocols RMON2 can monitor: <ul style="list-style-type: none"> • Internet Protocol (IP) • Secure Shell version 2 (SSHv2) • Transmission Control Protocol (TCP) • User Datagram Protocol (UDP) • File Transfer Protocol (FTP) • Hypertext Transfer Protocol (HTTP) • Telnet • Remote login (rlogin) • Trivial File Transfer Protocol (TFTP) • Simple Networking Management Protocol (SNMP) |

| Name | Description |
|-------------------------|---|
| AddressMapConfig | Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following: <ul style="list-style-type: none"> notSupported supportedOff supportedOn If the value is supportedOn, the probe adds entries to the Address Map tab that maps the network layer address to the MAC layer address. |
| HostConfig | Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following: <ul style="list-style-type: none"> notSupported supportedOff supportedOn If the value is supportedOn, the probe adds entries to the Host Control tab to collect statistics for network layer and application layer hosts. |
| MatrixConfig | Describes and configures the probe support for the network layer and application layer host tables for this protocol. The value can be one of the following: <ul style="list-style-type: none"> notSupported supportedOff supportedOn |
| Owner | Shows the entity that configured this entry. |

Viewing the Data Source for Protocol Distribution Statistics

View the Distribution Control tab to see the network segment data source on which the protocol distribution statistics are measured. The management IP mentioned as a data source represents the IP that the SNMP agent uses to access the switch.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Protocol Distribution**.
3. Click the **Distribution Control** tab.

Distribution Control Field Descriptions

Use the data in the following table to use the **Distribution Control** tab.

| Name | Description |
|----------------------|---|
| Index | Shows a unique identifier for the entry in the table. |
| DataSource | Specifies the source of data for this protocol distribution. |
| DroppedFrames | Shows the total number of frames that the probe receives and drops but does not include in the StatsDropEvents value. This event can occur if the probe is out of resources and sheds the load from this collection. This value does not include packets that were not counted because they had MAC-layer errors. |
| CreateTime | Shows the value of the sysUpTime when the entry was last activated. |
| Owner | Shows the entity that configured this entry. |

Viewing Protocol Distribution Statistics

View protocol distribution statistics to see traffic statistics that each protocol generates by local area network (LAN) segment.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Protocol Distribution**.
3. Click the **Distribution Stats** tab.

Distribution Stats Field Descriptions

Use the data in the following table to use the **Distribution Stats** tab.

| Name | Description |
|-------------------|---|
| LocalIndex | Identifies the protocol distribution an entry is part of, as well as the particular protocol that it represents. |
| Pkts | Shows the number of packets without errors received for this protocol type. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| Octets | Shows the number of octets in packets received for this protocol type since it was added to the table. This value does not include octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |

Viewing the Host Interfaces Enabled for Monitoring

View the entries in the address map control tab to see which host interfaces are enabled for monitoring on the switch. Each entry in this table enables the discovery of addresses on a new interface.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Address Map**.
3. Click the **Address Map Control** tab.

Address Map Control Field Descriptions

Use the data in the following table to use the **Address Map Control** tab.

| Name | Description |
|----------------------|---|
| Index | Shows a unique identifier for the entry in the table. |
| DataSource | Shows the source of data for the entry. |
| DroppedFrames | Shows the total number of frames that the probe receives and drops but does not include in the StatsDropEvents value. This event can occur if the probe is out of resources and sheds the load from this collection. This value does not include packets that were not counted because they had MAC-layer errors. |
| Owner | Shows the entity that configured this entry. |

Viewing Address Mappings

View the mappings of network layer address to physical address to interface.

About This Task

The probe adds entries on this tab based on the source MAC and network addresses in packets without MAC-level errors.

The probe populates this table for all protocols on the **Protocol Directories** tab with a value of **AddressMapConfig** equal to **supportedOn**.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Address Map**.
3. Click the **Address Map** tab.

Address Map Field Descriptions

Use the data in the following table to use the **Address Map** tab.

| Name | Description |
|------------------------|--|
| LocalIndex | Shows a unique identifier for the entry in the table. |
| HostAddress | Shows the network address for this entry. The format of the value depends on the protocol portion of the local index. |
| Source | Shows the interface or port on which the network address was most recently seen. |
| PhysicalAddress | Shows the physical address on which the network address was most recently seen. |
| LastChange | Shows the value of the sysUpTime when the entry was created or last changed. If this value changes frequently, it can indicate duplicate address problems. |

Viewing the Data Source for Host Statistics

View the Host Control tab to see the data source for both network layer and application layer host statistics.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Network Layer Host**.
3. Click the **Host Control** tab.

Host Control Field Descriptions

Use the data in the following table to use the **Host Control** tab.

| Name | Description |
|---------------------|---|
| Index | Shows a unique identifier for the entry in the table. |
| DataSource | Shows the source of data for the associated host table. The statistics in this group reflect all packets on the local network segment that attaches to the identified interface. |
| NHDropFrames | Shows the total number of frames that the probe receives and drops but does not include in the StatsDropEvents value. This event can occur if the probe is out of resources and sheds the load from this collection. This value does not include packets that were not counted because they had MAC-layer errors. |

| Name | Description |
|---------------------|---|
| AHDropFrames | Shows the total number of frames that the probe receives and drops but does not include in the StatsDropEvents value. This event can occur if the probe is out of resources and sheds the load from this collection. This value does not include packets that were not counted because they had MAC-layer errors. |
| Owner | Shows the entity that configured this entry. |

Viewing Network Host Statistics

View network host statistics to see Layer 3 traffic statistics for each host. The network layer host MIB monitors traffic packets in and out of hosts based on the network layer address.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Network Layer Host**.
3. Click the **Network Host Stats** tab.

Network Host Stats Field Descriptions

Use the data in the following table to use the **Network Host Stats** tab.

| Name | Description |
|--------------------|--|
| LocalIndex | Shows a unique identifier for the entry in the table. |
| HostAddress | Shows the host address for this entry. |
| InPkts | Shows the number of packets without errors transmitted to this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| OutPkts | Shows the number of packets without errors transmitted by this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| InOctets | Shows the number of octets transmitted to this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |

| Name | Description |
|-------------------|--|
| OutOctets | Shows the number of octets transmitted by this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |
| CreateTime | Shows the value of the sysUpTime when the entry was last activated. |

Viewing Application Host Statistics

View application host statistics to see traffic statistics by application protocol for each host.

Procedure

1. In the navigation pane, expand the **Configuration > Serviceability > RMON** folders.
2. Click **Application Layer Host**.
3. Click the **Application Host Stats** tab.

Application Host Stats Field Descriptions

Use the data in the following table to use the **Application Host Stats** tab.

| Name | Description |
|--------------------|---|
| Index | Shows a unique identifier for the entry in the table. |
| HostAddress | Identifies the network layer address of this entry. |
| LocalIndex | Identifies the network layer protocol of the address. |
| InPkts | Shows the number of packets for this protocol type, without errors, transmitted to this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| OutPkts | Shows the number of packets for this protocol type, without errors, transmitted by this address. This value is the number of link-layer packets so a single, fragmented network-layer packet can increment the counter several times. |
| InOctets | Shows the number of octets transmitted to this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |

| Name | Description |
|-------------------|--|
| OutOctets | Shows the number of octets transmitted by this address, excluding octets in packets that contained errors. This value counts octets in the entire packet that contained the protocol, not just the particular protocol frames. |
| CreateTime | Shows the value of the sysUpTime when the entry was last activated. |

RMON Alarm Variables

RMON alarm variables are divided into three categories. Each category has subcategories.

The following table lists the alarm variable categories and provides a brief variable description.

Table 306: RMON alarm variables

| Category | Subcategory | Variable | Definition |
|----------|-------------|----------------------------|--|
| Security | | rcCliNumAccessViolations.0 | The number of CLI access violations detected by the system. |
| | | rcWebNumAccessBlocks.0 | The number of accesses the Web server blocked. |
| | | snmpInBadCommunityNames.0 | The total number of SNMP messages delivered to the SNMP protocol entity that represented an SNMP operation not allowed by the SNMP community named in the message. |
| Errors | Interface | ifInDiscards | The number of inbound packets discarded even though no errors were detected to prevent the packets being deliverable to a higher-layer protocol. One possible reason for discarding a packet is to free buffer space. |
| | | ifInErrors | For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors, preventing them from being deliverable to a higher-layer protocol. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|--------------------------|---|
| | | ifOutDiscards | The number of outbound packets discarded even though no errors were detected to prevent the packets being transmitted. One possible reason for discarding such a packet is to free buffer space. |
| | | ifOutErrors | For packet-oriented interfaces, the number of outbound packets that were not transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that were not transmitted because of errors. |
| | Ethernet | dot3StatsAlignmentErrors | A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the Frame Check Sequence (FCS) check. The count represented by an instance of this object increments when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions exist are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|----------------------------------|---|
| | | dot3StatsFCSErrors | A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. The count represented by an instance of this object increments when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions occur are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. |
| | | dot3StatsSingleCollisionFrames | A count of successfully transmitted frames on a particular interface where transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts object, the ifOutMulticastPkts object, or the ifOutBroadcastPkts object, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. |
| | | dot3StatsMultipleCollisionFrames | A count of successfully transmitted frames on a particular interface where transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts object, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|--------------------------------|---|
| | | dot3StatsSQETestErrors | A count of times that the SQE TEST ERROR message is generated by the PLS sublayer for a particular interface. The SQE TEST ERROR message is defined in section 7.2.2.2.4 of ANSI/IEEE 802.3-1985 and its generation is described in section 7.2.4.6 of the same document. |
| | | dot3StatsDeferredTransmissions | A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. |
| | | dot3StatsLateCollisions | The number of times that a collision is detected on a particular interface later than 512 bit-times into the transmission of a packet; 512 bit-times corresponds to 51.2 microseconds on a 10 Mb/s system. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. |
| | | dot3StatsExcessiveCollisions | A count of frames where the transmission on a particular interface fails due to excessive collisions. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|------------------------------------|---|
| | | dot3StatsInternalMacTransmitErrors | <p>A count of frames where the transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object.</p> <p>The precise meaning of the count represented by an instance of this object is implementation specific. In particular, an instance of this object can represent a count of transmission errors on a particular interface that are not otherwise counted.</p> |
| | | dot3StatsCarrierSenseErrors | <p>The number of times the carrier sense condition was lost or never asserted when the switch attempted to transmit a frame on a particular interface. The count represented by an instance of this object increments at most once for each transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt.</p> |
| | | dot3StatsFrameTooLongs | <p>A count of frames received on a particular interface that exceeds the maximum permitted frame size. The count represented by an instance of this object increments when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtained are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.</p> |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|-----------------------------------|---|
| | | dot3StatsInternalMacReceiveErrors | <p>A count of frames where the transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is counted by an instance of this object only if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object.</p> <p>The precise meaning of the count represented by an instance of this object is implementation-specific. In particular, an instance of this object can represent a count of transmission errors on a particular interface that are not otherwise counted.</p> |
| | IP | ipInHdrErrors.0 | The number of input datagrams discarded due to errors in the datagram IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, and errors discovered in processing IP options. |
| | | ipInDiscards.0 | The number of discarded input IP datagrams where no problems were encountered to prevent continued processing. An example of why they were discarded can be lack of buffer space. This counter does not include any datagrams discarded while awaiting reassembly. |
| | | ipOutDiscards.0 | The number of output IP datagrams where no problems were encountered to prevent transmission to the destination, but that were discarded (for example, for lack of buffer space). This counter includes datagrams counted in ipForwDatagrams if packets meet this (discretionary) discard criterion. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|----------------------------------|---|
| | | ipFragFails.0 | The number of IP datagrams discarded because they needed to be fragmented at this entity but were not, for example, because the Don't Fragment flag was set. |
| | | ipReasmFails.0 | The number of failures detected by the IP reassembly algorithm (for whatever reason: timed out, errors, and so forth). This is not necessarily a count of discarded IP fragments because some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received. |
| | | icmpInParmProbs.0 | The number of ICMP In parameter problem messages received. |
| | | icmpOutParmProbs.0 | The number of ICMP Out parameter problem messages received. |
| | MLT | rcStatMltEtherAlignmentErrors | The number of frames received on an MLT that are not an integral number of octets in length, but do not pass the FCS check. |
| | | rcStatMltEtherFCSErrors | The number of frames received on an MLT that are an integral number of octets in length, but do not pass the FCS check. |
| | | rcStatMltEtherSingleCollFrames | The number of successfully transmitted frames on a particular MLT where transmission is inhibited by exactly one collision. |
| | | rcStatMltEtherMultipleCollFrames | The number of successfully transmitted frames on a particular MLT where transmission is inhibited by more than one collision. |
| | | rcStatMltEtherSQETestError | A count of times that the SQE TEST ERROR message is generated by the PLS sublayer for a particular MLT. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|---------------------------------|--|
| | | rcStatMltEtherDeferredTransmiss | A count of frames where the first transmission attempt on a particular MLT is delayed because the medium is busy. The count represented by an instance of this object. |
| | | rcStatMltEtherLateCollisions | The number of times that a late collision is detected on a particular MLT later than 512 bit-times into the transmission of a packet; 512-bit-times corresponds to 51.2-microseconds on a 10 Mb/s system. |
| | | rcStatMltEtherExcessiveCollis | The number of times that excessive collisions are detected on a particular MLT later than 512 bit-times into the transmission of a packet; 512 bit-times corresponds to 51.2 microseconds on a 10-Mb/s system. |
| | | rcStatMltEtherMacTransmitError | A count of frames where the transmission on a particular MLT fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the LateCollisions object, the ExcessiveCollisions object, or the CarrierSenseErrors object. |
| | | rcStatMltEtherCarrierSenseError | The number of times the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular MLT. The count represented by an instance of this object increments at most once for each transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|-------------------------------|--|
| | | rcStatMltEtherFrameTooLong | A count of frames received on a particular MLT that exceeds the maximum permitted frame size. The count represented by an instance of this object increments when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). |
| | | rcStatMltEtherMacReceiveError | A count of frames for which reception on a particular MLT fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the FrameTooLongs object, the AlignmentErrors object, or the FCSErrors object. |
| | Other | rcTblArNoSpace | The number of entries not added to the address translation table due to lack of space. |
| | | snmplnAsnParseErrs.0 | The total number of ASN.1 or BER errors encountered by the SNMP protocol entity when it decodes received SNMP messages. |
| | | rcStgPortInBadBpdus | The number of bad BPDUs received by this port. |
| | | dot1dTpPortInDiscards | Count of valid frames received that were discarded (that is, filtered) by the forwarding process. |
| Traffic | Interface | ifInOctets | The total number of octets received on the interface, including framing characters. |
| | | ifInMulticastPkts | The number of packets, delivered by this sublayer to a higher sublayer, that are addressed to a multicast address at this sublayer. For a MAC layer protocol, this number includes both Group and Functional addresses. |
| | | ifInBroadcastPkts | The number of packets, delivered by this sublayer to a higher (sub) layer, that are addressed to a broadcast address at this sublayer. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|--------------------|---|
| | | ifInUnkownProtos | For packet-oriented interfaces, the number of packets received through the interface that are discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing, the number of transmission units received through the interface that are discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter is always 0. |
| | | ifOutOctets | The total number of octets transmitted from the interface, including framing characters. |
| | | ifOutMulticastPkts | The total number of packets that higher-level protocols requested be transmitted, and that are addressed to a multicast address at this sublayer, including those that are discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. |
| | | ifoutBroadcastPkts | The total number of packets that higher level protocols requested transmitted, and that were addressed to a broadcast address at this sublayer, including those discarded or not sent. |
| | | ifLastChange | The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last reinitialization of the local network management subsystem, this object contains a value of zero. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-----------------|---------------------------|--|
| | RmonEther Stats | etherStatsOctets | The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). Use this object as a reasonable estimate of Ethernet utilization. For greater precision, sample the etherStatsPkts and etherStatsOctets objects before and after a common interval. |
| | | etherStatsPkts | The total number of packets (including bad packets, broadcast packets, and multicast packets) received. |
| | | etherStatsBroadcastPkts | The total number of good packets received that are directed to the broadcast address. This number does not include multicast packets. |
| | | etherStatsMulticastPkts | The total number of good packets received that are directed to a multicast address. This number does not include packets directed to the broadcast address. |
| | | etherStatsCRCAAlignErrors | The total number of packets received that had a length (excluding framing bits, but including FCS octets) of 64 to 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). |
| | | etherStatsUndersizePkts | The total number of packets received that are less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed. |
| | | etherStatsOversizePkts | The total number of packets received that are longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|----------------------|--|
| | | etherStatsFragments | The total number of packets received that are less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). It is entirely normal for etherStatsFragments to increment because it counts both runts (which are normal occurrences due to collisions) and noise hits. |
| | | etherStatsCollisions | The best estimate of the total number of collisions on this Ethernet segment. |
| | IP | ipInReceives.0 | All incoming IP packets. |
| | | ipInAddrErrors.0 | The number of bad IP destination addresses. |
| | | ipForwDatagrams.0 | IP packets forwarded. |
| | | ipInUnknownProtos.0 | Number of unsupported IP protocols. |
| | | ipInDelivers.0 | The number of IP In packets delivered. |
| | | ipOutRequests.0 | The total number of IP datagrams that local IP user protocols supplied to IP in request for transmission. |
| | | ipOutNoRoutes.0 | The number of IP datagrams discarded because no route was found to transmit to the destination. |
| | | ipFragOKs.0 | The number of IP datagrams successfully fragmented. |
| | | ipFragCreates.0 | The number of IP datagram fragments generated as a result of fragmentation. |
| | | ipReasmReqds.0 | The number of requests to reassemble fragments. |
| | | ipReasmOKs.0 | The number of fragments reassembled successfully. |
| | ICMP | icmpInSrcQuenchs.0 | The number of ICMP Source Quench messages received. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|-------------------------|---|
| | | icmpInRedirects.0 | The number of ICMP redirect messages. |
| | | icmpInEchos.0 | The number of ICMP Echo requests messages received. |
| | | icmpInEchosReps.0 | The number of ICMP Echo reply messages received. |
| | | icmpInTimeStamps.0 | The number of ICMP timestamp request messages received. |
| | | icmpInTimeStampsReps.0 | The number of ICMP timestamp reply messages received. |
| | | icmpInAddrMasks.0 | The number of ICMP mask request messages reviewed. |
| | | icmpInAddrMasksReps.0 | The number of ICMP mask reply messages reviewed. |
| | | icmpInDestUnreachs.0 | The number of ICMP destinations unreachable messages received. |
| | | icmpInTimeExcds.0 | The number of ICMP Time Exceeded messages received. |
| | | icmpOutSrcQuenchs.0 | The number of ICMP Source Quench messages sent. |
| | | icmpOutRedirects.0 | The number of ICMP redirect messages sent. |
| | | icmpOutEchos.0 | The number of ICMP Echo request messages sent. |
| | | icmpOutEchosReps.0 | The number of ICMP Echo reply messages sent. |
| | | icmpOutTimeStamps.0 | The number of ICMP Timestamp request messages sent. |
| | | icmpOutTimeStampsReps.0 | The number of ICMP Timestamp reply messages sent. |
| | | icmpOutAddrMasks.0 | The number of ICMP Address mask messages sent. |
| | | icmpOutAddrMasksReps.0 | The number of ICMP Address mask reply messages sent. |
| | | icmpOutDestUnreachs.0 | The number of ICMP destination unreachable messages sent. |
| | | icmpOutTimeExcds.0 | The number of ICMP time exceeded messages sent. |
| | Snmp | snmpInPkts.0 | The total number of messages delivered to the SNMP entity from the transport service. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|--------------------------|---|
| | | snmpOutPkts.0 | The total number of SNMP messages passed from the SNMP protocol entity to the transport service. |
| | | snmplnBadVersions.0 | The total number of SNMP messages delivered to the SNMP protocol entity that were intended for an unsupported SNMP version. |
| | | snmplnBadCommunityUses.0 | The total number of SNMP messages delivered to the SNMP protocol entity that represented an SNMP operation that was not allowed by the SNMP community named in the message. |
| | | snmplnTooBigs.0 | The total number of SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is tooBig. |
| | | snmplnNoSuchNames.0 | The total number of SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is noSuchName. |
| | | snmplnBadValues. 0 | The total number of SNMP PDUs received that were generated by the SNMP protocol entity and for which the value of the error-status field is badValue. |
| | | snmplnReadOnlys.0 | The total number of valid SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is readOnly. It is a protocol error to generate an SNMP PDU that contains the value readOnly in the error-status field; as such, this object is provided as a means of detecting incorrect implementations of the SNMP. |
| | | snmplnGenErrs.0 | The total number of SNMP PDUs delivered to the SNMP protocol entity and for which the value of the error-status field is genErr. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|----------------------|---|
| | | snmpInTotalReqVars.0 | The total number of MIB objects retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs. |
| | | snmpInTotalSetVars.0 | The total number of MIB objects altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs. |
| | | snmpInGetRequests.0 | The total number of SNMP Get-Request PDUs accepted and processed by the SNMP protocol entity. |
| | | snmpInGetNexts.0 | The total number of SNMP Get-Next PDUs accepted and processed by the SNMP protocol entity. |
| | | snmpInSetRequests.0 | The total number of SNMP Set-Request PDUs accepted and processed by the SNMP protocol entity. |
| | | snmpInGetResponses.0 | The total number of SNMP Get-Response PDUs accepted and processed by the SNMP protocol entity. |
| | | snmpInTraps.0 | The total number of SNMP Trap PDUs accepted and processed by the SNMP protocol entity. |
| | | snmpOutTooBigs.0 | The total number of SNMP PDUs generated by the SNMP protocol entity and for which the value of the error-status field is tooBig. |
| | | snmpOutNoSuchNames.0 | The total number of SNMP PDUs generated by the SNMP protocol entity and for which the value of the error-status field is noSuchName. |
| | | snmpOutBadValues.0 | The total number of SNMP PDUs sent that were generated by the SNMP protocol entity and for which the value of the error-status field is badValue. |
| | | snmpOutGenErrs.0 | The total number of SNMP PDUs generated by the SNMP protocol entity and for which the value of the error-status field is genErr. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|------------------------------|---|
| | | snmpOutGetRequests.0 | The total number of SNMP Get-Request PDUs generated by the SNMP protocol entity. |
| | | snmpOutGetNexts.0 | The total number of SNMP Get-Next PDUs generated by the SNMP protocol entity. |
| | | snmpOutSetRequests.0 | The total number of SNMP Set-Request PDUs generated by the SNMP protocol entity. |
| | | snmpOutGetResponses.0 | The total number of SNMP Get-Response PDUs generated by the SNMP protocol entity. |
| | | snmpOutTraps.0 | The total number of SNMP Trap PDUs generated by the SNMP protocol entity. |
| | Bridge | rcStgTimeSinceTopologyChange | The time (in hundredths of a second) since the last topology change was detected by the bridge entity. |
| | | rcStgTopChanges | The total number of topology changes detected by this bridge since the management entity was last reset or initialized. |
| | | rcStgMaxAge | The maximum age of Spanning Tree Protocol information learned from the network on any port before it is discarded, in hundredths of a second. This is the actual value that this bridge is currently using. |
| | | rcStgPortForwardTransitions | The number of times this port transitioned from the Learning state to the Forwarding state. |
| | | rcStgPortInConfigBpdus | The number of Config BPDUs received by this port. |
| | | rcStgPortInTcnBpdus | The number of Topology Change Notification BPDUs received by this port. |
| | | rcStgPortOutConfigBpdus | The number of Config BPDUs transmitted by this port. |
| | | rcStgPortOutTcnBpdus | The number of Topology Change Notification BPDUs transmitted by this port. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|----------------------------------|--|
| | | dot1dTpPortInFrames | The number of frames received by this port from its segment. A frame received on the interface corresponding to this port is counted by this object only if it is for a protocol being processed by the local bridging function, including bridge management frames. |
| | | dot1dTpPortOutFrames | The number of frames transmitted by this port to its segment. A frame transmitted on the interface corresponding to this port is counted by this object if and only if it is for a protocol processed by the local bridging function, including bridge management frames. |
| | | dot1dTpLearnedEntryDiscards.0 | The total number of Forwarding Database entries learned but discarded due to a lack of space to store them in the Forwarding Database. If this counter increases, it indicates that the forwarding database is regularly becoming full (a condition that has negative performance effects on the subnetwork). If this counter has a significant value but does not increase, it indicates that the problem occurred but is not persistent. |
| | Utilization | rcSysBufferUtil.0 | Buffer utilization as a percentage of the total amount of buffer space in the system. A high value indicates congestion. |
| | | rcSysNVRamUsed.0 | Nonvolatile RAM (NVRAM) in use in kilobytes. |
| | | rcSysLastChange.0 | Last management-initiated configuration change since sysUpTime. |
| | | rcSysLastVlanChange.0 | Last management-initiated VLAN configuration change since sysUpTime. |
| | MLT | rcStatMltIfExtnIfInMulticastPkts | The total number of multicast packets delivered to this MLT interface. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|-----------------------------------|--|
| | | rcStatMltIfExtnIfInBroadcastPkts | The total number of broadcast packets delivered to this MLT Interface. |
| | | rcStatMltIfExtnIfOutMulticastPkts | The total number of MLT interface multicast packets delivered to this MLT interface. |
| | | rcStatMltIfExtnIfOutBroadcastPkts | The total number of MLT interface broadcast packets delivered to this MLT interface. |
| | | rcStatMltIfExtnIfHCInOctets | The total number of octets received on this MLT interface including framing characters detected by the high-count (64-bit) register. |
| | | rcStatMltIfExtnIfHCInUcastPkts | The number of packets delivered by this MLT interface to a higher MLT that were not addressed to a multicast or broadcast address as detected by the high-count (64-bit) register. |
| | | rcStatMltIfExtnIfHCInMulticastPkt | The total number of multicast packets delivered to this MLT interface detected by the high-count (64-bit) register. |
| | | rcStatMltIfExtnIfHCInBroadcastPkt | The total number of broadcast packets delivered to this MLT interface detected by the high-count (64-bit) register. |
| | | rcStatMltIfExtnIfHCOctets | The total number of octets transmitted from the MLT interface, including framing characters. |
| | | rcStatMltIfExtnIfHCOutUcastPkts | The number of packets transmitted by this MLT interface to a higher MLT that were not addressed to a multicast or broadcast address as detected by the high-count (64-bit) register. |

Table 306: RMON alarm variables (continued)

| Category | Subcategory | Variable | Definition |
|----------|-------------|---------------------------------|--|
| | | rcStatMltIfExtnIfHCOutMulticast | The total number of packets that higher-level protocols requested be transmitted, and that were addressed to a multicast address at this sublayer, including those that were discarded or not sent registered by the high-count (64-bit) register. |
| | | rcStatMltIfExtnIfHCOutBroadcast | The total number of packets that higher-level protocols requested be transmitted, and that were addressed to a broadcast address at this sublayer, including those that were discarded or not sent registered by the high-count (64-bit) register. |

Note

In addition to these elements that are offered in a graphical way by EDM, you can manually set any valid OID in the variable field to be monitored by an alarm. For these cases, the name of the variable cannot be translated automatically in OID, the exact OID must be set as a sequence of numbers.

Route Filtering and IP Policies

When the switch routes IP traffic, you can apply a number of filters to manage, accept, redistribute, and announce policies for unicast routing table information. Filters apply differently to different unicast routing protocols.

Note

IPv6 ingress QoS ACL/Filters and IPv6 Egress Security and QoS ACL/Filters are not supported. For information on the maximum number of IPv6 ingress port/vlan security ACL/filters supported on the switch, see [Release Notes for VOSS](#).

The following figure shows how filters apply to BGP, RIP, and OSPF protocols.

Figure 219: Route filtering for BGP, RIP, and OSPF routing protocols

The following figure shows how filters apply to the IS-IS protocol for Fabric Connect Layer 3 VSNs or IP Shortcuts.

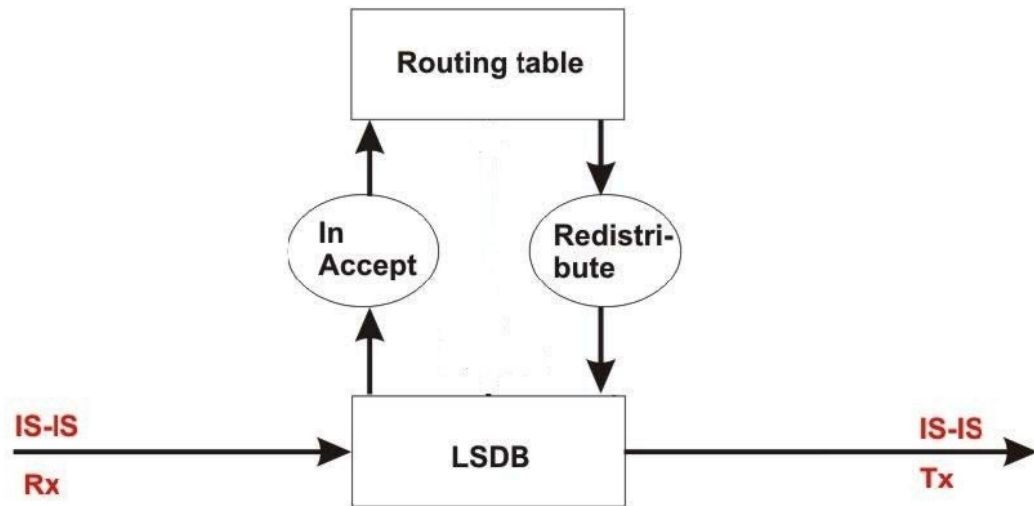

Figure 220: Route filtering for the IS-IS routing protocol

Accept Policies

Accept policies are applied to incoming traffic to determine whether to add the route to the routing table. Accept policies are applied differently to protocols, as follows:

- RIP and BGP—filters apply to all incoming route information.

- OSPF—filters apply only to external route information. Internal routing information is not filtered because otherwise, other routers in the OSPF domain can have inconsistent databases that can affect the router view of the network topology.
- IS-IS —filters apply to all incoming route information.

In a network with multiple routing protocols, you can prefer specific routes from RIP instead of from OSPF. The network prefix is a commonly used match criterion for accept policies.

Redistribution Filters

Redistribution filters notify changes in the route table to the routing protocol (within the device). With redistribution filters, providing you do not breach the protocol rules, you can choose not to advertise everything that is in the protocol database, or you can summarize or suppress route information. By default, no external routes are leaked to protocols that are not configured.

Announce Policies

Announce policies are applied to outgoing advertisements to neighbors or peers in the protocol domain to determine whether to announce specific route information. Out filtering applies to RIP updates and BGP NLRI updates.

In contrast, announce policies are not applied to IS-IS or OSPF information because routing information must always be consistent across the domain. To restrict the flow of external route information in the IS-IS or OSPF protocol database, apply redistribution filters instead of announce policies.

Route Filtering Stages

The following figure shows the three distinct filter stages that are applied to IP traffic.

These stages are:

- Filter stage 1 is the accept policy or in filter that applies to incoming traffic to detect changes in the dynamic (protocol-learned) routing information, which are then submitted to the routing table.
- Filter stage 2 is the redistribution filter that applies to the entries in the routing table to the protocol during the leaking process.
- Filter stage 3 is the announce policy or out filter that applies to outgoing traffic within a protocol domain.

The following figure shows the logical process for route filtering on the switch.

Figure 222: Route filtering logic

Prefix list

In the switch software, you can create one or more IP prefix lists and apply these lists to IP route policy.

Route Policy Definition

You can define an IP route policy and its attributes globally, and then apply them individually to interfaces and protocols. You can also form a unified database of route policies that the RIP or OSPF protocol can use for type of filtering purpose. A name or ID identifies a policy.

Under a policy you can have several sequence numbers. If you do not configure a field in a policy, the field appears as 0 in CLI show command output. This value indicates that the device ignores the field in the match criteria. Use the clear option to remove existing configurations for the field.

Each policy sequence number contains a set of fields. Only a subset of those fields is used when the policy is applied in a certain context. For example, if a policy has a configured set-preference field, it is used only when the policy is applied for accept purposes. This field is ignored when the policy is applied for announce or redistribute purposes.

You can only apply one policy for each purpose (RIP Announce, for example) on a given RIP interface. In this case, all sequence numbers under the policy apply to that filter. A sequence number also acts as an implicit preference; a lower sequence number is preferred.

The following tables display the accept, announce, and redistribute policies for RIP, OSPF, IS-IS and BGP. The tables also display which matching criteria apply for a certain routing policy. In these tables, 1 denotes advertise router, 2 denotes RIP gateway, and 3 denotes that external type 1 and external type 2 are the only options.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Note

IPv4 and IPv6 route-maps cannot be configured on the same match statement.

IP policy configuration using the CLI

Configure IP policies to form a unified database of route policies that Routing Information Protocol (RIP) or Open Shortest Path First (OSPF) can use for filtering tasks.

A policy is identified by a name or an ID. Under a given policy you can have several sequence numbers, each of which is equal to one policy in the old convention. Each policy sequence number contains a set of fields. Only a subset of those fields is used when the policy is applied in a certain context. For example, if a policy has a configured set-preference field, use only when the policy is applied for accept purposes. This field is ignored when the policy is applied for announce and redistribute purposes.

You can apply one policy for one purpose, for example, RIP announce on a RIP interface. All sequence numbers under the given policy apply to that filter. A sequence number also acts as an implicit preference; a lower sequence number is preferred.

Configuring prefix lists

Configure a prefix list to allow or deny specific route updates. A prefix list policy specifies route prefixes to match. After a match occurs, the system uses the route.

The prefix list contains a set of contiguous or noncontiguous routes. Reference prefix lists by name from within a routing policy.

About This Task

Important

When you configure a prefix list for a route policy, add the prefix as a.b.c.d/32. You must enter the full 32-bit mask to exact a full match of a specific IP address.

You configure prefix lists on a VRF instance the same way you configure the GlobalRouter, except that you must use VRF Router Configuration mode.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure a prefix list:

```
ip prefix-list WORD<1-64> {A.B.C.D/X} [ge <0-32>] [id <1-2147483647>]
[le <0-32>]
```

3. (Optional) Rename an existing prefix list:

```
ip prefix-list WORD<1-64> name WORD<1-64>
```

4. Display the prefix list:

```
show ip prefix-list [prefix {A.B.C.D}] [vrf WORD<1-16>] [vrfids
WORD<0-512>] [WORD <1-64>]
```

Example

Configure a prefix-list. Display the prefix list.

```
Switch> enable
Switch# configure terminal
Switch(config)# ip prefix-list LIST1 192.0.2.1/255.255.255.0
Switch(config)# show ip prefix-list LIST1
```

```
=====
Prefix List - GlobalRouter
```

```

=====
                PREFIX                MASKLEN FROM TO
-----
List 1      LIST1:
           192.0.1.2.1      24      24      24
1 Total Prefix List entries configured
-----
Name Appendix for Lists Converted from Old Config:
@A=conv addr list, @N=conv net list, @NR=conv net list modified as range

```

Variable definitions

Use the data in the following table to use the **ip prefix-list** command.

| Variable | Value |
|--------------------------------|--|
| <i>{A.B.C.D/X}</i> | Specifies the IP address and the mask in one of the following formats: <ul style="list-style-type: none"> a.b.c.d/x a.b.c.d/x.x.x.x default |
| <i>ge <0-32></i> | Specifies the minimum length to match. Lower bound and higher bound mask lengths together can define a range of networks. |
| <i>id <1-2147483647></i> | Specifies the Prefix list ID. |
| <i>le <0-32></i> | Specifies the maximum length to match. Lower bound and higher bound mask lengths together can define a range of networks. |
| <i>name WORD<1-64></i> | Renames the specified prefix list. The name length is 1-64 characters. |
| <i>WORD<1-64></i> | Specifies the name for a new prefix list. |

Use the data in the following table to use the **show ip prefix-list** command.

| Variable | Value |
|---------------------------------|--|
| <i>{A.B.C.D}</i> | Specifies the prefix to include in the command output. |
| <i>vrf WORD<1-16></i> | Specifies the name of the VRF. |
| <i>vrfids WORD<0-512></i> | Specifies the ID of the VRF and is an integer in the range of 0-512. |
| <i>WORD<1-64></i> | Specifies a prefix list, by name, to use for the command output. |

Use the following table to use the **show ip prefix-list** command output.

| Variable | Value |
|----------|---|
| PREFIX | Indicates the member of a specific prefix list. |
| MASKLEN | Indicates the prefix mask length in bits. |
| FROM | Indicates the prefix mask starting point in bits. |
| TO | Indicates the prefix mask endpoint in bits. |

Configure IP Route Policies

Configure a route policy so that the device can control routes that certain packets can take. For example, you can use a route policy to deny certain Border Gateway Protocol (BGP) routes.

The route policy defines the matching criteria and the actions taken if the policy matches.

About This Task

After you create and enable the policy, you can apply it to an interface. You can apply one policy for one purpose, for example, RIP Announce, on a given RIP interface. In this case, all sequence numbers under the given policy apply to that filter.

Create and enable the policy for IS-IS accept policies for Fabric Connect for Layer 3 Virtual Services Networks (VSNs) and IP Shortcuts, then apply the IS-IS accept policy filters.

Note

After you configure route-map in Global Configuration mode or VRF Router Configuration mode, the device enters Route-Map Configuration mode, where you configure the action the policy takes, and define other fields the policy enforces.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Note

You cannot configure IPv4 and IPv6 route-maps on the same match statement.

Procedure

1. Enter Route-Map Configuration mode:

```
enable
```

```
configure terminal
```

```
route-map WORD<1-64> <1-65535>
```

2. At the route-map prompt, define the match criteria for the policy:

```
match {as-path WORD<0-256> | community WORD<0-256> | community-exact
enable | extcommunity WORD<0-1027> | interface WORD<0-259> | local-
preference <0-2147483647> | metric <0-65535> | metric-type-isis <any|
internal|external> | network WORD<0-259> | next-hop WORD<0-259> |
protocol WORD<0-60> | route-source WORD<0-259> | route-type <any|
local|internal|external|external-1|external-2> | tag WORD<0-256> | vrf
WORD<1-16> | vrfids WORD<0-512> }
```

3. Define the action the policy takes:

- a. Allow the route:

```
permit
```

OR

- b. Ignore the route:

```
no permit
```

4. Define the set criteria for the policy:

```
set {as-path WORD<0-256> | as-path-mode <tag|prepend> | automatic-tag
enable | community WORD<0-256> | community-mode <additive|none|
unchanged> | injectlist WORD<0-1027> | ip-preference <0-255> | local-
preference <0-2147483647> | mask <A.B.C.D> | metric <0-65535> |
metric-type <type1|type2> | metric-type-internal <0-1> | metric-type-
isis <none|internal|external> | metric-type-live-metric | next-hop
WORD<0-256> | nssa-pbit enable | origin <igp|egp|incomplete> | origin-
egp-as <0-65535> | tag WORD<0-256> | weight <0-65535> }
```

5. Display current information about the IP route policy:

```
show route-map [WORD<1-64>] [<1-65535>] [vrf WORD<1-16>] [vrfids
WORD<0-512>]
```

Example

Enter Route-Map Configuration mode. At the route-map prompt, define the fields the policy enforces. Define the action the policy takes. Display current information about the IP route policy.

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#route-map RedisStatic 1
Switch:1(route-map)# match metric 0
Switch:1(route-map)# permit
Switch:1(route-map)# show route-map RedisStatic

Variable Definitions

Use the data in the following table to use the **match** command.

| Variable | Value |
|---|---|
| <i>as-path</i> WORD<0-256> | Configures the device to match the as-path attribute of the Border Gateway Protocol (BGP) routes against the contents of the specified AS-lists. This field is used only for BGP routes and ignored for all other route types.
WORD <0-256> specifies the list IDs of up to four AS-lists, separated by a comma.
Use the no operator to disable match as-path: no match as-path WORD<0-256> |
| <i>community</i> WORD<0-256> | Configures the device to match the community attribute of the BGP routes against the contents of the specified community lists. This field is used only for BGP routes and ignored for all other route types.
WORD <0-256> specifies the list IDs of up to four defined community lists, separated by a comma.
Use the no operator to disable match community: no match community WORD<0-256> |
| <i>community-exact</i> enable | When disabled, configures the device so match community-exact results in a match when the community attribute of the BGP routes match an entry of a community-list specified in match-community.
When enabled, configures the device so match-community-exact results in a match when the community attribute of the BGP routes matches all of the entries of all the community lists specified in match-community.
enable enables match community-exact.
Use the no operator to disable match community-exact: no match community-exact enable |
| <i>extcommunity</i> WORD <0-1027> | Configures the device to match the extended community.
WORD<0-1027> specifies an integer value from 1-1027 that represents the community list ID you want to create or modify. |
| <i>interface</i> WORD <0-259> | If configured, configures the device to match the IP address of the interface by which the RIP route was learned against the contents of the specified prefix list. This field is used only for RIP routes and ignored for all other route types.
WORD <0-259> specifies the name of up to four defined prefix lists, separated by a comma.
Use the no operator to disable match-interface: no match interface WORD <0-259> |
| <i>local-preference</i>
<0-2147483647> | Configures the device to match the local preference, applicable to all protocols.
<0-2147483647> specifies the preference value. |

| Variable | Value |
|---|---|
| <code>metric <0-65535></code> | Configures the device to match the metric of the incoming advertisement or existing route against the specified value. If 0, this field is ignored.
<code><0-65535></code> specifies the metric value. The default is 0. |
| <code>network WORD <0-259></code> | Configures the device to match the destination network against the contents of the specified prefix lists.
<code>WORD <0-259></code> specifies the name of up to four defined prefix lists, separated by a comma.
Use the no operator to disable match network: <code>no match network WORD <0-259></code> |
| <code>next-hop WORD<0-259></code> | Configures the device to match the next-hop IP address of the route against the contents of the specified prefix list. This field applies only to nonlocal routes.
<code>WORD <0-259></code> specifies the name of up to four defined prefix lists, separated by a comma.
Use the no operator to disable match next hop: <code>no match next-hop WORD<0-259></code> |
| <code>protocol WORD<0-60></code> | Configures the device to match the protocol through which the route is learned.
<code>WORD <0-60></code> is xxx, where xxx is local, ospf, ebgp, ibgp,isis, rip, static, or a combination separated by .
Use the no operator to disable match protocol: <code>no match protocol WORD<0-60></code> |
| <code>route-source WORD<0-259></code> | Configures the system to match the next-hop IP address for RIP routes and advertising router IDs for OSPF routes against the contents of the specified prefix list. This option is ignored for all other route types.
<code>WORD <0-259></code> specifies the name of up to four defined prefix lists, separated by a comma.
Use the no operator to disable match route source: <code>no match route-source WORD<0-259></code> |
| <code>route-type {any local internal external external-1 external-2}</code> | Configures a specific route type to match (applies only to OSPF routes).
<code>any local internal external external-1 external-2</code> specifies OSPF routes of the specified type only (External-1 or External-2). Another value is ignored. |
| <code>tag WORD<0-256></code> | Specifies a list of tags used during the match criteria process. Contains one or more tag values.
<code>WORD<0-256></code> is a value from 0-256. |
| <code>[vrf WORD<1-16>] [vrfs WORD<0-512>]</code> | Configures a specific VRF to match (applies only to RIP routes). |

Use the data in the following table to use the **set** command.

| Variable | Value |
|---|--|
| <code>as-path WORD<0-256></code> | Configures the device to add the AS number of the AS-list to the BGP routes that match this policy.
<code>WORD<0-256></code> specifies the list ID of up to four defined AS-lists separated by a comma.
Use the no operator to delete the AS number: <code>no set as-path WORD<0-256></code> |
| <code>as-path-mode <tag prepend></code> | Configures the AS path mode.
Prepend is the default configuration. The device prepends the AS number of the AS-list specified in <code>set-as-path</code> to the old <code>as-path</code> attribute of the BGP routes that match this policy.

Note:
Prepend is not applicable to an internal BGP (iBGP) peer with outbound route policy. For more information about iBGP, see BGP on page 390. |
| <code>automatic-tag enable</code> | Configures the tag automatically. Used for BGP routes only.
Use the no operator to disable the tag: <code>no set automatic-tag enable</code> |
| <code>community WORD<0-256></code> | Configures the device to add the community number of the community list to the BGP routes that match this policy.
<code>WORD <0-256></code> specifies the list ID of up to four defined community lists separated by a comma.
Use the no operator to delete the community number: <code>no set community WORD<0-256></code> |
| <code>community-mode <additive none unchanged></code> | Configures the community mode.
<code>additive</code> —the device prepends the community number of the community list specified in <code>set-community</code> to the old community path attribute of the BGP routes that match this policy.
<code>none</code> —the device removes the community path attribute of the BGP routes that match this policy to the specified value. |
| <code>injectlist WORD<0-1027></code> | Configures the device to replace the destination network of the route that matches this policy with the contents of the specified prefix list.
<code>WORD<0-1027></code> specifies one prefix list by name.
Use the no operator to disable <code>set injectlist</code> : <code>no set injectlist</code> |
| <code>ip-preference <0-255></code> | Configures the preference. This applies to accept policies only.
<code><0-255></code> is the range you can assign to the routes. |
| <code>local-preference <0-65535></code> | Configures the device to match the local preference, applicable to all protocols. <code><0-65535></code> specifies the preference value. |

| Variable | Value |
|--|--|
| <code>mask <A.B.C.D></code> | Configures the mask of the route that matches this policy. This applies only to RIP accept policies. <i>A.B.C.D</i> is a valid contiguous IP mask. Use the no operator to disable set mask: <code>no set mask</code> |
| <code>metric <0-65535></code> | Configures the metric value for the route while announcing a redistribution. The default is 0. If the default is configured, the original cost of the route is advertised into OSPF for RIP, the original cost of the route or default-import-metric is used (applies to IS-IS routes also). |
| <code>metric-type {type1 type2}</code> | Configures the metric type for the routes to announce into the OSPF domain that matches this policy. The default is type 2. This field is applicable only for OSPF announce policies. |
| <code>metric-type-internal <0-1></code> | Configures the MED value for routes advertised to ebgp nbrs to the IGP metric value. <code><0-1></code> specifies the metric type internal. |
| <code>metric-type-isis <none internal external></code> | Configures the metric type for IS-IS routes. The default is none. This field is applicable only for IS_IS policies. |
| <code>metric-type-live-metric</code> | Configures the metric type for BGP routes. The default is disabled. This field is applicable only for BGP policies. |
| <code>next-hop WORD <1-256></code> | Specifies the IP address of the next-hop router. Both IPv4 and IPv6 addresses are supported. Use the no operator to disable set next-hop: <code>no set next-hop</code> |
| <code>nssa-pbit enable</code> | Configures the not so stubby area (NSSA) translation P bit. Applicable to OSPF announce policies only. Use the no operator to disable set nssa-pbit: <code>no set nssa-pbit enable</code> |
| <code>origin {igp egp incomplete}</code> | Configures the device to change the origin path attribute of the BGP routes that match this policy to the specified value. |
| <code>origin-egp-as <0-65535></code> | Indicates the remote autonomous system number. Applicable to BGP only. |
| <code>tag <0-65535></code> | Configures the tag of the destination routing protocol. If not specified, the device forwards the tag value in the source routing protocol. A value of 0 indicates that this parameter is not configured.

Note:
This parameter is not supported on all hardware platforms. |
| <code>weight <0-65535></code> | Configures the weight value for the routing table. For BGP, this value overrides the weight configured through NetworkTableEntry, FilterListWeight, or NeighborWeight. Used for BGP only. A value of 0 indicates that this parameter is not configured. |

Use the data in the following table to use the **name** command.

| Variable | Value |
|-------------------------------|--|
| <code>WORD<1-64></code> | Renames a policy and changes the name field for all sequence numbers under the given policy. |

Job aid

Use the data in the following table to use the `show route-map` command output.

Table 312: Variable definitions

| Variable | Value |
|----------|---|
| NAME | Indicates the name of the route policy. |
| SEQ | Indicates the second index used to identify a specific policy within the route policy group (grouped by ID). Use this field to specify different match and set parameters and an action. |
| MODE | Indicates the action to take when this policy is selected for a specific route. Options are permit, deny, or continue. Permit indicates to allow the route. Deny indicates to ignore the route. Continue means continue checking the next match criteria configured in the next policy sequence; if none, take the default action in the given context. |
| EN | Indicates whether this policy is enabled. If disabled, the policy is not used. |

Configure a Policy to Accept External Routes from a Router

Perform this procedure to configure a policy to accept external routes from a specified advertising router.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter OSPF Router Configuration mode:

```
enable

configure terminal

router ospf
```
2. Create a policy to accept external routes from a specified advertising route:

```
accept adv-rtr <A.B.C.D>
```
3. Exit to the Privileged EXEC mode.

```
exit
```
4. Apply the OSPF accept policy change:

```
ip ospf apply accept adv-rtr <A.B.C.D>
```
5. Confirm your configuration:

```
show ip ospf accept
```

Example

Log on to the OSPF Router Configuration mode:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#router ospf
```

Create a policy to accept external routes from a specified advertising route:

```
Switch:1(config-ospf)#accept adv-rtr 192.0.2.122
```

Enable an OSPF accept entry for a specified advertising route:

```
Switch:1(config-ospf)#accept adv-rtr 192.0.2.122 enable
```

Exit to the Privileged EXEC mode:

```
Switch:1(config-ospf)#exit
Switch:1(config)#exit
```

Apply the OSPF accept policy change and confirm your configuration:

```
Switch:1#ip ospf apply accept adv-rtr 192.0.2.122
Switch:1#show ip ospf accept
=====
                        Ospf Accept - GlobalRouter
=====
ADV_RTR          MET_TYPE ENABLE POLICY
-----
192.0.2.122      -          FALSE
```

Variable definitions

Use the data in the following table to use the **accept adv-rtr** command.

| Variable | Value |
|---------------------------------------|---|
| <A.B.C.D> | Specifies the IP address. |
| <i>enable</i> | Enables an OSPF accept entry for a specified advertising router. Use the no operator to disable an OSPF accept entry: <code>no accept adv-rtr <A.B.C.D> enable</code> |
| <i>metric-type {type1 type2 }</i> | Indicates the OSPF external type. This parameter describes which types of OSPF external routes match this entry.
means match all external routes.
<i>type1</i> means match external type 1 only.
<i>type2</i> means match external type 2 only.
Use the no operator to disable metric-type: <code>no ip ospf accept adv-rtr <A.B.C.D> metric-type</code> |
| <i>route-map WORD<0-64></i> | Specifies the name of the route policy to use for filtering external routes advertised by the specified advertising router before accepting into the routing table. |

Apply OSPF Accept Policy Changes

Apply OSPF accept policy changes to allow the configuration changes in the policy to take effect in an OSPF Accept context (and to prevent the device from attempting to apply the changes one by one after each configuration change).

About This Task

Important

Changing OSPF Accept contexts is a process-oriented operation that can affect system performance and network accessibility while you perform the procedures. If you want to change the default preferences for an OSPF Accept or a prefix-list configuration (as opposed to the default preference), do so before enabling the protocols.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Apply an OSPF accept policy change:
ip ospf apply accept [vrf WORD<1-16>]
3. Display information about the configured OSPF entries:
show ip ospf accept [vrf WORD<1-16>] [vrfids WORD<0-512>]

Example

Apply the OSPF accept policy and confirm the configuration:

```
Switch:1>enable
Switch:1#ip ospf apply accept
Switch:1#show ip ospf accept
=====
                        Ospf Accept - GlobalRouter
=====
ADV_RTR      MET_TYPE ENABLE POLICY
-----
192.0.2.122  -          TRUE
```

Variable definitions

Use the data in the following table to use the **ip ospf apply accept adv-rtr** command.

Table 313: Variable definitions

| Variable | Value |
|-----------------------------|---|
| <i>adv-rtr</i> | Commits entered changes. Issue this command after you modify a policy configuration that affects an OSPF accept policy. |
| <i>vrf WORD<1-16></i> | Specifies the name of the VRF. |

Use the data in the following table to use the **show ip ospf accept** command output.

Table 314: Variable definitions

| Variable | Value |
|----------|--|
| ADV_RTR | Indicates the router advancing the packets. |
| MET_TYPE | Indicates the metric type for the routes to import into OSPF routing protocol, which passed the matching criteria configured in this route policy. Options include: local, internal, external, externaltype1, and externaltype2. |
| ENABLE | Indicates if the policy is enabled. |
| POLICY | Indicates the type of policy. |

Configure Inter-VRF Redistribution Policies

Configure redistribution entries to allow a protocol to announce routes of a certain source type, for example, static, RIP, or direct.

Before You Begin

- Ensure the routing protocols are globally enabled.
- You must configure the route policy, if required.
- Ensure the VRFs exist.
- You must create the route policy and prefix list under the source VRF context.

Note

The route policies treat permit and deny rules differently for inbound and outbound traffic.

- For an in-policy (RIP, BGP) or an accept policy (OSPF) using a route-map, if a particular route is not explicitly denied in the accept policy or in-policy with the route-map, then the route is implicitly allowed.
- For an out-policy (RIP, BGP) or a redistribute policy (RIP, OSPF, BGP) using a route-map, even if a particular route is not explicitly allowed in the redistribution policy or out-policy with the route-map, then the route is implicitly denied.
- In order to permit or deny only explicit routes, configure a policy with additional sequences, where, the last sequence permits all routes that are not explicitly permitted or denied.

Procedure

1. Enter VRF Router Configuration mode for a specific VRF context:

```
enable
```

```
configure terminal
```

```
router vrf WORD<1-16>
```

2. Create the redistribution instance:

```
ip <bgp|ospf|rip> redistribute <bgp|direct|ipv6-direct|ipv6-isis|ipv6-  
static|isis|ospf|ospfv3|rip|static|dvr>
```

3. Apply a route policy if required:

```
ip <bgp|ospf|rip> redistribute <bgp|direct|ipv6-direct|ipv6-isis|ipv6-  
static|isis|ospf|ospfv3|rip|static|dvr> route-map <WORD 0-64> [vrf-src  
<WORD 1-16>]
```

4. Use the following variable definitions table to configure other parameters as required.

5. Enable the redistribution:

```
ip <bgp|ospf|rip> redistribute <bgp|direct|ipv6-direct|ipv6-isis|ipv6-  
static|isis|ospf|ospfv3|rip|static|dvr> enable [vrf-src <WORD 1-16>]
```

6. Ensure that the configuration is correct:

```
show ip <bgp|ospf|rip> redistribute [vrf WORD<1-16>] [vrfids  
WORD<0-512>]
```

For RIPng, use `show ipv6 rip redistribute`.

7. Apply the redistribution:

```
ip <bgp|ospf|rip> apply redistribute <bgp|direct|ipv6-direct|ipv6-  
isis|ipv6-static|isis|ospf|ospfv3|rip|static|dvr> [vrf WORD<1-16>]  
[vrf-src WORD<1-16>]
```

Example

```
Switch:1>enable
Switch:1#config terminal
```

Log on to the VRF Router Configuration mode:

```
Switch:1(config)#router vrf test
```

Create the redistribution instance:

```
Switch:1(router-vrf)#ip rip redistribute ospf
```

Enable the redistribution

```
Switch:1(router-vrf)#ip rip redistribute ospf enable
```

Ensure that the configuration is correct:

```
Switch:1(router-vrf)#show ip rip redistribute
```

Exit to Global Configuration mode:

```
Switch:1(router-vrf)#exit
```

Apply the redistribution:

```
Switch:1(config)#ip rip apply redistribute ospf
```

Variable definitions

Use the data in the following table to use the redistribution commands.

| Variable | Value |
|--|---|
| <code><bgp direct isis ospf rip static dvr></code> | Specifies the type of routes to redistribute—the protocol source. |
| <code>vrf WORD<1-16></code> | Specifies the VRF instance. |
| <code>vrfids WORD<0-512></code> | Specifies a list of VRF IDs. |
| <code>vrf-src WORD<1-16></code> | Specifies the source VRF instance. This parameter is not required for redistribution within the same VRF. |

Use the data in the following table to use the **ip <bgp|ospf|rip> redistribute <bgp|direct|isis|ospf|rip|static|dvr>** command.

| Variable | Value |
|---|---|
| <code>apply [vrf-src WORD<1-16>]</code> | Applies the redistribution configuration. |
| <code>enable [vrf-src WORD<1-16>]</code> | Enables the OSPF route redistribution instance. |
| <code>metric <metric-value> [vrf-src WORD<1-16>]</code> | Configures the metric to apply to redistributed routes. |

| Variable | Value |
|---|--|
| <code>metric-type <type1 type2>
[vrf-src WORD<1-16>]</code> | Specifies a type 1 or a type 2 metric. For metric type 1, the cost of the external routes is equal to the sum of all internal costs and the external cost. For metric type 2, the cost of the external routes is equal to the external cost alone. |
| <code>route-map <WORD 0-64>
[vrf-src WORD<1-16>]</code> | Configures the route policy to apply to redistributed routes. |
| <code>subnets <allow suppress>
[vrf-src WORD<1-16>]</code> | Allows or suppresses external subnet route advertisements when routes are redistributed into an OSPF domain. |

IP Policy Configuration using Enterprise Device Manager

You can form a unified database of route policies that the protocols (RIP, OSPF or Border Gateway Protocol [BGP]) can use for any type of filtering task.

For information about configuring a prefix list, see [Configuring a prefix list](#) on page 2776. For more information about community list, see [Configure a Community Access List](#) on page 496. For more information about AS path list, see [Configure an AS Path List](#) on page 496.

A name or an ID identifies a policy. Under a policy you can have several sequence numbers, each of which is equal to one policy in the old convention. If a field in a policy is not configured, it appears as 0 or any when it appears in Enterprise Device Manager (EDM). This means that the field is ignored in the match criteria. You can use the clear option to remove existing configurations for any field.

Each policy sequence number contains a set of fields. Only a subset of those fields is used when the policy is applied in a certain context. For example, if a policy has a set-preference field set, it is used only when the policy is applied for accept purposes. This field is ignored when the policy is applied for announce and redistribute purposes.

You can apply only one policy for one purpose (for example, RIP Announce on a given RIP interface). In that example, all sequence numbers under the given policy are applicable for that filter. A sequence number also acts as an implicit preference: a lower sequence number is preferred.

Configuring a prefix list

Configure a prefix list to allow or deny specific route updates. A prefix list policy specifies route prefixes to match. After a match occurs, the system uses the route.

The prefix list contains a set of contiguous or non-contiguous routes. Reference prefix lists by name from within a routing policy.

Before You Begin

- Change the VRF instance as required to configure a prefix list on a specific VRF instance.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > IP**.
2. Click **Policy**.
3. Click the **Prefix List** tab.

4. Click **Insert**.
5. In the **Id** box, type an ID for the prefix list.
6. In the **Prefix** box, type an IP address for the route.
7. In the **PrefixMaskLength** box, type the length of the prefix mask.
8. Configure the remaining parameters as required.
9. Click **Insert**.

Prefix List field descriptions

Use the data in the following table to use the **Prefix List** tab.

| Name | Description |
|----------------------|---|
| Id | Configures the list identifier. |
| Prefix | Configures the IP address of the route. |
| PrefixMaskLen | Configures the specified length of the prefix mask. You must enter the full 32-bit mask to exact a full match of a specific IP address, for example, if you create a policy to match on the next hop. |
| Name | Names a specified prefix list during the creation process or renames the specified prefix list. The name length can use from 1 to 64 characters. |
| MaskLenFrom | Configures the lower bound of the mask length. The default is the mask length. Lower bound and higher bound mask lengths together can define a range of networks. |
| MaskLenUpto | Configures the higher bound mask length. The default is the mask length. Lower bound and higher bound mask lengths together can define a range of networks. |

Configure a Route Policy

Configure a route policy so that all protocols use them for In, Out, and Redistribute purposes.

Procedure

1. In the navigation pane, expand: **Configuration > IP**.
2. Select **Policy**.
3. Select the **Route Policy** tab.
4. Select **Insert**.
5. Enter the appropriate information for your configuration in the Insert Route Policy dialog box.
6. Select **Insert**.

Route Policy Field Descriptions

Use the data in the following table to use the **Route Policy** tab.

| Name | Description |
|-----------------------|--|
| Id | Specifies the ID of an entry in the Prefix list table. |
| SequenceNumber | Specifies a policy within a route policy group. |

| Name | Description |
|---------------------------|---|
| Name | Specifies the name of the policy. This command changes the name field for all sequence numbers under the given policy. |
| Enable | Indicates whether this policy sequence number is enabled or disabled. If disabled, the policy sequence number is ignored. The default is disabled. |
| Mode | Specifies the action to take when a policy is selected for a specific route. Select permit (allow the route) or deny (ignore the route). The default is permit. |
| MatchProtocol | Selects the appropriate protocol. If configured, matches the protocol through which the route is learned. This field is used only for RIP Announce purposes. The default is to enable all match protocols. |
| MatchNetwork | Specifies if the system matches the destination network against the contents of the specified prefix list. |
| MatchIpRouteSource | Specifies if the system matches the next-hop IP address for RIP routes and advertising router IDs for OSPF routes against the contents of the specified prefix list. This option is ignored for all other route types.
Select the ellipsis and choose from the list in the Match Route Source dialog box. You can select up to four entries. To clear an entry, use the ALT key.
You can also change this field in the Route Policy tab of the Policy dialog box. |
| MatchIpRouteDest | Specifies if the system matches the next-hop IP address for RIP routes and advertising router IDs for OSPF routes against the contents of the specified prefix list. This option is ignored for all other route types. |
| MatchNextHop | Specifies if the system matches the next-hop IP address of the route against the contents of the specified prefix list. This field applies only to nonlocal routes.
Select the ellipsis and choose from the list in the Match Next Hop dialog box. You can select up to four entries. To clear an entry, use the ALT key. |
| MatchInterface | Specifies if the system matches the IP address of the interface by which the RIP route was learned against the contents of the specified prefix list. This field is used only for RIP routes and ignored for all other type of route.
Select the ellipsis and choose from the list in the Match Interface dialog box. You can select up to four entries. To clear an entry, use the ALT key. |
| MatchRouteType | Configures a specific route type to match (applies only to OSPF routes).
Externaltypel and Externaltype2 specify the OSPF routes of the specified type only. OSPF internal refers to intra- and inter-area routes. The default is any. |
| MatchMetric | Specifies if the system matches the metric of the incoming advertisement or existing route against the specified value (1 to 65535). If 0, this field is ignored. The default is 0. |

| Name | Description |
|------------------------------|--|
| MatchMetricTypeIspis | Specifies the match metric type field in the incoming ISIS routes in accept policy. |
| MatchAsPath | Configures if the system matches the BGP autonomous system path. Applicable to BGP only. This overrides the BGP neighbor filter list information. |
| MatchCommunity | Filters incoming and outgoing updates based on a Community List. Applicable to BGP only. The default is disable. |
| MatchCommunityExact | Indicates if the match must be exact (that is, all of the communities specified in the path must match). Applicable to BGP only. The default is disabled. |
| MatchTag | Specifies a list of tags used during the match criteria process. Applicable to BGP only. It contains one or more tag values. |
| MatchVrf | Identifies the source VRFs that leaks routes to the local VRF (applies only to RIP routes). |
| MatchLocalPref | Specifies the local preference value to be matched. |
| NssaPbit | Configures or resets the P bit in specified type 7 link state advertisements (LSA). By default, the Pbit is always configured in case the user configures the Pbit to a disable state for a particular route policy other than all type 7. LSAs associated with that route policy have the Pbit cleared. With this intact, not so stubby area (NSSA) area border router (ABR) does not perform translation of these LSAs to type 5. The default is enable. |
| SetRoutePreference | Configures a value from 0 to 255. The default value is 0. If the default is configured, the global preference value is used. When configured to a value greater than zero, specifies the route preference value assigned to the routes that matches the policy. This feature applies to accept policies only. |
| SetMetricTypeInternal | Identifies the MED value for routes advertised to BGP numbers to the Interior Gateway Protocol (IGP) metric value. The value must be 0 or 1. The default is 0. |
| SetMetricTypeIspis | Sets the metric type IS-IS. |
| SetMetric | Configures the system to use the metric value for the route while announcing or redistributing. The default-import-metric is 0. If the default is configured, the original cost of the route is advertised into OSPF; for RIP, the original cost of the route or the default value is used (applies to IS-IS routes also). The default is 0. |
| SetMetricType | Configures the metric type for the routes to announce into the OSPF routing protocol that matches this policy. Applicable to OSPF protocol only. The default is type 2. This field is applicable only for OSPF announce policies. The default is type2. |
| SetNextHop | Configures the IP address of the next-hop router. Applicable to BGP only. The default is 0.0.0.0. |

| Name | Description |
|----------------------------|---|
| SetInjectNetList | Configures the destination network of the route that matches this policy with the contents of the specified prefix list. Select the ellipsis and choose from the list in the Set Inject NetList dialog box. |
| SetMask | Configures the mask of the route that matches this policy. This applies only to RIP accept policies. |
| SetAsPath | Indicates the AS path value to use whether the SetAsPathMode field is Tag or Prepend. Applicable to BGP only.

Note:
Prepend is not applicable to an internal BGP (iBGP) peer with outbound route policy. |
| SetAsPathMode | Configures if the system converts the tag of a route into an AS path. Applicable to BGP protocol only. The mode is either Tag or Prepend tag. The value is applicable only while redistributing routes to BGP. The default is prepend.

Note:
Prepend is not applicable to an iBGP peer with outbound route policy. |
| SetAutomaticTag | Enables the automatic tag feature. Applicable to BGP protocol only. The default is disable. |
| SetCommunityNumber | Configures the community number for BGP advertisements. This value can be a number (1 to 42949672000) or no-export or no-advertise. |
| SetCommunityMode | Configures the community mode for the BGP protocol. This value can be either append, none, or unchanged. The default is unchanged. <ul style="list-style-type: none"> • Unchanged—keeps the community attribute in the route path as it is. • None—removes the community in the route path additive. • Append—adds the community number specified in SetCommunityNumber to the community list attribute. |
| SetExtCommunity | Configures a BGP community. The values are 0 to 256. |
| SetExtCommunityMode | Configures the extended-community mode. The value can be append, unchanged, or overwrite. The default value is unchanged. <ul style="list-style-type: none"> • append — creates another community string. • unchanged — keeps the community attribute as it is. • overwrite — changes the current value. |
| SetOrigin | Configures the origin for the BGP protocol to IGP, EGP, incomplete, or unchanged. If not configured, the system uses the route origin from the IP routing table (protocol). The default is unchanged. |

| Name | Description |
|-----------------------|---|
| SetLocalPref | Configures the local preference for the BGP protocol only. The system uses this value during the route decision process for the BGP protocol. The default is 0. |
| SetOriginEgpAs | Indicates the remote autonomous system number for the BGP protocol. The default is 0. |
| SetWeight | Configures the weight value for the routing table for the BGP protocol. This field must be used with the match as-path condition. For BGP, this value overrides the weight configured through the NetworkTableEntry, FilterListWeight, or NeighborWeight. The default is 0. |
| SetTag | Configures the list of tags used during the match criteria process for the BGP protocol. The default is 0. |
| Ipv6SetNextHop | Specifies the address of the IPv6 next hop router. |

Apply a Route Policy

Apply route policies to define route behavior.

About This Task

Important

Changing route policies or prefix lists that affect OSPF accept or redistribute is a process-oriented operation that can affect system performance and network reachability while you perform the procedures. Therefore, if you want to change a prefix list or a routing protocol, you configure all route policies and prefix lists before enabling the protocols.

Procedure

1. In the navigation pane, expand: **Configuration > IP**.
2. Select **Policy**
3. Select the **Applying Policy** tab.
4. Select the type of policy to apply.
5. Select **Apply**.

Applying Policy field descriptions

Use the data in the following table to use the **Applying Policy** tab.

| Name | Description |
|--------------------------|---|
| RoutePolicyApply | Specifies that configuration changes in the policy take effect in an OSPF route policy context. This prevents the system from attempting to apply the changes one by one after each configuration change. The default is enabled. |
| RedistributeApply | Specifies that configuration changes in the policy take effect for an OSPF Redistribute context. This prevents the system from attempting to apply the changes one-by-one after each configuration change. The default is enabled. |
| OspfInFilterApply | Specifies that configuration changes in a route policy or a prefix list take effect in an OSPF Accept context. This prevents the system from attempting to apply the changes one by one after each configuration change. The default is enabled.

Note:
This field does not appear on all hardware platforms. If you do not see this command in EDM, the feature is not supported on your hardware. |

Configure an OSPF Accept Policy

Perform the following procedure to create or configure an OSPF accept policy.

Procedure

1. In the navigation pane, expand: **Configuration > IP**.
2. Select **Policy**.
3. Select the **OSPF Accept** tab.
4. Select **Insert**.
5. Configure the parameters as required.
6. Select **Insert**.

OSPF Accept field descriptions

Use the data in the following table to use the **OSPF Accept** tab.

| Name | Description |
|-----------------------|--|
| AdvertisingRtr | Specifies the routing ID of the advertising router. |
| Enable | Enables or disables the advertising router. You can also enable or disable advertising in the OSPF Accept tab of the Policy dialog box by clicking in the field and selecting enable or disable from the menu. The default is disable. |

| Name | Description |
|-------------------|--|
| MetricType | <p>Specifies the OSPF external type. This parameter describes which types of OSPF ASE routes match this entry.</p> <ul style="list-style-type: none"> Any means match either ASE type 1 or 2 Type1 means match any external type 1 Type2 means match any external type 2 <p>You can also select your entry in the OSPF Accept tab of the Policy dialog box by clicking in the field and selecting any, type1, or type2 from the menu. The default is any.</p> |
| PolicyName | <p>Specifies the name of the OSPF in filter policy. Click the ellipsis button and choose from the list in the Policy Name dialog box. To clear an entry, use the ALT key.</p> |

Configuring inbound/outbound filtering policies on a RIP interface

About This Task

Configure inbound filtering on a RIP interface to determine whether to learn a route on a specified interface and to specify the parameters of the route when it is added to the routing table. Configure outbound filtering on a RIP interface to determine whether to advertise a route from the routing table on a specified interface and to specify the parameters of the advertisement.

The port on which the multimedia filter is enabled becomes a DIFFSERV access port.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > IP**.
2. Click **Policy**.
3. Click the **RIP In/Out Policy** tab.
4. In the desired row, double-click the **InPolicy** or **OutPolicy** column.
5. Select a preconfigured In/Out policy and click **OK**.

RIP In/Out Policy field descriptions

Use the data in the following table to use the **RIP In/Out Policy** tab.

| Name | Description |
|------------------|--|
| Address | Specifies the IP address of the RIP interface. |
| Interface | Specifies the internal index of the RIP interface. |
| InPolicy | Specifies the policy name used for inbound filtering on this RIP interface. This policy determines whether to learn a route on this interface and specifies the parameters of the route when it is added to the routing table. |
| OutPolicy | Specifies the policy name used for outbound filtering on this RIP interface. This policy determines whether to advertise a route from the routing table on this interface and specifies the parameters of the advertisement. |

Deleting inbound/outbound filtering policies on a RIP interface

About This Task

Delete a RIP In/Out policy when you no longer want to learn a route on a specified interface or advertise a route from the routing table on a specified interface.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > IP**.
2. Click **Policy**.
3. Click the **RIP In/Out Policy** tab.
4. In the desired row, double-click the **InPolicy** or **OutPolicy** column for the policy you want to delete.
5. In the **InPolicy** or **OutPolicy** dialog box, press **CTRL** and then, click the policy you want to delete.
6. Click **OK**.
The policy is deleted and you are returned to the RIP In/Out Policy tab.
7. Click **Apply**.

RSMLT

In many cases, core network convergence time depends on the length of time a routing protocol requires to successfully converge. Depending on the specific routing protocol, this convergence time can cause network interruptions that range from seconds to minutes.

Routed Split MultiLink Trunking (RSMLT) permits rapid failover for core topologies by providing an active-active router concept to core SMLT networks.

RSMLT scenarios include SMLT triangles, squares, and SMLT full-mesh topologies, with routing enabled on the core VLANs.

Routing protocols include the following:

- IP Unicast Static Routes
- RIP1
- RIP2
- OSPF
- BGP

In the event of core router failures, RSMLT manages packet forwarding, thus eliminating dropped packets during the routing protocol convergence.

IPv6 RSMLT

Routed Split Multi-Link Trunking (RSMLT) is an enhancement to SMLT that enables the exchange of Layer 3 information between peer nodes in a switch cluster. RSMLT provides two main advantages over SMLT:

- provides backup for the peer after the peer goes down
- routes traffic on behalf of the peer to prevent Virtual Inter-Switch Trunk (vIST) overload

IPv6 RSMLT enables the subsecond failover for IPv6 forwarding.

The overall model for IPv6 RSMLT is essentially identical to that of IPv4 RSMLT. In short, RSMLT peers exchange their IPv6 configuration and track their states by using vIST messages. An RSMLT node always performs IPv6 forwarding on the IPv6 packets destined to the MAC addresses of the peer. If an RSMLT node detects that the RSMLT peer is down, the node forwards IPv6 traffic destined to the IPv6 addresses of the peer.

With RSMLT enabled, an SMLT switch performs IP forwarding on behalf of the SMLT peer, which prevents IP traffic from being sent over the vIST.

IPv6 RSMLT supports the full set of topologies and features supported by IPv4 RSMLT, including SMLT triangles, squares, and SMLT full-mesh topologies, with routing enabled on the core VLANs.

Because you configure RSMLT on a VLAN, not at the IP layer, the configuration applies to both IPv4 and IPv6. You cannot enable or disable RSMLT on a VLAN for IPv6 but not IPv4; or for IPv4 but not IPv6.

With IPv6, you must configure the RSMLT peers to use the same set of IPv6 prefixes.

Supported routing protocols include the following:

- IPv6 static routes

- OSPFv3

**Note**

IPv6 RSMLT is not virtualized, therefore it is not possible to enable IPv6 and RSMLT together on a VLAN which is associated with a VRF.

Configuration errors will appear if you attempt to perform the following:

- Create an IPv6 interface on a VLAN which is associated with a VRF and RSMLT is enabled on the VLAN.
- Enable RSMLT on an IPv6 enabled VLAN which is associated with a VRF.

IPv6 differences

The following list identifies ways in which the IPv6 implementation of RSMLT differs from the IPv4 implementation of RSMLT.

- After the switch begins to forward traffic on behalf of the peer, duplicate address detection (DAD) is not executed for the IPv6 address of the peer. The implementation assumes that the peer IPv6 address is already known to be unique.
- An RSMLT switch installs a neighbor entry for the peer IPv6 address immediately after the peer disappearance is detected, possibly while a route for the peer still exists. This action can result in packets destined to the peer IPv6 address being delivered to the CP for a short period of time.
- You cannot configure a vIST with IPv6 peer address
- In a dual-stack VLAN, adding or deleting IPv4 or IPv6 does not affect the RSMLT functionality of one another. If you add IPv4 or IPv6 to an existing IPv6 or IPv4 RSMLT VLAN, the RSMLT state for the protocol you add second will be the same as the previous RSMLT state.

SMLT and RSMLT Operation in Layer 3 Environments

Figure 223 on page 2790 shows a typical redundant network example with user aggregation, core, and server access layers. To minimize the creation of many IP subnets, one VLAN (VLAN 1, IP subnet A) spans all wiring closets.

SMLT provides the loop-free topology and forwards all links for VLAN 1, IP subnet A.

The aggregation layer switches are configured with routing enabled and provide active-active default gateway functionality through RSMLT.

After you enable RSMLT on a VLAN (on both aggregation devices), the cluster devices simply inform each other (over vIST messaging) of their physical IP and MAC on that VLAN. Thereafter, the two cluster devices take mutual ownership of their IP addresses on that VLAN. This action means each cluster device routes IP traffic that is directed to the physical MAC of the IP or the physical MAC of the peer IP on that VLAN, and when one of them is down the other cluster device:

- Replies to ARP requests for both the IP and the peer IP on that VLAN
- Replies to pings to the IP and the peer IP on that VLAN

In this case, routers R1 and R2 forward traffic for IP subnet A. RSMLT provides both router failover and link failover. For example, if the Split MultiLink Trunk link between R2 and R4 is broken, the traffic fails over to R1 as well.

For IP subnet A, VRRP with a backup master can provide the same functionality as RSMLT, as long as no additional router is connected to IP subnet A.

RSMLT provides superior router redundancy in core networks (IP subnet B), where OSPF is used for the routing protocol. Routers R1 and R2 provide router backup for each other, not only for the edge IP subnet A, but also for the core IP subnet B. Similarly routers R3 and R4 provide router redundancy for IP subnet C and also for core IP subnet B.

Router R1 Failure

The following figure shows SMLT and RSMLT in Layer 3 environments.

Figure 223: SMLT and RSMLT in Layer 3 environments

R3 and R4 both use R1 as their next hop to reach IP subnet A. Even though R4 sends the packets to R2, they are routed directly at R2 into subnet A. R3 sends its packets to R1 and they are also sent directly into subnet A. After R1 fails, all packets are directed to R2, with SMLT. R2 still routes for R2 and R1. After OSPF convergence, the routing tables in R3 and R4 change their next hop to R2 to reach IP subnet A. You can configure the hold-up timer (that is, for the amount of time R2 routes for R1 in a failure) for a time period greater than the routing protocol convergence, you can configure it as indefinite (that is, the members of the pair always route for each other).

Use an indefinite hold-up timer value for applications that use RSMLT at the edge instead of VRRP.

Router R1 Recovery

When R1 restarts after a failure, it does not route traffic for R2, nor does it provide backup for R2, until the hold-down timer expires. Similar to VRRP, the hold-down timer value must be greater than the time the routing protocol requires to converge its tables.

During the hold-down interval, R1 routes traffic if the destination MAC of the packet is its own routable VLAN MAC. R1 bridges incoming traffic to R2 if the destination MAC of the packet is the routable VLAN MAC of R2. A temporary default route (one having a route preference equal to 4) that points to R2 is installed on R1. R1 uses this temporary route to forward traffic to R2 that it cannot route itself because of the incomplete routing table; the default route is not saved in the configuration file.

After the hold-down timer expires, the temporary default route that points to R2 is deleted; from this moment on, in addition to routing packets destined to itself, R1 starts routing packets for R2, as well.

RSMLT Network Design and Configuration

Because RSMLT is based on SMLT, all SMLT configuration rules apply. In addition, RSMLT is enabled on the SMLT aggregation switches for each VLAN. The VLAN must be a member of SMLT links and vIST's L2VSN. For more information about how to configure SMLT in a Layer 2 environment, see [MultiLink Trunking and Split MultiLink Trunking](#) on page 2254.

The VLAN also must be routable (IP address configured) and you must configure an Interior Gateway Protocol (IGP) such as OSPF on all four routers, although it is independent of RSMLT. All routing protocols, even static routes, work with RSMLT.

The RSMLT pair switches provide backup for each other. As long as one of the two routers of an vIST pair is active, traffic forwarding is available for both next hops R1/R2 and R3/R4.

RSMLT Edge Support

The switch stores the peer MAC and IP address pair in its local configuration file and restores the configuration if the peer does not restore after a simultaneous restart of both RSMLT-peer switches.

The RSMLT edge support feature adds an enhancement whereby the peer MAC (for the IP on the VLAN) is committed to the config.cfg file after you use the **save config** command. If you power off both devices, and then power up only one of them, that single device can still take ownership of its peer IP on that VLAN even if it has not seen that peer switch since it started. This enhancement is necessary if you configure the peer (the device which is still down) IP as the default gateway in end stations.

If you enable RSMLT edge support, you must also ensure that the hold-up timer for RSMLT on those edge VLANs equals infinity (9999). This timer value ensures that if one cluster device fails, the remaining cluster device maintains ownership of the failed peer IP indefinitely.

The edge VLAN can be tagged over SMLT links, single attached links, or more SMLT links.

Important

If you clear the peer information the device can stop forwarding for the peer.

RSMLT implementation does not use a virtual IP address but instead uses physical IP addresses for redundancy. At the same time, you can deploy RSMLT in either routed configurations, or edge

configurations, where you previously used VRRP (and back-up master). Previously, if a power outage occurred or a shutdown of both switches within a dual core vIST pair, only one device came back up. Clients using the powered-off device IP/MAC as the default gateway lost connectivity to the network. In such a scenario, even with RSMLT enabled on the device, it cannot act as a backup for the peer as it was unaware of the peer IP or MAC address.

After both the dual core vIST switches come back, the vIST is operational. If an RSMLT peer-enabled message is received from the peer, normal RSMLT operation occurs.

If the peer has either an IP or MAC change, you must save the configuration for the RSMLT edge support to operate correctly. However, if the vIST peer up message is not received (for example, if you do not enable RSMLT properly), and you enable the RSMLT edge support flag, the RSMLT hold-down timer starts and permits routing protocols to converge; during this time user operation can be affected. After the hold-down timer expires, saved peer information is picked up and the device starts to act as backup for the peer by adding the previously saved MAC and ARP records.

The hold-up timer starts and after this timer expires the previously added MAC and ARP records are deleted and the device stops acting as backup for the peer, as the peer is not running proper RSMLT for the VLAN. The RSMLT is a parameter for each VLAN, and therefore all affects are on an individual VLAN basis, not necessarily a global device. Edge support mode uses the local values of the hold-down timer (default value of 60 seconds) and hold-up timer (default value of 180 seconds).

RSMLT Configuration using CLI

Use the procedures in this section to configure RSMLT using CLI.

Configure RSMLT on a VLAN

Configure RSMLT on a VLAN to exchange Layer 3 information between peer nodes in a switch cluster. This configuration applies to both IPv4 and IPv6.

Before You Begin

- An IP routing protocol is enabled on VLAN Layer 3 interfaces.
- VLANs with Layer 3 interfaces participate in Split MultiLink Trunking (SMLT).

About This Task

The VLAN can be either IPv4 or IPv6, or both. RSMLT configuration on a VLAN simultaneously affects both IPv4 and IPv6. By default, RSMLT is disabled on a VLAN.

Procedure

1. Enter VLAN Interface Configuration mode:

```
enable  
  
configure terminal  
  
interface vlan <1-4059>
```
2. Configure the holddown timer:

```
ip rsmlt holddown-timer <0-3600>
```

3. Configure the holdup timer:

```
ip rsmlt holdup-timer <0-9999>
```
4. Enable RSMLT on the VLAN:

```
ip rsmlt
```

Example

Configure and enable RSMLT on a VLAN:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#interface vlan 100
Switch:1(config-if)#ip rsmlt holddown-timer 100
Switch:1(config-if)#ip rsmlt holdup-timer 200
Switch:1(config-if)#ip rsmlt
```

Variable Definitions

The following table defines parameters for the **ip rsmlt** command.

| Variable | Value |
|--------------------------------------|---|
| <i>holddown-timer</i>
<0-3600> | Defines how long the recovering or restarting system remains in a non-Layer 3 forwarding mode for the peer router MAC address. The default is 60. Configure this value to be longer than the anticipated routing protocol convergence.
If you disable RSMLT on a VLAN, non default values for this variable do not save across restarts. |
| <i>holdup-timer</i>
<0-3600 9999> | Defines how long the RSMLT system maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 1800.
If you disable RSMLT on a VLAN, non default values for this variable do not save across restarts. |

The following table defines parameters for the **interface** command.

| Variable | Value |
|----------|--|
| <1-4059> | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |

Enable RSMLT Edge Support

Enable RSMLT Edge support to store the RSMLT peer MAC and IP address-pair in the local configuration file and restore the configuration if the peer does not restore after a simultaneous restart of both RSMLT peer systems.

If enabled, peer MAC and IP information for all RSMLT-enabled VLANs is saved after you next use the **save config** command.

About This Task

RSMLT Edge support configuration applies to both IPv4 and IPv6. You do not configure IPv4 and IPv6 separately.

The RSMLT Edge support default is disabled.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Enable RSMLT Edge support:

```
ip rsmlt edge-support
```

Example

If you have enabled RSMLT Edge Support, disable the feature as follows:

```
Switch:1(config)#no ip rsmlt edge-support
```

View RSMLT Information

Show RSMLT information to view data about all RSMLT interfaces. The output of the command includes IPv6 information for the local and peer nodes.

About This Task

If you use the **show ip rsmlt** command after you delete an RSMLT, the RSMLT still shows in the command output until you restart the switch.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Show RSMLT information about the interface:

```
show ip rsmlt [local|peer] [vrf WORD<1-16>] [vrfids WORD<0-512>]
```
3. View the status of the switch to act as a peer forwarder:

```
show ip rsmlt edge-support
```

Examples

```
Switch:1>show ip rsmlt

Switch:1>show ip rsmilt edge-support

RSMILT Peer Info:
    rsmilt-peer-forwarding : disable
    
```

Variable definitions

Use the data in the following table to use the **show ip rsmlt** command.

| Variable | Value |
|---------------------------------|--|
| <i>local</i> | Shows local RSMLT information. |
| <i>peer</i> | Shows RSMLT information for the peer. |
| <i>vrf WORD<1-16></i> | Shows information for a specific VRF name. |
| <i>vrfids WORD<0-512></i> | Shows information for a specific VRF ID. |

RSMLT Configuration using EDM

Use the procedures in this section to configure RSMLT using EDM.

Configuring RSMLT on a VLAN

Configure RSMLT on a VLAN to exchange Layer 3 information between peer nodes in a switch cluster. This configuration applies to both IPv4 and IPv6.

Before You Begin

- Enable an IP routing protocol on VLAN Layer 3 interfaces.
- Ensure VLANs with Layer 3 interfaces participate in Split MultiLink Trunking (SMLT).

About This Task

The VLAN can be either IPv4 or IPv6, or both. RSMLT configuration on a VLAN simultaneously affects both IPv4 and IPv6.

Procedure

1. In the navigation tree, expand the following folders: **Configuration > VLAN**.
2. Click **VLANs**.
3. Click the **Basic** tab.
4. Select a VLAN.
5. Click **IP**.
6. Click the **RSMLT** tab.
7. Select **Enable**.
8. In the **HoldDownTimer** field, type a hold-down timer value.
9. In the **HoldUpTimer** field, type a holdup timer value.
10. Click **Apply**.

RSMLT field descriptions

Use the data in the following table to use the **RSMLT** tab.

| Name | Description |
|----------------------|---|
| Enable | Enables RSMLT. The default is disabled. |
| HoldDownTimer | Defines how long the recovering or restarting system remains in a non-Layer 3 forwarding mode for the peer router MAC address.
The range of this value is from 0 to 3600 seconds. The default is 60.
If you disable RSMLT on a VLAN, non default values for this field do not save across restarts. |
| HoldUpTimer | Defines how long the RSMLT system maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 1800.
If you disable RSMLT on a VLAN, non default values for this field do not save across restarts. |

Enabling RSMLT Edge support

Enable RSMLT Edge support to store the RSMLT peer MAC and IP address-pair in the local configuration file and restore the configuration if the peer does not restore after a simultaneous restart of both RSMLT peer systems.

The default is disabled.

About This Task

RSMLT Edge support configuration applies to both IPv4 and IPv6.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > IP**.
2. Click **RSMLT**.
3. Click the **Globals** tab.
4. Select **EdgeSupportEnable**.
5. Click **Apply**.

View and Edit IPv4 RSMLT Local Information

About This Task

Perform the following procedure to view and edit RSMLT local VLAN information.

Procedure

1. In the navigation pane, expand **ConfigurationIP**.
2. Select **RSMLT**.
3. Select the **Local** tab.
4. Configure the parameters as required.

5. Select **Apply**.

Local field descriptions

Use the data in the following table to use the **Local** tab.

| Name | Description |
|----------------------|---|
| IfIndex | IP interface identification. |
| VlanId | Specifies the VLAN ID of the chosen VLAN. |
| IpAddr | Specifies the IP address on the RSMLT VLAN. |
| MacAddr | Specifies the MAC address of the selected VLAN. |
| Enable | Displays the RSMLT operating status as enabled or disabled. |
| OperStatus | Displays the RSMLT operating status as either up or down. The default is down. |
| HoldDownTimer | Defines how long the recovering/restarting system remains in a non-Layer 3 forwarding mode for the peer router MAC address. The range of this value is from 0 to 3600 seconds. The default is 60. |
| HoldUpTimer | Defines how long the RSMLT system maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 1800. |
| SmltId | Specifies the ID range for the SMLT. A valid range is 1 to 512. |
| VrfId | Identifies the VRF. |
| VrfName | Indicates the VRF name. |

Modify the IPv6 RSMLT Local Information

Edit the existing RSMLT configuration for the local node in the cluster.

Procedure

1. In the navigation pane, expand **ConfigurationIPv6**.
2. Select **RSMLT**.
3. Select the **Local** tab.
4. Select a cell to change the value.
5. Select **Apply**.

Local field descriptions

Use the data in the following table to use the **Local** tab.

| Name | Description |
|-------------------------|---|
| IfIndex | Shows the route SMLT operation index. |
| Ipv6Addr | Configures the IPv6 address of the RSMLT interface. |
| Ipv6PrefixLength | Configures the IPv6 prefix length. |

| Name | Description |
|----------------------|---|
| Enable | Enables or disables RSMLT. The default is disabled. |
| HoldDownTimer | Defines how long the recovering/rebooting switch remains in a non-Layer 3 forwarding mode for the peer router MAC address. The default is 60. |
| HoldUpTimer | Defines how long the RSMLT switch maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 1800. |
| OperStatus | Displays the RSMLT operating status as either up or down. |
| SmltId | Specifies the ID range for the SMLT. |
| VlanId | Configures the VLAN ID. |
| MacAddr | Configures the MAC address of the VLAN. |
| VrfId | Indicates the virtual router ID to which the local RSMLT instance belongs. |
| VrfName | Indicates the virtual router name to which the local RSMLT instance belongs. |

Modify IPv6 RSMLT Peer Information

Edit the existing configuration for the RSMLT peer node in the cluster.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **RSMLT**.
3. Select the **Peer** tab.
4. Select a cell to change the value.
5. Select **Apply**.

Peer field descriptions

Use the data in the following table to use the **Peer** tab.

| Name | Description |
|-------------------------|---|
| IfIndex | Shows the route SMLT operation index. |
| Ipv6Addr | Configures the IPv6 address of the RSMLT interface. |
| Ipv6PrefixLength | Configures the IPv6 prefix length. |
| AdminStatus | Shows the administrative status of RSMLT on the peer. |

| Name | Description |
|------------------------------|--|
| HoldDownTimer | Defines how long the recovering/rebooting switch remains in a non-Layer 3 forwarding mode for the peer router MAC address. The default is 0. |
| HoldDownTimeRemaining | Indicates the time remaining in the HoldDownTimer. |
| HoldUpTimer | Defines how long the RSMLT switch maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 0. |
| HoldUpTimeRemaining | Indicates the time remaining in the HoldUpTimer. |
| OperStatus | Displays the RSMLT operating status as either up or down. |
| SmltId | Specifies the ID range for the SMLT. |
| VlanId | Specifies the VLAN ID in the range of 1 to 4059. By default, VLAN IDs 1 to 4059 are configurable and the system reserves VLAN IDs 4060 to 4094 for internal use. On switches that support the <i>vrf-scaling</i> and <i>spbm-config-mode</i> boot configuration flags, if you enable these flags, the system also reserves VLAN IDs 3500 to 3998. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. |
| MacAddr | Configures the MAC address of the VLAN. |
| VrfId | Indicates the virtual router ID to which the peer belongs. |
| VrfName | Indicates the virtual router name to which the peer belongs. |

View IPv4 RSMLT Peer Information

About This Task

Perform this procedure to view and edit RSMLT peer information.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RSMLT**.
3. Select the **Peer** tab.

Peer field descriptions

Use the following table to use the **Peer** tab.

| Name | Description |
|------------------------------|--|
| IfIndex | IP interface identification. |
| VlanId | Specifies the VLAN ID of the chosen VLAN. |
| IpAddr | Specifies the IP address on the RSMLT VLAN. |
| MacAddr | Specifies the MAC address of the selected VLAN. |
| Enable | Displays the RSMLT operating status as enabled or disabled. |
| OperStatus | Displays the RSMLT operating status as either up or down. The default is down. |
| HoldDownTimer | Defines how long the recovering/restarting system remains in a non-Layer 3 forwarding mode for the peer router MAC address. The range of this value is from 0 to 3600 seconds. The default is 0. |
| HoldUpTimer | Defines how long the RSMLT system maintains forwarding for its peer. The value is a range from 0 to 3600 seconds or 9999. 9999 means infinity. The default is 0. |
| HoldDownTimeRemaining | Displays the time remaining of the HoldDownTimer. The default is 0. |
| HoldUpTimeRemaining | Displays the time remaining of the HoldUpTimer. The default is 0. |
| SmtId | Specifies the ID range for the Split MultiLink Trunk. A valid range is 1 to 32. |
| VrfId | Identifies the VRF. |
| VrfName | Indicates the VRF name. |

View IPv6 RSMLT Edge Peers

View the RSMLT peers for which the switch acts as a peer forwarder.

Procedure

1. In the navigation pane, expand **Configuration > IPv6**.
2. Select **RSMLT**.
3. Select the **Edge Peers** tab.

Edge Peers field descriptions

Use the data in the following table to use the **Edge Peers** tab.

| Name | Description |
|-----------------------------|--|
| PeerVlanId | Specifies the ID of the VLAN associated with this entry. |
| PeerIpv6Address | Specifies the IPv6 address of the peer RSMLT interface. |
| PeerIpv6PrefixLength | Specifies the peer IPv6 address prefix. |
| PeerMacAddress | Specifies the peer MAC address. |

View IPv4 RSMLT Edge Support Information

About This Task

View RSMLT edge support information to verify the RSMLT peer MAC/IP address-pair in its local configuration file and restore the configuration if the peer does not restore it after a simultaneous restart of both RSMLT-peer systems.

Procedure

1. In the navigation pane, expand **Configuration > IP**.
2. Select **RSMLT**.
3. Select the **Edge Peers** tab.

Edge Peers field descriptions

Use the data in the following table to use the **Edge Peers** tab fields.

| Name | Description |
|-----------------------|---|
| VlanId | Specifies the VLAN ID of the chosen VLAN. |
| PeerIpAddress | Specifies the peer IP address. |
| PeerMacAddress | Specifies the peer MAC address. |
| PeerVrfId | Identifies the Peer VRF. |
| PeerVrfName | Specifies the Peer VRF name. |

Secure AAA server communication

Table 317: Internet Key Exchange product support

| Feature | Product | Release introduced |
|--|-----------------|------------------------------------|
| For configuration details, see VOSS User Guide . | | |
| Note:
VOSS Releases 6.0 and 6.0.1 do not support this feature. | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VOSS 5.1.2 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 5.1.2 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VOSS 5.1.2 |
| | VSP 8400 Series | VOSS 5.1.2 |
| | VSP 8600 Series | VSP 8600 8.0 demonstration feature |
| | XA1400 Series | VOSS 8.0.50 |

Note

DEMO FEATURE - Secure AAA server communication is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Note

Secure AAA server communication is only supported on VSP 8600 Series. You can use RADsec for RADIUS security on VOSS devices running Release 8.2 or later.

The VSP 8600 Series supports IP Security (IPsec) for the AAA server communication. IPsec provides the ability to secure RADIUS and TACACS+ servers against unwanted traffic by filtering on specific network adapters, by allowing or blocking specific protocols and enabling the server to selectively allow traffic from specific source IP addresses.

An AAA server program deals with requests for access to computer resources and provides authentication, authorization, and accounting (AAA) services. The switch communicates with AAA servers using Remote Authorization Dial-in User Service (RADIUS) and Terminal Access Controller Access Control System Plus (TACACS+). It is not sufficient to protect authentication information with only RADIUS or TACACS+.

The following diagram shows the communication between AAA client and AAA server. The IPsec module on the client encrypts the packets to the AAA server and decrypts the packets from the AAA server. Similarly, the IPsec module on the server encrypts or decrypts the packets to or from the client.

To implement secure AAA server communication, the VSP 8600 Series software supports the following:

- IPsec with Internet Key Exchange (IKE) protocol for both IPv4 and IPv6.
- IPv4 implementation of IPsec, is mainly for protocols involved in communication with AAA servers, that is, RADIUS and TACACS+. However, it supports all UDP and TCP protocols.
- Digital signature as authentication method for IKE, in addition to the pre-shared key authentication method.
- Automatic and manual keying for session establishment. IKE is the default automated key management protocol for IPsec.
- IKEv1 and IKEv2 protocol.

Internet Key Exchange (IKE) protocol

Internet Key Exchange (IKE) protocol sets up a Security Association (SA) in IPsec. SA is the relationship between two network devices that define attributes such as authentication mechanism, encryption and hash algorithms, exchange mode, and key length for secured communications. SA should be agreed to by both the devices.

The IKE protocol is based on Internet Security Association and Key Management Protocol (ISAKMP) which helps in building a secured connection between two or more hosts using the following concepts:

- authentication
- encryption
- key management
- security association (SA)
- policy

IKE uses a key exchange mechanism based on the Diffie-Hellman encryption key exchange protocol. IKE provides periodic automatic key renegotiation, pre-shared and public key infrastructures, and anti-replay defence. It is layered on top of the UDP protocol and uses UDP port 500 to exchange information between peers.

IKE phases

A switch negotiates with a peer using IKE in two phases.

- In phase 1, the switch negotiates the IKE SA to protect the negotiations that take place in phase 2. The SAs negotiated in phase 1 are bi-directional, and are applicable to traffic originating in both directions.
- In phase 2, the peers negotiate and establish the SAs for IPsec and session keys through quick mode. A Diffie-Hellman key exchange is done to achieve perfect forward secrecy, which ensures that the compromise of a single key does not permit access to data other than that protected by that compromised key. The SAs in phase 2 are uni-directional. They are used according to the direction of the traffic. The quick mode is initiated by either of the peer endpoints irrespective of who initiated phase 1.

IKE modes

There are two modes of exchanging messages in Phase 1:

- Main mode

This is a secure mode of exchanging messages. It allows protection of the confidentiality of the peers during negotiation. This mode provides more flexibility in proposals compared to aggressive mode. As the main mode requires a total of 6 messages to be exchanged between peers, it is more time consuming.

- Aggressive mode

This mode is less secure than the main mode. It does not protect the confidentiality of the peers. However, it requires only a total of 3 messages to be exchanged for phase 1, which makes this mode faster than the main mode. The number of total message exchange is reduced in this mode because some messages are embedded in other messages.

The mode of message exchange in phase 2 is called quick mode. In this mode a total of 3 messages are exchanged between the peers. This mode is used to establish IPsec SA. The negotiations in the quick mode are protected during the phase 1 negotiations in main mode.

IKE policies

A combination of security parameters used during the IKE SA negotiation is called a policy. The policies must be configured on both the peers and at least one of the policies should match on both ends to have a successful negotiation for. If a policy is not configured on both peers or if a policy does not match on both ends, an SA cannot be setup and data cannot be exchanged.

The following are the attributes of an IKE policy:

- Encryption — This is the cryptographic algorithm that is sent in the proposal by the initiator or responder during the phase 1 negotiation. This cryptographic algorithm is used to encrypt phase 2 negotiation messages. The supported encryption algorithms are:
 - DES
 - 3DES
 - AES
- Hash function — This function is used as part of the authentication mechanism during the authentication of peers in phase 1. It is always used with the authentication algorithm. The supported values are:
 - MD5
 - SHA1
 - SHA256
- Authentication — This process authenticates the peers. Following are the supported authentication modes:
 - Digital Signatures — The digital signatures use digital certificate which is signed by the certificate authority (CA) for authentication.
 - Pre-shared keys (PSK) — The PSKs are shared out-of-band between the peers before hand. Using PSK in main mode exchange limits identifying the peer to an IP address (and not host name).
- Diffie-Hellman (DH) Group — This is an algorithm used by two peers that are unknown to each other to establish a shared secret key. This key that is decided during phase 1 is used to encrypt subsequent message exchanges during phase 2 to establish security associations (SA) and security policies (SP) for IPsec sessions. The supported DH Groups are as follows:
 - Group 1 (MODP768)
 - Group 2 (MODP1024)
 - Group 14 (MODP2048)
- Lifetime — This is a time and data limit agreed by peers to protect an SA from getting compromised. It ensures that the peers renegotiate the SAs just before the lifetime value expires, that is, when the time limit is reached.
- Dead-peer detection — This is a process in which the switch waits for a response from peer for a limited number of seconds before declaring the peer as dead. It is a keep-alive mechanism required to perform IKE peer fail-over and to reclaim lost resources by freeing up SAs that are no longer in use.

IKE authentication

The security gateway of a peer must authenticate the security gateway of the peer it intends to communicate with. This ensures that IKE SAs are established between the peers. The switch supports the following two authentication methods:

- Digital certificates (using RSA algorithms)

For digital certificate authentication, the initiator signs the message interchange data using the private key. The responder uses the public key of the initiator to verify the signature. The public key is exchanged by messages containing an X.509v3 certificate. This certificate provides an assurance that the identity of a peer, as represented in the certificate, is associated with a particular public key.

- Pre-shared keys

Pre-shared key authentication, the same secret must be configured on both security gateways before the gateways can authenticate each other.

Signature authentication

The switch receives the digital signature of its peer in a message exchange. The switch verifies the digital signature by using the public key of the peer. The certificate of the peer, received during the IKE negotiation, contains the public key. To ensure that the peer certificate is valid, the switch verifies its digital signature by using the certificate authority (CA) public key contained in the root CA certificate. The switch and its IKE peer require at least one common trusted root CA for authentication to work.

When IKE is configured to use digital certificates for authentication, the certificates are retrieved from the trusted certificate store in the switch, based on the provided distinguished name. The certificates received from the peer are verified with the public key.

IKEv2

The software supports IKEv2, which is an enhancement of the IKEv1 protocol. All IKEv2 communications consist of pairs of messages: a request and a response. The IKEv2 protocol uses a non-reliable transport protocol (UDP using ports 500). The pairs of exchanges allows ensuring of reliability to the IKEv2 protocol, as there is an expected response for each request.

IKEv2 provides a number of improvements over IKEv1, including the following:

- A simplified initial exchange of messages that reduces latency and increases connection establishment speed.
 - IKEv2 makes use of a single four-message exchange instead of the eight different initial exchanges of IKEv1.
 - It improves upon IKEv1's latency by making the initial exchange to be of two round trips of four messages, and allows the ability to add setup of a child SA on that exchange.
- Improved reliability through the use of sequence numbers, and acknowledgments.
 - IKEv2 reduces the number of possible error states by making the protocol reliable as all messages are acknowledged and sequenced.
- IKE SA integrity algorithms are supported only in IKEv2.
- Traffic Selectors are specified in IKEv2 by their own payloads type and not by overloading ID payloads. This makes the Traffic Selectors more flexible.
- No lifetime negotiations for IKEv2, but in IKEv1 SA lifetimes are negotiated.

IKEv2 OCSF validation

Confirmation of certificate reliability is essential to achieve the security assurances public key cryptography provides. One fundamental element of such confirmation is reference to certificate revocation status. IKEv2 enables the use of Online Certificate Status Protocol (OCSF) for in-band signaling of certificate revocation status. The IKEv2 supports the authentication methods as pre shared key and digital certificate. It allows the verification of the digital certificate sent by the peer whether it is revoked or not. This is done through a method by sending the digital certificate to the OCSF server. The

OCSP server in turn verifies the certificate status and sends the response back. Based on the response from OCSP server, the device validates the certificate.

Secure AAA server communication and IKE limitations

This section describes the limitations associated with secure AAA server communication feature.

- AAA server protection is provided only for SSH/CLI/WEB/Telnet/Console Access Protection.
- FQDN (Fully Qualified Domain Names) is not supported to identify endpoints. This is because, the user configures the IP address for the AAA servers in the switch.
- XAUTH (2-factor authentication) is not supported.
- Domain of Interpretation is not supported other than for IPsec.
- NAT Traversal is not supported.
- Custom IKE messages and vendor ID for the messages are not supported.
- IKE fragmentation is not supported.
- IKE and IPsec is not supported on the Segmented Management Instance interfaces, or with management applications such as RADIUS and TACACS+. You can configure RADIUS security with RADsec on supported devices.

Note

Exception: VSP 8600 Series supports IKE on Segmented Management Instance and RADIUS with IPsec as a DEMO FEATURE.

IKE Configuration for Secure AAA Server using CLI

This section describes procedures of IKE configuration for secure AAA server using CLI.

Configure an IKE Phase 1 Profile

About This Task

Use the following procedure to configure an IKE Phase 1 profile.

Procedure

1. Enter Global Configuration mode:
`enable`
`configure terminal`
2. Create an IKE phase 1 profile:
`ike profile WORD<1-32>`
3. Configure the IKE phase 1 profile hash algorithm:
`ike profile WORD<1-32> hash-algo <md5|sha|sha256|any>`
4. Configure the IKE phase 1 profile encryption algorithm:
`ike profile WORD<1-32> encrypt-algo <desCbc|3DesCbc|aesCbc|any>`
5. Configure the IKE phase 1 profile Diffie-Hellman group:
`ike profile WORD<1-32> dh-group <modp768|modp1024|modp2048|any>`

- Configure the IKE phase 1 encryption key length:

```
ike profile WORD<1-32> encrypt-key-len <128|192|256>
```

- Configure the IKE phase 1 lifetime, in seconds:

```
ike profile WORD<1-32> lifetime-sec <0-4294967295>
```

- (Optional) Delete the IKE Phase 1 profile:

```
no ike profile WORD<1-32>
```

Variable Definition

The following table defines parameters for the **ike profile** commands.

| Variable | Value |
|---|---|
| <code>profile WORD<1-32></code> | Specifies the IKE profile name. |
| <code>hash-algo <md5 sha sha256 any></code> | Specifies the type of hash algorithm. The default value is sha256. To set this option to the default value, use the default operator with the command: default ike profile WORD<1-32> hash-algo |
| <code>encrypt-algo <desCbc 3DesCbc aesCbc any></code> | Specifies the type of encryption algorithm. The default value is aesCbc. To set this option to the default value, use the default operator with the command: default ike profile WORD<1-32> encrypt-algo |
| <code>dh-group <modp768 modp1024 modp2048 any></code> | Specifies the Diffie-Hellman (DH) group. DH groups categorize the key used in the key exchange process, by its strength. The key from a higher group number is more secure. The default value is modp2048. To set this option to the default value, use the default operator with the command: default ike profile WORD<1-32> dh-group |
| <code>encrypt-key-len <128 192 256></code> | Specifies the length of the encryption key. The default is 256. To set this option to the default value, use the default operator with the command: default ike profile WORD<1-32> encrypt-key-len |
| <code>lifetime-sec <0-4294967295></code> | Specifies the lifetime value in seconds. The lifetime ensures that the peers renegotiate the SAs just before the expiry of the lifetime value, to ensure that Security Associations are not compromised. The default value is 86400 seconds. To set this option to the default value, use the default operator with the command: default ike profile WORD<1-32> lifetime-sec |

Create an IKE Phase 1 Policy

IKE policy establishes Security Associations (SA) and message exchanges with IKE peers to successfully set up secured channels.

About This Task

Use the following procedure to create the IKE Phase 1 policy.

Procedure

- Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create an IKE Phase 1 profile:

```
ike policy WORD<1-32> laddr WORD<1-256> raddr WORD<1-256>
```

3. (Optional) Delete the IKE Phase 1 profile:

```
no ike policy WORD<1-32>
```

Variable Definition

The following table defines parameters for the **ike policy <1-320> laddr** command.

| Variable | Value |
|--------------------------|---|
| <i>policy</i> WORD<1-32> | Specifies the name of the IKE Phase 1 policy. |
| <i>laddr</i> WORD<1-256> | Specifies the local IPv4 or IPv6 address. |
| <i>raddr</i> WORD<1-256> | Specifies the remote IPv4 or IPv6 address. |

Configuring profile to be used for IKE Phase 1 policy

Use the following procedure to configure the IKE Phase1 profile to be used for the IKE Phase 1 policy.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the profile name to be used for IKE Phase 1 policy:

```
ike policy WORD<1-32> profile WORD<1-32>
```

Variable Definition

The following table defines parameters for the **ike policy WORD<1-32> profile WORD<1-32>** command.

| Variable | Value |
|---------------------------|---|
| <i>policy</i> WORD<1-32> | Specifies the name of the IKE Phase 1 policy. |
| <i>profile</i> WORD<1-32> | Specifies the name of the IKE Phase 1 profile to be used for the policy. To set this option to the default value, use the default operator with the command: default ike policy WORD<1-32> profile |

Configure IKE Phase 2 Perfect Forward Secrecy

Use the following procedure to configure IKE Phase 2 perfect forward secrecy (PFS).

About This Task

A Diffie-Hellman key exchange is done to achieve perfect forward secrecy. This ensures that the compromise of even a single key does not permit access to data other than that protected by that key.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Configure the IKE Phase 2 perfect forward secrecy:

```
ike policy WORD<1-32> p2-pfs <enable|disable> [use-ike-group <enable|
disable>] [dh-group <modp768|modp1024|modp2048|any]
```
3. (Optional) Disable Phase 2 perfect forward secrecy:

```
no ike policy <1-32> p2-pfs
```

Variable Definition

The following table defines parameters for the **ike policy WORD<1-32> p2-pfs** command.

| Variable | Value |
|---|--|
| <i>policy</i> WORD<1-32> | Specifies the name of the IKE Phase 1 policy. |
| <i>p2-pfs</i> | Enables the Phase 2 perfect forward secrecy. |
| <i>dh-group</i> <modp768 modp1024 modp2048 any> | Configures the Diffie-Hellman (DH) group to be used for Phase 2 perfect forward secrecy (PFS). The default value is modp2048. To set this option to the default value, use the default operator with the command: default ike policy WORD<1-32> p2-pfs dh-group |
| <i>use-ike-group</i> <enable disable> | Specifies whether to use the IKE Phase 1 DH group for Phase 2 PFS or not to use it. The default is enable. To set this option to the default value, use the default operator with the command: default ike policy WORD<1-32> p2-pfs use-ike-group |

Configure the IKE Authentication Method

Use the following procedure to configure the IKE authentication method. The default is pre-shared key.

About This Task

As part of the IKE protocol, one security gateway must authenticate another security gateway to make sure that IKE SAs are established with the intended party. The switch supports two authentication methods:

- Digital certificates

Configure peer identity name for IKE phase 1 and revocation check method.

- Pre-shared keys

Configure the same secret on both security gateways before the gateways can authenticate each other.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Configure the IKE authentication method using one of the following:

- To use a digital certificate:

```
ike policy WORD<1-32> auth-method digital-certificate [peer-name  
WORD <1-64> | revocation-check-method <crl|none|ocsp>]
```

- To use a pre-shared key:

```
ike policy WORD<1-32> auth-method pre-shared-key
```

```
ike policy WORD<1-32> pre-shared-key WORD<0-32>
```

Variable Definitions

The following table defines parameters for the **ike policy WORD<1-32> auth-method** command.

| Variable | Value |
|---|---|
| <i>pre-shared-key</i> | Specifies the authentication method as pre-shared key. |
| <i>digital-certificate peer-name WORD <1-64></i> | Specifies peer identity name for IKE phase 1. |
| <i>digital-certificate revocation-check-method<crl none ocsp></i> | Specifies the revocation check method. To set this option to the default value, use the default operator with the command: default ike policy WORD<1-32> revocation-check-method |

The following table defines parameters for the **ike policy WORD<1-32> pre-shared-key** command.

| Variable | Value |
|--|--|
| <i>pre-shared-key WORD<0-32></i> | Specifies the pre-shared key. For Federal Information Processing Standards (FIPS) compliance, the minimum length is 14 characters. |

Configure Dead-Peer Detection Timeout

Use the following procedure to configure the dead-peer detection (DPD) timeout for the IKE Phase 1 policy.

About This Task

Dead Peer Detection (DPD) timeout is the interval for which the system sends messages to a peer to confirm its availability.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Configure the DPD timeout:

```
ike policy WORD<1-32> dpd-timeout <1-4294967295>
```

Variable Definition

The following table defines parameters for the **ike policy WORD<1-32> dpd-timeout** command.

| Variable | Value |
|-----------------------------------|---|
| <i>policy</i> WORD<1-32> | Specifies the name of the IKE Phase 1 policy. |
| <i>dpd-timeout</i> <1-4294967295> | Specifies the dead peer detection timeout in seconds for the IKE Phase 1 policy. The default is 300 seconds. To set this option to the default value, use the default operator with the command: default ike policy WORD<1-32> dpd-timeout |

Enable the Admin State of IKE Phase 1 Policy

Use the following procedure to enable admin state of IKE Phase 1 policy.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable admin state of IKE Phase 1 policy:

```
ike policy WORD<1-32> enable
```
3. (Optional) Disable IKE Phase 1 policy:

```
no ike policy WORD<1-32> enable
```

Display IKE Profiles

Use the following procedure to display the configured IKE profiles:

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Display all IKE profiles:

```
show ike profile
```
3. Display a specific ike profile:

```
show ike profile WORD<1-32>
```

Example

```
Switch:1#show ike profile
=====
                        IKE Profile
=====
Name                    Hash    Encrypt  Encrypt  DH      Exchange  Lifetime
                        Algo     Algo     Key Len  Group   Mode       seconds
-----
DFLT_IKE_PROFILE       sha256  aesCbc   256      modp2048  main       86400
ikePRO                  sha256  aesCbc   256      modp2048  main        180
test                    sha256  aesCbc   256      modp2048  main       86400
```

Variable Definition

The following table defines parameters for the **show ike profile** command.

| Variable | Value |
|---------------------------|--|
| <i>profile</i> WORD<1-32> | Specifies the name of the profile to be displayed. |

Job aid

The following table describes the fields in the output for the **show ike profile** command.

| Parameter | Description |
|-------------------------|--|
| <i>Name</i> | Specifies the name of the IKE Phase 1 profile. |
| <i>Hash Algo</i> | Specifies the hash authorization algorithm. The supported values are md5, sha, and sha256. |
| <i>Encrypt Algo</i> | Specifies the cryptographic algorithm. The supported values are desCbc, 3DesCbc, and aesCbc. |
| <i>Encrypt Key Len</i> | Specifies the length of the encryption key. The supported values are 128, 192 and 256. |
| <i>DH Group</i> | Specifies the Diffie-Hellman (DH) group. The supported values are modp768, modp1024, and modp2048. |
| <i>Exchange Mode</i> | Specifies the IKE mode. The supported mods are main mode and aggressive mode. |
| <i>Lifetime seconds</i> | Specifies the lifetime value in seconds. The value ranges from 0 to 4294967295 seconds. |

Display IKE Policies

Use the following procedure to display the configured IKE policies.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display all IKE policies:
show ike policy

3. Display a specific IKE policy:
`show ike policy WORD<1-32>`
4. Display a specific IKE policy at local address.
`show ike policy WORD<1-32> laddr WORD<1-256>`
5. Display a specific IKE policy at remote address.
`show ike policy WORD<1-32> laddr WORD<1-256> raddr WORD<1-256>`

Example

```
Switch:1#show ike policy

```

Variable Definition

The following table defines parameters for the **show ike policy** command.

| Variable | Value |
|--------------------------|---|
| <i>policy</i> WORD<1-32> | Specifies the name of the policy to be displayed. |
| <i>laddr</i> WORD<1-256> | Specifies the local IPv4 or IPv6 address. |
| <i>raddr</i> WORD<1-256> | Specifies the remote IPv4 or IPv6 address. |

Job aid

The following table describes the fields in the output for the **show ike policy** command.

| Parameter | Description |
|--------------------------------|--|
| <i>Policy Name</i> | Specifies the name of the policy that is displayed. |
| <i>Addr Type</i> | Specifies whether the IP address is an IPv4 or IPv6 address. |
| <i>Local Address</i> | Specifies the local IPv4 or IPv6 address. |
| <i>Remote Address</i> | Specifies the remote IPv4 or IPv6 address. |
| <i>Profile Name</i> | Specifies the name of the profile. |
| <i>Profile version</i> | Specifies the version of the profile, version 1 or version 2. |
| <i>Auth-Method</i> | Specifies the authentication method. The supported values are digital-certificate and pre-shared-key. |
| <i>Revocation-Check Method</i> | Specifies the revocation check method as OCSP, CRL or none. |
| <i>Peer-identity name</i> | Specifies peer identity name for IKE phase 1. |
| <i>Pre-Shared Key</i> | Specifies the pre-shared key value. |
| <i>DPD Timeout</i> | Specifies the Dead-peer detection timeout in seconds. The supported value ranges from 1 to 4294967295 seconds. |
| <i>Admin State</i> | Specifies whether the IKE admin state is enabled or disabled. |
| <i>Oper State</i> | Specifies whether the policy is operational or not. The values are up and down. |
| <i>P2 PFS</i> | Specifies whether Phase 2 perfect forward secrecy is enabled or not. |
| <i>Use IKE DH Grp</i> | Specifies whether IKE can use the DH group or not. The values are enable and disable. |
| <i>DH Group</i> | Specifies the type of DH group selected. The supported values are modp768, modp1024, and modp2048. |
| <i>IntfId</i> | Specifies the ID of the interface on which the policy is applied. |

Display IKE Security Association

Use the following procedure to display the configured IKE Phase 1 for version 1 and 2 security associations (SA).

Procedure

1. Enter Privileged EXEC mode:
enable

2. Display all the security associations:

```
show ike sa
```

3. Display security associations for IKE Phase 1 for version 1:

```
show ike sa version v1 WORD<1-32> laddr WORD<1-256> raddr WORD<1-256>
```

4. Display security associations for IKE Phase 1 for version 2:

```
show ike sa version v2 WORD<1-32> laddr WORD<1-256> raddr WORD<1-256>
```

Example

```
Switch:1(config)#show ike sa version v1

Variable Definition

The following table defines parameters for the **show ike sa** command.

| Variable | Value |
|--|---|
| <i>sa</i> | Specifies the IKE security association identifier. |
| <i>version v1</i>
<i>WORD<1-32> laddr</i>
<i>WORD<1-256> raddr</i>
<i>WORD<1-256></i> | Specifies the local IPv4 or IPv6 address for IKE Phase 1, version 1 SA. |
| <i>version v2</i>
<i>WORD<1-32> laddr</i>
<i>WORD<1-256> raddr</i>
<i>WORD<1-256></i> | Specifies the local IPv4 or IPv6 address for IKE Phase 1, version 2 SA. |

Job aid

The following table describes the fields in the output for the **show ike profile** command.

| Parameter | Description |
|-------------------------|--|
| <i>Policy Name</i> | Specifies the name of the IKE Phase 1 policy. |
| <i>Addr Type</i> | Specifies whether the IP address is an IPv4 or IPv6 address. |
| <i>Local Address</i> | Specifies the local IPv4 or IPv6 address. |
| <i>Remote Address</i> | Specifies the remote IPv4 or IPv6 address. |
| <i>Name</i> | Specifies the name of the IKE Phase 1 profile. |
| <i>DPD Timeout</i> | Specifies the Dead-peer detection timeout in seconds. The supported value ranges from 1 to 4294967295 seconds. |
| <i>Hash Algo</i> | Specifies the hash authorization algorithm. The supported values are MD5, SHA1, and SHA256. |
| <i>Encrypt Algo</i> | Specifies the cryptographic algorithm. The supported values are DES, 3DES, and AES. |
| <i>DH Group</i> | Specifies the Diffie-Hellman (DH) group. The supported values are MOD768, MOD1024, and MOD2048. |
| <i>Lifetime seconds</i> | Specifies the lifetime value in seconds. The value ranges from 0 to 4294967295 seconds. |
| <i>Status</i> | Specifies the status of the security association. |

Configure an IKEv2 Profile

About This Task

Use the following procedure to configure an IKEv2 profile.

Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```

2. Create an IKEv2-profile:

```
ike v2-profile WORD<1-32>
```
3. Configure the IKEv2 profile hash algorithm:

```
ike v2-profile WORD<1-32> hash-algo <md5|sha|sha256|any>
```
4. Configure the IKEv2 profile encryption algorithm:

```
ike v2-profile WORD<1-32> encrypt-algo <desCbc|3DesCbc|aesCbc|any>
```
5. Configure the IKEv2 profile integrity algorithm:

```
ike v2-profile WORD<1-32> integrity-algo <hmac-md5|hmac-sha|hmac-sha256|aes-xcbc|any>
```
6. Configure the IKEv2 profile dh group:

```
ike v2-profile WORD<1-32> dh-group <modp768|modp1024|modp2048|any>
```
7. Configure the IKEv2 profile encryption key length:

```
ike v2-profile WORD<1-32> encrypt-key-len <128|192|256>
```
8. Configure the IKEv2 profile lifetime, in seconds:

```
ike v2-profile WORD<1-32> lifetime-sec <0-4294967295>
```
9. (Optional) Delete the IKEv2 profile:

```
no ike v2-profile WORD<1-32>
```

Variable Definition

The following table defines parameters for the **ike v2-profile** commands.

| Variable | Value |
|--|--|
| <i>profile</i> WORD<1-32> | Specifies the IKE v2-profile name. |
| <i>hash-algo</i> <md5 sha sha256 any> | Specifies the type of hash algorithm. The default value is sha256. To set this option to the default value, use the default operator with the command:
default ike v2-profile WORD<1-32> hash-algo |
| <i>encrypt-algo</i> <desCbc 3DesCbc aesCbc any> | Specifies the type of encryption algorithm. The default value is aesCbc. To set this option to the default value, use the default operator with the command: default ike v2-profile WORD<1-32> encrypt-algo |
| <i>integrity-algo</i> <md5 sha-1 sha-256 aes-xcbc> | Specifies the type of integrity algorithm. The default is sha256. To set this option to the default value, use the default operator with the command: default ike v2-profile WORD<1-32> integrity-algo |
| <i>dh-group</i> <modp768 modp1024 modp2048 any> | Specifies the Diffie-Hellman (DH) group. DH groups categorize the key used in the key exchange process, by its strength. The key from a higher group number is more secure. The default value is modp2048. To set this option to the default value, use the default operator with the command: default ike v2-profile WORD<1-32> dh-group |

| Variable | Value |
|---|--|
| <i>encrypt-key-len</i>
<128 192 256> | Specifies the length of the encryption key. The default is 256. To set this option to the default value, use the default operator with the command: default ike v2-profile WORD<1-32> encrypt-key-len |
| <i>lifetime-sec</i>
<0-4294967295> | Specifies the lifetime value in seconds. The lifetime ensures that the peers renegotiate the SAs just before the expiry of the lifetime value, to ensure that Security Associations are not compromised. The default value is 86400 seconds. To set this option to the default value, use the default operator with the command: default ike v2-profile WORD<1-32> lifetime-sec |

Display IKEv2 Profiles

Use the following procedure to display the configured IKEv2 profiles.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Display all IKEv2 profiles:
show ike v2-profile
3. Display a specific IKEv2 profile:
show ike v2-profile WORD<1-32>

Example

```
Switch:1#show ike v2-profile test
```

```
=====
                                IKE2 Profile
=====

Name         Mode           Algo      Algo      Key
Length      Mode
-----
test
256         main           sha256    aesCbc

=====
                                IKE2 Profile
=====
Lifetime     DH      Integrity
Name         Group   Algorithm
seconds
-----
test
180         modp2048 sha256
```

Variable Definitions

The following table defines parameters for the **show ike v-2profile** command.

| Variable | Value |
|--------------------|-----------------------------------|
| <i>WORD</i> <1-32> | Specifies the name of the policy. |

Job aid

The following table describes the fields in the output for the **show ike v2-profile** command.

| Parameter | Description |
|----------------------------|--|
| <i>Name</i> | Specifies the name of the IKEv2 profile. |
| <i>Hash Algo</i> | Specifies the hash authorization algorithm. The supported values are MD5, SHA1, and SHA256. |
| <i>Encrypt Algo</i> | Specifies the cryptographic algorithm. The supported values are DES, 3DES, and AES. |
| <i>Encrypt Key Length</i> | Specifies the length of the encryption key. The supported values are 128, 192, and 256. |
| <i>DH Group</i> | Specifies the Diffie-Hellman (DH) group. The supported values are modp768, modp024, and modp048. |
| <i>Integrity Algorithm</i> | Specifies IKE SA integrity algorithms supported in IKEv2. |
| <i>Exchange Mode</i> | Specifies the IKE mode. The supported mods are main mode and aggressive mode. |
| <i>Lifetime seconds</i> | Specifies the lifetime value in seconds. The value ranges from 0 to 4294967295 seconds. |

IKE Configuration for Secure AAA Server using EDM

This section describes the procedures of IKE configuration for secure AAA server using EDM.

Configure IKE Phase 1 Profile

Use the following procedure to create and configure an IKE Phase 1 profile.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **IKE**.
3. Click the **Profile** tab.
4. Click **Insert**.
5. In the **Name** field, type a profile name.
6. Complete the remaining optional configuration to customize the policy.
7. Click **Insert**.

IKE profile field descriptions

Use the data in the following table to use the **IKE > Profile** tab.

| Name | Description |
|----------------------------|--|
| Name | Description |
| Name | Specifies the name of the profile. |
| HashAlgorithm | Specifies the hash algorithms that can be used during IKE Phase 1 SA negotiation. The default value is sha256. |
| EncryptionAlgorithm | Specifies the encryption algorithms that can be used during IKE Phase 1 SA negotiation. The default value is aesCbc. |
| EncryptKeyLen | Specifies the key length that should be used during IKE Phase 1 SA negotiation. The default value is 128. |
| DHGroup | Specifies the Diffie-Hellman groups that can be used during IKE Phase 1 SA negotiation. The default value is mod1024. |
| ExchangeMode | Specifies the IKE Phase 1 negotiation mode. The default value is main. |
| LifetimeSeconds | Specifies the amount of time for which an IKE Phase 1 SA can remain valid during IKE Phase 1 negotiation. A value of 0 means no the SA always remains valid. The default value is 86400 seconds. |

Configure IKEv2 Profile

Use the following procedure to create and configure an IKEv2 profile.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **IKE**.
3. Click the **V2 Profile** tab.
4. Click **Insert**.
5. In the **Name** field, type a profile name.
6. Complete the remaining optional configuration to customize the policy.
7. Click **Insert**.

V2 Profile field descriptions

Use the data in the following table to use the **IKE > V2 Profile** tab.

| Name | Description |
|----------------------------|--|
| Name | Specifies the IKE v2 profile name. |
| HashAlgorithm | Specifies the type of hash algorithm that can be used during IKE version 2 SA version 2 negotiation. The default value is sha256. |
| EncryptionAlgorithm | Specifies the encryption algorithms that can be used during IKE version 2 SA version 2 negotiation. The default value is aesCbc. |
| EncryptKeyLen | Specifies the type of encryption algorithm. The default value is keylen-256. |
| DHGroup | Specifies the Diffie-Hellman (DH) group. DH groups categorize the key used in the key exchange process, by its strength. The key from a higher group number is more secure. The default value is modp2048. |
| ExchangeMode | Specifies the IKE v2 profile negotiation mode. The default value is main. |
| LifetimeSeconds | Specifies the lifetime value in seconds. The lifetime ensures that the peers renegotiate the SAs just before the expiry of the lifetime value, to ensure that Security Associations are not compromised. The default value is 86400 seconds. |
| IntegrityAlgorithm | Specifies the type of integrity algorithm. |

Configure IKE Phase 1 Policy

Use the following procedure to create and configure an IKE Phase 1 policy.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **IKE**.
3. Click the **Policy** tab.
4. Click **Insert**.
5. In the **LocalIndex** field, click either **Port** or **Vlan**, and then select an interface.
6. In the **LocalAddrType** field, select the type of the local address.
7. In the **LocalAddr** field, type the address of the local peer.
8. In the **RemoteAddrType** field, select the type of the remote address.
9. In the **RemoteAddr** field, type the address of the remote peer.
10. In the **Name** field, type the name for the policy.

Name must be assigned when creating the policy. Once the policy is created, the name cannot be changed.

11. Complete the remaining optional configuration to customize the policy.
12. Click **Insert**.

Policy field descriptions

Use the data in the following table to use the **Policy** tab.

| Name | Description |
|-----------------------------|--|
| LocalIfIndex | Specifies the Interface Index of the local address. Only port and vlan interfaces are supported. |
| LocalAddrType | Specifies whether the local address is an IPv4 or IPv6 address. |
| LocalAddr | Specifies the address of the local peer. |
| RemoteAddrType | Specifies whether the remote address is an IPv4 or IPv6 address. |
| RemoteAddr | Specifies the address of the remote peer. |
| Name | Specifies the name given to the policy. The name should be assigned while creating the policy. You cannot change the name after the policy is created. |
| ProfileName | Specifies the name of the profile that should be used for this policy. |
| ProfileVersion | Specifies the profile version used for the policy. |
| PeerName | Specifies the peer name. |
| AuthenticationMethod | Specifies the proposed authentication method for the Phase 1 security association. The default authentication method is pre-shared key. |
| PSKValue | Specifies the value of the Pre-Shared Key if the authentication method is set to PSK. |
| DPDTimeout | Specifies the Dead Peer Detection timeout in seconds. Default value is 300 seconds. |
| P2PFS | Specifies whether or not the perfect forward secrecy (PFS) is used when refreshing keys. To use PFS, select enable. The default value is disable. |
| P2PfsUseIkeGroup | Specifies whether or not to use the same GroupId (Diffie-Hellman Group) for phase 2 as was used in phase 1. Ignore this entry if P2PFS is disabled. The default value is enable. |
| P2PfsDHGroup | Specifies the Diffie-Hellman group to use for phase 2 when P2PFS is enabled and P2PfsUseIkeGroup is disabled. The default value is mod1024. |
| AdminState | Specifies whether the policy is administratively enabled or disabled. The default value is disable. |

| Name | Description |
|------------------------------|---|
| OperStatus | Shows is the policy is operationally up or down. |
| RevocationCheckMethod | Specifies the revocation check method as OCSP, CRL or none. |

Display IKE Phase 1 Security Association

Use the following procedure to view the IKE Phase 1 security association.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **IKE**.
3. Click the **SA** tab.

IKE SA field descriptions

Use the data in the following table to use the **IKE > SA** tab.

| Name | Description |
|-----------------------------|---|
| Id | Specifies the profile ID. |
| LocalIndex | Specifies the Interface Index of the local address. Only port and vlan interfaces are supported. |
| LocalAddrType | Specifies whether the local address is an IPv4 or IPv6 address. |
| LocalAddr | Specifies the address of the local peer. |
| RemoteAddrType | Specifies whether the remote address is an IPv4 or IPv6 address. |
| RemoteAddr | Specifies the address of the remote peer. |
| Name | Specifies the name given to the SA. |
| AuthenticationMethod | Specifies the proposed authentication method for the Phase 1 security association. The default authentication method is pre-shared key. |
| DPDTimeout | Specifies the Dead Peer Detection timeout in seconds. |
| HashAlgorithm | Specifies the hash algorithm negotiated for this IKE Phase 1 SA. |
| EncryptionAlgorithm | Specifies the encryption algorithm negotiated for this IKE Phase 1 SA. |
| EncryptKeyLen | Specifies the encryption key length negotiated for this IKE Phase 1 SA. |
| DHGroup | Specifies the Diffie-Hellman group negotiated for this IKE Phase 1 SA. |
| ExchangeMode | Specifies the IKE Phase 1 SA mode. |

| Name | Description |
|------------------------|--|
| LifetimeSeconds | Specifies the amount of time for which an IKE Phase 1 SA can remain valid during IKE Phase 1 negotiation. A value of 0 means no the SA always remains valid. |
| Status | Specifies whether the SA is active or inactive. |
| Initiator | Specifies whether specifies the whether the SA is created by an initiator or a responder. |

Display IKE V2 Security Association

Use the following procedure to view the IKE version 2 security association.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **IKE**.
3. Click the **V2 SA** tab.

V2 SA field descriptions

Use the data in the following table to use the **IKE > V2 SA** tab.

| Name | Description |
|-----------------------------|--|
| Id | Specifies the profile ID. |
| LocalIndex | Specifies the Interface Index of the local address. Only port and vlan interfaces are supported. |
| LocalAddrType | Specifies whether the local address is an IPv4 or IPv6 address. |
| LocalAddr | Specifies the address of the local peer. |
| RemoteAddrType | Specifies whether the remote address is an IPv4 or IPv6 address. |
| RemoteAddr | Specifies the address of the remote peer. |
| Name | Specifies the name given to the SA. |
| AuthenticationMethod | Specifies the proposed authentication method for theVersion 2 security association. The default authentication method is pre-shared key. |
| DPDTimeout | Specifies the Dead Peer Detection timeout in seconds. |
| HashAlgorithm | Specifies the hash algorithm negotiated for this IKE Version 2 SA. |
| EncryptionAlgorithm | Specifies the encryption algorithm negotiated for this IKE Version 2 SA. |
| EncryptKeyLen | Specifies the encryption key length negotiated for this IKE Version 2 SA. |

| Name | Description |
|---------------------------|--|
| DHGroup | Specifies the Diffie-Hellman group negotiated for this IKE Version 2 SA. |
| ExchangeMode | Specifies the IKE Version 2 SA mode. |
| LifetimeSeconds | Specifies the amount of time for which an IKE Version 2 SA can remain valid during IKE Version 2 negotiation. A value of 0 means no the SA always remains valid. |
| Status | Specifies whether the SA is active or inactive. |
| Initiator | Specifies whether specifies the whether the SA is created by an initiator or a responder. |
| IntegrityAlgorithm | Specifies the type of integrity algorithm. |

Secure Shell Fundamentals

Methods of remote access such as Telnet or FTP generate unencrypted traffic. Anyone that can see the network traffic can see all data, including passwords and user names. Secure Shell (SSH) is a client and server protocol that specifies the way to conduct secure communications over a network. Secure Shell

can replace Telnet and other remote login utilities. Secure File Transfer Protocol (SFTP) can replace FTP with an encrypted alternative.

Note

If both SSH and SFTP are concurrently active, you have the ability to disable SFTP while allowing SSH to remain active. For more information, see [Disabling SFTP without disabling SSH](#) on page 2854.

The switch software supports Secure CoPy protocol (SCP), which is a secure file transfer protocol. Use SCP to securely transfer files between a local host and a remote host. SCP is in off state by default, but you can turn it on when you enable SSH using the **boot config flags** command in the global config mode. The switch supports SCP only as an SCP server, which means that clients can send files to the switch or can request files from the switch. Secure CoPy (SCP) can replace FTP with an encrypted alternative.

Secure Shell supports a variety of the different public and private key encryption schemes available. Using the public key of the host server, the client and server negotiate to generate a session key known only to the client and the server. This one-time key encrypts all traffic between the client and the server. The switch supports Secure Shell version 2 (SSHv2).

Figure 224: Overview of the SSHv2 protocol

By using a combination of host, server, and session keys, the SSHv2 protocol can provide strong authentication and secure communication over an insecure network, offering protection from the following security risks:

- IP spoofing
- IP source routing
- Domain name server (DNS) spoofing
- Man-in-the-middle/TCP hijacking attacks
- Eavesdropping and password sniffing

Even if network security is compromised, traffic cannot be played back or decrypted, and the connection cannot be hijacked.

The SSH secure channel of communication does not provide protection against break-in attempts or denial-of-service (DoS) attacks.

With the SSHv2 server in the switch, you can use an SSHv2 client to make a secure connection to the switch and work with commercially available SSHv2 clients. For more information about supported clients, see [Third-party SSH and SCP client software](#) on page 2839. The switch also supports outbound connections to remote SSHv2 servers to provide complete inbound and outbound secure access.

Outbound connections

The SSHv2 client supports SSHv2 DSA public key authentication and password authentication.

Note

You must enable SSH globally before you can generate SSH DSA user keys.

The SSHv2 client is a secure replacement for outbound Telnet. Password authentication is the easiest way to use the SSHv2 client feature.

Instead of password authentication, you can use DSA public key authentication between the SSHv2 client and an SSHv2 server. Before you can perform a public key authentication, you must generate the key pair files and distribute the key files to all the SSHv2 server systems. Because passphrase encrypts and further protects the key files, you must provide a passphrase to decrypt the key files as part of the DSA authentication.

To attempt public key authentication, the SSHv2 client looks for the associated DSA key pair files in the `/intflash/.ssh` directory. If no DSA key pair files are found, the SSHv2 client automatically prompts you for password authentication. If the SSHv2 client succeeds with the authentication, then a new secured SSHv2 session is established to the remote SSHv2 server. For more information, see [.DSA authentication access level and file name](#) on page 2841.

Important

If you configure the DSA user key with a passphrase but you do not supply the correct passphrase when you try to make the SSHv2 connection, then the system defaults back to the password authentication. If the SSHv2 client succeeds with the authentication, then a new secured SSHv2 session is established to the remote SSHv2 server.

SSH version 2

SSH version 2 (SSHv2) protocol is a complete rewrite of the SSHv1 protocol. In SSHv2 the functions are divided among three layers:

- SSH Transport Layer (SSH-TRANS)

The SSH Transport Layer manages the server authentication and provides the initial connection between the client and the server. After the connection is established, the Transport Layer provides a secure, full-duplex connection between the client and server.

- SSH Authentication Protocol (SSH-AUTH)

The SSH Authentication Protocol runs on top of the SSH Transport Layer and authenticates the client-side user to the server. SSH-AUTH defines three authentication methods: public key, host-based, and password. SSH-AUTH provides a single authenticated tunnel for the SSH connection protocol.

- SSH Connection Protocol (SSH-CONN)

The SSH Connection Protocol runs on top of the SSH Transport Layer and user authentication protocols. SSH-CONN provides interactive logon sessions, remote execution of commands, forwarded TCP/IP connections, and forwarded X11 connections. These services are multiplexed into the single encrypted tunnel provided by the SSH transport layer.

The following figure shows the three layers of the SSHv2 protocol.

Figure 225: Separate SSH version 2 protocols

The modular approach of SSHv2 improves on the security, performance, and portability of the SSHv1 protocol.

Important

The SSHv1 and SSHv2 protocols are not compatible. The switch does not support SSHv1.

Security features

The SSHv2 protocol supports the following security features:

- **Authentication.** This feature determines, in a reliable way, the SSHv2 client. During the log on process, the SSHv2 client is queried for a digital proof of identity.

Supported authentications with the switch as a server for SSHv2, are: RSA, DSA, and passwords. Supported authentications with the switch as a client for SSHv2, are: DSA and passwords. The switch does not support RSA when the switch acts as a client.

When the switch acts as an SSH server, by default the switch allows a maximum of only four sessions, although it can accommodate up to eight sessions at a time. However, only one SSH public key encryption per access level is allowed at a time. For instance, if multiple SSH public key encryption clients need to connect to the server with the same access level, such as rwa, then the clients must connect to the server one-by-one as the switch only supports one public key per access level.

- Encryption. The SSHv2 server uses encryption algorithms to scramble data and render it unintelligible except to the receiver.

Supported encryption and ciphers are: 3DES, AES128-cbc, AES192-cbc, AES256-cbc, AES128-ctr, AES192-ctr, AES256-ctr, MD5, secure hash algorithm 1 (SHA-1) and SHA-2.

- Integrity. This feature guarantees that the data transmits from the sender to the receiver without alterations. If a third party captures and modifies the traffic, the SSHv2 server detects this alteration.

Note

SCP is supported for RWA users only. RW or R level will not work and the switch logs a message on the device.

SSHv2 considerations using EDM

You must use CLI to initially configure SSHv2. You can use Enterprise Device Manager (EDM) to change the SSHv2 configuration parameters. CLI is the user interface for SSHv2 configuration and use the console port to configure the SSHv2 parameters. Depending on the hardware platform, the console port displays as console or 10101.

Important

Do not enable SSHv2 secure mode using Configuration and Orchestration Manager (COM). If you enable SSHv2 secure mode, then the system disables Simple Network Management Protocol (SNMP). This locks you out of a COM session. Enable SSH secure mode using CLI or EDM.

SSHv2 secure mode is different from enhanced secure mode and hsecure. SSHv2 secure mode disables unsecure management protocols on the device such as FTP, rlogin, SNMP, Telnet, and TFTP. SSHv2 secure mode is enabled through the **ssh secure** command.

When you enable SSHv2 secure mode, the system disables FTP, remote login (rlogin), SNMPv1, SNMPv2, SNMPv3, Telnet and TFTP. After SSHv2 secure mode is enabled, you can choose to enable individual non-secure protocols. However, after you save the configuration and restart the system, the non-secure protocol is again disabled, even though it is shown as enabled in the configuration file. After you enable SSHv2 secure mode, you cannot enable non-secure protocols by disabling SSHv2 secure mode.

Note

rlogin is supported only on the VSP 8600 Series.

You can disable block-snmp after you enable SSHv2 secure mode, and you can connect again using COM.

User ID Logs

User ID log of an SSH session established by SCP client

The switch logs the user ID of an SSH session initiated by the SCP client. If an SCP client establishes an SSH session, the message appears in the following format:

```
CP1 [08/06/15 09:43:42.230:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH user
authentication succeeded for user rwa on host 10.68.231.194
CP1 [08/06/15 09:43:42.232:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH SCP session
start by user rwa on host 10.68.231.194
CP1 [08/06/15 09:43:44.020:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SCP session
closed by user rwa on host 10.68.231.194
CP1 [08/06/15 09:43:44.021:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH session
closed by user rwa on host 10.68.231.194
```

In the preceding example log output, rwa is the user name.

User ID log of an SSH session established by SFTP

The switch logs the user ID of an SSH session initiated by SFTP. If SFTP establishes an SSH session, the message appears in the following format:

```
CP1 [08/06/15 09:45:32.903:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH user
authentication succeeded for user rwa on host 10.68.231.194
CP1 [08/06/15 09:45:32.905:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SFTP session
start: user rwa on host 10.68.231.194
CP1 [08/06/15 09:45:46.775:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SFTP session
closed by user rwa on host 10.68.231.194
CP1 [08/06/15 09:45:46.776:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH SFTP
session end: user rwa on host 10.68.231.194
CP1 [08/06/15 09:45:46.776:UTC] 0x000d8602 00000000 GlobalRouter SSH INFO SSH session
closed by server for user rwa on host 10.68.231.194
```

In the preceding example log output, rwa is the user name.

User key files

Generating keys requires that you have free space on the flash. A typical configuration requires less than 2 kbyte of free space. Before you generate a key, verify that you have sufficient space on the flash, using the **dir** command. If the flash is full when you attempt to generate a key, an error message appears and the key is not generated. You must delete some unused files and regenerate the key.

If you remove only the public keys, enabling the SSH does not create new public keys.

SSHv2 password authentication uses the same login and password authentication mechanism as Telnet. The SSHv2 client also supports DSA public key authentication compatible with the switch SSHv2 server and Linux SSHv2 server for SSHv2.

If the switch is the client, use the following table to locate the DSA user key files for DSA authentication for user access level `rwa`.

Table 319: DSA user key files

| SSH server | SSH client side | SSH server side |
|---|--|--|
| switch with enhanced secure mode disabled | Private and public keys by access level: <ul style="list-style-type: none"> • <code>rwa—/intflash/.ssh/id_dsa_rwa</code> (private key), <code>/intflash/.ssh/id_dsa_rwa.pub</code> (public key) • <code>rw—/intflash/.ssh/id_dsa_rw</code> (private key), <code>/intflash/.ssh/id_dsa_rw.pub</code> (public key) • <code>ro—/intflash/.ssh/id_dsa_ro</code> (private key), <code>/intflash/.ssh/id_dsa_ro.pub</code> (public key) • <code>rwl1—/intflash/.ssh/id_dsa_rwl1</code> (private key), <code>/intflash/.ssh/id_dsa_rwl1.pub</code> (public key) • <code>rwl2—/intflash/.ssh/id_dsa_rwl2</code> (private key), <code>/intflash/.ssh/id_dsa_rwl2.pub</code> (public key) • <code>rwl3—/intflash/.ssh/id_dsa_rwl3</code> (private key), <code>/intflash/.ssh/id_dsa_rwl3.pub</code> (public key) | Public keys on the server side based on access level: <ul style="list-style-type: none"> • <code>rwa—/intflash/.ssh/dsa_key_rwa</code> (public key) • <code>rw—/intflash/.ssh/dsa_key_rw</code> (public key) • <code>ro—/intflash/.ssh/dsa_key_ro</code> (public key) • <code>rwl1—/intflash/.ssh/dsa_key_rwl1</code> (public key) • <code>rwl2—/intflash/.ssh/dsa_key_rwl2</code> (public key) • <code>rwl3—/intflash/.ssh/dsa_key_rwl3</code> (public key) |
| switch with enhanced secure mode enabled | Private and public keys by access role level: <ul style="list-style-type: none"> • <code>administrator—/intflash/.ssh/id_dsa_admin</code> (private key), <code>/intflash/.ssh/id_dsa_admin.pub</code> (public key) • <code>operator —/intflash/.ssh/id_dsa_operator</code> (private key), <code>/intflash/.ssh/id_dsa_operator.pub</code> (public key) • <code>security —/intflash/.ssh/id_dsa_security</code> (private key), <code>/intflash/.ssh/id_dsa_security.pub</code> (public key) • <code>auditor —/intflash/.ssh/id_dsa_auditor</code> (private key), <code>/intflash/.ssh/id_dsa_auditor.pub</code> (public key) • <code>privilege —/intflash/.ssh/id_dsa_priv</code> (private key), <code>/intflash/.ssh/id_dsa_priv.pub</code> (public key) | Public keys on the server side based on access level: <ul style="list-style-type: none"> • <code>administrator—/intflash/.ssh/dsa_key_admin</code> (public key) • <code>operator—/intflash/.ssh/dsa_key_operator</code> (public key) • <code>security—/intflash/.ssh/dsa_key_security</code> (public key) • <code>privilege—/intflash/.ssh/dsa_key_priv</code> (public key) • <code>auditor—/intflash/.ssh/dsa_key_auditor</code> (public key) |

Table 319: DSA user key files (continued)

| SSH server | SSH client side | SSH server side |
|---------------------|---|---|
| Linux with Open SSH | ~/.ssh/id_dsa (private key) file
permission 400
~/.ssh/id_dsa.pub (public key) file
permission 644 | ~/.ssh/authorized_keys (public key)
file |
| ERS 8600/8800 | — | /flash/.ssh/dsa_key_rwa (public key) |

When you attempt to make an SSH connection from the switch, the SSHv2 client looks in its own internal flash for the public key pair files. If the key files exist, the SSHv2 client prompts you for the passphrase to decrypt the key files. If the passphrase is correct, the SSHv2 client initiates the DSA key authentication to the remote SSHv2 server. The SSHv2 client looks for the login user access level public key file on the SSHv2 server to process and validate the public key authentication. If the DSA authentication is successful, then the SSHv2 session is established.

If no matching user key pair files exist on the client side when initiating the SSHv2 session, or if the DSA authentication fails, you are automatically prompted for a password to attempt password authentication.

If the remote SSHv2 server is a Linux system, the server looks for the login user public key file `~/.ssh/authorized_keys` by default for DSA authentication. For a Linux SSHv2 client, the user DSA key pair files are located in the user home directory as `~/.ssh/id_dsa` and `~/.ssh/id_dsa.pub`.

Block SNMP

The boot flag setting for block-snmpp (**boot config flags block-snmpp**) and the runtime configuration of SSH secure (**ssh secure**) each modify the block-snmpp boot flag. If you enable SSH secure mode, the system automatically sets the block-snmpp boot flag to true; the change takes effect immediately. After enabling SSH in secure mode, you can manually change the block-snmpp flag to false to allow both SSH and SNMP access.

Important

The block flag setting for block-snmpp blocks Simple Network Management Protocol (SNMP)v1, SNMPv2, and SNMPv3.

SCP command

Use short file names with the Secure CoPy (SCP) command. The entire SCP command, including all options, user names, and file names must not exceed 80 characters. The switch supports incoming SCP connections but does not support outgoing connections using an SCP client.

Third-party SSH and SCP client software

Tested software

The following table describes the third-party SSH and SCP client software that has been tested but is not included with the switch software.

Table 320: Tested software

| SSH Client | Secure Shell (SSH) | Secure Copy (SCP) |
|--|--|--|
| Tera Term Pro with TTSSH extension
MS Windows | <ul style="list-style-type: none"> • Supports SSHv2. • Authentication: <ul style="list-style-type: none"> - RSA is supported when the switch acts as a server. The switch does not support RSA as a client. - DSA - Password • Provides a keygen tool. • It creates both RSA and DSA keys. | <ul style="list-style-type: none"> • Client distribution does not include SCP client. |
| Secure Shell Client
Windows 2000 | <ul style="list-style-type: none"> • Supports SSHv2 client. • Authentication <ul style="list-style-type: none"> ◦ DSA ◦ Password • Provides a keygen tool. • It creates a DSA key in SSHv2 format. • The switch generates a log message stating that a DSA key has been generated. | <ul style="list-style-type: none"> • Client distribution includes an SCP client that is not compatible with switch. |
| OpenSSH
Unix Solaris 2.5 / 2.6 | <ul style="list-style-type: none"> • Supports SSHv2 clients. • Authentication: <ul style="list-style-type: none"> - RSA is supported when the switch acts as a server. The switch does not support RSA as a client. - DSA - Password • Provides a keygen tool. • It creates both RSA and DSA keys. | <ul style="list-style-type: none"> • Client distribution includes an SCP client that is supported on switch. |
| WinSCP | N/A | This SCP client is unsupported on the switch. |

Switch as client

The switch acting as the SSHv2 client generates a DSA public and private server key pair. The public part of the key for DSA is stored in the following location:

```
/intflash/.ssh/dsa_key_rwa
```

The public part of the key must be copied to the SSH server and be named according to the naming requirement of the server.

Consult [DSA authentication access level and file name](#) on page 2841 for proper naming convention.

If a DSA key pair does not exist, you can generate the DSA key pair using the **ssh dsa-user-key [WORD<1-15>] [size <1024-1024>]** command.

You need to copy the DSA public key to the SSHv2 server that you connect to using the switch as a client. RSA is not supported when using the switch as a client, but you can use RSA when the switch is acting as the server.

Switch as server

After you install one of the SSHv2 clients you must generate a client and server key using the RSA or DSA algorithms.

To authenticate an SSHv2 client using DSA, the administrator must copy the public part of the client DSA key to /intflash/.ssh directory on the switch that acts as the SSHv2 server. The file that is copied over to the SSHv2 server must be named according to [DSA authentication access level and file name](#) on page 2841.

DSA authentication access level and file name

The following table lists the access levels and file names that you must use to store the SSHv2 client authentication information using DSA onto the switch that acts as the SSHv2 server.

Table 321: DSA authentication access levels and file names

| Client key format or WSM | Access level | File name |
|---|--------------|-----------------------------|
| Client key in non IETF and IETF format with enhanced secure mode disabled

Note:
The switch supports IETF and non-IETF for DSA. | RWA | /intflash/.ssh/dsa_key_rwa |
| | RW | /intflash/.ssh/dsa_key_rw |
| | RO | /intflash/.ssh/dsa_key_ro |
| | L3 | /intflash/.ssh/dsa_key_rwl3 |
| | L2 | /intflash/.ssh/dsa_key_rwl2 |
| | L1 | /intflash/.ssh/dsa_key_rwl1 |

Table 321: DSA authentication access levels and file names (continued)

| Client key format or WSM | Access level | File name |
|------------------------------------|---------------|---------------------------------|
| Client key in enhanced secure mode | administrator | /intflash/.ssh/dsa_key_admin |
| | operator | /intflash/.ssh/dsa_key_operator |
| | security | /intflash/.ssh/dsa_key_security |
| | privilege | /intflash/.ssh/dsa_key_priv |
| | auditor | /intflash/.ssh/dsa_key_auditor |

The switch generates an RSA public and private server key pair. The public part of the key for RSA is stored in /intflash/.ssh/ssh_key_rsa_pub.key. If an RSA key pair does not exist, then the switch automatically generates one when you enable the SSH server. To authenticate a client using RSA, the administrator must copy the public part of the client RSA key to the switch.

RSA authentication access level and file name

The following table lists the access levels and file names you can use for storing the SSH client authentication information using RSA.

Table 322: RSA authentication access levels and file names

| Client key format or WSM | Access level | File name |
|---|---------------|---------------------------------|
| Client key in IETF format with enhanced secure mode disabled. | RWA | /flash/.ssh/rsa_key_rwa |
| | RW | /flash/.ssh/rsa_key_rw |
| | RO | /flash/.ssh/rsa_key_ro |
| | L3 | /flash/.ssh/rsa_key_rwl3 |
| | L2 | /flash/.ssh/rsa_key_rwl2 |
| | L1 | /flash/.ssh/rsa_key_rwl1 |
| Client key with enhanced secure mode enabled | administrator | /intflash/.ssh/rsa_key_admin |
| | operator | /intflash/.ssh/rsa_key_operator |
| | security | /intflash/.ssh/rsa_key_security |
| | privilege | /intflash/.ssh/rsa_key_priv |
| | auditor | /intflash/.ssh/rsa_key_auditor |

SSH rekeying

SSH rekeying is an SSHv2 feature that allows the SSH server or client to force a key exchange between server and client, while changing the encryption and integrity keys. After you enable SSH rekeying, key exchanges occur after a pre-determined time interval or after the data transmitted in the session reaches the data-limit threshold. The default time-interval is 1 hour and the default data-limit is 1 GB. You can configure these values using the **ssh rekey** command.

SSH rekey is optional. You can enable SSH rekey only when SSH is enabled globally. Most SSH clients and servers do not provide a rekey mechanism, do not enable SSH rekey in such cases. Active sessions shut down if the rekey fails.

**Note**

You cannot enable SSH rekey selectively for either SSH client or server, it is enabled both on the SSH client and server together.

Configure Secure Shell using CLI

Use Secure Shell version 2 (SSHv2) to enable secure communications support over a network for authentication, encryption, and network integrity.

Before You Begin

- Disable the `sshd` daemon. All SSHv2 commands, except `enable`, require that you disable the `sshd` daemon.
- Set the user access level to `read/write/all` community strings.
- Disable all nonsecure access services. As a best practice, disable the following services: Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP), Telnet, and Remote login (`rlogin`). For more information about disabling access services, see [Enable Remote Access Service](#) on page 179.

**Note**

`rlogin` is only supported on VSP 8600 Series.

- Use the console port to configure the SSHv2 parameters. Depending on your hardware platform, the console port displays as `console` or `10101`.

Enabling the SSHv2 server

Enable the SSHv2 server to provide secure communications for accessing the switch. The switch does not support SSHv1.

Before You Begin

To enable SSH, ensure to enable RSA or DSA authentication, or both using command `ssh rsa-auth` or `ssh dsa-auth`.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```
2. Enable the SSH server:

```
boot config flags sshd
```
3. Save the configuration file:

```
save config
```

Example

Enable the SSHv2 server:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#boot config flags sshd
Switch:1(config)#save config
```

Changing the SSH server authentication mode

Use this procedure to change the SSH server authentication mode from the default of password-authentication to keyboard-interactive.

About This Task

If you enable keyboard-interactive authentication mode, the server uses that mode over other authentication methods, except for public-key authentication, if the SSH client supports it.

If you enable keyboard-interactive authentication mode, the server generates the password prompts to display to the client rather than the client generating the prompts automatically like with password-authentication.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`
2. Enable keyboard-interactive authentication:
`ssh keyboard-interactive-auth`

Configure SSH Configuration Parameters

Note

DEMO FEATURE - Two-Factor Authentication-X.509v3 Certificates for SSH is a demonstration feature on some products. Demonstration features are provided for testing purposes. Demonstration features are for lab use only and are not for use in a production environment. For more information on feature support, see [VOSS Feature Support Matrix](#).

Configure Secure Shell version 2 (SSHv2) parameters to support public and private key encryption connections. The switch does not support SSHv1.

Before You Begin

You must enable SSH globally before you can generate SSH DSA user keys.

Procedure

1. Enter Global Configuration mode:
`enable`

`configure terminal`

2. Configure the authentication type to use:

```
ssh authentication-type {[aead-aes-128-gcm-ssh] [aead-aes-256-gcm-ssh]
[hmac-sha1] [hmac-sha2-256]}
```
3. Enable DSA authentication:

```
ssh dsa-auth
```
4. Generate a new DSA host key:

```
ssh dsa-host-key [<1024-1024>]
```
5. Generate a new SSH DSA user key:

```
ssh dsa-user-key WORD<1-15> [size [<1024-1024>]]
```
6. Configure the type of encryption to use:

```
ssh encryption-type {[3des-cbc] [aead-aes-128-gcm-ssh] [aead-aes-256-
gcm-ssh] [aes128-cbc] [aes128-ctr] [aes192-cbc] [aes192-ctr] [aes256-cbc]
[aes256-ctr] [blowfish-cbc] [rijndael128-cbc] [rijndael192-cbc]}
```
7. Configure the key-exchange to use:

```
ssh key-exchange-method {[diffie-hellman-group1-sha1] [diffie-hellman-
group14-sha1]}
```
8. Configure the maximum number of SSH sessions:

```
ssh max-sessions <0-8>
```
9. Enable password authentication:

```
ssh pass-auth
```
10. Configure the SSH connection port:

```
ssh port <22,1024..49151>
```
11. Enable RSA authentication:

```
ssh rsa-auth
```
12. Generate a new RSA host key:

```
ssh rsa-host-key [<1024-2048>]
```
13. Generate a new RSA user key.

```
ssh rsa-user-key WORD<1-15>
```
14. Enable X.509 V3 authentication:

```
ssh x509v3-auth enable
```
15. Configure X.509 V3 revocation:

```
ssh x509v3-auth revocation-check-method {none | ocsf}
```
16. Configure X.509 V3 username:

```
ssh x509v3-auth username {overwrite | strip-domain | use-domain
WORD<1-254>}
```
17. Enable SSH secure mode:

```
ssh secure
```
18. Configure the authentication timeout:

```
ssh timeout <1-120>
```
19. Configure the SSH version:

```
ssh version <v2only>
```

20. Enabling SSH rekey:

```
ssh rekey data-limit <1-6>

ssh rekey time-interval <1-6>

ssh rekey enable
```

Example

Enable DSA authentication and configure the maximum number of SSH session:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ssh dsa-auth
Switch:1(config)#ssh max-sessions 5
```

Variable Definitions

The following table defines parameters for the **ssh** command.

| Variable | Value |
|--|---|
| <i>authentication-type</i> { [aead-aes-128-gcm-ssh] [aead-aes-256-gcm-ssh] [hmac-sha1] [hmac-sha2-256] } | Specifies the authentication type. Select from one of the following: <ul style="list-style-type: none"> • aead-aes-128-gcm-ssh • aead-aes-256-gcm-ssh • hmac-sha1 • hmac-sha2-256 Use the no operator before this parameter, no ssh authentication-type {[aead-aes-128-gcm-ssh] [aead-aes-256-gcm-ssh] [hmac-sha1] [hmac-sha2-256] }, to disable the authentication type. To disable all authentication types use the command no ssh authentication-type. |
| <i>dsa-auth</i> | Enables or disables the DSA authentication. The default is enabled. Use the no operator before this parameter, no ssh dsa-auth, to disable DSA authentication. |
| <i>dsa-host-key</i> <1024-1024> | Generates a new SSH DSA host key. The DSA host key size is 1024. Use the no operator before this parameter, no ssh dsa-host-key, to disable SSH DSA host key. |

| Variable | Value |
|---|---|
| <code>dsa-user-key WORD <1-15></code> | <p>Generates a new SSH DSA user key. WORD<1-15> specifies the user access level.</p> <p>You must enable SSH globally before you can generate SSH DSA user keys.</p> <p>If enhanced secure mode is disabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • rwa — Specifies read-write-all. • rw — Specifies read-write. • ro — Specifies read-only. • rw1 — Specifies read-write for Layer 1. • rw2 — Specifies read-write for Layer 2. • rw3 — Specifies read-write for Layer 3. <p>If you enable enhanced secure mode, the switch uses role-based authentication. You associate each username with a specific role and the appropriate authorization rights to commands based on that role. If enhanced secure mode is enabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • admin—Specifies a user role with access to all of the configurations, show commands, and the ability to view the log file and security commands. The administrator role is the highest level of user roles. • operator—Specifies a user role with access to all of the configurations for packet forwarding on Layer 2 and Layer 3, and has access to show commands to view the configuration, but cannot view the audit logs and cannot access security and password commands. • auditor—Specifies a user role that can view log files and view all configurations, except password configuration. • security—Specifies a user role with access only to security settings and the ability to view the configurations. • priv—Specifies a user role with access to all of the commands that the administrator has access to, and is referred to as an emergency-admin. However, the user with the privilege role must be authenticated within the switch locally. RADIUS and TACACS+ authentication is not accessible. A user role at the privilege level must login to the switch through the console port only. <p>Use the no operator before this parameter, <code>no ssh dsa-user-key WORD<1-15></code>, to disable SSH DSA user key.</p> |

| Variable | Value |
|---|--|
| <code>encryption-type</code>
{ [3des-cbc] [aead-aes-128-gcm-ssh] [aead-aes-256-gcm-ssh] [aes128-cbc] [aes128-ctr] [aes192-cbc] [aes192-ctr] [aes256-cbc] [aes256-ctr] [blowfish-cbc] [rijndael128-cbc] [rijndael192-cbc] } | <p>Configures the encryption-type. Select an encryption-type from one of the following:</p> <ul style="list-style-type: none"> • 3des-cbc • aead-aes-128-gcm-ssh • aead-aes-256-gcm-ssh • aes128-cbc • aes128-ctr • aes192-cbc • aes192-ctr • aes256-cbc • aes256-ctr • blowfish-cbc • rijndael128-cbc • rijndael192-cbc <p>Use the no operator before this parameter <code>no ssh encryption-type { [3des-cbc] [aead-aes-128-gcm-ssh] [aead-aes-256-gcm-ssh] [aes128-cbc] [aes128-ctr] [aes192-cbc] [aes192-ctr] [aes256-cbc] [aes256-ctr] [blowfish-cbc] [rijndael128-cbc] [rijndael192-cbc] }</code> to disable the encryption type. To disable all authentication types use the command <code>no ssh encryption-type</code>.</p> |
| <code>max-sessions <0-8></code> | Specifies the maximum number of SSH sessions allowed. A value from 0 to 8. Default is 4. |
| <code>pass-auth</code> | Enables password authentication. The default is enabled. |
| <code>port <22,1024-49151></code> | <p>Configures the Secure Shell (SSH) connection port. <code><22,1024 to 49151></code> is the TCP port number. The default is 22.</p> <p>Important:
You cannot configure TCP port 6000 as the SSH connection port.</p> |
| <code>rsa-auth</code> | <p>Enables RSA authentication. The default is enabled.</p> <p>Use the no operator before this parameter, <code>no ssh rsa-auth</code>, to disable RSA authentication.</p> |
| <code>rsa-host-key WORD<1-15></code> | <p>Generates a new SSH RSA host key. Specify an optional key size from 1024 to 2048. The default is 2048.</p> <p>Use the no operator before this parameter, <code>no ssh rsa-host-key</code>, to disable SSH RSA host key.</p> |

| Variable | Value |
|---|--|
| <p><i>rsa-user-key</i> [<1024-2048>]</p> | <p>Generates a new SSH RSA user key. WORD<1-15> specifies the user access level.</p> <p>You must enable SSH globally before you can generate SSH DSA user keys.</p> <p>If enhanced secure mode is disabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • rwa — Specifies read-write-all • rw — Specifies read-write • ro — Specifies read-only • rw1 — Specifies read-write for Layer 1 • rw2 — Specifies read-write for Layer 2 • rw3 — Specifies read-write for Layer 3 <p>If you enable enhanced secure mode, the switch uses role-based authentication. You associate each username with a specific role and the appropriate authorization rights to commands based on that role. If enhanced secure mode is enabled, the value user access levels for the switch are:</p> <ul style="list-style-type: none"> • admin—Specifies a user role with access to all of the configurations, show commands, and the ability to view the log file and security commands. The administrator role is the highest level of user roles. • operator—Specifies a user role with access to all of the configurations for packet forwarding on Layer 2 and Layer 3, and has access to show commands to view the configuration, but cannot view the audit logs and cannot access security and password commands. • auditor—Specifies a user role that can view log files and view all configurations, except password configuration. • security—Specifies a user role with access only to security settings and the ability to view the configurations • priv—Specifies a user role with access to all of the commands that the administrator has access to, and is referred to as an emergency-admin. However, the user with the privilege role must be authenticated within the switch locally. RADIUS and TACACS+ authentication is not accessible. A user role at the privilege level must login to the switch through the console port only. <p>Use the no operator before this parameter, <code>no ssh rsa-user-key WORD<1-15></code>, to disable SSH RSA user key.</p> |
| <p><i>secure</i></p> <p>Note:
Exception: rlogin only supported on VSP 8600 Series.</p> | <p>Enables SSH in secure mode and immediately disables the access services SNMP, FTP, TFTP, remote login (rlogin), and Telnet. The default is disabled.</p> <p>Use the no operator before this parameter, <code>no ssh secure</code>, to disable SSH in secure mode.</p> |
| <p><i>timeout</i> <1-120></p> | <p>Specifies the SSH connection authentication timeout in seconds. Default is 60 seconds.</p> |
| <p><i>version</i> <v2only></p> | <p>Configures the SSH version. The default is v2only. The switch only supports SSHv2.</p> |

| Variable | Value |
|---|---|
| <code>x509v3-auth enable</code> | Configures X.509 V3 authentication. The default is enabled.
Use the no operator before the parameter, <code>no ssh x509v3-auth enable</code> , to disable X.509 V3 authentication.
Use the no operator before the parameter, <code>no ssh x509v3-auth username</code> , to disable X.509 V3 username.
x509v3-auth is available for demonstration purposes on some products. For more information, see VOSS Feature Support Matrix . |
| <code>x509v3-auth [revocation-check-method <none ocsp>]</code> | Configures X.509 V3 authentication revocation check method. The default is OCSP.
<ul style="list-style-type: none"> none - Specifies no revocation check method. <p>ocsp - Specifies Online Certificate Status Protocol (OCSP) as revocation check method.</p> x509v3-auth is available for demonstration purposes on some products. For more information, see VOSS Feature Support Matrix . |
| <code>x509v3-auth [username <overwrite strip-domain use-domain WORD<1-254>]</code> | Configures X.509 V3 username configuration. The default is disabled.
<ul style="list-style-type: none"> overwrite - Specifies the switch to send the principal name and domain name from the certificate to the RADIUS server for authorization. strip-domain - Specifies the switch to send the principal name from the certificate without the domain name to the RADIUS server for authorization. use-domain WORD<1-254> - Specifies the switch to send the principal name from the certificate, with the domain name you entered to the RADIUS server for authorization. Use the no operator before the parameter, <code>no ssh x509v3-auth username</code> , to disable X.509 V3 username.
x509v3-auth is available for demonstration purposes on some products. For more information, see VOSS Feature Support Matrix . |

Verifying and displaying SSH configuration information

Verify that SSH services are enabled on the switch and display SSH configuration information to ensure that the SSH parameters are properly configured.

Procedure

1. To enter User EXEC mode, log on to the switch.
2. Verify that SSH services are enabled and view the SSH configuration:

```
show ssh <global|session>
```

Example

Display global system SSH information:

```
Switch:1>show ssh global
Total Active Sessions      : 0
version                    : v2only
```

```

port : 22
max-sessions : 4
timeout : 60
action rsa-host key : rsa-hostkeysize 2048
action dsa-host key : dsa-hostkeysize 1024
rsa-auth : false
dsa-auth : true
pass-auth : true
keyboard-interactive-auth : false
sftp enable : true
enable : true
authentication-type : aead-aes-128-gcm-ssh aead-aes-256-gcm-ssh hmac-sha1
hmac-sha2-256
encryption-type : 3des-cbc aead-aes-128-gcm-ssh aead-aes-256-gcm-ssh
aes128-cbc aes128-ctr aes192-cbc aes192-ctr aes256-cbc aes256-ctr blowfish-
cbc rijndael128-cbc rijndael192-cbc
key-exchange-method : diffie-hellman-group1-sha1 diffie-hellman-group14-sha1

```

Variable Definitions

The following table defines parameters for the `show ssh` command.

| Variable | Value |
|----------------|--|
| <i>global</i> | Display global system SSH information. |
| <i>session</i> | Display the current session SSH information. |

Connect to a Remote Host using the SSH Client

Make an SSH connection to a remote host.

Before You Begin

Enable the SSH server on the remote host.

About This Task

The command format, for the CLI SSH client command, is similar to Telnet with two additional parameters: `-l login` and an optional `-p port` parameter.

On IPv6 networks, the switch supports SSH server only. The switch does not support outbound SSH client over IPv6. On IPv4 networks, the switch supports both SSH server and SSH client.

Procedure

1. Enter Privileged EXEC mode:

```
enable
```
2. Connect to a remote host:

```
ssh WORD<1-256> -l WORD<1-32> [-p <1-32768>]
```

Example

Connect to the remote host:

```
Switch:1>enable
Switch:1#ssh 192.0.2.1 -l rwa
```

Variable Definitions

The following table defines parameters for the **ssh** command.

| Variable | Value |
|---------------------|---|
| <i>WORD</i> <1-32> | Specifies the user login name of the remote SSH server. |
| <i>-p</i> <1-32768> | Specifies the port number to connect to the remote SSH server. The default is 22. |

Generating user key files

Configure the SSH parameters to generate DSA user key files.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Enable SSH server.
3. Create the DSA user key file:

```
ssh dsa-user-key [WORD<1-15>][size <1024-1024>]
```
4. Enter the encryption password to protect the key file.
5. Copy the user public key file to the remote SSH servers.
6. If you are generating the compatible keys on a Linux system, use the following steps:
 - a. Create the DSA user key file:

```
ssh-keygen -t dsa
```
 - b. Copy the user public key to the remote SSH servers.

Note

The DSA pair key files can be generated on the Linux system and used by the SSH client on the switch.

Example

Create the DSA user key file with the user access level set to read-write-all and size of the DSA user key set to 1024 bits:

```
Switch:1>enable
Switch:1#configure terminal
Switch:1(config)#ssh dsa-user-key rwa size 1024
```

Variable Definitions

The following table defines parameters for the **ssh dsa-user-key** command.

| Variable | Value |
|--------------------------------|--|
| <i>WORD</i> <1-15
> | <p>Specifies the user access level. If enhanced secure mode is disabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • <i>rwa</i>—Specifies read-write-all. • <i>rw</i>—Specifies read-write. • <i>ro</i>—Specifies read-only • <i>rw13</i>—Specifies read-write for Layer 3. • <i>rw12</i>—Specifies read-write for Layer 2. • <i>rw11</i>—Specifies read-write for Layer 1. <p>If you enable enhanced secure mode, the switch uses role-based authentication. You associate each username with a specific role and the appropriate authorization rights to commands based on that role.</p> <p>If enhanced secure mode is enabled, the valid user access levels for the switch are:</p> <ul style="list-style-type: none"> • <i>admin</i>—Specifies a user role with access to all of the configurations, show commands, and the ability to view the log file and security commands. The administrator role is the highest level of user roles. • <i>operator</i>—Specifies a user role with access to all of the configurations for packet forwarding on Layer 2 and Layer 3, and has access to show commands to view the configuration, but cannot view the audit logs and cannot access security and password commands. • <i>auditor</i>—Specifies a user role that can view log files and view all configurations, except password configuration. • <i>security</i>—Specifies a user role with access only to security settings and the ability to view the configurations. • <i>priv</i>—Specifies a user role with access to all of the commands that the administrator has access to, and is referred to as an emergency-admin. However, the user with the privilege role must be authenticated within the switch locally. RADIUS and TACACS+ authentication is not accessible. A user role at the privilege level must login to the switch through the console port only. |
| <i>size</i>
<1024-
1024> | Specifies the size of the DSA user key. The default is 1024 bits. |

Manage an SSL Certificate

The TLS server selects the server certificate in the following order:

1. A certificate authority (CA)-signed certificate if the certificate is already present in the `/intflash/.cert/` folder on the switch.
2. A self-signed certificate if the certificate is already present in the `/intflash/.cert/` folder on the switch.

If the server certificates are not available, the TLS server generates a new self-signed certificate at startup and uses that by default. The self-signed certificate is available in `/intflash/.cert/.ssl`. You can choose to use an online or offline CA-signed certificate, which will take precedence over the self-signed certificate.

For more information about SSL certificate manipulation, see [Certificate Order Priority](#) on page 2878.

About This Task

If a certificate is already present, you must confirm that it can be deleted before a new one is created.

After you create a certificate, the system logs one of the following INFO alarms:

- New default Server Certificate and Key are generated and installed
- Current Server Certificate and Key are installed

The default certificate key length for a certificate generated on the switch is 2,048 bits.

Note

The **ssl certificate [validity-period-in-days <30-3650>]** command in this procedure does not require a system reboot.

Procedure

1. Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

2. Create and install a new self-signed certificate:

```
ssl certificate [validity-period-in-days <30-3650>]
```

3. Delete a certificate:

```
no ssl certificate
```

Note

The certificate loaded in memory remains valid until you use the **ssl reset** command or reboot the system.

Variable Definitions

The following table defines parameters for the **ssl certificate** command.

| Variable | Value |
|---|--|
| <i>validity-period-in-days</i>
<30-3650> | Specifies an expiration time for the certificate. The default is 365 days. |

Disabling SFTP without disabling SSH

Disable SFTP while allowing SSH to remain active.

Before You Begin

Enhanced secure mode must be enabled. For information about enabling enhanced secure mode, see [Enabling enhanced secure mode](#) on page 3329.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Enable the SSHv2 server:

```
no ssh sftp enable
```
3. Save the configuration file:

```
save config
```

Enabling SSH rekey

Before You Begin

Enable SSH globally.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```
2. Enter the following command:

```
ssh rekey enable
```

Example

```
Switch:1>enable
Switch:1#configure terminal
```

Enable SSH rekeying globally:

```
Switch:1(config)#ssh rekey enable
```

Variable Definitions

The following table defines parameters for the **ssh rekey** command.

| Variable | Value |
|---------------|-----------------------------|
| <i>enable</i> | Enables SSH rekey globally. |

Configuring SSH rekey data-limit

Use the following procedure to configure the limit for data transmission during the session.

Procedure

1. Enter Global Configuration mode:

```
enable

configure terminal
```

- Enter the following command:

```
ssh rekey data-limit <1-6>
```

Example

```
Switch:1>enable
Switch:1#configure terminal
```

Configure the SSH rekey data-limit to 2 GB:

```
Switch:1(config)#ssh rekey data-limit 2
```

Variable Definitions

The following table defines parameters for the **ssh rekey data-limit** command.

| Variable | Value |
|----------|--|
| <1-6> | Sets the SSH rekey data limit in GB, range is 1-6. |

Configuring SSH rekey time-interval

Use the following procedure to configure a time interval, after which the key exchange takes place.

Procedure

- Enter Global Configuration mode:

```
enable
```

```
configure terminal
```

- Enter the following command:

```
ssh rekey time-interval <1-6>
```

Example

```
Switch:1> enable
Switch:1# configure terminal
```

Configure the SSH rekey time-interval to 3 hours:

```
Switch:1(config)# ssh rekey time-interval 3
```

Variable Definitions

The following table defines parameters for the **ssh rekey time-interval** command.

| Variable | Value |
|----------|--|
| <1-6> | Sets the time-interval for SSH rekeying in hours, the range is 1 to 6. |

Displaying SSH rekey information

Use the following procedure to display the SSH rekey information.

Procedure

1. Enter Privileged EXEC mode:
enable
2. Enter the following command:
show ssh rekey

Example

```
Switch:1> enable
Switch:1#show ssh rekey
  Rekey Status      : TRUE
  Rekey data limit  : 1 GB
  Rekey time interval : 1 hours
```

Field descriptions

The following table describes the output for the **show ssh rekey** command.

| Name | Description |
|---------------------|---|
| Rekey status | Displays the status (TRUE or FALSE) of SSH rekeying. |
| Rekey data limit | Displays the configured SSH rekey data transmission limit GB. |
| Rekey time interval | Displays the configured SSH rekey time interval in hours. |

Enabling or Disabling the SSH Client**About This Task**

You can disable the SSH client functionality on the switch. By default, the SSH client functionality is enabled.

**Note**

In order to enable the SSH client functionality, SSH must be enabled globally.

Procedure

1. Enter Global Configuration mode:
enable

configure terminal
2. Disable the SSH client functionality:
no ssh client <enable>

3. Use one of the following commands to enable the SSH client functionality:

- `ssh client <enable>`
- `default ssh client <enable>`

Note

You must enable SSH globally before the SSH client functionality can be re-enabled.

Example

Display the general SSH settings::

```
Switch:1(config)# show ssh global
```

```
Total Active Sessions : 0
  version                : v2only
  port                   : 22
  max-sessions           : 4
  timeout                : 60
  action rsa-host key    : rsa-hostkeysize 2048
  action dsa-host key    : dsa-hostkeysize 1024
  rsa-auth               : true
  dsa-auth               : true
  pass-auth              : true
  keyboard-interactive-auth : false
  sftp enable            : true
  enable                 : true
  client enable          : true
```

Disable SSH client functionality:

```
Switch:1(config)# no ssh client
```

```
Switch:1(config)# show ssh global
```

```
Total Active Sessions : 0
  version                : v2only
  port                   : 22
  max-sessions           : 4
  timeout                : 60
  action rsa-host key    : rsa-hostkeysize 2048
  action dsa-host key    : dsa-hostkeysize 1024
  rsa-auth               : true
  dsa-auth               : true
  pass-auth              : true
  keyboard-interactive-auth : false
  sftp enable            : true
  enable                 : true
  client enable          : false
```

Downgrading or Upgrading from Releases that Support Different Key Sizes

Use this procedure if you need to downgrade or upgrade from a release that supports different key sizes.

Different releases can support different DSA host key, RSA host key, and DSA user key sizes. If you need to upgrade or downgrade to an earlier release that does not support the same key size, you must delete

all of the keys from the .ssh directory and generate new keys for SSH. If you do not do this, key sizes that are no longer supported will no longer function.

You only need to perform this procedure if you have previously generated DSA host, RSA host, or DSA user keys with a release that supports different key sizes.

Procedure

1. Use the following command to disable SSH:

```
no ssh
```

2. From the config terminal go to the .ssh directory using the command:

```
cd /intflash/.ssh
```

3. After you upgrade or downgrade, delete the following keys from the .ssh directory.

```
ssh_dss.key
ssh_rsa.key
moc_sshc_dsa_file
moc_sshc_rsa_file
id_dsa_rwa
id_dsa_rwa.pub
id_rsa_rwa
id_rsa_rwa.pub
moc_sshc_dsa_file_fed
moc_sshc_rsa_file_fed
known_hosts
ssh_ecdsa.key
dsa_key <access level like rwa/rw/ro/admin/security/privilege/operator/auditor>,
example: dsa_key_rwa
rsa_key <access level like rwa/rw/ro/admin/security/privilege/operator/auditor>,
example: rsa_key_rwa
```

4. Generate a new DSA host key:

```
ssh dsa-host-key [<1024-1024>]
```

5. Generate a new SSH DSA user key:

```
ssh dsa-user-key WORD<1-15> [size <1024-1024>]
```

6. Generate a new RSA host key:

```
ssh rsa-host-key [<1024-2048>]
```

Secure Shell configuration using Enterprise Device Manager

Use Secure Shell version 2 (SSHv2) to enable secure communications support over a network for authentication, encryption, and network Integrity.

On IPv6 networks, the switch supports SSHv2 server only. The switch does not support outbound SSHv2 client over IPv6. On IPv4, the switch supports both SSHv2 server and SSHv2 client.

For more information, see [Change Secure Shell Parameters](#) on page 2859.

Change Secure Shell Parameters

You can use Enterprise Device Manager to change the SSHv2 configuration parameters. However, as a best practice, use the CLI to perform the initial configuration of SSHv2. The switch does not support SSHv1.

Before You Begin

- The user access level is read/write/all community strings.
- You must disable the SSH service before you configure the SSH service parameters. If the SSHv2 service is enabled, all fields appear dimmed until the SSH service is disabled.

Procedure

1. In the navigation pane, expand **Configuration > Security > Control Path**.
2. Click **SSH**.
3. Click the **SSH** tab.
4. In the **Enable** field, select the type of SSH service you want to enable.
5. In the **Version** field, select a version.
6. In the **Port** field, type a port.
7. In the **MaxSession** field, type the maximum number of sessions allowed.
8. In the **Timeout** field, type the timeout.
9. From the **KeyAction** field, choose a key action.
10. In the **RsaKeySize** field, type the RSA key size.
11. In the **DSAKeySize** field, type the DSA key size.
12. Select the **RsaAuth** check box for RSA authentication.
13. Select the **DsaAuth** check box for DSA authentication.
14. Select the **PassAuth** check box for password authentication.
15. In the **AuthType** section, select the authentication types you want.
16. In the **Encryption Type** section, select the authentication types you want.
17. In the **KeyExchangeMethod** section, select the authentication types you want.
18. Click **Apply**.

SSH Field Descriptions

Use the data in the following table to use the **SSH** tab.

| Name | Description |
|--|---|
| Enable

Note:
Exception: rlogin is only supported on VSP 8600 Series. | Enables, disables, or securely enables SSHv2. The options are: <ul style="list-style-type: none"> • false • true • secure Select false to disable SSHv2 services. Select true to enable SSHv2 services. Select secure to enable SSH and disable access services (SNMP, FTP, TFTP, rlogin, and Telnet). The default is false.

Important:
Do not enable SSHv2 secure mode using Enterprise Device Manager. Enabling secure mode disables SNMP. This locks you out of the Enterprise Device Manager session. Enable SSHv2 secure mode using CLI. |
| Version | Configures the SSH version. The options are: <ul style="list-style-type: none"> • v2only The default is v2only. |

| Name | Description |
|--------------------------|--|
| Port | Configures the SSHv2 connection port number. <22 or 1024-49151> is the port range of SSHv2.

Important:
You cannot configure the TCP port 6000 as SSHv2 connection port. |
| MaxSession | Configures the maximum number of SSHv2 sessions allowed. The value can be from 0 to 8. The default is 4. |
| Timeout | Configures the SSHv2 authentication connection timeout in seconds. The default is 60 seconds. |
| KeyAction | Configures the SSHv2 key action. The options are: <ul style="list-style-type: none"> • none • generateDsa • generateRsa • deleteDsa • deleteRsa |
| RsaKeySize | Configures SSHv2 RSA key size. The value can be from 1024 to 2048. The default is 2048. |
| DsaKeySize | Configures the SSHv2 DSA key size. The value can be from 512 to 1024. The default is 1024. |
| RsaAuth | Enables or disables SSHv2 RSA authentication. The default is enabled. |
| DsaAuth | Enables or disables SSHv2 DSA authentication. The default is enabled. |
| PassAuth | Enables or disables SSHv2 RSA password authentication. The default is enabled. |
| RekeyEnable | Enables SSH rekey globally. The default is disabled.

Note:
Exception: Not supported on XA1400 Series or VSP 8600 Series |
| RekeyTimeInterval | Configures a time interval, after which the key exchange takes place. The default is 1 hour.

Note:
Exception: Not supported on XA1400 Series or VSP 8600 Series |
| RekeyDataLimit | Configures the limit for data transmission during the session. The default is 1 GB.

Note:
Exception: Not supported on XA1400 Series or VSP 8600 Series |

| Name | Description |
|--------------------------------|--|
| SftpEnable | Enables or disables SFTP. You can use this check box to disable SFTP without affecting the SSH status. The default is enabled. |
| KeyboardInteractiveAuth | Changes the SSH server authentication mode from the default of password authentication to keyboard interactive. |
| ClientEnable | Enables SSH client functionality on the switch. By default, the SSH client functionality is enabled. To enable the SSH client functionality, SSH must be enabled globally. |
| AuthType | <p>Specifies the authentication type. Select from one of the following:</p> <ul style="list-style-type: none"> • hmacSha1 • hmacSha2256 • aeadAes128GcmSsh • aeadAes256GcmSsh <p>By default, all authentication types are selected.</p> |
| EncryptionType | <p>Configures the encryption-type. Select an encryption-type from one of the following:</p> <ul style="list-style-type: none"> • aes128Cbc • aes256Cbc • threeDesCbc • aeadAes128GcmSsh • aeadAes256GcmSsh • aes128Ctr • rijndael128Cbc • aes256Ctr • aes192Ctr • aes192Cbc • rijndael192Cbc • blowfishCbc |
| KeyExchangeMethod | <p>Configures the key-exchange type. Select from one of the following:</p> <ul style="list-style-type: none"> • diffieHellmanGroup14Sha1 • diffieHellmanGroup1Sha1 |

Security

[Security Fundamentals](#) on page 2863

[Security Configuration using CLI](#) on page 2880

[Security Configuration using EDM](#) on page 2926

Security Fundamentals

This section provides conceptual content to help you configure and customize the security services on the switch.

Security overview

Security is a critical attribute of networking devices. Security features are split into two main areas:

- Control path—protects the access to the device from a management perspective.
- Data path—protects the network from malicious users by controlling access authorization to the network resources (such as servers and stations). This protection is primarily accomplished by using filters or access lists.

You can protect the control path using the following mechanism:

- logon and passwords
- access policies to specify the network and address that can use a service or daemon
- secure protocols, such as Secure Shell (SSH), Secure Copy (SCP), and the Simple Network Management Protocol version 3 (SNMPv3)
- the Message Digest 5 Algorithm (MD5) to protect routing updates, Open Shortest Path First (OSPF), and Border Gateway Protocol (BGP)

You can protect the data path using the following mechanism

- Media Access Control (MAC) address filtering
- Layer 3 filtering, such as Internet Protocol (IP) and User Datagram Protocol (UDP)/Transmission Control Protocol (TCP) filtering
- routing policies to prevent users from accessing restricted areas of the network
- mechanisms to prevent denial-of-service (DOS) attacks

Security Modes

The switch support three security modes:

- Enhanced secure
- Hsecure
- SSH secure

Enable SSH secure mode to allow only SSH to be used and disable all other protocols which include Telnet, rlogin, FTP, SNMP, TFTP, HTTP, and HTTPS. Enabling this mode disables Telnet, rlogin, FTP, SNMP, TFTP, HTTP, and HTTPS by setting the boot flags for these protocols to off. You can over-ride the configuration and enable required protocols individually for run-time use. The administrator must enable required protocols individually for run-time use again following a reboot even if you save the configuration. This is because the SSH secure mode enable takes precedence at the time of reboot and the other protocols will be disabled even though the configuration file has them set to enabled.

Note

Rlogin is only supported on VSP 8600 Series.

Note

Disabling SSH secure mode will not automatically enable the OA&M protocols that were disabled. The boot flags for the required protocols will have to be individually set to enabled.

The following table lists the differences between enhanced secure mode and hsecure mode.

Table 323: Enhanced secure mode versus hsecure mode

| Feature | Enhanced secure | Hsecure |
|---------------------|---|---|
| Authentication | Role-based: <ul style="list-style-type: none"> • admin • privilege • operator • security • auditor | Access-level based: <ul style="list-style-type: none"> • rwa • rw • ro • l3 • l2 • l1 |
| Password length | Minimum of 8 characters with the exception of the Admin, which requires a minimum of 15 characters | 10 characters, minimum |
| Password rules | 1 or 2 upper case, lower case, numeric and special characters | Minimum of 2 upper case, 2 lower case, 2 numeric and 2 special characters |
| Password expiration | Per-user minimum change interval is enforced, which is programmed by the Administrator | Global expiration, configured by the Admin |
| Password-unique | Previous passwords and common passwords between users are prevented | The same |
| Password renewal | Automatic password renewal is enforced | The same |
| Audit logs | Audit logs are encrypted, and authorized users are able to view, modify, and delete. | Standard operation |

Table 323: Enhanced secure mode versus hsecure mode (continued)

| Feature | Enhanced secure | Hsecure |
|-----------------------|---|---|
| SNMPv3 | Password rules apply to SNMPv3 Auth&Priv. SNMPv3 is required (V1/V2 disabled) | SNMPv1 and SNMPv2 can be enabled. |
| EDM | Site Admin to enable or disable | Disabled |
| Telnet and FTP | Site Admin to enable or disable | The same |
| DOS attack Prevention | Not available | Prevents DOS attacks by filtering IP addresses and IP address ranges. |

For information on Enhanced secure mode and SSH, see [Enhanced secure mode authentication access levels](#) on page 3313.

hsecure Mode

The switch supports a flag called high secure (hsecure). hsecure introduces the following behaviors for passwords:

- 10-character enforcement
- aging time
- limitation of failed logon attempts
- protection mechanism to filter certain IP addresses

After you enable the hsecure flag, the software enforces the 10-character rule for all passwords. This password must contain a minimum of two uppercase characters, two lowercase characters, two numbers, and two special characters.

After you enable hsecure, the system requires you to save the configuration file and reboot the system for hsecure to take effect. If the existing password does not meet the minimum requirements for hsecure, the system prompts you to change the password during the first login.

The default username is rwa and the default password is rwa. In hsecure, the system prompts you to change these during first login because they do not meet the minimum requirements for hsecure.

When you enable hsecure, the system disables Simple Network Management Protocol (SNMP) v1, SNMPv2 and SNMPv3. If you want to use SNMP, you must re-enable SNMP, using the command **no boot config flag block-snmp**.

Aging Enforcement

After you enable the hsecure flag, you can configure a duration after which you must change your password. You configure the duration by using the aging parameter.

For SNMP and File Transfer Protocol (FTP), after a password expires, access is denied. Before you access the system, you must change a community string to a new string consisting of more than eight characters.

Important

Consider the following after you enable the hsecure flag:

- You cannot enable the Web server for Enterprise Device Manager (EDM) access.
- You cannot enable the Secure Shell (SSH) password authentication.

Filtering Mechanism

Incorrect IP source addresses as network or broadcast addresses are filtered at the virtual router interface. Source addresses 192.168.168.0 and 192.168.168.255 are discarded.

This change is valid for all IP subnets, not only for /24.

You can filter addresses only if you enable the hsecure mode.

CLI Passwords

The switch ships with default passwords assigned for access to Command Line Interface (CLI) through a console or management session. If you have read/write/all access authority, and you are using SNMPv3, you can change passwords that are in an encrypted format. If you are using Enterprise Device Manager (EDM), you can also specify the number of available Telnet sessions and rlogin sessions.

Note

Rlogin is only supported on VSP 8600 Series.

Important

The default passwords are documented and well known. Change the default passwords and community strings immediately after you first log on.

If you enable enhanced secure mode with the **boot config flags enhancedsecure-mode** command, you enable different access levels, along with stronger password complexity, length, and minimum change intervals. For more information on system access fundamentals and configuration, see [System Access](#) on page 3306.

Port Lock feature

You can use the Port Lock feature to administratively lock a port or ports to prevent other users from changing port parameters or modifying port action. You cannot modify locked ports until the ports are first unlocked.

Access Policies for Services

You can control access to the switch by creating an access policy. An access policy specifies the hosts or networks that can access the device through various services, such as Telnet, SNMP, Trivial File Transfer

Protocol (TFTP), File Transfer Protocol (FTP), Hypertext Transfer Protocol (HTTP), remote shell (rsh), and remote login (rlogin). You can enable or disable access services by setting flags from CLI.

**Note**

rlogin and rsh are only supported on VSP 8600 Series.

You can define network stations that can explicitly access the switch or stations that cannot access it. For each service you can also specify the level of access, such as read-only or read-write-all.

**Important**

A third-party security scan shows the switch service ports open and in the listen state. No connections are accepted on these ports unless you enable the particular daemon. The switch does not dynamically start and stop the daemons at runtime and needs to keep them running from system startup.

For more information about configuring access policies, see [Access Policies for Services](#) on page 3310.

User-based policy support

You can set up a user-based policy (UBP) system by using Enterprise Policy Manager (EPM), a RADIUS server.

EPM is an application designed to manage the traffic prioritization and network access security for business applications. It provides centralized control of advanced packet classification and the ability to priority mark, police, meter, or block traffic.

EPM 5.0 supports UBPs, which allow security administrators to establish and enforce roles and conditions for each user for all access ports in the network. The UBP feature in EPM works in conjunction with Extensible Access Protocol (EAP) technology to enhance the security of the network. Users log on to the networks and are authenticated as the network connection is established.

The UBP feature works as an extension to the Roles feature in EPM. In a UBP environment, role objects are linked directly to specific users (as RADIUS attributes), as opposed to being linked simply to device interfaces. The role object then links the users to specific policies that control the user's access to the network.

When the RADIUS server successfully authenticates a user, the device sends an EAP session start event to the EPM policy server. The policy server then sends user-based policy configuration information for the new user roles to the interface, based on the role attribute that was assigned to that user on the RADIUS server.

Denial-of-Service Attack Prevention

Table 324: Denial-of-service attack prevention product support

| Feature | Product | Release introduced |
|--|-----------------|--------------------|
| For configuration details, see VOSS User Guide . | | |
| Directed Broadcast | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VOSS 5.1.1 |
| | VSP 4900 Series | VOSS 8.1 |
| | VSP 7200 Series | VOSS 5.1.1 |
| | VSP 7400 Series | VOSS 8.0 |
| | VSP 8200 Series | VOSS 5.1.1 |
| | VSP 8400 Series | VOSS 5.1.1 |
| | VSP 8600 Series | Not Supported |
| | XA1400 Series | Not Supported |
| High Secure mode (hsecure boot configuration flag) | 5520 Series | VOSS 8.2.5 |
| | VSP 4450 Series | VSP 4450 4.0 |

| | VSP 8400 Series | VOSS 4.2 |
| | VSP 8600 Series | VSP 8600 4.5 |
| | XA1400 Series | VOSS 8.0.50 |

Hsecure

The switch supports a configurable flag, called high secure (hsecure). High secure mode introduces a protection mechanism to filter certain IP addresses, and two restrictions on passwords: 10-character enforcement and aging time.

If the device starts in hsecure mode with default factory settings, and no previously configured password, the system will prompt you to change the password. The new password must follow the rules mandated by high secure mode. After you enable hsecure and restart the system, if you have an invalid-length password you must change the password.

If you enable hsecure for the first time and the password file does not exist, then the device creates a normal default username (rwa) and password (rwa). In this case, the password does not meet the minimum requirements for hsecure and as a result the system prompts you to change the password.

The following information describes hsecure mode operations:

- When you enable the hsecure flag, after a certain duration you are asked to change your password. If not configured, the aging parameter defaults to 90 days.
- For SNMP and FTP, access is denied when a password expires. You must change the community strings to a new string made up of more than eight characters before accessing the system.
- You cannot enable the Web server at any time.
- You cannot enable the SSH password-authentication feature at any time.
