Table of Contents

Preface

This section discusses the conventions used in this guide, ways to provide feedback, additional help, and other Extreme Networks® publications.

Text Conventions

The following tables list text conventions that are used throughout this guide.

Table 1: Notice Icons

Icon	Notice Type	Alerts you to...
	General Notice	Helpful tips and notices for using the product.
	Note	Important features or instructions.
	Caution	Risk of personal injury, system damage, or loss of data.
	Warning	Risk of severe personal injury.
New!	New Content	Displayed next to new content. This is searchable text within the PDF.

Table 2: Text Conventions

Convention	Description
`Screen displays`	This typeface indicates command syntax, or represents information as it appears on the screen.
The words **enter** and **type**	When you see the word "enter" in this guide, you must type something, and then press the Return or Enter key. Do not press the Return or Enter key when an instruction simply says "type."
[Key] names	Key names are written with brackets, such as **[Return]** or **[Esc]**. If you must press two or more keys simultaneously, the key names are linked with a plus sign (+). Example: Press **[Ctrl]**+**[Alt]**+**[Del]**
Words in italicized type	Italics emphasize a point or denote new terms at the place where they are defined in the text. Italics are also used when referring to publication titles.

Platform-Dependent Conventions

Unless otherwise noted, all information applies to all platforms supported by ExtremeXOS software, which are the following:

- ExtremeSwitching® switches
- Summit® switches
- SummitStack™

When a feature or feature implementation applies to specific platforms, the specific platform is noted in the heading for the section describing that implementation in the ExtremeXOS command documentation (see the Extreme Documentation page at www.extremenetworks.com/documentation/). In many cases, although the command is available on all platforms, each platform uses specific keywords. These keywords specific to each platform are shown in the Syntax Description and discussed in the Usage Guidelines sections.

Providing Feedback to Us

Quality is our first concern at Extreme Networks, and we have made every effort to ensure the accuracy and completeness of this document. We are always striving to improve our documentation and help you work better, so we want to hear from you! We welcome all feedback but especially want to know about:

- Content errors or confusing or conflicting information.
- Ideas for improvements to our documentation so you can find the information you need faster.
- Broken links or usability issues.

If you would like to provide feedback to the Extreme Networks Information Development team, you can do so in two ways:

- Use our short online feedback form at https://www.extremenetworks.com/documentation-feedback/.
- Email us at documentation@extremenetworks.com.

Please provide the publication title, part number, and as much detail as possible, including the topic heading and page number if applicable, as well as your suggestions for improvement.

Getting Help

If you require assistance, contact Extreme Networks using one of the following methods:

Extreme Portal	Search the GTAC (Global Technical Assistance Center) knowledge base, manage support cases and service contracts, download software, and obtain product licensing, training, and certifications.
The Hub	A forum for Extreme Networks customers to connect with one another, answer questions, and share ideas and feedback. This community is monitored by Extreme Networks employees, but is not intended to replace specific guidance from GTAC.
Call GTAC	For immediate support: 1-800-998-2408 (toll-free in U.S. and Canada) or +1 408-579-2826. For the support phone number in your country, visit: www.extremenetworks.com/support/contact

Before contacting Extreme Networks for technical support, have the following information ready:

- Your Extreme Networks service contract number and/or serial numbers for all involved Extreme Networks products
- A description of the failure
- A description of any action(s) already taken to resolve the problem
- A description of your network environment (such as layout, cable type, other relevant environmental information)
- Network load at the time of trouble (if known)

- The device history (for example, if you have returned the device before, or if this is a recurring problem)
- Any related RMA (Return Material Authorization) numbers

Subscribing to Service Notifications

You can subscribe to email notifications for product and software release announcements, Vulnerability Notices, and Service Notifications.

1 Go to www.extremenetworks.com/support/service-notification-form.
2 Complete the form with your information (all fields are required).
3 Select the products for which you would like to receive notifications.

Note
You can modify your product selections or unsubscribe at any time.

4 Click **Submit**.

Documentation and Training

To find Extreme Networks product guides, visit our documentation pages at:

Current Product Documentation	www.extremenetworks.com/documentation/
Archived Documentation (for earlier versions and legacy products)	www.extremenetworks.com/support/documentation-archives/
Release Notes	www.extremenetworks.com/support/release-notes
Hardware/Software Compatibility Matrices	https://www.extremenetworks.com/support/compatibility-matrices/
White papers, data sheets, case studies, and other product resources	https://www.extremenetworks.com/resources/

Training

Extreme Networks offers product training courses, both online and in person, as well as specialized certifications. For more information, visit www.extremenetworks.com/education/.

1 About this Guide

Notational Conventions

This manual describes the *CLI (Command Line Interface)* commands and configurations required to bring up and deploy Extreme Networks' access points, wireless controllers and service platforms within a WiNG 7.2.0 managed network.

The WiNG 7.2.0 software supports the following access points and service platforms:

- Access Points — AP505i, AP510i, AP510e, AP560i, AP560h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Note
The 802.11ax AP5XX model access points are a part of the ExtremeWireless OmniEdge line of products.

WiNG 7.2.0 introduces the following <XXXX> ExtremeMobility access points:

-
-

The other ExtremeMobility AP5XX model access points supported by the WiNG 7.X.X software are:

- AP560h - This is a dual-radio, cloud-ready, stadium optimized, *Wi-Fi* 6, 802.11ax outdoor access point with eight internal antennas, supporting two internal antenna modes: *30 degree and 70 degree*. It is ideally suited for high-density user environments, such as stadiums, large public venues, convention centers and school auditoriums. The AP560h offers flexible deployment options and can be mounted under a seat, to a pole, and a wall, thereby ensuring exceptional mobile user experience.
- AP560i - This is a cloud-ready, stadium optimized, Wi-Fi 6, 802.11ax outdoor access point with two internal antenna. It is ideally suited for high-density user environments, such as stadiums, large public venues, convention centers and school auditoriums. The AP560i offers flexible deployment options and can be mounted under a seat, to a pole, and a wall, thereby ensuring exceptional mobile user experience.
- AP510e - This is a next generation, enterprise-class 802.11ax access point. The AP features a dual-band radio, a band locked radio, and comes with eight (8) Wi-Fi *external* antennas and one *Bluetooth Low Energy* (BLE) antenna.
- AP510i - This is a next generation, enterprise-class 802.11ax access point. The “i” in AP510i indicates that it comes with internal antennas. The AP features a dual-band radio, a band locked radio, and comes with eight (8) Wi-Fi internal antennas and one BLE antenna.
- AP505i - This is a next generation, enterprise-class 802.11ax access point. The “i” in AP505i indicates that it comes with internal antennas. The AP505i can be used in stadiums, public venues such as hospitals and hotels, retail industry, and educational institutions. The 802.11ax technology supports more users and *internet of things* (IoT) devices.

Notational Conventions

The following notational conventions are used in this document:

- Italics are used to highlight specific items in the general text, and to identify chapters and sections in this and related documents.
- Bullets (•) indicate:
  - lists of alternatives
  - lists of required steps that are not necessarily sequential
  - action items
- Sequential lists (those describing step-by-step procedures) appear as numbered lists

Understanding Command Syntax

<variable>	Variables are described with a short description enclosed within a '<' and a '>' pair.
	For example, the command,
	`nx9500-6C8809>show interface ge 1`
	is documented as:
	`show interface ge <1-2>`
	where:
	• show – is the command – displays information
	• interface – is the keyword – represents the interface type
	• <1-2> – is the variable – represents the ge interface index value
	
	Note: Since this output is from an NX 9500 service platform, which supports only two (2) GE interfaces, the index value is shown as <1-2>. This value will vary depending on the platform type.

|	The pipe symbol. This is used to separate the variables/keywords in a list.
	For example, the command,
	`nx9500-6C8809> show .....`
	is documented as:
	`show [adoption|bluetooth|bonjour|boot|.....`
	where:
	• show – is the command – displays information
	• [adoption|bluetooth|bonjour|boot|.....] – indicates the different keywords that can be combined with the *show* command. However, only one of the above option can be used at a time.
	
	`show adoption ...`
	`show bluetooth ...`
	`show bonjour ...`

[]	Of the different keywords and variables listed inside a '[' & ']' pair, only one can be used. Each choice in the list is separated with a '|' (pipe) symbol.
	For example, the command,
	`nx9500-6C8809# clear ...`
	is documented as:
	`clear [arp-cache|bonjour|cdp|counters|crypto| event-history|firewall|gre|ip|ipv6|l2tpv3-stats|lacp| license|lldp|logging|mac-addresstable|mint|role|rtls| spanning-tree|traffic-shape|vrrp]`
	where:
	• clear – is the command
	• [arp-cache|bonjour|cdp|counters|crypto| .....|vrrp] – indicates that these keywords are available for this command. However, only one can be used at a time.

{ }	Any command/keyword/variable or a combination of them inside a '{' &'}' pair is optional. All optional commands follow the same conventions as listed above. However, they are displayed italicized.
	For example, the command,
	`nx9500-6C8809> show adoption ....`
	is documented as:
	`show adoption info *{on <DEVICE-NAME>}*`
	here:
	• show adoption info – is the command. This command can also be used as:
	`show adoption info`
	The command can also be extended as:
	`show adoption info *{on <DEVICE-NAME>}*`
	here:
	• {on <DEVICE-NAME>} – is the optional keyword.

command / keyword	The first word is always a command. Keywords are words that must be entered as is. Commands and keywords are mandatory.
	For example, the command,
	`nx9500-6C8809>show wireless`
	is documented as:
	`show wireless`
	where:
	• show – is the command
	• wireless – is the keyword

()	Any command/keyword/variable or a combination of them inside a '(' & ')' pair are recursive. All recursive commands can be listed in any order and can be used once along with the rest of the commands.
	For example, the command,
	`crypto pki export request generate-rsa-key test autogen-subject-name ...`
	is documented as:
	`nx9500-6C8809#crypto pki export request generate-rsa-key test autogen-subject-name (<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)`
	here:
	• crypto pki export request generate-rsa-key <RSA-KEYPAIR-NAME> auto-gen-subject-name – is the command
	• <RSA-KEYPAIR-NAME> – is the RSA keypair name (in this example, the keypair name is 'test')
	• (<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>) – is the set of recursive parameters (separated by commas) that can be used in any order.

2 Introduction

WiNG 7.1.X Operating System Overview
CLI Overview

This chapter provides a general overview of the WiNG 7 operating system and the *CLI (Command Line Interface)* structure. It also provides a list of commands required to deploy and manage access points within the WiNG managed network.

WiNG 7.1.X Operating System Overview

The WiNG 7 operating system is a solution designed for 802.11n, 802.11ac and 802.11ax networking. It is a convergence of the legacy ExtremeWireless™ WiNG (5.9.X) and ExtremeWireless™ (10.X) wireless operating systems. It offers a high-level of flexibility and scalability covering both campus and distributed modes of deployment.

WiNG 7.1.X brings together the following key benefits of both deployment topologies under one fold:

- *ExtremeWireless* - The ExtremeWireless software provides a secure, highly scalable, cost-effective solution based on the IEEE 802.11 standard. The system is intended for enterprise networks operating on multiple floors in more than one building, and is ideal for public environments, such as airports and convention centers that require multiple access points. It is an ideal solution for high-density, campus and stadium deployments. It is well suited to meet the needs of enterprises in the education, healthcare, sports and entertainment verticals. The ExtremeWireless OS key strengths are:
  - Extensive Policy Framework
  - Contextual Device and Application Control
  - Application Visibility & Control with Analytics
  - BYOD - Single *SSID* with Programmable Data Path
  - Voice & Video Optimized with Seamless Roaming
- *ExtremeWireless WiNG* - The WiNG architecture is a solution designed for 802.11n and 802.11ac networking. It is designed for standalone or distributed hierarchical networks. The ExtremeWireless WiNG software distributes intelligence right to the network edge, empowering every controller and access point with the intelligence needed to be network-aware, able to identify and dynamically route traffic over the most efficient path available at that time. It is highly scalable and well suited to meet the needs of large, geographically distributed enterprises. It is an ideal wireless networking solution for the retail, manufacturing, transportation & logistics, and hospitality verticals. The ExtremeWireless OS key strengths are:
  - Simple Guest Access with Analytics
  - Contextual Application Control
  - Advanced Diagnostics and Remote Troubleshooting
  - Intrusion, Compliance and Wi-Fi Forensics
  - Scale-out 1000s of APs with Rapid Rollout

- Self-tuning RF (Smart-RF)
- Distributed Service Intelligence

Going forward, this unified, common, wireless, infrastructure WiNG 7.1 OS will power both ExtremeWireless and ExtremeWireless WiNG product families. The WiNG 7.1.2 OS supports the following platforms:

- Access Points - AP510i, AP505i, AP510e, AP560i, AP560h
- Service Platforms - NX5500, NX7500, NX9500, NX9600 and VX9000

Interoperability with WiNG 5.9.X

Interoperability with access points running the WiNG 5.9.X OS is another salient feature of the WiNG 7.1.X OS. As part of this inter-interoperability, WiNG 7.1.X wireless controllers and service platforms are capable of deploying and managing the following WiNG 5.9.X APs:

- Access Points - AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533

Dual Mode Capability

The WiNG 7 AP5XX (AP505, AP510 and AP560) model access points have the capability of operating in the **`Distributed`** and **`Centralized`** modes. For a newly-manufactured, out-of-the-box AP5XX model access point the mode of operation is not specified.

Note
For more information, see Dual Mode Capability.

AP560h Specifications

The enterprise class 802.11ax AP560h access point has the following features:

- Radios: 2 radios; 1 IoT radio (2.4 GHz).
- Console Port: RJ45.
- Two Ethernet Ports:
  - GE1 - 10/100/1000/2500/5000 Mbps auto-negotiation Ethernet port, RJ45, with *Power over Ethernet* PoE In
  - GE2 - 10/100/1000 Mbps auto-negotiation Ethernet port, RJ45, with PoE In
- LEDs: 2 – All LEDs will be on during reset
- One Reset button
- Power: PoE 802.3af; 12VDC external power in connector.
- Antennas:
  - Eight WiFi internal antennas, supporting the following internal antenna modes:
    30 degree
    70 degree
  - One BLE internal antenna

AP560i Specifications

The enterprise class 802.11ax AP560i access point has the following features:

- Radios: 2 radios; 1 IoT radio (2.4 GHz).
- Console Port: RJ45.
- Two Ethernet Ports:
  - GE1 - 10/100/1000/2500/5000 Mbps auto-negotiation Ethernet port, RJ45, with PoE In
  - GE2 - 10/100/1000 Mbps auto-negotiation Ethernet port, RJ45, with PoE In
- LEDs: 2 – All LEDs will be on during reset
- One Reset button
- Power: PoE 802.3af; 12VDC external power in connector.
- Antennas:
  - Eight WiFi internal antennas
  - One BLE internal antenna

AP510e Specifications

The enterprise class 802.11ax AP510e access point has the following features:

- Radios: 2 radios; 1 IoT radio (2.4 GHz).
- Console Port: RJ45.
- Two Ethernet Ports:
  - GE1 - 10/100/1000/2500/5000 Mbps auto-negotiation Ethernet port, RJ45, with PoE In
  - GE2 - 10/100/1000 Mbps auto-negotiation Ethernet port, RJ45, with PoE In
- LEDs: 6 – All LEDs will be on during reset
- One Reset button
- Power: PoE 802.3af; 12VDC external power in connector.
- Antennas:
  - Eight WiFi external antennas
  - One BLE internal antenna

AP510i Specifications

The enterprise class 802.11ax AP510i access point has the following features:

- Radios: 2 radios; 1 IoT radio (2.4 GHz).
- Console Port: RJ45.
- Two Ethernet Ports:
  - GE1 - 10/100/1000/2500/5000 Mbps auto-negotiation Ethernet port, RJ45, with PoE In
  - GE2 - 10/100/1000 Mbps auto-negotiation Ethernet port, RJ45, with PoE In
- LEDs: 6 – All LEDs will be on during reset
- One Reset button
- Power: PoE 802.3af; 12VDC external power in connector.
- Antennas:
  - Eight WiFi internal antennas
  - One BLE internal antenna

AP505i Specifications

The enterprise class 802.11ax AP505i access point has the following features:

- Radios: 2 radios (one band locked at 2.4 GHz and the other band at 5 GHz); 1 IoT radio (2.4 GHz)
- Console port: RJ45
- Two Ethernet ports:
  - GE1 - 10/100/1000/2500 Mbps auto-negotiation Ethernet port, RJ45, with PoE In
  - GE2 - 10/100/1000 Mbps auto-negotiation Ethernet port, RJ45, with NO PoE
- LEDs: 6 LEDs; all LEDs will be on during reset
- One reset button
- Power: PoE 802.3af; 12VDC external power in connector
- Antennas:
  - Eight WiFi internal antennas
  - One BLE internal antenna

Note
For more information on the AP505i, AP510i/e and AP560i/h, refer to the respective installation guides, available at https://extremenetworks.com/documentation.

CLI Overview

This section describes the commands available within a device's CLI structure. CLI is available for access points, wireless controller, and service platforms.

You can access the CLI by using:

- A terminal emulation program running on a computer connected to the serial port on the device (AP, wireless controller, and service platform).
- A Telnet session through SSH *(Secure Shell)* over a network.

Configuration for connecting to a Controller using a terminal emulator

If connecting through the serial port, use the following settings to configure your terminal emulator:

Bits Per Second	**19200** - For NX5500, NX7500, NX9500, NX9600, VX9000 model service platforms. **115200** - For AP505 and AP510 model access points
Data Bits	**8**
Parity	**None**
Stop Bit	**1**
Flow Control	**None**

When a CLI session is established, complete the following (user input is in **bold**):

```
login as: <username>
administrator's login password: <password>
```

User Credentials

Use the following credentials when logging into a device for the first time:

User Name	`admin`
Password	`admin123`

When logging into the CLI for the first time, you are prompted to change the password. Reset the password and use it for subsequent logins.

Examples in this reference guide

Examples used in this reference guide are generic to the each supported wireless controller, service platform, and AP model. Commands that are not common, are identified using the notation "Supported in the following platforms." For an example, see below:

Supported in the following platforms:

- Wireless Controller – NX 5500

The above example indicates the command is only available for a NX 5500 model wireless controller.

The CLI is used for configuring, monitoring, and maintaining the network. The user interface allows you to execute commands on supported wireless controllers, service platforms, and APs, using either a serial console or a remote access method.

This chapter describes basic CLI features. Topics covered include an introduction to command modes, navigation and editing features, help features and command history.

The CLI is segregated into different command modes. Each mode has its own set of commands for configuration, maintenance, and monitoring. The commands available at any given time depend on the mode you are in, and to a lesser extent, the particular model used. Enter a question mark (?) at the system prompt to view a list of commands available for each command mode/instance.

Use specific commands to navigate from one command mode to another. The standard order is: USER EXEC mode, PRIV EXEC mode and GLOBAL CONFIG mode.

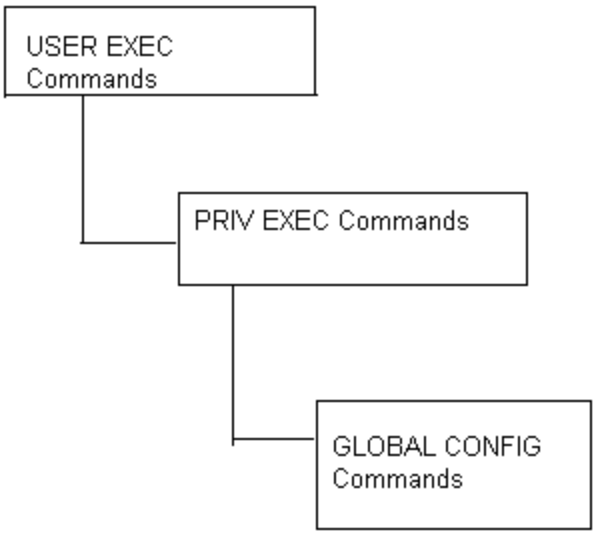

Figure 1: Figure: Hierarchy of User Modes

Command Modes

A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode). For security, only a limited subset of EXEC commands are available in the USER EXEC mode. This level is reserved for tasks that do not change the device's (wireless controller, service platform, or AP) configuration.

```
ap505-13403B>
```

The system prompt signifies the device name and the last three bytes of the device MAC address.

To access commands, enter the PRIV EXEC mode (the second access level for the EXEC mode). Once in the PRIV EXEC mode, enter any EXEC command. The PRIV EXEC mode is a superset of the USER EXEC mode.

```
ap505-13403B>en
ap505-13403B#
```

Most of the USER EXEC mode commands are one-time commands and are not saved across device reboots. Save the command by executing 'commit' command. For example, the show command displays the current configuration and the clear command clears the interface.

Access the GLOBAL CONFIG mode from the PRIV EXEC mode. In the GLOBAL CONFIG mode, enter commands that set general system characteristics. Configuration modes, allow you to change the running configuration. If you save the configuration later, these commands are stored across device reboots.

Access a variety of protocol specific (or feature-specific) modes from the global configuration mode. The CLI hierarchy requires you to access specific configuration modes only through the global configuration mode.

```
ap505-13403B#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
ap505-13403B(config)#
```

You can also access sub-modes from the global configuration mode. Configuration sub-modes define specific features within the context of a configuration mode.

```
ap505-13403B(config)#aaa-policy test
ap505-13403B(config-aaa-policy-test)#
```

To enter the logged device's configuration, execute the following command:

```
ap505-13403B(config)#self
ap505-13403B(config-device-94-9B-2C-13-40-38)#
```

The following table summarizes the available controller commands:

Table 3: Controller CLI Modes and Commands

User Exec Mode	Priv Exec Mode	Global Configuration Mode
captive-portal-page-upload	archive	aaa-policy
change-passwd	boot	aaa-tacacs-policy
clear	captive-portal-page-upload	alias
clock	cd	AP505
cluster	change-passwd	AP510
commit	clear	application
connect	clock	application-group
create-cluster	cluster	application-policy
crypto	commit	association-acl-policy
crypto-cmp-cert-update	configure	auto-provisioning-policy
database	connect	bgp
database-backup	copy	ble-data-export-policy
database-restore	cpe (supported on NX7500, NX9500, NX9600, and VX9000)	bonjour-gw-discovery-policy
debug	create-cluster	bonjour-gw-forwarding-policy
device-upgrade	crypto	bonjour-gw-query-forwarding-policy
disable	crypto-cmp-cert-update	captive-portal
enable	database	clear
file-sync	database-backup	client-identity
help	database-restore	client-identity-group
join-cluster	debug	clone

Table 3: Controller CLI Modes and Commands (continued)

User Exec Mode	Priv Exec Mode	Global Configuration Mode
l2tpv3	delete	crypto-cmp-policy
logging	device-upgrade	customize
mint	diff	database-client-policy (supported only on VX9000)
no	dir	database-policy (supported only on NX9500, NX9600, and VX9000)
on	disable	device
opendns	edit	device-categorization
page		dhcp-server-policy
ping	enable	dhcpv6-server-policy
ping6	erase	dns-whitelist
revert	ex3500 (supported only on NX9500, NX9600, and VX9000)	event-system-policy
service	factory-reset	ex3500
show	file-sync	ex3500-management-policy
ssh	halt	ex3500-qos-class-map-policy
telnet	help	ex3500-qos-policy-map
terminal	join-cluster	ex3524
time-it	l2tpv3	ex3548
traceroute	logging	firewall-policy
traceroute6	mint	global-association-list
virtual-machine (supported only on NX9500, NX9600, and VX9000)	mkdir	guest-management
watch	more	help
write	no	host
clrscr	on	igmp-snoop-policy (This command has been deprecated. IGMP snooping is now configurable under the profile/device configuration mode. For more information, see ip on page 1167.
exit	opendns	inline-password-encryption
	page	iot-device-type-imagotag-policy
	ping	ip
	ping6	ipv6
	pwd	ipv6-router-advertisement-policy
	raid (supported only on NX9500, NX9600, and NX7500)	l2tpv3

Table 3: Controller CLI Modes and Commands (continued)

User Exec Mode	Priv Exec Mode	Global Configuration Mode
	re-elect	location-policy
	reload	mac
	remote-debug	management-policy
	rename	meshpoint
	revert	meshpoint-qos-policy
	rmdir	mint-policy
	self	nac-list
	service	no
	set-personality	nsight-policy
	show	NX5500 (supported only on NX9500, NX9600, and VX900 and)
	ssh	NX7500 (supported only on NX9500, NX9600, and VX9000)
	t5 (supported only on RFS400, NX9500, NX9600, and VX9000)	NX9000 (supported only on NX9500, NX9600, and VX9000)
	telnet	NX9600 (supported only on NX9600, and VX9000)
	terminal	passpoint-policy
	time-it	password-encryption
	traceroute	profile
	traceroute6	radio-qos-policy
	upgrade	radius-group
	upgrade-abort	radius-server-policy
	virtual-machine (supported only on NX9500, NX9600 and VX9000)	radius-user-pool-policy
	watch	rename
		replace
	write	rf-domain
	clrscr	rfs4000
	exit	roaming-assist-policy
		role-policy
		route-map
		routing-policy
		rtl-server-policy
		schedule-policy
		self

Table 3: Controller CLI Modes and Commands (continued)

Getting Context Sensitive Help

Enter a question mark (?) at the system prompt to display a list of commands available for each mode. Obtain a list of arguments and keywords for any command using the CLI context-sensitive help.

Use the following commands to obtain help specific to a command mode, command name, keyword or argument:

Command	Description
(prompt)# help	Displays a brief description of the help system
(prompt)# abbreviated-command-entry?	Lists commands in the current mode that begin with a particular character string

Command	Description
(prompt)# abbreviated-command-entry<TAB>	Completes a partial command name
(prompt)# ?	Lists all commands available in the command mode
(prompt)# command ?	Lists the available syntax options (arguments and keywords) for the command
(prompt)# command keyword ?	Lists the next available syntax option for the command

Note
The system prompt varies depending on the configuration mode.

Note
Enter Ctrl + V to use ? as a regular character and not as a character used for displaying context sensitive help. This is required when the user has to enter a URL that ends with a ?

Note
The escape character used through out the CLI is "\". To enter a "\" use "\\" instead.

When using context-sensitive help, the space (or lack of a space) before the question mark (?) is significant. To obtain a list of commands that begin with a particular sequence, enter the characters followed by a question mark (?). Do not include a space. This form of help is called word help, because it completes a word.

```
nx9500-6C8809#service?
  service  Service Commands

nx9500-6C8809#
```

```
ap505-13403B#se?
  self             Config context of the device currently logged into
  service          Service Commands
  set-personality  Change personality on next reload

ap505-13403B#
```

Enter a question mark (?) (in place of a keyword or argument) to list keywords or arguments. Include a space before the "?". This form of help is called command syntax help. It shows the keywords or arguments available based on the command/keyword and argument already entered.

  wireless                          Wireless service commands

nx9500-6C8809#
```

It is possible to abbreviate commands and keywords to allow a unique abbreviation. For example, "configure terminal" can be abbreviated as **config t**. Since the abbreviated command is unique, the wireless controller accepts the abbreviation and executes the command.

Enter the help command (available in any command mode) to provide the following description:

```
ap505-13403B>help

When using the CLI, help is provided at the command line when typing '?'.

If no help is available, the help content will be empty. Backup until entering a '?'
shows the help content.

There are two styles of help provided:
1. Full help. Available when entering a command argument (e.g. 'show ?'). This will
   describe each possible argument.

2. Partial help. Available when an abbreviated argument is entered. This will display
   which arguments match the input (e.g. 'show ve?').

ap505-13403B>
```

Using the No Command

Almost every command has a `no` form. Use no to disable a feature or function or return it to its default. Use the command without the no keyword to re-enable a disabled feature.

Using CLI Editing Features and Shortcuts

A variety of shortcuts and edit features are available. The following sections describe these features:

Moving the Cursor on the Command Line

The following table shows the key combinations or sequences to move the command line cursor. **Ctrl** defines the control key, which must be pressed simultaneously with its associated letter key. **Esc** means the escape key (which must be pressed first), followed by its associated letter key. Keys are not case sensitive. Specific letters are used to provide an easy way of remembering their functions. The bold characters indicate the relation between a letter and its function.

Table: Keystrokes Details

Keystrokes	Function Summary	Function Details
Left Arrow or Ctrl-B	Back character	Moves the cursor one character to the left When entering a command that extends beyond a single line, press the Left Arrow or Ctrl-B keys repeatedly to move back to the system prompt.
Right Arrow or Ctrl-F	Forward character	Moves the cursor one character to the right
Esc- B	Back word	Moves the cursor back one word
Esc- F	Forward word	Moves the cursor forward one word
Ctrl-A	Beginning of line	Moves the cursor to the beginning of the command line
Ctrl-E	End of line	Moves the cursor to the end of the command line
Ctrl-D		Deletes the current character
Ctrl-U		Deletes text up to cursor
Ctrl-K		Deletes from the cursor to end of the line
Ctrl-P		Obtains the prior command from memory
Ctrl-N		Obtains the next command from memory
Esc-C		Converts the letter at the cursor to uppercase
Esc-L		Converts the letter at the cursor to lowercase
Esc-D		Deletes the remainder of a word
Ctrl-W		Deletes the word up to the cursor
Ctrl-Z		Returns to the root prompt
Ctrl-T		Transposes the character to the left of the cursor with the character located at the cursor
Ctrl-L		Clears the screen

Completing a Partial Command Name

If you cannot remember a command name (or if you want to reduce the amount of typing you have to perform), enter the first few letters of a command, then press the Tab key. The command line parser completes the command if the string entered is unique to the command mode. If your keyboard does not have a **Tab** key, press **Ctrl-L**.

The CLI recognizes a command once you have entered enough characters to make the command unique. If you enter "conf" within the privileged EXEC mode, the CLI associates the entry with the configure command, since only the configure command begins with **conf**.

In the following example, the CLI recognizes a unique string in the privileged EXEC mode when the Tab key is pressed:

```
nx9500-6C8809#conf[TAB]

nx9500-6C8809#configure

nx9500-6C8809#configure[ENTER]
Enter configuration commands, one per line.  End with CNTL/Z.
nx9500-6C8809(config)#
```

When using the command completion feature, the CLI displays the full command name. The command is not executed until the **Return** or **Enter** key is pressed. Modify the command if the full command was not what you intended in the abbreviation. If entering a set of characters (indicating more than one command), the system lists all commands beginning with that set of characters.

Enter a question mark (**?**) to obtain a list of commands beginning with that set of characters. Do not leave a space between the last letter and the question mark (?).

In the following example, all commands, available in the current context, starting with the characters ‘co’ are listed:

```
nx9500-6C8809#co?
  commit     Commit all changes made in this session
  configure  Enter configuration mode
  connect    Open a console connection to a remote device
  copy       Copy from one file to another

nx9500-6C8809#
```

Note

The characters entered before the question mark are reprinted to the screen to complete the command entry.

Command Output pagination

Output often extends beyond the visible screen length. For cases where output continues beyond the screen, the output is paused and a

```
--More--
```

prompt displays at the bottom of the screen. To resume the output, press the Enter key to scroll down one line or press the **Space bar** to display the next full screen of output.

Creating Profiles

Profiles are sort of a 'template' representation of configuration. The system has:

- a default profile for each of the following service platforms:
  - NX5500, NX7500, NX9500, NX9600, and VX9000
- a default profile for each of the following access points:
  - AP505 and AP510

You can modify a default profile. In the following example, an IP address is assigned to the management port on the default AP505 profile.

```
nx9500-6C8809(config)#profile ap505 default-ap505
nx9500-6C8809(config-profile-default-ap505)#interface me1
nx9500-6C8809(config-profile-default-ap505-if-me1)#ip address 172.16.10.2/24
nx9500-6C8809(config-profile-default-ap505-if-me1)#commit
nx9500-6C8809(config-profile-default-ap505)#exit
nx9500-6C8809(config)#
```

The following command displays a default ap505 profile configuration:

```
nx9500-6C8809(config-profile-default-ap505)#
nx9500-6C8809(config-profile-default-ap505)#show context

```

Changing Default Profile

This section describes how to change the default profile by creating vlan 150 and mapping to ge1 physical interface.

Log on to the controller in config mode and follow the procedure below:

```
nx9500-6C8809(config-profile-default-ap505)#interface vlan 150
nx9500-6C8809(config-profile-default-ap505-if-vlan150)#ip address 192.168.150.20/24
nx9500-6C8809(config-profile-default-ap505-if-vlan150)#exit
nx9500-6C8809(config-profile-default-ap505)#interface ge 1
nx9500-6C8809(config-profile-default-ap505-if-ge1)#switchport access vlan 150
```

```
nx9500-6C8809(config-profile-default-ap505-if-ge1)#commit write memory
[OK]
nx9500-6C8809(config-profile-default-ap505-if-ge1)#show interface vlan 150
Interface vlan150 is UP
  Hardware-type: vlan, Mode: Layer 3, Address: 00-15-70-81-70-1D
  Index: 6, Metric: 1, MTU: 1500
  IP-Address: 192.168.150.20/24
    input packets 0, bytes 0, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
    output packets 2, bytes 140, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0
  IPv6 mode is disabled

nx9500-6C8809(config-profile-default-ap505-if-ge1)#
```

Enabling Remote Administration

A terminal server may function in remote administration mode if either the terminal services role is not installed on the machine or the client used to invoke the session has enabled the admin controller.

- A terminal emulation program running on a computer connected to the serial port on the controller. The serial port is located on the front of the controller.
- A Telnet session through a SSH *(Secure Shell)* over a network. The Telnet session may or may not use SSH depending on how the controller is configured. Using SSH for remote administration tasks is recommended.

Configuring Telnet for Management Access

To enable Telnet for management access, use the serial console to login to the device and perform the following:

1 The session, by default, opens in the USER EXEC mode (one of the two access levels of the EXEC mode). Access the PRIV EXEC mode from the USER EXEC mode.

```
ap505-13403B>en
ap505-13403B#
```

2 Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

```
ap505-13403B#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
ap505-13403B(config)#
```

3 Go to ‘default-management-policy’ mode.

```
ap505-13403B(config)#management-policy ?
  MANAGEMENT  Name of the management policy to be configured (will be created
              if it does not exist)

ap505-13403B(config)#management-policy default
ap505-13403B(config-management-policy-default)#
```

4 Enter Telnet and the port number at the command prompt. Note, the port number is optional. If you do not specify the port, the system, by default, assigns port 23 for Telnet. Commit your changes. Telnet is enabled.

```
ap505-13403B(config-management-policy-default)#telnet
ap505-13403B(config-management-policy-default)#commit write
ap505-13403B(config-management-policy-default)#end
ap505-13403B#exit
```

5 Connect to the controller through Telnet using its configured IP address. If logging in for the first time, use the following credentials:

User Name	**admin**
Password	**admin123** Note: When logging in for the first time, you will be prompted to change the password. Re-set the password and use it for subsequent logins.

6 To change password, on subsequent logins, access the default management-policy configuration mode and enter the username, new password, role, and access details.

```
ap505-13403B(config-management-policy-default)#user testuser password test@123
 role helpdesk access all

Configuring SSH for Management Access

By default, SSH is enabled from the factory settings on the controller. The controller requires an IP address and login credentials.

To enable SSH access on a device, login through the serial console and perform the following:

1 The session, by default, opens in the USER EXEC mode (one of the two access levels of the EXEC mode). Access the PRIV EXEC mode from the USER EXEC mode.

```
ap505-13403B>en
ap505-13403B#
```

2 Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

```
ap505-13403B#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
ap505-13403B(config)#
```

3 Go to ‘default-management-policy’ mode.

```
ap505-13403B(config)#management-policy ?
  MANAGEMENT  Name of the management policy to be configured (will be created
              if it does not exist)
```

```
ap505-13403B(config)#management-policy default
ap505-13403B(config-management-policy-default)#
```

4 Enter SSH at the command prompt.

```
ap505-13403B(config-management-policy-default)#ssh
ap505-13403B(config-management-policy-default)#commit write
ap505-13403B(config-management-policy-default)#end
ap505-13403B#exit
```

5 Connect to the access point through SSH using its configured IP address. If logging in for the first time, use the following credentials:

User Name	**admin**
Password	**admin123** Note: When logging in for the first time, you will be prompted to change the password. Re-set the password and use it for subsequent logins.

6 On subsequent logins, to change the password, access the default management-policy configuration mode and enter the username, new password, role, and access details.

```
ap505-13403B(config-management-policy-default)#user testuser password test@123

3 User Exec Mode Commands

user-exec-commands

Logging in to the wireless controller or access point places you within the USER EXEC command mode. Typically, a login requires a user name and password. You have three login attempts before the connection attempt is refused. USER EXEC commands (available at the user level) are a subset of the commands available at the privileged level. In general, USER EXEC commands allow you to connect to remote devices, perform basic tests, and list system information.

To list available USER EXEC commands, use ? at the command prompt. The USER EXEC prompt consists of the device host name followed by an angle bracket (>).

```
<DEVICE>>?
Command commands:
  captive-portal-page-upload  Captive portal internal and advanced page upload
  change-passwd               Change password
  clear                       Clear
  clock                       Configure software system clock
  cluster                     Cluster commands
  commit                      Commit all changes made in this session
  connect                     Open a console connection to a remote device
  create-cluster              Create a cluster
  crypto                      Encryption related commands
  crypto-cmp-cert-update      Update the cmp certs
  database                    Database
  database-backup             Backup database
  database-restore            Restore database
  debug                       Debugging functions
  device-upgrade              Device firmware upgrade
  disable                     Turn off privileged mode command
  enable                      Turn on privileged mode command
  file-sync                   File sync between controller and adoptees
  help                        Description of the interactive help system
  join-cluster                Join the cluster
  l2tpv3                      L2tpv3 protocol
  logging                     Modify message logging facilities
  mint                        MiNT protocol
  no                          Negate a command or set its defaults
  on                          On RF-Domain
  opendns                     OpenDNS configuration
  page                        Toggle paging
  ping                        Send ICMP echo messages
  ping6                       Send ICMPv6 echo messages
  revert                      Revert changes
  service                     Service Commands
  show                        Show running system information
  ssh                         Open an ssh connection
  telnet                      Open a telnet connection
  terminal                    Set terminal line parameters
  time-it                     Check how long a particular command took between
                              request and completion of response
  traceroute                  Trace route to destination
  traceroute6                 Trace route to destination(IPv6)
  virtual-machine             Virtual Machine
  watch                       Repeat the specific CLI command at a periodic
```

```
                              interval
  write                       Write running configuration to memory or
                              terminal

  clrscr                      Clears the display screen
  exit                        Exit from the CLI

<DEVICE>>
```

user-exec-commands

The following table summarizes the User Exec Configuration Mode commands:

Table 4: User Exec Mode Commands

Command	Description
captive-portal-page-upload on page 33	Uploads captive portal advanced pages
change-password on page 36	Changes the password of a logged user
clear on page 37	Resets the last saved command
clock on page 51	Configures the system clock
cluster on page 52	Accesses the cluster context
commit on page 53	Commits changes made in the active session.
connect on page 53	Establishes a console connection to a remote device
create-cluster on page 64	Creates a new cluster on a specified device
crypto on page 54	Enables encryption
crypto-cmp-cert-update on page 65	Triggers a CMP certificate update on a specified device or devices
database on page 66	Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)
database-backup on page 70	Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server
database-restore on page 71	Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database.
device-upgrade on page 72	Configures device firmware upgrade settings
enable on page 78	Turns on (enables) the privileged mode command set
join-cluster on page 84	Adds a device (access point, wireless controller, or service platform) to an existing cluster of devices
file-sync on page 78	Configures parameters enabling syncing of PKCS#12 and wireless-bridge certificate between the staging-controller and adopted access points
help on page 81	Describes the interactive help system.
l2tpv3 on page 85	Establishes or brings down L2TPv3 *(Layer 2 Tunneling Protocol Version 3)* tunnels
logging on page 87	Modifies message logging facilities

Table 4: User Exec Mode Commands (continued)

Command	Description
mint on page 88	Configures MiNT protocol
no on page 90	Negates a command or sets its default
on on page 91	Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show
opendns on page 91	Connects to the OpenDNS site using OpenDNS registered credentials (username, password) OR OpenDNS API token to fetch the OpenDNS device_id. This command is a part of the process integrating access points, controllers, and service platforms with OpenDNS.
page on page 95	Toggles a device's (Access Point, wireless controller, or service platform) paging function
ping on page 96	Sends ICMP echo messages to a user-specified location
ping6 on page 97	Sends ICMPv6 echo messages to a user-specified location
ssh on page 98	Opens an SSH connection between two network devices
telnet on page 99	Opens a Telnet session
terminal on page 100	Sets the length and width of the terminal window
time-it on page 101	Verifies the time taken by a particular command between request and response
traceroute on page 101	Traces the route to its defined IPv4 destination
traceroute6 on page 102	the route to its defined IPv6 destination
watch on page 109	Repeats a specific CLI command at a periodic interval
virtual-machine on page 103	Installs, configures, and monitors the status of VMs *(virtual machines)*. This command is specific to the NX 9500 and NX 9510 series service platforms.
exit on page 110	Ends the current CLI session and closes the session window

Note

For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Common Commands on page 616.

Note

The input parameter <HOSTNAME>, if used in syntaxes across this chapter, cannot include an underscore (_) character.

captive-portal-page-upload

Uploads *captive portal* pages to adopted access points. Use this command to provide access points with specific captive portal configurations, so that they can successfully provision login, welcome, and condition pages to clients attempting to access the wireless network using the captive portal.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|delete-file|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all] {upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME>|all] {from-controller} {(upload-time <TIME>)}
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME>|all|on rf-domain [<DOMAIN-NAME>|all]]
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

Parameters

```
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all] {upload-time <TIME>}
```

captive-portal-page-upload <CAPTIVE-PORTAL-NAME>	Uploads advanced pages of the captive portal identified by the <CAPTIVE-PORTAL-NAME> parameter • <CAPTIVE-PORTAL-NAME> – Specify captive portal's name (should be existing and configured).
<MAC/HOSTNAME>	Uploads to a specified AP • <MAC/HOSTNAME> – Specify the AP's MAC address or hostname.
all	Uploads to all APs
upload-time <TIME>	Schedules an AP upload time • <TIME> – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format. The scheduled upload time is your local system's time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device. To view a list of uploaded captive portal files, execute the `show → captive-portal-page-upload → list-files <CAPTIVE-PORTAL-NAME>` command.

```
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME>|all] {from-controller} {(upload-time <TIME>)}
```

captive-portal-page-upload <CAPTIVE-PORTAL-NAME>	Uploads web pages of the captive portal identified by the <CAPTIVE-PORTAL-NAME> parameter • <CAPTIVE-PORTAL-NAME> – Specify the captive portal's name (should be existing and configured).
rf-domain [<DOMAIN-NAME>|all]	Uploads to all APs within a specified RF Domain or all RF Domains • <DOMAIN-NAME> – Uploads to APs within a specified RF Domain. Specify the RF Domain name. • all – Uploads to APs across all RF Domains

from-controller	Optional. Uploads captive-portal web pages to APs via the controller to which the APs are adopted
upload-time <TIME>	Optional. Schedules an AP upload time • <TIME> – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format. The scheduled upload time is your local system's time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device. To view a list of uploaded captive portal files, execute the `show → captive-portal-page-upload → list-files <CAPTIVE-PORTAL-NAME>` command.

```
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME>|all|on rf-domain [<DOMAIN-NAME>|
all]]
```

captive-portal-page-upload cancel-upload	Cancels a scheduled AP upload

cancel-upload [<MAC/HOSTNAME>| all|on rf-domain [<DOMAIN-NAME>| all]	Select one of the following options:
	• <MAC/HOSTNAME> – Cancels scheduled upload to a specified AP. Specify the AP's MAC address or hostname.
	• all – Cancels all scheduled AP uploads
	• on rf- domain – Cancels all scheduled uploads within a specified RF Domain or all RF Domains
	  • <DOMAIN-NAME> – Cancels scheduled uploads within a specified RF Domain. Specify the RF Domain name.
	  • all – Cancels scheduled uploads across all RF Domains

```
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
```

captive-portal-page-upload delete-file	Deletes a specified captive portal's uploaded captive-portal web pages
<CAPTIVE-PORTAL-NAME> <FILE-NAME>	Identifies the captive-portal and Web pages to delete • <CAPTIVE-PORTAL-NAME> – Specify the captive portal name. • <FILE-NAME> – Specify the file name. The specified internal captive portal page is deleted.

```
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

captive-portal-page-upload load-file	Loads captive-portal web pages
<CAPTIVE-PORTAL-NAME> <URL>	Specify the captive portal's name and location. The captive portal should be existing and configured. IPv4 URLs: • tftp://<hostname|IP>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file • sftp://<user>:<passwd>@<hostname|IP>[:port]>/path/file • http://<hostname|IP>[:port]/path/file • cf:/path/file • usb<n>:/path/file IPv6 URLs: • tftp://<hostname|IPv6>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file • sftp://<user>:<passwd>@<hostname|IPv6>[:port]>/path/file • http://<hostname|IPv6>[:port]/path/file **Note:** The captive portal pages are downloaded to the controller from the location specified here. After downloading use the`captive-portal-page-upload → <CAPTIVE-PORTAL-NAME> → <DEVICE-OR-DOMAIN-NAME>` command to upload these pages to APs.

Examples

```
ap510-133B3B#captive-portal-page-upload load-file captive_portal_test tftp://89.89.89.17/
pages_new_only.tar
ap510-133B3B#show captive-portal-page-upload load-file-status
Download of captive_portal_test advanced page file is complete
ap510-133B3B#
ap510-133B3B#show captive-portal-page-upload status
Number of APs currently being uploaded : 1
Number of APs waiting in queue to be uploaded : 0
-------------------------------------------------------------------------------------
        AP           STATE     UPLOAD TIME PROGRESS RETRIES LAST UPLOAD ERROR UPLOADED BY
-------------------------------------------------------------------------------------
  ap510-133B3B   downloading   immediate   100      0       -                 None
-------------------------------------------------------------------------------------
ap510-133B3B#
```

change-password

Changes the password of the logged user.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>
```

Parameters

```
change passwd {<OLD-PASSWORD>} <NEW-PASSWORD>
```

<OLD-PASSWORD>	Optional. Specify the existing password.
<NEW-PASSWORD>	Specify the new password. **Note:** The password can also be changed interactively. To do so, press **[Enter]** after the command.

Usage Guidelines

A password must be from 1 - 64 characters.

Examples

```
nx9500-6C8809#change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
nx9500-6C8809#write memory
OK
nx9500-6C8809#
```

clear

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared, using this command, depends on the mode in which the clear command is executed.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
clear [arp-cache|bonjour|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6|l2tpv3-stats|lacp|license|lldp|mac-address-table|mint|role|rtls|spanning-tree|traffic-shape|vrrp]
clear arp-cache {on <DEVICE-NAME>}
clear bonjour cache {on <DEVICE-NAME>}
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
clear counters [all|ap|bridge|interface|radio|router|thread|wireless-client]
clear counters all {(on <DEVICE-OR-DOMAIN-NAME>)}
clear counters [bridge|router|thread]
clear counters interface <INF-TYPE> {(on <DEVICE-OR-DOMAIN-NAME>)}
clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-3>}|wireless-client {<MAC>}] {(on <DEVICE-OR-DOMAIN-NAME>)}
clear crypto [ike|ipsec] sa
clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}
clear crypto ipsec sa {on <DEVICE-NAME>}
clear event-history
clear firewall [dhcp|dos|flows|neighbors]
clear firewall [dhcp|neighbors] snoop-table {on <DEVICE-NAME>}
clear firewall [dos stats|flows [ipv4|ipv6]] {on <DEVICE-NAME>}
clear gre stats {on <DEVICE-NAME>}
clear ip [bgp|dhcp|ospf]
clear ip bgp [<IP>|all|external|process]
clear ip bgp [<IP>|all|external] {in|on|out|soft}
clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}
clear ip bgp [<IP>|all|external] {out} {(on <DEVICE-NAME>)}
clear ip bgp [<IP>|all|external] {soft {in|out}} {on <DEVICE-NAME>}
clear ip bgp process {on <DEVICE-NAME>}
clear ip dhcp bindings [<IP>|all] {on <DEVICE-NAME>}
clear ip ospf process {on <DEVICE-NAME>}
clear mac-address-table {address|interface|vlan} {on <DEVICE-NAME>}
clear ipv6 neighbor-cache {on <DEVICE-NAME>}
clear lacp [<1-4> counters|counters]
clear license [borrowed|lent to <BORROWER-CONTROLLER-NAME>] {on <DEVICE-NAME>}
clear l2tpv3-stats tunnel <TUNNEL-NAME> {session <SESSION-NAME>} {on <DEVICE-NAME>}
clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}
clear mac-address-table {address|interface|mac-auth-state|vlan} {on <DEVICE-NAME>}
clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}
clear mac-address-table {interface [<IN-NAME>|ge <1-2>|port-channel <1-2>| vmif <1-8>]} {on <DEVICE-NAME>}
clear mac-address-table mac-auth-state address <MAC> vlan <1-4094> {on <DEVICE-NAME>}
clear mint mlcp history {on <DEVICE-NAME>}
clear role ldap-stats {on <DEVICE-NAME>}
clear rtls [aeroscout|ekahau]
clear rtls [aeroscout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}|on <DEVICE-OR-DOMAIN-NAME>}
clear spanning-tree detected-protocols{interface|on}
clear spanning-tree detected-protocols {on <DEVICE-NAME>}
clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-
```

```
channel <1-X>|pppoe1|up1|vlan <1-4094>|wwan1]} {on <DEVICE-NAME>}
clear traffic-shape statistics class <1-4> {(on <DEVICE-NAME>)}
clear vrrp [error-stats|stats] {on <DEVICE-NAME>}
```

Parameters

```
clear arp-cache {on <DEVICE-NAME>}
```

arp-cache	Clears *ARP (Address Resolution Protocol)* cache entries on a AP, wireless controller, or service platform. This protocol matches the layer 3 IP addresses to the layer 2 MAC addresses.
on <DEVICE-NAME>	Optional. Clears ARP cache entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear bonjour cache {on <DEVICE-NAME>}
```

bonjour cache	Clears all *Bonjour* cached statistics. Once cleared the system has to re-discover available Bonjour services.
on <DEVICE-NAME>	Optional. Clears all Bonjour cached statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
```

cdp	Clears *CDP (Cisco Discovery Protocol)* table entries
lldp	Clears *LLDP (Link Layer Discovery Protocol)* table entries
neighbors	Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step
on <DEVICE-NAME>	Optional. Clears CDP or LLDP neighbor table entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear counters all {(on <DEVICE-OR-DOMAIN-NAME>)}
```

counters	Clears all counters on the logged device or on all devices within a specified RF Domain. These counters are: AP, bridge, interface, radio, router, thread and wireless clients.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Specify the device name or the RF Domain name. • on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears all counters on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. Note: If you do not specify a device name or an RF Domain name, the system clears all counters on the logged device.

```
clear counters [bridge|router|thread]
```

counters	Clears counters based on the parameters passed. The options are: AP, bridge, interface, radio, router, thread and wireless clients.
[bridge|router|thread]	Select one of the following options: • bridge – Clears bridge counters. When executed, this command resets the bridge forwarding cache. • router – Clears router counters. When executed, this command resets the router counters. • thread – Clears thread counters. When executed, this command resets the pre-thread counters.

```
clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-X>}|wireless-client {<MAC>}]
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

counters	Clears counters based on the parameters passed. The options are: AP, bridge, interface, radio, router, thread and wireless clients.
ap <MAC>	Clears counters for all APs or a specified AP • <MAC> – Optional. Specify the AP's MAC address. Note: If no MAC address is specified, all AP counters are cleared.
radio <MAC/DEVICE-NAME> <1-X>	Clears radio interface counters on a specified device or on all devices • <MAC/DEVICE-NAME> – Optional. Specify the device's hostname or MAC address. Optionally, append the radio interface number (to the radio ID) using one of the following formats: AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX (where RX is the interface number). • <1-X> – Optional. Identifies the radio interface by its index. Specify the radio interface index, if not specified as part of the radio ID. Note, the number of radio interfaces available varies with the access point type. Note: If no device name or MAC address is specified, all radio interface counters are cleared.

wireless-client <MAC>	Clears counters for all wireless clients or a specified wireless client • <MAC> – Optional. Specify the wireless client's MAC address. Note: If no MAC address is specified, all wireless client counters are cleared.
on <DEVICE-OR-DOMAIN-NAME>	The following option is common to all of the above keywords: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears AP, radio, or wireless client counters on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
clear counters interface <INF-TYPE> <INF-NUMBER>{(on <DEVICE-OR-DOMAIN-NAME>)}
```

counters	Clears counters based on the parameters passed. The options are: AP, bridge, interface, radio, router, thread and wireless clients.
interface <INF-TYPE> <INF-NUMBER>	Clears interface counters • <INF-TYPE> - Specify the interface type as Ethernet, VLAN, port-channel, usb, all, etc. • <INF-NUMBER> - After specifying the interface type, specify the interface number.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Clears the specified interface counters on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}
```

crypto	Clears encryption module's cached statistics
ike sa [<IP>|all]	Clears *Internet Key Exchange* (IKE) *security associations* (SAs) • <IP> – Clears IKE SA entries for the peer identified by the <IP> keyword • all – Clears IKE SA entries for all peers
on <DEVICE-NAME>	Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear crypto ipsec sa {on <DEVICE-NAME>}
```

crypto	Clears encryption module's cached statistics
ipsec sa {on <DEVICE-NAME>}	Clears *IPsec/IPsec-ESP/IPsec-AH* database SAs • on <DEVICE-NAME> – Optional. Clears IPSec SA entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear gre stats {on <DEVICE-NAME>}
```

gre stats	Clears GRE tunnel statistics
on <DEVICE-NAME>	Optional. Clears GRE tunnel statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear event-history
```

event-history	Clears event history cache entries

```
clear firewall [dhcp|neighbors] snoop-table {on <DEVICE-NAME>}
```

firewall	Clears configured wireless firewall filter statistics based on the parameters passed
[dhcp|neighbors] snoop-table	Clears the following snoop-table database • dhcp - Clears the *DHCP (Dynamic Host Configuration Protocol)* snooping binding database. • neighbors - Clears *IPv6* neighbor cache.
on <DEVICE-NAME>	The following option is common to both the 'dhcp' and 'neighbor' parameters: • on <DEVICE-NAME> - Optional. Executes the command on as specified device. • <DEVICE-NAME> - Specify the AP, wireless controller, or service platform name.

```
clear firewall [dos stats|flows [ipv4|ipv6]] {on <DEVICE-NAME>}
```

firewall	Clears configured wireless firewall filter statistics based on the parameters passed
dos stats	Clears *DoS* statistics

flows [ipv4|ipv6]	Clears all established IPv4 or IPv6 firewall session statistics • ipv4 - Optional. Clears only IPv4 firewall session statistics • ipv6 - Optional. Clears only ipv6 firewall session statistics Note: If you do not specify IPv4 or IPv6, the system clears all ACL related statistics.
on <DEVICE-NAME>	The following option is common to both the 'dos' and 'flows' parameters: • on <DEVICE-NAME> - Optional. Executes the command on as specified device. • <DEVICE-NAME> - Specify the AP, wireless controller, or service platform name.

```
clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}
```

ip bgp [<IP>|all|external]	Clears on-going *BGP (Border Gateway Protocol)* sessions based on the option selected • <IP> – Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address. • all – Clears all BGP peer sessions • external – Clears *external BGP* (eBGP) peer sessions This command is applicable only to the NX9500, NX9600, and VX9000 platforms. Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The `clear > ip > bgp command` clears BGP sessions. To reduce lose of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.
in prefix-filter	Optional. Clears inbound route updates • prefix-filter – Optional. Clears the existing *Outbound Route Filtering* (ORF) prefix-list
on <DEVICE-NAME>	Optional. Clears route updates on a specified device • <DEVICE-NAME> – Specify the name of the AP or service platform.

```
clear ip bgp [<IP>|all|external] {out} {(on <DEVICE-NAME>)}
```

ip bgp [<IP>|all|external]	Clears on-going *BGP* sessions based on the option selected • <IP> – Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address. • all – Clears all BGP peer sessions • external – Clears eBGP peer sessions This command is applicable only to the NX9500, NX9600, and VX9000 platforms.
out	Optional. Clears outbound route updates. Optionally specify the device on which to execute this command.
on <DEVICE-NAME>	The following keyword is recursive and optional. • on <DEVICE-NAME> – Optional. Clears BGP sessions on a specified device • <DEVICE-NAME> – Specify the name of the AP or service platform.

```
clear ip bgp [<IP>|all|external] {soft {in|out}} {on <DEVICE-NAME>}
```

ip bgp [<IP>|all|external]	Clears on-going *BGP* sessions based on the option selected • <IP> – Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address. • all – Clears all BGP peer sessions • external – Clears eBGP peer sessions This command is applicable only to the NX9500, NX9600, and VX9000 platforms.
soft {in|out}	Optional. Initiates soft-reconfiguration of route updates for the specified IP address • in – Optional. Enables soft reconfiguration of inbound route updates • out – Optional. Enables soft reconfiguration of outbound route updates Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The `clear > ip > bgp` command clears BGP sessions. To reduce loss of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.
on <DEVICE-NAME>	Optional. Initiates soft reconfiguration inbound/outbound route updates on a specified device • <DEVICE-NAME> – Specify the name of the AP or service platform.

```
clear ip bgp process {on <DEVICE-NAME>}
```

ip bgp process	Clears all BGP processes running This command is applicable only to the NX9500, NX9600, and VX9000 platforms.
on <DEVICE-NAME>	Optional. Clears all BGP processes on a specified device • <DEVICE-NAME> – Specify the name of the AP or service platform.

```
clear ip dhcp bindings [<IP>|all] {on <DEVICE-NAME>}
```

ip	Clears a DHCP *(Dynamic Host Configuration Protocol)* server's IP address binding entries
dhcp bindings	Clears DHCP connections and server bindings
<IP>	Clears specific address binding entries. Specify the IP address to clear binding entries.
all	Clears all address binding entries
on <DEVICE-NAME>	Optional. Clears a specified address binding or all address bindings on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear ip ospf process {on <DEVICE-NAME>}
```

ip ospf process	Clears already enabled OSPF *(Open Shortest Path First)* process and restarts the process
on <DEVICE-NAME>	Optional. Clears OSPF process on a specified device OSPF is a link-state IGP *(interior gateway protocol)*. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighboring routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear ipv6 neighbor-cache {on <DEVICE-NAME>}
```

clear ipv6 neighbor-cache	Clears IPv6 neighbor cache entries
on <DEVICE-NAME>	Optional. Clears IPv6 neighbor cache entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear lacp [<1-4> counters|counters]
```

clear lacp [<1-4> counters| counters]	Clears *LACP (Link Aggregation Control Protocol)* counters/statistics for a specified channel group or all channel groups configured • <1-4> counters – Clears LACP stats for a specified channel group. Specify the port-channel index number from 1 - 4. Note, LACP is supported only on the NX5500, NX7500, NX9500, and NX9600 model service platforms. However, the NX9500 series service platforms support only two (2) channel groups, and the other model service platforms support four (4) channel groups. • counters – Clears LACP stats for all configured channel groups on the device

```
clear license [borrowed|lent to <BORROWER-CONTROLLER-NAME>] {on <DEVICE-NAME>}
```

license	Releases borrowed licenses or revokes lent licenses
borrowed	Releases all licenses borrowed by the logged controller or by a specified controller **Note:** If you do not specify a controller name, the command is executed on the controller you have logged on to.
lent to <BORROWING-CONTROLLER-NAME>	Revokes licenses lent to a specified controller • to <BORROWING-CONTROLLER-NAME> - Specifies the borrowing controller's name. When specified, the system revokes all licenses (AP, AAP) lent to the specified controller.

on <DEVICE-NAME>	Optional. This option is common to both of the above parameters.
	• on <DEVICE-NAME> - Specify the name of the controller on which the command is to be executed.
	  • <DEVICE-NAME> – Specify the name of the wireless controller or service platform.
	  Note:
	  If you do not specify the controller name, the system executes the command on the logged controller.

```
clear l2tpv3-stats tunnel <TUNNEL-NAME> {session <SESSION-NAME>} {on <DEVICE-NAME>}
```

l2tpv3-stats	Clears L2TPv3 tunnel statistics for a specified L2TPv3 tunnel
tunnel <TUNNEL-NAME>	Specifies the tunnel name

session <SESSION-NAME>	Optional. Clears a specific session statistics in the specified L2TPv3 tunnel. • <SESSION-NAME> - Specify the session name. Note: If you do not specify the session name, the system clears statistics for all sessions.
on <DEVICE-NAME>	This option is common to all of the above parameters. • on <DEVICE-NAME> - Optional. Executes the command on a specified device. • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. Note: If you do not specify the device name, the system clears L2TPv3 tunnel and session statistics on the logged device.

```
clear mac-address-table{address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}
```

mac-address-table	Clears MAC address forwarding table data based on the parameters passed Use this command to clear the following: all or specified MAC addresses from the system, all MAC addresses on a specified interface, all MAC addresses on a specified VLAN, or the authentication state of a MAC address.
address <MAC>	Optional. Clears a specified MAC address from the MAC address table. • <MAC> – Specify the MAC address in one of the following formats: AA-BB-CC-DD-EE-FF or AA:BB:CC;DD:EE:FF or AABB.CCDD.EEFF Note: If executed without specifying any MAC address(es), all MAC addresses from the MAC address table will be removed.
vlan <1-4094>	Optional. Clears all MAC addresses for a specified VLAN • <1-4094> – Specify the VLAN ID from 1 - 4094
on <DEVICE-NAME>	Optional. Clears a single MAC entry or all MAC entries, for the specified VLAN on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear mac-address-table {interface [<IF-NAME>|ge <1-X>|port-channel <1-X>]} {on <DEVICE-
NAME>}
```

mac-address-table	Clears MAC address forwarding table data based on the parameters passed Use this command to clear the following: all or specified MAC addresses from the system, all MAC addresses on a specified interface, all MAC addresses on a specified VLAN, or the authentication state of a MAC address.
interface	Clears all MAC addresses for the selected interface. Use the options available to specify the interface.

<IF-NAME>	Clears MAC address forwarding table for the specified layer 2 interface (Ethernet port) • <IF-NAME> – Specify the layer 2 interface name.
ge <1-X>	Clears MAC address forwarding table for the specified GigabitEthernet interface • <1-X> – Specify the GigabitEthernet interface index from 1 - X. Note: The number of GE interfaces supported varies for different device types.
port-channel <1-X>	Clears MAC address forwarding table for the specified port-channel interface • <1-X> – Specify the port-channel interface index from 1 - X. Note: The number of port-channel interfaces supported varies for different device types.
on <DEVICE-NAME>	Optional. Clears the MAC address forwarding table, for the selected interface, on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear mac-address-table mac-auth-state address <MAC> vlan <1-4904> {on <DEVICE-NAME>}
```

mac-address-table mac-auth-state address <MAC> vlan <1-4904>	Clears MAC addresses learned from a particular VLAN when WLAN MAC authentication and *captive portal* fall back is enabled Access points/controllers provide WLAN access to clients whose MAC address has been learned and stored in their MAC address tables. Use this command to clear a specified MAC address on the MAC address table. Once cleared the client has to re-authenticate, and is provided access only on successful authentication. • <MAC> – Specify the MAC address to clear. • vlan <1-4904> – Specify the VLAN interface from 1 - 4094. In the AP/controller's MAC address table, the specified MAC address is cleared on the specified VLAN interface.
on <DEVICE-NAME>	Optional. Clears the specified MAC address on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. Note: If a device is not specified, the system clears the MAC address on all devices.

```
clear mint mlcp history {on <DEVICE-NAME>}
```

mint	Clears MiNT related information
mlcp history	Clears *MiNT Link Creation Protocol* (MLCP) client history
on <DEVICE-NAME>	Optional. Clears MLCP client history on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear role ldap-stats {on <DEVICE-NAME>}
```

role ldap-stats	Clears *Lightweight Directory Access Protocol* (LDAP) server statistics
on <DEVICE-NAME>	Optional. Clears LDAP server statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear rtls [aeroscout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}| on <DEVICE-OR-DOMAIN-NAME>}
```

rtls	Clears *Real Time Location Service* (RTLS) statistics
aeroscout	Clears RTLS Aeroscout statistics
ekahau	Clears RTLS Ekahau statistics
<MAC/DEVICE-NAME>	This keyword is common to the 'aeroscout' and 'ekahau' parameters. • <MAC/DEVICE-NAME> – Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, or service platform. Specify the AP's MAC address or hostname.
on <DEVICE-OR-DOMAIN-NAME>	This keyword is common to the 'aeroscout' and 'ekahau' parameters. • on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, service platform, or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
clear spanning-tree detected-protocols {on <DEVICE-NAME>}
```

spanning-tree	Clears spanning tree entries on an interface and restarts protocol migration
detected-protocols	Restarts protocol migration
on <DEVICE-NAME>	Optional. Clears spanning tree entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|up1|vlan <1-4094>|wwan1]} {on <DEVICE-NAME>}
```

spanning-tree	Clears spanning tree entries on an interface and restarts protocol migration
detected-protocols	Restarts protocol migration

interface [<INTERFACE-NAME>| ge <1-X>|me1| port-channel <1-X>| pppoe1|up1| vlan <1-4094>| wwan1]	Optional. Clears spanning tree entries on different interfaces • <INTERFACE-NAME> – Clears detected spanning tree entries on a specified interface. Specify the interface name. • ge <1-X> – Clears detected spanning tree entries for the selected GigabitEthernet interface. Select the GigabitEthernet interface index from 1 - X. • me1 – Clears FastEthernet interface spanning tree entries • port-channel <1-X> – Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X. The number of port-channel interfaces supported varies for different device types. • pppoe1 – Clears detected spanning tree entries for *PPPoE (Point-to-Point Protocol over Ethernet)* interface • up1 – Clears detected spanning tree entries for the WAN Ethernet interface • vlan <1-4094> – Clears detected spanning tree entries for the selected VLAN interface. Select a *Switch Virtual Interface* (SVI) VLAN ID from 1- 4094. • wwan1 – Clears detected spanning tree entries for wireless WAN interface.
on <DEVICE-NAME>	Optional. Clears spanning tree entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear traffic-shape statistics class <1-4> {(on <DEVICE-NAME>)
```

traffic-shape statistics	Clears traffic shaping statistics
class <1-4>	Clears traffic shaping statistics for a specific traffic class • <1-4> – Specify the traffic class from 1 - 4. **Note:** If the traffic class is not specified, the system clears all traffic shaping statistics.
on <DEVICE-NAME>	Optional. Clears traffic shaping statistics for the specified traffic class on a specified device • <DEVICE-NAME> – Specify the name of the access point, wireless controller, or service platform.

```
clear vrrp [error-stats|stats] {on <DEVICE-NAME>}
```

vrrp	Clears *VRRP (Virtual Router Redundancy Protocol)* statistics
error-stats	Clears global error statistics

stats	Clears VRRP related statistics
on <DEVICE-NAME>	This following keywords are common to the 'error-stats' and 'stats' parameters: • on <DEVICE-NAME> – Optional. Clears VRRP statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```

clock

Sets a device's system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device's clock is set without resetting the time zone, the time is displayed relative to the UTC *(Universal Time Coordinated)* – Greenwich Time. To display time in the local time zone format, in the device's configuration mode, use the timezone command. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. We recommend that you reset the local time zone on the device prior to setting the clock.

Note

This command and its syntax is common to both the User Executable and Privilege Executable configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

Parameters

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

clock set	Sets a device's software system clock
<HH:MM:SS>	Sets the current time (in military format hours, minutes, and seconds) Note: By default, the WiNG software displays time in the 24-hour clock format. This setting cannot be changed.
<1-31>	Sets the numerical day of the month
<MONTH>	Sets the month of the year (Jan to Dec)
<1993-2035>	Sets a valid four digit year from 1993 - 2035
on <DEVICE-NAME>	Optional. Sets the clock on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
ap510-133B3B(config-device-94-9B-2C-13-3B-3B)#America/Los_Angeles
ap510-133B3B>clock set 00:46:06 8 Jan 2019
ap510-133B3B>show clock
2019-01-08 00:51:34 PST
ap510-133B3B>
```

cluster

Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member. Commands executed under this context are executed on all members of the cluster.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
cluster start-election
```

Parameters

```
cluster start-election
```

start-election	Starts a new cluster master election

Examples

```
nx9500-6C8809>cluster start-election
```

commit

Commits changes made in the active session. Use the commit command to save and invoke settings entered during the current transaction.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
commit {write}{memory}
```

Parameters

```
commit {write}{memory}
```

write	Optional. Commits changes made in the current session
memory	Optional. Writes to memory. This option ensures current changes persist across reboots.

Examples

```
ap510-133B3B#commit
[OK]
ap510-133B3B#
```

connect

Begins a console connection to a remote device using the remote device's MiNT ID or name

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

Parameters

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

mint-id <MINT-ID>	Connects to the remote system using its MiNT ID • <MINT-ID> – Specify the remote device's MiNT ID.
<REMOTE-DEVICE-NAME>	Connects to the remote system using its name • <REMOTE-DEVICE-NAME> – Specify the remote device's name.

Examples

```
ap510-133B3B>connect
ap510-133B3B ap510-13452A default/ap510-133B3B default/ap510-13452A mint-id

crypto

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate CSR *(Certificate Signing Request)*.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
crypto [key|pki]
crypto key [export|generate|import|zeroize]
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL {background|on|passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|on|passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}
crypto pki [authenticate|export|generate|import|zeroise]
crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background} {(on <DEVICE-NAME>)}
crypto pki export [request|trustpoint]
crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name [<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>]
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)
crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>, fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}
crypto pki import [certificate|crl|trustpoint]
crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} {(on <DEVICE-NAME>})
crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}
```

Parameters

```
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

key	Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.
export rsa <RSA-KEYPAIR-NAME>	Exports an existing RSA Keypair to a specified destination • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name.

<EXPORT-TO-URL>	Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported. After specifying the destination address (where the RSA Keypair is exported), configure one of the following parameters: background or passphrase.
background	Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.
passphrase <KEY-PASSPHRASE> background	Optional. Encrypts RSA Keypair before exporting • <KEY-PASSPHRASE> – Specify a passphrase to encrypt the RSA Keypair. • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.
on <DEVICE-NAME>	The following parameter is recursive and common to all of the above parameters: • on <DEVICE-NAME> – Optional. Performs export operation on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
```

key	Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.

generate rsa <RSA-KEYPAIR-NAME> [2048|4096]	Generates a new RSA Keypair
	• <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name.
	  • [2048|4096] – Sets the size of the RSA key in bits. The options are 2048 bits and 4096 bits. The default size is 2048 bits.
	
	  After specifying the key size, optionally specify the device (access point or controller) to generate the key on.

on <DEVICE-NAME>	Optional. Generates the new RSA Keypair on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-
PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

key	Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.
import rsa <RSA-KEYPAIR-NAME>	Imports a RSA Keypair from a specified source • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name.
<IMPORT-FROM-URL>	Specify the RSA Keypair source address. Both IPv4 and IPv6 address formats are supported. After specifying the source address (where the RSA Keypair is imported from), configure one of the following parameters: background or passphrase.

background	Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.
passphrase <KEY-PASSPHRASE> background	Optional. Decrypts the RSA Keypair after importing • <KEY-PASSPHRASE> – Specify the passphrase to decrypt the RSA Keypair. • background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point, controller, or service platform) to perform the import on.
on <DEVICE-NAME>	The following parameter is recursive and common to the 'background' and 'passphrase' keywords: • on <DEVICE-NAME> – Optional. Performs import operation on a specific device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}
```

key	Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.
zeroize rsa <RSA-KEYPAIR-NAME>	Deletes a specified RSA Keypair • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name. Note: All device certificates associated with this key will also be deleted.
force	Optional. Forces deletion of all certificates associated with the specified RSA Keypair. Optionally specify a device on which to force certificate deletion.
on <DEVICE-NAME>	The following parameter is recursive and optional: • on <DEVICE-NAME> – Optional. Deletes all certificates associated with the RSA Keypair on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki authenticate <TRUSTPOINT-NAME> <URL> {background} {(on <DEVICE-NAME>)}
```

pki	Enables PKI *(Private Key Infrastructure)* management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA *(Certificate Authority)* certificates.
authenticate <TRUSTPOINT-NAME>	Authenticates a trustpoint and imports the corresponding CA certificate • <TRUSTPOINT-NAME> – Specify the trustpoint name.
url	Specify CA's location. Both IPv4 and IPv6 address formats are supported. Note: The CA certificate is imported from the specified location.

background	Optional. Performs authentication in the background. If selecting this option, you can optionally specify the device (access point, controller, or service platform) to perform the export on.
on <DEVICE-NAME>	The following parameter is recursive and optional: • on <DEVICE-NAME> – Optional. Performs authentication on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-
subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
export request	Exports CSR to the CA for digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key.
[generate-rsa-key| use-rsa-key] <RSA-KEYPAIR-NAME>	Generates a new RSA Keypair or uses an existing RSA Keypair • generate-rsa-key – Generates a new RSA Keypair for digital authentication • use-rsa-key – Uses an existing RSA Keypair for digital authentication • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.
autogen-subject-name	Auto generates subject name from configuration parameters. The subject name identifies the certificate.
<EXPORT-TO-URL>	Specify the CA's location. Both IPv4 and IPv6 address formats are supported. Note: The CSR is exported to the specified location.
email <SEND-TO-EMAIL>	Exports CSR to a specified e-mail address • <SEND-TO-EMAIL> – Specify the CA's e-mail address.
fqdn <FQDN>	Exports CSR to a specified FQDN *(Fully Qualified Domain Name)* • <FQDN> – Specify the CA's FQDN.
ip-address <IP>	Exports CSR to a specified device or system • <IP> – Specify the CA's IP address.

```
crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-
key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-
address <IP>)
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
export request	Exports CSR to the CA for a digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key.

[generate-rsa-key| short [generate-rsa-key|use-rsa-key]| use-rsa-key] <RSA-KEYPAIR-NAME>	Generates a new RSA Keypair or uses an existing RSA Keypair
	• generate-rsa-key – Generates a new RSA Keypair for digital authentication
	• short [generate-rsa-key|use-rsa-key] – Generates and exports a shorter version of the CSR
	  • generate-rsa-key – Generates a new RSA Keypair for digital authentication. If generating a new RSA Keypair, specify a name for it.
	  • use-rsa-key – Uses an existing RSA Keypair for digital authentication. If using an existing RSA Keypair, specify its name.
	• use-rsa-key – Uses an existing RSA Keypair for digital authentication
	  • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.

subject-name <COMMON-NAME>	Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate • <COMMON-NAME> – Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length).
<COUNTRY>	Sets the deployment country code (2 character ISO code)
<STATE>	Sets the state name (2 to 64 characters in length)
<CITY>	Sets the city name (2 to 64 characters in length)
<ORGANIZATION>	Sets the organization name (2 to 64 characters in length)
<ORGANIZATION-UNIT>	Sets the organization unit (2 to 64 characters in length)
<EXPORT-TO-URL>	Specify the CA's location. Both IPv4 and IPv6 address formats are supported. The CSR is exported to the specified location.
email <SEND-TO-EMAIL>	Exports CSR to a specified e-mail address • <SEND-TO-EMAIL> – Specify the CA's e-mail address.
fqdn <FQDN>	Exports CSR to a specified FQDN • <FQDN> – Specify the CA's FQDN.
ip-address <IP>	Exports CSR to a specified device or system • <IP> – Specify the CA's IP address.

```
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase
<KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
export trustpoint <TRUSTPOINT-NAME>	Exports a trustpoint along with CA certificate, CRL *(Certificate Revocation List)*, server certificate, and private key • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

<EXPORT-TO-URL>	Specify the destination address. Both IPv4 and IPv6 address formats are supported. The trustpoint is exported to the address specified here.
background	Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on
passphrase <KEY-PASSPHRASE> background	Optional. Encrypts the key with a passphrase before exporting • <KEY-PASSPHRASE> – Specify the passphrase to encrypt the trustpoint. • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.
on <DEVICE-NAME>	The following parameter is recursive and common to the 'background' and 'passphrase' keywords: • on <DEVICE-NAME> – Optional. Performs export operation on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.
generate	Generates a certificate and a trustpoint
self-signed <TRUSTPOINT-NAME>	Generates a self-signed certificate and a trustpoint • <TRUSTPOINT-NAME> – Specify a name for the certificate and its trustpoint.
[generate-rsa-key| use-rsa-key] <RSA-KEYPAIR-NAME>	Generates a new RSA Keypair, or uses an existing RSA Keypair • generate-rsa-key – Generates a new RSA Keypair for digital authentication • use-rsa-key – Uses an existing RSA Keypair for digital authentication • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.
autogen-subject-name	Auto generates the subject name from the configuration parameters. The subject name helps to identify the certificate.
email <SEND-TO-EMAIL>	Optional. Exports the self-signed certificate to a specified e-mail address • <SEND-TO-EMAIL> – Specify the e-mail address.
fqdn <FQDN>	Optional. Exports the self-signed certificate to a specified FQDN • <FQDN> – Specify the FQDN.

ip-address <IP>	Optional. Exports the self-signed certificate to a specified device or system • <IP> – Specify the device's IP address.
on <DEVICE-NAME>	Optional. Exports the self-signed certificate on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-
KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION>
<ORGANIZATION-UNIT> {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.
generate self-signed <TRUSTPOINT-NAME>	Generates a self-signed certificate and a trustpoint • <TRUSTPOINT-NAME> – Specify a name for the certificate and its trustpoint.
[generate-rsa-key| use-rsa-key] <RSA-KEYPAIR-NAME>	Generates a new RSA Keypair, or uses an existing RSA Keypair • generate-rsa-key – Generates a new RSA Keypair for digital authentication • use-rsa-key – Uses an existing RSA Keypair for digital authentication • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.
subject-name <COMMON-NAME>	Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate • <COMMON-NAME> – Specify the common name used with this certificate. The name should enable you to identify the certificate easily and should not exceed 2 to 64 characters in length.
<COUNTRY>	Sets the deployment country code (2 character ISO code)
<STATE>	Sets the state name (2 to 64 characters in length)
<CITY>	Sets the city name (2 to 64 characters in length)
<ORGANIZATION>	Sets the organization name (2 to 64 characters in length)
<ORGANIZATION-UNIT>	Sets the organization unit (2 to 64 characters in length)
email <SEND-TO-EMAIL>	Optional. Exports the self-signed certificate to a specified e-mail address • <SEND-TO-EMAIL> – Specify the e-mail address.
fqdn <FQDN>	Optional. Exports the self-signed certificate to a specified FQDN • <FQDN> – Specify the FQDN.
ip-address <IP>	Optional. Exports the self-signed certificate to a specified device or system • <IP> – Specify the device's IP address.

```
crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} {(on
<DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
import	Imports certificates, CRL, or a trustpoint to the selected device
[certificate|crl] <TRUSTPOINT-NAME>	Imports a signed server certificate or CRL • certificate – Imports signed server certificate • crl – Imports CRL • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).
<IMPORT-FROM-URL>	Specify the signed server certificate or CRL source address. Both IPv4 and IPv6 address formats are supported. The server certificate or the CRL (based on the parameter passed in the preceding step) is imported from the location specified here.
background	Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.
on <DEVICE-NAME>	The following parameter is recursive and optional: • on <DEVICE-NAME> – Optional. Performs import operation on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background|passphrase
<KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
import	Imports certificates, CRL, or a trustpoint to the selected device
trustpoint <TRUSTPOINT-NAME>	Imports a trustpoint and its associated CA certificate, server certificate, and private key • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).
<IMPORT-FROM-URL>	Specify the trustpoint source address. Both IPv4 and IPv6 address formats are supported.
background	Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.

passphrase <KEY-PASSPHRASE> background	Optional. Decrypts trustpoint with a passphrase after importing • <KEY-PASSPHRASE> – Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on. • background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on.
on <DEVICE-NAME>	The following parameter is recursive and optional: • on <DEVICE-NAME> – Optional. Performs import operation on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
zeroize trustpoint <TRUSTPOINT-NAME>	Imports certificates, CRL, or a trustpoint to the selected device
[certificate|crl] <TRUSTPOINT-NAME>	Deletes a trustpoint and its associated CA certificate, server certificate, and private key • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).
del-key	Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.
on <DEVICE-NAME>	The following parameter is recursive and optional: • on <DEVICE-NAME> – Optional. Deletes the trustpoint on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Usage Guidelines

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- IPv4 URLs:

  tftp://<hostname|IPv4>[:port]/path/file

  ftp://<user>:<passwd>@<hostname|IPv4>[:port]/path/file

  sftp://<user>@<hostname|IPv4>[:port]>/path/file

  http://<hostname|IPv4>[:port]/path/file

  cf:/path/file

  usb<n>:/path/file

- IPv6 URLs:

  tftp://<hostname|IPv6>[:port]/path/file

  ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file

  sftp://<user>@<hostname|IPv6>[:port]>/path/file

  http://<hostname|IPv6>[:port]/path/file

Examples

```
ap510-133B3B#crypto key generate rsa local 2048 on ap510-133B3B
RSA Keypair successfully generated
ap510-133B3B#
```

create-cluster

Creates a new device cluster, with the specified name, and assigns it an IP address and routing level

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load balance is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

Parameters

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

create-cluster	Creates a cluster
name <CLUSTER-NAME>	Configures the cluster name • <CLUSTER-NAME> – Specify a cluster name. Define a name for the cluster that uniquely identifies its configuration or profile support requirements. The name cannot exceed 64 characters.

ip <IP>	Specifies the device's IP address used for cluster creation • <IP> – Specify the device's IP address in the A.B.C.D format.
level [1|2]	Optional. Configures the routing level for this cluster • 1 – Configures level 1 (local) routing • 2 – Configures level 2 (inter-site) routing

Examples

```
nx9500-6C8809#create-cluster name TechPubs1 ip 192.168.13.8 level 2
... creating cluster
... committing the changes
... saving the changes
Please Wait .
[OK]
nx9500-6C8809#
nx9500-6C8809#show cluster configuration

Cluster Configuration Information
 Name                          : TechPubs1
 Configured Mode               : Active

```

Related Commands

cluster on page 52	Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member.
join-cluster on page 84	Adds an access point, wireless controller or service platform, as a member, to an existing cluster of controllers

crypto-cmp-cert-update

Triggers a CMP *(Certificate Management Protocol)* certificate update on a specified device or devices

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}
```

Parameters

```
crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}
```

crypto-cmp-cert-update <TRUSTPOINT-NAME> on <DEVICE-NAME>	Triggers a CMP certificate update on a specified device or devices • <TRUSTPOINT-NAME> – Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context mode to configure the trustpoint. • on <DEVICE-NAME> – Optional. Initiates a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list. <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
NOC-NX9500#crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
NOC-NX9500#
```

database

Enables automatic repairing (vacuuming) and dropping databases. Also enables keyfile generation.

If enforcing authenticated access to a database, use this command to generate the keyfile. Every keyfile has a set of associated users having a username and password. Access to the database is allowed only if the user credentials entered during database login are valid. For more information on enabling database authentication, see Enabling Database Authentication.

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
database [drop|keyfile|repair]
database drop [all|captive-portal]
database repair {on <DEVICE-NAME>}
database keyfile [export|generate|import|zerzoise]
database keyfile generate
database keyfile [export|import] <URL>
database keyfile zerzoise
```

Parameters

```
database drop [all|captive-portal]
```

database drop [all|captive-portal|]	Drops (deletes) all or a specified database. Execute the command on the device hosting the database. • all – Drops all databases, captive portal and NSight • captive-portal – Drops the captive-portal database

```
database repair {on <DEVICE-NAME>}
```

database repair on <DEVICE-NAME>	Enables automatic repairing of all databases. Repairing (vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements. Execute the command on the database host. • on <DEVICE-NAME> – Optional. Specifies the name of the database host. When specified, databases on the specified host are periodically checked to identify and remove obsolete data documents. • <DEVICE-NAME> – Specify the name of the access point, wireless controller, or service platform. **Note:** If no device is specified, the system repairs all databases.

```
database keyfile generate
```

database keyfile generate	Enables database keyfile management. This command is part of a set of configurations required to enforce database authentication. Use this command to generate database keyfiles. After generating the keyfile, create the username and password combination required to access the database. For information on creating database users, see service on page 623. For information on enabling database authentication, see Enabling Database Authentication. • generate – Generates the keyfile. In case of a replica-set deployment, execute the command on the primary database host. Once generated, export the keyfile to a specified location from where it is imported on to the replica-set hosts.

```
database keyfile [export|import] <URL>
```

database keyfile [export|import] <URL>	Enables database keyfile management. This command is part of a set of configurations required to enforce database authentication. Use this command to exchange keyfiles between replica set members. • export – Exports the keyfile to a specified location on an FTP/SFTP/TFTP server. Execute the command on the database host on which the keyfile has been generated. • import – Imports the keyfile from a specified location. Execute the command on the replica set members. The following parameter is common to both of the above keywords: • <URL> – Specify the location to/from where the keyfile is to be exported/ imported. Use one of the following options to specify the keyfile location: ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file tftp://<hostname|IP>[:port]/path/file

```
database keyfile zerzoise
```

database keyfile zerzoise	Enables database keyfile management. Use this command to delete keyfiles • zerzoise – Deletes an existing keyfile.

Examples

```
vx9000-1A1809#database keyfile generate
Database keyfile successfully generated
vx9000-1A1809#
vx9000-1A1809#database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
vx9000-1A1809#
vx9000-D031F2#database keyfile import ftp://1.1.1.111/db-key
Database keyfile successfully imported
vx9000-D031F2#
```

Example: Enabling Database Authentication

Follow the steps below to enable database authentication and set up the onboard database. Note, the example uses replica set database deployment.

1 On the primary database host,

a Generate the database keyfile.

```
Primary-DB-HOST>database keyfile generate
Database keyfile successfully generated
Primary-DB-HOST>
```

b Use the `show > database > keyfile` command to view the generated keyfile.

c Export the keyfile to an external location. This is required only in case of database replica-set deployment.

```
Primary-DB-HOST>database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
Primary-DB-HOST>
```

d Create the users that are allowed access to the database.

```
Primary-DB-HOST#service database authentication create-user username techpubs
password techPubs@123
Database user [techpubs] created.
Primary-DB-HOST#
```

e View the database user account created.

```
Primary-DB-HOST#show database users
--------------------------------
         DATABASE USER
--------------------------------
 techpubs
--------------------------------
Primary-DB-HOST#
```

2 On the replica set host, import the keyfile from the location specified in Step 1 c.

```
Secondary-DB-HOST#database keyfile import ftp://1.1.1.111/db-key
```

3 In the database-policy context, – (used on the WiNG device hosting the captive-portal database)

a Enable authentication.

```
Primary-DB-HOST(config-database-policy-techpubs)#authentication
```

b Configure the user accounts created in Step 1 d.

```
Primary-DB-HOST(config-database-policy-techpubs)#authentication username techpubs
password S540QFZz9LzSOdX1ZJEqDgAAAAy3b7GtyO4Z/Ih2ruxnOYnr
```

```
Primary-DB-HOST(config-database-policy-techpubs)#show context
database-policy techpubs
 authentication
 authentication username techpubs password 2 S540QFZz9LzSOdX1ZJEqDgAAAAy3b7GtyO4Z/
Ih2ruxnOYnr
 replica-set member nx7500-A02B91 arbiter
 replica-set member vx9000-1A1809 priority 1
 replica-set member vx9000-D031F2 priority 20
Primary-DB-HOST(config-database-policy-techpubs)#
```

4 Use the database policy created in the previous step on the primary database.

```
Primary-DB-HOST(config-device-B4-C7-99-6C-88-09)#use database-policy techpubs
```

5 In the database-client policy context

Note
This configuration is needed in deployments implementing captive-portal registration and database authentication with an onboard database.

a Configure the user credentials created in Step 1 d.

```
NOC-Controller(config-database-client-policy-techpubs)#authentication username
techpubs password S540QFZz9LzSOdX1ZJEqDgAAAAy3b7GtyO4Z/Ih2ruxnOYnr
```

b View the configuration.

```
NOC-Controller(config-database-client-policy-techpubs)#show context
database-client-policy techpubs
 authentication username techpubs password 2 S540QFZz9LzSOdX1ZJEqDgAAAAy3b7GtyO4Z/
Ih2ruxnOYnr
NOC-Controller(config-database-client-policy-techpubs)#
```

6 Use the database client policy configured in the previous step on the WiNG device that will access the database.

```
<DB-CLIENT>(config-device-B4-C7-99-6C-88-09)#use database-client-policy techpubs
```

Related Commands

database-restore on page 71	Restores a previously exported databases
database-policy global config on page 299	Documents database-policy configuration commands. Use this option to enable a WiNG device as the database.
database-client-policy global-config on page 296	Documents database-client-policy configuration commands. The database-client-policy is only needed in deployments implementing captive-portal registration and database authentication with an onboard database. Use this command to enable the controller or RF Domain manager to authenticate with the database.
service on page 623	Documents the database user account configuration details

database-backup

Backs up *captive portal* and/or NSight database to a specified location and file on an FTP, SFTP, or TFTP server. Execute this command on the database host.

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
database-backup database [captive-portal|nsight|nsight-placement-info] <URL>
database-backup database [captive-portal|nsight] <URL>
database-backup database nsight-placement-info <URL>
```

Parameters

```
database-backup database [captive-portal|nsight] <URL>
```

database-backup database [captive-portal|nsight]	Backs up captive portal and/or NSight database to a specified location. Select the database to backup: • captive-portal – Backs up captive portal database • nsight – Backs up NSight database After specifying the database type, configure the destination location.
<URL>	Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats: ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz

```
database-backup database nsight-placement-info <URL>
```

database-backup database nsight-placement-info <URL>	Backs up the NSight access point placement related details to a specified location • <URL> – Specify the URL in one of the following formats: ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz tftp://<hostname|IP>[:port]/path/file.tar.gz

Examples

```
NS-DB-nx9510-6C87EF>database-backup database nsight tftp://192.168.9.50/testbckup
NS-DB-nx9510-6C87EF>show database backup-status
Last Database Backup Status : In_Progress(Starting tftp transfer.)
Last Database Backup Time   : 2018-01-01 12:48:05
NS-DB-nx9510-6C87EF>show database backup-status
Last Database Backup Status : Successful
Last Database Backup Time   : Mon Jan 01 12:48:08 IST 2018
NS-DB-nx9510-6C87EF>
```

Related Commands

database on page 66	Enables automatic repairing (vacuuming) and dropping of databases (captive-portal and/or NSight)
database-restore on page 71	Restores a previously exported (backed up) database (captive-portal and/or NSight)]

database-restore

Restores a previously exported database, *captive portal* and/or NSight. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
database-restore database [captive-portal|nsight] <URL>
```

Parameters

```
database-restore database [captive-portal|nsight] <URL>
```

database-restore database [captive-portal| nsight]	Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type: • captive-portal – Restores captive portal database • nsight – Restores NSight database After specifying the database type, configure the destination location and file name from where the files are restored.
<URL>	Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats: ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz tftp://<hostname|IP>[:port]/path/file.tar.gz

Examples

```
nx9500-6C874D#database-restore database nsight ftp://anonymous:anonymous@192.168.13.10/
backups/nsight/nsight.tar.gz
```

Related Commands

database on page 66	Enables automatic repairing (vacuuming) and dropping of databases (captive-portal and NSight)

device-upgrade

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
device-upgrade [<MAC/HOSTNAME>|all|ap505|ap510|ap560|nx5500|nx7500|nx9500|nx9600|vx9000|
cancel-upgrade|load-image|rf-domain]

device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>|upgrade-time <TIME>

device-upgrade all {force|no-reboot|reboot-time <TIME>|staggered-reboot|
upgrade-time <TIME> {no-reboot|reboot-time <TIME>}} {(staggered-reboot)}

device-upgrade [ap505|ap510|ap560|nx5500|nx7500|nx9500|nx9600|vx9000]
[all|containing <SUB-STRING>] {force|no-reboot|reboot-time <TIME>|
upgrade-time <TIME> {no-reboot|reboot-time <TIME>}}

device-upgrade cancel-upgrade [<MAC/HOSTNAME>|all|ap505|ap510|ap560|nx5500|nx7500|nx9500|

```

```
{(<MAC/HOSTNAME>|force|from-controller|no-reboot|reboot-time <TIME>|staggered-reboot|
upgrade-time <TIME>)}
```

Parameters

```
device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>|upgrade-time <TIME>
{no-reboot|reboot-time <TIME>}}
```

<MAC/HOSTNAME>	Upgrades firmware on the device identified by the <MAC/HOSTNAME> keyword • <MAC/HOSTNAME> – Specify the device's MAC address or hostname.
no-reboot	Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
reboot-time <TIME>	Optional. Schedules an automatic reboot after a successful upgrade • <TIME> – Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

upgrade-time <TIME> {no-reboot| reboot-time <TIME>}	Optional. Schedules an automatic device firmware upgrade and specifies the time at which the device is to be upgraded
	• <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade:
	  • no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
	  • reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

```
device-upgrade all {force|no-reboot|reboot-time <TIME>|upgrade-time <TIME>
{no-reboot|reboot-time <TIME>}} {(staggered-reboot)}
```

all	Upgrades firmware on all devices
force	Optional. Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.
no-reboot	Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
reboot-time <TIME>	Optional. Schedules an automatic reboot after a successful upgrade • <TIME> – Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

upgrade-time <TIME> {no-reboot| reboot-time <TIME>}	Optional. Schedules an automatic firmware upgrade on all devices, of the specified type, on a specified day and time
	• <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade:
	  • no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
	  • reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

staggered-reboot	This keyword is recursive and common to all of the above. • Optional. Enables staggered reboot (one at a time), without network impact

```
device-upgrade [ap505|ap510|ap560|nx5500|nx7500|nx9500|nx9600|vx9000]
[all|containing <SUB-STRING] {force|no-reboot|reboot-time <TIME>|
upgrade-time <TIME> {no-reboot|reboot-time <TIME>}}
{(staggered-reboot)}
```

device-upgrade <DEVICE-TYPE> all	Upgrades firmware on all devices of a specific type. Select the device type. The options are: AP510, AP505, AP560, NX5500, NX7500, NX9500, NX9600, VX9000 After selecting the device type, schedule an automatic upgrade and/or an automatic reboot.
force	Optional. Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.
no-reboot	Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
reboot-time <TIME>	Optional. Schedules an automatic reboot after a successful upgrade • <TIME> – Optional. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

upgrade-time <TIME> {no-reboot| reboot-time <TIME>}	Optional. Schedules an automatic firmware upgrade on all devices, of the specified type, on a specified day and time
	• <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade:
	  • no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
	  • reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

staggered-reboot	This keyword is recursive and common to all of the above. • Optional. Enables staggered reboot (one at a time), without network impact

```
device-upgrade cancel-upgrade [<MAC/HOSTNAME>|all|ap505|ap510|ap560|nx5500|nx7500|nx9500|
nx9600|vx9000|on rf-domain [<RF-DOMAIN-NAME>|all]]
```

cancel-upgrade	Cancels a scheduled firmware upgrade based on the parameters passed. This command provides the following options to cancel scheduled firmware upgrades: • Cancels upgrade on specific device(s). The devices are identified by their MAC addresses or hostnames. • Cancels upgrade on all devices within the network • Cancels upgrade on all devices of a specific type. Specify the device type. • Cancels upgrade on specific device(s) or all device(s) within a specific RF Domain or all RF Domains. Specify the RF Domain name.
cancel-upgrade [<MAC/ HOSTNAME>| all]	Cancels a scheduled firmware upgrade on a specified device or on all devices • <MAC/HOSTNAME> – Cancels a scheduled upgrade on the device identified by the <MAC/HOSTNAME> keyword. Specify the device's MAC address or hostname. • all – Cancels scheduled upgrade on all devices
cancel-upgrade <DEVICE-TYPE> all	Cancels scheduled firmware upgrade on all devices of a specific type. Select the device type. The options are: ap510 and ap505
cancel-upgrade on rf-domain [<RF-DOMAIN-NAME>|all]	Cancels scheduled firmware upgrade on all devices in a specified RF Domain or all RF Domains • <RF-DOMAIN-NAME> – Cancels scheduled device upgrade on all devices in a specified RF Domain. Specify the RF Domain name. • all – Cancels scheduled device upgrade on all devices across all RF Domains

```
device-upgrade load-image [ap505|ap510|ap560|nx5500|nx7500|nx9500|nx9600|vx9000]
{<IMAGE-URL>|on <DEVICE-OR-DOMAIN-NAME>}
```

load-image <DEVICE-TYPE>	Loads device firmware image from a specified location. Use this command to specify the device type and the location of the corresponding image file. • <DEVICE-TYPE> - Specify the device type. The options are: AP510, AP505, AP560, AP560, NX5500, NX7500, NX9500, NX9600, VX9000. After specifying the device type, provide the location of the required device firmware image.
<IMAGE-URL>	Specify the device's firmware image location in one of the following formats: IPv4 URLs: • tftp://<hostname|IP>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file • sftp://<user>:<passwd>@<hostname|IP>[:port]>/path/file • http://<hostname|IP>[:port]/path/file • cf:/path/file • usb<n>:/path/file IPv6 URLs: • tftp://<hostname|IPv6>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file • sftp://<user>:<passwd>@<hostname|IPv6>[:port]>/path/file • http://<hostname|IPv6>[:port]/path/file
on <DEVICE-OR-DOMAIN-NAME>	Specify the name of the device or RF Domain. The image, of the specified device type is loaded from the device specified here. In case of an RF Domain, the image available on the RF Domain manager is loaded. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
device-upgrade rf-domain [<RF-DOMAIN-NAME>|all|containing <WORD>|filter location <WORD>]
[all|ap505|ap510|ap560|nx5500|nx7500|nx9500|nx9600|vx9000] {(<MAC/HOSTNAME>|force|
from-controller|no-reboot|reboot-time <TIME>|staggered-reboot|upgrade-time <TIME>)}
```

rf-domain [<RF-DOMAIN-NAME>|all| containing <WORD>| filter location <WORD>]	Upgrades firmware on devices in a specified RF Domain or all RF Domains. Devices within a RF Domain are upgraded through the RF Domain manager. • <RF-DOMAIN-NAME> – Upgrades devices in the RF Domain identified by the <RF-DOMAIN-NAME> keyword. • <RF-DOMAIN-NAME> – Specify the RF Domain name. • all – Upgrades devices across all RF Domains • containing <WORD> – Filters RF Domains by their names. RF Domains with names containing the sub-string identified by the <WORD> keyword are filtered. Devices on the filtered RF Domains are upgraded. • filter location <WORD> – Filters devices by their location. All devices with location matching the <WORD> keyword are upgraded.
<DEVICE-TYPE>	After specifying the RF Domain, select the device type. The options are: AP510, AP505, AP560, NX5500, NX7500, NX9500, NX9600, VX9000. After specifying the RF Domain and the device type, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.

<MAC/HOSTNAME>	Optional. Use this option to identify specific devices (by their MAC address/ Hostnames) that are to be upgraded. Specify the device's MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller. Note: If no MAC address or hostname is specified, all devices of the type selected are upgraded.
force	Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.
from-controller	Optional. Upgrades a device through the adopted device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.
no-reboot {staggered-reboot}	Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
reboot-time <TIME> {staggered-reboot}	Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.
staggered-reboot	This keyword is common to all of the above. Optional. Enables staggered reboot (one at a time) without network impact

upgrade-time <TIME> {no-reboot| reboot-time <TIME>}	Optional. Schedules an automatic firmware upgrade
	• <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. After a scheduled upgrade, the following actions can be performed.
	  • no-reboot – Optional. Disables automatic reboot after a successful upgrade the device must be manually restarted)
	  • reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/ YYYY-HH:MM or HH:MM format.

nx9500-6C8809#
```

enable

Turns on (enables) the privileged mode command set. The prompt changes from `ap510-133B3B>` to `ap510-133B3B#`. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
enable
```

Parameters

```
None
```

Examples

```
ap510-133B3B>enable
ap510-133B3B#
```

file-sync

Syncs trustpoint and/or EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and its adopted devices.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the adopted devices are configured to use EAP-TLS authentication.
- Execute the command on the controller adopting the devices.
- Ensure that the X.509 certificate file is installed on the controller.

Syncing of trustpoint/wireless-bridge certificate can be automated. To automate file syncing, in the controller's device/profile configuration mode, execute the following command: `file-sync [auto|count <1-20>]`.

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
file-sync [cancel|load-file|trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge]
file-sync cancel [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
file-sync load-file [trustpoint|wireless-bridge]]
file-sync load-file [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] <URL>
file-sync [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all] {from-controller}] {reset-radio|upload-time <TIME>}
```

Parameters

```
file-sync cancel [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
```

file-sync cancel [trustpoint <TRUSTPOINT-NAME>| wireless-bridge] [<DEVICE-NAME>| all|rf-domain [<DOMAIN-NAME>| all]]	Cancels scheduled file synchronization • trustpoint – Cancels scheduled trustpoint synchronization on a specified device, all devices, or devices within a specified RF Domain • <TRUSTPOINT-NAME> - Specify the trustpoint name. • wireless-bridge – Cancels scheduled wireless-bridge certificate synchronization on a specified device, all devices, or devices within a specified RF Domain • <DEVICE-NAME> – Cancels scheduled trustpoint/certificate synchronization on a specified device. Specify the device's hostname or MAC address. • all – Cancels scheduled trustpoint/certificate synchronization on all devices • rf-domain [<DOMAIN-NAME>|all] – Cancels scheduled trustpoint/certificate synchronization on all devices in a specified RF Domain or in all RF Domains <DOMAIN-NAME> – Cancels scheduled trustpoint/certificate synchronization within a specified RF Domain. Specify the RF Domain's name. all – Cancels scheduled trustpoint/certificate synchronization on all RF Domains

```
file-sync load-file [trustpoint|wireless-bridge] <URL>
```

file-sync load-file [trustpoint| wireless-bridge] <URL>	Loads the following files on to the staging controller: • trustpoint – Loads the trustpoint, including CA certificate, server certificate and private key • wireless-bridge – Loads the wireless-bridge certificate to the staging controller Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization. • <URL> – Provide the trustpoint/certificate location using one of the following formats: tftp://<hostname|IP>[:port]/path/file ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file sftp://<user>:<passwd>@<hostname|IP>[:port]>/path/file http://<hostname|IP>[:port]/path/file **Note:** Both IPv4 and IPv6 address types are supported. cf:/path/file usb<n>:/path/file

```
file-sync [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|all|rf-domain
[<DOMAIN-NAME>|all] {from-controller}] {reset-radio|upload-time <TIME>}
```

file-sync trustpoint <TRUSTPOINT-NAME> [<DEVICE-NAME>| all|rf-domain [<DOMAIN-NAME> |all] from-controller]	Configures file-syncing parameters
	• trustpoint <TRUSTPOINT-NAME> – Syncs a specified trustpoint between controller and its adopted devices
	  • <TRUSTPOINT-NAME> – Specify the trustpoint name.
	
	Note: Trustpoint are synced all the way down the hierarchical structure. If you issue the command on the NOC controller, the specified trustpoint will be synced all the way down the site controllers and their adopted APs.
	• wireless-bridge – Syncs wireless-bridge certificate between controller and its adopted devices
	
	After specifying the file that is to be synced, configure following file-sync parameters:
	  • <DEVICE-NAME> – Syncs trustpoint/certificate with a specified AP. Specify the device's hostname or MAC address.
	  • all – Syncs trustpoint/certificate with all devices
	  • rf-domain [<DOMAIN-NAME>|all] from-controller – Syncs trustpoint/certificate with all devices in a specified RF Domain or in all RF Domains
	<DOMAIN-NAME> – Select to sync with APs within a specified RF Domain. Specify the RF Domain's name.
	all – Select to sync with APs across all RF Domains
	from-controller – Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager
	
	After specifying the access points, specify the following options: **reset-radio** and **upload-time**.

reset-radio	This keyword is recursive and applicable to all of the above parameters. Optional. Resets the radio after file synchronization. Reset the radio in case the certificate is renewed along with no changes made to the 'bridge EAP username' and 'bridge EAP password'.
upload-time <TIME>	This keyword is recursive and applicable to all of the above parameters. • upload-time – Optional. Schedules certificate upload at a specified time • <TIME> – Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed.

Examples

```
<CONTROLLER>#file-sync wireless-bridge ap510-133B3B upload-time 06/01/2019-12:30
-------------------------------------------------------------------------------
          CONTROLLER               STATUS                  MESSAGE
-------------------------------------------------------------------------------
     B4-C7-99-6D-B5-D4           Success           Queued 1 APs to upload
-------------------------------------------------------------------------------
<CONTROLLER>#
```

help

Describes the interactive help system. Use this command to access the advanced help feature. Use "**?**" anytime at the command prompt to access the help topic

Two kinds of help are provided:

- Full help is available when ready to enter a command argument
- Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example 'show ve?').

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
help {search|show}
help {search <WORD>} {detailed|only-show|skip-no|skip-show}
```

Parameters

```
help {search <WORD>} {detailed|only-show|skip-no|skip-show}
```

search <WORD>	Optional. Searches for CLI commands related to a specific target term • <WORD> – Specify a target term (for example, a feature or a configuration parameter). After specifying the term, select one of the following options: detailed, only-show, skip-no, or skip-show. The system displays information based on the option selected.
detailed	Optional. Searches and displays help strings in addition to mode and commands
only-show	Optional. Displays only "show" commands. Does not display configuration commands.
skip-no	Optional. Displays only configuration commands. Does not display "no" commands
skip-show	Optional. Displays only configuration commands. Does not display "show" commands

```

join-cluster

Adds a device (access point, wireless controller, or service platform), as a member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster. Note, a cluster can be only formed of devices of the same model type.

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

Parameters

```
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

join-cluster	Adds a access point wireless controller, or service platform to an existing cluster
<IP>	Specify the cluster member's IP address.
user <USERNAME>	Specify a user account with super user privileges on the new cluster member
password <WORD>	Specify password for the account specified in the user parameter
level [1|2]	Optional. Configures the routing level • 1 – Configures level 1 routing • 2 – Configures level 2 routing
mode [active|standby]	Optional. Configures the cluster mode • active – Configures this cluster as active • standby – Configures this cluster to be on standby mode

Usage Guidelines

To add a device to an existing cluster:

- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding a device to a cluster, execute the "write memory" command to ensure the configuration persists across reboots.

Examples (User Exec Mode)

```
nx9500-6C8809>join-cluster 192.168.13.15 user admin password superuser level 1
mode standby
... connecting to 192.168.13.15
... applying cluster configuration
... committing the changes
... saving the changes
[OK]

Related Commands

create-cluster on page 64	Creates a new cluster on the specified device
cluster on page 52	Initiates cluster context. The cluster context enables centralized management and configuration of all cluster members from any one member.

l2tpv3

Establishes or brings down a L2TPv3 *(Layer 2 Tunnel Protocol Version 3)* tunnel

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
l2tpv3 tunnel [<TUNNEL-NAME>|all]
l2tpv3 tunnel <TUNNEL-NAME> [down|session|up]
l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
```

Parameters

```
l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
```

l2tpv3 tunnel	Establishes or brings down L2TPV3 tunnels
<TUNNEL-NAME> [down|up]	Specifies the tunnel name to establish or bring down • down – Brings down the specified tunnel • up – Establishes the specified tunnel
on <DEVICE-NAME>	Optional. Establishes or brings down a tunnel on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
```

l2tpv3 tunnel	Establishes or brings down L2TPV3 tunnels
<TUNNEL-NAME> [session <SESSION-NAME>] [down|up]	Establishes or brings down a specified session inside an L2TPV3 tunnel • <TUNNEL-NAME> – Specify the tunnel name. • session <SESSION-NAME> – Identifies a specific session <SESSION-NAME> – Specify the session name. down – Brings down the session identified by the <SESSION-NAME> keyword up – Establishes the session identified by the <SESSION-NAME> keyword
on <DEVICE-NAME>	Optional. Establishes or brings down a tunnel session on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
```

l2tpv3 tunnel	Establishes or brings down L2TPV3 tunnel
all [down|up]	Establishes or brings down all L2TPV3 tunnels • down – Brings down all tunnels • up – Establishes all tunnels
on <DEVICE-NAME>	Optional. Establishes or brings down all tunnels on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809>l2tpv3 tunnel testTunnel session testSession1 up on ap505-13403
```

Note
For more information on the L2TPV3 tunnel configuration mode and commands, see L2TPv3 Policy on page 1700.

logging

Modifies message logging settings

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings}
```

Parameters

```
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings}
```

monitor	Sets the terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified. • <0-7> – Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows: • alerts – Optional. Immediate action needed (severity=1) • critical – Optional. Critical conditions (severity=2) • debugging – Optional. Debugging messages (severity=7) • emergencies – Optional. System is unusable (severity=0) • errors – Optional. Error conditions (severity=3) • informational – Optional. Informational messages (severity=6) • notifications – Optional. Normal but significant conditions (severity=5) • warnings – Optional. Warning conditions (severity=4) **Note:** Before configuring the message logging level, ensure logging module is enabled. To enable message logging, in the device's configuration mode, execute the logging > on command. Message logging can also be enabled on a profile. All devices using the profile will have message logging enabled.

Examples

```
ap505-13403B(config-device-94-9B-2C-13-40-38)#logging on
ap505-13403B>logging monitor debugging
ap505-13403B>show logging

mint

Uses MiNT protocol to perform a ping and trace route to a remote device

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
mint [ping|traceroute]
mint ping <MINT-ID> {(count <1-10000>|size <1-64000>|timeout <1-10>)}
mint traceroute <MINT-ID> {(destination-port <1-65535>|max-hops <1-255>|
source-port <1-65535>|timeout <1-255>)}
```

Parameters

```
mint ping <MINT-ID> {(count <1-10000>|size <1-64000>|timeout <1-10>)}
```

ping <MINT-ID>	Sends a MiNT echo message to a specified destination • <MINT-ID> – Specify the destination device's MiNT ID.
count <1-10000>	Optional. Sets the number of ping packets sent to the specified MiNT destination • <1-60> – Specify a value from 1 - 10000. The default is 3.
size <1-64000>	Optional. Sets the MiNT payload size in bytes • <1-64000> – Specify a value from 1 - 640000. The default is 64 bytes.
timeout <1-10>	Optional. Sets a response time in seconds • <1-10> – Specify a value from 1 sec - 10 sec. The default is 1 second.

```
mint traceroute <MINT-ID> {(destination-port <1-65535>|max-hops <1-255>|
source-port <1-65535>|timeout <1-255>)}
```

traceroute <MINT-ID>	Prints the route packets trace to a device • <MINT-ID> – Specify the destination device's MiNT ID.
destination-port <1-65535>	Optional. Sets the *Equal-cost Multi-path* (ECMP) routing destination port • <1-65535> – Specify a value from 1 - 65535. The default port is 45.
max-hops <1-255>	Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction • <1-255> – Specify a value from 1 - 255. The default is 30.
source-port <1-65535>	Optional. Sets the ECMP source port • <1-65535> – Specify a value from 1 - 65535. The default port is 45.
timeout <1-255>	Optional. Sets the minimum response time period in seconds • <1-65535> – Specify a value from 1 sec - 255 sec. The default is 30 seconds.

Examples

```
nx9500-6C8809#mint ping 68.88.0D.A7
MiNT ping 68.88.0D.A7 with 64 bytes of data.
 Response from 68.88.0D.A7: id=1 time=0.364 ms
 Response from 68.88.0D.A7: id=2 time=0.333 ms
 Response from 68.88.0D.A7: id=3 time=0.368 ms

--- 68.88.0D.A7 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.333/0.355/0.368 ms
nx9500-6C8809#
```

no

Use the no command to remove a setting or to revert a setting to its default value.

Note
The commands have their own set of parameters that can be reset.

Syntax

```
no [adoption|captive-portal|crypto|debug|logging|page|service|terminal|virtual-machine|
wireless]
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>] {on <DEVICE-OR-
DOMAIN-NAME>}
no crypto pki [server|trustpoint]
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}|on
<DEVICE-NAME>}
no logging monitor
no page
no service [block-adopter-config-update|locator|snmp|ssm|wireless]
no service snmp sysoid wing5
no service block-adopter-config-update
no service ssm trace pattern {<WORD>} {on <DEVICE-NAME>}
no service wireless [trace pattern {<WORD>} {on <DEVICE-NAME>}|unsanctioned ap air-
terminate <BSSID> {on <DOMAIN-NAME>}]
no service locator {on <DEVICE-NAME>}
no terminal [length|width]
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
no wireless client [all|<MAC>]
no wireless client all {filter|on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Resets or reverts settings based on the parameters passed

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

```
nx9500-6C8809>no adoption
nx9500-6C8809>no page
nx9500-6C8809>no service cli-tables-expand line
```

on

Executes the following commands in the RF Domain context: *clrscr*, *do*, *end*, *exit*, *help*, *service*, and *show*

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
on rf-domain [<RF-DOMAIN-NAME>|all]
```

Parameters

```
on rf-domain [<RF-DOMAIN-NAME>|all]
```

on rf-domain [<RF-DOMAIN-NAME>|all]	Enters the RF Domain context based on the parameter specified • <RF-DOMAIN-NAME> – Specify the RF Domain name. Enters the specified RF Domain context. • all – Specifies all RF Domains.

Examples

```
nx9500-6C8809>on rf-domain TechPubs
nx9500-6C8809(TechPubs)>?
on RF-Domain Mode commands:

  clrscr   Clears the display screen
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  service  Service Commands
  show     Show running system information

nx9500-6C8809(TechPubs)>
nx9500-6C8809(rf-domain-all)>?
on RF-Domain Mode commands:

  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  service  Service Commands
  show     Show running system information

nx9500-6C8809(rf-domain-all)>
```

opendns

Fetches the OpenDNS device_id from the OpenDNS site. Use this command to fetch the OpenDNS device_id. Once fetched, apply the device_id to WLANs that are to be OpenDNS enabled.

OpenDNS is a free DNS service that enables swift Web navigation without frequent outages. It is a reliable DNS service that provides the following services: DNS query resolution, Web-filtering, protection against virus and malware attacks, performance enhancement, etc.

This command is part of a set of configurations that are required to integrate WiNG devices with OpenDNS. When integrated, DNS queries going out of the WiNG device (access point, controller, or service platform) are re-directed to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers that act as proxy DNS servers.

For more information on integrating WiNG devices with OpenDNS site, see Enabling OpenDNS Support.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Syntax

```
opendns [APIToken|username]
opendns APIToken <OPENDNS-APITOKEN>
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

Note
Note, as per the current implementation both of the above commands can be used to fetch the device_id from the OpenDNS site.

Parameters

```
opendns APIToken <OPENDNS-APITOKEN>
```

opendns	Fetches the device_id from the OpenDNS site using the OpenDNS API token
APIToken <OPENDNS-APITOKEN>	Configures the OpenDNS APIToken. This is the token provided you by CISCO at the time of subscribing for their OpenDNS service. • <OPENDNS-APITOKEN> – Provide the OpenDNS API token (should be a valid token). For every valid OpenDNS API token provided a device_id is returned. Apply this device_id to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the device_id in the WLAN context, see opendns on page 554.

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

opendns	Fetches the device_id from the OpenDNS site using the OpenDNS credentials
username <USERNAME>	Configures the OpenDNS user name. This is your OpenDNS email ID provided by CISCO at the time of subscribing for their OpenDNS service. • <USERNAME> – Provide the OpenDNS user name (should be a valid OpenDNS username).
password <OPENDNS-PSWD>	Configures the password associated with the user name specified in the previous step • <OPENDNS-PSWD> – Provide the OpenDNS password (should be a valid OpenDNS password).
label <LABEL>	Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal. • <LABEL> – Specify your network label. For every set of user name, password, and label passed only one unique device_id is returned. Apply this device_id to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the device_id in the WLAN context, see opendns on page 554.

Usage Guidelines

Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

Example

```
ap7161-E6D512>opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7161-E6D512>

nx9600-7F3C7F>opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073 device_id =
001480fe36dcb245
nx9600-7F3C7F>
```

Example: Enabling OpenDNS Support

The following example shows how to enable OpenDNS support:

1 Fetch the OpenDNS device_id from the OpenDNS site.

a In the User/Privilege executable mode execute one of the following commands:

```
nx9500-6C8809#opendns APIToken <OPENDNS-APITOKEN>
nx9500-6C8809#opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073
device_id = 001480fe36dcb245#
```

OR

```
nx9500-6C8809#opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

Note

The *OpenDNS API token* and/or *user account credentials* are provided the OpenDNS service provider when subscribing for the OpenDNS service.

b Apply the device_id fetched in the step 1 to the WLAN.

```
nx9500-6C8809(config-wlan-opendns)#opendns device-id <OPENDNS-DEVICE-ID>
nx9500-6C8809(config-wlan-opendns)#opendns device-id 001480fe36dcb245
nx9500-6C8809(config-wlan-opendns)#show context
wlan opendns
 ssid opendns
 bridging-mode local
 encryption-type none
 authentication-type none
 opendns device-id 001480fe36dcb245
nx9500-6C8809(config-wlan-opendns)#
```

Note
Once applied, DNS queries originating from wireless clients associating with the WLAN are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet.

2 Configure a DHCP server policy, and set the DHCP pool's DNS server configuration to point to the OpenDNS servers.

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#dns-server 208.67.222.222
```

Note
You can configure any one of the following OpenDNS servers: 208.67.222.222 OR 208.67.222.220

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#show context
 dhcp-pool opendnsPool
  dns-server  208.67.222.222
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#
```

3 Apply the DHCP server policy configured in step 2 on the access point, controller, or service platform.

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#use dhcp-server-policy opendns
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context include-factory | include
use
 use profile default-nx9000
 use rf-domain TechPubs
 use database-policy default
 use nsight-policy noc
 use dhcp-server-policy opendns
 use auto-provisioning-policy TechPubs
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

Note
When configured, DNS queries are forwarded by the access point, controller, or service platform to the specified OpenDNS resolver.

4 Configure an IP Access Control List with the following permit and deny rules:

```
nx9500-6C8809(config-ip-acl-OpenDNS)#permit udp any host 208.67.222.222 eq dns rule-
precedence 1 rule-description "allow dns queries only to OpenDNS"
nx9500-6C8809(config-ip-acl-OpenDNS)#deny udp any any eq dns rule-precedence 10 rule-
description "block all DNS queries"
nx9500-6C8809(config-ip-acl-OpenDNS)#permit ip any any rule-precedence 100 rule-
description "allow all other ip packets"
nx9500-6C8809(config-ip-acl-OpenDNS)#show context
ip access-list OpenDNS
permit udp any host 208.67.222.222 eq dns rule-precedence 1 rule-description "allow
```

```
dns queries only to OpenDNS"
deny udp any any eq dns rule-precedence 10 rule-description "block all dns queries"
permit ip any any rule-precedence 100 rule-description "allow all other ip packets"
nx9500-6C8809(config-ip-acl-OpenDNS)#
```

Note
When configured and applied in the WLAN context, the IP ACL prevents wireless clients from adding their own DNS servers to bypass the Web filtering and network policies enforced by OpenDNS.

5 Apply the IP ACL configured in step 4 in the WLAN context.

```
nx9500-6C8809(config-wlan-opendns)#use ip-access-list out OpenDNS
nx9500-6C8809(config-wlan-opendns)#show context
wlan opendns
 ssid opendns
 vlan 1
 bridging-mode local
 encryption-type none
 authentication-type none
 use ip-access-list in OpenDNS
 use ip-access-list out OpenDNS
 opendns device-id 0014AADF8EDC6C59
nx9500-6C8809(config-wlan-opendns)#
```

Note
When applied to the WLAN, only the DNS queries directed to the OpenDNS server are forwarded. All other DNS queries are dropped.

page

Toggles a device's paging function. Enabling this option displays the CLI command output page by page, instead of running the entire output at once.

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
page
```

Parameters

None

Examples

```
nx9500-6C8809#page
nx9500-6C8809#
```

Related Commands

no on page 90	Disables paging
no on page 160	Disables paging

ping

Sends ICMP *(Internet Controller Message Protocol)* echo messages to a user-specified location

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|
source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

Parameters

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|
source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

<IP/HOSTNAME>	Specify the destination IP address or hostname. When entered without any parameters, this command prompts for an IP address or a hostname.
count <1-10000>	Optional. Sets the pings to the specified destination • <1-10000> – Specify a value from 1 - 10000. The default is 5.
dont-fragment {count|size}	Optional. Sets the don't fragment bit in the ping packet. Packets with the dont-fragment bit specified are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified MTU *(maximum transmission unit)* value, an error message is sent from the device trying to fragment it. • count <1-10000> – Optional. Sets the pings to the specified destination from 1 - 10000. The default is 5. • size <1-64000> – Optional. Sets the ping payload size from 1 - 64000 bytes. The default is 100 bytes.

size <1-64000>	Optional. Sets the ping payload size in bytes • <1-64000> – Specify the ping payload size from 1 - 64000. The default is 100 bytes.
source [<IP>|pppoe| vlan <1-4094>| wwan]	Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination. • <IP> – Specifies the source IP address • pppoe – Selects the PPP over Ethernet interface • vlan <1-4094> – Selects the VLAN interface from 1 - 4094 • wwan – Selects the wireless WAN interface

Examples

```
NOC-NX9500>ping 10.234.160.13
PING 10.234.160.13 (10.234.160.13) 100(128) bytes of data.
108 bytes from 10.234.160.13: icmp_seq=1 ttl=64 time=3.61 ms
108 bytes from 10.234.160.13: icmp_seq=2 ttl=64 time=0.177 ms

NOC-NX9500>
```

ping6

Sends ICMPv6 echo messages to a user-specified IPv6 address

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}
```

Parameters

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}
```

<IPv6/HOSTNAME>	Specify the destination IPv6 address or hostname.
<INTF-NAME>	Specify the interface name for link local/broadcast address
count <1-10000>	Optional. Sets the pings to the specified IPv6 destination • <1-10000> – Specify a value from 1 - 10000. The default is 5.
size <1-64000>	Optional. Sets the IPv6 ping payload size in bytes • <1-64000> – Specify the ping payload size from 1 - 64000. The default is 100 bytes.

Usage Guidelines

To configure a device's IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address <IPv6-ADDRESS>` command. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information, see ipv6 on page 1175 (profile config mode).

Examples

```
nx9500-6C8809(config-device-00-23-68-1B-35-96-if-ge4)#show ipv6 interface brief
--------------------------------------------------------------------------------
INTERFACE   IPV6 MODE   IPV6-ADDRESS/MASK               TYPE          STATUS   PROTOCOL

rtt min/avg/max/mdev = 0.299/0.318/0.401/0.031 ms
nx9500-6C8809>
```

ssh

Opens a SSH *(Secure Shell)* connection between two network devices

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

Parameters

```
ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

<IP/HOSTNAME>	Specify the remote system's IP address or hostname.
<USERNAME>	Specify the name of the user requesting SSH connection with the remote system.
<INF-NAME/ LINK-LOCAL-ADD>	Optional. Specify the interface's name or link local address.

Example

```
ap505-13403B#ssh 10.234.160.5 admin
admin@10.234.160.5's password:
nx9500-6C8809>
```

telnet

Opens a Telnet session between two network devices

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

Parameters

```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

<IP/HOSTNAME>	Configures the destination remote system's IP (IPv4 or IPv6) address or hostname. The Telnet session is established between the connecting system and the remote system. • <IP/HOSTNAME> – Specify the remote system's IPv4 or IPv6 address or hostname.
<TCP-PORT>	Optional. Specify the *Transmission Control Protocol* (TCP) port number.
<INTF-NAME>	Optional. Specify the interface name for the link local address.

Examples

```
nx9500-6C8809#telnet 10.234.160.36

Entering character mode
Escape character is '^]'.

AP505 release 7.1.0.0-114D
ap505-13403B login:
```

terminal

Sets the length and width of the CLI display window on a terminal

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
terminal [length|width] <0-512>
```

Parameters

```
terminal [length|width] <0-512>
```

length <0-512>	Sets the number of lines displayed on a terminal window • <0-512> – Specify a value from 0 - 512.
width <0-512>	Sets the width (the number of characters displayed) of the terminal window • <0-512> – Specify a value from 0 - 512.

Examples

```
ap505-13403B#show terminal
Terminal Type: xterm
Length: 0     Width: 80
ap505-13403B#
ap505-13403B#terminal length 30
ap505-13403B#terminal width 100
ap505-13403B#show terminal
Terminal Type: xterm
Length: 30     Width: 100
ap505-13403B#
```

Related Commands

no on page 90	Resets the width or length of the terminal window
no on page 160	Resets the width or length of the terminal window

time-it

Verifies the time taken by a particular command between request and response

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
time-it <COMMAND>
```

Parameters

```
time-it <COMMAND>
```

time-it <COMMAND>	Verifies the time taken by a particular command to execute and provide a result • <COMMAND> – Specify the command.

Examples

```
ap505-13403B#time-it config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
That took 0.00 seconds..
ap505-13403B(config)#
```

traceroute

Traces the route to a defined destination

Use '--help' or '-h' to display a complete list of parameters for the traceroute command

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
traceroute <LINE>
```

Parameters

```
traceroute <LINE>
```

traceroute <LINE>	Traces the route to a destination IP address or hostname • <LINE> – Specify the destination IPv4 address or hostname.

Examples

```
NOC-NX9500#traceroute 10.234.160.11
traceroute to 10.234.160.11 (10.234.160.11), 30 hops max, 46 byte packets
 1  10.234.160.11 (10.234.160.11)  8.115 ms  0.410 ms  0.370 ms
NOC-NX9500#
```

traceroute6

Traces the route to a specified IPv6 destination

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
traceroute6 <LINE>
```

Parameters

```
traceroute6 <LINE>
```

traceroute6 <LINE>	Traces the route to a destination IPv6 address or hostname • <LINE> – Specify the destination IPv6 address or hostname.

Examples

```
nx9500-6C88097#traceroute6 2001:10:10:10:10:10:10:2
traceroute to 2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2) from
2001:10:10:10:10:10:10:1, 30 hops max, 16 byte packets
 1  2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2)  0.622 ms  0.497 ms  0.531 ms
nx9500-6C8809#
```

virtual-machine

Installs, configures, and monitors the status of *virtual machines*

Note
This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]
virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}
virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}
virtual-machine install [<VM-NAME>|team-urc|team-rls|team-vowlan]
virtual-machine restart [<VM-NAME>|hard|team-urc|team-rls|team-vowlan]
virtual-machine set [autostart|memory|vcpus|vif-count|vif-mac|vif-to-vmif|vnc]
virtual-machine set [autostart [ignore|start]|memory <512-8192>|vcpus <1-4>|vif-count
<0-2>|
vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|vnc [disable|
enable]]
[<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

The following virtual-machine commands are supported only on the VX9000 platform:

```
virtual-machine volume-group [add-drive|replace-drive|resize-drive|resize-volume-group]
virtual-machine volume-group [add-drive|replace-drive] <BLOCK-DEVICE-LABEL>
virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABLE> <NEW-BLOCK-DEVICE-LABEL>
virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>
```

Parameters

```
virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}
```

assign-usb-ports team-vowlan	Assigns USB ports to TEAM-VoWLAN on a specified device • on <DEVICE-NAME> – Optional. Specify the device name. **Note:** Use the `no > virtual-machine > assign-usb-ports` command to reassign the port to WiNG. **Note:** TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

```
virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}
```

virtual-machine export	Exports an existing VM image and settings. Use this command to export the VM to another device in the same domain.
	• <VM-NAME> – Specify the VM name.
	  • <FILE> – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location.
	  • <URL> – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path:
	  tftp://<hostname|IP>[:port]/path/file
	  ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
	  sftp://<user>:<passwd>@<hostname|IP>[:port]>/path/file
	  http://<hostname|IP>[:port]/path/file
	• on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
	  • <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
	
	Note: The VM should be in a stop state during the export process.
	
	Note: If the destination is a device, the image is copied to a predefined location (VM archive).

```
virtual-machine install [<VM-NAME>|team-centro|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine install	Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. • <VM-NAME> – Specify the VM name. • team-centro – Installs the VM TEAM-Centro image • team-rls – Installs the VM TEAM-RLS image • team-vowlan – Installs the VM TEAM-VoWLAN image Specify the device on which to install the VM. • on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices • <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

```
virtual-machine set [autostart [ignore|start]|memory <512-8192>|vcpus <1-4>|vif-count
<0-2>|
vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|vnc [disable|
enable]]
[<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine set	Configures the VM settings
	• autostart – Specifies whether to autostart the VM on system reboot
	  • ignore – Enables autostart on each system reboot
	  • start – Disables autostart
	• memory – Defines the VM memory size
	  • <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
	• vcpus – Specifies the number of VCPUS for this VM
	  • <1-4> – Specify the number of VCPUS from 1- 4.
	• vif-count – Configures or resets the VM's VIFs
	  • <0-2> – Specify the VIF number from 0 - 2.
	• vif-mac – Configures the MAC address of the selected virtual network interface
	  • <1-2> – Select the VIF
	  <1-8> – Specify the MAC index for the selected VIF
	  <MAC> – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.
	
	Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the 'set' keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM's interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the vif-to-vmif command to map a VIF to a VMIF on the DP bridge.
	• vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8.
	
	WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.
	By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.
	• vnc – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
	  • disable – Disables VNC port
	  • enable – Enables VNC port
	
	  After configuring the VM settings, identify the VM to apply the settings.
	• <VM-NAME> – Applies these settings to the VM identified by the <VM-NAME> keyword. Specify the VM name.
	• team-urc – Applies these settings to the VM TEAM-URC

	• team-rls – Applies these settings to the VM TEAM-RLS • team-vowlan – Applies these settings to the VM TEAM-VoWLAN

```
virtual-machine start [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine start	Starts the VM, based on the parameters passed. Select one of the following options: • <VM-NAME> – Starts the VM identified by the <VM-NAME> keyword. Specify the VM name. • team-urc – Starts the VM TEAM-URC • team-rls – Starts the VM TEAM-RLS • team-vowlan – Starts the VM TEAM-VoWLAN The following keywords are common to all of the above parameters: • on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices • <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

```
virtual-machine stop [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine stop hard	Stops the VM, based on the parameters passed. Select one of the following options: • <VM-NAME> – Stops the VM identified by the <VM-NAME> keyword. Specify the VM name. • team-urc – Stops the VM TEAM-URC • team-rls – Stops the VM TEAM-RLS team-vowlan – Stops the VM TEAM-VoWLAN The following keywords are common to all of the above parameters: • on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas. Note: The option ‘hard’ forces the selected VM to shutdown. Note: The option ‘hard’ forces the selected VM to shutdown.

```
virtual-machine uninstall [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine uninstall	Uninstalls the specified VM • <VM-NAME> – Uninstalls the VM identified by the <VM-NAME> keyword. Specify the VM name. • team-urc – Uninstalls the VM TEAM-URC • team-rls – Uninstalls the VM TEAM-RLS team-vowlan – Stops the VM TEAM-VoWLAN The following keywords are common to all of the above parameters: • on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas. **Note:** This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

```
virtual-machine volume-group [add-drive|resize-drive] <BLOCK-DEVICE-LABEL>
```

virtual-machine volume-group [add-drive|resize-drive] <BLOCK-DEVICE-LABEL>]	Enables provisioning of logical volume-groups on the VX9000 platform. Logical volume-groups are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives. However, volume-groups can be provisioned only on new VX9000 installation and cannot be added to existing VX9000 installation. • add-drive – Adds a new block-device to the VM. Note, currently a maximum of 3 (three) block devices can be added. To add a new drive, first halt the VM, In the Hypervisor, add a new storage disk to the VM and restart the VM. Once the VM comes up, use this command to add the new drive. To identify the new drive execute the `show > virtual-machine > volume-group > status` command. • resize-drive - Resizes a drive in the VM's volume group. To increase the size of a drive in the volume-group, first halt the VM. In the Hypervisor, increase the size of the existing secondary storage drive and restart the VM. Once the VM comes up, use this command to resize the drive. To identify the drive with the additional free space, execute the `show > virtual-machine > volume-group > status` command. The following keyword is common to all of the above parameters: • <BLOCK-DEVICE-LABEL> –Specify the block-device label to be added or resized depending on the action being performed.

```
virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABEL> <NEW-BLOCK-DEVICE-LABEL>
```

virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABEL> <NEW-BLOCK-DEVICE-LABEL>]	Enables provisioning of VMs as logical volume-groups on the VX9000 platform. Logical volume-group VMs are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives. • replace-drive – Replaces an existing block-device with a new block-device in a volume-group. To replace a drive in the volume-group, first halt the VM. In the Hypervisor, add the new drive and restart the VM. Once the VM comes up, use this command to replace an existing drive with the new drive. To identify the drive with the additional free space, execute the `show > virtual-machine > volume-group > status` command • <BLOCK-DEVICE-LABEL> –Specify the block-device label to be replaced. <BLOCK-DEVICE-LABEL> – Specify the replacement block-device label.

```
virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>
```

virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>	Enables provisioning of VMs as logical volume-groups on the VX9000 platform. Logical volume-group VMs are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives • resize-volume-group – Adds drive space to an existing block-device in the volume-group • <BLOCK-DEVICE-LABEL> –Specify the block-device label to which additional drive space is to be provided

Examples

```
The following examples show the VM installation process:
```

Insatllation media: USB

```
<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/
win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

Installation media: pre-installed disk image

```
<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/
win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable  on <DEVICE-NAME>

In the preceding example, the command is executed on the device identified by the <DEVICE-
NAME> keyword. In such a scenario, the disk-size is ignored if specified. The VM has the
install media as first boot device.
```

Installation media: VM archive

```
<DEVICE>#virtual-machine install type vm-archive install-media flash:/vms/<VM-NAME> vcpus
3

In the preceding example, the default configuration attached with the VM archive
overrides any parameters specified.
```

Exporting an installed VM:

```
<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
In the preceding example, the command copies the VM archive on to the URL (VM should be
in stop state).
<DEVICE>>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
<DEVICE>>
VX-DE6F97>cirtual-machine add-drive sdb
VX-DE6F97>show virtual-machine volume-group status
----------------------------------------
Logical Volume: lv1
----------------------------------------
 STATUS           : available

VX-DE6F97>
```

watch

Repeats the specified CLI command at periodic intervals

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
watch <1-3600> <LINE>
```

Parameters

```
watch <1-3600> <LINE>
```

watch	Repeats a CLI command at a specified interval (in seconds)
<1-3600>	Select an interval from 1 - 3600 sec. Pressing CTRL-Z halts execution of the command.
<LINE>	Specify the CLI command.

Examples

In the following example, the controller pings the specified IP address once in every 40 seconds.

```
NOC-NX9500>watch 40 ping 10.234.160.13
PING 10.234.160.13 (10.234.160.13) 100(128) bytes of data.
108 bytes from 10.234.160.13: icmp_seq=1 ttl=64 time=0.257 ms
108 bytes from 10.234.160.13: icmp_seq=2 ttl=64 time=0.176 ms
108 bytes from 10.234.160.13: icmp_seq=3 ttl=64 time=0.170 ms
```

```
108 bytes from 10.234.160.13: icmp_seq=4 ttl=64 time=0.170 ms
108 bytes from 10.234.160.13: icmp_seq=5 ttl=64 time=0.169 ms

--- 10.234.160.13 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3998ms
rtt min/avg/max/mdev = 0.169/0.188/0.257/0.036 ms
PING 10.234.160.13 (10.234.160.13) 100(128) bytes of data.
108 bytes from 10.234.160.13: icmp_seq=1 ttl=64 time=0.251 ms
108 bytes from 10.234.160.13: icmp_seq=2 ttl=64 time=0.174 ms
108 bytes from 10.234.160.13: icmp_seq=3 ttl=64 time=0.154 ms
108 bytes from 10.234.160.13: icmp_seq=4 ttl=64 time=0.170 ms
108 bytes from 10.234.160.13: icmp_seq=5 ttl=64 time=0.169 ms

--More--
NOC-NX9500>
```

exit

Ends the current CLI session and closes the session window

For more information, see exit.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
exit
```

Parameters

```
None
```

Examples

```
nx9500-6C8809>exit
```

4 Privileged Exec Mode Commands

privileged-exec-commands

Most PRIV EXEC commands set operating parameters. Privileged-level access should be password protected to prevent unauthorized use. The PRIV EXEC command set includes commands contained within the USER EXEC mode. The PRIV EXEC mode also provides access to configuration modes, and includes advanced testing commands.

Note
To password-protect the Privilege mode, in the Management Policy, configure the privilege-mode-password. For more information, see privilege-mode-password on page 1534.

The PRIV EXEC mode prompt consists of the hostname of the device followed by a pound sign (#).

To access the PRIV EXEC mode, enter the following at the prompt:

```
<DEVICE>>enable
<DEVICE>#
```

The PRIV EXEC mode is often referred to as the enable mode, because the enable command is used to enter the mode.

There is no provision to configure a password to get direct access to PRIV EXEC (enable) mode.

```
<DEVICE>#?
Privileged command commands:
  <DEVICE>#?
Privileged command commands:
  archive                      Manage archive files
  boot                         Boot commands
  captive-portal-page-upload   Captive portal internal and advanced page upload
  cd                           Change current directory
  change-passwd                Change password
  clear                        Clear
  clock                        Configure software system clock
  cluster                      Cluster commands
  commit                       Commit all changes made in this session
  configure                    Enter configuration mode
  connect                      Open a console connection to a remote device
  copy                         Copy contents of one dir to another
  cpe                          T5 CPE configuration
  create-cluster               Create a cluster
  crypto                       Encryption related commands
  crypto-cmp-cert-update       Update the cmp certs
  database                     Database
  database-backup              Backup database
  database-restore             Restore database
  debug                        Debugging functions
  delete                       Deletes specified file from the system
  device-upgrade               Device firmware upgrade
  diff                         Display differences between two files
  dir                          List files on a filesystem
  disable                      Turn off privileged mode command
```

```
  edit                          Edit a text file
  enable                        Turn on privileged mode command
  erase                         Erase a filesystem
  ex3500                        EX3500 commands
  factory-reset                 Delete startup configuration on device(s),
                                reload the device(s) and remove configuration
                                entry from the controller
  file-sync                     File sync between controller and adoptees
  format                        Format file system
  halt                          Halt the system
  help                          Description of the interactive help system
  join-cluster                  Join the cluster
  l2tpv3                        L2tpv3 protocol
  logging                       Modify message logging facilities
  mint                          MiNT protocol
  mkdir                         Create a directory
  more                          Display the contents of a file
  no                            Negate a command or set its defaults
  on                            On RF-Domain
  opendns                       Opendns username/password configuration
  operational-mode              Change personality on next reload
  page                          Toggle paging
  ping                          Send ICMP echo messages
  ping6                         Send ICMPv6 echo messages
  pwd                           Display current directory
  raid                          RAID operations
  re-elect                      Perform re-election
  reload                        Halt and perform a warm reboot
  remote-debug                  Troubleshoot remote system(s)
  rename                        Rename a file
  revert                        Revert changes
  rmdir                         Delete a directory
  self                          Config context of the device currently logged
                                into
  service                       Service Commands
  show                          Show running system information
  ssh                           Open an ssh connection
  t5                            T5 commands
  telnet                        Open a telnet connection
  terminal                      Set terminal line parameters
  time-it                       Check how long a particular command took between
                                request and completion of response
  traceroute                    Trace route to destination
  traceroute6                   Trace route to destination(IPv6)
  upgrade                       Upgrade software image
  upgrade-abort                 Abort an ongoing upgrade
  virtual-machine               Virtual Machine
  watch                         Repeat the specific CLI command at a periodic
                                interval
  write                         Write running configuration to memory or
                                terminal

  clrscr                        Clears the display screen
  exit                          Exit from the CLI

<DEVICE>
```

privileged-exec-commands

The following table summarizes the PRIV EXEC configuration mode commands:

Table 5: Privileged Exec Commands

Command	Description
archive on page 115	Manages file archive operations
boot on page 117	Specifies the boot partition as primary or secondary. The device boots using the image stored in the specified partition.
captive-portal-page-upload on page 33	Uploads captive portal advanced pages to adopted access points
cd on page 118	Changes the current directory
change-password on page 36	Changes the password of the currently logged-in user
clear on page 37	Clears parameters, cache entries, table entries, and other similar entries
clock on page 51	Configures the system clock
cluster on page 52	Initiates a cluster context
configure on page 119	Enters the global configuration mode
commit on page 53	Commits changes made in the active session.
connect on page 53	Begins a console connection to a remote device
copy on page 120	Clears parameters, cache entries, table entries, and other similar entries
cpe on page 120	Enables adopted T5 CPE *(Customer Premises Equipment)* device(s) management. Use this command to perform the following operations on the CPEs: boot, reload, upgrade. This command is specific to the RFS 4000, NX 95XX, and NX 96XX devices.
create-cluster on page 64	Creates a new cluster on a specified device
crypto on page 54	Enables encryption
crypto-cmp-cert-update on page 65	Triggers a CMP certificate update on a specified device or devices
database on page 66	Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)
database-backup on page 70	Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server
database-restore on page 71	Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database.
delete on page 122	Deletes a specified file from the system
device-upgrade on page 72	Configures device firmware upgrade parameters
diff on page 123	Displays the differences between two files
dir on page 124	Displays the list of files on a file system
disable on page 125	Disables the privileged mode command set
edit on page 125	Edits a text file
erase on page 126	Erases a file system
ex3500 on page 129	Enables the EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP related configurations.

Table 5: Privileged Exec Commands (continued)

Command	Description
factory-reset on page 136	Erases startup configuration on a specified device or all devices within a specified RF Domain Note: Use this command to revert an AP505 and AP510 model access points personality flag to 'unknown'.
file-sync on page 78	Configures parameters enabling syncing of PKCS#12 and wireless-bridge certificate between the staging-controller and adopted access points
help on page 81	Describes the interactive help system.
halt on page 141	Halts a device (access point, wireless controller, or service platform)
join-cluster on page 84	Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices
l2tpv3 on page 85	Establishes or brings down L2TPV3 tunnels
logging on page 87	Modifies message logging parameters
mint on page 88	Configures MiNT settings
mkdir on page 142	Creates a new directory in the file system
more on page 142	Displays the contents of a file
no on page 160	Negates a command or sets its default
on on page 91	Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show
opendns on page 91	Connects to the OpenDNS site using OpenDNS registered credentials (username, password) OR OpenDNS API token to fetch the OpenDNS device_id. This command is a part of the process integrating access points, controllers, and service platforms with OpenDNS.
operational-mode on page 143	Resets a standalone AP's mode of operation from 'distributed' to 'centralized'. Note: This command is only applicable on AP505, AP510 and AP560 model access points.
page on page 95	Toggles a device's (access point, wireless controller, or service platform) paging function
ping on page 96	Sends ICMP echo messages to a user-specified location
ping6 on page 97	Sends ICMPv6 echo messages to a user-specified location
pwd on page 144	Displays the current directory
re-elect on page 145	Re-elects the tunnel controller (wireless controller, service platform, or access point)
reload on page 145	Halts a device (wireless controller, service platform, or access point) and performs a warm reboot
rename on page 151	Renames a file in the existing file system
rmdir on page 152	Deletes an existing file from the file system
self on page 153	Displays the configuration context of the device

Table 5: Privileged Exec Commands (continued)

Command	Description
ssh on page 98	Connects to another device using a secure shell
t5 on page 153	Executes the following operations on a T5 device: copy, rename, delete, and write. This command is specific to the NX95XX and NX96XX devices.
telnet on page 99	Opens a Telnet session
terminal on page 100	Sets the length and width of the terminal window
telnet on page 99	Verifies the time taken by a particular command between request and response
time-it on page 101	Verifies the time taken by a particular command between request and response
traceroute on page 101	Traces the route to a defined IPv4 destination
traceroute6 on page 102	Traces the route to a defined IPv6 destination
upgrade on page 155	Upgrades the software image
upgrade-abort on page 158	Aborts an ongoing software image upgrade
exit on page 110	Ends the current CLI session and closes the session window
watch on page 109	Repeats the specific CLI command at a periodic interval
virtual-machine on page 103	Installs, configures, and monitors the status of VMs. This command is specific to the NX95XX and NX96XX series service platforms.
raid on page 159	Enables RAID management. This command is specific to the NX95XX and NX96XX series service platforms.

Note
For information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Common Commands on page 616.

Note
The input parameter <HOSTNAME>, if used in syntaxes across this chapter, cannot include an underscore (_) character.

archive

Manages file archive operations

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
archive tar /table [<FILE>|<URL>]
archive tar /create [<FILE>|<URL>] <FILE>
archive tar /xtract [<FILE>|<URL>] <DIR>
```

Parameters

```
archive tar /table [<FILE>|<URL>]
```

tar	Manipulates (creates, lists, or extracts) a tar file
/table	Lists the files in a tar file
<FILE>	Defines a tar filename
<URL>	Sets the tar file URL

```
archive tar /create [<FILE>|<URL>] <FILE>
```

tar	Manipulates (creates, lists or extracts) a tar file
/create	Creates a tar file
<FILE>	Defines tar filename
<URL>	Sets the tar file URL

```
archive tar /xtract [<FILE>|<URL>] <DIR>
```

tar	Manipulates (creates, lists or extracts) a tar file
/xtract	Extracts content from a tar file
<FILE>	Defines tar filename
<URL>	Sets the tar file URL
<DIR>	Specify a directory name. When used with /create, dir is the source directory for the tar file. When used with /xtract, dir is the destination file where contents of the tar file are extracted.

Examples

Following examples show how to zip the folder flash:/log/?

```
nx9500-6C8809#dir flash:/
Directory of flash:/

nx9500-6C8809#
```

boot

Changes the next boot partition or image on a specified device or on the logged device. The WiNG devices have two partitions: primary and secondary, with each partition containing an image of the operating system. Whenever the device boots up it loads the image from the partition specified here.

The partition currently in control of the boot process is the active partition, the other partition is the inactive partition with the alternate image. Use this command to manually change the next boot partition or image.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
boot system [active|inactive|primary|secondary] {on <DEVICE-NAME>}
```

Parameters

```
boot system [active|inactive|primary|secondary] {on <DEVICE-NAME>}
```

system [active|inactive|primary|secondary]	Specifies the image used by the device to boot up • active – Changes the next boot image to the current, running (active) image • inactive – Changes the next boot image to the current, inactive image • primary – Changes the next boot partition to the primary partition. • secondary – Changes the next boot partition to the secondary partition. Note: You will need to reload the device in order for the change to take effect.
on <DEVICE-NAME>	Optional. Changes the next boot image or partition on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. Note: If no device is specified, the logged device's next boot-up configuration is changed.

Examples

```
ap505-13403B#show boot

ap505-13403B#
```

cd

Changes the current directory

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
cd {<DIR>}
```

Parameters

```
cd {<DIR>}
```

<DIR>	Optional. Changes the current directory to the directory identified by the <DIR> keyword. If a directory name is not provided, the system displays the current directory.

Examples

```
ap505-13403B#cd flash:/log/
ap505-13403B#pwd
flash:/log/
ap505-13403B#
```

configure

Enters the configuration mode. Use this command to enter the current device's configuration mode, or enable configuration from the terminal.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
configure {self|terminal}
```

Parameters

```
configure {self|terminal}
```

self	Optional. Enables the logged-in device's configuration mode
terminal	Optional. Enables configuration from the terminal

Examples

```
ap505-13403B#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
ap505-13403B(config)#
nx9500-6C8809#configure self
Enter configuration commands, one per line.  End with CNTL/Z.
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

copy

Copies a file (config,log,txt...etc) from any location to the Access Point, wireless controller, or service platform and vice-versa

Note

Copying a new config file to an existing running-config file merges it with the existing running-config file on the wireless controller. Both the existing running-config and the new config file are applied as the current running-config. Copying a new config file to a start-up config file replaces the existing start-up config file with the parameters of the new file. It is recommended that you erase the existing start-up config file and then copy the new config file to the startup config.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]
```

Parameters

```
copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]
```

<SOURCE-FILE>	Specify the source file to copy.
<SOURCE-URL>	Specify the source file's location (URL).
<DESTINATION-FILE>	Specify the destination file to copy to.
<DESTINATION-URL>	Specify the destination file's location (URL).

Examples

Transferring file snmpd.log to remote TFTP server.

```
ap505-13403B#c#copy flash:/log/upgrade.log tftp://10.233.89.183:/upgrade.log
Accessing running-config file from remote TFTP server into switch running-config.
ap505-13403B#c#copy tftp://10.233.89.183:/running-config running-config
```

cpe

Enables a WiNG controller to perform certain operations on CPEs *(Customer Premises Equipments)* through an adopted T5 controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL *(Digital Subscriber Line)* as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
cpe [boot|reload|upgrade]
cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}
cpe [reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```

Note

These commands can also be executed on the T5 profile and device context. For more information, see #unique_122.

Parameters

```
cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}
```

cpe boot system	Changes the image used by a CPE to boot. When reloading, the CPE uses the specified image.
cpe [<1-24>|all]	Identifies the CPE(s) on which this change is implemented • <1-24> – Reloads only those CPEs whose IDs have been specified. Specify the ID from 1 - 24. • all – Reloads all CPEs
[primary|secondary]	Select the next boot image • primary – Uses the primary image when reloading • secondary – Uses the secondary image when reloading
on <T5-DEVICE-NAME>	Optional. Performs this operation on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname.

```
cpe [reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```

cpe [reload| upgrade <IMAGE-LOCATION>]	Performs the following operations on CPEs • reload – Reloads the device • upgrade <IMAGE-LOCATION> – Upgrades the device • <IMAGE-LOCATION> – Specify the location of the firmware image. Both IPv4 and IPv6 addresses are supported. Use one of the following options to provide the location: IPv4 URLs: • tftp://<hostname|IP>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file • sftp://<user>:<passwd>@<hostname|IP>[:port]>/path/file • http://<hostname|IP>[:port]/path/file cf:/path/file usb<n>:/path/file IPv6 URLs: • tftp://<hostname|[IPv6]>[:port]/path/file • ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file • sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]>/path/file • http://<hostname|[IPv6]>[:port]/path/file **Note:** After specifying the operation to perform, identify the device(s).
cpe [<1-24>|all]	Identifies the CPE(s) on which the operation is performed • <1-24> – Configures the CPE's ID from 1 - 24 • all – Configures all CPEs
on <T5-DEVICE-NAME>	Optional. Performs this operation on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname.

Example

```
nx9500-6C8809#show t5 cpe boot on t5-ED7C6C

delete

Deletes a specified file from the device's file system

Syntax

```
delete [/force <FILE>|/recursive <FILE>|<FILE>]
```

Parameters

```
delete [/force <FILE>|/recursive <FILE>|<FILE>]
```

/force	Forces deletion without a prompt
/recursive	Performs a recursive delete
<FILE>	Specifies the file name • Deletes the file specified by the <FILE> parameter

Examples

```
nx9500-6C8809#delete flash:/out.tar flash:/out.tar.gz
Delete flash:/out.tar [y/n]? y
Delete flash:/out.tar.gz [y/n]? y
nx9500-6C8809

[y/n]? n
Delete flash:/backup//imish_1087_18381X.core.gz
[y/n]? n
nx9500-6C8809
```

diff

Displays the differences between two files on a device's file system or a particular URL

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
diff [<FILE>|<URL>] [<FILE>|<URL>]
```

Parameters

```
diff [<FILE>|<URL>] [<FILE>|<URL>]
```

<FILE>	The first <FILE> is the source file for the diff command. The second <FILE> is used for comparison.
<URL>	The first <URL> is the source file's URL. The second <URL> is the second file's URL.

Examples

```
ap505-13403B#diff startup-config running-config
--- startup-config
```

```

dir

Lists files on a device's file system

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dir {/all|/recursive|<DIR>|all-filesystems}
```

Parameters

```
dir {/all|/recursive|<DIR>|all-filesystems}
```

/all	Optional. Lists all files
/recursive	Optional. Lists files recursively
<DIR>	Optional. Lists files in the named file path
all-filesystems	Optional. Lists files on all file systems

Examples

```
nx9500-6C8809#dir flash:/
Directory of flash:/

--More--
nx9500-6C8809#
```

disable

Turns off (disables) the privileged mode command set. This command returns to the User Executable mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
disable
```

Parameters

None

Examples

```
nx9500-6C8809#disable
nx9500-6C8809>
ap505-13403B#disable
ap505-13403B>
```

edit

Edits a text file on the device's file system

ap505-13403B#dis ap505-13403B>

Syntax

```
edit <FILE>
```

Parameters

```
edit <FILE>
```

<FILE>	Specify the name of the file to modify.

Examples

```
ap505-13403B#edit startup-config
  GNU nano 1.2.4               File: startup-config

erase

Erases a device's (wireless controller, Access Point, and service platform) file system. Erases the content of the specified storage device. Also erases the startup configuration to restore the device to its default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
erase [flash:|nvram:|startup-config|usb1:|usb2:|usb3:|usb4:]
erase [flash:|nvram:|usb1:|usb2:|usb3:|usb4:]
erase startup-config {<HOSTNAME/MAC>|on <DOMAIN-NAME> {containing <SUB-STRING>|exclude-
controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}}
```

Parameters

```
erase [flash:|nvram:|usb1:|usb2:|usb3:|usb4:]
```

flash:	Erases everything in the device's flash: file
nvram:	Erases everything in the device's nvram: file
startup-config	Erases the device's startup configuration file. The startup configuration file is used to configure the device when it reboots.
usb1:	Erases everything in the device's usb1: file
usb2:	Erases everything in the device's usb2: file
usb3:	Erases everything in the device's usb3: file
usb4:	Erases everything in the device's usb4: file

```
erase startup-config {<HOSTNAME/MAC>|on <DOMAIN-NAME> {containing <SUB-STRING>|
exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}}
```

startup-config:	Erases the startup configuration file on a specified device or devices in a specified RF Domain. The specified device(s) are reloaded after the startup configuration file is erased. Use the **<HOSTNAME/MAC>** or **on <DOMAIN-NAME>** options to identify the device or RF Domain respectively. Once executed, the configuration file, for the targeted device or for all device(s) in the targeted RF Domain, is also erased from the adopting controller's configuration file. They are automatically reloaded once the startup configuration file has been erased.
<HOSTNAME/MAC>	Optional. Erases the startup configuration file on the device identified by the <HOSTNAME/MAC> keyword. Specify the device's hostname or MAC address.
on <DOMAIN-NAME> {containing <SUB-STRING>| exclude-controllers| exclude-rf-domain-manager| filter <DEVICE-TYPE>}	Optional. Erases the startup configuration file on all devices or specified device(s) in a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are: • containing <SUB-STRING> – Optional. Executes the command on all devices containing a specified sub-string in their hostname <SUB-STRING> – Specify the sub-string to match. The startup configuration file is erased on all devices whose hostname contains the sub-string specified here. • exclude-controllers – Optional. Executes the command on all devices excluding controllers. The startup configuration file is erased on all devices except controllers. • exclude-rf-domain-manager – Optional. Executes the command on all devices excluding RF Domain managers. The startup configuration file is erased on all devices except RF Domain managers. • filter <DEVICE-TYPE> – Optional. Executes the command on all devices of a specified type. <DEVICE-TYPE> – Specify the device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP-7522, AP 7532, AP 7562, AP 7602, AP-7612, AP 7622, AP7632, AP7662, AP-8163, AP-8432, AP-8533, RFS 4000, NX 5500, NX 7500, NX 95XX, NX 96XX, and VX. The startup configuration file is erased on all devices of the type specified here. For example, if AP7602 is the device-type specified, the startup configuration file on all AP7602, within the RF Domain, is erased.

Examples

```
nx9500-6C8809#erase ?
  cf:             Erase everything in cf:
  flash:          Erase everything in flash:
  nvram:          Erase everything in nvram:
  startup-config  Reset configuration to factory default
  usb1:           Erase everything in usb1:
  usb2:           Erase everything in usb2:
nx9500-6C8809#
```

ex3500

Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP-related configurations.

The copy keyword provides multiple copy options. It allows you to upload or download code images or configuration files between the switch's flash memory and an FTP/TFTP server. When you save the system code or configuration settings to a file on an FTP/TFTP server, that file can later be downloaded to the switch to restore system operation. The success of the file transfer depends on the accessibility of the FTP/TFTP server and the quality of the network connection.

Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
ex3500 [adoptd|boot|copy|delete|ip]
ex3500 adoptd upgrade <URL> on <EX3500-DEVICE-NAME>
ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [file|ftp|running-config|startup-config|tftp|unit]
ex3500 copy [file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>]
ex3500 copy [ftp|tftp] [add-to-running-config|file|https-certificate|public-key|running-config|startup-config]
ex3500 copy [ftp|tftp] add-to-running-config <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> <SOURCE-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [ftp|tftp] file <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [ftp|tftp] https-certificate <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> <SOURCE-CERT-FILE-NAME> <SOURCE-PVT-KEY-FILE-NAME> <PVT-PASS-WORD> on <EX3500-DEVICE-NAME>
ex3500 copy [ftp|tftp] public-key <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1|2] <SOURCE-PUB-KEY-FILE-NAME> <USER-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [ftp|tftp] [running-config|startup-config] <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> <SOURCE-CONFIG-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy running-config [file <DEST-FILE-NAME>|ftp <FTP-SERVER-IP> <USER-NAME> <PASSWORD> <DEST-FILE-NAME>|startup-config|tftp <TFTP-SERVER-IP> <DEST-FILE-NAME>] on <EX3500-DEVICE-NAME>
ex3500 copy startup-config [file <DEST-FILE-NAME>|ftp <FTP-SERVER-IP> <USER-NAME> <PASSWORD> <DEST-FILE-NAME>|running-config|tftp <TFTP-SERVER-IP> <DEST-FILE-NAME>] on <EX3500-DEVICE-NAME>
ex3500 copy unit file <1-1> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 delete [file|public-key]
ex3500 delete file [name <FILE-NAME>|unit <1-1> name <FILE-NAME>] on <EX3500-DEVICE-NAME>
ex3500 delete public-key <USER-NAME> [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh [crypto|save]
ex3500 ip ssh crypto host-key generates [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh crypto zeroize [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh save host-key on <EX3500-DEVICE-NAME>
```

Parameters

```
ex3500 adoptd upgrade <URL> on <EX3500-DEVICE-NAME>
```

ex3500 adoptd upgrade	Upgrades an adopted EX3500 switch After an upgrade, reboot the EX3500 switch to initiate the new image. Note: To view an EX3500's current image version, use the `show > version > on <EX3500-DEVICE-NAME>` command.
<URL>	Specifies the location and image file name in the following format: tftp://<IP>[/path]/file
on <EX3500-DEVICE-NAME>	Executes the command on a specified EX3500 switch • <EX3500-DEVICE-NAME> – Specify the EX3500 switch's hostname.

```
ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>
```

ex3500 boot system	Boots a EX3500 switch using a specified configuration file
<1-1>	Identifies the EX3500 unit by its ID number. Specify the EX3500 ID from 1 - 1. Note: As of now only one (1) EX3500 unit can be managed through a NOC controller.
(config|opcode) <FILE-NAME>	The following keywords are recursive: Specifies the image file to use for booting. The options are: • config – Uses the configuration file to boot the switch • opcode – Uses the opcode *(Operation Code)*, which is the runtime code, to boot the switch. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device. The following parameter is common to the 'config' and opcode' keywords: • <FILE-NAME> – Specify the configuration/runtime-code file name.
on <EX3500-DEVICE-NAME>	Reloads a specified EX3500 switch • <EX3500-DEVICE-NAME> – Specify the EX3500 switch's hostname. You can also specify its MAC address.

```
ex3500 copy file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>
```

ex3500 copy	Copies a configuration file to another file
file file <SOURCE-FILE-NAME> <DEST-FILE-NAME>	Copies a specified file (this is the source configuration file) • file – Copies the specified source file to a specified file (this is the destination configuration file) • <SOURCE-FILE-NAME> – Specify the source configuration file's name <DEST-FILE-NAME> – Specify the destination configuration file's name. When specifying the destination file name, keep in mind the following points: - It should not contain slashes (\ or /), - It should not exceed 32 characters for files on the switch, or 127 characters for files on the server.
on <EX3500-DEVICE-NAME>	Copies the file to a specified EX3500 switch • <EX3500-DEVICE-NAME> – Specify the EX3500 switch's hostname. The specified source file is copied to specified destination file on the EX3500 identified here.

```
ex3500 copy [ftp|tftp] add-to-running-config <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>
<SOURCE-FILE-NAME> on <EX3500-DEVICE-NAME>
```

ex3500 copy [ftp|tftp]	Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc. This command also allows you to add a remote system's running configuration to the current system configuration.
add-to-running-config	Adds a remote system's running configuration to the current system
<FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>	Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server. • <FTP/TFTP-SERVER-IP> – Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> – If using a FTP server, specify the FTP server's user name (should be an authorized user) <PASSWORD> – Specify the password applicable for the above specified FTP server user name.
<SOURCE-FILE-NAME>	After specifying the server details, specify the name of the running configuration file. • <SOURCE-FILE-NAME> – Specify the source file's name.
on <EX3500-DEVICE-NAME>	Copies the file to a specified EX3500 switch • <EX3500-DEVICE-NAME> – Specify the EX3500 switch's hostname. The specified source file is copied to specified destination file on the EX3500 identified here.

```
ex3500 copy [ftp|tftp] file <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1|2] <SOURCE-
FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>
```

ex3500 copy [ftp|tftp]	Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.
file	Copies to a specified file system
<FTP/TFTP-SERVER-IP> <USER-NAME> <PASS-WORD>	Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server. • <FTP/TFTP-SERVER-IP> – Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> – If using a FTP server, specify the FTP server's user name (should be an authorized user) <PASSWORD> – Specify the password applicable for the above specified FTP server user name.
[1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME>	After specifying the server details, select the file type and specify the name of the source and destination file names. • [1|2] – Select the file type from 1 - 2. • 1 – Copies the EX3500 configuration file. • 2 – Copies the opcode, which is the runtime code. The opcode is like an operating system that enables the EX3500 software to communicate with the EX3500 device. <SOURCE-FILE-NAME> – Specify the source file's name. <DEST-FILE-NAME> – Specify the destination file's name.
on <EX3500-DEVICE-NAME>	Copies the file to a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname. The specified source file is copied to specified destination file on the EX3500 identified here.

```
ex3500 copy [ftp|tftp] https-certificate <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>
<SOURCE-CERT-FILE-NAME> <SOURCE-PVT-KEY-FILE-NAME> <PVT-PASS-WORD> on <EX3500-DEVICE-NAME>
```

ex3500 copy [ftp|tftp]	Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.
https-certificate	Copies HTTPS secure site certificate from the FTP or TFTP server to the switch
<FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>	Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server. • <FTP/TFTP-SERVER-IP> – Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> – If using a FTP server, specify the FTP server's user name (should be an authorized user) <PASSWORD> – Specify the password applicable for the above specified FTP server user name.

<SOURCE-CERT-FILE-NAME> <SOURCE-PVT-KEY-FILE-NAME> <PVT-PASS-WORD>	After identifying the FTP or TFTP server, specify the following: • <SOURCE-CERT-FILE-NAME> – Specify the source HTTPS secure site certificate file name. • <SOURCE-PVT-KEY-FILE-NAME> – Specify the source private-key file name. <PVT-PASS-WORD> – Specify the private password.
on <EX3500-DEVICE-NAME>	Copies the file to a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

```
ex3500 copy [ftp|tftp] public-key <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1|2]
<SOURCE-PUB-KEY-FILE-NAME> <USER-NAME> on <EX3500-DEVICE-NAME>
```

ex3500 copy [ftp|tftp]	Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.
public-key	Copies the SSH public key from the FTP or TFTP server to the switch
<FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>	Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server. • <FTP/TFTP-SERVER-IP> – Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> – If using a FTP server, specify the FTP server's user name (should be an authorized user) <PASSWORD> – Specify the password applicable for the above specified FTP server user name.
[1|2] <SOURCE-PUB-KEY-FILE-NAME> <USER-NAME>	After identifying the FTP or TFTP server, specify the following: • [1|2] – Configures the SSH public key type as RS or DSA • 1 – Configures the public key type as RSA • 2 – Configures the public key type as DSA <SOURCE-PUB-KEY-FILE-NAME> – Specifies the source public key file name <USER-NAME> – Specifies the public key's user name
on <EX3500-DEVICE-NAME>	Copies the public key to a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

```
ex3500 copy [ftp|tftp] [running-config|startup-config] <FTP/TFTP-SERVER-IP> <USER-NAME>
<PASSWORD> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>
```

ex3500 copy [ftp|tftp]	Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.
[running-config| startup-config]	Copies the running or startup configuration file to one of the following destinations: file system, FTP server, or TFTP server The running configuration file can be copied to the startup configuration file and vice versa.

<FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>	If copying to a FTP/TFTP server, configure the following parameters: • <FTP/TFTP-SERVER-IP> – Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> – If using a FTP server, specify the FTP server's user name (should be an authorized user) <PASSWORD> – Specify the password applicable for the above specified FTP server user name.
<DEST-FILE-NAME>	Configures the destination file name. The running or startup configuration file is copied to the specified destination file. • <DEST-FILE-NAME> – Specify the destination file name. You can also copy the running configuration file to the startup configuration file and vice versa.
on <EX3500-DEVICE-NAME>	Copies the running or startup configuration file on to a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

```
ex3500 copy unit file <1-1> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>
```

ex3500 copy unit	Copies from a EX3500 switch
file <1-1> [1|2]	Copies the file system from the EX3500 switch identified by the unit number • <1-1> – Specify the unit number from 1 - 1. • [1|2] – Select the file type from 1 - 2. 1 – Copies the selected unit's configuration file. • 2 – Copies the selected unit's opcode, which is the runtime code. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device.
<SOURCE-FILE-NAME>	Configures the source file name • <SOURCE-FILE-NAME> – Specify the source file name. You can copy the running configuration file to the startup configuration file and vice versa.
<DEST-FILE-NAME>	Configures the destination file name. The running or startup configuration file is copied to the specified file. • <DEST-FILE-NAME> – Specify the destination file name. You can copy the running configuration file to the startup configuration file and vice versa.
on <EX3500-DEVICE-NAME>	Copies the running or startup configuration file on to a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

```
ex3500 delete file [name <FILE-NAME>|unit <1-1> name <FILE-NAME>] on <EX3500-DEVICE-NAME>
```

ex3500 delete file	Deletes a file or image on a specified EX3500 device
name <FILE-NAME>	Specifies the file to delete. The specified file is deleted. • <FILE-NAME> – Specify the file name.

unit <1-1> name <FILE-NAME>	Identifies the unit in the stackable system on which the file is located • <1-1> – Select the unit from 1 - 1. • name – After identifying the unit, specify the file to delete. The specified file is deleted. <FILE-NAME> – Specify the file name.
on <EX3500-DEVICE-NAME>	Executes the command on a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

```
ex3500 delete public-key <USER-NAME> [dsa|rsa] on <EX3500-DEVICE-NAME>
```

ex3500 delete public-key <USER-NAME> [dsa|rsa]	Deletes a specified user's public key • <USER-NAME> – Specify the SSH user's name. • dsa – Deletes the specified user's DSA (version 2) key • rsa – Deletes the specified user's RSA (version 1) key
on <EX3500-DEVICE-NAME>	Executes the command on a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

```
ex3500 ip ssh crypto host-key generates [dsa|rsa] on <EX3500-DEVICE-NAME>
```

ex3500 ip ssh crypto host-key generates [dsa|rsa]	Generates the host-key pair (public and private). This host key is used by the SSH server to negotiate a session key and encryption method with the client trying to connect to it. • dsa – Generates DSA (version 2) key type • rsa – Generates RSA (version 1) key type Note: The RSA Version 1 is used only for SSHv1.5 clients, whereas DSA Version 2 is used only for SSHv2 clients. Note: This generated host-key pair is stored in the volatile memory (i.e RAM). To save the host-key pair in the flash memory, use the `ex3500 > ip > ssh > save > host-key` command.
on <EX3500-DEVICE-NAME>	Executes the command on a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

```
ex3500 ip ssh zeroize [dsa|rsa] <EX3500-DEVICE-NAME>
```

ex3500 ip ssh zeroize [dsa|rsa]	Removes the host-key (DSA and RSA) from the volatile memory (i.e. RAM)
on <EX3500-DEVICE-NAME>	Executes the command on a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

```
ex3500 ip ssh save host-key on <EX3500-DEVICE-NAME>
```

ex3500 ip ssh save host-key	Saves the host-key (DSA and RSA) to the flash memory
on <EX3500-DEVICE-NAME>	Executes the command on a specified EX3500 device • <EX3500-DEVICE-NAME> – Specify the EX3500 device's hostname.

Usage Guidelines

When using the ex3500 command and its parameters, keep in mind the following:

- Destination file names should not:
  - Contain slashes (\ or /),
  - Exceed 32 characters for files on the switch, or 127 characters for files on the server.
- The FTP server's default user name is set as "anonymous".
- The Boot ROM and Loader cannot be uploaded or downloaded from the FTP/TFTP server. Follow instructions provided in the release notes for new firmware, or contact your distributor for help.
- The "Factory_Default_Configure" can be used as the source to copy from, but cannot be used as the destination.
- Although the switch supports only two operation code files, the maximum number of user-defined configuration files supported is 16.

Example

```
nx9500-6C8809#ex3500 adopted upgrade tftp://192.168.0.99/ex3500-adopted-5.8.5.0.img on
ex3524-ED5EAC
Flash programming started
Flash programming completed
Successful
nx9500-6C8809#
nx9500-6C8809#ex3500 copy tftp file 10.2.0.100 1 m360.bix m360.bix on ex3524-ED5EAC
\Write to FLASH Programming.
-Write to FLASH finish.
Success.
nx9500-6C8809#
nx9500-6C8809#ex3500 copy tftp startup-config 10.2.0.99 startup.01 startup on ex3524-
ED5EAC
TFTP server ip address: 10.1.0.99
Flash programming started.
Flash programming completed.
Success.
nx9500-6C8809#
```

factory-reset

Erases startup configuration on a specified device or all devices based on the parameters passed.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
factory-reset [config-all|config-device-only|deep|on <RF-DOMAIN-NAME>]
factory-reset [config-all|config-device-only] [<HOSTNAME/MAC> {<HOSTNAME/MAC>}|
on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|
exclude-rf-domain-manager|filter <DEVICE-TYPE>}]
factory-reset deep <AP-HOSTNAME>
factory-reset on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|
exclude-rf-domain-manager|filter <DEVICE-TYPE>}
```

Parameters

```
factory-reset [config-all|config-device-only] [<HOSTNAME/MAC> {<HOSTNAME/MAC>}|
on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|
exclude-rf-domain-manager|filter <DEVICE-TYPE>}]
```

[config-all| config-device-only]	Erases startup configuration and reloads only controller-adopted devices. • config-all – Erases startup configuration on all adopted devices or on specified adopted devices. Issue the command on the controller or virtual controller AP. To execute the command on a specified device, provide the device hostname/MAC address. Note: This option also removes the device's configuration staged on the adopting controller. • config-device-only – Erases only the startup configuration on all adopted devices or on specified adopted devices. Issue the command on the controller or virtual controller AP. To execute the command on a specified device, provide the device hostname/MAC address. Note: This option only erases the startup configuration. It does not remove the device's configuration staged on the adopting controller. Note: For more information on the actions performed by this command, click here.
<HOSTNAME/MAC> {<HOSTNAME/MAC>}	This parameter is common to the 'config-all' and 'config-device-only' keywords: • <HOSTNAME/MAC> – Erases startup configuration and reloads the device identified by the <HOSTNAME/MAC> keyword. Specify the device's hostname or MAC address. • <HOSTNAME/MAC> – Optional. You can optionally specify multiple space-separated devices.
on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>	The following parameters are common to the 'config-all' and 'config-device-only' keywords: • on <RF-DOMAIN-NAME> – Erases startup configuration and reloads all devices or specified device(s) within a specified RF Domain • <RF-DOMAIN-NAME> – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are: containing <SUB-STRING> – Optional. Executes the command on all devices containing a specified sub-string in their hostname <SUB-STRING> – Specify the sub-string to match. exclude-controllers – Optional. Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller. exclude-rf-domain-manager – Optional. Executes the command on all devices excluding RF Domain managers. Use this option when executing the command on the NOC, Site controller, or RF Domain manager. filter <DEVICE-TYPE> – Optional. Executes the command on all devices of a specified type

	<DEVICE-TYPE> – Specify the device type. The options are: AP510, AP505.

```
factory-reset deep <AP-HOSTNAME>
```

deep	Resets an adopted AP's mode of operation to factory-default setting (that is not specified). Issue the command on the adopting WiNG VC/Controller and specify the AP' hostname. Once the AP's mode of operation is reverted to factory-default setting, the AP reboots and moves into the discovery mode to determine its mode of operation. The WiNG 7.1 AP505 and AP510 model access points have the capability of operating in the following two modes: **Distributed** and **Centralized**. For a newly-manufactured, out-of-the-box AP505 and AP510 access point the mode of operation is not specified. Note: For more information on operational modes and how it is set, see Dual Mode Capability.
<AP-HOSTNAME>	Specify the hostname of the AP on which the deep reset is to be implemented.

```
factory-reset on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|
exclude-rf-domain-manager|filter <DEVICE-TYPE>}
```

factory-reset	Erases startup configuration and reloads device(s) based on the parameters passed Note: For more information on the actions performed by this command, click here.
on <RF-DOMAIN-NAME> {containing <SUB-STRING>| exclude-controllers| exclude-rf-domain-manager| filter <DEVICE-TYPE>]}	Erases startup configuration and reloads all devices or specified device(s) within a specified RF Domain identified by the <RF-DOMAIN-NAME> keyword • <RF-DOMAIN-NAME> – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are: • containing <SUB-STRING> – Optional. Executes the command on all devices containing a specified sub-string in their hostname <SUB-STRING> – Specify the sub-string to match. • exclude-controllers – Optional. Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller. • exclude-rf-domain-manager – Optional. Executes the command on all devices excluding RF Domain managers. Use this option when executing the command on the NOC, site controller, or RF Domain manager. • filter <DEVICE-TYPE> – Optional. Executes the command on all devices of a specified type <DEVICE-TYPE> – Specify the device type. The options are: AP510, AP505, RFS4000, NX5500, NX7500, NX9500, NX9600, and VX9000. The startup configuration is erased on all devices of the type specified here. For example, if AP510 is the device-type specified, the command is executed on all AP510s within the specified RF Domain.

Usage Guidelines (Actions performed by the factory-reset command)

The action taken by this command depends on the parameters passed.

- For the **`factory-reset [<DEVICE-NAME>|on <RF-DOMAIN-NAME>]`** options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.
  - Erases the device configuration entries from the controller's configuration for the target device (or) for all the devices in the target RF Domain.
  - Reloads the target device (or) all devices in the target RF Domain.
- For the **`factory-reset config-all [<DEVICE-NAME>|on <RF-DOMAIN-NAME>]`** options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.
  - Erases the device configuration entries from the controller's configuration for the target device (or) for all the devices in the target RF Domain.
- For the **`factory-reset config-device-only [<DEVICE-NAME>|on <RF-DOMAIN-NAME>]`** options, the command:

- Erases startup configuration on the target device (or) all devices in the target RF Domain.

Example

```
nx9500-6C8809#factory-reset config-device-only ap505-134038
In progress ....
Erased startup-config - success 1 fail 0
Successful device deletion - total 1
nx9500-6C8809#
nx9500-6C8809#factory-reset deep ap505-13403B
In progress ....
reset ap deep - success 1 fail 0
Successful device deletion - total 1
nx9500-6C8809#
```

halt

Stops (halts) a device (Access Point, wireless controller, or service platform). Once halted, the system must be restarted manually.

This command stops the device immediately. No indications or notifications are provided while the device shuts down.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
halt force {on <DEVICE-NAME>}
```

Parameters

```
halt force {on <DEVICE-NAME>}
```

halt	Halts a device
force	Optional. Forces a device to halt ignoring in-progress operations, such as firmware upgrades, downloads, unsaved configuration changes, etc.
	The following keywords are recursive and applicable to the 'force' parameter: • on <DEVICE-NAME> – Optional. Specifies the name of the device to be halted • <DEVICE-NAME> – Enter the name of the AP, wireless controller, or service platform. **Note:** If the device name is not specified, the logged device is halted.

Example

```
nx9500-6C8809#halt on rfs4000-229D58
nx9500-6C8809#
```

mkdir

Creates a new directory in the file system

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
mkdir <DIR>
```

Parameters

```
mkdir <DIR>
```

<DIR>	Specify a directory name. **Note:** A directory, specified by the <DIR> parameter, is created within the file system.

Examples

```
nx9500-6C8809#dir
Directory of flash:/.

  drwx             Thu Sep 27 07:10:45 2018   tmptpd

nx9500-6C8809#
```

more

Displays files on the device's file system. This command navigates and displays specific files in the device's file system.

The more command also displays the startup configuration file.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
more <FILE>
```

Parameters

```
more <FILE>
```

<FILE>	Specify the file name and location. Provide the complete path to the file.

Examples

```
ap505-13403B#more flash:/archived_logs/startup.2.log
00-09-44-01-01-19
Jan 01 00:09:44 2019: %KERN-6-INFO: [    0.000000] Booting Linux on physical CPU 0x0.

--More--
ap505-13403B#
```

operational-mode

Resets a WiNG standalone AP's mode of operation from 'distributed' or 'centralized'.

The WiNG 7.1 AP505 and AP510 model access points have the capability of operating in the following two modes: **`Distributed`** and **`Centralized`**. For a newly-manufactured, out-of-the-box AP505 and AP510 access point the mode of operation is not specified.

Note
For more information on the dual modes of operation, see Dual Mode Capability.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Syntax

```
operational-mode centralized
```

Parameters

```
operational-mode centralized
```

operational-mode centralized	Resets the WiNG standalone AP's mode of operation to: • centralized - In the *Centralized* mode ExtremeWireless AP models AP505i and AP510i adopt to the ExtremeCloud Appliance. A Centralized site topology allows seamless roaming within one geographic location. For more information, please refer to the ExtremeCloud Appliance User Guide available at https://extremenetworks.com/documentation. **Note:** After issuing the command, reload the AP for the change to take effect.

Examples

```
ap505-134038#operational-mode centralized
ap505-134038#reload
The system will be rebooted, do you want to continue? (y/n): y
ap505-134038#
```

pwd

Displays the full path of the present working directory, similar to the UNIX pwd command

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
pwd
```

Parameters

```
None
```

Examples

```
ap505-13403B#pwd
flash:/
ap505-13403B#
ap505-13403B#dir
Directory of flash:/.

ap505-13403B#
```

re-elect

Re-elects the tunnel controller (wireless controller or service platform)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

Parameters

```
re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

re-elect tunnel-controller	Re-elects the tunnel controller
<WORD> {on <DEVICE-NAME>}	Optional. Re-elects the tunnel controller on all devices whose preferred tunnel controller name matches <WORD> • on <DEVICE-NAME> – Optional. Re-elects the tunnel controller on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Example

```
rfs4000-229D58#re-elect tunnel-controller
OK
rfs4000-229D58#
```

reload

Halts a device or devices and performs a warm reboot

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
reload {<DEVICE-MAC-OR-HOSTNAME>|at|cancel|force|in|on|staggered}
reload {(<DEVICE-MAC-OR-HOSTNAME>)}
reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}
reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}
reload {force} {(<DEVICE-MAC-OR-HOSTNAME>|on <DOMAIN-NAME>|staggered)}
reload {force} {on <DOMAIN-NAME> {staggered}|staggered {<DEVICE-MAC-OR-HOSTNAME>|
on <DOMAIN-NAME>}} {containing <WORD>|exclude-controllers|exclude-rf-domain-manager|
filter <DEVICE-TYPE>}
reload {in <1-999>} {list|on}
reload {in <1-999>} {list {<LINE>|all}|on <DEVICE-OR-DOMAIN-NAME>}
reload {in <1-999>} {on <DEVICE-OR-DOMAIN-NAME>}
reload {on <DOMAIN-NAME>} {containing <WORD>|exclude-controllers|
exclude-rf-domain-manager|filter <DEVICE-TYPE>}
reload {staggered} {(<DEVICE-MAC-OR-HOSTNAME>)|on <DOMAIN-NAME>} {containing <WORD>|
exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}
```

Parameters

```
reload {on <DEVICE-OR-DOMAIN-NAME>}
```

reload <DEVICE-MAC-OR-HOSTNAME>	Initiates device(s) reload and configures associated parameters The following keyword is recursive and allows you to specify multiple devices: • <DEVICE-MAC-OR-HOSTNAME> – Optional. Reloads a specified device(s), identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. **Note:** If no device is specified, the system reloads the logged device.

```
reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}
```

reload at	Initiates device(s) reload and configures associated parameters • at – Optional. Schedules a reload at a specified time and day. Use the following keywords to specify the time and day: <TIME>, <1-31>, <MONTH>, and <1993-2035>.
<TIME>	Specifies the time in the HH:MM:SS format
<1-31>	Specifies the day of the month from 1 - 31
<MONTH>	Specifies the month from Jan - Dec
<1993-2035>	Specifies the year from 1993 - 2035. It should be a valid 4 digit year.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Performs reload at the scheduled time, on a specified device or all devices within a specified RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. When a RF Domain name is provided, all devices within the specified RF Domain are reloaded at the scheduled time. If no device is specified, the reload is scheduled on the logged device.

```
reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}
```

reload cancel on <DEVICE-OR-DOMAIN-NAME>	Cancels pending/scheduled reloads of device(s) cancel – Optional. Cancels all pending reloads • on <DEVICE-OR-DOMAIN-NAME> – Optional. Cancels reloads pending on a specified device or all devices within a specified RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. Note: If no device is specified, the system cancels reloads pending on the logged device.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Reloads on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
reload {force} {(<DEVICE-MAC-OR-HOSTNAME>)}
```

reload force	Initiates device(s) reload and configures associated parameters • force – Optional. Forces device(s) to reload, while ignoring conditions like upgrade in progress, unsaved changes, etc. Use the options provided to force a reload on a specified device or all devices in a RF Domain.
<DEVICE-MAC-OR-HOSTNAME>	This keyword is recursive and allows you to specify multiple devices. • <DEVICE-MAC-OR-HOSTNAME> – Optional. Forces a reload on a specified device identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. When executed, the specified device(s) are forced to halt and a warm reboot is performed. Note: If no device is specified, the system forcefully reloads the logged device.

```
reload {force} {on <DOMAIN-NAME> {staggered}|staggered {<DEVICE-MAC-OR-HOSTNAME>|on
<DOMAIN-NAME>}}
{containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}
```

reload force	Initiates device(s) reload and configures associated parameters • force – Optional. Forces device(s) to reload, while ignoring conditions like upgrade in progress, unsaved changes, etc. Use the options provided to force a reload on a specified device or all devices in a RF Domain.
on <DOMAIN-NAME> staggered	Optional. Forces a reload on all devices in a RF Domain • <DOMAIN-NAME> – Optional. Specify the name of the RF Domain. When executed, all devices within the specified RF Domain are forced to halt and a warm reboot is performed. • staggered – Optional. Enables staggered reload of devices (one at a time) without network impact. Use this option when rebooting multiple devices within an RF Domain. When executed, all devices within the specified RF Domain are forced to halt and reboot in a staggered manner.

staggered {<DEVICE-MAC-OR-HOSTNAME>| on <DOMAIN-NAME>}	Optional. Enables staggered reload of devices (one at a time) without network impact • <DEVICE-MAC-OR-HOSTNAME> – Optional. Forces a reload on specified device(s) identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. This is a recursive keyword that allows you to specify multiple devices. When executed, the specified device(s) are forced to halt and a warm reboot is performed. • on <DOMAIN-NAME> – Optional. Forces a reload on all devices in a RF Domain. Specify the name of the RF Domain. When executed, all devices within the specified RF Domain are forced to halt and a warm reboot is performed. Note: If no device or RF Domain is specified, the system forcefully reloads the logged device.

{containing <WORD>| exclude-controllers exclude-rf-domain-manager| filter <DEVICE-TYPE>}	When forcefully reloading devices in a RF Domain, you can use following options to filter specific devices or device types:
	• containing <WORD> – Optional. Filters out devices containing a specified sub-string in their hostnames
	  • <WORD> – Optional. Provide the sub-string to match. All devices having hostnames containing the provided sub-string are filtered and forcefully reloaded.
	• exclude-controllers – Optional. Excludes all controllers in the specified RF Domain from the reload process
	• exclude-rf-domain-manager – Optional. Excludes the RF Domain manager from the reload process
	• filter <DEVICE-TYPE> – Optional. Filters devices by the device type specified. Select the type of device. All devices, of the specified type, within the specified RF Domain, are forcefully reloaded.
	  • <DEVICE-TYPE> – Select the type of device to reload. The options are: AP505, AP510, AP560, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533, NX5500, NX75XX, NX9000, NX9600, VX9000.

```
reload {in <1-999>} {list {<LINE>|all}|on <DEVICE-OR-DOMAIN-NAME>}
```

reload in <1-999>	Initiates device(s) reload and configures associated parameters • in – Optional. Performs a reload after a specified time period • <1-999> – Specify the time from 1 - 999 minutes
list {<LINE>|all}	Optional. Reloads all adopted devices or specified devices • <LINE> – Optional. Reloads listed devices. List all devices (to be reloaded) separated by a space. • all – Optional. Reloads all devices adopted by this controller
on <DEVICE-OR-DOMAIN-NAME>	Optional. Reloads a specified device or all devices within a specified RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
reload {on <DOMAIN-NAME>} {containing <WORD>|exclude-controllers|
exclude-rf-domain-manager|filter <DEVICE-TYPE>}
```

reload on <DOMAIN-NAME>	Initiates device(s) reload and configures associated parameters
	• on <DOMAIN-NAME> – Optional. Enables reload of all devices in a RF Domain
	  • <DOMAIN-NAME> – Specify the name of the RF Domain. When executed, all devices within the specified RF Domain are immediately halted and a warm reboot is performed.
	
	  Note: If no RF Domain is specified, the system reloads the logged device.

{containing <WORD>| exclude-controllers| exclude-rf-domain-manager| filter <DEVICE-TYPE>}	When reloading devices in a RF Domain, you can use following options to filter specific devices or device types:
	• containing <WORD> – Optional. Filters out devices containing a specified sub-string in their hostnames.
	  • <WORD> – Optional. Provide the sub-string to match. All devices having hostnames containing the provided sub-string are filtered and forcefully reloaded.
	• exclude-controllers – Optional. Excludes all controllers in the specified RF Domain from the reload process
	• exclude-rf-domain-manager – Optional. Excludes the RF Domain manager from the reload process
	• filter <DEVICE-TYPE> – Optional. Filters devices by the device type specified. Select the type of device to reload. All devices, of the specified type, within the specified RF Domain, are forcefully reloaded.
	  • <DEVICE-TYPE> – Select the type of device to reload. The options are: AP505, AP510, AP560, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533, NX5500, NX75XX, NX9000, NX9600, VX9000.

```
reload {staggered} {(<DEVICE-MAC-OR-HOSTNAME>)|on <DOMAIN-NAME>} {containing <WORD>|
exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}
```

reload staggered	Initiates device(s) reload and configures associated parameters • staggered – Optional. Enables staggered reload of devices (one at a time) without network impact
{<DEVICE-MAC-OR-HOSTNAME>| on <DOMAIN-NAME>}	Use one of the following options to specify a single device, multiple devices, or a RF Domain • <DEVICE-MAC-OR-HOSTNAME> – Optional. Performs staggered reload on specified device(s) identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. This is a recursive keyword that allows you to specify multiple devices. When executed, the specified device(s) are halted and a warm reboot is performed. Multiple devices are halted and rebooted one at a time without impacting network functioning. • <DOMAIN-NAME> – Optional. Performs staggered reload of all devices in a RF Domain. Specify the name of the RF Domain. When executed, devices in the specified RF Domain are halted and rebooted one at a time without impacting network functioning. Use additional filter options to filter devices in the specified RF Domain. Note: If no device or RF Domain is specified, the system reloads the logged device.
{containing <WORD>| exclude-controllers| exclude-rf-domain-manager| filter <DEVICE-TYPE>}	When reloading devices in a RF Domain, you can use following options to filter specific devices or device types: • containing <WORD> – Optional. Filters out devices containing a specified sub-string in their hostnames. • <WORD> – Optional. Provide the sub-string to match. All devices having hostnames containing the provided sub-string are filtered and reloaded. • exclude-controllers – Optional. Excludes all controllers in the specified RF Domain from the reload process • exclude-rf-domain-manager – Optional. Excludes the RF Domain manager from the reload process • filter <DEVICE-TYPE> – Optional. Filters devices by the device type specified. Select the type of device. All devices, of the specified type, within the specified RF Domain, are reloaded. <DEVICE-TYPE> – Select the type of device to reload. The options are: AP505, AP510, AP560, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533, NX5500, NX75XX, NX9000, NX9600, VX9000.

ap510-133B38#
```

rename

Renames a file in the devices' file system

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
rename <OLD-FILE-NAME> <NEW-FILE-NAME>
```

Parameters

```
rename <OLD-FILE-NAME> <NEW-FILE-NAME>
```

<OLD-FILE-NAME>	Specify the file to rename.
<NEW-FILE-NAME>	Specify the new file name.

Examples

```
rfs4000-229D58#dir

rmdir

Deletes an existing directory from the file system (only empty directories can be removed)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
rmdir <DIR>
```

Parameters

```
rmdir <DIR>
```

rmdir <DIR>	Specifies the directory name **Note:** The directory, specified by the <DIR> parameter, is removed from the file system.

Examples

```
nx9500-6C8809#dir
Directory of flash:/.

  drwx             Wed Sep 14 13:54:10 2016   log

self

Enters the logged device's configuration context

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
self
```

Parameters

None

Examples

```
nx9500-6C8809#self
Enter configuration commands, one per line.  End with CNTL/Z.
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

t5

Executes following operations on a T5 device through the WiNG controller:

- copy, rename, and delete files on the T5 device's file system
- write running configuration to the T5 device's memory

The T5 switch is a means of providing cost-effective, high-speed, wall-to-wall coverage across a building. The T5 switch leverages the in-building telephone lines to extend Ethernet and Wireless LAN networks without additional expenditure on re-wiring. This setup is ideally suited for hotels, providing high-speed Wi-Fi coverage to guest rooms.

The entire setup consists of the DSL T5 switch, TW-510 Ethernet wallplates, and TW-511 wireless wallplate access points. Replace the phone jack plate in a room with the TW-511 delivers 802.11 a/b/g/n and extend wireless connectivity in that room and the neighboring rooms. These TW-511 wallplates (also referred to as the CPEs) are connected to the T5 switch over the DSL interface using a phone block.

The T5 switch is adopted and managed through a WiNG controller. The connection between the T5 and WiNG switches is over a WebSocket.

Note
For more information on other T5 CPE related commands, see cpe on page 120.

Supported in the following platforms:

- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|
rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}
```

Parameters

```
t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|
rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}
```

copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>	Copies file to an external server • <SOURCE-FILE-NAME> – Specify the source file name. • <DEST-FILE-NAME> – Specify the destination file name. The content from the source file is copied to the destination file. The source or destination files can be local or remote FTP or TFTP files. The source file also can be a pre-defined keyword. At least one of the files should be a local file. Use this command to copy the startup and/or running configurations to an external server.
delete <FILE-NAME>	Deletes files on the T5 device's file system • <FILE-NAME> – Specify the file name. The specified file is deleted.
rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>	Renames a file on the T5 device's file system • <SOURCE-FILE-NAME> – Specify the source file name • <DEST-FILE-NAME> – Specify the new file name. The source file is renamed to the input provided here.
write memory	Writes running configuration to an adopted T5 device's memory • memory – Writes running configuration to the T5 device's *non-volatile* (NV) memory.
on <T5-DEVICE-NAME>	Optional. Executes these operation on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname.

Example

```
nx9500-6C8809#t5 write memory on t5-ED7C6C
Success
nx9500-6C8809#
```

upgrade

Upgrades a device's software image

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
upgrade [<FILE>|<URL>|dhcp-vendor-options]
upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>|on <RF-DOMAIN-NAME>}
upgrade dhcp-vendor-options {<DEVICE-NAME>|on <RF-DOMAIN-NAME>}
upgrade dhcp-vendor-options {<DEVICE-NAME>} {<DEVICE-NAME>}
upgrade dhcp-vendor-options {on <RF-DOMAIN-NAME>} {containing <SUB-STRING>|exclude-
controllers|
exclude-rf-domain-managers|filter <DEVICE-TYPE>}
```

Parameters

```
upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>|on <RF-DOMAIN-NAME>}
```

<FILE>	Specify the target firmware image location in one of the following format: cf:/path/file usb1:/path/file usb2:/path/file usb<n>:/path/file

<URL>	Specify the target firmware image location. Use one of the following formats:
	• IPv4 URLS:
	  • tftp://<hostname|IP>[:port]/path/file
	  • ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
	  • sftp://<user>:<passwd>@<hostname|IP>[:port]>/path/file
	  • http://<hostname|IP>[:port]/path/file
	  • cf:/path/file
	  • usb<n>:/path/file
	• IPv6 URLS:
	  • tftp://<hostname|IPv6>[:port]/path/file
	  • ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
	  • sftp://<user>:<passwd>@<hostname|IPv6>[:port]>/path/file
	  • http://<hostname|IPv6>[:port]/path/file

background	Optional. Performs upgrade in the background
on <DEVICE-NAME>	Optional. Upgrades the software image on a specified remote device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
on <RF-DOMAIN-NAME>	Optional. Upgrades the software image on all devices within a specified RF Domain • <RF-DOMAIN-NAME> – Specify the name of the RF Domain.

```
upgrade dhcp-vendor-options {<DEVICE-NAME>} {<DEVICE-NAME>}
```

dhcp-vendor-options	Uses DHCP vendor options to upgrade device(s)
<DEVICE-NAME> {<DEVICE-NAME>}	Optional. Uses DHCP vendor options to upgrade a specified device. Specify the name of the AP, wireless controller, or service platform. • <DEVICE-NAME> – Optional. You can optionally specify multiple comma-separated device names/MAC addresses to upgrade.

```
upgrade dhcp-vendor-options {on <RF-DOMAIN-NAME>} {containing <SUB-STRING>|
exclude-controllers|exclude-rf-domain-managers|filter <DEVICE-TYPE>}
```

dhcp-vendor-options	Uses DHCP vendor options to upgrade device(s)

on <RF-DOMAIN-NAME> {containing <SUB-STRING>| exclude-controllers| exclude-rf-domain-managers| filter <DEVICE-TYPE>}	Optional. Uses DHCP vendor options to upgrade all devices or specified device(s) within the RF Domain identified by the <RF-DOMAIN-NAME> keyword
	• <RF-DOMAIN-NAME> – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, all devices within the RF Domain are upgraded. These filters are:
	  • containing <SUB-STRING> – Optional. Upgrades all devices, within the specified RF Domain, containing a specified sub-string in their hostname
	  <SUB-STRING> – Specify the sub-string to match.
	• exclude-controllers – Optional. Upgrades all devices, within the specified RF Domain, excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller.
	• exclude-rf-domain-manager – Optional. Upgrades all devices, within the specified RF Domain, excluding RF Domain managers. Use this option when executing the command on the NOC, Site controller, or RF Domain manager.
	• filter <DEVICE-TYPE> – Optional. Executes the command on all devices, within the specified RF Domain, of a specified type
	  • <DEVICE-TYPE> – Specify the device type. The options are: AP505, AP510, AP560, NX5500, NX7500, NX9500, NX9600, and VX9000. Upgrades all devices of the type specified here. For example, if AP510 is the device-type specified, all AP510 within the specified RF Domain are upgraded.

Example

```
nx9500-6C8809#upgrade ftp://symbol:symbol@134.141.244.24/NX9500-7.2.0.0-006D.img

Running from partition /dev/sda8
Validating image file header
Removing other partition
Making file system
Extracting files (this may take some
time).....................................................................................
.....................................................................................
.....................................................................................
.........
Control C disabled
Version of firmware update file is 7.2.0.0-006D
Removing unneeded files from flash:/crashinfo directory
Removing unneeded files from flash:/var2/log directory
Creating LILO files
```

```
Running LILO
Successful
nx9500-6C8809#
```

```
nx9500-6C8809#show boot
------------------------------------------------------------------------------------
     IMAGE            BUILD DATE              INSTALL DATE          VERSION

Related Commands

no on page 160	Removes a patch installed on a specified device

upgrade-abort

Aborts an ongoing software image upgrade

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
upgrade-abort {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
upgrade-abort {on <DEVICE-OR-DOMAIN-NAME>}
```

upgrade-abort	Aborts an ongoing software image upgrade
on <DEVICE-OR-DOMAIN-NAME>	Optional. Aborts an ongoing software image upgrade on a specified device or domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

```
rfs4000-229D58#upgrade ftp://anonymous:anonymous@192.168.13.10/LatestBuilds/W59/

raid

Enables RAID *(Redundant Array of Independent Disks)* management. RAID is a group of one or more independent, physical drives, referred to as an array or drive group, These physically independent drives are linked together and appear as a single storage unit or multiple virtual drives. Replacing a single, large drive system with an array, improves performance (input and output processes are faster) and increases fault tolerance within the data storage system.

In an array, the drives can be organized in different ways, resulting in different RAID types. Each RAID type is identified by a number, which determines the RAID level. The common RAID levels are 0, 00, 1, 5, 6, 50 and 60. The WiNG MegaRAID implementation supports RAID-1, which provides data mirroring, but does not support data parity. RAID-1 consists of a two-drive array, where the data is simultaneously written on both drives, ensuring total data redundancy. In case of a drive failure the information on the other drive is used to rebuild the failed drive.

An array is said to be degraded when one of its drives has failed. A degraded array continues to function and can be rebooted using the one remaining functional drive. When a drive fails, the chassis sounds an alarm (if enabled), and the CLI prompt changes to “RAID degraded”. The failed drive is automatically replaced with a hot spare (provided a spare is installed). The spare is used to re-build the array.

Use this command to:

- Verify the current array status
- Start and monitor array consistency checks
- Retrieve date and time of the last consistency check
- Shut down drives before physically removing them
- Install new drives
- Assign drives as hot spares
- Identify a degraded drive
- Deactivate an alarm (triggered when a drive is removed from the array)

Note

The NX 9500 service platform includes a single Intel MegaRAID controller, configured to provide a single virtual drive. This virtual drive is of the RAID-1 type, and has a maximum of two physical drives. In addition to these two drives, there are three hot spares, which are used in case of a primary drive failure.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
raid [check|install|locate|remove|silence|spare]
raid [check|silence]
raid [install|locate|remove|spare] drive <0-4>
```

Parameters

```
raid [check|silence]
```

check	Starts a consistency check on the RAID array. Use the `show > raid` command to view consistency check status. A consistency check verifies the data stored in the array. When regularly executed, it helps protect against data corruption, and ensures data redundancy. Consistency checks also warn of potential disk failures.
silence	Deactivates an alarm **Note:** When enabled, an audible alarm is triggered when a drive in the array fails. The silence command deactivates the alarm (sound). **Note:** To enable RAID alarm, in the device configuration mode, use the `raid > alarm > enable` command. An NX 9500 profile can also have the RAID alarm feature activated. For more information on the enabling RAID alarm, see raid on page 1301.

```
raid [install|locate|remove|spare] drive <0-4>
```

install <0-4>	Includes a new drive, inserted in one of the available slots, in the array. Specify the drive number. **Note:** Drives 0 and 1 are the array drives. Drives 2, 3, and 4 are the hot spare drives. You can include the new drive in a degraded array, or enable it as a hot spare. **Note:** If the array is in a degraded state, the re-build process is triggered and the new drive is used to repair the degraded array.
locate <0-4>	Enables LEDs to blink on a specified drive. Specify the drive number. **Note:** Blinking LEDs enable you correctly locate a drive.
remove <0-4>	Removes (shuts downs) a disk from the array, before it is physically removed from its slot. Specify the drive number containing the disk. **Note:** Use this command to also remove a hot spare.
spare <0-4>	Converts an unused drive into a hot spare. Specify the drive number.

Example

```
nx9500-6C874D#raid install drive 0
Error: Input Error: Drive 0 is already member of array, can't be added
nx9500-6C874D#

nx9500-6C8809#raid spare drive 1

Error: RAID operation failed, returned 2, output: Input Error: Drive 1 is member of
array, can't be a hotspare
/
nx9500-6C8809#
```

no

Use the `no` command to revert to turn off an enabled feature or to revert a setting to default value.

The no commands have their own set of parameters that can be reset. These parameters depend on the context in which the command is being used.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [adoption|captive-portal|cpe|crypto|debug|logging|page|raid|service|terminal|
upgrade|virtual-machine|wireless]
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
```

Note

The `no > adoption` command resets the adoption state of a specified device (and all devices adopted to it) or devices within a specified RF Domain. When executed without specifying the device or RF Domain, the command resets the adoption state of the logged device and all devices, if any, adopted to it.

```
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>]
{on <DEVICE-OR-DOMAIN-NAME>}
no crypto pki [server|trustpoint]
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}|
on <DEVICE-NAME>}
no logging monitor
no page
no service [block-adopter-config-update|locator|snmp|ssm|wireless]
no service block-adopter-config-update
no service locator {on <DEVICE-NAME>}
no service snmp sysoid wing5
no service ssm trace pattern {<WORD>} {(on <DEVICE-NAME>)}
no service wireless [trace pattern {<WORD>} {(on <DEVICE-NAME>)}|
unsanctioned ap air-terminate <BSSID> {on <DOMAIN-NAME>}]
no terminal [length|width]
no upgrade <PATCH-NAME> {on <DEVICE-NAME>}
no wireless client [all|<MAC>]
no wireless client all {filter|on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

The following command is available only on the NX9500 and NX9600 series service platforms:

```
no cpe led cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
no raid locate
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Resets or reverts settings based on the parameters passed

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

```
NOC-NX9500#no adoption on ?
  DEVICE-OR-DOMAIN-NAME  AP/Controller/RF-Domain name

NOC-NX9500#

NOC-NX9500#no page
NOC-NX9500#

NOC-NX9500#no upgrade ?
  WORD  Name of the patch to remove

NOC-NX9500#
```

5 Global Configuration Commands

global-config-commands

This chapter summarizes the global-configuration commands in the CLI command structure.

The term global indicates characteristics or features effecting the system as a whole. Use the Global Configuration Mode to configure the system globally, or enter specific configuration modes to configure specific elements (such as interfaces or protocols). Use the configure terminal command (under PRIV EXEC) to enter the global configuration mode.

The following example describes the process of entering the global configuration mode from the privileged EXEC mode:

```
<DEVICE>#configure terminal
<DEVICE>(config)#
```

Note
The system prompt changes to indicate you are now in the global configuration mode. The prompt consists of the device host name followed by (config) and a pound sign (#).

Commands entered in the global configuration mode update the running configuration file as soon as they are entered. However, these changes are not saved in the startup configuration file until a `commit → write → memory` command is issued.

```
<DEVICE>(config)#?
Global configuration commands:
  aaa-policy                          Configure a
                                      authentication/accounting/authorization
                                      policy
  aaa-tacacs-policy                   Configure an
                                      authentication/accounting/authorization
                                      TACACS policy
  alias                               Alias

                                      MESHPOINT configuration context for one
                                      or more MESHPOINTs
meshpoint-qos-policy                  Configure a meshpoint quality-of-service
```

```
                                    policy
  mint-policy                       Configure the global mint policy
  nac-list                          Configure a network access control list
  no                                Negate a command or set its defaults
  nsight-policy                     Configure a Nsight policy
  nx45xx                            NX45XX integrated services platform
  nx5500                            NX5500 wireless controller
  nx65xx                            NX65XX integrated services platform
  nx75xx                            NX75XX wireless controller
  nx9000                            NX9000 wireless controller
  passpoint-policy                  Configure a passpoint policy
  password-encryption               Encrypt passwords in configuration
  profile                           Profile related commands - if no
                                    parameters are given, all profiles are
                                    selected
  purview-application-group         Configure a Purview application-grou
  purview-application-policy        Configure a Purview application policy
  radio-qos-policy                  Configure a radio quality-of-service
                                    policy
  radius-group                      Configure radius user group parameters
  radius-server-policy              Create device onboard radius policy
  radius-user-pool-policy           Configure Radius User Pool
  rename                            Clone configuration object
  replace                           Replace configuration object
  rf-domain                         Create a RF Domain or enter rf-domain
                                    context for one or more rf-domains
  rfs4000                           RFS4000 wireless controller
  rfs6000                           RFS6000 wireless controller
  rfs7000                           RFS7000 wireless controller
  roaming-assist-policy             Configure a roaming-assist policy
  role-policy                       Role based firewall policy
  route-map                         Dynamic routing route map Configuration
  routing-policy                    Policy Based Routing Configuration
  rtl-server-policy                 Configure a rtl server policy
  schedule-policy                   Configure a schedule policy
  self                              Config context of the device currently
                                    logged into
  sensor-policy                     Configure a sensor policy
  smart-rf-policy                   Configure a Smart-RF policy
  t5                                T5 DSL switch
  url-filter                        Configure a url filter
  url-list                          Configure a URL list
  vx9000                            VX9000 wireless controller
  web-filter-policy                 Configure a web filter policy
  wips-policy                       Configure a wips policy
  wlan                              Create a new WLAN or enter WLAN
                                    configuration context for one or more
                                    WLANs
  wlan-qos-policy                   Configure a wlan quality-of-service
                                    policy
  write                             Write running configuration to memory or
                                    terminal

  clrscr                            Clears the display screen
  commit                            Commit all changes made in this session
  do                                Run commands from Exec mode
  end                               End current mode and change to EXEC mode
  exit                              End current mode and down to previous
                                    mode
  revert                            Revert changes
  service                           Service Commands
  show                              Show running system information

<DEVICE>(config)#
```

global-config-commands

The following table summarizes the Global Configuration Mode commands:

Table 6: Global Config Commands

Command	Description
aaa-policy on page 170	Creates a *AAA (Authentication, Authorization, and Accounting)* policy and enters its configuration mode. This policy enables administrators to define access control within the network.
aaa-tacacs-policy on page 171	Creates a AAA-TACACS policy and enters its configuration mode. This policy provides access control to network devices such as routers, network access servers, and other computing devices through centralized servers.
alias on page 172	Configures network, VLAN, and service aliases
ap505 on page 182	Adds an AP505 to the network
ap510 on page 182	Adds an AP510 to the network
application on page 183	Creates an application definition and enters its configuration mode. This command allows you to create a customized application detection definition.
application-group on page 191	Creates an application group and enters its configuration mode
application-policy on page 195	Creates an application policy and enters its configuration mode. This policy defines the actions executed on recognized HTTP (for example, Facebook), enterprise (for example, Webex) and peer-to-peer (for example, gaming) applications or application-categories.
association-acl-policy on page 212	Creates an association ACL policy and enters its configuration mode. This policy restricts access by specifying a client MAC address or range of addresses to either include or exclude from WLAN connectivity.
auto-provisioning-policy on page 213	Creates an auto provisioning policy and enters its configuration mode. This policy defines the process by which an access point discovers controllers and associates with it.
bgp on page 214	Configures *BGP (Border Gateway Protocol)* settings
ble-data-export-policy on page 216	Creates a *Bluetooth Low Energy* (BLE) data export policy and enters its configuration mode.
bonjour-gw-discovery-policy on page 219	Creates a *Bonjour* GW Discovery policy and enters its configuration mode. This policy configures the VLANs on which Bonjour services are located.
bonjour-gw-forwarding-policy on page 223	Configures a Bonjour GW Forwarding policy and enters its configuration mode. This policy enables the discovery of services on VLANs not visible to the device running the Bonjour Gateway.
bonjour-gw-query-forwarding-policy on page 224	Creates a Bonjour GW Query Forwarding policy and enters its configuration mode. This policy enables Bonjour query forwarding across multiple VLANs.
captive-portal on page 225	Creates a captive portal and enters its configuration mode
clear on page 270	Clears the event history
client-identity on page 271	Creates a client identity definition and enters its configuration mode. This feature enables client identification through DHCP device fingerprinting.
client-identity-group on page 277	Creates a new client identity group and enters its configuration mode

Table 6: Global Config Commands (continued)

Command	Description
clone on page 281	Clones a specified configuration object
crypto-cmp-policy on page 282	Creates a *Certificate Management Protocol* (CMP) policy and enters its configuration mode. CMP is an Internet protocol designed to obtain and manage digital certificates in a *Public Key Infrastructure* (PKI) network.
customize on page 283	Customizes the CLI command summary output
database-client-policy global-config on page 296	Creates a database client policy and enters its configuration mode. In case of ExtremeWireless WiNG deployments integrated with Extreme Nsight and ExtremeGuest, use this option to configure the credentials required to authenticate with the Extreme Nsight or ExtremeGuest server database.
database-policy global config on page 299	Creates a database policy and enters its configuration mode. This policy enables the database, and also configures the database replica set.
device on page 304	Specifies configuration on multiple devices
device-categorization on page 305	Creates a device categorization list and enters its configuration mode. The list categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network.
dhcp-server-policy on page 308	Creates a *DHCP (Dynamic Host Configuration Protocol)* server policy and enters its configuration mode. This policy allows hosts on an IP network to request and be assigned IP addresses and discover information about the network.
dhcpv6-server-policy on page 309	Creates a DHCPv6 server policy and enters its configuration mode. This policy configures hosts with IPv6 addresses, IP prefixes and other configuration attributes required on an IPv6 network.
dns-whitelist on page 310	Creates a DNS whitelist and enters its configuration mode. A DNS whitelist is used with a captive portal to provide access services to requesting wireless clients.
event-system-policy on page 351	Creates an Event system policy and enters its configuration mode. This policy enables administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform.
ex3500 on page 313	Creates an EX3500 time range list and enters its configuration mode
ex3500-management-policy on page 317	Creates an EX3500 management policy and enters its configuration mode. This policy controls access to the EX3500 switch from management stations using SNMP.
ex3500-qos-class-map-policy on page 333	Creates an EX3500 QoS class map policy and enters its configuration mode. The QoS policy map assigns priority to mission critical EX3500 switch data traffic, prevents EX3500 switch bandwidth congestion, and prevents packet drops.
ex3500-qos-policy-map on page 338	Creates an EX3500 QoS policy map and enters its configuration mode. This policy defines rules that filter traffic exchanged between the EX3500 switch and its connected devices.
ex3524 on page 348	Adds a EX3524 switch to the network
ex3548 on page 350	Adds a EX3548 switch to the network

Table 6: Global Config Commands (continued)

Command	Description
firewall-policy on page 366	Creates a firewall policy and enters its configuration mode. This policy configures safe guards against *DoS* attacks and packet storms. It also configures firewall parameters, such as logging, application layer gateway, TCP protocol checks, state flow checks, etc.
global-association-list on page 367	Configures a global list of client MAC addresses
guest-management-policy on page 370	Creates a guest management policy and enters its configuration mode. This policy redirects guest users to a registration portal, upon association to a captive portal *Service Set Identifier* (SSID).
host on page 380	Sets the system's network name
inline-password-encryption on page 381	Stores the encryption key in the startup configuration file
iot-device-type-imagotag-policy on page 381	Creates an IoT Device-Type Imagotag policy and enters its configuration mode. This policy enables support for SES-imagotag's ESL tags on WiNG APs (with USB ports).
ip on page 390	Creates a IP *ACL (Access Control List)* and/or a *SNMP (Simple Network Management Protocol)* ACL, and enters its configuration mode
ipv6 on page 392	Creates a IPv6 ACL and enters its configuration mode
ipv6-router-advertisement-policy on page 393	Creates an IPv6 *router advertisement* (RA) policy and enters its configuration mode
l2tpv3 on page 404	Configures *Layer 2 Tunneling Protocol Version 3* (L2TPv3) tunnel policy and enters its configuration mode. This policy defines control and encapsulation protocols for tunneling layer 2 frames between two IP nodes.
location-policy on page 406	Configures a location policy and enters its configuration mode
mac on page 410	Configures *MAC* access lists (goes to the MAC ACL mode)
management-policy on page 411	Creates a management policy and enters its configuration context. This policy configures services that run on a device, such as welcome messages, banners, etc.
meshpoint on page 412	Creates a meshpoint and enters its configuration mode
meshpoint-qos-policy on page 413	Creates a meshpoint *QoS (Quality of Service)* policy and enters its configuration mode
mint-policy on page 414	Creates a MiNT security policy and enters its configuration mode
nac-list on page 415	Creates a network ACL and enters its configuration mode
no on page 611	Negates a command or sets its default
nsight-policy (global-config-mode) on page 418	Creates an NSight policy and enters its configuration mode
passpoint-policy on page 426	Creates a new passpoint policy and enters its configuration mode
password-encryption on page 427	Enables password encryption
profile on page 428	Creates a device profile and enters its configuration mode
purview-application-group on page 432	Creates a Purview Application Group and enters its configuration mode

Table 6: Global Config Commands (continued)

Command	Description
purview-application-policy on page 436	Creates a Purview Application Policy and enters its configuration mode
radio-qos-policy on page 453	Creates a radio *QoS* policy and enters its configuration mode
radius-group on page 454	Creates a *RADIUS (Remote Authentication Dial In User Service)* group and enters its configuration mode
radius-server-policy on page 455	Creates a RADIUS server policy and enters its configuration mode
radius-user-pool-policy on page 456	Creates a RADIUS user pool policy and enters its configuration mode
rename on page 457	Renames and existing *top-level object* (TLO)
replace on page 458	Selects an existing device by its MAC address or hostname and replaces it with a new device having a different MAC address
rf-domain on page 460	Creates an RF Domain and enters its configuration mode
roaming-assist-policy on page 493	Configures a roaming assist policy and enters its configuration mode. This policy enables access points to assist wireless clients in making roaming decisions, such as which access point to connect, etc.
nx5500 on page 491	Adds an NX5500 to the network
nx7500 on page 491	Adds an NX7500 to the network
nx9000 on page 492	Adds an NX9500 to the network
role-policy on page 494	Creates a role policy and enters its configuration mode
route-map on page 495	Creates a dynamic BGP route map and enters its configuration mode
routing-policy on page 496	Creates a routing policy and enters its configuration mode
rtl-server-policy on page 496	Creates an RTL server policy and enters its configuration mode. The RTL server policy provides the exact location (URL) at which the Euclid server can be reached.
schedule-policy on page 499	Creates a schedule policy and enters its configuration mode
self on page 503	Displays a logged device's configuration context
sensor-policy on page 503	Creates a sensor policy and enters its configuration mode
smart-rf-policy on page 508	Creates a Smart RF policy and enters its configuration mode
t5 on page 509	Configures a t5 wireless controller. This command is applicable only on the RFS4010, NX7500, NX9500, NX9600, and VX9000 platforms.
web-filter-policy on page 511	Creates a Web Filtering policy and enters its configuration mode
wips-policy on page 517	Creates a WIPS policy and enters its configuration mode
wlan on page 518	Creates a *WLAN (Wireless Local Area Network)* and enters its configuration mode
wlan-qos-policy on page 593	Creates a WLAN QoS policy and enters its configuration mode
url-filter on page 594	Creates an URL filter and enters its configuration mode. URL filtering is a licensed feature.

Table 6: Global Config Commands (continued)

Command	Description
url-list on page 604	Creates an URL list and enters its configuration mode.
vx9000 on page 608	Configures a *Virtual WLAN Controller* (V-WLC) in a *virtual machine* (VM) environment

Note
For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Common Commands on page 616.

Note
The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character.

aaa-policy

Configures an AAA *(Authentication, Accounting, and Authorization)* policy. AAA policies define access control within the network.

A controller, service platform, or access point can interoperate with external RADIUS and LDAP servers (AAA Servers) to provide an additional user database and authentication resource. Each WLAN can maintain its own unique AAA configuration. Up to six servers can be configured for providing AAA services.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
aaa-policy <AAA-POLICY-NAME>
```

Parameters

```
aaa-policy <AAA-POLICY-NAME>
```

<AAA-POLICY-NAME>	Specify the AAA policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#aaa-policy test
nx9500-6C8809(config-aaa-policy-test)#?
AAA Policy Mode commands:
  accounting           Configure accounting parameters
  attribute            Configure RADIUS attributes in access and accounting
                       requests
  authentication       Configure authentication parameters
  health-check         Configure server health-check parameters
  mac-address-format   Configure the format in which the MAC address must be
                       filled in the Radius-Request frames
```

```
  no                    Negate a command or set its defaults
  proxy-attribute       Configure radius attribute behavior when proxying
                        through controller or rf-domain-manager
  server-pooling-mode   Configure the method of selecting a server from the
                        pool of configured AAA servers
  use                   Set setting to use

  clrscr                Clears the display screen
  commit                Commit all changes made in this session
  do                    Run commands from Exec mode
  end                   End current mode and change to EXEC mode
  exit                  End current mode and down to previous mode
  help                  Description of the interactive help system
  revert                Revert changes
  service               Service Commands
  show                  Show running system information
  write                 Write running configuration to memory or terminal

nx9500-6C8809(config-aaa-policy-test)#
```

Related Commands

no on page 611	Removes an existing AAA policy

Note
For more information on the AAA policy commands, see AAA Policy on page 1303.

aaa-tacacs-policy

Configures AAA TACACS+ *(Terminal Access Controller Access-Control System)* policy. TACACS+ is a protocol created by CISCO Systems which provides access control to network devices such as routers, network access servers and other networked computing devices through one or more centralized servers. TACACS provides separate authentication, authorization, and accounting services running on different servers.

TACACS controls user access to devices and network resources while providing separate accounting, authentication, and authorization services. Some of the services provided by TACACS are:

- Authorizing each command with the TACACS+ server before execution.
- Accounting each session's logon and log off events.
- Authenticating each user with the TACACS+ server before enabling access to network resources.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>
```

Parameters

```
aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>
```

<AAA-TACACS-POLICY-NAME>	Specify the AAA-TACACS policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#aaa-tacacs-policy testpolicy
nx9500-6C8809(config-aaa-tacacs-policy-testpolicy)#?
AAA TACACS Policy Mode commands:
  accounting      Configure accounting parameters
  authentication  Configure authentication parameters
  authorization   Configure authorization parameters
  no              Negate a command or set its defaults

  clrscr          Clears the display screen
  commit          Commit all changes made in this session
  do              Run commands from Exec mode
  end             End current mode and change to EXEC mode
  exit            End current mode and down to previous mode
  help            Description of the interactive help system
  revert          Revert changes
  service         Service Commands
  show            Show running system information
  write           Write running configuration to memory or terminal

nx9500-6C8809(config-aaa-tacacs-policy-testpolicy)#
```

Related Commands

no on page 611	Removes an existing AAA TACACS policy

Note
For more information on the AAA-TACACS policy commands, see AAA-TACACS Policy on page 1763.

alias

Configures the following types of aliases: network, VLAN, host, string, network-service, etc. Aliases are objects having a unique name and content that is determined by the alias type (for example, network, VLAN, network-service, etc.).

A typical, large enterprise network, consists of multiple sites (RF Domains) having similar configuration parameters with few elements that vary, such as networks or network ranges, hosts having different IP addresses, and VLAN IDs or URLs. These elements can be defined as aliases (object oriented wireless firewalls) and used across sites by applying overrides to the object definition. Using aliases results in a configuration that is easier to understand and maintain.

Multiple instances of an alias (same type and same name) can be defined at any of the following levels: global, RF Domain, profile, or device. An alias defined globally functions as a TLO *(top-level-object)*. Global aliases are not mandatory, and can be defined at the domain-level, or profile, or device-level only. An alias defined on a device is applicable to that device only. An alias defined on a profile applies to every device using the profile. Similarly, aliases defined at the RF Domain level apply to all devices within that domain.

Aliases defined at any given level can be overridden at any of the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

The different aliases types supported are:

- address-range alias – Maps a user-friendly name to a range of IP addresses. An address-range alias can be utilized at different deployments. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location's network range is 172.16.13.20 through 172.16.13.110, the remote location's ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.
- host alias – Maps a user-friendly name to a specific host (identified by its IP address. For example, 192.168.10.23). A host alias can be utilized at different deployments. For example, if a central network DNS server is set a static IP address, and a remote location's local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.
- network alias – Maps a user-friendly name to a network. A network alias can be utilized at different deployments. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location's network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.
- network-group alias – Maps a user-friendly name to a single or a range of addresses of devices, hosts, and network configurations. Network configurations are complete networks in the form 192.168.10.0/24 or IP address range in the form 192.168.10.10-192.168.10.20.

  A network-group alias can contain a maximum of eight (8) host entries, eight (8) network entries, and eight (8) IP address-range entries. A maximum of 32 network-group alias entries can be created.

  A network-group alias can be used in IP firewall rules to substitute hosts, subnets, and IP address ranges.
- network-service alias – Maps a user-friendly name to service protocols and ports. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network-service alias. When used with an ACL, the network-service alias defines the service-specific components of the ACL rule. Overrides can be applied to the service alias, at the device level, without modifying the ACL. Application of overrides to the service alias allows an ACL to be used across sites.

  Use a network-service alias to associate more than one IP address to a network interface, providing multiple connections to a network from a single IP node.
- number alias – Maps a user-friendly name to a number
- vlan alias – Maps a user-friendly name to a VLAN ID. A VLAN alias can be used at different deployments. For example, if a named VLAN is defined as 10 for the central network, and the VLAN is set at 26 at a remote location, the VLAN can be overridden at the deployment location with an alias. At the remote deployment location, the network is functional with a VLAN ID of 26, but utilizes

the name defined at the centrally managed network. A new VLAN need not be created specifically for the remote deployment.

- string alias – Maps a user-friendly name to a specific string (for example, RF Domain name). A string alias can be utilized at different deployments. For example, if the main domain at a remote location is called *loc1.domain.com* and at another deployment location it is called *loc2.domain.com*, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the *loc1.domain.com* domain and at the other with the *loc2.domain.com* domain.
- encrypted-string alias – Maps a user-friendly name to a string value. The string value of this alias is encrypted when "password-encryption" is enabled. Encrypted-string aliases can be used for string configuration parameters that are encrypted by the "password-encryption" feature.
- hashed-string alias – Maps a user-friendly name to a hashed-string value. Hashed-string aliases can be used for string configuration parameters that are hashed, such as passwords.

Note
When used with ACLs, network, network-group, and network-service aliases act as enhanced firewalls.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]

alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>

alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>

alias host <HOST-ALIAS-NAME> <HOST-IP>

alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>]

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-
IP>
{<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|network <NETWORK-ADDRESS/MASK>
{<NETWORK-ADDRESS/MASK>}]

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|
ntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www)}

alias number <NUMBER-ALIAS-NAME> <0-4294967295>

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

Parameters

```
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
```

address-range <ADRESS-RANGE-ALIAS-NAME>	Creates an address range alias, defining a range of IP addresses • <ADRESS-RANGE-ALIAS-NAME> – Specify the address range alias name. Note: Alias name should begin with '$'.
<STARTING-IP> to <ENDING-IP>	Associates a range of IP addresses with this address range alias • <STARTING-IP> – Specify the first IP address in the range. • to <ENDING-IP> – Specify the last IP address in the range.

```
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>
```

encrypted-string <ENCRYPTED-STRING-ALIAS-NAME>	Creates an alias for an encrypted string. Use this alias for string configuration values that are encrypted when "password-encryption" is enabled. For example, in the management-policy, use it to define the SNMP community string. For more information, see snmp-server on page 1539 (management policy config mode). • <ENCRYPTED-STRING-ALIAS-NAME> – Specify the encrypted-string alias name. Note: Alias name should begin with '$'.

[0|2] <LINE>	Configures the value associated with the alias name specified in the previous step
	• [0|2] <LINE> – Configures the alias value
	
	Note: If password-encryption is enabled, in the `show > running-config` output, this clear text is displayed as an encrypted string, as shown below:
	`nx9500-6C8809(config)#show running-config`
	`!.............................`
	`alias encrypted-string $enString 2`
	`fABMK2is7UToNiZE3MQXbgAAAAxB0ZIysdqsEJwr6AH/Da//`
	`!`
	`--More--`
	`nx9500-6C8809`
	
	In the above `show > running-config` output, the '2' displayed before the encrypted-string alias value indicates that the displayed text is encrypted and not a clear text.
	However, if password-encryption is disabled the clear text is displayed as is:
	`nx9500-6C8809(config)#show running-config`
	`!.............................`
	`!`
	`alias encrypted-string $enString 0 test11223344`
	`!`
	`--More--`
	`nx9500-6C8809`
	
	For more information on enabling password-encryption, see password-encryption on page 427.

```
alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>
```

hashed-string <HASHED-STRING-ALIAS-NAME>	Creates an alias for a hashed string. Use this alias for configuration values that are hashed strings, such as passwords. For example, in the management-policy, use it to define the privilege mode password. For more information, see privilege-mode-password on page 1532. • <HASHED-STRING-ALIAS-NAME> – Specify the hashed-string alias name. **Note:** Alias name should begin with '$'.

<LINE>	Configures the hashed-string value associated with this alias.
	`nx9500-6C8809(config)#show running-config`
	`!`
	`alias encrypted-string $WRITE 2`
	`sBqVCDAoxs3oByF5PCSuFAAAAAd7HT2+EiT/l/BXm9c4SBDv`
	`!`
	`alias hashed-string $PriMode 1`
	`faffdde27cb49ad634ea20df4f7c8ef2685894d10ffcb1b2efba054112e`
	`cfc75`
	`0`
	`--More--`
	`nx9500-6C8809`
	In the above `show > running-config` output, the '1' displayed before the hashed-string alias value indicates that the displayed text is hashed and not clear text.

```
alias host <HOST-ALIAS-NAME> <HOST-IP>
```

host <HOST-ALIAS-NAME>	Creates a host alias, defining a single network host • <HOST-ALIAS-NAME> – Specify the host alias name. **Note:** Alias name should begin with '$'.
<HOST-IP>	Associates the network host's IP address with this host alias. For example, 'alias host $HOST 1.1.1.100'. In this example, the host alias name is: $HOST and the host IP address it is mapped to is: 1.1.1.100. • <HOST-IP> – Specify the network host's IP address.

```
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
```

network <NETWORK-ALIAS-NAME>	Creates a network alias, defining a single network address • <NETWORK-ALIAS-NAME> – Specify the network alias name. **Note:** Alias name should begin with '$'.
<NETWORK-ADDRESS/MASK>	Associates a single network with this network alias. For example, *'alias network $NET 1.1.1.0/24*'. In this example, the network alias name is: *$NET* and the network it is mapped to is: *1.1.1.0/24*. • <NETWORK-ADDRESS/MASK> – Specify the network's address and mask.

```
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-
IP>
{<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|network <NETWORK-ADDRESS/MASK>
{<NETWORK-ADDRESS/MASK>}]
```

network <NETWORK-GROUP-ALIAS-NAME>	Creates a network-group alias • <NETWORK-GROUP-ALIAS-NAME> – Specify the network-group alias name. Note: Alias name should begin with '$'. The network-group aliases are used in ACLs, to define the network-specific components. ACLs using aliases can be used across sites by re-defining the network-group alias elements at the device or profile level. After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses.
address-range <STARTING-IP> to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}	Associates a range of IP addresses with this network-group alias • <STARTING-IP> – Specify the first IP address in the range. • to <ENDING-IP> – Specify the last IP address in the range. <STARTING-IP> to <ENDING-IP> – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.
host <HOST-IP> {<HOST-IP>}	Associates a single or multiple hosts with this network-group alias • <HOST-IP> – Specify the hosts' IP address. • <HOST-IP> – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured.
network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}	Associates a single or multiple networks with this network-group alias • <NETWORK-ADDRESS/MASK> – Specify the network's address and mask. • <NETWORK-ADDRESS/MASK> – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured.

```
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|igmp|
igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|
ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www)}
```

alias network-service <NETWORK-SERVICE-ALIAS-NAME>	Configures an alias that specifies available network services and the corresponding source and destination software ports • <NETWORK-SERVICE-ALIAS-NAME> – Specify a network-service alias name. Note: Alias name should begin with '$'. Network-service aliases are used in ACLs, to define the service-specific components. ACLs using aliases can be used across sites by re-defining the network-service alias elements at the device or profile level.
proto [<0-254>| <WORD>|eigrp|gre| igmp|igp|ospf|vrrp]	Use one of the following options to associate an Internet protocol with this network-service alias: • <0-254> – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the Protocol field of the IPv4 header and the Next Header field of IPv6 header. For example, the UDP *(User Datagram Protocol)* designated number is 17. • <WORD> – Identifies the protocol by its name. Specify the protocol name. • eigrp – Selects EIGRP *(Enhanced Interior Gateway Routing Protocol)*. The protocol number 88. • gre – Selects GRE *(Generic Routing Encapsulation)*. The protocol number is 47. • igmp – Selects IGMP *(Internet Group Management Protocol)*. The protocol number is 2. • igp – Selects IGP *(Interior Gateway Protocol)*. The protocol number is 9. • ospf – Selects OSPF *(Open Shortest Path First)*. The protocol number is 89. • vrrp – Selects VRRP *(Virtual Router Redundancy Protocol)*. The protocol number is 112.
{(<1-65535>| <WORD>| bgp|dns|ftp| ftp-data| gopher|https|ldap| nntp| ntp|pop3|proto| sip|smtp|sourceport [<1-65535>| <WORD>]|ssh|telnet| tftp|www)}	After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports. • <1-65535> – Optional. Configures a destination port number from 1 - 65535 • <WORD> – Optional. Identifies the destination port by the service name provided. For example, the SSH service uses TCP port 22. • bgp – Optional. Configures the default BGP *(Border Gateway Protocol)* services port (179) • dns – Optional. Configures the default DNS *(Domain Name System)* services port (53) • ftp – Optional. Configures the default FTP *(File Transfer Protocol)* control services port (21) • ftp-data – Optional. Configures the default FTP data services port (20) • gopher – Optional. Configures the default gopher services port (70) • https – Optional. Configures the default HTTPS services port (443) • ldap – Optional. Configures the default LDAP *(Lightweight Directory Access Protocol)* services port (389) • nntp – Optional. Configures the default NNTP *(Newsgroup)* services port (119) • ntp – Optional. Configures the default NTP *(Network Time Protocol)* services port (123)

	• POP3 – Optional. Configures the default POP3 *(Post Office Protocol)* services port (110) • proto – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step. • sip – Optional. Configures the default SIP *(Session Initiation Protocol)* services port (5060) • smtp – Optional. Configures the default SMTP *(Simple Mail Transfer Protocol)* services port (25) • sourceport [<1-65535>|<WORD>] – Optional. After specifying the destination port, you may specify a single or range of source ports. • <1-65535> – Specify the source port from 1 - 65535. • <WORD> – Specify the source port range, for example 1-10. • ssh – Optional. Configures the default SSH services port (22) • telnet – Optional. Configures the default Telnet services port (23) • tftp – Optional. Configures the default TFTP *(Trivial File Transfer Protocol)* services port (69) • www – Optional. Configures the default HTTP services port (80)

```
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
```

alias number <NUMBER-ALIAS-NAME> <0-4294967295>	Creates a number alias identified by the <NUMBER-ALIAS-NAME> keyword. Number aliases map a name to a numeric value. For example, '*alias number $NUMBER 100*'. In this example: • The number alias name is: *$NUMBER* • The value assigned is: *100* The value referenced by alias $NUMBER, wherever used, is 100. • <NUMBER-ALIAS-NAME> – Specify the number alias name. Note: Alias name should begin with '$'. • <0-4294967295> – Specify the number, from 0 - 4294967295, assigned to the number alias created.

```
alias string <STRING-ALIAS-NAME> <LINE>
```

alias string <STRING-ALIAS-NAME>	Creates a string alias identified by the <STRING-ALIAS-NAME> keyword • <STRING-ALIAS-NAME> – Specify the string alias name. **Note:** Alias name should begin with '$'. • <LINE> – Specify the string value. String aliases map a name to an arbitrary string value. For example, '*alias string $DOMAIN test.example_company.com*'. In this example, • the string alias name is: $*DOMAIN* • the string value it is mapped to is: *test.example_company.com* (a domain name). The value referenced by alias $DOMAIN, wherever used, is test.example_company.com. You can also use a string alias to configure the Bonjour Service instance name. Once configured, use the string alias in the Bonjour Gateway Discovery Policy context to specify the Bonjour service instance name to be used as the match criteria. For more information, see bonjour-gw-discovery-policy on page 219.

```
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

alias vlan <VLAN-ALIAS-NAME>	Creates a VLAN alias identified by the <VLAN-ALIAS-NAME> keyword • <VLAN-ALIAS-NAME> – Specify the VLAN alias name. **Note:** Alias name should begin with '$'.
<1-4094>	Maps the VLAN alias to a VLAN ID • <1-4094> – Specify the VLAN ID from 1 - 4094.

Examples

```
rfs4000-229D58(config)#alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
rfs4000-229D58(config)#alias network $TestNetworkAlias 192.168.13.0/24
rfs4000-229D58(config)#alias host $TestHostAlias 192.168.13.100
rfs4000-229D58(config)#alias vlan $TestVLANAlias 1
rfs4000-229D58(config)#alias address-range $AddRangeAlias 192.168.13.2 to 192.168.13.10
rfs4000-229D58(config)#alias network-service $NetServAlias proto igmp
rfs4000-229D58(config)#show running-config | include alias
alias network-group $NetGrAlias address-range 192.168.13.7 to 192.168.13.9 192.168.13.20
to 192.168.13.25
alias network $NetworkAlias 192.168.13.0/24
alias host $HostAlias 192.168.13.10
alias address-range $AddRangeAlias 192.168.13.2 to 192.168.13.10
alias network-service $NetServAlias proto igmp
alias vlan $VlanAlias 1
rfs4000-229D58(config)#
nx9500-6C8809(config)#alias number $NUMBER 100
nx9500-6C8809(config)#show context include-factory | include alias
alias string $DOMAIN test.examplecompany.com
alias string $DOMAIN2 test.example_company.com
alias number $NUMBER 100
alias string $SN B4C7996C8809

Related Commands

no on page 611	Removes an existing network, VLAN, service, or string alias

ap505

Invokes an AP505 acces point's configuration context.

Supported in the following platforms:

- Access Point — AP505
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ap505 <MAC>
```

Parameters

```
ap505 <MAC>
```

<MAC>	Specify the AP505's MAC address.

Examples

```
nx9500-6C8809(config)#ap505 2B-16-0c-18-0D-11
nx9500-6C8809(config-device-2B-16-0c-18-0D-11)#show con
ap505 2B-16-0c-18-0D-11
 use profile default-ap505
 use rf-domain default
 hostname ap505-180D11

```

Related Commands

no on page 611	Removes an AP510 from the network

ap510

Invokes an AP510 acces point's configuration context.

Supported in the following platforms:

- Access Point — AP510
- Wireless Controllers — RFS4000

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ap510 <MAC>
```

Parameters

```
ap510 <MAC>
```

<MAC>	Specify the AP510's MAC address.

Examples

```
nx9500-6C8809(config)#ap510 01-11-CD-21-0B-13
nx9500-6C8809(config-device-01-11-CD-21-0B-13)#show con
ap510 01-11-CD-21-0B-13
 use profile default-ap510
 use rf-domain default
 hostname ap510-210B13

application

Global Configuration Commands on page 163

Creates an application definition and enters its configuration mode. Use this command to create application detection signatures that are not in the pre-defined set of application definitions provided by ExtremeWireless WiNG.

Application Visibility and Control (AVC) enables detection of top-level hosting applications along with the services these applications host. It also provides Metadata extraction capabilities for a variety of protocols and applications.

AVC and statistics reporting is available on both the WiNG 5.9.X and WiNG 7.1.X operating systems. However, the DPI engine used to check the data points varies. The WiNG 7.1.X OS uses *EAA (Extreme Application Analytics)* (Purview™) DPI engine to detect applications (layer 7 traffic) and manage traffic flow. It recognizes 36 application categories with 2457 applications. The WiNG 5.9.X operating system uses a third-party DPI engine, which recognizes 23 application-categories with a total of 2384 applications.

The `application` command is part of the AVC feature. It allows you to create custom application definitions to detect native applications. Refer to the following on how to use the customized application definitions:

- For WiNG 5.9.X networks, configure the application definition on the controller and apply in the following contexts.
  - To enable packet filtering on WiNG 5.9.X APs, use the application definition in the application-policy on page 195 and specify allow, deny or mark rules for these application packets.

- To enable mandatory stats reporting on WiNG 5.9.X APs, use the application definition in an application-group on page 191.

- For WiNG 7.1.2 networks, configure the application definition on the controller and apply in the following contexts:
  - To enable packet filtering on WiNG 7.1.X APs, use the application definition in the purview-application-policy on page 436 and specify allow, deny or mark rules for these application packets .
  - To enable packet filtering on WiNG 7.1.X APs, use the custom application definition in an purview-application-group on page 432.

Note
The WiNG 7.1.2 OS does not support Purview™ on NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Supported on the following WiNG 7.1.2 APs:

- Access Points — AP505i, AP510i/e, AP560i/h

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
application <APPLICATION-NAME>
```

Parameters

```
application <APPLICATION-NAME>
```

application <APPLICATION-NAME>	Creates a new application definition and enters its configuration mode • <APPLICATION-NAME> – Specify a name of the new application definition. It is created if not already existing in the system.

Examples

```
nx9500-6C8809(config-application-Custom)#?
Application Mode commands:
  app-category          Set application category (default is custom)
  description           Add application description
  https                 Secure HTTP
  no                    Negate a command or set its defaults
  purview-app-category  Set application category (default is custom)
  use                   Set setting to use

  clrscr                Clears the display screen
  commit                Commit all changes made in this session
  do                    Run commands from Exec mode
  end                   End current mode and change to EXEC mode
  exit                  End current mode and down to previous mode
  help                  Description of the interactive help system
  revert                Revert changes
  service               Service Commands
  show                  Show running system information
  write                 Write running configuration to memory or terminal
```

```
nx9500-6C8809(config-application-Custom)#
```

Related Commands

purview-application-policy on page 436	Creates a Purview application policy and enters its configuration mode.

app-category

application on page 183

Configures the application category type for this custom application definition.

Note
This parameter is applicable only for WiNG 5.9.X supported APs. Define the app-category type for this custom application definition. Use this custom application definition in the application-group on page 191 and application-policy on page 195 contexts.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Note
This parameter is not applicable for the WiNG 7.1.2 AP5XX model APs.

Syntax

```
app-category <APP-CATEGORY-NAME>
```

Parameters

```
app-category <APP-CATEGORY-NAME>
```

app-category <APP-CATEGORY-NAME>	Select the category best suited for this application definition. There are twenty three categories. These are: business, conference, custom, database, filetransfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and Web. The default setting is *custom*. Use this option to categorize your internal custom applications, so that they do not appear as unknown traffic.

Examples

```
nx9500-6C8809(config-application-Bing)#app-category [TAB]
business              conference            custom
database              filetransfer          gaming
generic               im                    mail
mobile                network\ management   other
p2p                   remote_control        sharehosting
social\ networking    streaming             tunnel
voip                  web

 app-category streaming
nx9500-6C8809(config-application-Bing)#
```

Related Commands

no on page 190	Resets application category to default (custom)

description

application on page 183

Configures a description for this application definition

Supported on the following WiNG 7.1.2 APs:

- Access Points — AP505i, AP510i/e, AP560i/h

Syntax

```
description <WORD>
```

Parameters

```
description <WORD>
```

description <WORD>	Configures a description for this application definition • <WORD> – Specify a description not exceeding 80 characters in length. Enter the descriptive text within double quotes.

Examples

```
nx9500-6C8809(config-application-Bing)#description "Bing is Microsoft's Web search engine"
nx9500-6C8809(config-application-Bing)#show context
application Bing
```

```
 description "Bing is Microsoft's Web search engine"
 app-category streaming
nx9500-6C8809(config-application-Bing)#
```

Related Commands

no on page 190	Removes this description configured for this application

https

application on page 183

Configures the HTTPS parameter type, attribute type, match criteria for the HTTPS server name and 64 character maximum server name attribute used in the HTTPS server message exchange

Supported on the following WiNG 7.1.2 APs:

- Access Points — AP505i, AP510i/e, AP560i/h

Syntax

```
https server-cert common-name [contains|ends-with] <WORD>
```

Parameters

```
https server-cert common-name [contains|ends-with] <WORD>
```

https server-cert	Configures the HTTPS parameter type as server certificate
common-name [contains|ends-with] <WORD>	Configures the HTTPS attribute match criteria as common name. This is the only option applicable when the HTTPS parameter type is set to server-cert. Use one of the following options to provide the common-name attribute value used as the match criteria: • contains – Filters applications having common-name attributes containing the string specified here • ends-with – Filters applications ending with the string specified here • <WORD> – Specify the string to match (should not exceed 64 characters).

Examples

```
nx9500-6C8809(config-application-Bing)#https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#show context
application Bing
 description "Bing is Microsoft's web search engine"
 app-category streaming
 https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#
```

Related Commands

no on page 190	Removes the HTTPS common-name attribute value configured with this application category

purview-app-category

application on page 183

Configures the application category type for this custom (user-defined) purview-application definition

Note

This parameter is applicable only for WiNG 7.1.2 supported APs. Define the purview-app-category type of this custom application definition. Apply this custom application definition in the purview-application-group on page 432 and purview-application-policy on page 436 contexts.

Supported on the following WiNG 7.1.2 APs:

- Access Points — AP505i, AP510i/e, AP560i/h

Syntax

```
purview-app-category <PURVIEW-APP-CATEGORY-NAME>
```

Parameters

```
purview-app-category <PURVIEW-APP-CATEGORY-NAME>
```

purview-app-category <PURVIEW-APP-CATEGORY-NAME>	Select the category best suited for this application definition. The *EAA*, formerly known as Purview™, supports 36 application categories with 2457 applications. Note: Refer to Examples below for the app-categories supported by the Purview™ engine. The default setting is *custom*. Use this option to categorize your internal custom applications, so that they do not appear as unknown traffic.

Examples

```
nx9500-6C8809(config-application-Custom)#purview-app-category
ads               biz               certs             cloud
cloudcpu          corp              custom            db
education         finance           games             health
location          mail              news              other
p2p               proto             realtimecomms     restrictcontent
search            shopping          social            sports
storage           streaming         travel            unknown
updates           vpn               webapp            webcontent
webfile           webmeet
nx9500-6C8809(config-application-Custom)#
```

The following example displays the canned (built-in, system-provided apps) starting with 'h':

```
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#application h [TAB]
hashforcash  hashunited  hoopla
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#
```

The following example, creates application definition 'hulu' and assigns it to the app-category 'streaming'.

```
nx9500-6C8809(config)#application hulu
nx9500-6C8809(config-application-hulu)#
nx9500-6C8809(config-application-hulu)#purview-app-category streaming
```

```
nx9500-6C8809(config-application-hulu)#show context
application hulu
 purview-app-category streaming
nx9500-6C8809(config-application-hulu)#
```

The following example shows 'hulu' application definition added to the list of available applications:

```
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#application h [TAB]
hashforcash  hashunited   hoopla hulu
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#
```

Related Commands

no on page 190	Resets application category to default (custom)

use

application on page 183

Associates a network-service alias or a URL list with this application definition

For applications using protocols other than HTTPS, use this command to define the protocols, ports, and/or URL host name to match.

Supported on the following WiNG 7.1.2 APs:

- Access Points — AP505i, AP510i/e, AP560i/h

Syntax

```
use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]
```

Parameters

```
use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]
```

use	Configures this application definition to use a network-service alias or a URL list
network-service <NETWORK-SERVICE-ALIAS-NAME>	Associates a network-service alias with this application definition • <NETWORK-SERVICE-ALIAS-NAME> – Specify the network-service alias name (should be existing and configured). The network-service alias should specify the protocols and ports to match.
url-list <URL-LIST-NAME>	Associates a URL list with this application definition. URL lists are utilized for whitelisting and blacklisting Web application URLs from being launched and consuming bandwidth within the WiNG managed network. • <URL-LIST-NAME> – Specify the URL list name (should be existing and configured). The URL list should specify the HTTP URL host names to match.

Examples

```
nx9500-6C8809(config-application-Bing)#use url-list Bing
nx9500-6C8809(config-application-Bing)#show context
application Bing
 description "Bing is Microsoft's web search engine"
```

```
 app-category streaming
 use url-list Bing
 https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#
```

Related Commands

no on page 190	Removes the network-service alias or the URL list associated with this application definition

no

application on page 183

Removes or resets this application definition's configured settings

Supported on the following WiNG 7.1.2 APs:

- Access Points — AP505i, AP510i/e, AP560i/h

Syntax

```
no [app-category|description|https|purview-app-category|use]
```

Note
The 'purview-app-category' parameter is applicable only on the WiNG 7.1.X, AP5XX model APs.

```
no [app-category|purview-app-category|description]
no https server-cert common-name [contains|ends-with] <WORD>
no use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes or resets this application definition's configured settings based on the parameters passed

Examples

The following example displays the application definition 'Bing' parameters before the 'no' commands are executed:

```
nx9500-6C8809(config-application-Bing)#show context
application Bing
 description "Bing is Microsoft's web search engine"
 app-category streaming
 use url-list Bing
 https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#
nx9500-6C8809(config-application-Bing)#no description
nx9500-6C8809(config-application-Bing)#no https server-cert common-name exact bing.com
```

The following example displays the application definition 'Bing' parameters after the 'no' commands are executed:

```
nx9500-6C8809(config-application-Bing)#show context
application Bing
 app-category streaming
 use url-list Bing
nx9500-6C8809(config-application-Bing)#
```

application-group

Global Configuration Commands on page 163

Creates an Application Group and enters its configuration mode. An application group is a collection of system-provided and/or user-defined applications. Application group allows you to enforce mandatory stats reporting for specific traffic types.

The WiNG 5.9.X OS uses a third-party DPI engine to implement *Application Visibility and Control* (AVC). It detects top-level hosting applications (layer 7) along with the services these applications host.

Use AVC to implement:

- Packet filtering - allow, deny or mark packets based on rules defined in the Application policy.
- Mandatory stats reporting - enable mandatory stats reporting for an application or set of applications defined in the Application group.

The `application-group` command is part of the mandatory stats reporting feature. To enable mandatory stats reporting, follow the steps below:

1 Create an application-group and specify the applications for which mandatory stats reporting is to be enabled.

Note
If the required application definition is not system-provided, use the `application` command to create a custom app signature.

2 Use this application-group in the NSight policy.

3 Apply the NSight policy in the RF Domain context.

Note
For more information and examples, see mandatory on page 420.

Note
For information on enabling mandatory stats reporting on WiNG 7.1.2 APs see `purview-application-group`.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
application-group <APPLICATION-GROUP-NAME>
```

Parameters

```
application-group <APPLICATION-GROUP-NAME>
```

application-group <APPLICATION-GROUP-NAME>	Creates an application group and enters its configuration mode • <APPLICATION-GROUP-NAME – Specify the application group name. If an application group with the specified name does not exist, it is created. The name should not exceed 32 characters in length.

Examples

```
nx9500-6C8809(config)#application-group amazon
nx9500-6C8809(config-app-group-amazon)#?
Application Group Mode commands:
  application  Add application to group
  description  Add application-group description
  no           Negate a command or set its defaults

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-app-group-amazon)#
```

Related Commands

no on page 611 (global-config-mode)	Removes an existing application group
application-policy on page 195	Creates an application policy and enters its configuration mode.
application on page 183	Creates an application definition and enters its configuration mode. Use this command to create customized application detection signatures.

application

application-group on page 191

Adds an application to this application group. You can add a system-provided or user-defined application.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
application <APPLICATION-NAME>
```

Parameters

```
application <APPLICATION-NAME>
```

application <APPLICATION-NAME>	Configures the application to be added to this application group • <APPLICATION-NAME> – Provide the application name (should be available as an option in the system). A maximum of eight (8) applications can be added to a group. Note: If the desired application is not available as an option, use the application on page 183 command to add it.

Examples

To view all applications available in the system, use [TAB], as shown in the following example:

```
nx9500-6C8809(config-app-group-test)#application [TAB]
Display all 300 possibilities? (y or n)
1-clickshare-com                1-upload-com
1-upload-to                     10upload-com

--More--
nx9500-6C8809(config-app-group-test)#
```

Select the desired application from the list displayed, as shown in the following examples:

```
nx9500-6C8809(config-app-group-amazon)#application amazon [TAB]
amazon-prime-music  amazon-prime-video  amazon_cloud  amazon_shop
nx9500-6C8809(config-app-group-amazon)#
nx9500-6C8809(config-app-group-amazon)#application amazon-prime-music
nx9500-6C8809(config-app-group-amazon)#application amazon-prime-video
nx9500-6C8809(config-app-group-amazon)#application amazon_cloud
nx9500-6C8809(config-app-group-amazon)#application amazon_shop
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
 application amazon-prime-music
 application amazon-prime-video
 application amazon_cloud
 application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
```

Note, the system returns an error message if the application entered is not listed, as shown in the following example:

```
nx9500-6C8809(config-app-group-test)#application bing
% Error: application 'bing' is not defined
nx9500-6C8809(config-app-group-test)#
```

Related Commands

no on page 194	Removes a specified application from this application group

description

application-group on page 191

Configures a description for this application group

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
description <WORD>
```

Parameters

```
description <WORD>
```

description <WORD>	Configures a description for this application group that uniquely differentiates it from other existing application groups • <WORD> – Provide a description not exceeding 80 characters in length.

Examples

```
nx9500-6C8809(config-app-group-amazon)#description "This application-group lists
 all Amazon applications."
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
 description "This application-group lists all Amazon applications."

no

application-group on page 191

Removes this application group's configured parameters (application and/or description)

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
no [application <APPLICATION-NAME>|description]
```

Parameters

```
no [application <APPLICATION-NAME>|description]
```

no <PARAMETERS>	Removes an application associated with this group, and removes this group's description

Examples

The following example displays the application-group ‘amazon’ configuration before the execution of ‘no’ commands:

```
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
 description "This application-group lists all Amazon applications."
 application amazon-prime-music
 application amazon-prime-video
 application amazon_cloud
 application amazon_shop
nx9500-6C8809(config-app-group-amazon)#

nx9500-6C8809(config-app-group-amazon)#no application amazon_cloud

nx9500-6C8809(config-app-group-amazon)#no description
```

The following example displays the application-group ‘amazon’ configuration after the execution of ‘no’ commands:

```
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
 application amazon-prime-music
 application amazon-prime-video
 application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
```

application-policy

Global Configuration Commands on page 163

Creates an application policy and enters its configuration mode. Application policies allow you to define rules that dictate how each traffic type is managed on your network. An application policy contains application (Layer 7) rules.

An application rule leverages the AP's *deep packet inspection* (DPI) engine to detect the underlying application to which a frame or flow belongs. The rule then applies access control and quality of service actions to all the traffic associated with the application, not just traffic destined for specific IP addresses or ports. The control actions regulate both access control and traffic engineering (rate limit, marking, and prioritization) for applications and groups.

Once created and configured, apply the application policy at the following levels within the network to enforce application assurance:

- RADIUS *change of authorization* (CoA) usage – In the device/profile configuration mode, use the **application-policy → radius → <APPLICATION-POLICY-NAME>** command to apply the policy to every user successfully authenticated by the RADIUS server.
- User role – In the role-policy-user-role configuration mode, use the **use → application-policy <APPLICATION-POLICY-NAME>** command to apply the policy to all users assigned to the role.

- WLAN – In the WLAN configuration mode, use the **use → application-policy <APPLICATION-POLICY-NAME>** command to apply the policy to all users accessing the WLAN.
- Bridge VLAN – In the bridge VLAN configuration mode, use the **use → application-policy <APPLICATION-POLICY-NAME>** command to apply the policy for the traffic corresponding to the bridged VLAN.

Note
The WiNG 7.1.2 enabled, AP5XX model access points implement application visibility and control through the purview-application-policy on page 436.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
application-policy <APPLICATION-POLICY-NAME>
```

Parameters

```
application-policy <APPLICATION-POLICY-NAME>
```

application-policy <APPLICATION-POLICY-NAME>	Specify the application policy name. If an application policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length.

Examples

```
nx9500-6C8809(config)#application-policy TestAppliPolicy
nx9500-6C8809(config-app-policy-TestAppliPolicy)#?
Application Policy Mode commands:
  allow             Allow packets
  deny              Deny packets
  description       Application policy description
  enforcement-time  Configure policy enforcement based on time
  logging           Application recognition logging
  mark              Mark packets
  no                Negate a command or set its defaults
  rate-limit        Rate-limit packets

  clrscr            Clears the display screen
  commit            Commit all changes made in this session
  do                Run commands from Exec mode
  end               End current mode and change to EXEC mode
  exit              End current mode and down to previous mode
  help              Description of the interactive help system
  revert            Revert changes
  service           Service Commands
  show              Show running system information
  write             Write running configuration to memory or terminal

```

Related Commands

no on page 611 (global-config-mode)	Removes an existing application policy
application on page 183	Creates an application definition and enters its configuration mode. Use this command to create customized application detection signatures.
application-group on page 191	Creates an application group and enters its configuration mode.

allow

application-policy on page 195

Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action applied

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] schedule
<SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

Parameters

```
allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] schedule
<SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

allow	Creates an allow rule and configures the match criteria. The options are app-category and application.
app-category [<APP-CATEGORY-NAME>|all]	Uses application category as the match criteria • <APP-CATEGORY-NAME> – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system forwards the packet or else drops it. • all – The system forwards all packets irrespective of the application category.
application <APPLICATION-NAME>	Uses application name as the match criteria • <APPLICATION-NAME> – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system forwards the packet. Note: The WiNG system provides approximately 309 canned applications. In addition to these, the database also includes custom-made applications. These are application definitions created using the application on page 183 command.

schedule <SCHEDULE-POLICY-NAME>	Schedules an enforcement time for this allow rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time. • schedule <SCHEDULE-POLICY-NAME> – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy > enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). • <SCHEDULE-POLICY-NAME> – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. **Note:** In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time on page 203.

precedence <1-256>	Assigns a precedence value for this allow rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.
	Let us consider application *youtube* belonging to app-category *streaming*. The action required is: Allow youtube packets, and deny all other applications belonging to app-category streaming.
	The rules can be defined as:
	`#allow application youtube precedence 1`
	`#deny app-category streaming precedence 2`
	The following configuration is incorrect:
	`#deny app-category streaming precedence 1`
	`#allow application youtube precedence 2`
	Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.
	The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

Examples

The following example shows how to view all built-in, system provided applications:

```
nx9500-6C8809(config-app-policy-test)#allow application [TAB]
Display all 300 possibilities? (y or n)
1-clickshare-com                    1-upload-com
1-upload-to                         10upload-com
123upload-pl                        139pan-com
163pan-com                          1clickshare-net
1fichier-com                        1kxun
2channel                            2gis
2shared-com                         360mobile
```

```
4fastfile-com                       4share-ws
Dota\ 2                             EA\ Origin
--More--
nx9500-6C8809(config-app-policy-test)#
```

The following examples show two allow rules, allowing access to all packets belonging to the application category ‘business’ and the application ‘Bing’:

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bi [TAB]
Bing                      BitTorrent                BitTorrent_encrypted
BitTorrent_plain          BitTorrent_uTP            BitTorrent_uTP_encrypted
nx9500-6C8809(config-app-policy-Bing)#
```

Note: Bing is not one of the WiNG built-in database applications. It is a customized application created using the application command.

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bing precedence 1
nx9500-6C8809(config-app-policy-Bing)#allow app-category [TAB]
all                   antivirus\ update    audio
business              conference           custom
database              filetransfer         gaming
generic               im                   mail
mobile                network\ management  other
p2p                   remote_control       social\ networking
standard              streaming            tunnel
video                 voip                 web
nx9500-6C8809(config-app-policy-Bing)#
nx9500-6C8809(config-app-policy-Bing)#allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 allow application Bing precedence 1
 allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#
```

The following example shows an application policy 'SocialNet' having an allow rule with an associated schedule policy named 'FaceBook':

```
nx9500-6C8809(config-app-policy-SocialNet)#allow application facebook schedule Facebook
precedence 1
nx9500-6C8809(config-app-policy-SocialNet)#show context
application-policy SocialNet
 description "This application policy relates to Social Networking sites."
 allow application facebook schedule FaceBook precedence 1
nx9500-6C8809(config-app-policy-SocialNet)#
```

The schedule policy ‘FaceBook’ configuration is as follows. As per this policy, the above allow rule will apply to all FaceBook packets every Friday between 13:00 and 18:00 hours.

```
nx9500-6C8809(config-schedule-policy-FaceBook)#show context
schedule-policy FaceBook
 description "Allows FaceBook traffic on Fridays."
 time-rule days friday start-time 13:00 end-time 18:00
nx9500-6C8809(config-schedule-policy-FaceBook)#
```

Related Commands

no on page 211	Removes this allow rule from the application policy

deny (application-policy-config-mode)

application-policy on page 195

Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] schedule
<SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

Parameters

```
deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] schedule
<SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

deny	Creates a deny rule and configures the match criteria. The options are app-category and application.
app-category [<APP-CATEGORY-NAME>|all]	Uses application category as the match criteria • <APP-CATEGORY-NAME> – Specify the application category name. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system drops the packet. • all – The system drops all packets irrespective of the application category.
application <APPLICATION-NAME>	Uses application name as the match criteria • <APPLICATION-NAME> – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system drops the packet. There are approximately 300 canned applications in the database. In addition to these, the database displays custom-made applications also. These are application definitions created using the application command.

schedule <SCHEDULE-POLICY-NAME>	Schedules an enforcement time for this deny rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time. • schedule <SCHEDULE-POLICY-NAME> – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the `application-policy > enforcement-time` command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). • <SCHEDULE-POLICY-NAME> – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time on page 203.

precedence <1-256>	Assigns a precedence value for this deny rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.
	Let us consider application *youtube* belonging to app-category *streaming*. The rules can be defined as:
	`#allow application youtube precedence 1`
	`#deny app-category streaming precedence 2`
	The following configuration is incorrect:
	`#deny app-category streaming precedence 1`
	`#allow application youtube precedence 2`
	Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.
	The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

Examples

The following example shows one deny rule, denying access to all packets belonging to the application category 'social\ networking':

```
nx9500-6C8809(config-app-policy-Bing)#deny app-category social\ networking precedence 3
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#
```

The following example displays the schedule policy 'DenyS-N' settings. The time-rule defined in the policy is all weekdays from 9:30 AM to 11:30 PM.

```
nx9500-6C8809(config-schedule-policy-DenyS-N)#show context
schedule-policy DenyS-N
 description "Denies all social Networking sites on weekdays."
 time-rule days weekdays start-time 09:30 end-time 23:30
nx9500-6C8809(config-schedule-policy-DenyS-N)#
```

The following example displays the schedule policy 'FaceBook' settings. The time-rule defined in the policy is Friday from 1:00 PM to 6:00 PM.

```
nx9500-6C8809(config-schedule-policy-FaceBook)#show context
schedule-policy FaceBook
 description "Allows FaceBook traffic on Fridays."
 time-rule days friday start-time 13:00 end-time 18:00
nx9500-6C8809(config-schedule-policy-FaceBook)#
```

The following example shows an application policy 'SocialNet' defining an allow and deny rule. Both rules have different enforcement time, defined by their respective schedule policies (DenyS-N and FaceBook). As per these two schedule policy settings, this application policy:

- Denies all social\ networking sites on weekdays (barring Fridays between 1:00 PM to 6:00 PM) from 9:30 AM to 11:30 PM.
- On Fridays, between 1:00 PM to 6:00 PM, it:
  - Denies all social\ networking sites except Facebook.

```
nx9500-6C8809(config-app-policy-SocialNet)#show context
application-policy SocialNet
 description "This application policy relates to Social Networking sites."
 allow application facebook schedule FaceBook precedence 1
 deny app-category "social networking" schedule DenyS-N precedence 2
nx9500-6C8809(config-app-policy-SocialNet)#
```

Related Commands

no on page 211	Removes this deny rule from the application policy

description

application-policy on page 195

Configures a brief description for this application policy that enables you to differentiate it from other application policies

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
description <LINE>
```

Parameters

```
description <LINE>
```

description <LINE>	Configures this application policy's description • <LINE> – Specify a brief description not exceeding 80 characters in length.

Examples

```
nx9500-6C8809(config-app-policy-Bing)#description "This application policy allows Bing
search engine packets"
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 description "This application policy allows Bing search engine packets"
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#
```

Related Commands

no on page 211	Removes this application policy's description

enforcement-time

application-policy on page 195

Configures an enforcement time period in days and hours for this application policy. The enforcement time is applicable only to those rules, within the application policy, that do not have a schedule policy associated. By default an application policy is enforced on all days.

Note

Schedule policies are a means of enforcing allow/deny/mark/rate-limit rules at different time periods. If no schedule policy is applied, all rules within an application policy are enforced at the time specified using this enforcement-time command. For more information on configuring a schedule policy, see schedule-policy on page 499.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|
weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}
```

Parameters

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|
weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}
```

enforcement-time days	Enforces this application policy on only on the days specified here • sunday – Enforces the policy only on Sundays • monday – Enforces the policy only on Mondays • tuesday – Enforces the policy only on Tuesdays • wednesday – Enforces the policy only on Wednesdays • thursday – Enforces the policy only on Thursdays • friday – Enforces the policy only on Fridays • saturday – Enforces the policy only on Saturdays • all – Enforces the policy on all days. This is the default setting. • weekends – Enforces the policy only on weekends • weekdays – Enforces the policy only on weekdays In case no enforcement time is specified, the application policy is enforced on all days (i.e., always active). If using schedule policies with the allow/deny/mark/rate-limit rules, the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting of 'all').
start-time <HH:MM> end-time <HH:MM>	Optional. Configures this application policy's enforcement period • start-time – Configures the start time. This is the time at which the application policy enforcement begins. • end-time – Configures the end time. This is the time at which the application policy enforcement ends. • <HH:MM> – Specify the start and end time in the HH:MM format.

Examples

```
nx9500-6C8809(config-app-policy-Bing)#enforcement-time days weekdays start-time 10:30 end-time 20:00
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 description "This application policy allows Bing search engine packets"
 enforcement-time days weekdays start-time 10:30 end-time 20:00
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#
```

Related Commands

no on page 211	Removes this application policy's enforcement period

logging

application-policy on page 195

Enables DPI application recognition logging. It also sets the logging level.

DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When enabled, DPI inspects packets of all flows to identify applications (such as, Netflix, Twitter, Facebook, etc.) and extract metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
logging [level|on]
logging on
logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings]
```

Parameters

```
logging on
```

logging on	Enables logging of application recognition hits made by the DPI engine. This option is disabled by default.

```
logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings]
```

logging level [<0-7>|alerts| critical| debugging| emergencies|errors| informational| notifications| warnings]	Sets the logging level for application recognition hits made by the DPI engine. This option is disabled by default. • <0-7> – Sets the message logging severity level on a scale of 0 - 7 • emergencies – Severity level 0: System is unusable • alerts – Severity level 1: Requires immediate action • critical – Severity level 2: Critical conditions • errors – Severity level 3: Error conditions • warnings – Severity level 4: Warning conditions • notifications – Severity level 5: Normal but significant conditions (this is the default setting) • informational – Severity level 6: Informational messages • debugging – Severity level 7: Debugging messages

Examples

```
nx9500-6C8809(config-app-policy-Bing)#logging level critical
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 description "This application policy allows Bing search engine packets"
 enforcement-time days weekdays start-time 12:30 end-time 20:00
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
 logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```

Related Commands

no on page 211	Resets the logging level to default (notifications). And the `no → logging → on` command disables DPI logging.

mark

application-policy on page 195

Creates a mark rule and configures the match criteria based on which packets are marked

Marks packets, matching a specified set of application categories or applications/protocols, with 802.1p priority level or DSCP ToS *(type of service)* code. Marking packets is a means of identifying them for specific actions, and is used to provide different levels of service to different traffic types.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

```
mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
[8021p <0-7>|dscp <0-63>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

Parameters

```
mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
[8021p <0-7>|dscp <0-63>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

mark	Creates a mark rule and configures the match criteria. When applied, the rule marks packets, matching the criteria configured here, with 802.1p priority value or DSCP code. The match criteria options are: app-category and application.
app-category [<APP-CATEGORY-NAME>|all]	Uses application category as the match criteria • <APP-CATEGORY-NAME> – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system marks the packet. • all – The system marks all packets irrespective of the application category.
application <APPLICATION-NAME>	Uses application name as the match criteria • <APPLICATION-NAME> – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system marks the packet. The WiNG database provides approximately 309 canned applications. In addition to these, the database includes custom-made applications. These are application definitions created using the application on page 183 command.
8021p <0-7>	Marks packets matching the specified criteria with 802.1p priority value • <0-7> – Specify a value from 0 - 7. The IEEE 802.1p signaling standard enables marking of layer 2 network traffic. Layer 2 network devices (such as switches), using 802.1p standards, group traffic into classes based on their 802.1p priority value, which is appended to the packet's MAC header. In case of traffic congestion, packets with higher priority get precedence over lower priority packets and are forwarded first.

dscp <0-63>	Marks packets matching the specified criteria with DSCP ToS code • <0-63> – Specify a value from 0 - 63. The DSCP protocol marks layer 3 network traffic. Layer 3 network devices (such as routers) using DSCP, mark each layer 3 packet with a six-bit DSCP code, which is appended to the packet's IP header. Each DSCP code is assigned a corresponding level of service, enabling packet prioritization.
schedule <SCHEDULE-POLICY-NAME>	Schedules an enforcement time for this mark rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time. • schedule <SCHEDULE-POLICY-NAME> – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy > enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). • <SCHEDULE-POLICY-NAME> – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time on page 203.

precedence <1-256>	Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.
	Let us consider application *youtube* belonging to app-category *streaming*. The action required is: Allow youtube packets and deny all other applications belonging to app-category streaming.
	The rules can be defined as:
	`#allow application youtube precedence 1`
	`#deny app-category streaming precedence 2`
	The following configuration is incorrect:
	`#deny app-category streaming precedence 1`
	`#allow application youtube precedence 2`
	Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.
	The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

Examples

```
nx9500-6C8809(config-app-policy-Bing)#mark app-category video dscp 9 precedence 4
nx9500-6C8809(config-app-policy-Bing)#mark application facetime dscp 10 precedence 5
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 description "This application policy allows Bing search engine packets"
 enforcement-time days weekdays start-time 12:30 end-time 20:00
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
 mark app-category video dscp 9 precedence 4
 mark application facetime dscp 10 precedence 5
 logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```

Related Commands

no on page 211	Removes this mark rule from the application policy

rate-limit

application-policy on page 195

Creates a rate-limit rule and configures the match criteria

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
rate-limit [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> schedule <SCHEDULE-POLICY-
NAME> (precedence <1-256>)
```

Parameters

```
rate-limit [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> schedule <SCHEDULE-POLICY-
NAME> (precedence <1-256>)
```

rate-limit	Creates a rate-limit rule and configures the match criteria. When applied, the rule applies a rate-limit to packets that match the criteria configured here. These packets could be incoming, outgoing, or both. The match criteria options are: *app-category* and *application*.
app-category [<APP-CATEGORY-NAME>|all]	Uses application category as the match criteria • <APP-CATEGORY-NAME> – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system rate-limits the packet. • all – The system rate-limits all packets irrespective of the application category.

application <APPLICATION-NAME>	Uses application name as the match criteria • <APPLICATION-NAME> – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system rate-limits the packet.
[egress|ingress]	The egress and ingress parameters are recursive and can be used to rate limit either incoming, outgoing, or both incoming and outgoing traffic. • egress – Selects the traffic type as outgoing • ingress – Selects the traffic type as outgoing After selecting the traffic type (incoming/outgoing) configure the rate and maximum burst size.
rate <50-1000000>	The following parameters are common to the 'egress' and 'ingress' keywords: • rate – Configures the rate limit, in Kbps, for both incoming and outgoing packets • <50-1000000> – Specify the rate limit from 50 - 1000000 Kbps.
max-burst-size	The following parameters are common to the 'egress' and 'ingress' keywords: • max-burst-size – Configures the maximum burst size, in Kbytes, for both incoming and outgoing packets • <2-1024> – Specify the maximum burst size from 2 - 1024 Kbytes.

schedule <SCHEDULE-POLICY-NAME>	Schedules an enforcement time for this rate-limit rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time. • schedule <SCHEDULE-POLICY-NAME> – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the `application-policy > enforcement-time` command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). • <SCHEDULE-POLICY-NAME> – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time.

precedence <1-256>	Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.
	Let us consider application *youtube* belonging to app-category *streaming*. The action required is: Allow youtube packets and deny all other applications belonging to app-category streaming.
	The rules can be defined as:
	`#allow application youtube precedence 1`
	`#deny app-category streaming precedence 2`
	The following configuration is incorrect:
	`#deny app-category streaming precedence 1`
	`#allow application youtube precedence 2`
	Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.
	The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

Examples

```
nx9500-6C8809(config-app-policy-Bing)#rate-limit application BGP ingress rate 100
max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 description "This application policy allows Bing search engine packets"
 enforcement-time days weekdays start-time 12:30 end-time 20:00
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
 mark app-category video dscp 9 precedence 4
```

```
 mark application facetime dscp 10 precedence 5
 rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-
size 25 precedence 6
 logging level critical
nx9500-6C8809(config-app-policy-Bing)#

size 25 precedence 6
 logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```

association-acl-policy

Configures an association ACL policy. This policy defines a list of devices allowed or denied access to the network.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>
```

Parameters

```
association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>
```

<ASSOCIATION-ACL-POLICY-NAME>	Specify the association ACL policy name. If the policy does not exist, it is created.

Examples

```
NOC-NX9500(config)#association-acl-policy test
NOC-NX9500(config-assoc-acl-test)#?
Association ACL Mode commands:
  deny     Specify MAC addresses to be denied
  no       Negate a command or set its defaults
  permit   Specify MAC addresses to be permitted

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
```

```
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

NOC-NX9500(config-assoc-acl-test)#
```

Related Commands

no on page 611	Removes this Association ACL Policy

Note
For more information on the association-acl-policy, see Association-ACL Policy on page 1348.

auto-provisioning-policy

Configures an auto provisioning policy. This policy configures the automatic provisioning of device adoption. The policy configures how an AP is adopted based on its type.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>
```

Parameters

```
auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>
```

<AUTO-PROVISIONING-POLICY-NAME>	Specify the auto provisioning policy name. If the policy does not exist, it is created.

Examples

```
NOC-NX9500(config)#auto-provisioning-policy test
NOC-NX9500(config-auto-provisioning-policy-test)#?
Auto-Provisioning Policy Mode commands:
  adopt                     Add rule for device adoption
  auto-create-rfd-template  When RF Domain specified by the matching rule
                            template does not exist create new RF Domain
                            automatically
  default-adoption          Adopt devices even when no matching rules are
                            found.  Assign default profile and default
                            rf-domain
  deny                      Add rule to deny device adoption
  evaluate-always           Set the flag to evaluate the policy everytime,
                            regardless of previous adoption status
  no                        Negate a command or set its defaults
  redirect                  Add rule to redirect device adoption
  upgrade                   Add rule for device upgrade

  clrscr                    Clears the display screen
  commit                    Commit all changes made in this session
  do                        Run commands from Exec mode
```

```
  end                          End current mode and change to EXEC mode
  exit                         End current mode and down to previous mode
  help                         Description of the interactive help system
  revert                       Revert changes
  service                      Service Commands
  show                         Show running system information
  write                        Write running configuration to memory or terminal

NOC-NX9500(config-auto-provisioning-policy-test)#
```

Related Commands

no on page 611	Removes an existing Auto Provisioning policy

Note

For more information on the auto-provisioning-policy, see Auto-Provisioning Policy on page 1326.

bgp

Configures BGP *(Border Gateway Protocol)* settings

BGP is an inter-ISP routing protocol which establishes routing between ISPs *(Internet Service Providers)*. ISPs use BGP to exchange routing and reachability information between AS *(Autonomous Systems)* on the Internet. BGP makes routing decisions based on paths, network policies and/or rules configured by network administrators. The primary role of a BGP system is to exchange network reachability information with other BGP peers. This information includes information on AS that the reachability information traverses. This information is sufficient to create a graph of AS connectivity from which routing decisions can be created and rules enforced.

An AS is a set of routers under the same administration that use IGP *(Interior Gateway Protocol)* and common metrics to define how to route packets within the AS. AS uses inter-AS routing to route packets to other ASs. For an external AS, an AS appears to have a single coherent interior routing plan and presents a consistent picture of the destinations reachable through it.

Routing information exchanged through BGP supports only destination based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgment, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a graceful close (all outstanding data is delivered before the connection is closed).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-
NAME>
```

Parameters

```
bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-
NAME>
```

as-path-list <LIST-NAME>	Creates an AS path list and enters its configuration mode • <LIST-NAME> – Provide the AS-PATH-LIST name.
community-list <LIST-NAME>	Creates a community list and enters its configuration mode • <LIST-NAME> – Provide the COMMUNITY-LIST name.
extcommunity-list <LIST-NAME>	Creates an extended community list and enters its configuration mode • <LIST-NAME> – Provide the EXTCOMMUNITY-LIST name.
ip-access-list <LIST-NAME>	Creates a BGP IP access list and enters its configuration mode • <LIST-NAME> – Provide the BGP IP-ACCESS-LIST name.
ip-prefix-list <LIST-NAME>	Creates a BGP IP prefix list and enters its configuration mode • <LIST-NAME> – Provide the BGP IP-PREFIX-LIST name.

Examples

```
nx9500-6C8809(config)#bgp ?
  as-path-list       BGP AS path list Configuration
  community-list     Add a community list entry
  extcommunity-list  Add a extended community list entry (EXPERIMENTAL)
  ip-access-list     Add an access list entry
  ip-prefix-list     Build a prefix list

nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#bgp as-path-list AS-TEST-PATH
nx9500-6C8809(config-bgp-as-path-list-AS-TEST-PATH)#?
BGP AS Path List Mode commands:
  deny     Specify packets to reject
  no       Negate a command or set its defaults
  permit   Specify packets to forward

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-bgp-as-path-list-AS-TEST-PATH)#
```

Related Commands

no on page 611	Modifies BGP settings, based on the parameters passed

Note
For more information on the association-acl-policy, see Border Gateway Protocol on page 1867.

ble-data-export-policy

Creates a BLE data export policy and enters its configuration mode. This policy enables forwarding of BLE *(Bluetooth Low Energy)* data to an external, third-party server.

The BLE data export policy provides the external, third-party server's REST URL. After configuring the policy apply it on an RF Domain. Once applied, BLE-enabled, WiNG APs, within the domain, sense BLE iBeacon and Eddystone beacons from other BLE-enabled devices and forward device data to the specified third-party server. This data is forwarded in the JASON format.

Note

The following WiNG access points support BLE data forwarding: AP7632, AP7662

Before enabling BLE data export, ensure that the APs' Bluetooth radio is active and the mode is set to 'le-sensor'. For more information on configuring the Bluetooth settings on the AP's profile/device context, see interface-config-bluetooth-instance on page 1152.

After configuring the policy, in the RF Domain context,

- use the BLE data export policy. For more information, see use (rf-domain-config-mode) on page 488.
- use a sensor policy to define the interval at which data is forwarded. For more information, see use (rf-domain-config-mode) on page 488.

Supported in the following platforms:

- Access Points — AP7612, AP7632, AP7662, AP8432, AP8533

  Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Note

Not supported on AP505 and AP510.

Syntax

```
ble-data-export-policy <POLICY-NAME>
```

Parameters

```
ble-data-export-policy <POLICY-NAME>
```

<POLICY-NAME>	Specify the policy name. If a BLE data export policy with the specified name does not exist, it is created. **Note:** The name should not exceed 32 characters in length.

Examples

```
NOC-NX9500(config)#ble-data-export-policy test
NOC-NX9500(config-ble-data-export-policy-test)#?
Ble Data Export Policy Mode commands:
  no       Negate a command or set its defaults
```

```
  rest     Configure the url to send the real time RSSI feed to

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

NOC-NX9500(config-ble-data-export-policy-test)#
```

Related Commands

no on page 611	Removes an existing BLE data export policy

rest (ble-data-export-commands)

Configures the third-party, BLE-locationing server's URL. This is the external resource to which WiNG APs forward BLE data (UUID, RSSI, etc.) using the REST API. The data is forwarded in the JASON format.

Syntax

```
rest <URL>
```

Parameters

```
rest <URL>
```

rest <URL>	Configures the third-party server's URL • <URL> – Enter the URL. This is the location of the resource to which WiNG APs send real-time RSSI feeds.

Examples

```
ap8432-070235(config-ble-data-export-policy-test)#rest https://test.com/12/
ap8432-070235(config-ble-data-export-policy-test)#show context
ble-data-export-policy test
 rest https://test.com/12/
ap8432-070235(config-ble-data-export-policy-test)#
```

The following example shows the configurations will have to configure the following parameters to enable BLE data forwarding:

1 On the WiNG AP's profile/device context, configure the following Bluetooth parameters:

```
ap8432-070235(config-profile-test-if-bluetooth1)#mode le-sensor
ap8432-070235(config-profile-test-if-bluetooth1)#no shutdown
ap8432-070235(config-profile-test-if-bluetooth1)#show context
 interface bluetooth1
  no shutdown
  mode le-sensor
ap8432-070235(config-profile-test-if-bluetooth1)#
```

This enables the AP as a BLE sensor.

2 On the APs' controller,

a Configure a BLE data export policy, pointing to the external, third-party, REST end-point.

```
NOC-NX9500(config-ble-data-export-policy-test)#rest https://test.com/12/
```

b Configure a sensor policy.

```
NOC-NX9500((config-sensor-policy-test)#rssi-interval-duration 30
```

c Navigate to the BLE-enabled, WiNG AP's RF Domain context and:

- Use the BLE data export policy, configured in step 2a.

```
NOC-NX9500(config-rf-domain-ble)#use ble-data-export-policy test
```

This enables BLE data forwarding to the external, third-party server specified in the policy.

- Use the sensor policy, configured in step 2b.

```
NOC-NX9500(config-rf-domain-ble)#use sensor-policy test
```

When applied, BLE data is forwarded at the interval specified in the sensor policy.

Related Commands

no (ble-data-export-commands) on page 218	Removes the REST endpoint URL configuration
sensor-policy on page 503	Documents the Sensor policy configuration commands

no (ble-data-export-commands)

Removes the BLE data export policy settings

Syntax

```
no rest
```

Parameters

```
no rest
```

no rest	Removes the REST API endpoint's URL (in this case it is the third-party locationing server)

Examples

The following example shows the BLE Data Export policy 'test' settings before the 'no' command is executed:

```
ap8432-070235(config-ble-data-export-policy-test)#show context
ble-data-export-policy test
 rest https://test.com/12/
ap8432-070235(config-ble-data-export-policy-test)#
ap8432-070235(config-ble-data-export-policy-test)#no rest
```

The following example shows the BLE Data Export policy ‘test’ settings after the ‘no’ command was executed:

```
ap8432-070235(config-ble-data-export-policy-test)#show context
ble-data-export-policy test
ap8432-070235(config-ble-data-export-policy-test)#
```

bonjour-gw-discovery-policy

Bonjour is Apple’s zero-configuration networking (Zeroconf) implementation. Bonjour enables automatic IP address assignment, name to address resolution, and service discovery without having to configure a DHCP server, DNS server, and Directory server. When configured and applied on a WLAN, the Bonjour Gateway Discovery policy queries for and locates Bonjour devices (printers, computers, file-sharing servers, etc.) and services these computers provide over a local network. Bonjour works only within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.

Use this command to configure a Bonjour GW Discovery policy. The policy defines a list of services clients can discover across subnets. A maximum of 8 (eight) policies can be created on access points, wireless controllers, or service platforms.

When configured and applied, this feature enables Bonjour services on local and tunneled VLANs.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
bonjour-gw-discovery-policy <POLICY-NAME>
```

Parameters

```
bonjour-gw-discovery-policy <POLICY-NAME>
```

<POLICY-NAME>	Specify the Bonjour GW Discovery policy name. If the policy does not exist, it is created. In the Bonjour GW Discovery policy configuration mode, use the allow-service keyword to configure the services that the Bonjour gateway is allowed to discover. A maximum of 16 (sixteen) service rules can be created. Optionally, you can restrict this facility for users on specific VLANs. To do so, specify the VLAN IDs. Execute the bonjour-gw-forwarding-policy command to enable forwarding of Bonjour service responses across VLANs. To associate a Bonjour GW Discovery policy with a WLAN, in the WLAN configuration mode, execute the following command: `use > bonjour-gw-discovery-policy > <POLICY-NAME>`. For more information, see use (wlan-config-mode) on page 575. To associate a Bonjour GW Discovery policy with a VLAN, in the interface VLAN configuration mode, execute the following command: `use > bonjour-gw-discovery-policy > <POLICY-NAME>`. For more information, see use on page 1057. To associate a Bonjour GW Discovery policy with a user role, in the role-policy - user-role - configuration mode, execute the following command: `use > bonjour-gw-discovery-policy > <POLICY-NAME>`. For more information, see use on page 1631.

Examples

```
nx9500-6C8809(config)#bonjour-gw-discovery-policy TestPolicy
nx9500-6C8809(config-bonjour-gw-discovery-policy-TestPolicy)#?
 commands:
  allow-service  Allow Bonjour Service on local or tunneled vlan,Optionally
                 VLAN IDs can be given so service will be discovered for those
                 vlan only
  no             Negate a command or set its defaults

  clrscr         Clears the display screen
  commit         Commit all changes made in this session
  do             Run commands from Exec mode
  end            End current mode and change to EXEC mode
  exit           End current mode and down to previous mode
  help           Description of the interactive help system
  revert         Revert changes
  service        Service Commands
  show           Show running system information
  write          Write running configuration to memory or terminal

nx9500-6C8809(config-bonjour-gw-discovery-policy-TestPolicy)#sIsEtU_@3691
```

Related Commands

no on page 611	Removes an existing Bonjour GW Discovery policy

allow-service

Enables discovery of Bonjour devices and the services they provide on Local or Tunneled VLANs

Syntax

```
allow-service <BONJOUR-SERVICE-NAME> [local|tunneled]
allow-service <BONJOUR-SERVICE-NAME> local {instance-name contains <WORD>}
({service-vlans <WORD>})
allow-service <BONJOUR-SERVICE-NAME> tunneled {instance-name contains <WORD>}
```

Parameters

```
allow-service <BONJOUR-SERVICE-NAME> local {instance-name contains <WORD>}
({service-vlans <WORD>})
```

allow-service <BONJOUR-SERVICE-NAME>	Configures the services that can be discovered by the Bonjour gateway. And also configures the VLANs on which the selected services can be discovered. • <BONJOUR-SERVICE-NAME> – You can either select the Bonjour services from a set of system-provided, pre-defined Apple services, or use an existing alias to define a service not available in the predefined list. The predefined Apple services available are: Afp, AirPlay, AirPort, AirPrint, AirTunes, AppleTimeMachine, Chromecast, Daap, HomeSharing, Printer, and Scanner. Use the <WORD> keyword to define a service not included in the system-provided, pre-defined list. Ensure this device is registered with the Multicast DNS Responder (mDNSResponder).
local	Select to enable the discovery of the selected Bonjour Services on the local VLAN
instance-name contains <WORD>	Optional. Specifies the selected Bonjour service's instance name. When specified, the Bonjour service discovery queries contain the instance name. of the service to be discovered. This option is useful especially in large distributed, enterprise networks. Use it to create different instances of a Bonjour service for the different organizations or departments (VLANs) within your network. Creating instances allows you to advertise specific service instances for a specific set of VLANs, instead of advertising top-level Bonjour Services to various allocated VLAN(s). • contains <WORD> – Specify the instance name. You can either directly specify the string value to be used as a match criteria, or use a string alias (for example, $BONJOUR-STRING) to identify the string to match. If using a string alias, ensure that it is existing and configured. For information on configuring a string alias, see alias on page 172.
service-vlans <WORD>	Optional. Configures a VLAN or a list of VLANs on which the selected service is discoverable. When specified, Bonjour discovery queries are delivered to all clients on the specified VLANs. Applicable only if enabling Bonjour Services discovery on local VLANs.

```
allow-service <BONJOUR-SERVICE-NAME> tunneled {instance-name contains <WORD>}
```

allow-service <BONJOUR-SERVICE-NAME>	Configures the services that can be discovered by the Bonjour gateway. And also configures the VLANs on which the selected services can be discovered. • <BONJOUR-SERVICE-NAME> – You can either select the Bonjour Services from a set of system-provided, pre-defined Apple services, or use an existing alias to define a service not available in the predefined list. The predefined Apple services available are: Afp, AirPlay, AirPort, AirPrint, AirTunes, AppleTimeMachine, Chromecast, Daap, HomeSharing, Printer, and Scanner. Use the <WORD> keyword to define a service not included in the system-provided, predefine list.
tunneled	Select to enable the discovery of the selected Bonjour Services on tunneled VLANs
instance-name contains <WORD>	Optional. Adds a Bonjour Service instance name. If you have a large enterprise network, use this option to create different Bonjour Service instances for the different organizations or departments (VLANS) within your network. Creating instances allows you to advertise specific service instances for a specific set of VLANs, instead of advertising top-level Bonjour Services to various allocated VLAN(s). • contains <WORD> – Specify the sub-string to match. You can either directly specify the string value to be used as a match criteria, or use a string alias (for example, $BONJOUR-STRING) to identify the string to match. If using a string alias, ensure that it is existing and configured. For information on configuring aliases, see alias on page 172.

Examples

```
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#allow-service Printer lo
cal instance-name contains $Bonjour_Service service-vlans 1,2
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains $Bonjour_Service
 allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#
```

Following example configures the string alias named $Bonjour_Service:

```
nx9500-6C8809(config)#alias string $Bonjour_Service admin
nx9500-6C8809(config)#commit
nx9500-6C8809(config)#show context include-factory | include alias string
alias string $Bonjour_Service admin
nx9500-6C8809(config)#
```

Related Commands

no on page 611	Removes or modifies this Bonjour Gateway Discovery Policy settings

no

Removes or modifies the Bonjour Gateway Discovery policy settings

Syntax

```
no allow-service <BONJOUR-SERVICE-NAME> [local|tunneled] {service-vlans <WORD>}
```

Parameters

```
no allow-service <BONJOUR-SERVICE-NAME> [local|tunneled] {service-vlans <WORD>}
```

no <parameters>	Removes allow-service rules in the selected Bonjour GW Discovery policy, based on the parameters passed

Examples

The following example shows the Bonjour GW Discovery policy 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains $Bonjour_Service
 allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#
nx9500-6C8809(config-bonjour-gw-discovery-policy-test1)#no allow-service Afp local
```

The following example shows the Bonjour GW Discovery policy 'test' settings after the 'no' command was executed:

```
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains $Bonjour_Service
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#
```

bonjour-gw-forwarding-policy

Configures a Bonjour GW Forwarding policy. When configured and applied on the controller, the policy defines the service VLANs (the VLANs on which Bonjour services are running) and client VLANs where clients are present. All Bonjour responses from service VLANs are forwarded to client VLANs. A maximum of 2 (two) policies can be created on a wireless controller or service platform. And only 1 (one) policy can be created on an access point.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
bonjour-gw-forwarding-policy <POLICY-NAME>
```

Parameters

```
bonjour-gw-forwarding-policy <POLICY-NAME>
```

<POLICY-NAME>	Specify the Bonjour GW Forwarding policy name. If the policy does not exist, it is created. To receive Bonjour service responses from specific VLANs, specify the VLAN IDs. In the Bonjour GW Forwarding policy configuration mode, provide a list of VLAN IDs from which Bonjour responses can be received (format: 10-20, 25, 30-35). And then specify the list of client VLANs that can access Bonjour services. Execute the bonjour-gw-discovery-policy command to define the Bonjour services allowed on local and tunneled VLANs. To associate a Bonjour GW Forwarding policy with a device or profile, in the profile/device configuration mode, execute the `use > bonjour-gw-forwarding-policy > <POLICY-NAME>` command. For more information, see use (profile/device-config-mode-commands) on page 1247.

Examples

```
nx9500-6C8809(config)#bonjour-gw-forwarding-policy test
nx9500-6C8809(config-bonjour-gw-forwarding-policy-test)#?
(config-bonjour-gw-forwarding-policy) commands:
  forward-bonjour-response  Forwards bonjour service response across vlans
  no                        Negate a command or set its defaults

  clrscr                    Clears the display screen
  commit                    Commit all changes made in this session
  do                        Run commands from Exec mode
  end                       End current mode and change to EXEC mode
  exit                      End current mode and down to previous mode
  help                      Description of the interactive help system
  revert                    Revert changes
  service                   Service Commands
  show                      Show running system information
  write                     Write running configuration to memory or terminal

nx9500-6C8809(config-bonjour-gw-forwarding-policy-test)#
```

Related Commands

no on page 611	Removes an existing Bonjour GW Forwarding policy

bonjour-gw-query-forwarding-policy

Configures a Bonjour GW Query Forwarding policy and enters its configuration mode. When created and applied, this policy enables forwarding of Bonjour queries across VLANs.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
bonjour-gw-query-forwarding-policy <POLICY-NAME>
```

Parameters

```
bonjour-gw-query-forwarding-policy <POLICY-NAME>
```

<POLICY-NAME>	Specify the Bonjour GW Query Forwarding policy name. If the policy does not exist, it is created. In the Bonjour GW Query Forwarding policy configuration mode, specify the 'from' and 'to' VLAN(s). The from-vlans option configures the VLAN(s) that are the source of the Bonjour queries. The to-vlans option configures the destination VLAN(s) that can access the Bonjour queries. To associate a Bonjour GW Query Forwarding policy with a device or profile, in the profile/device configuration mode, execute the `use > bonjour-gw-query-forwarding-policy > <POLICY-NAME>` command. For more information, see use (profile/device-config-mode-commands) on page 1247.

Examples

```
nx9500-6C8809(config)#bonjour-gw-query-forwarding-policy test
nx9500-6C8809(config-bonjour-gw-query-forwarding-policy-test)#?
(config-bonjour-gw-query-forwarding-policy) commands:
  forward-bonjour-query  Forwards bonjour query across vlans
  no                     Negate a command or set its defaults

  clrscr                 Clears the display screen
  commit                 Commit all changes made in this session
  do                     Run commands from Exec mode
  end                    End current mode and change to EXEC mode
  exit                   End current mode and down to previous mode
  help                   Description of the interactive help system
  revert                 Revert changes
  service                Service Commands
  show                   Show running system information
  write                  Write running configuration to memory or terminal

nx9500-6C8809(config-bonjour-gw-query-forwarding-policy-test)#
```

Related Commands

no on page 611	Removes an existing Bonjour GW Query Forwarding policy

captive-portal

Configures a captive portal policy and enters its configuration mode. Once created and configured, use the captive portal policy in the WLAN context, and in the device/profile contexts of the access point or controller hosting the captive portal server.

A captive portal is a browser-based authentication mechanism that forces unauthenticated users to a web page. Captive portals capture and re-direct a wireless user's web-browser session to a captive portal login page where the user must enter valid credentials to access the wireless network. Once logged into the captive portal, additional *Acknowledgment*, *Agreement*, *Welcome*, *No Service* and *Fail* customized pages enhance screen flow and user experience.

Captive portals are recommended for providing guests or visitors authenticated access to network resources when 802.1X EAP is not a viable option. Captive portal authentication does not provide end-user data encryption, but it can be used with static WEP, WPA-PSK or WPA2-PSK encryption.

Authentication for captive portal access requests is performed using a username and password pair, authenticated by an integrated RADIUS server. Authentication for private network access is conducted either locally on the requesting wireless client, or centrally at a data center.

Captive portals use a Web provisioning tool to create guest user accounts directly on the controller, service platform, or access point. The connection medium defined for the Web connection is either HTTP or HTTPS. Both HTTP and HTTPS use a request and response procedure to disseminate information to and from requesting wireless clients.

Syntax

```
captive-portal <CAPTIVE-PORTAL-NAME>
```

Parameters

```
captive-portal <CAPTIVE-PORTAL-NAME>
```

<CAPTIVE-PORTAL-NAME>	Specify the captive portal name. If a captive portal with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#captive-portal test
nx9500-6C8809(config-captive-portal-test)#?
Captive Portal Mode commands:
  access-time                 Allowed access time for the client. Used when
                              there is no session time in radius response
  access-type                 Access type of this captive portal
  accounting                  Configure how accounting records are created for
                              this captive portal policy
  bypass                      Bypass captive portal
  connection-mode             Connection mode for this captive portal
  custom-auth                 Custom user information
  data-limit                  Enforce data limit for clients
  frictionless-onboarding     Register the client MAC address at ExtremeGuest
                              on redirection
  inactivity-timeout          Inactivity timeout in seconds. If a frame is not
                              received from client for this amount of time,
                              then current session will be removed
  ipv6                        Internet Protocol version 6 (IPv6)
  localization                Configure the FQDN address to get the
                              localization parameters for the client
  logout-fqdn                 Configure the FQDN address to logout the session
                              from client
  no                          Negate a command or set its defaults
  oauth                       OAuth 2.0 authentication configuration
  php-helper                  Configure the captive portal to use a server for
                              help with php
  post-authentication-vlan    Configure post authentication vlan for captive
                              portal users
  radius-vlan-assignment      Enable radius vlan assignment for captive portal
                              users
  redirection                 Configure connection redirection parameters
  report-loyalty-application  Report customer loyalty application presence in
                              clients
  server                      Configure captive portal server parameters
```

```
  simultaneous-users          Particular username can only be used by a
                              certain number of MAC addresses at a time
  terms-agreement             User needs to agree for terms and conditions
  use                         Set setting to use
  webpage                     Configure captive portal webpage parameters
  webpage-auto-upload         Enable automatic upload of internal and advanced
                              webpages
  webpage-location            The location of the webpages to be used for
                              authentication. These pages can either be hosted
                              on the system or on an external web server.
  welcome-back                Welcome back page settings

  clrscr                      Clears the display screen
  commit                      Commit all changes made in this session
  do                          Run commands from Exec mode
  end                         End current mode and change to EXEC mode
  exit                        End current mode and down to previous mode
  help                        Description of the interactive help system
  revert                      Revert changes
  service                     Service Commands
  show                        Show running system information
  write                       Write running configuration to memory or
                              terminal
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

captive-portal-mode-commands

The following table summarizes captive portal configuration mode commands:

Table 7: Captive-Portal-Mode Commands

Command	Description
access-time on page 229	Defines a client's access time. It is used when no session time is defined in the RADIUS response.
access-type on page 229	Configures a captive portal's access type
accounting on page 230	Enables a captive portal's accounting records
bypass on page 231	Enables bypassing of captive portal detection requests
connection-mode on page 232	Configures a captive portal's connection mode
custom-auth on page 232	Configures custom user information
data-limit on page 233	Enforces data limit on captive portal clients
frictionless-onboarding on page 234	Enables wireless clients, associated with guest WLANs, to self-register with the ExtremeGuest server.
inactivity-timeout on page 237	Defines an inactivity timeout in seconds
ipv6 on page 237	Configures the IPv6 address of the internal captive portal server
localization on page 238	Configures an FQDN address string that enables the client to receive localization parameters. This command also allows the configuration of a response message.

Table 7: Captive-Portal-Mode Commands (continued)

Command	Description
logout-fqdn on page 240	Clears the logout FQDN address
no on page 261	Reverts the selected captive portal's settings or resets settings to default
oauth on page 240	Enables OAuth-based authentication support on the captive portal. When enabled, OAuth allows captive-portal users to sign in to guest WLANs using their Facebook or Google credentials.
php-helper on page 242	Configures a PHP helper to serve the captive portal's PHP splash pages to guest users using social-media to login to the captive portal.
post-authentication-vlan on page 243	Assigns a post authentication RADIUS VLAN for this captive portal's users
radius-vlan-assignment on page 244	Assigns a RADIUS VLAN for this captive portal
redirection on page 245	Enables redirection of client connections to specified destination ports
report-royalty-application on page 245	Enables detection of captive portal client's loyalty application presence and stores this information in the captive portal's user database
server on page 246	Configures the captive portal server settings
simultaneous-users on page 248	Specifies a username used by a MAC address pool
terms-agreement on page 249	Enforces the user to agree to terms and conditions (included in login page) for captive portal access
use (captive-portal-config-mode) on page 250	Associates a AAA policy and a DNS whitelist with a captive portal
webpage on page 251	Configures captive portal Web page settings
webpage-auto-upload on page 259	Enables automatic upload of advanced Web pages on a captive portal
webpage-location on page 260	Specifies the location of Web pages used for captive portal authentication
welcome-back on page 260	Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins
configuring-device-registration-with-dynamic-vlan-assignment on page 263	Provides the configuration details required to enable device registration with dynamic VLAN assignment in a multi-vendor environment.
configuring WeChat Wi-Fi hotspot support in WiNG captive portal on page 265	Provides configuration detals required to enable WeChat Wi-Fi hotspot support in WiNG captive portal.
configuring ExtremeGuest captive portal on page 267	Provides the basic configurations required to deploy an *ExtremeGuest* setup

access-time

Defines the permitted access time for a client. It is used when no session time is defined in the RADIUS response.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
access-time <10-10080>
```

Parameters

```
access-time <10-10080>
```

<30-10080>	Defines the access time allowed for a wireless client from 10 - 10080 minutes. The default is 1440 minutes.

Examples

```
nx9500-6C8809(config-captive-portal-test)#access-time 35
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Reverts to the default permitted access time (1440 minutes)

access-type

Defines the captive portal's access type. The authentication scheme configured here is applied to wireless clients requesting captive portal guest access to the WiNG network.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
access-type [custom-auth-radius|logging|no-auth|radius|registration]
```

Parameters

```
access-type [custom-auth-radius|logging|no-auth|radius|registration]
```

custom-auth-radius	Specifies the custom user information used for authentication (RADIUS lookup of given information, such as name, e-mail address, telephone, etc.). When configured, accessing clients are required to provide a 1-32 character lookup data string used to authenticate their credentials. When selecting this option, use the custom-auth command to configure the required user information.
logging	Enables logging of user access details.
no-auth	Defines no authentication required for a guest. Requesting clients are redirected to the captive portal Welcome page without authentication.

radius	Enables RADIUS authentication for wireless clients. A requesting client's user credentials require authentication before access to the captive portal is permitted. This is the default setting.
registration	Enables captive portal's clients to self register. When enabled, a requesting client's user credentials require authentication locally or through social media credential exchange and validation. If enabled, use the **webpage > internal > registration > field** command to customize the registration page. If not customized, the default, built-in registration Web page is displayed.

Examples

```
nx9500-6C8809(config-captive-portal-test)#access-type logging
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Removes the captive portal access type or reverts to default (radius)

accounting

Enables support for accounting messages for this captive portal

When enabled, accounting for clients entering and exiting the captive portal is initiated. Accounting is the method of collecting and sending security server information for billing, auditing, and reporting user data. This data includes information, such as start and stop times, executed commands (such as PPP), number of packets and number of bytes transmitted etc. Accounting enables tracking of captive portal services consumed by clients.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
accounting [radius|syslog]
accounting radius
accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}
```

Parameters

```
accounting radius
```

radius	Enables support for RADIUS accounting messages. When enabled, this option uses an external RADIUS resource for AAA accounting. This option is disabled by default.

```
accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}
```

syslog host <IP/HOSTNAME>	Enables support for syslog accounting messages. When enabled, data relating to wireless client usage of remote access services is logged on the specified external syslog resource. This information assists in differentiating between local and remote users. Remote user information can be archived to an external location for periodic network and user administration. This option is disabled by default. • host <IP/HOSTNAME> – Specifies the destination where accounting messages are sent. Specify the destination's IP address or hostname.
port <1-65535>	Optional. Specifies the syslog server's listener port • <1-65535> – Specify the UDP port from 1- 65535. The default is 514.
proxy-mode [none| through-controller| through-rf-domain-manager]	Optional. Specifies the mode of proxying the syslog server • none – Accounting messages are sent directly to the syslog server • through-controller – Accounting messages are sent through the controller configuring the device • through-rf-domain-manager – Accounting messages are sent through the local RF Domain manager

Examples

```
nx9500-6C8809(config-captive-portal-test)#accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
 accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Disables accounting records for this captive portal

bypass

Enables bypassing of captive portal detection requests from wireless clients

Certain devices, such as Apple IOS devices send CNA *(Captive Network Assistant)* requests to detect existence of captive portals. When enabled, the bypass option does not allow CNA requests to be redirected to the captive portal pages.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
bypass captive-portal-detection
```

Parameters

```
bypass captive-portal-detection
```

bypass captive-portal-detection	Bypasses captive portal detection requests

Examples

```
rfs4000-229D58(config-captive-portal-test)#bypass captive-portal-detection
rfs4000-229D58(config-captive-portal-test)#show context
aptive-portal test
 bypass captive-portal-detection
rfs4000-229D58(config-captive-portal-test)#
```

Related Commands

no	Disables bypassing of captive portal detection requests

connection-mode

Configures a captive portal's mode of connection to the Web server. HTTP uses plain unsecured connection for user requests. HTTPS uses an encrypted connection to support user requests.

Both HTTP and HTTPS use the same URI *(Uniform Resource Identifier)*, so controller and client resources can be identified. However, the use of HTTPS is recommended, as it affords controller and client transmissions some measure of data protection HTTP cannot provide.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
connection-mode [http|https]
```

Parameters

```
connection-mode [http|https]
```

http	Sets HTTP as the default connection mode. This is the default setting.
https	Sets HTTPS as the default connection mode Note: HTTPS is a more secure version of HTTP, and uses encryption while sending and receiving requests.

Examples

```
nx9500-6C8809(config-captive-portal-test)#connection-mode https
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
 connection-mode https
 accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Removes this captive portal's connection mode

custom-auth

Configures custom user information

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
custom-auth info <LINE>
```

Parameters

```
custom-auth info <LINE>
```

info <LINE>	Configures information used for RADIUS lookup when *custom-auth RADIUS* access type is configured • <LINE> – Guest data needs to be provided. Specify the *name*, *e-mail address*, and *telephone number* of the user.

Examples

```
nx9500-6C8809(config-captive-portal-test)#custom-auth info bob bob@examplecompany.com
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Removes custom user information configured with this captive portal

data-limit

Enforces data transfer limits on captive portal clients. This feature enables the tracking and logging of user usage. Users exceeding the allowed bandwidth are restricted from the captive portal.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
data-limit <1-102400> {action [log-and-disconnect|log-only]}
```

Parameters

```
data-limit <1-102400> {action [log-and-disconnect|log-only]}
```

data-limit <1-102400>	Sets a captive portal client's data transfer limit in megabytes. This limit is applicable for both upstream and downstream data transfer. • <1-102400> – Specify a value from 1 - 102400 MB.
action [log-and-disconnect| log-only]	Optional. Specifies the action taken when a client exceeds the configured data limit. The options are: • log-and-disconnect – When selected, an entry is added to the log file any time a captive portal client exceeds the data limit, and the client is disconnected. • log-only – When selected, an entry is added to the log file any time a captive portal client exceeds the data limit. the client, however, remains connected to the captive portal. This is the default setting.

Examples

```
rfs4000-229D58(config-captive-portal-test)#data-limit 200 action log-and-disconnect
rfs4000-229D58(config-captive-portal-test)#
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 data-limit 200 action log-and-disconnect
rfs4000-229D58(config-captive-portal-test)#
```

Related Commands

no	Removes data limit enforcement for captive portal clients

frictionless-onboarding

Enables wireless clients, associated with guest WLANs, to self-register with the ExtremeGuest server. In other words, this feature enables frictionless on-boarding of guest users to the ExtremeGuest server.

It also provides an integration API, as a means of on-boarding guest users through a loyalty application.

Note
To enable this feature, in the Guest WLAN (using this captive-portal), enable MAC authentication and set the registration mode to 'device'. For infomration on enabling frictionless-onboarding, see Examples on page 234.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
frictionless-onboarding
```

Parameters

```
None
```

Examples

The following configurations are required to enable frictionless on-boarding of guest users to the ExtremeGuest server:

1 Create a captive-portal:

```
NX9500-EGuest(config)#captive-portal EGuest
NX9500-EGuest(config-captive-portal-EGuest)#
```

a Set the *access-type* as registration..

```
NX9500-WC-EGuest(config-captive-portal-EGuest)#access-type registration
```

This sets the guest user access and authentication mode to self-registration.

b Enable *frictionless-onboarding*.

```
NX9500-WC-EGuest(config-captive-portal-EGuest)#frictionless-onboarding
```

This enables auto-redirection of guest users to the ExtremeGuest server, where the user's MAC address is registered. Registered devices, on subsequent logins, are provided immediate access without interaction with Splash pages.

c Configure *Localization* URL..

```
NX9500-WC-EGuest(config-captive-portal-test)#localization fqdn local.guestaccess.com
```

When configured, the defined URL is triggered from a mobile application to derive location information from the wireless network so that an application can be localized to a particular store or region.

```
NX9500-WC-EGuest(config-captive-portal-Guest)#show context
captive-portal EGuest
 access-type registration
 webpage internal registration field city type text enable label "City" placeholder
"Enter City"
 webpage internal registration field street type text enable label "Address"
placeholder "123 Any Street"
 webpage internal registration field name type text enable label "Full Name"
placeholder "Enter First Name, Last Name"
 webpage internal registration field zip type number enable label "Zip" placeholder
"Zip"
 webpage internal registration field via-sms type checkbox enable title "SMS
Preferred"
 webpage internal registration field mobile type number enable label "Mobile"
placeholder "Mobile Number with Country code"
 webpage internal registration field age-range type dropdown-menu enable label "Age
Range" title "Age Range"
 webpage internal registration field email type e-address enable mandatory label
"Email" placeholder "you@domain.com"
 webpage internal registration field via-email type checkbox enable title "Email
Preferred"
 frictionless-onboarding
 localization fqdn local.guestaccess.com
NX9500-WC-EGuest(config-captive-portal-Guest)#
```

Note
This is an example fqdn URl.

2 Create a WLAN with the following settings:

a Set authentication-type as 'mac'.

```
NX9500-WC-EGuest(config-wlan-EGuest)#authentication-type mac
```

When configured, enables MAC authentication of guest users.

b Enable device registration.

```
NX9500-WC-EGuest(config-wlan-EGuest)#registration device group-name test expiry-time 300
```

When enabled, guest users' device MAC addresses are registered in the database. Registered devices are provided immediate access on subsequent logins.

c Set guest-registration as external.

```
NX9500-WC-EGuest(config-wlan-EGuest)#registration external follow-aaa
```

This enables forwarding of guest registration and authentication requests to an external authentication server resource, specified in an AAA policy.

Note, in this scenario, the external resource is the ExtremeGuest server.

Execute the command in the following step to specify the AAA Policy.

d Apply an AAA Policy to the WLAN.

```
NX9500-WC-EGuest(config-wlan-EGuest)#use aaa-policy guest
```

When applied, registration and authentication requests are forwarded to the authentication server configured in the specified AAA Policy.

Note
In the AAA policy, ensure that the authentication server configuration points to the ExtremeGuest server.

e Enable captive-portal enforcement.

```
NX9500-WC-EGuest(config-wlan-EGuest)#captive-portal-enforcement fall-back
```

When enabled, captive-portal validation is enforced on clients requesting access. Fall-back is an optional parameter that enforces captive-portal authentication only on failure of WLAN authentication.

f Use the captive-portal configured in Step 1 in the WLAN..

```
NX9500-WC-EGuest(config-wlan-EGuest)#use captive-portal EGuest
NX9500-WC-EGuest(config-wlan-EGuest)#show context
wlan EGuest
 ssid eguest
 bridging-mode local
 encryption-type none
 authentication-type mac
 use captive-portal EGuest
 captive-portal-enforcement fall-back
 registration device group-name test expiry-time 300
NX9500-WC-EGuest(config-wlan-EGuest)#
```

This is the captive-portal used with this WLAN for captive-portal validation of guest users.

Related Commands

no on page 261	Disables frictionless-onboarding of guest users to the ExtremeGuest server

inactivity-timeout

Defines an inactivity timeout in seconds. If a frame is not received from a client for the specified interval, the current session is terminated.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
inactivity-timeout <60-86400>
```

Parameters

```
inactivity-timeout <60-86400>
```

<60-86400>	Defines the interval for which a captive portal session is kept alive without receiving a frame from the client. The session is automatically terminated once this interval is over. • <60-86400> – Specify a value from 60 - 86400 seconds. The default is 10 minutes or 600 seconds.

Examples

```
nx9500-6C8809(config-captive-portal-test)#inactivity-timeout 750
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Removes the client inactivity interval configured with this captive portal

ipv6

Configures the internal captive portal server's (running on the centralized mode) IPv6 address. If using centralized server mode, use this option to define the controller, service platform, or access point resource's (hosting the captive portal) IPv6 address. For information on configuring the server mode, see server.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ipv6 server host <IPv6>
```

Parameters

```
ipv6 server host <IPv6>
```

ipv6 server host <IPv6>	Configures the IPv6 address of the internal captive portal server • <IPv6> – Specify the captive portal server's global IPv6 address.

Examples

```
rfs4000-229D58(config-captive-portal-test2)#ipv6 server host 2001:10:10:10:6d:33:fa:8b
rfs4000-229D58(config-captive-portal-test2)#show context
captive-portal test2
 access-type OAuth
 ipv6 server host 2001:10:10:10:6d:33:fa:8b
 OAuth client-id Google TechPubs.printer.google.com
rfs4000-229D58(config-captive-portal-test2)#
```

Related Commands

no	Removes the captive portal server's IPv6 address

localization

Configures an FQDN address string to get localization parameters for the client. Use this option to add a URL to trigger a one-time redirect on demand. The defined URL is triggered from a mobile application to derive location information from the wireless network so an application can be localized to a particular store or region.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
localization [fqdn <WORD>|response <WORD>]
```

Parameters

```
localization [fqdn <WORD>|response <WORD>]
```

localization	Enables localization and configures the related parameters.
fqdn <WORD>	Configures the FQDN address (for example, local.guestaccess.com) used to obtain localization parameters for a client. • <WORD> – Specify the FQDN address string. For example, local.guestaccess.com
response <WORD>	Configures the response message directed back to the client for localization HTTP requests. • <WORD> – Specify the response message (should not exceed 512 characters in length). The following built-in query tags can be included in the response message: 'WING_TAG_CLIENT_IP' -Captive portal client IPv4 address 'WING_TAG_CLIENT_MAC' - Captive portal client MAC address 'WING_TAG_WLAN_SSID ' - Captive portal client WLAN ssid 'WING_TAG_AP_MAC' - Captive portal client AP MAC address 'WING_TAG_AP_NAME' - Captive portal client AP Name 'WING_TAG_RF_DOMAIN' - Captive portal client RF Domain 'WING_TAG_USERNAME' - Captive portal authentication username 'WING_TAG_USERTYPE' - Captive portal usertype (new/return/refresh) Example:- <local><site>WING_TAG_RF_DOMAIN</site><ap>WING_TAG_AP_NAME</ap></local

Examples

```
nx9500-6C8809(config-captive-portal-test)#localization fqdn local.guestaccess.com
nx9500-6C8809(config-captive-portal-test)#localization response <local><site>SJExtreme</site><ap>ap8163-74B45C</ap><user>Bob</user><local>
nx9500-6C8809(config-captive-portal-TechPubsNew)#show context
captive-portal TechPubsNew
 webpage internal registration field city type text enable label "City" placeholder "Enter City"
 webpage internal registration field street type text enable label "Address" placeholder "123 Any Street"
 webpage internal registration field name type text enable label "Full Name" placeholder "Enter First Name, Last Name"
 webpage internal registration field zip type number enable label "Zip" placeholder "Zip"
 webpage internal registration field via-sms type checkbox enable title "SMS Preferred"
 webpage internal registration field mobile type number enable label "Mobile" placeholder "Mobile Number with Country code"
 webpage internal registration field age-range type dropdown-menu enable label "Age Range" title "Age Range"
 webpage internal registration field email type e-address enable mandatory label "Email" placeholder "you@domain.com"
 webpage internal registration field via-email type checkbox enable title "Email Preferred"
 localization fqdn local.guestaccess.com
```

```
 localization response <local><site>SJExtreme</site><ap>ap8163-74B45C</ap><user>Bob</
user><local>
nx9500-6C8809(config-captive-portal-TechPubsNew)#
```

Related Commands

no	Removes the FQDN address string and response message configured on a captive portal for localization

logout-fqdn

the Logout FQDN as the FQDN address to logout of the captive portal session from the client (for example, *logout.guest.com*).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
logout-fqdn <WORD>
```

Parameters

```
logout-fqdn <WORD>
```

logout-fqdn <WORD>	Configures the FQDN address used to logout • <WORD> – Provide the FQDN address (for example, logout.guestaccess.com).

Examples

```
rfs4000-229D58(config-captive-portal-test)#logout-fqdn logout.testuser.com
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 logout-fqdn logout.testuser.com
rfs4000-229D58(config-captive-portal-test)#
```

Related Commands

no	Clears the logout FQDN address

oauth

Enables OAuth-driven Google and/or Facebook authentication on captive portals that use internal Web pages.

To enable Google and Facebook captive-portal authentication:

- Enforce captive-portal authentication on the WLAN to which wireless-clients associate. For information, see captive-portal-enforcement.
- Set captive-portal Web page location to internal. For more information, see webpage-location.
- Register your captive-portal individually on Google/FaceBook APIs and generate a client-id and client-secret. The client-ids retrieved during registration are the IDs for the WiNG application running on the access point/controller. The WiNG application uses these client-ids to access the Google and Facebook Auth APIs, and authenticate the guest client on behalf of the user.

If enabling OAuth-driven Google and/or Facebook authentication on the captive portal, use this command to configure the Google/Facebook client-ids. Once enabled, the captive portal landing page, displayed on the client's browser, provides the Facebook and Google login buttons.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
oauth
oauth client-id [facebook|google] <WORD>
```

Parameters

```
oauth
```

oauth	Execute this command without the associated keywords to enable OAuth on this captive-portal. If enabling OAuth, ensure the captive-portal Web page location is configured as advanced or external.

```
oauth client-id [facebook|google] <WORD>
```

oauth client-id [facebook|google] <WORD>	Configures the client-ids retrieved from the Google and Facebook API manager portals during registration • facebook – Configures the Facebook API client-id (is a 15 digit entity) • google – Configures the Google API client-id (is a 12 digit number) • <WORD> – Provide the Facebook/Google client-id. If the captive-portal Web page location is advanced or external, and you are enabling OAuth support, you need not configure the client-id. In such a scenario, the client-id is configured through the EGuest server UI and not the WiNG CLI.

Example (User Exec Mode)

```
nx7500-6DCD39(config-captive-portal-test2)#OAuth
nx7500-6DCD39(config-captive-portal-test2)#OAuth client-id Google
xxxxxxxxxxxx.apps.googleusercontent.com Facebook yyyyyyyyyyyyyyy
nx7500-6DCD39(config-captive-portal-test2)#show context
captive-portal test2
 server host guest.social.com
  oauth
  oauth client-id Google xxxxxxxxxxxx.apps.googleusercontent.com Facebook yyyyyyyyyyyyyyy

nx7500-6DCD39(config-captive-portal-test)#
```

In the above example,

- xxxxxxxxxxxx - Is the 12 digit numeric part of your Google client-id.
- yyyyyyyyyyyyyyy - Is the 15 digit Facebook client-id

Related Commands

no	Removes all OAuth client identities configured for this captive portal

php-helper

Configures a PHP helper to serve the PHP splash pages to guest users logging in to the captive portal using social-media credentials. Configure a PHP helper only if the following criteria are fulfilled:

- OAuth-based authentication is enabled on the captive portal.
- The captive-portal server mode is “self”.
- The access point, hosting the captive-portal server, has low memory space.
- A hotspot server, hosting the captive-portal PHP splash pages, is up and running.

The WiNG software introduces HybridAuth support on captive portals. HybridAuth is an open-source, social-sign on PHP Library. In addition to Google and Facebook, it allows a variety of third-party social authentications, such as *LinkedIn*, *Twitter*, *Live*, *Yahoo*, *OpenID*, etc. However, HybridAuth uses space-consuming PHP splash pages that cannot be loaded on access points with low memory space. These access points can only serve the initial landing page, where guests clicking on a social login button are redirected by the php-helper to a PHP page hosted on the PHP-helper.

To create PHP splash pages, use the splash template configuration tool available on the EGuest *(ExtremeGuest)* dashboard. Upload the generated tar to both the hotspot server and the php helper. Note, the EGuest dashboard can be launched from the WiNG controller (NX9500/NX9600/VX9000) enabled as the EGuest server.

For more information on enabling the EGuest server, see eguest-server (VX9000 only) on page 987.

For more information on configuring an EGuest captive portal, see configuring ExtremeGuest captive portal on page 267.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
php-helper [controller|domain-manager]
php-helper controller <IP/HOSTNAME> hosting-vlan-interface <0-4096>
php-helper domain-manager <IP/HOSTNAME>
```

Parameters

```
php-helper controller <IP/HOSTNAME> hosting-vlan-interface <0-4096>
```

php-helper	Configures the php-helper parameters
controller <IP/HOSTNAME>	Configures the controller adopting the captive-portal access point as the php-helper • <IP/HOSTNAME> – Specify the adopting controller’s IP address or host name.
hosting-vlan-interface <0-4096>	Optional. Configures the VLAN on which the php-helper is reachable • <0-4096> – Specify the VLAN hosting the php-helper from 0 - 4096.

```
php-helper domain-manager <IP/HOSTNAME>
```

php-helper	Configures the php-helper parameters
domain-manager <IP/HOSTNAME>	Configures the captive-portal access point's RF Domain manager as the php-helper • <IP/HOSTNAME> – Specify the RF Domain manager's IP address or host name.

Examples

To enable php-helper configure the following parameters in the captive-portal context:

```
ap505-13403B(config-captive-portal-php-helper)#oauth
ap505-13403B(config-captive-portal-php-helper)#php-helper controller nx9500-6C8809
ap505-13403B(config-captive-portal-php-helper)#server mode self
ap505-13403B(config-captive-portal-php-helper)#server host cpsocial.extreme.com
```

Note, when configuring the server, specify the server's hostname and not the IP address, because some social media do not allow IP address as a redirect URI.

```
ap505-13403B(config-captive-portal-php-helper)#show running-config captive-portal php-
helper
captive-portal php-helper
 server host cpsocial.extreme.com
 php-helper controller nx9500-6C8809
 oauth
 webpage internal registration field city type text enable label "City" placeholder
"Enter City"
 webpage internal registration field street type text enable label "Address" placeholder
"123 Any Street"
 webpage internal registration field name type text enable label "Full Name" placeholder
--More--
ap505-13403B(config-captive-portal-php-helper)#
```

Related Commands

no	Removes the PHP helper configuration

post-authentication-vlan

Configures the VLAN that is assigned to this captive portal's users upon successful authentication

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]
```

Parameters

```
post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]
```

post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]	Configures the post authentication VLAN. The VLAN specified here is assigned to this captive portal's users after they have authenticated and logged on to the network. Provide the VLAN ID, or use an existing VLAN alias to identify the post authentication VLAN. • <1-4096> – Specify the VLAN's number from 1 - 4096. • <VLAN-ALIAS> – Specify the VLAN alias (should be existing and configured). VLAN alias names begin with a '$'.

Example

```
rfs4000-229D58(config-captive-portal-test)#post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#
```

Related Commands

no	Removes the post authentication RADIUS VLAN assigned to this captive portal's users

•

radius-vlan-assignment

Enables assignment of a RADIUS VLAN for this captive portal

When enabled, if the RADIUS server as part of the authentication process returns a client's VLAN-ID in a RADIUS access-accept packet, then all client traffic is forwarded on the post authentication VLAN. If disabled, the RADIUS server's VLAN assignment is ignored and the VLAN configuration defined within the WLAN configuration is used instead. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
radius-vlan-assignment
```

Parameters

None

Example

```
rfs4000-229D58(config-captive-portal-test)#radius-vlan-assignment
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 post-authentication-vlan 1
 radius-vlan-assignment
rfs4000-229D58(config-captive-portal-test)#
```

Related Commands

no	Disables assignment of a RADIUS VLAN for this captive portal

redirection

Configures a list of destination ports (separated by commas, or using a dash for a range) that are taken into consideration when redirecting client connections

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
redirection ports <LIST-OF-PORTS>
```

Parameters

```
redirection ports <LIST-OF-PORTS>
```

ports <LIST-OF-PORTS>	Configures destination ports considered for redirecting client connection A maximum of 16 ports can be specified in a comma-separated list. Standard ports 80 and 443 are always considered for client connections regardless of what's entered by the administrator.

Example

```
rfs4000-229D58(config-captive-portal-test)#redirection ports 1,2,3
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 redirection ports 1-3
rfs4000-229D58(config-captive-portal-test)#
```

Related Commands

no	Disables redirection of client connection

report-royalty-application

Enables detection of captive portal client's usage of a selected (preferred) loyalty application

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
report-loyalty-application {custom-app <APPLICATION-NAME>}
```

Parameters

```
report-loyalty-application {custom-app <APPLICATION-NAME>}
```

report-loyalty-application {custom-app <APPLICATION-NAME>}	Reports a captive portal client's loyalty application presence and stores this information in the captive portal's user database. The client's loyalty application detection occurs on the access point to which the client is associated. Retail administrators can use this information to assess whether patrons' loyalty application usage is as per expectation within specific retail environments. This option is disabled by default. • custom-app <APPLICATION-NAME> – Optional. Uses a custom application definition as match criteria. • <APPLICATION-NAME> – Specify the custom application name (should be existing and configured). Ensure that the application specified is available and configured. If not, create an application definition. For more information, see application on page 183. If no custom application definition is specified, the system uses localization to detect application presence.

Examples

```
nx9500-6C8809(config-captive-portal-test)#report-loyalty-application custom-app
AntiVirus
nx9500-6C8809(config-captive-portal-test)#show context include-factory | include
 report-loyalty-application
 report-loyalty-application custom-app AntiVirus
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no on page 261	Disables detection of customer-loyalty application presence

server

Configures captive portal server parameters, such as the hostname, IP address, and mode of operation. This is the captive-portal server hosting the captive portal Web pages.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
server [host|mode]
server host <IP/HOSTNAME>
server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}|self]
```

Parameters

```
server host <IP/HOSTNAME>
```

host <IP/HOSTNAME>	Configures the internal captive portal server (wireless controller, access point, service platform) • <IP/HOSTNAME> – Specify the IPv4/IPv6 address or hostname of the captive portal server. For centralized-controller mode, the server host should be a virtual hostname and not an IP address. If enabling OAuth (social-media login) on the captive portal, configure the server's hostname and not the IP address. This is because some social media do not allow IP address as redirect-uri. For more information, see oauth and php-helper.

```
server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}|self]
```

mode	Configures the captive portal server mode. This parameter identifies the device that will capture and redirect a wireless user's Web browser session to a landing page where the user has to provide login credentials in order to access the managed network. The captive portal implementation is very flexible and allows captive portal services to reside anywhere within the WiNG managed network. For example, the capture and redirection can be performed directly by the access points at the edge of the network, centrally on the controllers or service platforms managing the access points, or on dedicated wireless controller deployed within an isolated network.
centralized	Select this option if capture and redirection is provided by a designated wireless controller/service platform on the network defined using an IPv4/IPv6 address or hostname. This dedicated device can either be managing the dependent/independent access points or be a dedicated device deployed over the intermediate network. Ensure the IPv4 address or hostname of the wireless controller performing the capture and redirection is defined in the captive portal policy. And also, that the wireless controller is reachable via MINT.

centralized-controller {hosting-vlan-interface <0-4096>}	Select this option if capture and redirection is on a cluster of wireless controller/service platforms managing dependent/independent access points when redundancy is required. The capture and redirection is provided by one of the controllers in the cluster that is operating as the designated forwarder for the tunneled VLAN. The cluster can be configured as active/active or active/standby as required. If using this option, ensure a non-resolvable virtual hostname is defined in the captive portal policy which is shared between the controllers in the cluster. • hosting-vlan-interface – Optional. Configures the VLAN where the client can reach the captive-portal server. This option is available only for the centralized-controller mode. • <0-4096> – Specify the VLAN number (0 implies the controller is available on the client's VLAN).
self	Select this option if capture and redirection is provided by the access point that is servicing the captive portal enabled Wireless LAN. This is the default setting. When enabled each remote access point servicing the captive portal enabled WLAN performs the captive portal capture and redirection internally. The WLAN users are mapped to a locally bridged VLAN for which each access point has a SVI defined. The SVI can either have a static or dynamic (DHCP) IPv4 address assigned. The capture, redirection, and presentation of the captive portal pages are performed using the SVI on each access point the wireless device is associated to.

Examples

```
nx9500-6C8809(config-captive-portal-test)#server host 172.16.10.9
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 server host 172.16.10.9
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Resets or disables captive portal host and mode settings

simultaneous-users

Specifies the number of users (client MAC addresses) that can simultaneously log on to the captive portal. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
simultaneous-users <1-8192>
```

Parameters

```
simultaneous-users <1-8192>
```

simultaneous-users <1-8192>	Specifies the number of MAC addresses that can simultaneously access the captive portal • <1-8192> – Select a number from 1 - 8192.

Examples

```
nx9500-6C8809(config-captive-portal-test)#simultaneous-users 5
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 server host 172.16.10.9
 simultaneous-users 5
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Resets or disables captive portal commands

terms-agreement

Enforces the user to agree to terms and conditions (included in the login page) for captive portal access. This feature is disabled by default.

When enabled, the system enforces a previously registered user to re-confirm the terms of agreement, on successive log ins, only if the interval between the last log out and the current log in exceeds the agreement-refresh timeout configured in the WLAN context. For more information on configuring the agreement-refresh timeout value, see registration.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
terms-agreement
```

Parameters

None

Examples

```
nx9500-6C8809(config-captive-portal-test)#terms-agreement
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 server host 172.16.10.9

 terms-agreement
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Resets or disables captive portal commands

use (captive-portal-config-mode)

Configures a AAA policy and DNS whitelist with this captive portal policy. AAA policies are used to configure authentication and accounting servers for this captive portal. DNS whitelists restrict users to a set of configurable domains on the Internet.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]
```

Parameters

```
use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]
```

aaa-policy <AAA-POLICY-NAME>	Associates a AAA policy with this captive portal. AAA policies validate user credentials and provide captive portal access to the network. • <AAA-POLICY-NAME> – Specify the AAA policy name. For more information on AAA policies, see AAA Policy on page 1303.
dns-whitelist <DNS-WHITELIST-NAME>	Associates a DNS whitelist to use with this captive portal. A DNS whitelist defines a set of allowed destination IP addresses. DNS whitelists restrict captive portal access. • <DNS-WHITELIST-NAME> – Specify the DNS whitelist name. To effectively host captive portal pages on an external Web server, the IP address of the destination Web server(s) should be added to the DNS whitelist. For more information on DNS whitelists, see dns-whitelist.

Examples

```
nx9500-6C8809(config-captive-portal-test)#use aaa-policy test
nx9500-6C8809(config-captive-portal-test)#use dns-whitelist test
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 server host 172.16.10.9
 simultaneous-users 5
 terms-agreement
 use aaa-policy test
 use dns-whitelist test
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Removes a DNS Whitelist or a AAA policy from the captive portal

webpage

Use this command to define the appearance and flow of Web pages requesting clients encounter when accessing a controller, service platform, or access point managed captive portal. Define whether the Web pages are maintained locally or externally to the managing device as well as messages displayed requesting clients.

Configures Web pages displayed when interacting with a captive portal. There are six (6) different pages.

- acknowledgment – This page displays details for the user to acknowledge.
- agreement – This page displays “Terms and Conditions” that a user accepts before allowed access to the captive portal.
- fail – This page is displayed when the user is not authenticated.
- login – This page is displayed when the user connects to the captive portal. It fetches login credentials from the user.
- no-service – This page is displayed when a captive portal user is unable to access the captive portal due unavailability of critical services.
- registration – This page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database.
- welcome – This page is displayed to welcome an authenticated user to the captive portal.

These Web pages, which interact with captive portal users, can be located either on the controller or an external location.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
webpage [external|internal]

webpage external [acknowledgment|agreement|fail|login {post}|no-service|
registration|welcome] <URL>

webpage internal [acknowledgment|agreement|fail|login|no-service|org-name|org-signature|

{label <LINE>|mandatory|title <LINE>|placeholder <LINE>}

webpage internal welcome use-external-success-url

webpage internal [org-name|org-signature] <LINE>
```

Parameters

```
webpage external [acknowledgment|agreement|fail|login {post}|no-service|
registration|welcome] <URL>
```

external	Indicates Web pages being served are hosted on an external (to the captive portal) server resource
acknowledgment	Indicates the page is displayed for user acknowledgment of details. Users are redirected to this page to acknowledge information provided.
agreement	Indicates the page is displayed for “Terms & Conditions” The agreement page provides conditions that must be agreed to before captive portal access is permitted.
fail	Indicates the page is displayed for login failure The fail page asserts authentication attempt has failed, the user is not allowed to access the Internet (using this captive portal) and must provide the correct login information again to access the Internet.
login {post}	Indicates the page is displayed for getting user credentials. This page is displayed by default. • post – Optional. Redirects users to post externally when they during authentication The login page prompts the user for a username and password to access the captive portal and proceed to either the agreement page (if used) or the welcome page.
no-service	Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The no-service page asserts the captive portal service is temporarily unavailable due to technical reasons. Once the services become available, the captive portal user is automatically connected back to the services available through the captive portal. The possible scenarios are: • The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated • The external captive portal server is not reachable • The connectivity between the adopted AP and controller is lost • The external DHCP server is not reachable To provide this service, enable the following: • External captive portal server monitoring. • AAA server monitoring. This enables detection of RADIUS server failure. • External DHCP server monitoring. • AP to controller connectivity monitoring. For more information on enabling these critical resource monitoring, see service.
registration	Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.

welcome	Indicates the page is displayed after a user has been successfully authenticated The welcome page asserts a user has logged in successfully and can access the captive portal.
<URL>	Indicates the URL to the Web page displayed. Query String: URL can include query tags. Supported Query Tags are: 'WING_TAG_CLIENT_IP' - Captive portal client IPv4 address 'WING_TAG_CLIENT_MAC' - Captive portal client MAC address 'WING_TAG_WLAN_SSID ' - Captive portal client WLAN ssid 'WING_TAG_AP_MAC' - Captive portal client AP MAC address 'WING_TAG_AP_NAME' - Captive portal client AP Name 'WING_TAG_RF_DOMAIN' - Captive portal client RF Domain 'WING_TAG_CP_SERVER' - Captive portal server address 'WING_TAG_USERNAME' - Captive portal authentication username Example: http://cportal.com/policy/login.html?client_ip=WING_TAG_CLIENT_IP&ap_mc=WING_TAG_AP_MAC. Use '&' or '?' character to separate field-value pair. Enter 'ctrl-v' followed by '?' to configure query string

```
webpage internal [acknowledgment|agreement|fail|login|no-service|registration|welcome]
[description|footer|header|title] <CONTENT>
```

internal	Indicates the Web pages are hosted on an internal server resource. This is the default setting.
acknowledgment	Indicates the Web page is displayed for users to acknowledge the information provided
agreement	Indicates the page is displayed for “Terms & Conditions”
fail	Indicates the page is displayed for login failure
login	Indicates the page is displayed for entering user credentials
no-service	Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are: • The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated • The external captive portal server is not reachable • The connectivity between the adopted AP and controller is lost • The external DHCP server is not reachable To provide this service, enable the following: • External captive portal server monitoring. • AAA server monitoring. This enables detection of RADIUS server failure. • External DHCP server monitoring. • AP to controller connectivity monitoring. For more information on enabling these critical resource monitoring, see service.
registration	Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.
welcome	Indicates the page is displayed after a user has been successfully authenticated
description	Indicates the content is the description portion of each of the following internal Web pages: acknowledgment, agreement, fail, login, no-service, and welcome

footer	Indicates the content is the footer portion of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, registration, and welcome page. The footer portion contains the signature of the organization that hosts the captive portal.
header	Indicates the content is the header portion of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome page. The header portion contains the heading information for each of these pages.
title	Indicates the content is the title of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome page. The title for each of these pages is configured here.
<CONTENT>	The following keyword is common to all of the above internal Web page options: • <CONTENT> – Specify the content displayed for each of the different components of the internal Web page. Enter up to 900 characters for the description and 256 characters each for header, footer, and title.

```
webpage internal [acknowledgment|agreement|fail|login|no-service|registration|welcome]
[main-logo use-as-banner|small-logo] <URL>
```

internal	Indicates the Web pages are hosted on an internal server resource
acknowledgment	Indicates the Web page is displayed for users to acknowledge the information provided
agreement	Indicates the page is displayed for “Terms & Conditions”
fail	Indicates the page is displayed for login failure
login	Indicates the page is displayed for user credentials
no-service	Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are: • The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated • The external captive portal server is not reachable • The connectivity between the adopted AP and controller is lost • The external DHCP server is not reachable To provide this service, enable the following: • External captive portal server monitoring. • AAA server monitoring. This enables detection of RADIUS server failure. • External DHCP server monitoring. • AP to controller connectivity monitoring. For more information on enabling these critical resource monitoring, see service.
registration	Indicates the page displayed is the registration page to which users are redirected in order to register in the captive portal’s database Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.
welcome	Indicates the page is displayed after a user has been successfully authenticated
main-logo use-as-banner	The following keyword is common to all of the above internal Web page options: • main-logo – Indicates the main logo displayed in the header of each Web page • use-as-banner – Uses the image, specified here, as the Web page banner, in place of the logo and organization name

small-logo	The following keyword is common to all of the above internal Web page options: • small-logo – Indicates the logo image displayed in the footer portion of each Web page, and constitutes the organization's signature
<URL>	This parameter is common to the 'main-logo' and 'small-logo' keywords and provides the complete URL from where the main-logo and small-logo files are loaded and subsequently cached on the system. • <URL> – Specify the location and name of the main-logo and the small-logo image files.

```
webpage internal registration field [age-range|city|country|custom|disclaimer|
dob|email|gender|member|mobile|name|optout|street|via-email|via-sms|zip]
type [checkbox|date|dropdown-menu|e-address|number|radio-button|text] enable
{label <LINE>|mandatory|title <LINE>|placeholder <LINE>}
```

internal	Indicates the Web pages are hosted on an internal server resource
registration	Allows you to customize the user registration page. Select this option if the captive-portal's access-type is set to registration. Use the field and type options to define the input fields (for example, age-range, city, email, etc.) and the field type (for example, text, checkbox, dropdown-menu, radio-button, etc.) Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register. If the registration Web page is not customized, the built-in, default registration page is displayed to the client.

field [age-range| city|country| custom| disclaimer| dob|email| gender|member| mobile|name| optout| street|via-email|via-sms| zip]	Configures the captive portal's registration page fields
	Following are the available fields and the field type for each:
	• age-range – Creates the age-range input field (enabled by default and included in the built-in registration page)
	  • dropdown-menu – Configures the age-range field as a drop-down menu
	  • radio-button – Configures the age-range field as a radio button menu
	• city – Creates the postal address: city name input field (enabled by default and included in the built-in registration page)
	  • text – Configures the city field as only alpha-numeric and special characters input field
	• country – Creates the postal address: country name input field (disabled by default)
	  • text – Configures the country field as only alpha-numeric and special characters input field
	• custom <WORD> – Creates a customized field (as per your requirement). Use the 'custom' option to create a field not included in the built-in list.
	  • <WORD> – Provide a name for the field. On the registration page, the field is displayed under the name specified here.
	• disclaimer – Creates client's disclaimer-confirmation input field (disabled by default)
	• checkbox – Configures the disclaimer field as a check box
	• dob – Creates the client's date of birth (DoB) input field (disabled by default)
	  • date – Configures the DoB field as only date-format input field
	  • dropdown-menu – Configures the DoB field as a drop-down menu
	  • text – Configures the DoB field as only alpha-numeric and special characters input field
	• email – Creates the e-mail address input field (enabled by default and included in the built-in registration page)
	  • e-address – Configures the e-mail field as only e-mail address format input field
	• gender – Creates client's gender input field (disabled by default)
	  • dropdown-menu – Configures the gender field as a drop-down menu
	  • radio-button – Configures the gender field as a radio button menu
	• member – Creates client's loyalty or captive-portal membership card number input field (disabled by default)
	  • number – Configures the member field as only-numeric characters input field
	  • text – Configures the member field as only alpha-numeric and special characters input field
	• mobile – Creates the mobile number input field (enabled by default and included in the built-in registration page)
	  • number – Configures the mobile field as only-numeric characters input field
	  • text – Configures the mobile field as only alpha-numeric and special characters input field
	• name – Creates the client name input field (enabled by default and included in the built-in registration page)
	  • text – Configures the name field as only alpha-numeric and special characters input field

	• optout – Creates an input field that enables clients to opt out from registering
	  • checkbox – Configures the optout field as a check box
	• street – Creates the postal address: street name/number input field (enabled by default and included in the built-in registration page)
	  • text – Configures the street field as only alpha-numeric and special characters input field
	• via-email – Creates the client's preferred mode of communication as e-mail input field (enabled by default and included in the built-in registration page)
	  • checkbox – Configures the via-email field as a check box
	• via-sms – Creates the client's preferred mode of communication as SMS input field (enabled by default and included in the built-in registration page)
	  • checkbox – Configures the via-sms field as a check box
	• zip – Creates the postal address: zip input field (enabled by default and included in the built-in registration page)
	  • number – Configures the zip field as only-numeric characters input field
	  • text – Configures the zip field as only alpha-numeric and special characters input field

type [checkbox|date| dropdown-menu|e-address|number| radio-button|text]	After specifying the field, configure the field type. The options displayed depend on the field selected in the previous step. These options are: checkbox, date, dropdown-menu, e-address, number, radio-button, and text. • checkbox – Configures the field as a check box • date – Configures the field as only date-format input field • dropdown-menu – Configures the field as a drop-down menu • e-address – Configures the field as an e-mail address input field • number – Configures the field as only-numeric characters input field • radio-button – Configures the field as a radio button • text – Configures the field as only alpha-numeric and special characters input field Some of the fields can have more than one field type options. For example, the field 'zip' can either be a numerical field or a text. Select the one best suited for your captive-portal.
enable {label <LINE>| mandatory| title <LINE>| placeholder <LINE>}	Enables the field. When enabled, the field is displayed on the registration page. After enabling the field, optionally configure the following parameters: • label <LINE> – Optional. Configures the field's label • mandatory – Optional. Makes the field mandatory • title – Optional. Configures the comma-separated list of items to include in the drop-down menu. • placeholder <LINE> – Optional. Configures a string, not exceeding 300 characters, that is displayed within the field. If not configured, the field remains blank.

```
webpage internal welcome use-external-success-url
```

internal	Indicates the Web pages are hosted on an internal server resource
welcome	Indicates the page is displayed after a user has been successfully authenticated
use-external-success-url	When configured, redirects the user, on successful authentication, to an externally hosted success URL from the locally-hosted landing page. Use the **webpage > external > welcome > <URL>** command to specify the location of the Welcome page.

```
webpage internal [org-name|org-signature] <LINE>
```

internal	Indicates the Web pages are hosted on an internal server resource
org-name	Specifies the company's name, included on Web pages along with the main image
org-signature	Specifies the company's signature information, included in the bottom of Web pages along with a small image
<LINE>	Specify the company's name or signature depending on the option selected.

Examples

```
nx9500-6C8809(config-captive-portal-guest)#webpage external welcome http://192.168.9.46/

```

Related Commands

no	Resets or disables captive portal configurations

webpage-auto-upload

Enables automatic upload of advanced Web pages to requesting clients on association. Enable this option if the webpage-location is selected as advanced. For more information, see webpage-location.

If this feature is enabled, Access Points shall request for Web pages from the controller during adoption. If the controller has a different set of Web pages, than the ones existing on the Access Points, the controller shall distribute the Web pages uploaded on it to the Access Points.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
webpage-auto-upload
```

Parameters

None

Examples

```
nx9500-6C8809(config-captive-portal-test)#webpage-auto-upload
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 webpage-auto-upload
 logout-fqdn logout.testuser.com
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Disables automatic upload of advanced Web pages on a captive portal
webpage	Configures Web pages displayed when interacting with a captive portal
webpage-location	Specifies the location of the Web pages used for authentication

webpage-location

Specifies the location of the Web pages used for authentication. These pages can either be hosted on the system or on an external Web server.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
webpage-location [advanced|external|internal]
```

Parameters

```
webpage-location [advanced|external|internal]
```

advanced	Uses Web pages for login, welcome, failure, and terms created and stored on the controller. Select advanced to use a custom-developed directory full of Web page content that can be copied in and out of the controller, service platform, or access point. If selecting advanced, enable the webpage-auto-upload option to automatically launch the advanced pages to requesting clients upon association. For more information, see webpage-auto-upload.
external	Uses Web pages for login, welcome, failure, and terms located on an external server. Provide the URL for each of these pages.
internal	Uses Web pages for login, welcome, and failure that are automatically generated

Examples

```
nx9500-6C8809(config-captive-portal-test)#webpage-location external
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 server host 172.16.10.9
 simultaneous-users 5
 terms-agreement
 webpage-location external
 use aaa-policy test
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

no	Resets or disables captive portal Web page settings
webpage	Configures a captive portal's Web page (acknowledgment, agreement, login, welcome, fail, no-service, and terms) settings
webpage-auto-upload	Enables automatic upload of advanced Web pages on a captive portal

welcome-back

Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins. When enabled, a registered captive-portal guest user, on subsequent logins, is served the Acknowledgement page only if:

- The agreement-refresh option is enabled for device-based (device and device-OTP) registration, and

- The interval between logout and login is lesser than the agreement-refresh timeout configured in the WLAN context. If this interval exceeds the agreement-refresh timeout, the user is served the Agreement page. For more information on configuring the agreement-refresh timeout value, see registration.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP-7522, AP 7532, AP 7562, AP 7602, AP-7612, AP 7622, AP7632, AP7662, AP-8163, AP-8432, AP-8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX

Syntax

```
welcome-back pass-through
```

Parameters

```
welcome-back pass-through
```

welcome-back pass-through	Enables display of the Acknowledgement page to an already registered user on subsequent captive-portal log-ins, provided the interval between logout and login is lesser than the agreement-refresh timeout • pass-through – Provides user direct Internet access, from the Welcome-back page, without any user action

Examples

```
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 welcome-back pass-through
 webpage internal registration field city type text enable label "City" placeholder
"Enter City"

```

configuring-device-registration-with-dynamic-vlan-assignment

This section provides the configurations required to enable device registration with dynamic VLAN assignment in a multi-vendor environment.

1 Create vendor-specific RADIUS user groups and assign an allowed VLAN to each group, as shown in the following examples:

```
nx9500-6C8809(config)#radius-group Apple
nx9500-6C8809(config-radius-group-Apple)#policy vlan 200
nx9500-6C8809(config)#radius-group Samsung
nx9500-6C8809(config-radius-group-Samsung)#policy vlan 100
nx9500-6C8809(config)#radius-group Devices
nx9500-6C8809(config-radius-group-Devices)#policy vlan 1
```

Note

If necessary, configure the session-time for each of the above configured RADIUS group. This is the duration for which a RADIUS group client's session remains active after successful authentication. Upon expiration, the RADIUS session is terminated. Use the `policy > session-time > <5-144000>` command to specify the session-time.

2 Create a RADIUS user pool, add users to the pool, and assign the users to the vendor-specific user groups: as shown in the following examples:

```
nx9500-6C8809(config)#radius-user-pool-policy Vendor-Devices
nx9500-6C8809(config-radius-user-pool-Vendor-Devices)#user Samsung password 0 samsung
group Samsung
nx9500-6C8809(config-radius-user-pool-Vendor-Devices)#user test password 0 test123
group Apple
```

3 Create a RADIUS server policy, and associate the RADIUS groups and user pool created in steps 1 and 2 respectively, as shown in the following examples:

```
nx9500-6C8809(config)#radius-server-policy Guest-Radius
nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-user-pool-policy
Vendor-Devices
nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Samsung
nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Sony
nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Apple
```

4 Create an AAA Policy, on the controller, and configure the authentication server as self, as shown in the following example:

```
nx9500-6C8809(config)#aaa-policy OnBoard-NX
nx9500-6C8809(config-aaa-policy-OnBoard-NX)#authentication server 1 onboard controller
nx9500-6C8809(config-aaa-policy-OnBoard-NX)#show context
aaa-policy OnBoard-NX
 authentication server 1 onboard self
nx9500-6C8809(config-aaa-policy-OnBoard-NX)#
```

5 Create a captive-portal, and point to the captive-portal's server, enable RADIUS VLAN assignment, and associate the AAA policy, as shown in the following examples:

```
nx9500-6C8809(config)#captive-portal DeviceRegistration
nx9500-6C8809(config-captive-portal-DeviceRegistration)#server host
captive.extremenoc.com
nx9500-6C8809(config-captive-portal-DeviceRegistration)#radius-vlan-assignment
nx9500-6C8809(config-captive-portal-DeviceRegistration)#use aaa-policy OnBoard-NX
nx9500-6C8809(config-captive-portal-DeviceRegistration)#access-type radius
```

6 Configure a WLAN and enable RADIUS VLAN assignment, as shown in the following examples:

```
nx9500-6C8809(config)#wlan CP-OnBoarding
nx9500-6C8809(config-wlan-CP-OnBoarding)#ssid CP-OnBoarding
nx9500-6C8809(config-wlan-CP-OnBoarding)#radius vlan-assignment
nx9500-6C8809(config-wlan-CP-OnBoarding)#use aaa-policy OnBoard-NX
nx9500-6C8809(config-wlan-CP-OnBoarding)#use captive-portal DeviceRegistration
nx9500-6C8809(config-wlan-CP-OnBoarding)#captive-portal-enforcement fall-back
nx9500-6C8809(config-wlan-CP-OnBoarding)#registration device group-name Devices expiry-
time 4320
nx9500-6C8809(config-wlan-CP-OnBoarding)#authentication-type mac
```

7 Create an access point profile, associate the RADIUS server policy, captive-portal policy to it, and also assign the WLAN to the AP radio, as shown in the following examples:

```
nx9500-6C8809(config-profile-SITE-10)#use radius-server-policy Guest-Radius
nx9500-6C8809(config-profile-SITE-10)#use captive-portal server DeviceRegistration
nx9500-6C8809(config-profile-SITE-10-if-radio2)#wlan CP-OnBoarding bss 1 primary
nx9500-6C8809(config-profile-SITE-10-if-ge1)#switchport mode trunk
nx9500-6C8809(config-profile-SITE-10-if-ge1)#switchport trunk native vlan 90
nx9500-6C8809(config-profile-SITE-10-if-ge1)#switchport trunk allowed vlan
1,90,1000-1002
nx9500-6C8809(config-profile-SITE-10-if-ge1)#no switchport trunk native tagged
```

8 Use the access point profile in the access point's device context.

configuring WeChat Wi-Fi hotspot support in WiNG captive portal

WeChat is a popular messaging app used in China with more than 500 million installations. WeChat's WiFi hotspot solution allows businesses to provide Internet access to their customers. The WiNG captive portal can be configured to incorporate the WeChat WiFi hotspot, so that WeChat users, on their first connect to a WiNG access point, can automatically authenticate with the WeChat server through an intermediate server.

This section provides an example that shows the configurations required to be made on the WiNG portal to enable WeChat Wi-Fi hotspot.

1 Create an AAA policy re-directing the captive portal user to WeChat's AAA server for authentication, as shown in the following example:

```
nx9500-6C8809(config)#aaa-policy cloud2
nx9500-6C8809(config-aaa-policy-cloud2)#authentication server 1 host
cloud2.synchroweb.com secret 0 firmware
nx9500-6C8809(config-aaa-policy-cloud2)#show context
aaa-policy cloud2
authentication server 1 host cloud2.synchroweb.com secret 0 firmware
nx9500-6C8809(config-aaa-policy-cloud2)#
```

Note

Synchroweb is an *independent software vendor* (ISV), whose third-party software is being used as the intermediate server. The AAA server and RADIUS accounting server configured in AAA policy must be as per the specification provided by the ISV.

2 Create a DNS whitelist, whitelisting WeChat's server name in order to initiate RADIUS authentication. The "qq.com" domain name is where WeChat server can be reached.

```
nx9500-6C8809(config)#dns-whitelist wxWL
nx9500-6C8809(config-dns-whitelist-wxWL)#permit cloud2.synchroweb.com
nx9500-6C8809(config-dns-whitelist-wxWL)#permit qq.com suffix
nx9500-6C8809(config-dns-whitelist-wxWL)#show context
dns-whitelist wxWL
permit qq.com suffix
permit cloud2.synchroweb.com
nx9500-6C8809(config-dns-whitelist-wxWL)#
```

3 Create a captive portal and associate the AAA policy and DNS whitelist created in steps 1 & 2, as shown in the following example:

```
nx9500-6C8809(config)#captive-portal wxCP
nx9500-6C8809(config-captive-portal-wxCP)#use aaa-policy cloud2
nx9500-6C8809(config-captive-portal-wxCP)#use dns-whitelist wxWL
```

4 Configure the following parameters in the captive portal created in step 3:

```
nx9500-6C8809(config-captive-portal-wxCP)#access-time 10
nx9500-6C8809(config-captive-portal-wxCP)#server host guest.extreme.com
nx9500-6C8809(config-captive-portal-wxCP)#webpage-location external
nx9500-6C8809(config-captive-portal-wxCP)#webpage external login http://
cloud2.synchroweb.com/wechat.nx/index.phpc=WING_TAG_CLIENT_MAC
nx9500-6C8809(config-captive-portal-wxCP)#)#show context
captive-portal wxCP
access-time 10
server host guest.extreme.com
webpage-location external
webpage external login http://cloud2.synchroweb.com/wechat.nx/
index.phpc=WING_TAG_CLIENT_MAC
use aaa-policy cloud2
use dns-whitelist wxWL
--More--
nx9500-6C8809(config-captive-portal-wxCP)#
```

Note
The login URL configured here must be as per the specifications provided by the ISV.

Note
The access-type remains unchanged (i.e. radius, which is the default setting). The access-time is set to a minimum value (10 minutes in this example) in order to avoid the default value of 24 hours being applied, in case the RADIUS response does not contain the session-timeout attribute.

5 Create a WLAN and associate the captive portal created in step 3:

```
nx9500-6C8809(config)#wlan wxOpen
nx9500-6C8809(config-wlan-wxOpen)#ssid wxOpen
nx9500-6C8809(config-wlan-wxOpen)#vlan 200
nx9500-6C8809(config-wlan-wxOpen)#use captive-portal wxCP
nx9500-6C8809(config-wlan-wxOpen)#captive-portal-enforcement
nx9500-6C8809(config-wlan-wxOpen)#show context
wlan wxOpen
ssid wxOpen
vlan 200
bridging-mode local
encryption-type none
authentication-type none
use captive-portal wxCP
captive-portal-enforcement
nx9500-6C8809(config-wlan-wxOpen)#
```

Note
The modes of authentication and encryption remain unchanged (i.e. none, which is the default setting for both parameters). Ensure captive-portal-enforcement is enabled on the WLAN.

Following are the related commands:

AAA Policy on page 1303	Documents AAA policy configuration mode commands
dns-whitelist on page 310	Documents DNS whitelist configuration mode commands
captive-portal on page 225	Documents captive portal configuration mode commands
wlan on page 518	Documents WLAN configuration mode commands

configuring ExtremeGuest captive portal

This section documents the basic configurations required to deploy an *ExtremeGuest* (EGuest) setup. A typical EGuest deployment consists of the EGuest server, EGuest captive-portal database, and NOC adopting the access points. The EGuest server and database can be hosted only on the VX9000 platform.

In the following example, the EGuest server and database are hosted on the same device.

1 On the EGuest server/database host,

a enable the EGuest daemon. When enabled, the EGuest server is up and running.

```
EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#eguest-server
```

b apply a database-policy to enable the EGuest database.

```
EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#use database-policy default
```

c configure the NTP server. This is to ensure time synchronization across replica-set members (this is mandatory in replica-set deployments and should be configured either on the replica-set members' device or profile context).

```
EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#ntp server time.nist.govt
```

2 On the NOC,

a create an AAA policy with the following configurations:

- Configure the EGuest server (configured in Step 1) as the authentication and accounting RADIUS server.

```
NOC(config-aaa-policy-EguestAAA)#authentication server 1 host EG-Server secret 0
extreme123
NOC(config-aaa-policy-EguestAAA)#accounting server 1 host EG-Server secret 0
extreme123
```

- Configure the proxy-mode as 'through-controller'. When configured, all requests to the server are proxied through the NOC.

```
NOC(config-aaa-policy-EguestAAA)#authentication server 1 proxy-mode through-
controller
NOC(config-aaa-policy-EguestAAA)#accounting server 1 proxy-mode through-
controller
NOC(config-aaa-policy-EguestAAA)#show context
aaa-policy EguestAAA
accounting server 1 host EG-OnBServer secret 0 extreme123
accounting server 1 proxy-mode through-controller
authentication server 1 host EG-Server secret 0 extreme123
authentication server 1 proxy-mode through-controller
NOC(config-aaa-policy-EguestAAA)#
```

b Create a DNS whitelist. Note, DNS whitelist configuration is required only if enabling OAuth on the EGuest captive-portal. When created and used on the EGuest captive-portal, the DNS

whitelist renders social plugin buttons on the client prior to successful captive portal authentication.

- Configure the following permit rules:

```
NOC(config-dns-whitelist-EguestDNS)#permit fbstatic-a.akamaihd.net
NOC(config-dns-whitelist-EguestDNS)#permit connect facebook.net
NOC(config-dns-whitelist-EguestDNS)#permit facebook.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit fbcdn.net suffix
NOC(config-dns-whitelist-EguestDNS)#permit googleapis.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit google.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit googleusercontent.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit linkedin.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit static.licdn.com
NOC(config-dns-whitelist-EguestDNS)#permit twitter.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit twimg.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit instagramstatic-a.akamaihd.net
NOC(config-dns-whitelist-EguestDNS)#permit instagram.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit ssl.gstatic.com
NOC(config-dns-whitelist-EguestDNS)#permit extremenetworks.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit local.extreme.com
```

c Create a captive-portal with the following configurations:

- Specify the captive-portal server.

```
NOC(config-captive-portal-EguestCP)#server host guest.extreme.com
```

- Use the AAA policy created in Step 2 a.

```
NOC(config-captive-portal-EguestCP)#use aaa-policy EguestAAA
```

- Enable social-media authentication. This setting is optional.

```
NOC(config-captive-portal-EguestCP)#oauth
```

- Use the DNS whitelist created in Step 2 b. Note, the DNS whitelist is required only if enabling OAuth on the captive-portal.

```
NOC(config-captive-portal-EguestCP)#use dns-whitelist EguestDNS
```

- Configure the captive portal's webpage location as advanced.

Note
Webpage-location should be 'advanced' if using pages created with EGuest splash templates.

```
NOC(config-captive-portal-EguestCP)#webpage-location advanced
```

d Create a WLAN policy with the following configurations:

- Enable MAC authentication.

```
NOC(config-wlan-EguestWLAN)#authentication-type mac
```

- Use the AAA policy created in Step 2 a.

```
NOC(config-wlan-EguestWLAN)#use aaa-policy EguestAAA
```

Note
When used, access points/controllers forward registration requests to the EGuest server specified in the AAA policy. However, ensure that the `registration > external > follow-aaa` option is configured on the WLAN. See below.

```
NOC(config-wlan-EguestWLAN)#registration external follow-aaa
```

Note
This enables the use of the Authentication and Accounting servers specified in the AAA policy applied on the WLAN.

- Use the captive-portal created in Step 2 c.

```
NOC(config-wlan-EguestWLAN)#use captive-portal EguestCP
```

- Enable captive-portal enforcement with fall-back.

```
NOC(config-wlan-EguestWLAN)#captive-portal-enforcement fall-back
```

- Configure the following guest registration parameters:

```
NOC(config-wlan-EguestWLAN)#registration device group-name Eguest expiry-time
4320 agreement-refresh 1440
```

Note
This is the RADIUS group assigned to registered users post authentication.

```
NOC(config-wlan-EguestWLAN)#show context
wlan EguestWLAN
ssid _EXTREME-GUEST-NRF2017
vlan 1
bridging-mode local
encryption-type none
authentication-type mac
no answer-broadcast-probes
no client-client-communication
wireless-client hold-time 300
use aaa-policy EguestAAA
use captive-portal EguestCP
captive-portal-enforcement fall-back
registration device group-name Eguest expiry-time 4320 agreement-refresh 1440
registration external follow-aaa
mac-authentication cached-credentials
NOC(config-wlan-EguestWLAN)#
```

e In the NOC's self context, configure the EGuest server.

```
NOC(config-device-74-67-F7-5C-64-4A)#eguest-server host 1 EG-Server https
```

3 In the Access Point's device or profile context, use the captive-portal configured in Step 2 c.

```
Eguest-AP(config-device-74-67-F7-5C-64-4A)#use captive-portal EguestCP
```

4 To view EGuest registration status and statistics, on the EGuest server, use the following commands:

```
EG-Server-DB#show eguest registration statistics
EG-Server-DB#show eguest registration status
```

5 To clear EGuest registration statistics, on the EGuest server, use the following command:

```
EG-Server-DB#clear eguest registration statistics
```

Following are the related commands:

AAA Policy on page 1303	Documents AAA policy configuration mode commands
dns-whitelist on page 310	Documents DNS whitelist configuration mode commands
captive-portal on page 225	Documents captive portal configuration mode commands
wlan on page 518	Documents WLAN configuration mode commands
eguest-server (VX9000 only) on page 987	Documents the eguest-server command. When used in the EGuest server's device/profile context, without the 'host' option, it enables the EGuest daemon. When used on the NOC along with the 'host' option, it points to the EGuest server.

clear

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where executed.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
clear event-history
```

Parameters

```
clear event-history
```

event-history	Clears the event history file

Examples

```
nx9500-6C8809(config)#show event-history

client-identity

With an increase in *Bring Your Own Device* (BYOD) corporate networks, there is a parallel increase in the number of possible attack scenarios within the network. BYOD devices are inherently unsafe, as the organization's security mechanisms do not extend to these personal devices deployed in the corporate wireless network. Organizations can protect their network by limiting how and what these BYODs can access on and through the corporate network.

Device fingerprinting assists administrators by controlling how BYOD devices access a corporate wireless domain.

Device fingerprinting uses DHCP options sent by the client in request or discover packets to derive a unique signature specific to device class. For example, Apple devices have a different signature from Android devices. The signature is used to classify the devices and assign permissions and restrictions on each device class.

Device fingerprinting is a technique of collecting, analyzing, and identifying traffic patterns originating from remote computing devices. When enabled, device fingerprinting helps to identify a wireless client's device type. There are two methods of fingerprinting devices: Active and Passive.

Active fingerprinting is based on the fact that traffic patterns vary with varying device types. It involves the sending of requests (HTTP, etc.) to devices (clients) and analyzing their response to determine the device type. For example, an invalid request is sent to a device, and its error response is analyzed to identify the device type. Since active device fingerprinting involves sending of packets, the probability of the network getting flooded is very high, especially when many devices are being fingerprinted simultaneously.

Passive fingerprinting involves monitoring of devices to check for known traffic patterns specific to devices based on the protocol, driver implementation etc. This method accurately classifies a client's TCP/IP configuration, OS fingerprints, wireless settings etc. No packets are sent to the device. Some of the commonly used protocols for passive device fingerprinting are, TCP, DHCP, HTTP etc. This feature implements DHCP device fingerprinting, which relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than

Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

The client-identity command enables device fingerprinting. It creates a new client identity and enters its configuration mode. Client identity is a set of unique fingerprints used to identify a class of devices. This information is used to configure permissions and access rules for the identified class of devices in the network.

Note

The WiNG software provides a set of built-in device fingerprints that load by default and identify client device types. Use the `service > show > client-identity-defaults` command to view default client identity fingerprints.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
client-identity <CLIENT-IDENTITY-NAME>
```

Parameters

```
client-identity <CLIENT-IDENTITY-NAME>
```

client-identity <CLIENT-IDENTITY-NAME>	Creates a new client identity policy and enters its configuration mode • <CLIENT-IDENTITY-NAME> – Specify a client identity policy name. If the client identity policy does not exist, it is created.

Usage Guidelines

The following points should be considered when configuring the client identity (device fingerprinting) feature:

- Ensure that DHCP is enforced on the WLANs. For more information on enforcing DHCP on WLANs, see enforce-dhcp on page 546.
- Successful identification of different device types depends on the uniqueness of the configured fingerprints. DHCP fingerprinting identifies clients based on the patterns (fingerprints) in the DHCP discover and request messages sent by clients. If different operating systems have the same fingerprints. it will be difficult to identity the device type.
- When associating client identities with a role policy, ensure that the profile/device, under which the role policy is being used, also has an associated client identity group (containing all the client identities used by the role policy).

Examples

```
rfs4000-229D58(config)#client-identity test
nx9500-6C8809(config-client-identity-test)#?
Client Identity Mode commands:
  dhcp                     Add a DHCP option based match criteria
  dhcp-match-message-type  Specify DHCP message type to match
  no                       Negate a command or set its defaults
```

```
  clrscr                    Clears the display screen
  commit                    Commit all changes made in this session
  do                        Run commands from Exec mode
  end                       End current mode and change to EXEC mode
  exit                      End current mode and down to previous mode
  help                      Description of the interactive help system
  revert                    Revert changes
  service                   Service Commands
  show                      Show running system information
  write                     Write running configuration to memory or terminal

nx9500-6C8809(config-client-identity-test)#
```

Note

Use the `service > show > client-identity-defaults` command to view default, built-in, system-provided client identity fingerprints:

```
nx9500-6C8809#service show client-identity-defaults
client-identity Android-2-1
 dhcp 1 message-type request option 55 exact hexstring 0103061c21333a3b79
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.1
client-identity Android-2-2
 dhcp 1 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
client-identity Android-2-3
 dhcp 3 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15

client-identity-mode-commands

The following table summarizes the client-identity configuration mode commands:

Table 8: Client-Identity-Mode Commands

Command	Description
dhcp on page 274	Configures the DHCP option match criteria for device fingerprinting
dhcp-match-message-type on page 275	Configures the DHCP message type for device fingerprinting
no (client-identity-config-mode) on page 276	Removes the DHCP option (used for client identification) configurations

dhcp

Configures the DHCP option match criteria (signature) for the discover and request message types received from wireless clients

When accessing a network, DHCP discover and request messages are passed between wireless clients and the DHCP server. These messages contain DHCP options and option values that differ from device to device and are based on the DHCP implementation in the device's *Operating System* (OS). Options and option values contained in a client's messages are parsed and compared against the configured DHCP option values to identify the device. Once a device type is identified, the wireless client database is updated with the discovered device type.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dhcp <1-16> message-type [discover|request] [option|option-codes]
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes]
[contains|exact|starts-with] [ascii|hexstring] <WORD>
```

Parameters

```
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes]
[contains|exact|starts-with] [ascii|hexstring] <WORD>
```

dhcp <1-16>	Adds a DHCP option match criteria signature • <1-16> – Specify an index for this DHCP match criteria from 1 - 16. **Note:** A maximum of 16 match criteria can be configured.
message-type [discover|request]	Specifies the message type to which this DHCP match criteria is applicable • discover – Applies this match criteria to DHCP discover messages only. Indicates that the fingerprint is only checked with any DHCP discover messages received from any device. • request – Applies this match criteria to DHCP request messages only. Indicates that the fingerprint is only checked with any DHCP request messages received from any device. **Note:** It is recommended to configure client-identity with request messages, because clients rarely send discover messages. **Note:** If the message type is not specified, the fingerprint is checked with all message types (DHCP request and DHCP discover).
option <1-254>	The following keywords are common to the 'discover' and 'request' message types: • option – Configures a DHCP option value, which is used as the match criteria • <1-254> – Configures a code for this DHCP option from 1 - 254 (except option 53)
option-codes	The following keyword is common to the 'discover' and 'request' message types: • option-codes – Matches criteria based on the DHCP option codes contained in the client's discover/request messages Devices pass options in their DHCP discover/request messages as option codes, option types, and option value sets. These option codes are extracted and matched against the configured DHCP option codes and a fingerprint is derived. This derived fingerprint is used to identify the device.

contains	The following keyword is common to the 'discover' and 'request' message types: • contains – Specifies that the DHCP options received in the client's discover/request messages contains the configured option code string
exact	The following keyword is common to the discover and request message types: • exact – Specifies that the DHCP options received in the client's discover/request messages is an exact match with the configured option code string
starts-with	The following keyword is common to the 'discover' and 'request' message types: • starts-with – Specifies that the DHCP options received in the client's discover/request messages starts with the configured option code string
ascii <WORD>	The following keywords are common to the 'contains', 'exact', and 'starts-with' parameters: • ascii – Configures the DHCP option in the ASCII format • <WORD> – Specify the DHCP option ASCII value to match.
hexstring <WORD>	The following keywords are common to the 'contains', 'exact', and 'starts-with' parameters: • hexstring – Configures the DHCP option in the hexa-decimal format • <WORD> – Specify the DHCP option hexstring value to match.

Usage Guidelines

The following DHCP options are useful for identifying different device types:

- Option 55: Used by a DHCP client to request values for specific configuration parameters. It is a list of DHCP option codes and can be in the client's order of preference.
- Client configured list of DHCP options (all options parsed into a hex string).
- Option 60: Vendor class identifier. Used to identify the vendor and functionality of a DHCP client (some devices do not set the value of this field).

Though it is possible to use any option to configure a device fingerprint, the use of a combination of one or more of the preceding options to define a device is recommended.

Examples

```
nx9500-6C8809(config-client-identity-test)#dhcp 1 message-type request option
60 exact ascii MSFT\5.0
nx9500-6C8809(config-client-identity-test)#dhcp 2 message-type discover option
 2 exact hexstring 012456c22c44
nx9500-6C8809(config-client-identity-test)#show context
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
nx9500-6C8809(config-client-identity-test)#
```

Related Commands

no	Removes a DHCP option signature (match criteria)

dhcp-match-message-type

Configures the DHCP message type to match

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dhcp-match-message-type [all|any|discover|request]
```

Parameters

```
dhcp-match-message-type [all|any|discover|request]
```

dhcp-match-message-type [all|any|discover|request]	Specifies the DHCP message type to consider for matching • all – Matches all message types: discover and request. Indicates that the fingerprint is checked with both the DHCP request and the DHCP discover message. • any – Matches any message type: discover or request. Indicates that the fingerprint is checked with either the DHCP request or the DHCP discover message. • discover – Matches discover messages only. A match is made only if the discover message sent by the client matches the match criteria set in the client identity. Values configured for request messages are ignored. • request – Matches request messages only. A match is made only if the request message sent by the client matches the match criteria set in the client identity. Values configured for discover messages are ignored.

Examples

```
nx9500-6C8809(config-client-identity-test)#dhcp-match-message-type all
nx9500-6C8809(config-client-identity-test)#show context
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
 dhcp-match-message-type all
nx9500-6C8809(config-client-identity-test)#
```

Related Commands

no	Removes the DHCP message type to match

no (client-identity-config-mode)

Removes the DHCP options match criteria configurations

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [dhcp <1-16>|dhcp-match-message-type]
```

Parameters

```
no [dhcp <1-16>|dhcp-match-message-type]
```

dhcp <1-16>	Removes the DHCP option match criteria rule identified by the <1-16> keyword • <1-16> – Specify the DHCP option match criteria rule index
dhcp-match-message-type	Removes the DHCP message type to match

Examples

The following example shows the client identity 'test' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-client-identity-test)#show context
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
 dhcp-match-message-type all
nx9500-6C8809(config-client-identity-test)#
```

The following example shows the client identity 'test' settings after the 'no' commands are executed:

```
nx9500-6C8809(config-client-identity-test)#no dhcp 2
nx9500-6C8809(config-client-identity-test)#no dhcp-match-message-type
nx9500-6C8809(config-client-identity-test)#show context
client-identity test
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
nx9500-6C8809(config-client-identity-test)#
```

client-identity-group

Configures a new client identity group

A client identity group is a collection of client identities. Each client identity included in a client identity group is set a priority value that indicates the priority for that identity when device fingerprinting.

Device fingerprinting relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

A client identity group can be attached to a profile or device, enabling device fingerprinting on them.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
client-identity-group <CLIENT-IDENTITY-GROUP-NAME>
```

Parameters

```
client-identity-group <CLIENT-IDENTITY-GROUP-NAME>
```

client-identity-group <CLIENT-IDENTITY-GROUP-NAME>	Creates a new client identity group and enters its configuration mode • <CLIENT-IDENTITY-GROUP-NAME> – Specify a client identity group name. If the group does not exist, it is created.

Examples

```
nx9500-6C8809(config)#client-identity-group test
nx9500-6C8809(config-client-identity-group-test)#
Client Identity group Mode commands:
  client-identity  Client identity (DHCP Device Fingerprinting)
  load             Load Client identity Fingerprints
  no               Negate a command or set its defaults

  clrscr           Clears the display screen
  commit           Commit all changes made in this session
  do               Run commands from Exec mode
  end              End current mode and change to EXEC mode
  exit             End current mode and down to previous mode
  help             Description of the interactive help system
  revert           Revert changes
  service          Service Commands
  show             Show running system information
  write            Write running configuration to memory or terminal

nx9500-6C8809(config-client-identity-group-test)#
```

Related Commands

no on page 611	Removes an existing client identity group

client-identity-group-mode-commands

The following table summarizes the client identity group configuration mode commands:

Table 9: Client-Identity-Group-Mode Commands

Command	Description
client-identity on page 278	Associates an existing and configured client identity (device fingerprinting definition) with this client identity group
load on page 280	Loads default (system-provided) client identity fingerprints
no (client-identity-group-config-mode) on page 281	Removes the client identity associated with this client identity group

client-identity

Associates an existing and configured client identity (device fingerprinting definition) with this client identity group

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

Parameters

```
client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

client-identity <CLIENT-IDENTITY-NAME>	Associates a client identity with this group • <CLIENT-IDENTITY-NAME> – Specify a client identity name (should be existing and configured)
precedence <1-10000>	Determines the order in which client identity is used. • <1-10000> – Specify this client identity precedence from <1-10000>. The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets priority over a client identity having precedence 20.

Examples

The following example shows two client identities created and configured:

```
nx9500-6C8809(config)#show context
!
! Configuration of NX9500 version 7.1.0.0-010D
!
!
version 2.6

 --More--
nx9500-6C8809(config)#
```

The following example associates client identity ‘test’ with the client identity group ‘test’:

```
nx9500-6C8809(config-client-identity-group-test)#client-identity test precedence 1
```

The following example shows the client identity group ‘test’ with two associated client identities having precedence 1 and 2:

```
nx9500-6C8809(config-client-identity-group-test)#client-identity TestClientIdentity
precedence 2
rfs4000-229D58(config-client-identity-group-test)#show context
client-identity-group test
 client-identity test precedence 1
 client-identity TestClientIdentity precedence 2
nx9500-6C8809(config-client-identity-group-test)#
```

Related Commands

no	Removes the client identity associated with the client identity group

load

Loads default (built-in, system-provided) client identity fingerprints. This option is enabled by default.

The WiNG software provides some built-in client identity fingerprints that are automatically loaded when the client identity group if applied to a device (either directly or through the profile).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
load default-fingerprints
```

Parameters

```
load default-fingerprints
```

load default-fingerprints	Loads client identity default fingerprints. This option is enabled by default.

Examples

The auto-load default fingerprints option is enabled by default, as shown in the following example:

```
nx9500-6C874D(config-client-identity-group-test)#show context
client-identity-group test
 load default-fingerprints
nx9500-6C874D(config-client-identity-group-test)#
```

In scenarios where only customized client identities are to be applied, use the **no > load > default-fingerprints** command to disable auto-loading of default device fingerprints.

```
nx9500-6C874D(config-client-identity-group-test)#no load default-fingerprints
nx9500-6C874D(config-client-identity-group-test)#show context
client-identity-group test
 no load default-fingerprints
nx9500-6C874D(config-client-identity-group-test)#
```

Note

Use the `service > show > client-identity-defaults` command to view default client identity fingerprints.

```
nx9500-6C874D#service show client-identity-defaults
client-identity Android-2-1
 dhcp 1 message-type request option 55 exact hexstring 0103061c21333a3b79
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.1
client-identity Android-2-2
 dhcp 1 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
client-identity Android-2-3
 dhcp 3 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
 dhcp 1 message-type request option-codes exact hexstring 353d32393c37
 dhcp 2 message-type request option-codes exact hexstring 353d3236393c37
 dhcp 10 message-type request option-codes exact hexstring 353d3236393c0c37
```

```

```

Related Commands

no	Disables automatic loading of default client identity fingerprints

no (client-identity-group-config-mode)

Removes the client identity associated with the client identity group

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [client-identity|load]
no client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
no load default-fingerprints
```

Parameters

```
no client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

no client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>	Disassociates a specified client identity from this client identity group • <CLIENT-IDENTITY-NAME> – Specify the client identity name. • precedence <1-10000> – Specify the above specified client identity's precedence value from <1-10000>. The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets precedence over a client identity having precedence 20.

```
no load default-fingerprints
```

no load default-fingerprints	Disables automatic loading of built-in, system-provided client identity fingerprints

Examples

```
nx9500-6C8809((config-client-identity-group-test)#show context
client-identity-group test
 client-identity test precedence 1
<exsw5>(config-client-identity-group-test)#

nx9500-6C8809((config-client-identity-group-test)#no client-identity test
```

clone

Creates a replica of an existing object or device. The configuration of the new object or device is an exact copy of the existing object or device configuration. Use this command to copy existing configurations and then modifying only the required parameters.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
clone [TLO|device]
clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>
```

Parameters

```
clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
```

TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>	Creates a new TLO by cloning an existing top-level object. The new object has the same configuration as the cloned object. • <EXISTING-OBJECT-NAME> – Specify the existing object's (to be cloned) name • <NEW-OBJECT-NAME> – Provide the new object's name. Note: Enter `clone` and press **Tab** to list objects available for cloning.

```
clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>
```

device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>	Configures a new device based on an existing device configuration • <EXISTING-DEVICE-MAC/NAME> – Specify the existing device's name or MAC address (the device to be cloned) • <NEW-DEVICE-MAC> – Provide the new device's MAC address. Note: Enter `clone > device` and press **Tab** to list devices available for cloning.

Examples

```
nx9500-6C874D(config)#clone rf_domain TechPubs Cloned_TechPubs2
nx9500-6C874D(config)#show context

nx9500-6C874D(config)#
```

crypto-cmp-policy

Creates a crypto Certificate Management Protocol (CMP) policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>
```

Parameters

```
crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>
```

crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>	Specify the crypto CMP policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#crypto-cmp-policy CMP
nx9500-6C8809(config-cmp-policy-CMP)#?
CMP Policy Mode commands:
  ca-server             CMP CA Server configuration commands
  cert-key-size         Set key size for certificate request
  cert-renewal-timeout  Trigger a cert renewal request on timeout
  cross-cert-validate   Validate cross-cert using factory-cert
  no                    Negate a command or set its defaults
  subjectAltName        Configure subjectAltName value
  trustpoint            Trustpoint for CMP
  use                   Set setting to use

  clrscr                Clears the display screen
  commit                Commit all changes made in this session
  do                    Run commands from Exec mode
  end                   End current mode and change to EXEC mode
  exit                  End current mode and down to previous mode
  help                  Description of the interactive help system
  revert                Revert changes
  service               Service Commands
  show                  Show running system information
  write                 Write running configuration to memory or terminal

nx9500-6C8809(config-cmp-policy-CMP)#
```

Related Commands

no on page 611	Resets values or disables commands

Note

For more information on the crypto CMP policy, see Crypto-CMP Policy on page 1846.

customize

Customizes the output of the summary CLI commands. Use this command to define the data displayed as a result of various show commands.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
customize [cdp-lldp-info-column-width|hostname-column-width|show-adoption-status|

noise,q-index,radio-alias <3-67>,radio-id,radio-mac,rx-rate,signal,snr,t-index,
tx-rate)
```

Parameters

```
customize [cdp-lldp-info-column-width|hostname-column-width] <1-64>
```

hostname-column-width <1-64>	Configures default width of the hostname column in all show commands • <1-64> – Sets the hostname column width from 1 - 64 characters
cdp-lldp-info-column-width <1-64>	Configures the column width in the **show > cdp/lldp > [neighbor|report]** command output • <1-64> – Sets the column width from 1 - 64 characters

```
customize show-adoption-status (adopted-by,ap-name <1-64>,cdp-lldp-info,
config-status,last-adoption,msgs,uptime,version)
```

show-adoption-status	Configures the information displayed in the show > adoption > status command output. Select the columns (information) displayed from the following options: adopted-by, ap-name, cdp-lldp-info, config-status, last-adoption, msgs, uptime, and version. These are recursive parameters and you can select multiple options at a time. The columns displayed by default are: Device-Name, Version, Config-Status, MSGS, Adopted-By, Last-Adoption, and Uptime. Where ever available, you can optionally use the <1-64> parameter to set the column width.

```
customize show-wireless-client (ap-name <1-64>,auth,client-identity <1-32>,
bss,enc,hostname <1-64>,ip,last-active,location <1-64>,mac,radio-alias <3-67>,
radio-id,radio-type,role <1-32>,state,username <1-64>,vendor,vlan,wlan)
```

show-wireless-client	Customizes the **show > wireless > client** command output The columns displayed by default are: MAC, IPv4, Vendor, Radio-ID, WLAN. VLAN, and State.
ap-name <1-64>	Includes the ap-name column, which displays the name of the AP with which this client associates • <1-64> – Sets the ap-name column width from 1 - 64 characters
auth	Includes the auth column, which displays the authorization protocol used by the wireless client
client-identity <1-32>	Includes the client-identity (device type) column, which displays details gathered from DHCP device fingerprinting feature (when enabled). For more information, see client-identity. • <1-32> – Sets the client-identity column width from 1 - 32 characters
bss	Includes the BSS column, which displays the BSS ID the wireless client is associated with
enc	Includes the enc column, which displays the encryption suite used by the wireless client
hostname <1-64>	Includes the hostname column, which displays the wireless client's hostname • <1-64> – Sets the hostname column width from 1 - 64 characters
ip	Includes the IP column, which displays the wireless client's current IP address
last-active	Includes the last-active column, which displays the time of last activity seen from the wireless client

location <1-64>	Includes the location column, which displays the location of the client's associated Access Points • <1-64> – Sets the location column width from 1 - 64 characters
mac	Includes the MAC column, which displays the wireless client's MAC address
radio-alias <3-67>	Includes the radio-alias column, which displays the radio alias with the AP's hostname and radio interface number in the "HOSTNAME:RX" format • <3-67 – Sets the radio-alias column width from 3 - 67 characters
radio-id	Includes the radio-id column, which displays the radio ID with the AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format
radio-type	Includes the radio-type column, which displays the wireless client's radio type
role <1-32>	Includes the role column, which displays the client's role • <1-32> – Sets the role column width from 1 - 32 characters
state	Includes the state column, which displays the wireless client's current availability state
username <1-64>	Includes the username column, which displays the wireless client's username • <1-64> – Specify the username column width from 1 - 64 characters.
vendor	Includes the vendor column, which displays the wireless client's vendor ID
vlan	Includes the VLAN column, which displays the wireless client's assigned VLAN
wlan	Includes the WLAN column, which displays the wireless client's assigned WLAN

```
customize show-wireless-client-stats (hostname <1-64>,mac,rx-bytes,rx-errors,
rx-packets,rx-throughput,t-index,tx-bytes,tx-dropped,tx-packets,tx-throughput)
```

show-wireless-client-stats	Customizes the **show > wireless > client** stats command output The columns displayed by default are: MAC, Tx bytes, RX bytes, Tx pkts, Rx pkts, and Tx bps, RX bps, T-Index, and Dropped pkts.
hostname <1-64>	Includes the hostname column, which displays the wireless client's hostname • <1-64> – Sets the hostname column width from 1 - 64 characters
mac	Includes the MAC column, which displays the wireless client's MAC address
rx-bytes	Includes the rx-bytes column, which displays the total number of bytes received by the wireless client
rx-errors	Includes the rx-error column, which displays the total number of errors received by the wireless client
rx-packets	Includes the rx-packets column, which displays the total number of packets received by the wireless client
rx-throughput	Includes the rx-throughput column, which displays the receive throughput at the wireless client

t-index	Includes the t-index column, which displays the traffic utilization index at the particular wireless client
tx-bytes	Includes the tx-bytes column, which displays the total number of bytes transmitted by the wireless client
tx-dropped	Includes the tx-dropped column, which displays the total number of dropped packets by the wireless client
tx-packets	Includes the tx-packets column, which displays the total number of packets transmitted by the wireless client
tx-throughput	Includes the tx-throughput column, which displays the transmission throughput at the wireless client

```
customize show-wireless-client-stats-rf (average-retry-number,error-rate,noise,
q-index,rx-rate,signal,snr,t-index,tx-rate)
```

show-wireless-client-stats-rf	Customizes the **show > wireless > client** stats RF command output The columns displayed by default are: MAC, Signal (dBm), Noise (dBm), SNR (dB), TX Rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%).
average-retry-number	Includes the average-retry-number column, which displays the average number of retransmissions made per packet
error-rate	Includes the error-rate column, which displays the rate of error for the wireless client
hostname <1-64>	Includes the hostname column, which displays the wireless client's hostname • <1-64> – Sets the hostname column width from 1 - 64 characters
mac	Includes the MAC column, which displays the wireless client's MAC address
noise	Includes the noise column, which displays the noise (in dBm) as detected by the wireless client
q-index	Includes the q-index column, which displays the RF quality index Note: Higher values indicate better RF quality.
rx-rate	Includes the rx-rate column, which displays the receive rate at the particular wireless client
signal	Includes the signal column, which displays the signal strength (in dBm) at the particular wireless client
snr	Includes the snr column, which displays the *signal-to-noise* (SNR) ratio (in dB) at the particular wireless client
t-index	Includes the t-index column, which displays the traffic utilization index at the particular wireless client
tx-rate	Includes the tx-rate column, which displays the packet transmission rate at the particular wireless client

```
customize show-wireless-meshpoint-accelerated-multicast (ap-hostname,group-addr,
mesh-name,neighbor-hostname,neighbor-ifid,radio-alias,radio-id,radio-mac,subscriptions)
```

show-wireless-meshpoint-accelerated-multicast	Configures the information displayed in the **show > wireless > meshpoint > accelerated multicast** command output. Select the columns (information) displayed from the following options: ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions. These are recursive parameters and you can select multiple options at a time. The columns displayed by default are: Mesh, Radio, Neighbor-IFID, Neighbor-Hostname, Group-MAC, and Subscriptions.

```
customize show-wireless-meshpoint (ap-mac,cfg-as-root,hops,hostname <1-64>,
interface-ids,is-root,mesh-name <1-64>,mpid,next-hop-hostname <1-64>,next-hop-ifid,
next-hop-use-time,path-metric,root-bound-time,root-hostname <1-64>,root-mpid)
```

show-wireless-meshpoint	Customizes the **show > wireless > meshpoint** command output The columns displayed by default are: Mesh, Hostname, Hops, Is-Root, Config-As-Root, Root-Hostname, Root-Bound-Time, Path-Metric, Next-Hop-Hostname, and Next-Hop-Use-Time.
ap-mac	Includes the ap-mac column, which displays the AP's MAC address in the AA-BB-CC-DD-EE-FF format. Applicable only in case of non-wireless controller meshpoints
cfg-as-root	Includes the cfg-as-root column, which displays the configured root state of the meshpoint
hops	Includes the hops column, which displays the number of hops to the root for this meshpoint
hostname <1-64>	Includes the hostname column, which displays the AP's hostname. Applicable only in case of non-wireless controller meshpoints • <1-64> – Sets the hostname column width from 1 - 64 characters
interface-ids	Includes the interface-ids column, which displays the interface identifiers (interfaces used by this meshpoint)
is-root	Includes the is-root column, which displays the current root state of the meshpoint
mesh-name <1-64>	Includes the mesh-name column, which displays the meshpoint's name • <1-64> – Sets the mesh-name column width from 1 - 64 characters
mpid	Includes the mpid column, which displays the meshpoint identifier in the AA-BB-CC-DD-EE-FF format
next-hop-hostname <1-64>	Includes the next-hop-hostname column, which displays the next-hop AP's name (the AP next in the path to the bound root) • <1-64> – Sets the next-hop-hostname column width from 1 - 64 characters
next-hop-ifid	Includes the next-hop-ifid column, which displays the next-hop interface identifier in the AA-BB-CC-DD-EE-FF format
next-hop-use-time	Includes the next-hop-use-time column, which displays the time since this meshpoint started using this next hop
root-bound-time	Includes the root-bound-time column, which displays the time since this meshpoint has been bound to the current root

root-hostname <1-64>	Includes the root-hostname column, which displays the root AP's hostname to which this meshpoint is bound • <1-64> – Sets the root-hostname column width from 1 - 64 characters
root-mpid	Includes the root-mpid column, which displays the bound root meshpoint identifier in the AA-BB-CC-DD-EE-FF format

```
customize show-wireless-meshpoint-neighbor-stats (ap-hostname <1-64>,
neighbor-hostname <1-64>,neighbor-ifid,rx-bytes,rx-errors,rx-packets,rx-throughput,t-
index,
tx-bytes,tx-dropped,tx-packets,tx-throughput)
```

show-wireless-meshpoint-neighbor-stats	Customizes the **show > wireless > meshpoint > neighbor > stats** command output The columns displayed by default are: AP Hostname, Neighbor-IFID, TX bytes, RX bytes, Tx pkts, Rx pkts, Tx (bps), Rx (bps), T-Index (%), and Dropped pkts.
ap-name <1-64>	Includes the ap-name column, which displays name of the AP reporting a neighbor • <1-64> – Sets the ap-name column width from 1 - 64 characters
neighbor-hostname <1-64>	Includes the neighbor-hostname column, which displays the reported neighbor's hostname • <1-64> – Sets the neighbor-hostname column width from 1 - 64 characters
neighbor-ifid	Includes the neighbor-ifid column, which displays the neighbor's interface ID
rx-bytes	Includes the rx-bytes column, which displays the total bytes received
rx-errors	Includes the rx-error column, which displays the total bytes of error received
rx-packets	Includes the rx-packets column, which displays the number of packets received
rx-throughput	Includes the rx-throughput column, which displays neighbor's received throughput
t-index	Includes the t-index column, which displays the traffic utilization index at the neighbor end
tx-bytes	Includes the tx-bytes column, which displays the total bytes transmitted
tx-dropped	Includes the tx-dropped column, which displays the total bytes dropped
tx-packets	Includes the tx-packets column, which displays the number of packets transmitted
tx-throughput	Includes the tx-throughput column, which displays neighbor's transmitted throughput

```
customize show-wireless-meshpoint-neighbor-stats-rf (ap-hostname <1-64>,
average-retry-number,error-rate,neighbor-hostname <1-64>,neighbor-ifid,noise,
q-index,rx-rate,signal,snr,t-index,tx-rate)
```

show-wireless-meshpoint-neighbor-stats-rf	Customizes the **show > wireless > meshpoint > neighbor > statistics RF** command output The columns displayed by default are: AP Hostname, Neighbor-IFID, Signal (dBm), Noise (dBm), SNR (dB), Tx-Rate (Mbps), Rx-Rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%).
ap-name <1-64>	Includes the ap-name column, which displays name of the AP reporting a neighbor • <1-64> – Sets the ap-name column width from 1 - 64 characters
average-retry-number	Includes the average-retry-number column, which displays the average number of retransmissions made per packet.
error-rate	Includes the error-rate column
neighbor-hostname <1-64>	Includes the neighbor-hostname, which displays reported neighbor's hostname • <1-64> – Sets the neighbor-hostname column width from 1 - 64 characters
noise	Includes the noise column, which displays the noise level in dBm
q-index	Includes the q-index column, which displays the q-index
rx-rate	Includes the rx-rate column, which displays rate of receiving
signal	Includes the signal column, which displays the signal strength in dBM
snr	Includes the snr column, which displays the signal-to-noise ratio
t-index	Includes the t-index column, which displays t-index
tx-rate	Includes the tx-rate column, which displays rate of transmission

```
customize show-wireless-mint-client (client-alias <1-64>,client-bss,portal-alias
<1-64>,portal-bss,up-time)
```

show-wireless-mint-client	Configures the information displayed in the **show > wireless > mint > client** command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, portal-bss, and up-time. These are recursive parameters and you can select multiple options at a time. The columns displayed by default are: Portal, Portal-Radio-MAC, Client, Client-Radio-MAC, and Up-Time.

```
customize show-wireless-mint-client-stats (client-alias <1-64>,portal-alias <1-64>,
portal-bss,rx-bytes,rx-errors,rx-packets,rx-throughput,t-index,tx-bytes,tx-dropped,
tx-packets,tx-throughput)
```

show-wireless-mint-client-stats	Configures the information displayed in the **show > wireless > mint > client > statistics** command output. Select the columns (information) displayed from the following options: client-alias, portal-alias, portal-bss, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput. These are recursive parameters and you can select multiple options at a time. The columns displayed by default are: Portal, Portal-Radio-MAC, Client, Tx bytes, Rx bytes, TX pkts, Rx pkts, TX (bps), Rx (bps), T-Index (%), and Dropped pkts. Where ever available, you can optionally use the <1-64> parameter to set the column width.

```
customize show-wireless-mint-client-stats-rf (average-retry-number,
client-alias <1-64>,error-rate,noise,portal-alias <1-64>,portal-bss,q-index,rx-rate,
signal,snr,tx-rate)
```

show-wireless-mint-client-stats-rf	Configures the information displayed in the **show > wireless > mint > client > statistics > rf** command output. Select the columns (information) displayed from the following options: average-retry-number, client-alias, error-rate, noise, portal-alias, portal-bss, q-index, rx-rate, signal, snr, and tx-rate. These are recursive parameters and you can select multiple options at a time. The columns displayed by default are: MAC, Signal (dBm), Noise (dBm), SNR (dB), Tx-Rate (Mbps), Rx-rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%). Where ever available, you can optionally use the <1-64> parameter to set the column width.

```
customize show-wireless-mint-portal (client-alias <1-64>,client-bss,
portal-alias <1-64>,portal-bss,up-time)
```

show-wireless-mint-portal	Configures the information displayed in the **show > wireless > mint > portal** command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, portal-bss, and up-time. These are recursive parameters and you can select multiple options at a time. The columns displayed by default are: Client, Client-Radio-MAC, Portal, Portal-Radio-MAC, and Up-Time. Where ever available, optionally use the <1-64> parameter to set the column width.

```
customize show-wireless-mint-portal-stats-rf (average-retry-number,
client-alias <1-64>,client-bss,error-rate,noise,portal-alias <1-64>,q-index,rx-rate,
signal,snr,tx-rate)
```

show-wireless-mint-portal-stats-rf	Configures the information displayed in the **show > wireless > mint > portal > statistics > rf** command output. Select the columns (information) displayed from the following options: average-retry-number, client-alias, client-bss, error-rate, noise, portal-alias, q-index, rx-rate, signal, snr, tx-rate. These are recursive parameters and you can select multiple options at a time. The columns displayed by default are: Client, Client-Radio-MAC, Portal, Signal (dBm), Noise (dBm), SNR (dB), Tx-Rate (Mbps), Rx-rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%). Where ever available, optionally use the <1-64> parameter to set the column width.

```
customize show-wireless-radio (adopt-to,ap-name <1-64>,channel,location <1-64>,
num-clients,power,radio-alias <3-67>,radio-id,radio-mac,rf-mode,state)
```

show-wireless-radio	Customizes the show wireless radio command output
adopt-to	Includes the adopt-to column, which displays information about the wireless controller adopting this AP
ap-name <1-64>	Includes the ap-name column, which displays information about the AP this radio belongs • <1-64> – Sets the ap-name column width from 1 - 64 characters
channel	Includes the channel column, which displays information about the configured and current channel for this radio
location <1-64>	Includes the location column, which displays the location of the AP this radio belongs • <1-64> – Sets the location column width from 1 - 64 characters
num-clients	Includes the num-clients column, which displays the number of clients associated with this radio
power	Includes the power column, which displays the radio's configured and current transmit power
radio-alias <3-67>	Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the "HOSTNAME:RX" formate) • <3-67> – Sets the radio-alias column width from 3 - 67 characters
radio-id	Includes the radio-id column, which displays the radio‘s ID (combination of AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format)
radio-mac	Includes the radio-mac column, which displays the radio's base MAC address
rf-mode	Includes the rf-mode column, which displays the radio's operating mode. The radio mode can be 2.4 GHz, 5.0 GHz, or sensor.
state	Includes the state column, which displays the radio's current operational state

```
customize show-wireless-radio-stats (radio-alias <3-67>,radio-id,radio-mac,
rx-bytes,rx-errors,rx-packets,rx-throughput,tx-bytes,tx-dropped,tx-packets,
tx-throughput)
```

show-wireless-radio-stats	Customizes the show wireless radio statistics command output
radio-alias <3-67>	Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the "HOSTNAME:RX" format) • <3-67> – Sets the radio-alias column width from 3 - 67 characters
radio-id	Includes the radio-id column, which displays the radio‘s ID (combination of AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format)
radio-mac	Includes the radio-mac column, which displays the radio's base MAC address
rx-bytes	Includes the rx-bytes column, which displays the total number of bytes received by the radio
rx-errors	Includes the rx-error column, which displays the total number of errors received by the radio
rx-packets	Includes the rx-packets column, which displays the total number of packets received by the radio
rx-throughput	Includes the rx-throughput column, which displays the receive throughput at the radio
tx-bytes	Includes the tx-bytes column, which displays the total number of bytes transmitted by the radio
tx-dropped	Includes the tx-dropped column, which displays the total number of packets dropped by the radio
tx-packets	Includes the tx-packets column, which displays the total number of packets transmitted by the radio
tx-throughput	Includes the tx-throughput column, which displays the transmission throughput at the radio

```
customize show-wireless-radio-stats-rf (average-retry-number,error-rate,noise,
-index,radio-alias <3-67>,radio-id,radio-mac,rx-rate,signal,snr,t-index,tx-rate)
```

show-wireless-radio-stats-rf	Customizes the show wireless radio stats RF command output
average-retry-number	Includes the average-retry-number column, which displays the average number of retransmissions per packet
error-rate	Includes the error-rate column, which displays the rate of error for the radio
noise	Includes the noise column, which displays the noise detected by the radio
q-index	Includes the q-index column, which displays the RF quality index Higher values indicate better RF quality.
radio-alias <3-67>	Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the "HOSTNAME:RX" format) • <3-67> – Sets the radio-alias column width from 3 - 67 characters
radio-id	Includes the radio-id column, which displays the radio‘s ID (combination of AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format)

radio-mac	Includes the radio-mac column, which displays the radio's base MAC address
rx-rate	Includes the rx-rate column, which displays the receive rate at the particular radio
signal	Includes the signal column, which displays the signal strength at the particular radio
snr	Includes the snr column, which displays the signal-to-noise ratio at the particular radio
t-index	Includes the t-index column, which displays the traffic utilization index at the particular radio
tx-rate	Includes the tx-rate column, which displays the packet transmission rate at the particular radio

Examples

The following example shows the shows the show > adoption > status command output before customizing the output:

Related Commands

no on page 611	Restores custom CLI settings to default

database-client-policy global-config

Creates a database-client-policy and enters its configuration mode. The database-client-policy is only needed in deployments implementing captive-portal registration and database authentication with an onboard database. If enforcing database authentication, configure the user-name and password required to access the database on the database-client-policy.

Note
For more information on enabling database authentication, see Example: Enabling Database Authentication on page 68.

Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
database-client-policy <DATABASE-CLIENT-POLICY-NAME>
```

Parameters

```
database-client-policy <DATABASE-CLIENT-POLICY-NAME>
```

database-client-policy <DATABASE-CLIENT-POLICY-NAME>	Specify the database-client-policy name. If the policy does not exist, it is created. Once created and configured, apply this policy on the device hosting the database.

Examples

```
vx9000-34B78B(config)#database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#?
Database Client Policy Mode commands:
  authentication   Database authentication
  no               Negate a command or set its defaults

  clrscr           Clears the display screen
  commit           Commit all changes made in this session
  do               Run commands from Exec mode
  end              End current mode and change to EXEC mode
  exit             End current mode and down to previous mode
  help             Description of the interactive help system
  revert           Revert changes
  service          Service Commands
  show             Show running system information
  write            Write running configuration to memory or terminal

vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

Related Commands

no on page 611	Removes an existing database-client-policy
database-policy global config on page 299	Documents database policy configuration commands. If enforcing authenticated database access, use this command to enable authentication on the database and configure the username and password.
use (profile/device-config-mode-commands) on page 1247	Uses a database-client-policy in the VX9000's device or profile context
database on page 66	Drops or repairs a database. Also provides database keyfile management capabilities. If enforcing authenticated access to the database, use this command to generate, export, import, and zerzoise the keyfile.

database-client-policy-commands

The following table summarizes database-client-policy configuration mode commands:

Table 10: Database Client Policy Config Commands

Command	Description
authentication on page 297	Configures the captive-portal/NSight database users
no (database-client-policy-config-mode) on page 298	Removes the database host's IP/hostname configuration

authentication

Configures the database's user account details (username and password)

Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
authentication username <USER-NAME> password <PASSWORD>
```

Parameters

```
authentication username <USER-NAME> password <PASSWORD>
```

authentication username <USER-NAME> password <PASSWORD>	Configures the username and password required to access the database. Note, username and password specified here should be the same as those already created on the database host. For more information on creating database users, see service on page 623 (common commands). • username <USER-NAME> – Configures the user name • password <PASSWORD> – Configures the password for the username specified above. However, ensure database authentication is enabled in the database-policy. **Note:** For more information on database-policy, see database-policy global config on page 299. **Note:** For more information on enabling database authentication, see Example: Enabling Database Authentication on page 68.

Examples

```
vx9000-65672(config-database-client-policy-DBClientPolicy)# authentication username
extreme password 2 test@12345
vx9000-656725#show running-config database-client-policy replica-set
database-client-policy replica-set
 database-server 13.13.13.3
 database-server 14.14.14.2
 authentication username extreme password 2 q4cUyedmA4BFsn1kg/
xjCQAAAAliMbdrXKblQbsyrwMGdVzv
vx9000-656725#
```

Related Commands

no	Removes an existing database username and password

no (database-client-policy-config-mode)

Removes the database host's IP/hostname configuration. Also removes database user details.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
no [authentication|database-server]
no authentication username <USER-NAME>
no database-server [<IP>|<HOST-NAME>|<IPv6>]
```

Parameters

```
no [authentication|database-server]
```

no <PARAMETERS>	Removes the database VM's IPv4/Ipv6 address or hostname associated with this database client policy. Also removes database user details.

Examples

```
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
database-server 192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#

vx9000-34B78B(config-database-client-policy-DBClientPolicy)#no database-server

vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

database-policy global config

Creates a database-policy and enters its configuration mode. After creating the database-policy, use it on the database host. This enables the database. If deploying a database replica-set, use this command to define the replica set configurations.

To enforce database authentication, enable authentication on the database-policy, and configure the username and password required to access the database. Note, this command is part of a set of configurations that are required to enable authentication. For more information on the entire set of configurations, see Example: Enabling Database Authentication on page 68.

Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
database-policy <DATABASE-POLICY-NAME>
```

Parameters

```
database-policy <DATABASE-POLICY-NAME>
```

database-policy <DATABASE-POLICY-NAME>	Specify the database policy name. If the policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#database-policy test
nx9500-6C8809(config-database-policy-test)#?
Database Policy Mode commands:
  authentication  Database authentication
  no              Negate a command or set its defaults
  replica-set     Replica Set
  shutdown        Disable database server

  clrscr          Clears the display screen
  commit          Commit all changes made in this session
  do              Run commands from Exec mode
  end             End current mode and change to EXEC mode
  exit            End current mode and down to previous mode
```

```
  help            Description of the interactive help system
  revert          Revert changes
  service         Service Commands
  show            Show running system information
  write           Write running configuration to memory or terminal
nx9500-6C8809(config-database-policy-test)#
```

Related Commands

no on page 611	Removes an existing database-policy
database-client-policy global-config on page 296	Documents database-client policy configuration commands. The database-client-policy configures the IP address or hostname of the database host, and is used on the EGuest server's device context.
use (profile/device-config-mode-commands) on page 1247	Uses a database-client-policy in the VX9000's device or profile context
database on page 66	Drops or repairs a database. Also provides database keyfile management capabilities. If enforcing authenticated access to the database, use this command to generate, export, import, and zerzoise the keyfile.

database-policy-config-commands

The following table summarizes database-policy configuration mode commands:

Table 11: Database Policy Config Commands

Command	Description
authentication on page 300	Enables database authentication and configures the username and password required to access the database
replica-set on page 301	Adds a member to a database replica set
shutdown on page 303	Shuts down the database server
no (database-policy-config-mode) on page 303	Removes a member from the database replica set

authentication

Enables database authentication. When enabled and applied on the database host, this policy enforces authenticated access to the database. This command also configures the username and password required to access the database.

Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
authentication
authentication username <USER-NAME> password <PASSWORD>
```

Parameters

```
authentication
```

authentication	Enables database authentication on this database-policy. When executed without the associated keywords, the command enables authentication on the database host using the policy. Execute the command along with the username and password inputs to configure the user credentials required for access the database.

```
authentication username <USER-NAME> password <PASSWORD>
```

authentication username <USER-NAME> password <PASSWORD>	Configures the username and password required to access the database. Note, username and password specified here should be the same as those already created on the database host. For more information, see service (common commands). • username <USER-NAME> – Configures the database username • password <PASSWORD> – Configures the password for the username specified above Users using these credentials are allowed database access. In case of a split NSight/EGuest deployment, ensure that the database-client-policy running on the NSight/EGuest server has the same user details configured. For information on creating database-client-policy, see database-client-policy global-config on page 296. For more information on enabling database authentication, see Example: Enabling Database Authentication on page 68.

Examples

```
nx9500-6C874D(config-database-policy-test)#authentication
nx9500-6C874D(config-database-policy-test)#no shutdown
nx9500-6C874D(config-database-policy-test)#authentication username user1 password uesr@123
nx9500-6C874D(config-database-policy-test)#show context
database-policy test
 authentication
 authentication username user1 password 2 f20/dTjYiMnR/tqbGFaO5gAAAAjL/xo8clisk1TZjimo128t
nx9500-6C874D(config-database-policy-test)#
```

Related Commands

no	Disables database authentication, and removes the username and password configuration.

replica-set

Adds a member to a database replica set. A replica-set is a group of devices (replica-set members) running the database instances that maintain the same data set. Replica sets provide redundancy and high availability and are the basis for all production deployments. The replica set usually consists of: an arbiter, a primary member, and one or more secondary members. The primary member and the secondary member(s) maintain replicas of the data set.

Before deploying a replica set, ensure that each of the replica-set member:

- has the DB instances installed, and
- is able to communicate with every other member in the set.

After ensuring the above,

- Create a database policy (with identical replica-set configuration) on each of the member devices, and
- Use the database policy in the member device's configuration mode.

These member devices elect a primary member, which begins accepting client-write operations. Remaining devices in the replica-set, with the exception of the arbiter, are designated as secondary members.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
replica-set member [<IP>|<FQDN>] {arbiter|priority <0-255>}
```

Parameters

```
replica-set member [<IP>|<FQDN>] {arbiter|priority <0-255>}
```

replica-set member [<IP>|<FQDN>] {arbiter|priority <0-255>}	Adds a member to the database replica set. To identify the member, use one of the following options: • <IP> – Specify the member's IP address. • <FQDN> – Specify the member's FQDN. After specifying the IP address or FQDN, specify the following: • arbiter – Optional. Select to configure the member as the arbiter. • priority <0-255> – Optional. Configures the priority of a non-arbiter member of the replica set • <0-255> – Specify the priority from 0 - 255. This value determines the member's position within the replica set as primary or secondary. It also helps in electing the fall-back primary member in the eventuality of the current primary member being unreachable. A replica set should have at least three members. The maximum number of members can go up to fifty (50). However, configuring a three-member replica set is recommended. Replica sets should have odd number of members. In case of an even-numbered replica set, add an arbiter to make the member count odd. This ensures that at least one member gets a majority vote in the primary-member election.

Examples

```
nx9500-6C874D(config-database-policy-test)#replica-set member 192.168.13.14 arbiter
nx9500-6C874D(config-database-policy-test)#replica-set member 192.168.13.16 priority 1
nx9500-6C874D(config-database-policy-test)#replica-set member 192.168.13.12 priority 2
nx9500-6C874D(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.14 arbiter
 replica-set member 192.168.13.16 priority 1
nx9500-6C874D(config-database-policy-test)#
```

Related Commands

no	Removes a member from the database replica set

shutdown

Shuts down the database server. The factory default is set as `no > shutdown`.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
shutdown
```

Parameters

```
None
```

Examples

```
nx9500-6C874D(config-database-policy-test)#shutdown
nx9500-6C874D(config-database-policy-test)#show context
database-policy test
 shutdown
nx9500-6C874D(config-database-policy-test)#
```

Related Commands

no	Enables (brings-up) the database server

no (database-policy-config-mode)

Removes or reverts the database policy settings to default values

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
no [authentication|replica-set|shutdown]
no authentication {username <USER-NAME>}
no replica-set member [<IP>|<FQDN>]
no shutdown
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes a member from the database replica set, or brings up a database server that is down. Also disables database authentication and removes user

Examples

The following example shows a three-member replica set:

```
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.14 arbiter
 replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#
```

In the following example the arbiter is being removed, leaving the replica set with only two members:

```
nx9500-6C8809(config-database-policy-test)#no replica-set member 192.168.13.14
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#
```

Since a replica set must have at least three members, another member must be added to this replica set. This member may or may not be an arbiter.

```
nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.8 priority 3
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.16 priority 1
 replica-set member 192.168.13.8 priority 3
nx9500-6C8809(config-database-policy-test)#
```

device

Enables simultaneous configuration of multiple devices

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
device {containing|filter}
device {containing <STRING>} {filter type [ap505|ap510|ex3524|ex3548|rfs4000|nx5500|
nx75xx|nx9000|nx9600|t5|vx9000]}
device {filter type [ap505|ap510|ex3524|ex3548|rfs4000|nx5500|nx75xx|nx9000|nx9600|
t5|vx9000]}
```

Parameters

```
device {containing <STRING>} {filter type [ap505|ap510|ex3524|ex3548|rfs4000|nx5500|
nx75xx|nx9000|nx9600|
t5|vx9000]}
```

device	Enters a device's configuration mode. Use this command to simultaneously configure devices having similar configuration.
containing <STRING>	Optional. Configures the string to search for in the device's hostname. All devices having hostnames containing the string specified here are filtered, and can be configured simultaneously. • <STRING> – Specify the string to search for in the device's hostname.
filter type <DEVICE-TYPE>	Optional. Filters out a specific device type. After specifying the hostname string, select the device type. The options are: AP510, AP505, EX3424, EX3548, RFS4000, NX5500, NX7500, NX9500, NX9600, VX9000, and T5.

```
device  {filter type [ap505|ap510|ex3524|ex3548|rfs4000|nx5500|nx75xx|nx9000|nx9600|
t5|vx9000]}
```

device	Configures a basic device profile
filter type <DEVICE-TYPE>	Optional. Filters out a specific device type. The options are: AP510, AP505, EX3424, EX3548, RFS4000, NX5500, NX7500, NX9500, NX9600, VX9000, and T5..

Examples

```
ap505-13403B(config)#device filter type ap5
ap510  ap505
ap505-13403B(config)#device filter type ap505 ?
  <cr>

ap505-13403B(config)#device filter type ap505
ap505-13403B(config-device-{'type': 'ap505'})#
```

Related Commands

no on page 611	Removes multiple devices from the network

device-categorization

Configures a device categorization list, which categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network.

Proper classification and categorization of devices (access points, clients etc.) helps suppress unnecessary unauthorized access point alarms, allowing network administrators to focus on alarms on devices actually behaving in a suspicious manner. An intruder with a device erroneously authorized could potentially perform activities that harm your organization.

Authorized access points and clients are generally known to you and conform with your organization's security policies. Unauthorized devices are those detected as interoperating within the network, but are not approved. These devices should be filtered to avoid jeopardizing the data within a managed network. Use this command to apply the neighboring and sanctioned (approved) filters on peer devices operating within a wireless controller or access point's radio coverage area. Detected client MAC addresses can also be filtered based on their classification.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>
```

Parameters

```
device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>
```

<DEVICE-CATEGORIZATION-LIST-NAME>	Specify the device categorization list name. If a list with the same name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#device-categorization rfs4000
nx9500-6C8809(config-device-categorization-rfs4000)#?
Device Category Mode commands:
  mark-device  Add a device
  no           Negate a command or set its defaults

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-device-categorization-rfs4000)#
```

device-categorization-mode-commands

The following table summarizes device categorization configuration mode commands:

Table 12: Device-Categorization Config Mode Commands

Command	Description
mark-device on page 306	Adds a device to the device categorization list
no (device-categorization-config-mode) on page 307	Removes a device from the device categorization list

mark-device

Adds a device to the device categorization list as sanctioned or neighboring. Devices are further classified as AP or client.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
mark-device <1-1000> [sanctioned|neighboring] [ap|client]
mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
```

Parameters

```
mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
```

<1-1000>	Configures the device categorization entry index number
sanctioned	Marks a device as sanctioned. A sanctioned device is authorized to use network resources.
neighboring	Marks a device as neighboring. A neighboring device is a neighbor in the same network as this device.
ap {mac <MAC>| ssid <SSID>}	Marks a specified AP as sanctioned or neighboring based on its MAC address or the SSID it is beaconing • mac <MAC> – Optional. Specify the AP's MAC address • ssid <SSID> – Optional. Specify the SSID the AP is beaconing. After specifying the SSID, you can optionally specify MAC address of the radio. All APs are marked if no specific MAC address or SSID is provided.

```
mark-device [sanctioned|neighboring] client {mac <MAC>}
```

<1-1000>	Configures the device categorization entry index number
sanctioned	Marks the wireless client as sanctioned. A sanctioned device is authorized to use network resources.
neighboring	Marks the wireless client as neighboring. A neighboring device is a neighbor in the same network as this device.
client {mac <MAC>}	Marks a specified wireless client as sanctioned or neighboring based on its MAC address • mac <MAC> – Optional. Specify the wireless client's MAC address.

Examples

```
nx9500-6C8809(config-device-categorization-rfs4000)#mark-device 1 sanctioned ap
 mac 11-22-33-44-55-66
nx9500-6C8809(config-device-categorization-rfs4000)#show context
device-categorization rfs4000
 mark-device 1 sanctioned ap mac 11-22-33-44-55-66
nx9500-6C8809(config-device-categorization-rfs4000)#
```

Related Commands

no	Removes an entry from the device categorization list

no (device-categorization-config-mode)

Removes a device from the device categorization list

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no mark-device <1-1000> [neighboring|sanctioned] [ap|client]
no mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
no mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes a mark device (AP or wireless client) entry from this device categorization list

Examples

The following example shows the device categorization list ‘rfs7000’ settings before the ‘no’ command is executed:

```
nx9500-6C8809(config-device-categorization-rfs4000)#show context
device-categorization rfs4000
 mark-device 1 sanctioned ap mac 11-22-33-44-55-66
nx9500-6C8809(config-device-categorization-rfs4000)#
nx9500-6C8809(config-device-categorization-rfs4000)#no mark-device 1 sanctioned ap mac
11-22-33-44-55-66
```

The following example shows the device categorization list ‘rfs7000’ settings after the ‘no’ command is executed:

```
nx9500-6C8809(config-device-categorization-rfs4000)#show context
device-categorization rfs4000
nx9500-6C8809(config-device-categorization-rfs4000)#
```

dhcp-server-policy

Configures DHCPv4 server policy parameters, such as class, address range, and options. A new policy is created if it does not exist.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dhcp-server-policy <DHCP-SERVER-POLICY-NAME>
```

Parameters

```
dhcp-server-policy <DHCP-SERVER-POLICY-NAME>
```

<DHCP-POLICY-NAME>	Specify the DHCP server policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#dhcp-server-policy test
nx9500-6C8809(config-dhcp-policy-test)#?
DHCP policy Mode commands:
  bootp         BOOTP specific configuration
  dhcp-class    Configure DHCP class (for address allocation using DHCP
                user-class options)
  dhcp-pool     Configure DHCP server address pool
  dhcp-server   Activating dhcp server based on criteria
  no            Negate a command or set its defaults
  option        Define DHCP server option
  ping          Specify ping parameters used by DHCP Server

  clrscr        Clears the display screen
  commit        Commit all changes made in this session
```

```
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-dhcp-policy-test)#
```

Related Commands

no on page 611	Removes an existing DHCP server policy

Note
For more information on DHCPv4 policy, see DHCP-Server Policy on page 1425 .

dhcpv6-server-policy

Creates a DHCPv6 server policy and enters its configuration mode

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes, or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages non-duplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

When configured and applied to a device, the DHCPv6 server policy enables the device to function as a stateless DHCPv6 server.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>
```

Parameters

```
dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>
```

<DHCPv6-SERVER-POLICY-NAME>	Specify the DHCPv6 server policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#dhcpv6-server-policy test
nx9500-6C8809(config-dhcpv6-server-policy-test)#?
DHCPv6 server policy Mode commands:
  dhcpv6-pool              Configure DHCPV6 server address pool
  no                       Negate a command or set its defaults
  option                   Define DHCPv6 server option
  restrict-vendor-options  Restrict vendor specific options to be sent in
                           server reply
  server-preference        Server preference value sent in the reply, by the
                           server to client

  clrscr                   Clears the display screen
  commit                   Commit all changes made in this session
  do                       Run commands from Exec mode
  end                      End current mode and change to EXEC mode
  exit                     End current mode and down to previous mode
  help                     Description of the interactive help system
  revert                   Revert changes
  service                  Service Commands
  show                     Show running system information
  write                    Write running configuration to memory or terminal

nx9500-6C8809(config-dhcpv6-server-policy-test)#
```

Related Commands

no on page 611	Removes an existing DHCPv6 server policy

Note
For more information on DHCPv6 policy, see DHCP-Server Policy on page 1425.

dns-whitelist

Configures a DNS whitelist. A DNS whitelist is a list of allowed DNS destination IP addresses pre-approved to access a controller, service platform, or access point managed captive portal.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dns-whitelist <DNS-WHITELIST-NAME>
```

Parameters

```
dns-whitelist <DNS-WHITELIST-NAME>
```

<DNS-WHITELIST-NAME>	Specify the DNS whitelist name. If the whitelist does not exist, it is created.

Examples

```
nx9500-6C8809(config)#dns-whitelist test
nx9500-6C8809(config-dns-whitelist-test)#?
```

```
DNS Whitelist Mode commands:
  no       Negate a command or set its defaults
  permit   Match a host

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-dns-whitelist-test)#
```

Related Commands

no on page 611	Removes an existing DNS Whitelist

permit

A whitelist is a list of host names and IP addresses permitted access to the network or captive portal. This command adds a host or destination IP address to the DNS whitelist.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
permit <IPv4/IPv6/HOSTNAME> {suffix}
```

Parameters

```
permit <IPv4/IPv6/HOSTNAME> {suffix}
```

<IPv4/IPv6/ HOSTNAME>	Adds a device to the DNS whitelist • <IPv4/IPv6/HOSTNAME> – Provide a hostname or numerical IPv4 or IPv6 address for each destination IP address or host included in the whitelist. Note: A maximum of 256 entries can be made.
suffix	Optional. Matches any hostname including the specified name as suffix

Examples

```
nx9500-6C8809(config-dns-whitelist-test)#permit example_company.com suffix
nx9500-6C8809(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
nx9500-6C8809(config-dns-whitelist-test)#
```

Related Commands

no	Removes a DNS whitelist entry

no (dns-whitelist-config-mode)

Removes a specified host or IP address from the DNS whitelist, and prevents it from accessing network resources

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no permit <IPv4/IPv6/HOSTNAME>
```

Parameters

```
no permit <IPv4/IPv6/HOSTNAME>
```

<IPv4/IPv6/HOSTNAME>	Removes a device from the DNS whitelist (identifies the device by its IP address or hostname) • <IPv4/IPv6/HOSTNAME> – Specify the device's IPv4/IPv6 address or hostname.

Examples

```
nx9500-6C8809(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
nx9500-6C8809(config-dns-whitelist-test)#
nx9500-6C8809(config-dns-whitelist-test)#no permit example_company.com
nx9500-6C8809(config-dns-whitelist-test)#show context
dns-whitelist test
nx9500-6C8809(config-dns-whitelist-test)#
```

end

Ends and exits the current mode and moves to the PRIV EXEC mode

The prompt changes to the PRIV EXEC mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
end
```

Parameters

```
None
```

Examples

```
rfs4000-229D58(config)#end
rfs4000-229D58#
```

ex3500

Creates an EX3500 time range list and enters its configuration mode

An EX3500 time range list consists of a set of periodic and absolute time range rules. Periodic time ranges recur periodically at specified time periods, such as daily, weekly, weekends, weekdays, and on specific week days, for example on every successive Mondays. Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period (the starting and ending days and time are fixed).

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SEP *(Small Form-factor Pluggable)* transceiver slots for fiber connectivity. The EX3500 series switch can adopt to a NOC controller and be managed by it. The EX3500 time range values configured here are used in EX3500 MAC ACL firewall rules that filter an EX3500's incoming and outgoing traffic.

For more information on creating EX3500 rules, see ex3500 (mac-acl-config-commands) on page 1391 and #unique_321.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
ex3500 time-range <TIME-RANGE-NAME>
```

Parameters

```
ex3500 time-range <TIME-RANGE-NAME>
```

ex3500 time-range <TIME-RANGE-NAME>	Configures EX3500 time range list and enters its configuration mode • <TIME-RANGE-NAME> – Enter a name for this time range. If the time range does not exist, it is created.

Examples

```
nx9500-6C8809(config)#ex3500 time-range EX3500_TimeRange_02
nx9500-6C8809(config-ex3500-time-range-EX3500_TimeRange_02)#?
nx9500-6C8809 Time Range Configuration commands:
  absolute  Absolute time and date
  no        Negate a command or set its defaults
  periodic  Periodic time and date

  clrscr    Clears the display screen
  commit    Commit all changes made in this session
  do        Run commands from Exec mode
  end       End current mode and change to EXEC mode
  exit      End current mode and down to previous mode
  help      Description of the interactive help system
  revert    Revert changes
```

```
  service   Service Commands
  show      Show running system information
  write     Write running configuration to memory or terminal

nx9500-6C8809(config-ex3500-time-range-EX3500_TimeRange_02)#
```

Related Commands

no on page 611	Removes this EX3500 time range list

ex3500-time-range-config-commands

Table 13: EX3500 Time Range Config Commands

Command	Description
absolute on page 314	Configures an absolute time range rule for this EX3500 time range list
periodic on page 315	Configures a periodic time range rule for this EX3500 time range list
no (ex3500-time-range-config-mode) on page 317	Removes this EX3500 time range list settings

absolute

Configures an absolute time range rule for this EX3500 time range list. Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

Syntax

```
absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31>
<MONTH> <2013-2037>}
```

Parameters

```
absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31>
<MONTH> <2013-2037>}
```

absolute	Configures an absolute time range rule settings
start <0-23> <0-59> <1-31> <MONTH> <2013-2037>	Configures the start day and time settings • <0-23> – Specify the start time from 0 - 23 hours. • <0-59> – Specify the start time from 0 - 59 minutes. For example, if the values provided are 12 hours and 30 minutes, the start time is 12:30 A.M on the specified day. • <1-31> – Specify the day of month from 1 - 31 when the time range starts. • <MONTH> – Specify the month. The options are: April, August, December, February, January, July, June, March, May, November, October, September. <2013-2037> – Specify the year from 2013 - 2037.
end <0-23> <0-59> <1-31> <MONTH> <2013-2037>	Optional. Configures the end day and time settings • <0-23> – Specify the end time from 0 - 23 hours. • <0-59> – Specify the end time from 0 - 59 minutes. • <1-31> – Specify the day of month from 1 - 31 when the time range ends. • <MONTH> – Specify the month. The options are: April, August, December, February, January, July, June, March, May, November, October, September. <2013-2037> – Specify the year from 2013 - 2037.

Examples

```
EX3500(config-ex3500-time-range-EX3500-TimeRange-01)#absolute start 1 0 1
 june 2017 end 1 0 30 june 2018
EX3500(config-ex3500-time-range-EX3500-TimeRange-01)#show context
ex3500 time-range EX3500-TimeRange-01
 absolute start 1 0 1 june 2018 end 1 0 30 june 2018
EX3500(config-ex3500-time-range-EX3500-TimeRange-01)#
```

Related Commands

no (ex3500-time-range-config-mode) on page 317	Removes this absolute time range rule from the EX3500 time range list

periodic

Configures a periodic time range rule for this EX3500 time range list

Periodic time ranges are configured to recur based on periodicity such as daily, weekly, weekends, weekdays, and on specific week days, such as on every successive Sunday.

Supported in the following platforms:

- Service Platforms — NX 7500, NX 95XX, NX 96XX

Syntax

```
periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|
weekend] <0-23> <0-59> to [<023> <0-59>|daily|friday|monday|saturday|sunday|thursday|
tuesday|wednesday|weekdays|weekend] <0-23> <0-59> rule-precedence <1-7>
```

Parameters

```
periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|
weekend] <0-23> <0-59> to [<023> <0-59>|daily|friday|monday|saturday|sunday|thursday|
tuesday|wednesday|weekdays|weekend] <0-23> <0-59> rule-precedence <1-7>
```

periodic [daily|friday|monday| saturday|sunday| thursday| tuesday| wednesday| weekdays| weekend]	Configures this periodic time range's start day. The options are: • daily • Friday • Monday • Saturday • Sunday • Thursday • Tuesday • Wednesday • weekdays • weekend
<0-23> <0-59>	After specifying the start day, specify the start time in hours (24 hours format) and minutes • <0-23> – Specify the start time from 0 - 23 hours. • <0-59> – Specify the start time from 0 - 59 minutes. For example, if the values provided are 12 hours and 30 minutes, the start time is 12:30 A.M on the specified day.
to [<023> <0-59>|daily| friday|monday| saturday| sunday| thursday|tuesday| wednesday| weekdays| weekend]	Configures this periodic time range's end day. This is the day when the time range ends. The options available changes depending on the start day configured. The options are: • <0-23> <0-59> – Select this option to end the time range on the same day as it starts. Specify the end hour from 0 - 23 hours and the minutes from 0 - 59 minutes. • daily – Select this option if the time range starts and ends every day at a specified time • friday – Select this option if the time range ends on Fridays • monday – Select this option if the time range ends on Mondays • saturday – Select this option if the time range ends on Saturdays • sunday – Select this option if the time range ends on Sundays • thursday – Select this option if the time range ends on Thursdays • tuesday – Select this option if the time range ends on Tuesdays • wednesday – Select this option if the time range ends on Wednesdays • weekdays – Select this option if the time range ends on Weekdays • weekend – Select this option if the time range ends on Weekends If the time range does not end on the same day, select the end day, and then specify the end time, or else just specify the end time.
<0-23> <0-59>	After specifying the end day, specify the end time in hours (in 24 hours format) and minutes • <0-23> – Specify the end time from 0 - 23 hours. • <0-59> – Specify the end minute from 0 - 59 minutes. In case of time ranges starting and ending on the same day, ensure that the end time (hours and minutes) is not lower than the specified start time.
rule-precedence <1-7>	Configures a precedence value for this periodic time range rule. Rules with lower precedence have higher priority and are applied first. • <1-7> – Specify a precedence value from 1 - 7.

Examples

```
EX3500(config-ex3500-time-range-EX3500-TimeRange-01)#periodic daily 1 10
to daily 23 10 rule-precedence 1

EX3500(config-ex3500-time-range-EX3500-TimeRange-01)#show context
ex3500 time-range EX3500-TimeRange-01
 periodic daily 1 10 to daily 23 10 rule-precedence 1
 absolute start 1 0 1 june 2017 end 1 0 30 june 2018
EX3500(config-ex3500-time-range-EX3500-TimeRange-01)#
```

Related Commands

```

ex3500-management-policy

Creates an EX3500 management policy and enters its configuration mode. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

The EX3500 management policy is either applied:

- Individually on an adopted EX3500 series switch (in the device configuration mode), or
- To an EX3524 and EX3548 profile, which is then applied to an adopted EX3500 series switch.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

Going forward NX7500, NX9500, and NX9600 WiNG managed series service platforms and VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating system running the EX3500 switches. The WiNG service platforms utilize standardized interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

WiNG can partially manage an EX3500 without using DHCP option 193, provided the EX3500 is directly configured to specify the IPv4 addresses of potential WiNG adopters. To identify the potential WiNG adopter, in the EX3500's device configuration mode specify the adopter's IPv4 address using the `controller > host > <IP-ADDRESS>` command. WiNG service platforms leave the proprietary operating system running the EX3500 switches unmodified, and partially manage them utilizing standardized WiNG interfaces. WiNG service platforms use a translation layer to communicate with the EX3500.

Supported in the following platforms:

- Service Platforms — NZ7500, NX9500, NX9600, VX9000

Syntax

```
ex3500-management-policy <POLICY-NAME>
```

Parameters

```
ex3500-management-policy <POLICY-NAME>
```

<POLICY-NAME>	Specify the EX3500 management policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#ex3500-management-policy test
nx9500-6C8809(config-ex3500-management-policy-test)#?
nx9500-6C8809_Management Mode commands:
  enable       Modifies enable password parameters
  http         Hyper Text Terminal Protocol (HTTP)
  memory       Memory utilization
  no           Negate a command or set its defaults
  process-cpu  Process-cpu utilization
  snmp-server  Enable SNMP server configuration
  ssh          Secure Shell server connections
  username     Login TACACS server port

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
```

```
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-ex3500-management-policy-test)#
```

http on page 320	Configures the HTTP server settings used to authenticate HTTP connection to a EX3500 switch
memory on page 321	Configures the EX3500's memory utilization rising (upper) and falling (lower) threshold values
process-cpu on page 322	Configures the EX3500's CPU (processor) utilization rising (upper) and falling (lower) threshold values
snmp-server on page 323	Configures SNMP server settings. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.
ssh on page 330	Configures the SSH server settings used to authenticate SSH connection to a EX3500 switch
username on page 331	Configures a EX3500 switch user settings
no (ex3500-management-policy-config-mode) on page 332	Removes or reverts this EX3500 management policy settings

enable

Configures an executive password for this EX3500 management policy

Each EX3500 management policy can have a unique executive password with its own privilege level assigned. Utilize these passwords as specific EX3500 management sessions require priority over others.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, NX 7510

Syntax

```
enable password [0|7|level]
enable password [0|7] <PASSWORD>
enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]
```

Parameters

```
enable password [0|7] <PASSWORD>
```

enable password [0|7] <PASSWORD>	Creates a new executive password for this EX3500 management policy. The password could be in clear text or encrypted • 0 – Configures a clear text password using ASCII characters (should be 1 - 32 characters long) • 7 – Configures an encrypted password using HEX characters (should be 32 characters long) • <PASSWORD> – Specify the password.

```
enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]
```

enable password level <0-15>	Creates a new executive password for this EX3500 management policy and sets its privilege level • <0-15> – Specify the privilege level for this executive password from 0 - 15. Lower values have higher priority, to slot and prioritize executive passwords and EX3500 management sessions.
[0|7] <PASSWORD>	After setting the privilege level, configure the password, which could be in clear text or encrypted • 0 – Configures a clear text password using ASCII characters (should be 1 - 32 characters long) • 7 – Configures an encrypted password using HEX characters (should be 32 characters long) • <PASSWORD> – Specify the password.

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#enable password level 3 7
1234567890102030405060708092929l
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 enable password level 3 7 1234567890102030405060708092929l
 snmp-server notify-filter 1 remote 127.0.0.1
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

no (ex3500-management-policy-config-mode) on page 332	Removes a executive password from this EX3500 management policy

http

Configures the HTTP server settings used to authenticate HTTP connection to a EX3500 switch

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused

management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, NX 7510

Syntax

```
http [port <1-65535>|secure-port <1-65535>|secure-server|server]
```

Parameters

```
http [port <1-65535>|secure-port <1-65535>|secure-server|server]
```

http	Configures following HTTP settings: port, secure-port, secure-server, and server
port <1-65535>	Configures the HTTP port number. This is the port used to connect to the HTTP server. • <1-65535> – Specify a value from 1 - 65535. The default port is 80.
secure-port <1-65535>	Enables secure HTTP connection over a designated secure port. Ensure that the HTTP secure server is enabled before specifying the secure-server port. • <1-65535> – Specify the secure HTTP server port from 1 - 65535. The default port is 443.
secure-server	Enables HTTP secure server. This option is disabled by default.
server	Enables HTTP server. This option is enabled by default. Consequently, HTTP management access is allowed by default.

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#http secure-server

nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 http secure-server
 enable password level 3 7 12345678901020304050607080929291
 snmp-server notify-filter 1 remote 127.0.0.1
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

no (ex3500-management-policy-config-mode) on page 332	Reverts to default HTTP server settings (HTTP server enabled, HTTP port 80)

memory

Configures the EX3500's memory utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the memory utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500's memory and CPU utilization's upper and lower thresholds, you can avoid over utilization of the EX3500's processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, NX 7510

Syntax

```
memory [falling-threshold|rising-threshold] <1-100>
```

Parameters

```
memory [falling-threshold|rising-threshold] <1-100>
```

memory	Configures the EX3500's memory utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.
falling-threshold <1-100>	Configures the falling threshold for the EX3500 memory utilization • <1-100> – Specify the falling threshold as a percentage from 1 - 100. The default is 70%.
rising-threshold <1-100>	Configures the rising threshold for the EX3500's memory utilization • <1-100> – Specify the rising threshold as a percentage from 1 - 100. The default is 90%.

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#memory falling-threshold 50
nx9500-6C8809(config-ex3500-management-policy-test)#memory rising-threshold 95
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 http secure-server
 enable password level 3 7 12345678901020304050607080929291
 snmp-server notify-filter 1 remote 127.0.0.1
 memory falling-threshold 50
 memory rising-threshold 95
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

no (ex3500-management-policy-config-mode) on page 332	Reverts the memory utilization's falling-threshold and/or rising threshold to 70% and 90% respectively

process-cpu

Configures the EX3500's CPU (processor) utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the CPU utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500's memory and CPU utilization's upper and lower thresholds, you can avoid over utilization of the EX3500's processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, NX 7510

Syntax

```
process-cpu [falling-threshold|rising-threshold] <1-100>
```

Parameters

```
process-cpu [falling-threshold|rising-threshold] <1-100>
```

process-cpu	Configures the EX3500's CPU utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.
falling-threshold <1-100>	Configures the falling threshold for the EX3500's CPU utilization • <1-100> – Specify the falling threshold as a percentage from 1 - 100. The default is 70%.
rising-threshold <1-100>	Configures the rising threshold for the EX3500's CPU utilization • <1-100> – Specify the rising threshold as a percentage from 1 - 100. The default is 90%.

Example

```
nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu falling-threshold 60
nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 http secure-server
 enable password level 3 7 12345678901020304050607080929291
 snmp-server notify-filter 1 remote 127.0.0.1
 memory falling-threshold 50
 memory rising-threshold 95
 process-cpu falling-threshold 60
 process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

no (ex3500-management-policy-config-mode) on page 332	Reverts the CPU utilization's falling-threshold and/or rising threshold to 70% and 90% respectively

snmp-server

Configures *Simple Network Management Protocol* (SNMP) server settings. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

SNMP is an application layer protocol that facilitates the exchange of management information between the management stations and a managed EX3500 switch. SNMP-enabled devices listen on port 162 (by default) for SNMP packets from the management server. SNMP uses read-only and read-write community strings as an authentication mechanism to monitor and configure supported devices. The read-only community string is used to gather statistics and configuration parameters from a supported wireless device. The read-write community string is used by a management server to set device parameters. SNMP is generally used to monitor a system's performance and other parameters.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, NX 7510

Syntax

```
snmp-server {community|contact|enable|engine-id|group|host|location|notify-filter|
user|view}
snmp-server {community <STRING> {ro|rw}}
snmp-server {contact <NAME>}
snmp-server {enable traps {authentication|link-up-down}}
snmp-server {engine-id [local <WORD>|remote <IP> <WORD>]}
snmp-server {group <GROUP-NAME> [v1|v2c|v3 [auth|noauth|priv]] {notify <WORD>|read <WORD>|
write <WORD>}}
snmp-server {host <IP> [<STRING>|inform]}
snmp-server {host <IP> <STRING> version [v1|v2c|v3 [auth|noauth|priv]]
{udp-port <1-65535>}}
snmp-server {host <IP> inform [retry <0-255>|timeout <0-2147483647>]
<STRING> version [v2c|v3 [auth|noauth|priv]] {udp-port <1-65535>}}
snmp-server {location <WORD>}
snmp-server {notify-filter <WORD> remote <IP>}
snmp-server {user <USER-NAME> <GROUP-NAME> [remote-host|v1|v2c|v3]}
snmp-server {user <USER-NAME> <GROUP-NAME> remote-host <IP> v3 [auth|encrypted auth]
[md5|sha] <WORD> {priv [3des|aes128|aes192|aes256|des56] <WORD>}}
snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}
snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}
```

Parameters

```
snmp-server {community <STRING> {ro|rw}}
```

snmp-server {community <STRING> {ro|rw}}	Configures SNMP-server related settings • community – Optional. Configures an SNMP community access string used to authorize management access by clients using SNMP v1, v2c, or v3 • <STRING> – Specify the SNMP community access string (should not exceed 32 characters). After specifying the string, optionally specify the access type associated with it. • ro – Optional. Provides read-only access with this SNMP community string. Allows authorized clients to only retrieve MIB *(Management Information Base)* objects. This is the default setting. • rw – Optional. Provides read-write access with this SNMP community string. Allows authorized clients to retrieve as well as modify MIB objects. You can configure a maximum of five (5) community strings per vEX3500 management policy.

```
snmp-server {contact <NAME>}
```

snmp-server {contact <NAME>}	Configures SNMP-server related settings • contact – Optional. Configures the system's contact information • <NAME> – Specify the contact person's name (should not exceed 255 characters).

```
snmp-server {enable traps {authentication|link-up-down}}
```

snmp-server {enable traps {authentication|link-up-down}}	Configures SNMP-server related settings
	• enable traps – Optional. Enables the EX3500 switch to send following SNMP traps or notifications:
	  • authentication – Optional. Enables SNMP authentication trap. This option is disabled by default.
	  • link-up-down – Optional. Enables SNMP link up and link down traps. This option is disabled by default.
	If the command is executed without either of the above mentioned trap options, the system enables both authentication and link-up-down traps.
	If enabling SNMP traps, use the `snmp-server > host` command to specify the host(s) receiving the SNMP notifications.

```
snmp-server {engine-id [local <WORD>|remote <IP> <WORD>]}
```

snmp-server {engine-id [local <WORD>|remote <IP> <WORD>]}	Configures SNMP-server related settings
	• engine-id – Optional. Configures an identification string for the SNMPv3 engine. The SNMP engine is an independent SNMP agent residing either on the logged switch or on a remote device. It prevents message replay, delay, and redirection. In SNMPv3, the engine ID in combination with user passwords generates the security keys that is used for SNMPv3 packet authentication and encryption.
	  • local – Configures the SNMP engine on the logged switch
	  <WORD> – Specify the hexadecimal engine ID string identifying the SNMP engine (should be 9 - 64 characters in length).
	  • remote <IP> <WORD> – Configures a remote device as the SNMP engine
	  <IP> – Specify the remote device's IP address.
	  <WORD> – Specify the hexadecimal engine ID string identifying the SNMP engine (should be 9 - 64 characters in length).
	Configure the remote engine ID when using SNMPv3 informs. The remote ID configured here is used to generate the security digest for authentication and encryption of packets exchanged between the switch and the and the remote host user. SNMP passwords are localized using the engine ID of the authoritative agent. For informs, the authoritative SNMP agent is the remote agent. You therefore need to configure the remote agent's SNMP engine ID before you can send proxy requests or informs to it.

```
snmp-server {group <GROUP-NAME> [v1|v2c|v3 [auth|noauth|priv]] {notify <WORD>|
read <WORD>|write <WORD>}}
```

snmp-server group <GROUP-NAME>	Configures SNMP-server related settings • group – Optional. Configures an SNMP user group, mapping SNMP users to SNMP views • <GROUP-NAME> – Specify the SNMP group name (should not exceed 32 characters).

[v1|v2c|v3 [auth|noauth|priv]]	Configures the SNMP version used for authentication by this user group
	• v1 – Configures the SNMP version as v1.
	• v2c – Configures SNMP version as v2c
	• v3 – Configures the SNMP version as v3. If using SNMP v3, specify the authentication and encryption levels.
	  • auth – Uses SNMP v3 with authentication and no privacy
	  • noauth – Uses SNMP v3 with no authentication and no privacy
	  • priv – Uses SNMP v3 with authentication and privacy

notify <WORD>	Optional. Configures the notification view string • <WORD> – Specify the string (should not exceed 32 characters).
read <WORD>	Optional. Configures the read view string • <WORD> – Specify the string (should not exceed 32 characters).
write <WORD>	Optional. Configures the write view string • <WORD> – Specify the string (should not exceed 32 characters).

```
snmp-server {host <IP> <STRING> version [v1|v2c|v3 [auth|noauth|priv]] {udp-port
<1-65535>}}
```

snmp-server host <IP>	Configures SNMP-server related settings • host – Optional. Configures the host(s) receiving the SNMP notifications. At least one SNMP server host should be configured in order to configure the switch to send notifications • <IP> – Specify the SNMP host's IP address. You can configure a maximum of five (5) SNMP trap recipients per EX3500 management policy. Ensure that SNMP trap notification is enabled.
<STRING>	Configures the SNMP community string. You can configure the SNMP community string here, or else use the string configured using the `snmp-server > community <STRING> > {ro|rw}` command. It is recommended that you configure the SNMP community string prior to configuring the SNMP host. • <STRING> – Specify the community string. The string configured here is sent in the SNMP traps to the SNMPv1 or SNMPv2c hosts.
version [v1|v2c| v3 [auth| noauth| priv]]	Configures the SNMP version used • v1 – Configures the SNMP version as 1. This is the default setting. • v2c – Configures SNMP version as 2c • v3 – Configures the SNMP version as 3. If using SNMPv3, specify the authentication and encryption levels. • auth – Uses SNMP v3 with authentication and no privacy • noauth – Uses SNMP v3 with no authentication and no privacy • priv – Uses SNMP v3 with authentication and privacy
udp-port <1-65535>	Optional. After specifying the SNMP version, optionally specify the host UDP port • <1-65535> – Specify the UDP port. The default is 162.

```
snmp-server {host <IP> inform [retry <0-255>|timeout <0-2147483647>] <STRING>
version [v2c|v3 [auth|noauth|priv]] {udp-port <1-65535>}}
```

snmp-server host <IP>	Configures SNMP-server related settings • host – Optional. Configures the host(s) receiving the SNMP notifications • <IP> – Specify the SNMP host's IP address. You can configure a maximum of five (5) SNMP trap recipients per EX3500 management policy. Ensure that SNMP trap notification is enabled.
inform [retry <0-255>| timeout <0-2147483647>]	Enables sending of SNMP notifications as inform messages, and configures inform message settings. • retry <0-255> – Configures the maximum number attempts made to re-send an inform message in case the specified SNMP host does not acknowledge receipt. <0-255> – Specify a value from 0 - 255. The default is 3. • timeout <0-2147483647> – Configures the interval, in seconds, to wait for an acknowledgment from the SNMP host before re-sending an inform message • <0-2147483647> – Specify a value from 0 - 2147483647 seconds. The default is 1500 seconds. Inform messages are more reliable than trap messages since they include a request for acknowledgement of receipt. Using inform messages to communicate critical information would be good practice. However, since inform messages are retained in the memory until a response is received, they consume more memory and may also result in traffic congestion. Take into considerations these facts when configuring the notification format.
<STRING>	Configures the SNMP community string. You can configure the SNMP community string here, or else use the string configured using the `snmp-server > community <STRING> > {ro|rw}` command. It is recommended that you configure the SNMP community string prior to configuring the SNMP host. • <STRING> – Specify the community string. The string configured here is sent in the SNMP inform messages to the SNMPv2c or SNMPv3 hosts.

version [v2c| v3 [auth|noauth| priv]]	Configures the SNMP version used
	• v2c – Configures the SNMP version as v2c
	• v3 – Configures the SNMP version as v3. If using SNMP v3, specify the authentication and encryption levels.
	  • auth – Uses SNMP v3 with authentication and no privacy
	  • noauth – Uses SNMP v3 with *no authentication* and *no privacy*
	  • priv – Uses SNMP v3 with authentication and privacy
	
	SNMP inform messages are not supported on SNMP v1.

udp-port <1-65535>	Optional. After specifying the SNMP version, optionally specify the host UDP port • <1-65535> – Specify the UDP port. The default is 162.

```
snmp-server {location <WORD>}
```

snmp-server {location <WORD>}	Configures SNMP-server related settings • location – Optional. Configures the EX3500's location string • <WORD> – Specify the location (should not exceed 255 characters).

```
snmp-server {notify-filter <WORD> remote <IP>}
```

snmp-server notify-filter <WORD>	Configures SNMP-server related settings • notify-filter – Optional. Modifies the SNMP server's notify filter • <WORD> – Specify the SNMP notify-filter name.
remote <IP>	Optional. Configures the remote host's IP address • <IP> – Specify the IP address in the A.B.C.D format.

```
snmp-server {user <USER-NAME> <GROUP-NAME> remote <IP> v3 {auth|encrypted auth}
[md5|sha] <WORD> {priv [3des|aes128|aes192|aes256|des56] <WORD>}}
```

snmp-server user <USER-NAME> <GROUP-NAME>	Configures SNMP-server related settings • user – Optional. Configures the name of the SNMP user (connecting to the SNMP agent) and adds the user to an existing SNMP group. It also specifies the SNMP version type used. In case of SNMP version 3, this command also configures the remote host's IP address and the authentication type used. • <USER-NAME> – Specify the user's name (should not exceed 32 characters). <GROUP-NAME> – Specify the SNMP group name to which this user is assigned.
remote <IP> v3	Configures the remote host on which the SNMPv3 engine is running • <IP> – Specify the remote host's IP address. This option is available only for SNMPv3 engine. After configuring the remote host, optionally configure the authentication type and the corresponding authentication password used.
{auth|encrypted auth} [md5| sha] <WORD> {priv [3des| aes128| aes192|aes256| des56] <WORD>}	Optional. Configures authentication and encryption settings • auth – Specifies the authentication type used and configures the authentication password • encrypted – Enables encryption. When enabled all communications between the user and the SNMP engine are encrypted. After enabling encryption, specify the authentication type and configure the authentication password. The following parameters are common to the 'auth' and 'encrypted' keywords: • md5 – Uses MD5 to authenticate the user • sha – Uses SHA to authenticate the user The following parameter is common to the 'md5' and 'sha' keywords: • <WORD> – Specify the authentication password. If the 'encrypted' option is not being used, enter an 8 - 40 characters ASCII password. Whereas, in case of an encrypted password enter a HEX characters password of 32 characters. • priv – Optional. Uses SNMPv3 with privacy. Select one of the privacy options: des, aes128, aes192, aes256, des56. • <WORD> – Configures the privacy password. If the 'encrypted' option is not being used, enter an 8 - 40 characters long ASCII password. Whereas, the encrypted password should be 32 HEX characters.

```
snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}
```

snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}	Configures SNMP-server related settings • user – Optional. Configures the name of the SNMP user (connecting to the SNMP agent) and adds the user to an existing SNMP group. It also specifies the SNMP version type used. In case of SNMPv3, this command also configures the authentication type used and the enables encryption. • <USER-NAME> – Specify the user's name (should not exceed 32 characters). <GROUP-NAME> – Specify the SNMP group name to which this user is assigned. [v1|v2c|v3] – After specifying the group name, specify the SNMP version used. The options are SNMP version v1, SNMP version 2c, and SNMP version 3. If using SNMP version 3, optionally specify the authentication type and the corresponding authentication password used. Please see previous table for SNMPv3 authentication and encryption configuration details.

```
snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}
```

snmp-server view <VIEW-NAME>	Configures SNMP-server related settings • view – Optional. Creates an SNMP view. SNMP views are used to control user access to the MIB. • <VIEW-NAME> – Provide a name for this SNMP view (should not exceed 32 characters).
<OID-TREE-STRING> [excluded|included]	Configures the *object identifier* (OID) of a branch within the MIB tree • excluded – Specifies an excluded view • included – Specifies an included view

ssh

Configures the SSH server settings used to authenticate SSH connection to a EX3500 switch

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling unused and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, NX 7510

Syntax

```
ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]
```

Parameters

```
ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]
```

ssh	Enables SSH management access to an EX3500 switch. This option is disabled by default. Use this command to configure SSH access settings.
authentication-retries <1-5>	Configures the maximum number of retries made to connect to the SSH server resource • <1-5> – Specify a value from 1 - 5. The default setting is 3.
server	Enables SSH server connection
server-key size <512-1024>	Configures the SSH server key size • <512-1024> – Specify the SSH server key from 512 - 1,024. The default length is 768.
timeout <1-120>	Configures the SSH server resource inactivity timeout value in seconds. When the specified time is exceeded, the SSH server resource becomes unreachable and must be re-authenticated. • <1-120> – Specify a value from 1 120 seconds. The default is 120 seconds.

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#ssh authentication-retries 4
nx9500-6C8809(config-ex3500-management-policy-test)#ssh timeout 90

Related Commands

no (ex3500-management-policy-config-mode) on page 332	Disables SSH management access to an EX3500 switch

username

Configures a vEX3500 switch user settings

The EX3500 switch user details are stored in a local database on the NX 95XX, NX 96XX, NX 7510, or WiNG VM. You can configure multiple users, each having a unique name, access level, and password.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, NX 7510

Syntax

```
username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]
```

Parameters

```
username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]
```

username <USER-NAME>	Configures the TACACS server port username • <USER-NAME> – Specify the user name (should not exceed 32 characters)
access-level <0-15>	Configures the access level for this user. This value determines the access priority of each user requesting access and interoperability with EX3500 switch. • <0-15> – Specify the access level from 0 - 15. The default is 0.
nopassword	Allows user to login without a password
password [0|7] <PASSWORD>	Configures the password for this user • 0 – Configures a plain text password • 7 – Configures an encrypted password (should be 32 characters in length) • <PASSWORD> – Specify the password.

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#username user1 access-level 5
nx9500-6C8809(config-ex3500-management-policy-test)#username user1 password 0 user1@1234

ex3500-qos-class-map-policy

Creates a EX3500 QoS *(Quality of Service)* class map policy and enters its configuration mode

A QoS class map policy contains a set of DiffServ *(Differentiated Services)* classification criteria that are used to classify incoming traffic into different category and provide differentiated service based on this classification. Each policy defines a set match criteria rules that use objects, such as access lists, IP precedence or DSCP values, and VLANs. When configured and applied, the policy classifies traffic based on layer 2, layer 3, or layer 4 information contained in each incoming packet.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
ex3500-qos-class-map-policy <POLICY-NAME>
```

Parameters

```
ex3500-qos-class-map-policy <POLICY-NAME>
```

<POLICY-NAME>	Specify the EX3500 QoS class map policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#ex3500-qos-class-map-policy dscp
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#?
EX3500_Qos_class_map Mode commands:
  description  Class-map description
  match        Defines the match criteria to classify traffic
  no           Negate a command or set its defaults
  rename       Redefines the name of class-map

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

The following table summarizes EX3500 QoS class map policy configuration mode commands:

Table 15: EX3500 QoS Class Map Policy Config Commands

Command	Description
description on page 334	Configures a description for this EX3500 QoS class map policy
match on page 335	Configures match criteria rules used to classify traffic
rename on page 337	Renames an existing EX3500 QoS class map object
no (ex3500-qos-class-map-policy-config-commands) on page 337	Removes this EX3500 QoS class map policy's description and match criteria

description

Configures this EX3500 QoS class map policy's description

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

Syntax

```
description <LINE>
```

Parameters

```
description <LINE>
```

description <LINE>	Configures this EX3500 QoS class map policy's description • <LINE> – Enter a description that allows to you differentiate it from other policies with similar configuration (should not exceed 64 characters)

Examples

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#description "Matches packets
marked for DSCP service 3"
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
 description "Matches packets marked for DSCP service 3"
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

Related Commands

match

Configures match criteria rules used to classify traffic

Access lists, IP precedence, DSCP values, or VLANs are commonly used to classify traffic. Access lists select traffic based on layer 2, layer 3, or layer 4 information contained in each packet.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

Syntax

```
match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl]
<ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

Parameters

```
match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl]
<ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

match	Configures the match criteria. The options are: access-list, cos, ip, ipv6, vlan Incoming packets matching the specified criteria are included in this QoS class map.
access-list [ex3500-ext-access-list| ex3500-std-access-list| mac-acl] <ACL-NAME>	Uses access lists to provide the match criteria. You can use any one the following ACL types to classify traffic: • ex3500-ext-access-list – Uses an IPv4 EX3500 extended ACL • ex3500-std-access-list – Uses an IPv4 EX3500 standard ACL • mac-acl – Uses a MAC EX3500 ACL The following keyword is common to all of the above ACL types: • <ACL-NAME> – Specify the ACL name (should be existing and configured).

cos <0-7>	Configures the *class of service* (CoS) value used to apply user priority. CoS is a form of QoS applicable only to layer 2 Ethernet frames. It uses 3-bits (8 values) of the 802.1Q tag to differentiate and shape network traffic. • <0-7> – Specify the CoS value from 0 - 7. Following are the 8 traffic classes based on the CoS value: • 000 (0) - Routine • 001 (1) - Priority • 010 (2) - Immediate • 011 (3) - Flash • 100 (4) - Flash Override • 101 (5) - Critical • 110 (6) - Internetwork Control • 111 (7) - Network Control
ip [dscp <0-63>| precedence <0-7>]	Configures the IPv4 DSCP value to match and/or the IP precedence value to match. • <0-63> – Specify the DSCP value from 0 - 63. Use this option to specify the *type of service* (ToS) field values included in the IP header. The ToS field exists between the header length and the total length fields. The DSCP constitutes the first 6 bits of the ToS field. • precedence <0-7> – Configures the IP precedence to match. Following are the 8 traffic classes based on the IP precedence values: • 000 (0) - Routine • 001 (1) - Priority • 010 (2) - Immediate • 011 (3) - Flash • 100 (4) - Flash Override • 101 (5) - Critical • 110 (6) - Internetwork Control • 111 (7) - Network Control
ipv6 dscp <0-63>	Configures the IPv6 DSCP value to match • <0-63> – Specify the DSCP value from 0 - 63.
vlan <1-4094>	Configures the VLAN to match • <1-4094> – Specify the VLAN ID.

Usage Guidelines

When configuring match entries, take into consideration the following points:

- Deny rules included in an ACL (associated with a vEX3500 QoS class map policy) are ignored whenever an incoming packet matches the ACL.
- A class map policy cannot include both IP ACL or IP precedence rule and a VLAN rule.
- A class map policy containing a MAC ACL or VLAN rule cannot include either an IP ACL or a IP precedence rule.
- A class map policy can include a maximum of 16 match entries.

Examples

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
 description "Matches packets marked for DSCP service 3"
```

```
 match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
nx9500-6C8809(config-ex3500-qos-class-map-policy-test2)#match ip precedence 1
```

Related Commands

no (ex3500-qos-class-map-policy-config-commands) on page 337	Removes match criteria rules configured for this EX3500 QoS class map policy

rename

Renames an existing EX3500 QoS class map policy

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

Syntax

```
rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>
```

Parameters

```
rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>
```

rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>	Renames an existing EX3500 QoS class map • <EX3500-QOS-CLASS-MAP-POLICY-NAME> – Enter the EX3500 QoS class map's current name. • <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME> – Enter the new name.

Examples

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename [TAB]
dscp   test   test2
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename test2 IP_Precedence
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename [TAB]
dscp   IP_Precedence   test
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

no (ex3500-qos-class-map-policy-config-commands)

description

Removes this EX3500 QoS class map policy's description and match criteria

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

Syntax

```
no [description|match]

```

no <PARAMETERS>	Removes the EX3500 QoS class map policy's settings based on the parameters passed

Examples

The following example shows the EX3500 QoS class map policy 'test' settings before the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
 description "Matches packets marked for DSCP service 3"
 match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#no description
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#no match ip dscp
```

The following example shows the EX3500 QoS class map policy 'test' settings after the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy test
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

ex3500-qos-policy-map

Creates an EX3500 policy map and enters its configuration mode

An EX3500 policy map contains one or more EX3500 QoS class maps traffic classifications (existing and configured) and can be attached to multiple interfaces. Create a EX3500 policy map, and then use the class parameter to configure policies for traffic that matches the criteria defined in the EX3500 QoS class map policy. For more information, see match on page 335.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>
```

Parameters

```
ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>
```

<EX3500-QOS-POLICY-MAP-NAME>	Specify the EX3500 policy map's name

Examples

```
nx9500-6C8809(config)#ex3500-qos-policy-map testPolicyMap
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#?
nx9500-6C8809_Qos_policy_map Mode commands:
  class        Defines a traffic classification for the policy
  description  Policy-map description
  no           Negate a command or set its defaults

  clrscr       Clears the display screen
```

```
  commit       Commit all changes made in this session
  do           Run commands from Exec mode

ex3500-qos-policy-map config commands

The following table summarizes EX3500 QoS policy map configuration mode commands:

Table 16: EX3500 QoS Policy Map Config Commands

Command	Description
class on page 339	Creates a policy map class and enters its configuration mode
description on page 347	Configures this EX3500 QoS policy map's description
no (ex3500-qos-policy-map) on page 348	Removes this EX3500 QoS policy map's settings. Use this keyword to remove or modify the description and to remove the QoS traffic classification created.

class

Creates a policy map class and enters its configuration mode. The policy map class is a traffic classification upon which a policy can act.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

Syntax

```
class <EX3500-QoS-CLASS-MAP-POLICY-NAME>
```

Parameters

```
class <EX3500-QoS-CLASS-MAP-POLICY-NAME>
```

class <EX3500-QoS-CLASS-MAP-POLICY-NAME>	Specify the EX3500 QoS class map policy's name (should be existing and configured)

Examples

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#class dscp
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#?
commands:
  no       Negate a command or set its defaults
  police   Defines a policer for classified traffic
  set      Classify IP traffic

  clrscr   Clears the display screen
```

```
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#
```

Related Commands

set on page 345	Sets CoS value, *per-hop behavior* (PHB) value, and IP DSCP value in matching packets
police on page 340	Configures an enforcer for classified traffic
no (ex3500-qos-policy-map) on page 348	Removes this traffic classification's settings

police

Configures an enforcer for classified traffic

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

Syntax

```
police [flow|srtcm-color-aware|srtcm-color-blind|trtcm-color-aware|trtcm-color-blind]
police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]
police [srtcm-color-aware|srtcm-color-blind] <0-1000000> <0-16000000>
<0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|
drop]
police [trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000>
<0-16000000>
conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]
```

Parameters

```
police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]
```

police	Configures an enforcer for classified traffic
flow <0-1000000> <0-16000000>	Configures an enforcer for classified traffic based on the metered flow rate • <0-1000000> – Configures the CIR *(committed information rate)* from 0 -1000000 kilobits per second. • <0-16000000> – Configures the BC *(committed burst size)* from 0 - 16000000 bytes. Policing is based on a token bucket, where bucket depth (i.e., the maximum burst before the bucket overflows) is specified by the committed-burst field, and the average rate tokens are added to the bucket is specified by the committed-rate option. Note, the token bucket functions similar to that described in RFC 2697 and RFC 2698. The behavior of the meter is specified in terms of one *token bucket* (C), the rate at which the tokens are incremented CIR and the maximum size of the token bucket BC. The token bucket C is initially full, that is, the token count Tc(0) = BC. Thereafter, the token count Tc is updated CIR times per second as follows:The token bucket C is initially full, that is, the token count Tc(0) = BC. Thereafter, the token count Tc is updated CIR times per second as follows:
conform-action transmit	Configures the action applied when packets fall within the specified CIR and BC limits • transmit – Transmits packets falling within the specified CIR and BC limits. This is subject to there being enough tokens to service the packet, in which case the packet is set green.
violate-action [<0-63>|drop]	Configures the action applied when packets violate the specified CIR and BC limits • <0-63> – Applies a new DSCP value. Select the DSCP value from 0 - 63. • drops – Drops packets violating the specified CIR and BC limits

```
police [srtcm-color-aware|srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000>
conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]
```

police	Configures an enforcer for classified traffic
[srtcm-color-aware| srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000>	Configures an enforcer for classified traffic based on single rate three color meter (srTCM) mode. The srTCM as defined in RFC 2697 meters a traffic stream and processes its packets according to three traffic parameters – CIR, BC, and BE *(Excess Burst Size)*. • srtcm-color-blind - Single rate three color meter in color-blind mode • srtcm-color-aware - Single rate three color meter in color-aware mode The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet. • <0-1000000> – Configures the CIR from 0 -1000000 kilobits per second. • <0-16000000> – Configures the BC from 0 - 1600000 bytes. <0-16000000> – Configures the BE from 0 - 1600000 bytes. The behavior of the meter is specified in terms of its mode and two token buckets, C and E, which both share the common rate CIR. The maximum size of the token bucket C is BC and the maximum size of the token bucket E is BE. The token buckets C and E are initially full, that is, the token count Tc(0) = BC and the token count Te(0) = BE. Thereafter, the token counts Tc and Te are updated CIR times per second as follows: • If Tc is less than BC, Tc is incremented by one, else • If Te is less then BE, Te is incremented by one, else • neither Tc nor Te is incremented. When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-blind mode: • If Tc(t)-B > OR = 0, the packet is green and Tc is decremented by B down to the minimum value of 0, else • if Te(t)-B > OR = 0, the packets is yellow and Te is decremented by B down to the minimum value of 0, • else the packet is red and neither Tc nor Te is decremented. When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-aware mode: • If the packet has been pre-colored as green and Tc(t)-B 0, the packet is green and Tc is decremented by B down to the minimum value of 0, else • If the packet has been pre-colored as yellow or green and if • Te(t)-B > OR = 0, the packets is yellow and Te is decremented by B down to the minimum value of 0, else the packet is red and neither Tc nor Te is decremented. The metering policy guarantees a deterministic behavior where the volume of green packets is never smaller than what has been determined by the CIR and BC, that is, tokens of a given color are always spent on packets of that color. Refer to RFC 2697 for more information on other aspects of srTCM.
conform-action transmit	Configures the action applied when packet rates fall within the specified CIR and BC limits • transmit – Transmits packets falling within the specified CIR and BC limits

exceed-action [<0-63>|drop]	Configures the action applied when packet rates exceed the specified CIR and BC limits • <0-63> – Applies a new DSCP value. Select the DSCP value from 0 - 63 • drops – Drops packets exceeding the specified CIR and BC limits
violate-action [<0-63>|drop]	Configures the action applied when packet rates exceed the specified BE limit • <0-63> – Applies a new DSCP value. Select the DSCP value from 0 - 63 • drops – Drops packets exceeding the specified BE limit

```
police [trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000>
<0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|
drop]
```

police	Configures an enforcer for classified traffic
[trtcm-color-aware| trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000> <0-16000000>	Configures an enforcer for classified traffic based on a two rate three color meter (trTCM) mode. The trTCM as defined in RFC 2698 meters a traffic stream and processes its packets based on two rates – CIR and *Peak Information Rate* (PIR), and their associated burst sizes - BC and BP *(Peak Burst Size)*. • trtcm-color-blind - Two rate three color meter in color-blind mode • trtcm-color-aware - Two rate three color meter in color-aware mode • <0-1000000> – Configures the CIR from 0 - 1000000 kilobits per second <0-16000000> – Configures the BC from 0 - 1600000 bytes. <0-1000000> – Configures the PIR from 0 - 1000000 kilobits per second <0-16000000> – Configures the BP from 0 - 1600000 bytes The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet. The behavior of the meter is specified in terms of its mode and two token buckets, P and C, which are based on the rates PIR and CIR, respectively. The maximum size of the token bucket P is BP and the maximum size of the token bucket C is BC. The token buckets P and C are initially (at time 0) full, that is, the token count Tp(0) = BP and the token count Tc(0) = BC. Thereafter, the token count Tp is incremented by one PIR times per second up to BP and the token count Tc is incremented by one CIR times per second up to BC. When a packet of size B bytes arrives at time t, the following happens if trTCM is configured to operate in color-blind mode: • If Tp(t)-B < 0, the packet is red, else • if Tc(t)-B < 0, the packet is yellow and Tp is decremented by B, else • The packet is green and both Tp and Tc are decremented by B. When a packet of size B bytes arrives at time t, the following happens if trTCM is configured to operate in color-aware mode: • If the packet has been pre-colored as red or if Tp(t)-B < 0, the packet is red, else • if the packet has been pre-colored as yellow or if Tc(t)-B < 0, the packet is yellow and Tp is decremented by B, else • the packet is green and both Tp and Tc are decremented by B. The trTCM can be used to mark a IP packet stream in a service, where different, decreasing levels of assurances (either absolute or relative) are given to packets which are green, yellow, or red. Refer to RFC 2698 for more information on other aspects of trTCM.
conform-action transmit	Configures the action applied when packet rates fall within the specified CIR and BP limits • transmit – Transmits packets falling within the specified CIR and BC limits

exceed-action [<0-63>| drop]	Configures the action applied when packet rates exceed the specified CIR limit, but are within the specified PIR limit • <0-63> – Applies a new DSCP value. Select the DSCP value from 0 - 63. • drops – Drops packets exceeding the specified CIR and BC limit
violate-action [<0-63>| drop]	Configures the action applied when packet rates exceed the specified PIR limit • <0-63> – Applies a new DSCP value. Select the DSCP value from 0 - 63. • drops – Drops packets exceeding the specified BE limi

Usage Guidelines

When configuring the traffic class enforcer parameters, consider the following factors:

- You can configure up to 200 enforcers/policers (i.e., class maps) for ingress ports.
- The committed-rate cannot exceed the configured interface speed, and the committed-burst cannot exceed 16 Mbytes.

Examples

The following example uses the `police > trtcm-color-blind` command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#police
 trtcm-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action 0
violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show context
 class dscp
  police trtcm-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action
0 violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#
```

Related Commands

no (ex3500-traffic-class-config-commands) on page 347	Removes the traffic enforcer settings

set

Sets CoS value, PHB value, and IP DSCP value in matching packets

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

Syntax

```
set [cos <0-7>|ip dscp <0-63>|phb <0-7>]
```

Parameters

```
set [cos <0-7>|ip dscp <0-63>|phb <0-7>]
```

set	Sets the match criteria used to identify and classify traffic into different classes. The match criteria options are: CoS, IP DSCP, and PHB values.
cos <0-7>	Configures the CoS value for a matching packet (as specified by the match command) in the packet's VLAN tag • <0-7> – Specify a value from 0 - 7. The CoS is modified to the value specified here.
ip dscp <0-63>	Modifies the IP DSCP value in a matching packet (as specified by the match command) • <0-63> – Specify a value from 0 - 63. The DSCP value is modified to the value specified here.
phb <0-7>	Configures a PHB value for a matching packets • <0-7> – Specify a value from 0 -7. The PHB label is composed of five bits, three bits for per-hop behavior, and two bits for the color scheme used to control queue congestion. A packet is marked green, yellow, or red as per the following: • green if it does not exceed the CIR and BC limits • yellow if it exceeds the CIR and BC limits, but not the BE limit, and • red otherwise.

Examples

The following example uses the `set > phb` command to classify the service that incoming packets will receive, and then uses the `police > trtcm-color-blind` command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000 bytes, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#set phb 3
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)# police
trtcm-color-blind 100000 4000 1000000 6000 conform-action transmit exceed-action 0
violate-action drop
nx9500-6C8809nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-
test2)#show
context
 class test2
  set phb 3
  police trtcm-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action
0 violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#
```

The following example uses the **set > ip dscp** command to classify the service that incoming packets will receive, and then uses the **police > flow** command to limit the average bandwidth to 100,000 Kbps, the burst rate to 4000 bytes, and configure the response to drop any violating packets:

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#set ip  dscp 3
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)# police flow
100000 4000
conform-action transmit violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show context
 class dscp
  set ip dscp 3
```

```
  police flow 100000 4000 conform-action transmit violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#
```

Examples

The following example shows the EX3500 QoS policy map 'test' settings before the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
 description "This is a test EX3500 QoS Policy Map"
 class test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#
EX3500(config-ex3500-qos-policy-map-test)#no description
EX3500(config-ex3500-qos-policy-map-test)#no class test
```

The following example shows the EX3500 QoS policy map 'test' settings after the 'no' command are executed:

```
EX3500(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
EX3500(config-ex3500-qos-policy-map-test)#
```

ex3524

Adds a EX3524 switch to the network

The EX3524 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity.

To enable layer 3 adoption of the logged EX3524 switch to a NOC controller, navigate to the switch's device configuration mode and execute the following command: `controller > host > <IP/HOSTANME>`.

EX3524 devices are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3524 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3524 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the EX3524 operating system provides EX3524 controllers PoE and port management resources.

Going forward NX7500, NX9500, and NX9600 series service platforms and WiNG VMs can discover, adopt, and partially manage EX3524 series Ethernet switches without modifying the proprietary operating system running the EX3524 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3524 switches, and maintain a translation layer, understood by the EX3524 switch, for statistics retrieval.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
ex3524 <DEVICE-EX3524-MAC>
```

Parameters

```
ex3524 <DEVICE-EX3524-MAC>
```

<DEVICE-EX3524-MAC>	Specifies the MAC address of a EX3524 switch

Examples

```
nx9500-6C8809(config)#ex3524 A1-C4-33-6D-66-07
nx9500-6C8809(config-device-A1-C4-33-6D-66-07)#?
EX35xx Device Mode commands:
  hostname         Set system's network name
  interface        Select an interface to configure
  ip               Internet Protocol (IP)
  no               Negate a command or set its defaults
  power            EX3500 Power over Ethernet Command
  remove-override  Remove configuration item override from the device (so
                   profile value takes effect)
  upgrade          Configures upgrade option for ex3500 system
  use              Set setting to use

  clrscr           Clears the display screen
  commit           Commit all changes made in this session
  do               Run commands from Exec mode
  end              End current mode and change to EXEC mode
  exit             End current mode and down to previous mode
  help             Description of the interactive help system
  revert           Revert changes
  service          Service Commands
```

```
  show              Show running system information
  write             Write running configuration to memory or terminal

nx9500-6C8809(config-device-A1-C4-33-6D-66-07)#
```

Related Commands

no on page 611	Removes a EX3524 switch from the network

ex3548

Adds a EX3548 switch to the network

The EX3548 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
ex3548 <DEVICE-EX3548-MAC>
```

Parameters

```
ex3548 <DEVICE-EX3548-MAC>
```

<DEVICE-EX3548-MAC>	Specifies the MAC address of a EX3548 switch

Examples

```
nx9500-6C8809(config)#ex3548 22-65-78-09-12-35
nx9500-6C8809(config-device-22-65-78-09-12-35)#?
EX35xx Device Mode commands:
  hostname          Set system's network name
  interface         Select an interface to configure
  ip                Internet Protocol (IP)
  no                Negate a command or set its defaults
  power             EX3500 Power over Ethernet Command
  remove-override   Remove configuration item override from the device (so
                    profile value takes effect)
  upgrade           Configures upgrade option for ex3500 system
  use               Set setting to use

  clrscr            Clears the display screen
  commit            Commit all changes made in this session
  do                Run commands from Exec mode
  end               End current mode and change to EXEC mode
  exit              End current mode and down to previous mode
  help              Description of the interactive help system
  revert            Revert changes
  service           Service Commands
  show              Show running system information
  write             Write running configuration to memory or terminal

nx9500-6C8809(config-device-22-65-78-09-12-35)#
```

Related Commands

no on page 611	Removes a EX3548 switch from the network

event-system-policy

Configures a system wide events handling policy

Event system policies enable administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform. Each listed event can have customized notification settings defined and saved as part of an event policy. Thus, policies can be configured and administrated in respect to specific sets of client association, authentication or encryption, and performance events. Once policies are defined, they can be mapped to device profiles strategically as the likelihood of an event applies to particular devices.

To view an existing event system policy configuration details, use the `show > event-system-policy` command.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
event-system-policy <EVENT-SYSTEM-POLICY-NAME>
```

Parameters

```
event-system-policy <EVENT-SYSTEM-POLICY-NAME>
```

<EVENT-SYSTEM-POLICY-NAME>	Specify the event system policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#event-system-policy event-testpolicy
nx9500-6C8809(config-event-system-policy-event-testpolicy)#?
Event System Policy Mode commands:
  event    Configure an event
  no       Negate a command or set its defaults

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-event-system-policy-event-testpolicy)#
```

event-system-policy-mode-commands

The following table summarizes event system policy configuration mode commands:

Table 17: Event-System-Policy Config Mode Commands

Command	Description
event on page 352	Configures an event
no (event-system-policy-config-mode) on page 366	Negates a command or reverts to default

event

Configures an event and sets the action performed when the event happens

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
event <EVENT-TYPE> <EVENT-NAME> (email,forward-to-switch,snmp,syslog) [default|on|off]
```

The even types are:

```
nx9500-6C8809(config-event-system-policy-testpolicy)#event ?
  aaa              AAA/Radius module
  adapt            Adaptivity Module
  adopt-service    Adoption Service

  wips            Wireless IPS module

nx9500-6C8809(config-event-system-policy-testpolicy)#
```

Note

The parameter values for <EVENT-TYPE> and <EVENT-NAME> are summarized in the table under the Parameters section.

Parameters

```
event <EVENT-TYPE> <EVENT-NAME> (email,forward-to-switch,snmp,syslog) [default|on|off]
```

<event-type>	<event-name>
aaa	Enables and configures logging of the following authentication, authorization, and accounting related events: • radius-discon-msg – RADIUS disconnection message • radius-session-expired – RADIUS session expired message • radius-session-not-started – RADIUS session not started message • radius-vlan-update – RADIUS VLAN update message
adapt	Enables and configures logging of the following adaptivity module related events: • adaptivity-change – Event adaptivity change • adaptivity-rehome – Event adaptivity rehome
adopt-services	Enables and configures the logging of adopted services related events
adv-wips	Enables and configures the logging of advanced WIPS related events

<event-type>	<event-name>
ap	Enables and configures logging of the following AP related events: • adopted – Event AP adopted • adopted-to-controller – Event AP adopted to wireless controller • ap-adopted – Event access port adopted • ap-autoup-done – Event AP autoup done • ap-autoup-fail – Event AP autoup fail • ap-autoup-needed – Event AP autoup needed • ap-autoup-no-need – Event AP autoup not needed • ap-autoup-reboot – Event AP autoup reboot • ap-autoup-timeout – Event AP autoup timeout • ap-autoup-ver – Event AP autoup version • ap-reset-detected – Event access port reset detected • ap-reset-request – Event access port user requested reset • ap-timeout – Event access port timed out • ap-unadopted – Event access port unadopted • image-parse-failure – Event image parse failure • legacy-auto-update – Event legacy auto update • no-image-file – Event no image file • offline – Event AP detected as offline • online – Event offline AP detected as online • reset – Event reset • sw-conn-lost – Event software connection lost • unadopted – Event unadopted
bt	Enables and configures logging of the following bluetooth related events: • bt-started – Event bluetooth (bt) started • bt-state-change – Event bt state change • bt-tron-license - Logs a TRON license exists event • bt-tron-no-license - Logs a TRON license missing event
captive-portal	Enables and configures logging of the following captive portal (hotspot) related events: • allow-access – Event client allowed access • auth-failed – Event client authentication failed • auth-success – Event client authentication success • client-disconnect – Event client disconnected • client-removed – Event client removed • data-limit-exceed – Event client data limit exceeded • flex-log-access – Event flexible log access granted to client • inactivity-timeout – Event client time-out due to inactivity • page-cre-failed – Event page creation failure • purge-client – Event client purged • session-timeout – Event session timeout • vlan-switch – Event client switched VLAN

<event-type>	<event-name>
cdp	Enables and configures logging of the following *CISCO Discovery Protocol* (CDP) related event: • duplex-mismatch – Event duplex mismatch detected between CDP neighbors
certmgr	Enables and configures logging of the following certificate manager related events: • ca-cert-actions-failure – Event CA certificate actions failure • ca-cert-actions-success – Event CA certificate actions success • ca-key-actions-failure – Event CA key actions failure • ca-key-actions-success – Event CA key actions success • cert-expiry – Event certificate expiry • crl-actions-failure – Event *Certificate Revocation List* (CRL) actions failure • crl-actions-success – Event CRL actions success • csr-export-failure – Event CSR export failure • csr-export-success – Event CSR export success • delete-trustpoint-action – Event delete trustpoint action • export-trustpoint – Event trustpoint exported • import-trustpoint – Event trustpoint imported • rsa-key-actions-failure – Event RSA key actions failure • rsa-key-actions-success – Event RSA key actions success • svr-cert-actions-success – Event server certificate actions success • svr-cert-actions-failure – Event server certificate actions failure
certmgr-lite	Enables and configures logging of certificate manager (lite version) related event messages
cfgd	Enables and configures logging of the following configuration daemon module related events: • acl-attached-altered – Event *Access List* (ACL) attached altered • acl-rule-altered – Event ACL rule altered
cluster	Enables and configures logging of the following cluster module related events: • cmaster-cfg-update-fail – Event cluster master config update failed • max-exceeded – Event maximum cluster count exceeded • state-change – Event cluster state change (active/inactive) • state-change-active – Event cluster state change to active • state-change-inactive – Event cluster state change to inactive • state-retain-active – Event cluster state retained as active
crm	Enables and configures logging of the following *Critical Resource Monitoring* (CRM) related event • critical-resource-down – Event critical resource goes down • critical-resource-up – Event critical resource comes up
device	Enables and configures the logging of device module related events

<event-type>	<event-name>
database	Enables and configures logging of the following error conditions in the captive-portal/NSIght database: • database-election-fail – Event primary database node selection failure. Requires manual intervention to select primary database node. • database-exception – Event database may need to be dropped and device restarted • database-low-disk-space – Event database low disk space • database-new-state – Event database state change • database-op-failure – Event database failure • database-set-name-mismatch – Event replica-set not enabled on host • database-storage-mismatch – Event database mismatch. All database files must be removed. • operation-complete – Event database operation completed successfully • operation-failed – Event database operation failure
dhcpsvr	Enables and configures logging of the following DHCP server related events: • dhcp-start – Event DHCP server started • dhcpsvr-stop – Event DHCP sever stopped • relay-iface-no-ip – Event no IP address on DHCP relay interface • relay-no-iface – Event no interface for DHCP relay • relay-start – Event relay agent started • relay-stop – Event DHCP relay agent stopped

<event-type>	<event-name>
diag	Enables and configures logging of the following diagnostics module related events: • autogen-tech-sprt – Event autogen technical support • buf-usage – Event buffer usage • cpu-load – Event CPU load • cpu-usage-too-high – Event CPU usage high • cpu-usage-too-high-recovery – Event recovery from high CPU usage • disk-usage – Event disk usage • elapsed-time – Event elapsed time • fan-underspeed – Event fan underspeed • fd-count – Event forward count • free-flash-disk – Event free flash disk • free-flash-inodes – Event free flash inodes • free-nvram-disk – Event free nvram disk • free-nvram-inodes – Event free nvram inodes • free-ram – Event free ram • free-ram-disk – Event free ram disk • free-ram-inodes – Event free ram inodes • head-cache-usage – Event head cache usage • high-temp – Event high temp • ip-dest-usage – Event ip destination usage • led-identify – Event led identify • low-temp – Event low temp • mem-usage-too-high – Event memory usage high • mem-usage-too-high-recovery – Event recovery from high memory usage • new-led-state – Event new led state • over-temp – Event over temp • over-voltage – Event over voltage • poe-init-fail – Event PoE init fail • poe-power-level – Event PoE power level • poe-read-fail – Event PoE read fail • poe-state-change – Event PoE state change • poe-state-change – Event PoE state change • pwrsply-fail – Event failure of power supply • raid-degraded – Event *Redundant Array of Independent Disks* (RAID) degraded • raid-error – Event RAID error • ram-usage – Event ram usage • under-voltage – Event under voltage • wd-reset-sys – Event wd reset system • wd-state-change – Event wd state change

<event-type>	<event-name>
dot11	Enables and configures logging of the following 802.11 management module related events: • client-assoc-ignored – Wireless client association ignored event • client-associated – Wireless client associated event • client-denied-assoc – Event client denied association • client-disassociated – Wireless client disassociated • country-code – Event country code applied • country-code-error – Event country code error • eap-cached-keys – Event *Extensible Authentication Protocol* (EAP) cached keys • eap-client-timeout – Event EAP client timeout • eap-failed – Event EAP failed • eap-opp-cached-keys – Event EAP opp cached keys • eap-preauth-client-timeout – Event EAP pre authentication client timeout • eap-preauth-failed – Event EAP pre authentication failed • eap-preauth-server-timeout – Event EAP pre authentication server timeout • eap-preauth-success – Event EAP pre authentication success • eap-server-timeout – Event EAP server timeout • eap-success – Event EAP success • ft-roam-success – Event client fast BSS transition • gal-rx-request – Event GAL request received event • gal-tx-response – Event response sent to GAL request • gal-validate-failed – Event GAL validation failed • gal-validate-req – Event GAL validation request • gal-validate-success – Event GAL validation success • kerberos-client-success – Event client Kerberos authentication success • kerberos-wlan-failed – Event WLAN Kerberos authentication failed • kerberos-wlan-success – Event WLAN Kerberos authentication success • kerberos-wlan-timeout – Event Kerberos authentication timed out • move-operation-success – Event move operation success • tkip-cntrmeas-end – Event TKIP countermeasures ended • tkip-cntrmeas-start – Event TKIP countermeasures initiated • tkip-mic-fail-report – Event TKIP MIC failure report • tkip-mic-failure – Event TKIP MIC check failed • neighbor-denied-assoc – Event neighbor denied association • unsanctioned-ap-active – Event unsanctioned AP active • unsanctioned-ap-inactive – Event unsanctioned AP inactive • unsanctioned-ap-status-change – Event unsanctioned AP status change • voice-call-completed – Event voice call completed • voice-call-established – Event voice call established • voice-call-failed – Event voice call failed • wlan-time-access-disable – Event WLAN disabled by time-based-access • wlan-time-access-enable – Event WLAN re-enabled by time-based-access

<event-type>	<event-name>
	• wpa-wpa2-failed – Event WPA-WPA2 failed • wpa-wpa2-key-rotn – Event WPA-WPA2 key rotn • wpa-wpa2-success – Event WPA-WPA2 success
dot1x	Enables and configures logging of the following 802.1X authentication related events: • dot1x-failed – Event EAP authentication failure • dot1x-success – Event dot1x-success
fa	Enables and configures logging of fabric attach related events: • fa-accepted – Event fa-accepted • fa-pending – Event fa-pending
fwu	Enables and configures logging of the following *firmware update* (FWU) related events: • fwuaborted – Event fwu aborted • fwubadconfig – Event fwu aborted due to bad config • fwucorruptedfile – Event fwu aborted due to corrupted file • fwucouldntgetfile – Event fwu aborted because the system could not get file • fwudone – Event fwu done • fwufileundef – Event fwu aborted due to file undefined • fwunoneed – Event fwu no need • fwuprodmismatch – Event fwu aborted due to product mismatch • fwuserverundef – Event fwu aborted due to server undefined • fwuserverunreachable – Event fwu aborted due to server unreachable • fwusignmismatch – Event fwu aborted due to signature mismatch • fwusyserr – Event fwu aborted due to system error • fwuunsupportedhw – Event fwu aborted due to unsupported hardware • fwuunsupportedmodelnum – Event fwu aborted due to unsupported FIPS model number • fwuvermismatch – Event fwu aborted due to version mismatch
isdn	Configures file *Integrated Service Digital Network* (ISDN) module related event s • isdn-alert – Event ISDN alert • isdn-crit – Event ISDN critical • isdn-debug – Event ISDN debug • isdn-emerg – Event ISDN emergency • isdn-err – Event ISDN error • isdn-info – Event ISDN info • isdn-notice – Event ISDN notice • isdn-warning – Event ISDN warning
l2gre	Enables and configures logging of the following *Layer 2 GRE* (L2GRE) tunnel related events: • l2gre-tunnel-down – Event L2GRE tunnel down • l2gre-tunnel-failover – Event L2GRE tunnel failover • l2gre-tunnel-up – Event L2GRE tunnel up

<event-type>	<event-name>
l2tpv3	Enables and configures logging of the following *Layer 2 TPV3* (L2TPv3) tunnel related events: • l2tpv3-tunnel-down – Event L2TPv3 tunnel down • l2tpv3-tunnel-up – Event L2TPv3 tunnel up
licmgr	Enables and configures logging of the following license manager module related events: • lic-installed-count – Event total number of license installed count • lic-installed-default – Event default license installation • lic-installed – Event license installed • lic-invalid – Event license installation failed • lic-removed – Event license removed
lldp	Enables and configures logging of the following *Link Layer Discovery Protocol* (LLDP) related events: • lldp-loop-detected – Event layer 2 switching loop • lldp-loop-recovery – Event recovery from layer 2 switching loop
mgmt	Enables and configures logging of the following management services module related events: • log-http-init – Event Web server started • log-http-local-start – Event Web server started in local mode • log-http-start – Event Web server started in external mode • log-https-start – Event secure Web server started • log-https-wait – Event waiting for Web server to start • log-key-deleted – Event RSA key associated with SSH is deleted • log-key-restored – Event RSA key associated with SSH is added • log-trustpoint-deleted – Event trustpoint associated with HTTPS is deleted
mesh	Enables and configures logging of the following mesh module related events: • mesh-link-down – Event mesh link down • mesh-link-up – Event mesh link up • meshpoint-down – Event meshpoint down • meshpoint-loop-prevent-off – Event meshpoint loop prevent off • meshpoint-loop-prevent-on – Event meshpoint loop prevent on • meshpoint-path-change – Event meshpoint-path-change • meshpoint-root-change – Event meshpoint-root-change • meshpoint-up – Event meshpoint up

<event-type>	<event-name>
nsm	Configures *Network Service Module* (NSM) related event • dhcpc-err – Event DHCP certification error • dhcpdefrt – Event DHCP defrt • dhcpip – Event DHCP IP • dhcpipchg – Event DHCP IP change • dhcpipnoadd – Event DHCP IP overlaps static IP address • dhcplsexp – Event DHCP lease expiry • dhcpnak – Event DHCP server returned DHCP NAK response • dhcpnodefrt – Event interface no default route • if-failback – Event interface failback • if-failover – Event interface failover • ifdown – Event interface down • ifipcfg – Event interface IP config • ifup – Event interface up • nsm-ntp – Event translate host name
pm	Configures process monitor module related event s • procid – Event proc ID generated • procmaxrstrt – Event proc max restart • procnoresp – Event proc no response • procrstrt – Event proc restart • procstart – Event proc start • procstop – Event proc stop • procsysrstrt – Event proc system restart • startupcomplete – Event startup complete
radconf	Enables and configures logging of the following RADIUS configuration daemon related events: • could-not-stop-radius – Event could not stop RADIUS server • radiusdstart – Event RADIUS server started • radiusdstop – Event RADIUS server stopped

<event-type>	<event-name>
radio	Enables and configures logging of the following radio module related events: • acs-scan-complete – Event ACS scan completed • acs-scan-started – Event ACS scan started • cb-associated – Event client-bridge access point associates with an infrastructure access point • cb-roam – Event client-bridge access point roams from one infrastructure access point to another infrastructure access point • cb-wired-client-added – Event wired client is added to the client-bridge • cb-wired-client-removed – Event wired client is removed from the client-bridge • channel-country-mismatch – Event channel and country of operation mismatch • radar-det-info – Detected radar info • radar-detected – Event radar detected • radar-scan-completed – Event radar scan completed • radar-scan-started – Event radar scan started • radio-antenna-error – Event invalid antenna type on this radio • radio-antenna-setting – Event antenna type setting on this radio • radio-state-change – Event radio state change • resume-home-channel – Event resume home channel
rasst	Enables and configures the logging of roaming assist module related events
smrt	Enables and configures logging of the following SMART RF module related events: • calibration-done – Event calibration done • calibration-started – Event calibration started • channel-change – Event channel change • config-cleared – Configuration cleared event • cov-hole-recovery – Event coverage hole recovery • cov-hole-recovery-done – Event coverage hole recovery done • interference-recovery – Event interference recovery • neighbor-recovery – Event neighbor recovery • power-adjustment – Event power adjustment • root-recovery – Event meshpoint root recovery
smtpnot	Enables and configures logging of the following SMTP module related events: • cfg – Event cfg • cfginc – Event cfg inc • net – Event net • proto – Event proto • smtpauth – Event SMTP authentication • smtperr – Event SMTP error • smtpinfo – Event SMTP information

<event-type>	<event-name>
system	Enables and configures logging of the following system module related events: • clock-reset – Event clock reset • cold-start – Event cold start • config-commit – Event configuration commit • config-revision – Event config-revision done • devup-rfd-fail – Event device-upgrade failed on rf-domain manager managed devices • guest-user-exp – Event guest user purging • http-err – Event Web server did not start • login – Event successful login • login-fail – Event login fail. Occurs when user authentication fails. • login-fail-access – Event login fail access. Occurs in case of access violation. • login-fail-bad-role – Event login fail bad role. Occurs when user uses an invalid role to logon. • login-lockout – Event user account locked out message. Occurs when a user account is locked due to exceeding of maximum number failed login attempts threshold. Configure this event notification only if the max-fail and lockout-time parameters have been configured in the management-policy context. For more information, see password-entry on page 1531. • login-unlocked – Event user account un-locked. Occurs when a locked user account is re-activated. Enable this event notification only if the max-fail and lockout-time parameters have been configured in the management-policy context. For more information, see password-entry on page 1531. • logout – Event logout • maat-light – Event action on RIM *(Research in Motion)* radio(s) from the Maat light module • panic – Event panic • periodic-heart-beat – Event periodic heart beat • procstop – Event proc stop • server-unreachable – Event server-unreachable • system-autoup-disable – Event system autoup disable • system-autoup-enable – Event system autoup enable • t5-config-error – Event t5-config-error • ui-user-auth-fail – Event user authentication fail • ui-user-auth-success – Event user authentication success • warm-start – Event warm start • warm-start-recover – Event recovery from warm start

<event-type>	<event-name>
test	Enables and configures logging of the following test module related events: • testalert – Event test alert • testargs – Event test arguments • testcrit – Event test critical • testdebug – Event test debug • testemerg – Event test emergency • testerr – Event test error • testinfo – Event test information • testnotice – Event test notice • testwarn – Event test warning
tron	Enables and configures logging of the following TRON device (i.e., the ID Nodes) related events: • first-sighting - Logs an event when 'a first-sighting TRON message is generated for the ID node'. • offline - Logs an event when 'an off-line TRON message is generated for the node'. • online - Logs an event when 'an on-line TRON message is generated for the node'. • sporadic - Logs an event when 'a sporadic TRON message is generated for the ID node'.
vrrp	Enables and configures logging of the following *Virtual Router Redundancy Protocol* (VRRP) related events: • vrrp-monitor-change – Event VRRP monitor link state change • vrrp-state-change – Event VRRP state transition • vrrp-vip-subnet-mismatch – Event VRRP IP not overlapping with an interface addresses
webf	Enables and configures logging of the following Web Filtering (webf) module related events: • malform-url-request – Event malformed URL request • no-parent-engine – Event 'no session to URL classification server' • srvr-connect-fail – Event URL classification server unreachable • url-blocked – Event URL blocked • webf-lic-acquired – Event webf license acquired • webf-lic-missing – Event webf license missing • webf-lic-revoked – Event webf license revoked

<event-type>	<event-name>
wips	Enables and configures logging of the following Wireless IPS module related events: • air-termination-active – Event air termination active air-termination-ended – Event air termination ended air-termination-inactive – Event air termination inactive air-termination-initiated – Event air termination initiated rogue-ap-active – Event rogue AP active rogue-ap-inactive – Event rogue AP inactive unsanctioned-ap-active – Event unsanctioned AP active unsanctioned-ap-inactive – Event unsanctioned AP inactive unsanctioned-ap-status-change – Event unsanctioned AP changed state wips-client-blacklisted – Event WIPS client blacklisted • wips-client-rem-blacklist – Event WIPS client rem blacklist • wips-event – Event WIPS event triggered Note: Air-termination is not supported on AP505 and AP510 model access points.
email	Sends e-mail notifications to a pre configured e-mail ID
forward-to-switch	Forwards the messages to an external server
snmp	Logs an SNMP event
syslog	Logs an event to syslog
default	Performs the default action for the event
off	Switches the event off, when the event happens, and no action is performed
on	Switches the event on, when the event happens, and the configured action is taken

Examples

```
rfs4000-229D58(config-event-system-policy-event-testpolicy)#event aaa radius-discon-msg
email on forward-to-switch default snmp default syslog default

rfs4000-229D58(config-event-system-policy-testpolicy)#show context
event-system-policy test
 event aaa radius-discon-msg email on
rfs4000-229D58(config-event-system-policy-testpolicy)#

nx9500-6C8809(config-event-system-policy-test)#event database database-exception
 syslog default snmp default forward-to-switch default email default

nx9500-6C8809(config-event-system-policy-test)#event database operation-failed syslog
default snmp default forward-to-switch default email default

nx9500-6C8809(config-event-system-policy-test)#show context include-factory | grep
operation-failed
```

```
 event database operation-failed syslog default snmp default forward-to-switch default
email default
nx9500-6C8809(config-event-system-policy-test)#
```

Related Commands

no (event-system-policy-config-mode) on page 366	Resets or disables event monitoring

no (event-system-policy-config-mode)

Negates an event monitoring configuration

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no event <EVENT-TYPE> <EVENT-NAME> [email|forward-to-switch|snmp|syslog] [default|on|off]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes event monitoring and message forwarding activity based on the parameters passed The system stops network monitoring for the occurrence of the specified event and no notification is sent if the event occurs.

Examples

```
rfs4000-229D58(config-event-system-policy-TestPolicy)#event ap adopted syslog default
rfs4000-229D58(config-event-system-policy-TestPolicy)#no event ap adopted syslog
```

Related Commands

event on page 352	Configures the action taken for each event

firewall-policy

Configures a firewall policy. This policy defines a set of rules for managing network traffic and prevents unauthorized access to the network behind the firewall.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
firewall-policy <FIREWALL-POLICY-NAME>
```

Parameters

```
firewall-policy <FIREWALL-POLICY-NAME>
```

<FIREWALL-POLICY-NAME>	Specify the firewall policy name. If a firewall policy, with the specified name, does not exist, it is created.

Examples

```
nx9500-6C8809(config)#firewall-policy test
nx9500-6C8809(config-fw-policy-test)#?
Firewall policy Mode commands:
  acl-logging                    Log on flow creating traffic
  alg                            Enable ALG
  clamp                          Clamp value
  dhcp-offer-convert             Enable conversion of broadcast dhcp offers to
                                 unicast
  dns-snoop                      DNS Snooping
  firewall                       Wireless firewall
  flow                           Firewall flow
  ip                             Internet Protocol (IP)
  ip-mac                         Action based on ip-mac table
  ipv6                           Internet Protocol version 6 (IPv6)
  ipv6-mac                       Action based on ipv6-mac table
  logging                        Firewall enhanced logging
  no                             Negate a command or set its defaults
  proxy-arp                      Enable generation of ARP responses on behalf
                                 of another device
  proxy-nd                       Enable generation of ND responses (for IPv6)
                                 on behalf of another device
  stateful-packet-inspection-l2  Enable stateful packet inspection in layer2
                                 firewall
  storm-control                  Storm-control
  virtual-defragmentation        Enable virtual defragmentation for IPv4
                                 packets (recommended for proper functioning
                                 of firewall)

  clrscr                         Clears the display screen
  commit                         Commit all changes made in this session
  do                             Run commands from Exec mode
  end                            End current mode and change to EXEC mode
  exit                           End current mode and down to previous mode
  help                           Description of the interactive help system
  revert                         Revert changes
  service                        Service Commands
  show                           Show running system information
  write                          Write running configuration to memory or
                                 terminal

nx9500-6C8809(config-fw-policy-test)#
```

Related Commands

no on page 611	Removes an existing firewall policy

Note
For more information on Firewall policy, see Firewall Policy on page 1481.

global-association-list

Configures a global list of client MAC addresses. Based on the deny or permit rules specified, clients are either allowed or denied access to the managed network.

The global association list serves the same purpose as an Association *Access Control List* (ACL). However, the Association ACL allows a limited number of entries, a few thousand only, and does not suffice the requirements of a large deployment. This gap is filled by a global association list, which is much larger (with tens of thousands of entries). Both lists co-exist in the system. When an access request comes in, the association ACL is looked up first and if the requesting MAC address is listed in one of the deny ACLs, the association is denied. But, if the requesting client is permitted access, or if in case none of the ACLs list the client's MAC address, the global association ACL is checked. Once authenticated, the client's credentials are cached on the Access Point, and subsequent requests are not referenced to the controller. An entry in an APs credential cache means a pass in the global association list.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
global-association-list <GLOBAL-ASSOC-LIST-NAME>
```

Parameters

```
global-association-list <GLOBAL-ASSOC-LIST-NAME>
```

<GLOBAL-ASSOC-LIST-NAME>	Specify the global association list name. If a list with the same name does not exist, it is created. Map this global association list to a device (controller) or a controller profile. Once associated, the controller applies this association list to requests received from all adopted APs. For more information, see use (profile/device-config-mode-commands) on page 1247. The global association list can also be mapped to a WLAN. The usage of global access lists is controlled on a per-WLAN basis. For more information, see association-list on page 529.

Examples

```
rfs4000-229D58(config)#global-association-list my-clients
rfs4000-229D58(config-global-assoc-list-my-clients)#?
Global Association List Mode commands:
  default-action  Configure the default action when the client MAC does not
                  match any rule
  deny            Specify MAC addresses to be denied
  no              Negate a command or set its defaults
  permit          Specify MAC addresses to be permitted

  clrscr          Clears the display screen
  commit          Commit all changes made in this session
  do              Run commands from Exec mode
  end             End current mode and change to EXEC mode
  exit            End current mode and down to previous mode
  help            Description of the interactive help system
  revert          Revert changes
  service         Service Commands
  show            Show running system information
  write           Write running configuration to memory or terminal

rfs4000-229D58(config-global-assoc-list-my-clients)#
```

To enable global-association-list controlled client association, execute the following commands:

1 Create a global association list, and configure it as shown in the following examples:

```
rfs4000-880DA7(config)#global-association-list vtt-list
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit 01-22-33-44-55-66 description
sample
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit 40-B8-9A-39-F1-27 description
acer
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit 42-B8-9A-39-F1-27 description
ami
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit 6C-40-08-B2-80-6C description
mac
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit E0-98-61-34-11-47 description
my_mobile
rfs4000-880DA7(config-global-assoc-list-vtt-list)#show context
global-association-list vtt-list
 default-action deny
 permit 01-22-33-44-55-66 description sample
 permit 40-B8-9A-39-F1-27 description acer
 permit 42-B8-9A-39-F1-27 description ami
 permit 6C-40-08-B2-80-6C description mac
 permit E0-98-61-34-11-47 description my_mobile
rfs4000-880DA7(config-global-assoc-list-vtt-list)#
```

2 Attach this global association list to the profile or device context of the access point or controller, as shown in the following examples:

On the access point's profile context:

Note

Ensure that the global association list is associated with the profile being applied on the access point.

```
rfs4000-880DA7(config-profile-testAP505)#use global-association-list server vtt-list
rfs4000-880DA7(config-profile-testAP505)#show context include-factory | include g
lobal-association-list
 service global-association-list blacklist-interval 60
 use global-association-list server vtt-list
rfs4000-880DA7(config-profile-testAP505)#
```

On the access point's device context:

```
ap505-13403B(config-device-94-9B-2C-13-40-38)#use global-association-list server vtt-
list
ap505-13403B(config-device-94-9B-2C-13-40-38)#show context include-factory | in
clude global-association-list
 use global-association-list server vtt-list
ap505-13403B(config-device-94-9B-2C-13-40-38)#
```

On the controller's device context:

```
rfs4000-880DA7(config-device-00-23-68-88-0D-A7)#use global-association-list server vtt-
list
rfs4000-880DA7(config-device-00-23-68-88-0D-A7)#show context include-factory | in
clude global-association-list
 use global-association-list server vtt-list
rfs4000-880DA7(config-device-00-23-68-88-0D-A7)#
```

3 Attach this global association list with the WLAN, as shown in the following example:

```
rfs4000-880DA7(config-wlan-GLAssList)#association-list global vtt-list
rfs4000-880DA7(config-wlan-GLAssList)#show context include-factory | include
association-list
 association-list global vtt-list
rfs4000-880DA7(config-wlan-GLAssList)#
```

guest-management-policy

Configures a guest management policy that redirects guest users to a registration portal upon association to a captive portal. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) where previously, not-registered guest users can register. The internally hosted captive portal registration page can be customized based on business requirements.

Use the guest management policy commands to configure parameters, such as E-mail host and SMS gateway along with the credentials required for sending pass code to guest via e-mail and SMS. You can configure up to 32 different guest management policies. Each guest management policy allows you to configure the SMS gateway, SMS message body, E-mail SMTP server, E-mail subject contents, and E-mail message body. Although, at any point-in-time, multiple guest management policies may exist, only one guest management policy can be active per device.

Guest registration is supported only on the NX9500 and NX7500 series service platforms. However, the number of user identity entries supported on each varies. It is 2 million and 1 million user-identity entries for the NX9500 and NX7500 model service platforms respectively.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
guest-management <POLICY-NAME>
```

Parameters

```
guest-management <POLICY-NAME>
```

<POLICY-NAME>	Specify the guest management policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#guest-management guest
nx9500-6C8809(config-guest-management-guest)#?
Guest Management Mode commands:
  email                   Email guest-notification configuration
  guest-database-backup   Configure guest-database-backup parameters
  guest-database-export   Configure guest-database-export parameters
  no                      Negate a command or set its defaults
  sms                     SMS guest-notification configuration
  sms-over-smtp           Sms-over-smtp configuration to email sms gateway
                          address

  clrscr                  Clears the display screen
  commit                  Commit all changes made in this session
  do                      Run commands from Exec mode
```

```
  end                     End current mode and change to EXEC mode
  exit                    End current mode and down to previous mode
  help                    Description of the interactive help system
  revert                  Revert changes
  service                 Service Commands
  show                    Show running system information
  write                   Write running configuration to memory or terminal

nx9500-6C8809(config-guest-management-guest)#
```

Related Commands

guest-management-policy config commands

The following table summarizes guest management policy configuration mode commands:

Table 18: Guest Management Policy Config Commands

Command	Description
email on page 371	Configures guest user e-mail notification settings
guest-database-backup on page 373	Enables periodic backup of the captive portal's guest registration user database
guest-database-export on page 374	Schedules an export of the Guest Management User database to a specified external server
sms on page 375	Configures guest user SMS notification settings
sms-over-smtp on page 377	Configures an e-mail host server along with sender credentials and the recipient's gateway e-mail address to which the message is e-mailed. The gateway server converts the e-mail into SMS and forwards the message to the guest user's mobile device.
no (guest-management-policy-config-commands) on page 379	Removes this guest management policy settings

email

Configures guest user e-mail notification settings. When configured, guest users can register themselves with their e-mail credentials as a primary key for authentication. The captive portal system provides the pass code for their registration. Guest users need to use their registered e-mail, mobile, or member ID and the received pass code for subsequent logins to the captive portal.

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
email [host|message|subject]
email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
security [none|ssl|starttls] username <USER-NAME> password <PASSWORD>
email message <LINE>
email subject <LINE>
```

Parameters

```
email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS> security
[none|ssl|starttls] username <USER-NAME> password <PASSWORD>
```

email	Configures guest user e-mail notification settings
host [<IP/HOSTNAME>| <HOST-ALIAS-NAME>]	Configures the SMTP server's IP address or hostname used for guest management e-mail traffic, guest user credential validation, and pass code reception. Optionally you can use an existing host alias to identify the SMTP server host. • <IP/HOSTNAME> – Specify the SMTP server's IPv4 address or hostname. • <HOST-ALIAS-NAME> – Specify the host alias name (should be existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.
sender <EMAIL-ADDRESS>	Configures the sender's name for the guest user receiving the passcode required for registering their guest E-mail credentials using SMTP. • <EMAIL-SENDER> – Specify the sender's name (should not exceed 100 characters).
security [none|ssl|starttls]	Configures the encryption protocol used by the SMTP server when communicating the pass code • none – No encryption used. Use if no additional user authentication is needed beyond the required username and password combination. • SSL – Uses SSL encryption. This is the default setting. • STARTTLS – Uses STARTTLS encryption
username <USER-NAME>	Configures a username unique to this SMS guest management configuration. After configuring the username, specify the associated password. Ensure that the password is correctly provided to receive the pass code required for registering guest user credentials with SMS. • <USER-NAME> – Specify the username (should not exceed 100 characters).
password <PASSWORD>	Configures the password associated with the specified SMTP user name • <PASSWORD> – Specify the password (should not exceed 63 characters).

```
email message <LINE>
```

email	Configures guest user e-mail notification content
message <LINE>	Configures the content of the e-mail sent to the guest user notifying the pass code (should not exceed 1024 characters) • <LINE> – Specify the message content. When entering the message, use the following tags: GM-NAME – for the guest user's name GM_PASSCODE – for the pass code CR-NL – to enter a new line For example: Dear GM_NAME, CR-NL your internet access pass code is GM_PASSCODE. CR-NL Use this for internet access.

```
email subject <LINE>
```

email	Configures guest user e-mail notification subject line
subject <LINE>	Configures the subject line of the e-mail sent to the guest user notifying the pass code (should not exceed 100 characters) • <LINE> – Specify the subject line content. When entering the subject line, use the following tag: GM-NAME – for the guest user's name For example: GM_NAME, your internet access code

Examples

```
nx9500-6C8809(config-guest-management-test)#email host 192.168.13.10 sender
bob@extremenetworks.com security ssl username guest1 password guest1@123
nx9500-6C8809(config-guest-management-test)#show context
guest-management test
 email host 192.168.13.10 sender bob@extremenetworks.com security ssl username guest1
password guest1@123
nx9500-6C8809(config-guest-management-test)#
nx9500-6C8809(config-guest-management-test2)#email message Dear GM_Guest2, CR-NL
Your internet access passcode is GM_Guest2. CR-NL Use this for internet access.
nx9500-6C8809(config-guest-management-test2)#email subject GM_Guest2 Your internet access
code
nx9500-6C8809(config-guest-management-test2)#show context
guest-management test2
 email subject GM_Guest2 Your internet access code
 email message Dear GM_Guest2,  CR-NL  Your internet access passcode is GM_Guest2.  CR-
NL  Use this for internet access.
nx9500-6C8809(config-guest-management-test2)#
```

Related Commands

no (guest-management-policy-config-commands) on page 379	Removes the e-mail settings used to send notification mails to the guest user

guest-database-backup

Enables periodic backup of a captive portal's guest registration user database. This option is enabled by default.

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
guest-database-backup enable {<TIME>}
```

Parameters

```
guest-database-backup enable {<TIME>}
```

guest-database-backup enable {<TIME>}	Enables periodic backup of a captive portal's guest registration user database. This command also allows you to configure the time at which the system starts backing up the database. The default backup-start time is '00:00' (midnight every day). • <TIME> – Optional. Resets the periodic database backup-start time to a user-defined value in the HH;MM format. When specified, the system starts periodic backup of the database, every day, at the specified time.

Examples

```
nx9500-6C8809(config-guest-management-test)#guest-database-backup enable 12:30
nx9500-6C8809(config-guest-management-test)#show context
guest-management test
 guest-database-backup enable 12:30
nx9500-6C8809(config-guest-management-test)#
```

Related Commands

no (guest-management-policy-config-commands) on page 379	Disables periodic backup of a captive portal's guest registration user database

guest-database-export

Schedules an export of the Guest Management user database to a specified external server. This option is enabled by default.

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
guest-database-export <TIME> frequency <1-168> url-directory <URL>
{(format [csv|json]|last-visit-within <1-168>)}
```

Parameters

```
guest-database-export <TIME> frequency <1-168> url-directory <URL>
{(format [csv|json]|last-visit-within <1-168>)}
```

guest-database-export <TIME>	Schedules an export of the Guest Management User collection to an external server • <TIME> – Configures the start time of the export operation in the HH:MM format
frequency <1-168>	Configures the user collection export frequency in hours • <1-168> – Configures the frequency from 1 - 168 hours. If the frequency is set at 3 hours, the user database is exported once in every 3 hours. The default is 4 hours.
url-directory <URL>	Configures external server's URL and directory to where the collection is exported • <URL> – Specify the external server's URL

format [csv|json]	Optional. Configures the file format • csv – Exports collection to the specified location in CSV format. This is the default setting. • json – Exports collection to the specified location in JSON format
last-visit-within <1-168>	Configures a filters guest users who have last visited within a specified period of time • <1-168> – Specify a time period from 1 - 168 hours. If for example, the last-visit-within value is set at 2 hours, then only the last two hours guest user collections will be exported. The default is 4 hours.

Examples

```
nx9500-6C8809(config-guest-management-gm1)#guest-database-export 10:30 frequency  6 url-directory ftp://admin:xxxxxx@192.168.13.10/dbe_dir format json last-visit-within 168

sms

Configures guest user SMS notification settings. When configured, guest users can register themselves with their e-mail or mobile device ID as the primary key for authentication. The captive portal provides the pass code for registration. Guest users use their registered e-mail or mobile device ID and the received pass code for subsequent logins to the captive portal.

Note

When using SMS, ensure that the WLAN's mode of authentication is set to none and the mode of registration is set to user. In other words, captive portal authentication must always enforce guest registration.

SMS is similar to MAC address-based self registration, but in addition the captive portal sends an SMS message, containing an access code, to the user's mobile phone number provided at the time of registration. The captive portal verifies the code, returns the Welcome page and provides access. This allows the administrator to verify the phone number provided and can be traced back to a specific individual should the need arise.

The default gateway used with SMS is Clickatell. A pass code can be sent with SMS to the guest user directly using Clickatell, or the pass code can be sent via e-mail to the SMS Clickatell gateway server, and Clickatell sends the pass code SMS to the guest user.

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
sms [host|message]sms host clickatell username <USER-NAME> password <PASSWORD>
api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}
sms message <LINE>
```

Parameters

```
sms host clickatell username <USER-NAME> password <PASSWORD>
api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}
```

sms	Configures guest user SMS notification settings
host clickatell	By default, clickatell is the host SMS gateway server resource. Upon receiving the pass code e-mail, the SMS gateway sends the actual notification pass code SMS to the guest user.
username <USER-NAME>	Configures a username unique to this SMS guest management configuration. After configuring the username, specify the associated password. Ensure that the password is correctly provided to receive the pass code required for registering guest user credentials with SMS. • <USER-NAME> – Specify the username (should not exceed 32 characters).
password <PASSWORD>	Configures the password associated with the specified username • <PASSWORD> – Specify the password (should not exceed 63 characters).
api-id <ID>	Set a 32 character maximum API ID • <API-ID> – Specify the API ID (should not exceed 32 characters).
user-agent <PYCLICKATELL>	Since the SMS service provider by default is Clickatell, set the user agent name to pyclickatell. The user-agent value ensures the Clickatell SMS gateway server and its related credentials, needed for sending the pass code to guest users, are configured.
source-number <WORD>	Optional. Configures the long-address or the from-number associated with this Clickatell user account • <WORD> – Specify the source number (should not exceed 32 characters).

```
sms message <LINE>
```

sms	Configures guest user SMS notification content
message <LINE>	Configures the content of the SMS sent to the guest user notifying the pass code (should not exceed 1024 characters) • <LINE> – Specify the message content. When entering the message, use the following tags: GM-NAME – for the guest user's name GM_PASSCODE – for the pass code For example: Dear GM_NAME, your internet access pass code is GM_PASSCODE.

Examples

```
nx9500-6C8809(config-guest-management-test)#sms host clickatell username guest1
password guest1@123 api-id test user-agent pyclickatell

nx9500-6C8809(config-guest-management-test)#sms message Dear guest1, Your passcode for
internet access is GM-guest1

no (guest-management-policy-config-commands) on page 379	Removes the SMS settings used to send SMS to the guest user

sms-over-smtp

Configures an e-mail host server (for example: smtp.gmail.com) along with sender related credentials and the recipient gateway e-mail address to which the message is E-mailed. The gateway server converts the e-mail into SMS and sends the message to the guest user's mobile device.

When sending an e-mail, the e-mail client interacts with a SMTP server to handle the content transmission. The SMTP server on the host may have conversations with other SMTP servers to deliver the e-mail.

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
sms-over-smtp [host|message|subject]

sms-over-smtp host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
security [none|ssl|starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-
ADDRESS>

sms-over-smtp message <LINE>

sms-over-smtp subject <LINE>
```

Parameters

```
sms-over-smtp host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS> security
[none|ssl|starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>
```

sms-over-smtp	Configures guest user SMS over SMTP notification settings
host [<IP/HOSTNAME>| <HOST-ALIAS-NAME>]	Configures the SMS gateway server resource's IPv4 address or hostname used for guest management SMS over SMTP traffic, guest user credential validation and pass code reception. Optionally you can use an existing host alias to identify the SMS gateway server resource. • <IP/HOSTNAME> – Specify the SMTP gateway server resource's IP address or hostname. • <HOST-ALIAS-NAME> – Specify the host alias name (should existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.
sender <EMAIL-ADDRESS>	Configures the sender's e-mail address. The sender here is the guest user receiving the pass code. Guest users require this pass code for registering their guest e-mail credentials using SMTP. • <EMAIL-ADDRESS> – Specify the e-mail address (should not exceed 64 characters).
security [none|ssl|starttls]	Configures the encryption protocol used by the SMTP server when communicating the pass code • none – No encryption used. Use if no additional user authentication is needed beyond the required username and password combination. • SSL – Uses SSL encryption. This is the default setting. • STARTTLS – Uses STARTTLS encryption
username <USER-NAME>	Configures a username unique to this SMTP guest management configuration. After configuring the username, specify the associated password. Ensure that the correct password is provided to receive the pass code required for registering guest user credentials with SMTP. • <USER-NAME> – Specify the username (should not exceed 64 characters).
password <PASSWORD>	Configures the password associated with the specified SMTP user name • <PASSWORD> – Specify the password (should not exceed 64 characters).
recipient <EMAIL-ADDRESS>	Configures the e-mail recipient's e-mail address • <EMAIL-ADDRESS> – Specify the recipient's e-mail address (should not exceed 64 characters in length.

```
sms-over-smtp message <LINE>
```

sms-over-smtp	Configures guest user SMS over SMTP notification message content
message <LINE>	Configures the content of the SMS over SMTP sent to the guest user notifying the pass code (should not exceed 1024 characters) • <LINE> – Specify the message content. When entering the message, use the following tags: GM-NAME – for the guest user's name GM_PASSCODE – for the pass code CR-NL – to enter a new line For example: Dear GM_NAME, CR-NL your internet access pass code is GM_PASSCODE. CR-NL Use this access code for internet access.

```
sms-over-smtp subject <LINE>
```

sms-over-smtp	Configures guest user e-mail notification subject line content
subject <LINE>	Configures the subject line of the SMS over SMTP sent to the guest user notifying the pass code (should not exceed 100 characters) • <LINE> – Specify the subject line content. When entering the subject line, use the following tag: GM-NAME – for the guest user's name For example: GM_NAME, your internet access code

Examples

```
nx9500-6C8809(config-guest-management-test3)#sms-over-smtp host test sender
bob@extremenetworks.com security ssl username bob password bob@123 recipient
john@extremenetworks.com

```

host

Enters the configuration context of a remote device using its hostname

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
host <DEVICE-NAME>
```

Parameters

```
host <DEVICE-NAME>
```

<DEVICE-NAME>	Specify the device's hostname. All discovered devices are displayed when 'Tab' is pressed to auto complete this command.

Examples

```
NOC-NX9500(config)#host [TAB]
ap7522-8330A4                ap8163-74B45C
default/ap7522-8330A4        default/ap8163-74B45C
default/NOC-NX9500           default/RFS6K-SITE1-VLAN20
NOC-NX9500                   RFS6K-SITE1-VLAN20
RFS6K-SITE2-VLAN192          default/RFS6K-SITE2-VLAN192
```

```
NOC-NX9500(config)#host ap7522-8330A4
NOC-NX9500(config-device-84-24-8D-83-30-A4)#
```

inline-password-encryption

Stores the encryption key in the startup configuration file. By default, the encryption key is not stored in the startup-config file. Use the inline-password-encryption command to move the encrypted key to the startup-config file. This command uses the master key to encrypt the password, then moves it to the startup-config file.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
inline-password-encryption
```

Parameters

```
None
```

Usage Guidelines

When the configuration file is imported to a different device, it first decrypts the encryption key using the default key and then decrypts the rest of the configuration using the administrator configured encryption key.

Examples

The following command uses the specified password for encryption key and stores it outside of startup-config:

```
nx9500-6C8809(config)#password-encryption secret 2 12345678
nx9500-6C8809(config)#commit write memory
```

The following command moves the same password to the startup-config and encrypts it with the master key:

```
nx9500-6C8809(config)#inline-password-encryption
```

Related Commands

no on page 611	Disables storing of the encryption key in the startup configuration file
password-encryption on page 427	Enables password encryption

iot-device-type-imagotag-policy

Creates an IoT Device-Type Imagotag policy and enters its configuration mode. Use this option to enable support for SES-imagotag's ESL *(Electronic Shelf Label)* tags on WiNG APs with USB interfaces.

ESL tags are small, battery-powered devices used by retail businesses to display information, such as product code, pricing, etc. These tags are activated, configured, and managed through an SES-Imagotag provided server. The tags and server communicate through an ESL communicator (a USB dongle), connected to the USB port on the WiNG AP. This communication is over the 2.4 GHz band using a proprietary RF protocol. The ESL communicator acts as a bridge between the tags and the server, using WiNG AP as an infrastructure device.

This policy, when applied on an AP, enables the AP recognize the ESL communicator, and facilitate communication between communicator and tags.

The policy can be applied to the AP's self (in case of stand alone AP), or pushed to the AP through the adopting controller. In the latter case, apply the policy on the AP's profile.

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Note
The policy is applicable only on the AP-8432 model access point, which supports the USB interface.

Syntax

```
iot-device-type-imagotag-policy <POLICY-NAME>
```

Parameters

```
iot-device-type-imagotag-policy <POLICY-NAME>
```

iot-device-type-imagotag-policy <POLICY-NAME>	Specify an IoT Device Type Imagotag policy name. If another policy by the specified name does not exist, the policy is created.

Example

```
nx9500-6C8809(config)#iot-device-type-imagotag-policy ImagoTagPolicy
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#?
Iot Imagotag Policy Mode commands:
  channel       Auto channel selection
  enable        Enable ESL communicator
  fcc-mode      Enable fcc compatibility mode on ESL communicator
  no            Negate a command or set its defaults
  output-power  Maximum output power
  payload-size  Configure payload size
  server        ESL server
  ssl           Enable ssl on ESL communicator
  window-size   Configure window size

  clrscr        Clears the display screen

iot-device-type-imagotag-policy config commands

The following table summarizes IoT Device-Type Imagotag policy configuration mode commands:

Table 19: IoT-Device-Type Imagotag Policy Config Commands

Command	Description
channel (iot-device-type-imagotag-policy) on page 383	Configures the channel assigned for ESL communicator to tag communication in the 2.4 GHz band
enable (iot-device-type-imagotag-policy) on page 384	Enables the ESL communicator
fcc-mode (iot-device-type-imagotag-policy) on page 384	Enables the FCC compatibility mode on the ESL communicator
output-power (iot-device-type-imagotag-policy) on page 385	Configures the maximum output power for the ESL communicator
payload-size (iot-device-type-imagotag-policy) on page 386	Configures the maximum payload size in packets exchanged between ESL communicator and tags
server (iot-device-type-imagotag-policy) on page 387	Configures the ESL SES-Imagotag server's hostname or IP address
ssl (iot-device-type-imagotag-policy) on page 388	Enables SSL *(Secure Socket Layer)* encryption mode of communication between the AP and the SES-imagotag server.
window-size (iot-device-type-imagotag-policy) on page 387	Configures the transmission window size for messages exchanged between ESL communicator and tags.
no (iot-device-type-imagotag-policy) on page 389	Reverts this IoT Device-Type Imagotag policy settings to default values

channel (iot-device-type-imagotag-policy)

Manually configures the channel assigned for the *ESL communicator* to *tag* communication in the 2.4 GHz band. Or, enables ACS *(Auto-Channel Selection)* mode.

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
channel [<0-10>|acs]
```

Parameters

```
channel [<0-10>|acs]
```

channel [<0-10>|acs]	Configures the 2.4 GHz frequency channel, using one of the following options: • <0-10> – Manually configures the channel from 0 - 10. • acs – Enables ACS channel selection mode. This is the default setting.

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
  channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

no (iot-device-type-imagotag-policy) on page 389	Reverts the channel selection mode to ACS

enable (iot-device-type-imagotag-policy)

Enables the ESL communicator

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
enable
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#enable
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
  enable
  channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

no (iot-device-type-imagotag-policy) on page 389	Disables the ESL communicator

fcc-mode (iot-device-type-imagotag-policy)

Enables the FCC *(Federal Communications Commission)* compatibility mode on the ESL communicator. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
fcc-mode
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#fcc-mode
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
  enable
  fcc-mode
  channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

no (iot-device-type-imagotag-policy) on page 389	Disables FCC compatibility mode

output-power (iot-device-type-imagotag-policy)

Configures the maximum output power for the ESL communicator.

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
output-power [Level-A|Level-B|Level-C|Level-D|Level-E|Level-F|Level-G|Level-H]
```

Parameters

```
output-power [Level-A|Level-B|Level-C|Level-D|Level-E|Level-F|Level-G|Level-H]
```

output-power [Level-A|Level-B|Level-C|Level-D|Level-E|Level-F|Level-G|Level-H]	Configure the ESL communicator's output power in dBm. The options are: • Level-A – 1 dBm. This is the default setting. • Level-B - -4 dBm • Level-C - -6 dBm • Level-D - -12 dBm • Level-E - 0 dBm • Level-F - -2 dBm • Level-G - -8 dBm • Level-H - -10 dBm Note: SES-Imagotags recommends NOT to change the default setting, which is in conformance to various country/region specific RF regulations.

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#output-power Level-B
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
  enable
  output-power Level-B
  fcc-enable
  channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

no (iot-device-type-imagotag-policy) on page 389	Reverts the ESL communicator's output-power to default (Level-A)

payload-size (iot-device-type-imagotag-policy)

Configures the maximum size of the payload in packets exchanged between ESL communicator and tags

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
payload-size <1-32>
```

Parameters

```
payload-size <1-32>
```

payload-size <1-32>	Configures the packet's payload size • <1-32> – Specify the value from 1 - 32 bytes. The default setting is 32 bytes. Note: SES-Imagotags recommends NOT to change the default setting.

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#payload-size 25
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
  enable
  output-power Level-B
  payload-size 25
  fcc-enable
  channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

no (iot-device-type-imagotag-policy) on page 389	Reverts the payload size to default (32 bytes)

window-size (iot-device-type-imagotag-policy)

Configures the transmission window size for messages exchanged between ESL communicator and tags

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
window-size <1-14>
```

Parameters

```
window-size <1-14>
```

window-size <1-14>	Configures the window size • <1-14> – Specify a value from 1 - 14 bytes. The default value is 14 bytes. **Note:** SES-Imagotags recommends NOT to change the default setting.

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#window-size 12

nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
  enable
  output-power Level-B
  window-size 12
  payload-size 25
  port 200
  ssl-enable
  fcc-enable
  channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

no (iot-device-type-imagotag-policy) on page 389	Reverts the window-size to 14 bytes.

server (iot-device-type-imagotag-policy)

Configures the ESL SES-Imagotag server's IP address or hostname. As per the current implementation, at the ESL server end, the WiNG AP's IP address was configured to enable the server contact the AP and establish connection with the ESL communicator (USB Dongle). Starting with WiNG 5.9.3, the WiNG AP will send a connection request to the ESL server. For this purpose, the ESL Imagotag server's IP address or hostname has to be configured in the IOT Imagotag policy. Use this command to provide the SES-Imagotag server's IP address or hostname.

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
server [hostname|ip-address]
server [hostname <HOST-NAME>|ip-address [<IP>|<HOST-ALIAS-NAME>]] {port <1-65535>}
```

Parameters

```
server [hostname <HOST-NAME>|ip-address [<IP>|<HOST-ALIAS-NAME>]] {port <1-65535>}
```

server	Configures the ESL server's hostname or IP address
hostname <HOST-NAME>	Use this option to configure the ESL server's hostname. • <HOSTNAME> – Provide the hostname (could be FQDN, partial DN, etc.)
ip-address [<IP>|<HOST-ALIAS-NAME>]	Use this option to configure the ESL server's IP address • <IP> – Provide the IP address • <HOST-ALIAS-NAME> – Provide a host alias name. Note, if using this option, ensure that the host alias is existing and pointing to the ESL server host.
port <1-65535>	Optional. Configures the port on which the ESL server can be reached. • <1-65535> – Specify the port from 1 - 65535.

Examples

```
NOC-NX9500(config-iot-device-type-imagotag-policy-test)#server ip-address
10.234.160.225
NOC-NX9500(config-iot-device-type-imagotag-policy-test)#show context
 iot-device-type-imagotag-policy test
  enable
  output-power Level-B
  window-size 12
  payload-size 25
  ssl
  fcc-mode
  channel 9
  server ip-address 10.234.160.225
NOC-NX9500(config-iot-device-type-imagotag-policy-test)#
```

Related Commands

no (iot-device-type-imagotag-policy) on page 389	Removes the ESL server's hostname or IP address configuration

ssl (iot-device-type-imagotag-policy)

Enables secure, encrypted communication over the SSL *(Secure Socket Layer)* between the AP and SES-imagotag server. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
ssl
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#ssl
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
  enable
  output-power Level-B
  payload-size 25
  port 200
  ssl
  fcc-enable
  channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

no (iot-device-type-imagotag-policy) on page 389	Disables SSL encryption mode of communication

no (iot-device-type-imagotag-policy)

Reverts this IoT Device-Type Imagotag policy settings to default values

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
no [channel|enable|fcc-mode|output-power|payload-size|port|server|ssl|window-size]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Reverts this IoT Device-Type Imagotag policy settings to default value

Examples

The following example shows the Imagotag policy settings before the `no` commands are executed:

```
NOC-NX9500(config-iot-device-type-imagotag-policy-test)#no ?
iot-device-type-imagotag-policy test
  enable
  output-power Level-B
  window-size 12
  payload-size 25
  ssl
  fcc-mode
  channel 9
  server ip-address 10.234.160.225
NOC-NX9500(config-iot-device-type-imagotag-policy-test)#
NOC-NX9500(config-iot-device-type-imagotag-policy-test)#no payload-size
NOC-NX9500(config-iot-device-type-imagotag-policy-test)#no window-size
NOC-NX9500(config-iot-device-type-imagotag-policy-test)#no server
```

The following example shows the Imagotag policy settings after the 'no' commands are executed:

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-test)#show context
 iot-device-type-imagotag-policy test
  enable
  output-power Level-B
  ssl-enable
  fcc-enable
  channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-test)#
```

ip

Creates an *access control list* (ACL) and enters its configuration mode. Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ip [access-list|ex3500-ext-access-list|ex3500-std-access-list|snmp-access-list]
ip ex3500-ext-access-list <EX3500-EXT-ACL-NAME>
ip ex3500-std-access-list <EX3500-STD-ACL-NAME>
ip access-list <IP-ACL-NAME>
ip snmp-access-list <IP-SNMP-ACL-NAME>
```

Parameters

```
ip access-list <IP-ACL-NAME>
```

access-list <IP-ACL-NAME>	Creates an IP ACL and enters its configuration mode • <IP-ACL-NAME> – Specify the ACL name. If the access list does not exist, it is created.

```
ip ex3500-ext-access-list <EX3500-EXT-ACL-NAME>
```

ex3500-ext-access-list <EX3500-EXT-ACL-NAME>	Creates an EX3500 Extended ACL and enters its configuration mode • <EX3500-EXT-ACL-NAME> – Specify the ACL name. If an ACL with the specified name does not exist, it is created.

```
ip ex3500-std-access-list <EX3500-STD-ACL-NAME>
```

ex3500-std-access-list <EX3500-STD-ACL-NAME>	Creates an EX3500 Standard ACL and enters its configuration mode • <EX3500-EXT-ACL-NAME> – Specify the ACL name. If an ACL with the specified name does not exist, it is created.

```
ip snmp-access-list <IP-SNMP-ACL-NAME>
```

snmp-access-list <IP-SNMP-ACL-NAME>	Creates a SNMP IP ACL and enters its configuration mode. An SNMP IP ACL is an access control mechanism that uses a combination of IP ACL and SNMP community string. SNMP performs network management functions using a data structure called a MIB. SNMP is widely implemented but not very secure, since it uses only text community strings for accessing controller or service platform configuration files. Use SNMP ACLs (firewalls) to help reduce SNMP's vulnerabilities, as SNMP traffic can be easily exploited to produce a DoS. • <IP-SNMP-ACL-NAME> – Specify the SNMP IP ACL name. If the access list does not exist, it is created. After creating the SNMP ACL, define the deny/permit rules based on the network and/or host IP addresses. Once created and configured, link this SNMP IP ACL with a SNMP community string. To link the SNMP community string with the SNMP IP ACL, in the management-policy-config-mode, use the following command: `snmp-server > community <COMMUNITY-STRING> > [ro|rw] > ip-snmp-access-list <IP-SNMP-ACL-NAME>`.

Examples

```
nx9500-6C8809(config)#ip access-list test
nx9500-6C8809(config-ip-acl-test)#?
ACL Configuration commands:
  deny     Specify packets to reject
  disable  Disable rule if not needed
  no       Negate a command or set its defaults
  permit   Specify packets to forward

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-ip-acl-test)#
```

```
nx9500-6C8809(config)#ip snmp-access-list SNMPAcl
nx9500-6C8809(config-ip-snmp-acl-SNMPAcl)#?
SNMP ACL Configuration commands:
  deny     Specify packets to reject
  no       Negate a command or set its defaults
  permit   Specify packets to forward

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-ip-snmp-acl-SNMPAcl)#
```

Related Commands

no on page 611	Removes an existing IP access control list

Note
For more information on Access Control Lists, see Access-List Policy on page 1353.

ipv6

Creates an IPv6 ACL and enters its configuration mode. An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ipv6 access-list <IPv6-ACL-NAME>
```

Parameters

```
ipv6 access-list <IPv6-ACL-NAME>
```

access-list <IPv6-ACL-NAME>	Configures an IPv6 access list and enters its configuration mode • <IPv6-ACL-NAME> – Specify the IPv6 ACL name. If the access list does not exist, it is created.

Examples

```
rfs4000-229D58(config)#ipv6 access-list IPv6ACLTest
rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#?
IPv6 Access Control Mode commands:
  deny     Specify packets to reject
  no       Negate a command or set its defaults
  permit   Specify packets to forward

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#
```

Related Commands

no on page 611	Removes an IPv6 access control list

Note
For more information on access control lists, see Access-List Policy on page 1353.

ipv6-router-advertisement-policy

Creates an IPv6 RA policy and enters its configuration mode. An IPv6 router policy allows routers to advertise their presence in response to solicitation messages. After receiving a neighbor solicitation message, the destination node sends an advertisement message. which includes the link layer address of the source node. After receiving the advertisement, the destination device replies with a neighbor advertisement message on the local link. After the source receives the advertisement it can communicate with other devices.

Advertisement messages are also sent to indicate a change in link layer address for a node on the local link. With such a change, the multicast address becomes the destination address for advertisement messages.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ipv6-router-advertisement-policy <POLICY-NAME>
```

Parameters

```
ipv6-router-advertisement-policy <POLICY-NAME>
```

<POLICY-NAME>	Specify an IPv6 RA policy name. If a policy with the specified name does not exist, it is created.

Examples

```
rfs4000-229D58NOC-NX9500(config)#ipv6-router-advertisement-policy test
rfs4000-229D58NOC-NX9500(config-ipv6-radv-policy-test)#?
IPv6 Router Advertisement Policy Mode commands:
  advertise                       Option to advertise in router advertisement
  assist-neighbor-discovery       Send the Source Link Layer address option
                                  in Router Advertisement to assist in
                                  neighbor discovery
  check-ra-consistency            Check if the parameters advertised by other
                                  routers on the link are in conflict with
                                  those configured on this router. Conflicts
                                  are logged.
  dns-server                      DNS Server
  domain-name                     Configure domain-name
  managed-config-flag             Set the managed-address-configuration flag
                                  in Router Advertisements. When set, it
                                  indicates that the addresses are available
                                  via DHCPv6
```

```
  nd-reachable-time                 Time that a node assumes a neighbor is
                                    reachable after having received a
                                    reachability confirmation
  no                                Negate a command or set its defaults
  ns-interval                       Time between retransmitted Neighbor
                                    Solicitation messages
  other-config-flag                 Set the other-configuration flag in Router
                                    Advertisememts. When set, it indicates that
                                    other configuration information is
                                    available via DHCPv6.
  ra                                Router Advertisements
  router-lifetime                   Lifetime associated with the default router
  router-preference                 Preference of this router over other
                                    routers
  unicast-solicited-advertisement   Unicast the solicited Router Advertisements

  clrscr                            Clears the display screen
  commit                            Commit all changes made in this session
  do                                Run commands from Exec mode
  end                               End current mode and change to EXEC mode
  exit                              End current mode and down to previous mode
  help                              Description of the interactive help system
  revert                            Revert changes
  service                           Service Commands
  show                              Show running system information
  write                             Write running configuration to memory or
                                    terminal
rfs4000-229D58(config-ipv6-radv-policy-test)#
```

Related Commands

no on page 611	Removes the specified IPv6 RA policy

ipv6-router-advertisement-policy config commands

The following table summarizes the IPv6 *router advertisement* (RA) policy configuration mode commands:

Table 20: IPv6 Router Advertisement Policy Config Commands

Command	Description
advertise on page 395	Enables advertisement of IPv6 MTU *(maximum transmission unit)* and hop-count value in RAs
assist-neighbor-discovery on page 395	Enables advertisement of the source link layer address in RAs
check-ra-consistency on page 396	Enables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link
dns-server on page 396	Configures the DNS server's IPv6 address and lifetime advertised in RAs
domain-name on page 397	Configures the Domain name search label advertised in RAs
managed-config-flag on page 398	Sets the managed address configuration flag in RAs
nd-reachable-time on page 399	Enables advertisement of neighbor reachable time in RAs
ns-interval on page 400	Configures the interval between two successive retransmitted NS *(neighbor solicitation)* messages

Table 20: IPv6 Router Advertisement Policy Config Commands (continued)

Command	Description
other-config-flag on page 400	Sets the other-configuration flag in RAs
ra on page 401	Configures RA related parameters, such as the interval between two unsolicited successive RAs
router-lifetime on page 402	Configures the default router's lifetime, in seconds, advertised in RAs
router-preference on page 402	Configures the router preference field value advertised in RAs
unicast-solicited-advertisement on page 403	Enables unicasting of solicited RAs
no (ipv6-ra-policy-config-commands) on page 404	Removes or reverts router advertisement policy settings

advertise

Enables advertisement of IPv6 MTU and hop-count value in RAs

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
advertise [hop-limit|mtu]
```

Parameters

```
advertise [hop-limit|mtu]
```

advertise [hop-limit|mtu]	Enables advertisement of IPv6 MTU and hop-count value in RAs. Both these features are disabled by default.

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#advertise hop-limit
nx9500-6C8809(config-ipv6-radv-policy-test)#advertise mtu
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Disables advertisement of IPv6 MTU and hop-count value in RAs

assist-neighbor-discovery

Enables advertisement of the source link layer address in RAs to facilitate neighbor discovery. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
assist-neighbor-discovery
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#assist-neighbor-discovery
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Disables the advertisement of the source link layer address in RAs

check-ra-consistency

Enables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link. If the values advertised are inconsistent, a conflict is logged.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
check-ra-consistency
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#check-ra-consistency
```

```
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
 check-ra-consistency
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Disables comparison of interface-specific parameters advertised by other routers, within the link, with those advertised with this router

dns-server

Configures the DNS server's IPv6 address and lifetime. The configured values are advertised in RAs.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}
```

Parameters

```
dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}
```

dns-server <IPv6>	Configures the DNS server's IPv6 address Enables the use of a DNS server to resolve host names to IPv6 addresses. When an IPv6 host is configured with the address of a DNS server, the host sends DNS name queries to the server for resolution. • <IPv6> – Specify the DNS server's address. This address is advertised in RAs. A maximum of four (4) entries can be made per policy.
lifetime [<4-3600>|expired|infinite]	Optional. Configures the DNS server's (identified by the <IPv6> parameter) lifetime • <4-3600> – Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds. • expired – Advertises that this DNS server's lifetime has expired and should not be used • infinite – Advertises that this DNS server's lifetime is infinite

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#dns-server 2002::2 lifetime 3000
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Removes the DNS server settings advertised in RAs. Once removed these values are not advertised in RAs.

domain-name

Configures the Domain name search label advertised in RAs

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}
```

Parameters

```
domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}
```

domain-name <WORD>	Configures the Domain name search label advertised in RAs Enter a FQDN *(fully qualified domain name)*, which is an unambiguous domain name available in a router advertisement resource. To distinguish an FQDN from a regular domain name, a trailing period is added. For example, somehost.example.com. • <WORD> – Specify the Domain name search label. A maximum of four (4) entries can be made per policy.
lifetime [<4-3600>| expired|infinite]	Optional. Configures the Domain name search label's lifetime • <4-3600> – Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds. • expired – Advertises that this Domain name search label's lifetime has expired and should not be used • infinite – Advertises that this Domain name search label's lifetime is infinite

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Removes the Domain name settings advertised in RAs. Once removed these values are not advertised in RAs.

managed-config-flag

Sets the managed address configuration flag in RAs. When set, it indicates that IPv6 addresses are available through DHCPv6. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
managed-config-flag
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#managed-config-flag
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 managed-config-flag
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
```

```
 domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Removes the managed address configuration flag advertised in RAs

nd-reachable-time

Enables advertisement of *neighbor discovery* (ND) reachable time in RAs. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
nd-reachable-time [<5000-3600000>|global]
```

Parameters

```
nd-reachable-time [<5000-3600000>|global]
```

nd-reachable-time [<5000-3600000>| global]	Configures the interval, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation from the neighbor. Therefore, a neighbor is reachable, after being discovered, for a period specified here. This value is advertised in RAs. Use one of the following options: • <5000-3600000> – Configures an interface-specific value. Specify a value from 5000 - 3600000 milliseconds. The default is 5000 milliseconds. • global – Advertises the neighbor reachable time configured for the system. This is the value configured at the device configuration mode. For more information, see use (profile/device-config-mode-commands) on page 1247 (profile config mode).

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#nd-reachable-time 6000
nx9500-6C8809(config-ipv6-radv-policy-test)#show context

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Disables advertisement of neighbor reachable time in RAs

ns-interval

Configures the NS *(neighbor solicitation)* retransmit timer value advertised in RAs. This is the interval between two successive NS messages. When specified, it enables the sending of the specified value in RAs. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ns-interval [<1000-3600000>|global]
```

Parameters

```
ns-interval [<1000-3600000>|global]
```

ns-interval [<1000-3600000>| global]	Configures the NS interval advertised in RAs. Use one of the following options: • <1000-3600000> – Specify a value from 1000 - 3600000 milliseconds. The default is 1000 milliseconds. • global – Advertises the NS interval configured for the system. This is configured on the device in the device configuration mode. For more information, see ipv6 on page 1175 (profile config mode).

Examples

```
nx9500-6C8809nx9500-6C8809(config-ipv6-radv-policy-test)#ns-interval 3000
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 managed-config-flag
 nd-reachable-time global
 ns-interval 3000
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Disables advertisement of NS interval in RAs

other-config-flag

Sets the other-configuration flag in RAs. When set, it indicates that other configuration details, such as DNS-related information, are available through DHCPv6. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
other-config-flag
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#other-config-flag
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Removes the other-config-flag advertised on RAs

ra

Configures RA related parameters, such as the interval between two unsolicited successive RAs. It also allows suppression of RAs.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ra [interval <3-1800>|suppress]
```

Parameters

```
ra [interval <3-1800>|suppress]
```

interval <3-1800>	Configures the interval, in seconds, between two unsolicited successive RAs • <3-1800> – Specify a value from 3 - 1800 seconds. The default is 300 seconds. Note: The router-lifetime should be at least three times the specified router interval.
suppress	Enables the suppression of RAs. When enabled, the transmission of RAs in IPv6 packets is suppressed. This option is disabled by default. The `no > ra > suppress` command enables the sending of RAs.

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#ra interval 200
nx9500-6C8809(config-ipv6-radv-policy-test)#ra suppress
nx9500-6C8809(config-ipv6-radv-policy-test)#show context

nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Removes the RA interval, and enables the sending of RAs

router-lifetime

Configures the default router's lifetime, in seconds, advertised in RAs

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
router-lifetime <0-9000>
```

Parameters

```
router-lifetime <0-9000>
```

router-lifetime <0-9000>	Configures the default router's lifetime • <0-9000> – Specify a value from 0 - 9000 seconds. The default value is 1500 seconds. **Note:** A value of "0" indicates that this router is not the default router.

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#router-lifetime 2000
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 ra suppress

 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Removes the default router's lifetime

router-preference

Configures the router preference field value advertised in RAs. The options are high, medium, and low. This value is used to prioritize and select the default router when multiple routers are discovered.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
router-preference [high|medium|low]
```

Parameters

```
router-preference [high|medium|low]
```

router-preference [high|medium|low]	Sets this router's preference over other routers, in the link, to be the default router. The options are **high**, **low**, and **medium**. The default value is medium. The following points should be taken into consideration when configuring router preference: • For a router to be selected as a default router, the router's lifetime should not be equal to "0". • To enable default router selection, using router information contained in RAs, configure default router selection on that interface.

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#router-preference high
nx9500-6C8809-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 ra suppress
 ra interval 200
 managed-config-flag
 nd-reachable-time global
 router-lifetime 2000
 advertise mtu
 advertise hop-limit
 router-preference high
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

Related Commands

no (ipv6-ra-policy-config-commands) on page 404	Removes the router preference field value advertised in RAs

unicast-solicited-advertisement

Enables unicasting of solicited RAs. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
unicast-solicited-advertisement
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#unicast-solicited-advertisement
nx9500-6C8809(config-ipv6-radv-policy-test)#show context

nx9500-6C8809(config-ipv6-radv-policy-test)#
```

l2tpv3

Configures a L2TPv3 tunnel policy, used to create one or more L2TPV3 tunnels.

The L2TPv3 policy defines the control and encapsulation protocols needed for tunneling layer 2 frames between two IP nodes. This policy enables creation of L2TPv3 tunnels for transporting Ethernet frames between bridge VLANs and physical GE ports. L2TPv3 tunnels can be created between any vendor devices supporting L2TPv3 protocol.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
l2tpv3 policy <L2TPV3-POLICY-NAME>
```

Parameters

```
l2tpv3 policy <L2TPV3-POLICY-NAME>
```

l2tpv3 policy <L2TPV3-POLICY-NAME>	Configures an L2TPV3 tunnel policy • <L2TPV3-POLICY-NAME> – Specify a policy name. If a policy with the specified does not already exist, it is created. To modify an existing L2TPV3, specify its name.

Examples

```
nx9500-6C8809(config)#l2tpv3 policy L2TPV3Policy1
nx9500-6C8809(config-l2tpv3-policy-L2TPV3Policy1)#?
L2tpv3 Policy Mode commands:
  cookie-size             Size of the cookie field present in each l2tpv3 data
                          message
  failover-delay          Time interval for re-establishing the tunnel after
                          the failover (RF-Domain
                          manager/VRRP-master/Cluster-master failover)
  force-l2-path-recovery  Enables force learning of servers, gateways etc.,
                          behind the l2tpv3 tunnel when the tunnel is
                          established
  hello-interval          Configure the time interval (in seconds) between
                          l2tpv3 Hello keep-alive messages exchanged in l2tpv3
                          control connection
  no                      Negate a command or set its defaults
  reconnect-attempts      Maximum number of attempts to reestablish the
                          tunnel.
  reconnect-interval      Time interval between the successive attempts to
                          reestablish the l2tpv3 tunnel
  retry-attempts          Configure the maximum number of retransmissions for
                          signaling message
  retry-interval          Time interval (in seconds) before the initiating a
                          retransmission of any l2tpv3 signaling message
  rx-window-size          Number of signaling messages that can be received
                          without sending the acknowledgement
  tx-window-size          Number of signaling messages that can be sent
                          without receiving the acknowledgement

  clrscr                  Clears the display screen
  commit                  Commit all changes made in this session
  do                      Run commands from Exec mode
  end                     End current mode and change to EXEC mode
  exit                    End current mode and down to previous mode
  help                    Description of the interactive help system
  revert                  Revert changes
```

```
  service                 Service Commands
  show                    Show running system information
  write                   Write running configuration to memory or terminal

nx9500-6C8809(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

no on page 611	Removes an existing L2TPV3 tunnel policy
mint-policy on page 414	Configures the global MiNT policy

Note
For more information on the L2TPV3 tunnel configuration mode and commands, see l2tpv3 on page 404.

location-policy

Creates a Location policy and enters its configuration mode. Use this command to configure a policy that provides the ExtremeLocation server hostname, and the ExtremeLocation Tenant's API key needed to authenticate and authorize with the server. Apply this Location policy on the WiNG devices (site controller, virtual controllers, and standalone APs). When applied, these devices push/export site hierarchy to the ExtremeLocation server. The site hierarchy includes site details along with details of APs deployed within the site.

Note
Once created and configured, apply this Location policy on the WiNG controller's self, to enable Tenant site hierarchy reporting by the controller to the ExtremeLocation server.

Supported in the following platforms:

- Access Points — AP510, AP505
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
location-policy <LOCATION-POLICY-NAME>
```

Parameters

```
location-policy <LOCATION-POLICY-NAME>
```

location-policy <LOCATION-POLICY-NAME>	Specify the Location Policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#eloc-policy testLocPolicy
nx9500-6C8809(config-eloc-policy-testLocPolicy)#?
Eloc Policy Mode commands:
  enable        Enable this eloc policy
  location-key  API key used for location service
  no            Negate a command or set its defaults
```

```
  server-host   ExtremeLocation server configuration

  clrscr        Clears the display screen
  commit        Commit all changes made in this session
  end           End current mode and change to EXEC mode
  exit          End current mode and down to previous mode
  help          Description of the interactive help system
  revert        Revert changes
  service       Service Commands
  show          Show running system information
  write         Write running configuration to memory or terminal

nx9500-6C8809(config-eloc-policy-testLocPolicy)#
```

Related Commands

no on page 611	Removes an existing Location policy from the system

location-policy-config-mode commands

The following table summarizes the Location Policy configuration commands:

Table 21: Location Policy Config Mode Commands

Command	Description
enable on page 407	Enables the location policy
location-key on page 408	Configures the ExtremeLocation Tenant's API key. This key is used by the WiNG controller to authenticate with the ExtremeLocation server.
server-host on page 408	Configures the ExtremeLocation server's hostname
no (location-policy-config-commands) on page 409	Removes Location policy settings or reverts them to default values

enable

Enables this Location policy

Supported in the following platforms:

- Access Points —AP-7522, AP 7532, AP 7562, AP 7602, AP-7612, AP 7622, AP-8432, AP-8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 95XX, VX 9000

Syntax

```
enable
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-location-policy-ELocPolicy)#enable
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
 enable
nx9500-6C8809(config-location-policy-ELocPolicy)#
```

Related Commands

no (location-policy-config-commands) on page 409	Disables this Location policy

location-key

Configures the ExtremeLocation Tenant's API key. The WiNG controller uses this key to authenticate with the ExtremeLocation server, and stage the Tenant's site hierarchy (includes site details and details of AP deployed within the site).

Supported in the following platforms:

- Access Points —AP-7522, AP 7532, AP 7562, AP 7602, AP-7612, AP 7622, AP-8432, AP-8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 95XX, VX 9000

Syntax

```
location-key <API-KEY>
```

Parameters

```
location-key <API-KEY>
```

location-key <API-KEY>	Enter the 64-bit key that the WiNG controller uses to authenticate with the ExtremeLocation server. • <API-KEY> – Enter the key. Note: To generate API-Key, log into your ExtremeLocation Tenant account and use the ExtremeLocation UI. Enter that key here in the Location Policy.

Examples

```
nx9500-6C8809(config-location-policy-ELocPolicy)#location-key dGVzdEAxMjM0NQo
vnx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
 enable
 location-key dGVzdEAxMjM0NQo
nx9500-6C8809(config-location-policy-ELocPolicy)#
```

Related Commands

no (location-policy-config-commands) on page 409	Removes the Tenant's API-Key from the Location policy

server-host

Configures the ExtremeLocation server's hostname. When configured, the WiNG controller stages the Tenant's site hierarchy information to the specified server.

Supported in the following platforms:

- Access Points —AP-7522, AP 7532, AP 7562, AP 7602, AP-7612, AP 7622, AP-8432, AP-8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 95XX, VX 9000

Syntax

```
server-host 1 ip <HOSTNAME> {port <1-65535>}
```

Parameters

```
server-host 1 ip <HOSTNAME> {port <1-65535>}
```

server-host 1 ip <HOSTNAME>	Identifies the ExtremeLocation server by its hostname • <HOSTNAME> – Enter ExtremeLocation server's hostname. **Note:** Enter the server's hostname and not the IP address, as the IP address is likely to change periodically in order to balance load across multiple Location server instances.
{port <1-65535>}	optional. Configures the port on which the ExtremeLocation server is reachable • <1-63335> – Selects a port from 1 - 65535 for the ExtremeLocation server. **Note:** By default the ExtremeLocation server is reachable on port 443.

Examples

```
nx9500-6C8809(config-location-policy-ELocPolicy)#server-host 1 ip xyz.com
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
 enable
 server-host 1 ip xyz.com port 443
 location-key dGVzdEAxMjM0NQo
nx9500-6C8809(config-location-policy-ELocPolicy)#
```

Related Commands

no (location-policy-config-commands) on page 409	Removes ExtremeLocation server's hostname from the policy

no (location-policy-config-commands)

Removes this Location Policy settings or reverts them to default values

Supported in the following platforms:

- Access Points —AP-7522, AP 7532, AP 7562, AP 7602, AP-7612, AP 7622, AP-8432, AP-8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 95XX, VX 9000

Syntax

```
no [enable|location-key|server-host]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes this Location Policy settings or reverts to default values, based on the paremeters passed

Examples

The following example shows the 'ELocPolicy' policy settings before the 'no' commands were executed:

```
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
 enable
 server-host 1 ip xyz.com port 443
 location-key dGVzdEAxMjM0NQo
nx9500-6C8809(config-location-policy-ELocPolicy)#
nx9500-6C8809(config-location-policy-ELocPolicy)#no server-host 1
nx9500-6C8809(config-location-policy-ELocPolicy)#no enable
nx9500-6C8809(config-location-policy-ELocPolicy)#no location-key
```

The following example shows the 'ELocPolicy' policy settings after the 'no' commands were executed:

```
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
nx9500-6C8809(config-location-policy-ELocPolicy)#
```

mac

Configures a MAC ACL. Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
mac access-list <MAC-ACL-NAME>
```

Parameters

```
mac access-list <MAC-ACL-NAME>
```

access-list <MAC-ACL-NAME>	Configures a MAC access control list • <MAC-ACL-NAME> – Specify the ACL name. If a MAC ACL with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#mac access-list test
nx9500-6C8809(config-mac-acl-test)#?
MAC Extended ACL Configuration commands:
  deny     Specify packets to reject
  disable  Disable rule if not needed
  ex3500   Ex3500 device
  insert   Insert this rule (instead of overwriting a existing rule)
  no       Negate a command or set its defaults
  permit   Specify packets to forward

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
```

```
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-mac-acl-test)#
```

Related Commands

no on page 611	Removes an existing MAC access control list

Note
For more information on Access Control Lists, seeAccess-List Policy on page 1353 .

management-policy

Configures a management policy. Management policies include services that run on a device, welcome messages, banners, etc.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
management-policy <MANAGEMENT-POLICY-NAME>
```

Parameters

```
management-policy <MANAGEMENT-POLICY-NAME>
```

<MANAGEMENT-POLICY-NAME>	Specify the management policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#management-policy test
nx9500-6C8809(config-management-policy-test)#?
Management Mode commands:
  aaa-login                Set authentication for logins
  allowed-locations        Add allowed locations
  banner                   Define a login banner
  ftp                      Enable FTP server
  http                     Hyper Text Terminal Protocol (HTTP)
  https                    Secure HTTP
  idle-session-timeout     Configure idle timeout for a configuration session
                           (GUI or CLI)
  ipv6                     IPv6 management access restriction
  no                       Negate a command or set its defaults
  passwd-retry             Lockout user if too many consecutive login failures
  privilege-mode-password  Set the password for entering CLI privilege mode
  rest-server              Enable rest server for device on-boarding
                           functionality
  restrict-access          Restrict management access to the device
  snmp-server              SNMP
```

```
  ssh                       Enable ssh
  t5                        T5 configuration
  telnet                    Enable telnet
  user                      Add a user account

  clrscr                    Clears the display screen
  commit                    Commit all changes made in this session
  do                        Run commands from Exec mode
  end                       End current mode and change to EXEC mode
  exit                      End current mode and down to previous mode
  help                      Description of the interactive help system
  revert                    Revert changes
  service                   Service Commands
  show                      Show running system information
  write                     Write running configuration to memory or terminal

nx9500-6C8809(config-management-policy-test)#
```

Related Commands

no on page 611	Removes an existing management policy

Note
For more information on Management policy configuration, see Management Policy on page 1518.

meshpoint

Creates a new meshpoint and enters its configuration mode. Use this command to select and configure existing meshpoints.

Note
The WiNG 7.1.X release does not support Meshpoint configuration on AP5XX model access points. This feature will be supported in future releases.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
meshpoint [<MESHPOINT-NAME>|containing <WORD>]
```

Parameters

```
meshpoint [<MESHPOINT-NAME>|containing <WORD>]
```

<MESHPOINT-NAME>	Specify the meshpoint name. If the meshpoint does not exist, it is created.
containing <WORD>	Selects existing meshpoints containing the sub-string <WORD> in their names

Examples

```
nx9500-6C8809(config)#meshpoint testMeshpoint
nx9500-6C8809(config-meshpoint-testMeshpoint)#?
```

```
Mesh Point Mode commands:
  allowed-vlans  Set the allowed VLANs
  beacon-format  The beacon format of this meshpoint
  control-vlan   VLAN for meshpoint control traffic
  data-rates     Specify the 802.11 rates to be supported on this meshpoint
  description    Configure a description of the usage of this meshpoint
  force          Force suboptimal paths
  meshid         Configure the Service Set Identifier for this meshpoint
  neighbor       Configure neighbor specific parameters
  no             Negate a command or set its defaults
  root           Set this meshpoint as root
  security-mode  The security mode of this meshpoint
  shutdown       Shutdown this meshpoint
  use            Set setting to use
  wpa2           Modify ccmp wpa2 related parameters

  clrscr         Clears the display screen
  commit         Commit all changes made in this session
  do             Run commands from Exec mode
  end            End current mode and change to EXEC mode
  exit           End current mode and down to previous mode
  help           Description of the interactive help system
  revert         Revert changes
  service        Service Commands
  show           Show running system information
  write          Write running configuration to memory or terminal

nx9500-6C8809(config-meshpoint-testMeshpoint)#
```

Related Commands

no on page 611	Removes an existing meshpoint

Note
For more information on Meshpoint configuration, see Meshpoint Policy on page 1773.

meshpoint-qos-policy

Configures a set of parameters that defines the meshpoint QoS policy.

Note
The WiNG 7.1.X release does not support Meshpoint configuration on AP5XX model access points. This feature will be supported in future releases.

Configured on WiNG 7.1.X controller and pushed to the following WiNG 5.9.X APs:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8543, AP8533

Syntax

```
meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>
```

Parameters

```
meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>
```

<MESHPOINT-QOS-POLICY-NAME>	Specify the meshpoint QoS policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#meshpoint-qos-policy test
nx9500-6C8809(config-meshpoint-qos-test)#?
Mesh Point QoS Mode commands:
  accelerated-multicast  Configure accelerated multicast streams address and
                         forwarding QoS classification
  no                     Negate a command or set its defaults
  rate-limit             Configure traffic rate-limiting parameters on a
                         per-meshpoint/per-neighbor basis

  clrscr                 Clears the display screen
  commit                 Commit all changes made in this session
  do                     Run commands from Exec mode
  end                    End current mode and change to EXEC mode
  exit                   End current mode and down to previous mode
  help                   Description of the interactive help system
  revert                 Revert changes
  service                Service Commands
  show                   Show running system information
  write                  Write running configuration to memory or terminal

nx9500-6C8809(config-meshpoint-qos-test)#
```

Related Commands

no on page 611	Removes an existing meshpoint QoS policy

Note
For more information on Meshpoint QoS policy configuration, see Meshpoint Policy on page 1773.

mint-policy

Configures the global MiNT policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
mint-policy global-default
```

Parameters

```
mint-policy global-default
```

global-default	Configures the global default MiNT policy

Examples

```
nx9500-6C8809(config)#mint-policy global-default
nx9500-6C8809(config-mint-policy-global-default)#?
Mint Policy Mode commands:
  level    Mint routing level
  lsp      LSP
  mtu      Configure the global Mint MTU
  no       Negate a command or set its defaults
  router   Mint router
  udp      Configure mint UDP/IP encapsulation

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-mint-policy-global-default)#
```

Note
For more information on MiNT policy configuration, see MiNT Policy on page 1512.

nac-list

Configures a *Network Access Control* (NAC) list that manages access to the network. A NAC list configures a list of devices that can access a network based on their MAC addresses.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
nac-list <NAC-LIST-NAME>
```

Parameters

```
nac-list <NAC-LIST-NAME>
```

<NAC-LIST-NAME>	Specify the NAC list name. If a NAC list with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#nac-list test
nx9500-6C8809(config-nac-list-test)#?
NAC List Mode commands:
  exclude  Specify MAC addresses to be excluded from the NAC enforcement list
  include  Specify MAC addresses to be included in the NAC enforcement list
  no       Negate a command or set its defaults
```

```
  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-nac-list-test)#
```

Related Commands

no on page 611	Removes an existing NAC list

nac-list-mode-commands

The following table summarizes NAC list configuration mode commands:

Table 22: NAC-List Config Mode Commands

Command	Description
exclude on page 416	Specifies the MAC addresses excluded from the NAC enforcement list
include on page 417	Specifies the MAC addresses included in the NAC enforcement list
no (nac-list-config-commands) on page 418	Cancels an exclude or include NAC list rule

exclude

Specifies the MAC addresses excluded from the NAC enforcement list

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

Parameters

```
exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

<START-MAC>	Specifies a range of MAC addresses or a single MAC address to exclude from the NAC enforcement list • <START-MAC> – Specify the first MAC address in the range. Note: Use this parameter to specify a single MAC address.
<END-MAC>	Specifies the last MAC address in the range (optional if a single MAC is added to the list) • <END-MAC> – Specify the last MAC address in the range.
precedence <1-1000>	Sets the rule precedence. Exclude entries are checked in the order of their rule precedence. • <1-1000> – Specify a value from 1 - 1000.

Examples

```
nx9500-6C8809(config-nac-list-test)#exclude 00-40-96-B0-BA-2A precedence 1
nx9500-6C8809(config-nac-list-test)#show context
nac-list test
 exclude 00-40-96-B0-BA-2A 00-40-96-B0-BA-2A precedence 1
nx9500-6C8809(config-nac-list-test)#
```

Related Commands

no (nac-list-config-commands) on page 418	Removes an exclude rule from this NAC list

include

Specifies the MAC addresses included in the NAC enforcement list

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

Parameters

```
include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

<START-MAC>	Specifies a range of MAC addresses or a single MAC address to include in the NAC enforcement list • <START-MAC> – Specify the first MAC address in the range. Note: Use this parameter to specify a single MAC address.
<END-MAC>	Specifies the last MAC address in the range (optional if a single MAC is added to the list) • <END-MAC> – Specify the last MAC address in the range.
precedence <1-1000>	Sets the rule precedence. Include entries are checked in the order of their rule precedence. • <1-1000> – Specify a value from 1 - 1000.

Examples

```
nx9500-6C8809(config-nac-list-test)#include 00-15-70-38-06-49 precedence 2
nx9500-6C8809(config-nac-list-test)#show context
nac-list test
 exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
 include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
nx9500-6C8809(config-nac-list-test)#
```

Related Commands

no (nac-list-config-commands) on page 418	Removes an include rule from this NAC list

no (nac-list-config-commands)

Cancels an exclude or include NAC list rule

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [exclude|include]
no [exclude|include] <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes or reverts this NAC list's settings based on the parameters passed

Examples

The following example shows the NAC list 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-nac-list-test)#show context
nac-list test
 exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
 include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
nx9500-6C8809(config-nac-list-test)#
nx9500-6C8809(config-nac-list-test)#no exclude 00-40-96-B0-BA-2A precedence 1
```

The following example shows the NAC list 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-nac-list-test)#show context
nac-list test
 include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
nx9500-6C8809(config-nac-list-test)#
```

nsight-policy (global-config-mode)

Creates an NSight policy and enters its configuration mode. Starting with WiNG 5.9.4, Extreme NSight is a separate target, with the Extreme NSight server enabled on an external VM appliance. On the WiNG controller, the NSight policy configures this external NSight server's IP address or hostname.

Configure the NSight policy and apply to the RF Domain context. When applied, the RF Domain manager posts statistics (polled from devices within the RF Domain) to the external Extreme NSight server specified in the policy.

Note
Extreme NSight is a licensed feature. For more information on Extreme NSight™, please refer to the Extreme NSight™ User Guide, available at https://extremenetworks.com/documentation.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
nsight-policy <NSIGHT-POLICY-NAME>
```

Parameters

```
nsight-policy <NSIGHT-POLICY-NAME>
```

<NSIGHT-POLICY-NAME>	Specify the NSight policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#nsight-policy test
nx9500-6C8809(config-nsight-policy-test)#?
Nsight Policy Mode commands:
  enable              Enable this Nsight policy
  mandatory           Configure mandatory app stats reporting
  no                  Negate a command or set its defaults
  server              Configure Nsight server

  clrscr              Clears the display screen
  commit              Commit all changes made in this session
  end                 End current mode and change to EXEC mode
  exit                End current mode and down to previous mode
  help                Description of the interactive help system
  revert              Revert changes
  service             Service Commands
  show                Show running system information
  write               Write running configuration to memory or terminal

nx9500-6C8809(config-nsight-policy-test)#
```

Related Commands

no on page 611	Removes an existing NSight policy

nsight-policy config commands

The following table summarizes NSight policy configuration mode commands:

Table 23: NSight-Policy Config Mode Commands

Command	Description
enable on page 420	Enables this NSight policy
mandatory on page 420	Enables mandatory *Application Visibility and Control* (AVC) statistics reporting
server on page 425	Configures the external NSight server host's IP address or hostname.
no (nsight-policy-config-commands) on page 425	Removes this NSight policy settings

enable

Enables this NSight policy. The default setting is enabled.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
enable
```

Parameters

```
None
```

Examples

```
nx9510-6C8A5C(config-nsight-policy-test2)#enable
```

Related Commands

no (nsight-policy-config-commands) on page 425	Disables this NSight policy

mandatory

Enables mandatory *Application Visibility Control* (AVC) statistics reporting for a specified application group. When configured, the RF Domain manager reports usage stats for applications, in the specified group, to the on-premise, Extreme NSight server. By default, only the top-ten applications by usage are reported. This option allows you to configure mandatory stats reporting for applications that are not in the top-ten list.

To enable mandatory stats reporting for an application or set of applications, create an application group, add the desired application(s) and enable mandatory stats reporting for the group.

The RF Domain manager reports only the top-ten applications, by usage, to the Extreme NSight server. However, if you enable mandatory application stats reporting, applications that are not in the top-ten, most-used applications list are included in the report. This is done by dropping some of the top-ten applications. For example, if mandatory application reporting is enabled for five (5) applications, the report will contain these 5 applications, plus first 5 of the top-ten, most-used applications identified by the system. Thereby totaling the number to ten.

AVC and statistics reporting is available on both the WiNG 5.9.X and WiNG 7.1.X operating systems. However, the DPI engine used to check the data points varies. The WiNG 7.1.2 OS uses *EAA*, formerly

known as Purview™, and WiNG 5.9.X uses a third-party DPI engine. Consequently, the configuration differs depending on AP type. Refer to the following for configuration details required for WiNG 5.9.X and WiNG 7.1.X APs:

- Example 1: Configuring mandatory, app-usage stats reporting for WiNG 5.9.X APs. on page 421
- Example 2: Configuring mandatory, app-usage stats reporting for the new, WiNG 7.1.X, AP5XX APs. on page 422
- Example 3: Configuring mandatory, app-usage stats reporting in a mixed deployment of WiNG 5.9.X and WiNG 7.1.X APs. on page 423

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
mandatory app stats [app-group|purview-app-group]
mandatory app stats app-group <APP-GROUP-NAME>
mandatory app stats purview-app-group <PURVIEW-APP-GROUP-NAME>
```

Parameters

```
mandatory app stats app-group <APP-GROUP-NAME>
```

mandatory app stats	Enables mandatory, app-usage stats reporting for a specified *application group*
app-group <APP-GROUP-NAME>	Specifies the application group for which usage statistics reporting is to be made mandatory. Use this option for the WiNG 5.9.X access points that use a third-party DPI engine for data inspection. • <APP-GROUP-NAME> – Specify the application group name.

```
mandatory app stats purview-app-group <PURVIEW-APP-GROUP-NAME>
```

mandatory app stats	Enables mandatory, app-usage stats reporting for a specified *purview application group*
app-group <PURVIEW-APP-GROUP-NAME>	Specifies the Purview application group for which usage statistics reporting is to be made mandatory. Use this option for the new, 802.11ax, WiNG 7.1.X access points that use the Purview™ DPI engine for data inspection. • <PURVIEW-APP-GROUP-NAME> – Specify the Purview application group name.

Example 1: Configuring mandatory, app-usage stats reporting for WiNG 5.9.X APs.

The WiNG 5.9.X APs use a third-party DPI engine. If you have WiNG 5.9.X APs adopted to a WiNG 7.1.X controller, follow the steps below to enable mandatory, app-usage stats reporting:

1 Create an application-group.

```
<CONTROLER>(config)#application-group <APP-GROUP-NAME>
```

Example,

```
nx9500-6C8809(config)#application-group APPGRP
```

a Specify the target applications for which mandatory stats reporting is to be enabled.

```
<CONTROLLER>(config-app-group-APPGRP)#application <APPLICATION-NAME>
```

Example,

```
nx9500-6C8809(config-app-group-APPGRP)#show context
application-group APPGRP
 application ChatCube
 application ChatCube_apache
nx9500-6C8809(config-app-group-APPGRP)#
```

2 Create an NSight policy.

```
<CONTROLER>(config)#nsight-policy <POLICY-NAME>
```

Example,

```
nx9500-6C8809(config)#nsight-policy APPGRP
```

a Enable mandatory stats reporting for the application-group created in Step 1.

```
nx9500-6C8809(config-nsight-policy-APPGRP)#mandatory app stats app-group APPGRP
```

b Specify the NSight server's IP address or hostname.

```
nx9500-6C8809(config-nsight-policy-APPGRP)#server host 1.2.3.4
```

c Enable the NSight policy.

```
nx9500-6C8809(config-nsight-policy-APPGRP)#enable
```

3 Use the NSight policy created in Step 2 in the AP's RF Domain.

For example,

```
nx9500-6C8809(config-rf-domain-APPGRP)#use nsight-policy APPGRP
```

Example 2: Configuring mandatory, app-usage stats reporting for the new, WiNG 7.1.X, AP5XX APs.

The WiNG 7.1.X APs use Extreme Networks' Purview™ DPI engine. Follow the steps below to enable mandatory, app-usage stats reporting on these APs:

1 Create a purview-application-group on page 432.

```
<CONTROLER>(config)#purview-application-group <APP-GROUP-NAME>
```

Example,

```
nx9500-6C8809(config)#purview-application-group PURVIEW
```

a Specify the target applications for mandatory stats reporting.

```
<CONTROLLER>(config-purview-app-group-PURVIEW)#application <APPLICATION-NAME>
```

Example,

```
nx9500-6C8809(config-purview-app-group-PURVIEW)#show context
purview-application-group PURVIEW
 application ChatCube
 application ChatCube_apache
nx9500-6C8809(config-purview-app-group-PURVIEW)#
```

2 Create an NSight policy.

```
<CONTROLER>(config)#nsight-policy <POLICY-NAME>
```

Example,

```
nx9500-6C8809(config)#nsight-policy PURVIEW
```

a Enable mandatory stats reporting for the application-group created in Step 1.

```
nx9500-6C8809(config-nsight-policy-PURVIEW)#mandatory app stats purview-app-group
PURVIEW
```

b Specify the Extreme NSight server's IP address or hostname.

```
nx9500-6C8809(config-nsight-policy-PURVIEW)#server host 1.2.3.4 https
```

c Enable the NSight policy.

```
nx9500-6C8809(config-nsight-policy-PURVIEW)#enable
```

3 Use the NSight policy created in Step 2 in the AP's RF Domain context.

Example,

```
nx9500-6C8809(config-rf-domain-PURVIEW)#use nsight-policy PURVIEW
```

Example 3: Configuring mandatory, app-usage stats reporting in a mixed deployment of WiNG 5.9.X and WiNG 7.1.X APs.

In a mixed deployment, consisting of WiNG 5.9.X and WiNG 7.1.X APs, adopted to a WiNG 7.1.X controller, follow the steps below:

1 Place the WiNG 5.9.X and WiNG 7.1.X APs in separate RF Domains, as shown in the following example.

Example,

```
nx9500-6C8809(config)#show adoption timeline
-------------------------------------------------------------------------------
      AP-NAME    RF-DOMAIN    EVENT      TIME-STAMP        TIME-SINCE-EVENT
-------------------------------------------------------------------------------
   ap7562-84A224   WiNG5     adopted   2019-05-08 15:56:30   0 days 01:25:56
   ap7532-DF9A4C   WiNG5     adopted   2019-05-08 15:56:30   0 days 01:25:56
    ap505-134038   WiNG7     adopted   2019-05-08 15:56:30   0 days 01:25:56
   ap8432-070235   WiNG5     adopted   2019-05-08 15:56:28   0 days 01:25:58
-------------------------------------------------------------------------------
Total number of devices displayed: 4
nx9500-6C8809(config)#
```

Note

The WiNG 5.9.X and WiNG 7.1.X APs are placed in the WiNG5 and WiNG7 RF Domains respectively.

2 Create application groups for the WiNG 5.9.X and WiNG 7.1.X APs.

- For the WiNG 5.9.X APs, use the application-group command.

```
<CONTROLER>(config)#application-group <APP-GROUP-NAME>
```

Specify the applications for which mandatory, app-usage stats is to be enabled.

```
<CONTROLLER>(config-purview-app-group-PURVIEW)#application <APPLICATION-NAME>
```

Example,

```
nx9500-6C8809(config-purview-app-group-WiNG5)#show context
application-group WiNG5
 application ChatCube
 application ChatCube_apache
nx9500-6C8809(config-purview-app-group-WiNG5)#
```

- For WiNG 7.1.X APs, use the purview-application-group on page 432 command.

```
<CONTROLER>(config)#purview-application-group <APP-GROUP-NAME>
```

Specify the applications for which mandatory, app-usage stats is to be enabled.

```
<CONTROLLER>(config-purview-app-group-WiNG7)#application <APPLICATION-NAME>
```

Example,

```
nx9500-6C8809(config-purview-app-group-WiNG7)#show context
purview-application-group WiNG7
 application ChatCube
 application ChatCube_apache
nx9500-6C8809(config-purview-app-group-WiNG7)#
```

3 Create two NSight policies and enable mandatory, app-usage stats reporting for the application groups created in Step 1.

- For the WiNG 5.9.X APs:

  Example,

  ```
  nx9500-6C8809(config)#nsight-policy WiNG5
  ```

  1 Enable mandatory stats reporting.

  ```
  nx9500-6C8809(config-nsight-policy-WiNG5)#mandatory app stats app-group WiNG5
  ```

  2 Specify the Extreme NSight server's IP address or hostname.

  ```
  nx9500-6C8809(config-nsight-policy-WiNG5)#server host 1.2.3.4 https
  ```

  3 Enable the NSight policy.

  ```
  nx9500-6C8809(config-nsight-policy-WiNG5)#enable
  ```

- For the WiNG 7.1.X APs:

  Example,

  ```
  nx9500-6C8809(config)#nsight-policy WiNG7
  ```

  1 Enable mandatory stats reporting.

  ```
  nx9500-6C8809(config-nsight-policy-WiNG7)#mandatory app stats purview-app-group
  WiNG7
  ```

  2 Specify the NSight server's IP address or hostname.

  ```
  nx9500-6C8809(config-nsight-policy-WiNG7)#server host 1.2.3.4 https
  ```

  3 Enable the NSight policy.

  ```
  nx9500-6C8809(config-nsight-policy-WiNG7)#enable
  ```

4 Use the appropriate NSight policy in the WiNG 5.9.X and WiNG 7.1.X AP's RF Domains.

- For the WiNG 5.9.X APs:

  ```
  nx9500-6C8809(config-rf-domain-WiNG5)#use nsight-policy WiNG5
  ```

- For the WiNG 7.1.X APs:

  ```
  nx9500-6C8809(config-rf-domain-WiNG7)#use nsight-policy WiNG7
  ```

Related Commands

no (nsight-policy-config-commands) on page 425	Disables mandatory app-usage statistics reporting

server

Configures the external NSight server's IP address or hostname

Note
Starting with WiNG 5.9.4 NSight server cannot be configured on the VX9000, NX9500, or NX9600 platforms. Extreme NSight is a separate target that can only be deployed on an external VM appliance.

Note
For more information on Extreme NSight™, please refer to the Extreme NSight™ User Guide, available at https://extremenetworks.com/documentation.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX900

Syntax

```
server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}
```

Parameters

```
server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}
```

server host [<IP>| <HOSTNAME>| <X:X::X:X>]	Configures the NSight server's IP address or hostname. Use one of the following options to identify the NSight server: • <IP> – Configures the NSight server's IPv4 address • <HOSTNAME> – Configures the NSight server's hostname • <X:X::X:X> – Configures the NSight server's IPv6 address Note: When this NSight policy is applied to an RF Domain, the RF Domain manager posts statistics (polled from devices within the RF Domain) to the external Extreme NSight server host specified here.
{http|https}	Optional. Configures the protocol used to communicate with the NSight server • http – Optional. Uses HTTP to communicate • https – Optional. Uses HTTPS to communicate (this is the default setting)

Examples

```
nx9510-6C8A5C(config-nsight-policy-test2)#server host 172.22.0.153 http
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
 server host 172.22.0.153 http
nx9510-6C8A5C(config-nsight-policy-test2)#
```

Related Commands

no (nsight-policy-config-commands) on page 425	Removes NSight server's IP address or hostname configuration from this NSight policy

no (nsight-policy-config-commands)

Removes NSight policy settings or reverts them to default values

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9600, VX9000

Syntax

```
no [enable|mandatory app stats app-group <APPLICATION-GROUP-NAME>|server host [<IPv4>|
<HOST-NAME>|<IPv6>]]]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes NSight policy settings based on the parameters passed

Examples

The following example shows the NSight policy 'test2' settings before the 'no' command is executed:

```
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
 server host 172.22.0.153 http
nx9510-6C8A5C(config-nsight-policy-test2)#
nx9510-6C8A5C(config-nsight-policy-test2)#no server host 172.22.0.153
```

The following example shows the NSight policy 'test2' settings after the 'no' command is executed:

```
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
nx9510-6C8A5C(config-nsight-policy-test2)#
```

passpoint-policy

Creates a new passpoint policy and enters its configuration mode. The passpoint policy implements the Hotspot 2.0 Wi-Fi Alliance standard, enabling interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it.

The passpoint policy allows a single or set of Hotspot 2.0 configurations to be global and referenced by the devices that use it. It is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
passpoint-policy <POLICY-NAME>
```

Parameters

```
passpoint-policy <POLICY-NAME>
```

passpoint-policy <POLICY-NAME>	Specify the passpoint policy name. If a passpoint policy with the specified name does not exist, it is created.

Examples

```
rfs4000-229D58(config)#passpoint-policy test
rfs4000-229D58(config-passpoint-policy-test)#?
Passpoint Policy Mode commands:
  3gpp                    Configure a 3gpp plmn (public land mobile network) id
  access-network-type     Set the access network type for the passpoint
  connection-capability   Configure the connection capability for the passpoint
  domain-name             Add a domain-name for the passpoint
  hessid                  Set a homogeneous ESSID value for the passpoint
  internet                Advertise the passopint having internet access
  ip-address-type         Configure the advertised ip-address-type
  nai-realm               Configure a NAI realm for the passpoint
  net-auth-type           Add a network authentication type to the passpoint
  no                      Negate a command or set its defaults
  operator                Add configuration related to the operator of the
                          passpoint
  osu                     Online signup
  roam-consortium         Add a roam consortium for the passpoint
  venue                   Set the venue parameters of the passpoint
  wan-metrics             Set the wan-metrics of the passpoint

  clrscr                  Clears the display screen
  commit                  Commit all changes made in this session
  do                      Run commands from Exec mode
  end                     End current mode and change to EXEC mode
  exit                    End current mode and down to previous mode
  help                    Description of the interactive help system
  revert                  Revert changes
  service                 Service Commands
  show                    Show running system information
  write                   Write running configuration to memory or terminal

rfs4000-229D58(config-passpoint-policy-test)#
```

Related Commands

no on page 611	Removes an existing passpoint policy

Note
For more information on Passpoint policy, see Passpoint Policy on page 1817.

password-encryption

Enables password encryption and configures the passphrase used to encrypt passwords. When enabled, passwords configured within the system are not displayed as clear text.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
password-encryption secret 2 <LINE>
```

Parameters

```
password-encryption secret 2 <LINE>
```

secret 2 <LINE>	Encrypts passwords with a secret phrase • 2 – Specifies the encryption type as either SHA256-AES256 • <LINE> – Specify the encryption passphrase.

Examples

```
nx9500-6C8809(config)#password-encryption secret 2 test@123
```

To confirm if password encryption is enabled, execute the following command:

```
nx9500-6C8809(config)#show password-encryption status
Password encryption is enabled
nx9500-6C8809(config)#
```

The following example shows the privilege-mode-password as encrypted text. Note, the digit '1' preceding the password implies that displayed text is the encrypted password and not clear text.

```
nx9500-6C8809(config-management-policy-test)#show context include-factory |
include privilege-mode-password
 privilege-mode-password 1
bc28e4d82bb11fa75a3c56346441d48f50f19c47184e2575a59a6a5d18e63925
nx9500-6C8809(config-management-policy-test)#
```

Related Commands

no on page 611	Disables password encryption

profile

Configures profile related commands. If no parameters are given, all profiles are selected.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
profile {anyap|ap505|ap510|containing|filter|nx5500|nx75xx|nx9000|nx9600|vx9000}
profile {anyap|ap505|ap510|nx5500|nx75xx|nx9000|nx9600|vx9000} <DEVICE-PROFILE-NAME>
profile {containing <DEVICE-PROFILE-NAME>} {filter type [ap505|ap510||nx75xx|nx9000|
nx9600|
vx9000]}
profile {filter type [ap505|ap510|rfs6000|nx5500|nx75xx|nx9000|nx9600|vx9000]}
```

Parameters

```
profile {anyap|ap505|ap510|rfs6000|nx5500|nx75xx|nx9000|nx9600|vx9000}
<DEVICE-PROFILE-NAME>
```

profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>	Configures device profile commands. If no device profile is specified, the system configures all device profiles. • <DEVICE-TYPE> – Optional. Select the device type. The options are: AP505, AP510, NX5500, NX7500, NX9500, NX9600, and VX9000. After specifying the device type, specify the profile name. • <DEVICE-PROFILE-NAME> – Specify the profile name. Select 'anyap' to configure a profile applicable to any access point.

```
profile {containing <DEVICE-PROFILE-NAME>} {filter type [ap505|ap510|nx5500|nx75xx|
nx9000|nx9600|vx9000]}
```

profile	Configures device profile commands
containing <DEVICE-PROFILE-NAME>	Optional. Configures profiles that contain a specified sub-string in the hostname • <DEVICE-PROFILE-NAME> – Specify a substring in the profile name to filter profiles.
filter type	Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles. • type – Filters profiles by the device type. Select a device type from the following options: The options are: AP505, AP510, NX5500, NX7500, NX9500, NX9600, and VX9000.

```
profile {filter type[ap505|ap510|nx5500|nx75xx|nx9000|nx9600|vx9000]}
```

profile	Configures device profile commands
filter type	Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles. • type – Filters profiles by the device type. Select a device type from the following options: The options are: AP505, AP510, NX5500, NX7500, NX9500, NX9600, and VX9000.

Examples

```
<DEVICE>(config)#profile nx9000 test-NX9500
<DEVICE>(config-profile-test-NX9500)#?
Profile Mode commands:

purview-application-group

Global Configuration Commands on page 163

Creates a Purview Application Group and enters its configuration mode. A Purview application group is a collection of system-provided and/or user-defined applications. Application group allows you to enforce mandatory stats reporting for specific traffic types.

The WiNG 7.1.2 OS uses *EAA* (Purview™) DPI engine to implement *Application Visibility and Control* (AVC). It detects top-level hosting applications (layer 7) along with the services these applications host.

Use AVC to implement:

- Packet filtering - allow, deny or mark packets based on rules defined in the Purview application policy.
- Mandatory stats reporting - enable mandatory stats reporting for an application or set of applications defined in the Application group.

The `purview-application-group` command is part of the mandatory stats reporting feature. To enable mandatory stats reporting, follow the steps below:

1 Create a Purview application-group, specify the applications for which mandatory stats reporting is to be enabled.

Note
If the required application definition is not system-provided, use the `application` command to create a custom application signature.

2 Use this Purview application-group in the NSight policy.

3 Apply the NSight policy in the RF Domain context.

Note
For more information and examples, see mandatory on page 420.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Note

Purview DPI engine is not supported on the WiNG 5.9.X devices. This supported will be introduced in future releases. For information on enabling mandatory stats reporting on WiNG 5.9.X devices, see application-group.

Syntax

```
purview-application-group <PURVIEW-APP-GROUP-NAME>
```

Parameters

```
purview-application-group <PURVIEW-APP-GROUP-NAME>
```

purview-application-group <PURVIEW-APP-GROUP-NAME>	Creates a Purview application group and enters its configuration mode • <PURVIEW-APP-GROUP-NAME – Specify the application group name. If a Purview application group with the specified name does not exist, it is created. The name should not exceed 32 characters in length.

Examples

```
nx9500-6C8809(config)#purview-application-group PurvAppGrp
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#?
Purview Application Group Mode commands:
  application  Add application to group
  description  Add application-group description
  no           Negate a command or set its defaults

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-purview-app-group-PurvAppGrp)#
```

Related Commands

no on page 611 (global-config-mode)	Removes an existing Purview application group
application on page 183	Creates an application definition and enters its configuration mode.
purview-application-policy on page 436	Creates a Purview application policy and enters its configuration mode.
nsight-policy (global-config-mode) on page 418	Creates an NSight policy and enters its configuration mode.

application

purview-application-group on page 432

Adds an application definition to this Purview application group. You can add a system-provided or customized (user-defined) application.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
application <PURVIEW-APP-NAME>
```

Parameters

```
application <PURVIEW-APP-NAME>
```

application <PURVIEW-APP-NAME>	Configures the application to be added to this application group • <PURVIEW-APP-NAME> – Provide the application name (should be available as an option in the system). A maximum of eight (8) applications can be added to a group. Note: The Purview™ DPI engine recognizes 36 app categories with 2406 applications. If the desired application is not available as an option, use the application on page 183 command to add it.

Examples

To view all applications supported by the Purview ™ DPI engine, use [TAB], as shown in the following example:

```
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#application[TAB]
Display all 365 possibilities? (y or n)
163_com                          1Fichier
24x7_Media                       2K_Games
360_Software                     360buy
4chan                            4shared

9gag                             A_Feed
AB_Tutor                         Abacast
--More--
nx9500-6C8809(config-purview-app-group-PurvAppGrp
```

Select the desired application from the list displayed, as shown in the following examples:

```
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#application Ali[TAB]
Alibaba      Alibaba_Ads  AliExpress   Alipay
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#application Alipay
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#application Alibaba
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#application AliExpress
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#show context
application-group PurvAppGrp
 application Alipay
 application Alibaba
```

```
application AliExpress
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#
```

Related Commands

no on page 435	Removes a specified application from this application group

description

purview-application-group on page 432

Configures a description for this purview application group

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
description <WORD>
```

Parameters

```
description <WORD>
```

description <WORD>	Configures a description for this purview application group that uniquely differentiates it from other existing application groups • <WORD> – Provide a description not exceeding 80 characters in length.

Examples

```
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#description "This Purview Application
Group contains Alibaba application."
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#show context
purview-application-group PurvAppGrp
 description “This Purview Application Group contains Alibaba application.”
 application Alipay
 application Alibaba
 application AliExpress
 nx9500-6C8809(config-purview-app-group-PurvAppGrp)#
```

Related Commands

no on page 435	Removes the description configured for this purview application group

no

purview-application-group on page 432

Removes this purview application group’s configurations (application and/or description)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
no [application <PURVIEW-APP-NAME>|description]
```

Parameters

```
no [application <PURVIEW-APP-NAME>|description]
```

no <PARAMETERS>	Removes an application associated with this group, and removes the group's description

Examples

The following example displays the purview-application-group 'PurAppGrp' configuration before the execution of 'no' commands:

```
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#show context
application-group PurvAppGrp
 description "This Purview Application Group contains Alibaba application."
 application Alipay
 application Alibaba
 application AliExpress
 nx9500-6C8809(config-purview-app-group-PurvAppGrp)#
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#no application Alipay
nx9500-6C8809(config-app-group-amazon)#no description
```

The following example displays the purview-application-group 'PurAppGrp' configuration after the execution of 'no' commands:

```
nx9500-6C8809(config-purview-app-group-PurvAppGrp)#show context
application-group PurvAppGrp
 application Alibaba
 application AliExpress
 nx9500-6C8809(config-purview-app-group-PurvAppGrp)#
```

purview-application-policy

Global Configuration Commands on page 163

Creates a Purview application policy and enters its configuration mode. Application policies allow you to define rules that dictate how each traffic type is managed on your network. An application policy contains application (Layer 7) rules.

An application rule leverages the AP's *deep packet inspection* (DPI) engine to detect the underlying application to which a frame or flow belongs. The rule then applies access control and quality of service actions to all the traffic associated with the application, not just traffic destined for specific IP addresses or ports. The control actions regulate both access control and traffic engineering (rate limit, marking, and prioritization) for applications and groups.

Once created and configured, apply the application policy at the following levels to enforce application assurance:

- RADIUS *change of authorization* (CoA) – In the device/profile configuration mode, use the `application-policy → radius → <PURVIEW-APP-POLICY-NAME>` command to apply the policy to every user successfully authenticated by the RADIUS server. See purview-application-policy on page 1230 in the profile/device context.
- User role – In the role-policy-user-role configuration mode, use the `use → application-policy <PURVIEW-APP-POLICY-NAME>` command to apply the policy to all users assigned to the role. See use on page 1631 in the user-role policy context.
- WLAN – In the WLAN configuration mode, use the `use → application-policy <PURVIEW-APP-POLICY-NAME>` command to apply the policy to all users accessing the WLAN. See use (wlan-config-mode) on page 575
- Bridge VLAN – In the bridge VLAN configuration mode, use the `use → application-policy <PURVIEW-APP-POLICY-NAME>` command to apply the policy for the traffic corresponding to the bridged VLAN. See use on page 908 in the bridge VLAN context.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Note
Purview DPI engine is not supported on the WiNG 5.9.X devices. This supported will be introduced in future releases. For information on creating WiNG 5.9.X application policy, see `application-policy`.

Syntax

```
purview-application-policy <PURVIEW-APP-POLICY-NAME>
```

Parameters

```
purview-application-policy <PURVIEW-APP-POLICY-NAME>
```

purview-application-policy <PURVIEW-APP-POLICY-NAME>	Specify the Purview application policy name. If an application policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length.

Examples

```
nx9500-6C8809(config)#purview-application-policy PurAppPolicy
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#?
Purview Application Policy Mode commands:
  allow              Allow packets
  deny               Deny packets
  description        Purview application policy description
  enforcement-time   Configure policy enforcement based on time
  logging            Application recognition logging
  mark               Mark packets
  no                 Negate a command or set its defaults
```

```
  rate-limit        Rate-limit packets

  clrscr            Clears the display screen
  commit            Commit all changes made in this session
  do                Run commands from Exec mode
  end               End current mode and change to EXEC mode
  exit              End current mode and down to previous mode
  help              Description of the interactive help system
  revert            Revert changes
  service           Service Commands
  show              Show running system information
  write             Write running configuration to memory or terminal

nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#
```

nsight-policy (global-config-mode) on page 418	Creates an NSight policy and enters its configuration mode.

allow

purview-application-policy on page 436

Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action applied

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
allow [app-category [<PURVIEW-APP-CATEGORY-NAME>|all]|application <PURVIEW-APP-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

Parameters

```
allow [app-category [<PURVIEW-APP-CATEGORY-NAME>|all]|application <PURVIEW-APP-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

allow	Creates an allow rule and configures the match criteria. The match criteria options are: app-category and application.
app-category [<PURVIEW-APP-CATEGORY-NAME>|all]	Uses application category as the match criteria • <PURVIEW-APP-CATEGORY-NAME> – Specify the application category. • all – Select this option to allow all packets irrespective of the application category.
application <PURVIEW-APP-NAME>	Uses application name as the match criteria • application <PURVIEW-APP-NAME> – Specify the application name. Each packet's application is matched with the application specified here. In case of a match, the system forwards the packet. Note: The Purview™ engine recognizes 36 app-categories with 2406 canned applications. If the application you are looking for is not in this list, use the application on page 183 command to add the application to the list.

schedule <SCHEDULE-POLICY-NAME>	Schedules an enforcement time for this allow rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time. • schedule <SCHEDULE-POLICY-NAME> – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the `purview-application-policy → enforcement-time` command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). • <SCHEDULE-POLICY-NAME> – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. Note: In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time on page 445.

precedence <1-256>	Assigns a precedence value for this allow rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.
	Let us consider application *Apple_Streaming* belonging to app-category *streaming*.
	The action required is: Allow Apple_Streaming packets and deny all other applications belonging to app-category streaming.
	The rules can be defined as:
	`#allow application Apple_Streaming precedence 1`
	`#deny app-category streaming precedence 2`
	The following configuration is incorrect:
	`#deny app-category streaming precedence 1`
	`#allow application Apple_Streaming precedence 2`
	Application policy rules are applied in the increasing order of their precedence value. Once the *deny app-category streaming precedence 1* rule is hit, all streaming packets, including Apple_Streaming, are dropped. Consequently, there are no packets left to apply the subsequent allow rule. The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

Examples

The following example shows how to view all built-in, system provided Purview™ applications:

```
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#allow application[TAB]

--More--
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#
```

The following example shows an allow rule with precedence 1.

```
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#allow application Apple_Streaming
precedence 1
```

The following example shows a Purview application policy 'SocialNet' having an *allow* rule with an associated schedule policy named 'Flickr':

```
nx9500-6C8809(config-purview-app-policy-SocialNet)#allow application flickr schedule
Flickr precedence 1
nx9500-6C8809(config-purview-app-policy-SocialNet)#show context
purview-application-policy SocialNet
 description "This application policy relates to Social Networking sites."
 allow application flickr schedule Flickr precedence 1
nx9500-6C8809(config-purview-app-policy-SocialNet)#
```

The schedule policy 'Flickr' configuration is as follows. As per this policy, the above allow rule will apply to all Flickr packets every Friday between 13:00 and 18:00 hours.

```
nx9500-6C8809(config-schedule-policy-Flickr)#show context
schedule-policy Flickr
 description "Allows Flickr traffic on Fridays."
 time-rule days friday start-time 13:00 end-time 18:00
nx9500-6C8809(config-schedule-policy-Flickr)#
```

Related Commands

no on page 452	Removes this allow rule from the Purview application policy

deny

purview-application-policy on page 436

Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases..

Syntax

```
deny [app-category [<PURVIEW-APP-CATEGORY-NAME>|all]|application <PURVIEW-APP-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

Parameters

```
deny [app-category [<PURVIEW-APP-CATEGORY-NAME>|all]|application <PURVIEW-APP-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

deny	Creates a deny rule and configures the match criteria. The match criteria options are: app-category and application.
app-category [<PURVIEW-APP-CATEGORY-NAME>|all]	Uses application category as the match criteria • <PURVIEW-APP-CATEGORY-NAME> – Specify the application category name. • all – Select this option to deny all packets irrespective of the application category.
application <PURVIEW-APP-NAME>	Uses application name as the match criteria • <PURVIEW-APP-NAME> – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system drops the packet. Note: The Purview™ engine recognizes 36 app-categories with 2406 canned applications. If the application you are looking for is not in this list, use the application on page 183 command to add the application to the list.

schedule <SCHEDULE-POLICY-NAME>	Schedules an enforcement time for this deny rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time. • schedule <SCHEDULE-POLICY-NAME> – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the `purview-application-policy → enforcement-time` command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). • <SCHEDULE-POLICY-NAME> – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time on page 445.

precedence <1-256>	Assigns a precedence value for this allow rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.
	Let us consider application *Apple_Streaming* belonging to app-category *streaming*.
	The action required is: Allow Apple_Streaming packets and deny all other applications belonging to app-category streaming.
	The rules can be defined as:
	`#allow application Apple_Streaming precedence 1`
	`#deny app-category streaming precedence 2`
	The following configuration is incorrect:
	`#deny app-category streaming precedence 1`
	`#allow application Apple_Streaming precedence 2`
	Application policy rules are applied in the increasing order of their precedence value. Once the *deny app-category streaming precedence 1* rule is hit, all streaming packets, including Apple_Streaming, are dropped. Consequently, there are no packets left to apply the subsequent allow rule. The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

Examples

The following example shows how to view all built-in, system provided Purview™ app-categories:

```
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#allow app-category[TAB]
ads               all               biz               certs
cloud             cloudcpu          corp              custom
db                education         finance           games
health            location          mail              news
other             p2p               proto             realtimecomms
restrictcontent   search            shopping          social
```

```
sports          storage         streaming       travel
unknown         updates         vpn             webapp
webcontent      webfile         webmeet
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#
```

The following example shows a deny rule with precedence 2.

```
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#deny app-category streaming
precedence 2
```

The following example displays an application policy denying app-category 'social'. The policy is enforceable on weekdays from 9:30 AM to 10 PM.

```
nx9500-6C8809(config-purview-app-policy-DenyS-N)#show context
purview-application-policy DenyS-N
 description "This application policy denies Social Networking sites on weedays."
 enforcement-time days weekdays start-time 09:30 end-time 22:00
 deny app-category social precedence 1
nx9500-6C8809(config-purview-app-policy-DenyS-N)#
```

Related Commands

no on page 452	Removes this deny rule from the Purview application policy

description

purview-application-policy on page 436

Configures a brief description for this application policy that enables you to differentiate it from other application policies

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
description <LINE>
```

Parameters

```
description <LINE>
```

description <LINE>	Configures this application policy's description • <LINE> – Specify a brief description not exceeding 80 characters in length.

Examples

```
nx9500-6C8809(config-purview-app-policy-SocialNet)#description "This application policy
relates to Social Networking sites."
nx9500-6C8809(config-purview-app-policy-SocialNet)#show context
purview-application-policy SocialNet
```

```
 description "This application policy relates to Social Networking sites."
nx9500-6C8809(config-purview-app-policy-SocialNet)#
```

Related Commands

no on page 211	Removes this application policy's description

enforcement-time

purview-application-policy on page 436

Configures an enforcement time in days and hours. The enforcement time is applicable only to those rules, within the application policy, that do not have a schedule policy associated. By default an application policy is enforced on all days.

Note
Schedule policies enforce allow/deny/mark/rate-limit rules at different time periods. If absence of a schedule policy, application policy rules are enforced at the enforcement-time specified within the policy. For more information on configuring a schedule policy, see schedule-policy on page 499.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|
all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}
```

Parameters

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|
all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}
```

enforcement-time days	Enforces this application policy on only on the days specified here • sunday – Enforces the policy only on Sundays • monday – Enforces the policy only on Mondays • tuesday – Enforces the policy only on Tuesdays • wednesday – Enforces the policy only on Wednesdays • thursday – Enforces the policy only on Thursdays • friday – Enforces the policy only on Fridays • saturday – Enforces the policy only on Saturdays • all – Enforces the policy on all days. This is the default setting. • weekends – Enforces the policy only on weekends • weekdays – Enforces the policy only on weekdays In case no enforcement time is specified, the application policy is enforced on all days (i.e., always active). If using schedule policies with the allow/deny/mark/rate-limit rules, the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting of 'all').
start-time <HH:MM> end-time <HH:MM>	Optional. Configures this application policy's enforcement period • start-time – Configures the start time. This is the time at which the application policy enforcement begins. • end-time – Configures the end time. This is the time at which the application policy enforcement ends. • <HH:MM> – Specify the start and end time in the HH:MM format.

Examples

```
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#enforcement-time days weekends
start-time 10:30 end-time 20:00
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#show context
purview-application-policy PurAppPolicy
 description "This application policy allows Applie_Streaming packets on weekends."
 enforcement-time days weekends start-time 10:30 end-time 20:00
 allow application Apple_Streaming precedence 1
nx9500-6C8809(config-purview-app-policy-PurAppPolicy)#
```

Related Commands

no on page 452	Removes this application policy's enforcement period

logging

purview-application-policy on page 436

Enables DPI application recognition logging. It also sets the logging level.

DPI analyzes packet and packet content headers to determine the nature of network traffic. When enabled, the Purview™ DPI engine inspects layer 7 traffic to identify applications (such as, Netflix, Twitter, Facebook, etc.) and extract metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
logging [level|on]
logging on
logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings]
```

Parameters

```
logging on
```

logging on	Enables logging of application recognition hits made by the Purview™ DPI engine. This option is disabled by default.

```
logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings]
```

logging level [<0-7>|alerts| critical| debugging| emergencies|errors| informational| notifications| warnings]	Sets the logging level for application recognition hits made by the Purview™ DPI engine. This option is disabled by default. • <0-7> – Sets the message logging severity level on a scale of 0 - 7 • emergencies – Severity level 0: System is unusable • alerts – Severity level 1: Requires immediate action • critical – Severity level 2: Critical conditions • errors – Severity level 3: Error conditions • warnings – Severity level 4: Warning conditions • notifications – Severity level 5: Normal but significant conditions (this is the default setting) • informational – Severity level 6: Informational messages • debugging – Severity level 7: Debugging messages

Examples

```
nx9500-6C8809(config-purview-app-policy-Bing)#logging level critical
nx9500-6C8809(config-purview-app-policy-Bing)#show context
purview-application-policy Bing
 description "This application policy allows Bing search engine packets"
 enforcement-time days weekdays start-time 12:30 end-time 20:00
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
 logging level critical
nx9500-6C8809(config-purview-app-policy-Bing)#
```

Related Commands

no on page 452	Resets the logging level to default (notifications). And the **no** → **logging** → **on** command disables DPI logging.

mark

purview-application-policy on page 436

Creates a mark rule and configures the match criteria based on which packets are marked

Marks packets, matching a specified set of application categories or applications/protocols, with 802.1p priority level or DSCP *type of service* (ToS) code. Marking packets is a means of identifying them for specific actions, and is used to provide different levels of service to different traffic types.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
mark [app-category [<APP-CATEGORY-NAME>|all]|application <PURVIEW-APP-NAME>]
[8021p <0-7>|dscp <0-63>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

Parameters

```
mark [app-category [<PURVIEW-APP-CATEGORY-NAME>|all]|application <PURVIEW-APP-NAME>]
[8021p <0-7>|dscp <0-63>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

mark	Creates a mark rule and configures the match criteria. When applied, the rule marks packets, matching the criteria configured here, with 802.1p priority value or DSCP code. The match criteria options are: app-category and application.
app-category [<PURVIEW-APP-CATEGORY-NAME>|all]	Uses application category as the match criteria • <PURVIEW-APP-CATEGORY-NAME> – Specify the application category. • all – The system marks all packets.
application <PURVIEW-APP-NAME>	Uses application name as the match criteria • <PURVIEW-APP-NAME> – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system marks the packet. Note: The Purview™ engine recognizes 36 app-categories with 2406 canned applications. If the application you are looking for is not in this list, use the application on page 183 command to add the application to the list.
8021p <0-7>	Marks packets matching the specified criteria with 802.1p priority value • <0-7> – Specify a value from 0 - 7. The IEEE 802.1p signaling standard enables marking of layer 2 network traffic. Layer 2 network devices (such as switches), using 802.1p standards, group traffic into classes based on their 802.1p priority value, which is appended to the packet's MAC header. In case of traffic congestion, packets with higher priority get precedence over lower priority packets and are forwarded first.

dscp <0-63>	Marks packets matching the specified criteria with DSCP ToS code • <0-63> – Specify a value from 0 - 63. The DSCP protocol marks layer 3 network traffic. Layer 3 network devices (such as routers) using DSCP, mark each layer 3 packet with a six-bit DSCP code, which is appended to the packet's IP header. Each DSCP code is assigned a corresponding level of service, enabling packet prioritization.
schedule <SCHEDULE-POLICY-NAME>	Schedules an enforcement time for this mark rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time. • schedule <SCHEDULE-POLICY-NAME> – Associates a schedule policy with this rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the `purview-application-policy → enforcement-time` command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). • <SCHEDULE-POLICY-NAME> – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time on page 445.
precedence <1-256>	Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.

Examples

```
nx9500-6C8809(config-purview-app-policy-Bing)#mark app-category video dscp 9 precedence 4

nx9500-6C8809(config-purview-app-policy-Bing)#mark application facetime dscp 10

 mark app-category video dscp 9 precedence 4
 mark application facetime dscp 10 precedence 5
 logging level critical
nx9500-6C8809(config-purview-app-policy-Bing)#
```

Related Commands

no on page 452	Removes this mark rule from the application policy

rate-limit

purview-application-policy on page 436

Creates a rate-limit rule and configures the match criteria

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

Note
Purview DPI engine is not supported on the WiNG 7.1.2 enabled NX5500, NX7500, NX9500, NX9600 and VX9000 platforms. This support will be introduced in future releases.

Syntax

```
rate-limit [app-category [<PURVIEW-APP-CATEGORY-NAME>|all]|application <PURVIEW-APP-
NAME>]
([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> schedule <SCHEDULE-POLICY-
NAME> (precedence <1-256>)
```

Parameters

```
rate-limit [app-category [<PURVIEW-APP-CATEGORY-NAME>|all]|application <PURVIEW-APP-
NAME>]
([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> schedule <SCHEDULE-POLICY-
NAME> (precedence <1-256>)
```

rate-limit	Creates a rate-limit rule and configures the match criteria. When applied, a rate-limit is applied to packets that match the configured criteria. These packets could be incoming, outgoing, or both. The match criteria options are: *app-category* and *application*.
app-category [<PURVIEW-APP-CATEGORY-NAME>|all]	Uses application category as the match criteria • <PURVIEW-APP-CATEGORY-NAME> – Specify the application category. • all – The system rate-limits all packets irrespective of the application category.
application <PURVIEW-APP-NAME>	Uses application name as the match criteria • <PURVIEW-APP-NAME> – Specify the application name. Each packet's application is matched with the application specified here. In case of a match, the system rate-limits the packet.
[egress|ingress]	The egress and ingress parameters are recursive and can be used to rate limit either incoming, outgoing, or both incoming and outgoing traffic. • egress – Rate limits outgoing traffic • ingress – Rate limits incoming traffic After selecting the traffic type (incoming/outgoing) configure the rate and maximum burst size.
rate <50-1000000>	The following parameters are common to the 'egress' and 'ingress' keywords: • rate – Configures the rate limit, in Kbps, for both incoming and outgoing packets • <50-1000000> – Specify the rate limit from 50 - 1000000 Kbps.

max-burst-size	The following parameters are common to the 'egress' and 'ingress' keywords: • max-burst-size – Configures the maximum burst size, in Kbytes, for both incoming and outgoing packets • <2-1024> – Specify the maximum burst size from 2 - 1024 Kbytes.
schedule <SCHEDULE-POLICY-NAME>	Schedules an enforcement time for this rate-limit rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time. • schedule <SCHEDULE-POLICY-NAME> – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the `purview-application-policy → enforcement-time` command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). • <SCHEDULE-POLICY-NAME> – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time on page 445 .
precedence <1-256>	Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.

Examples

```
nx9500-6C8809(config-purview-app-policy-Bing)#rate-limit application BGP ingress rate 100
max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6

```

radio-qos-policy

Configures a radio QoS policy

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
radio-qos-policy <RADIO-QOS-POLICY-NAME>
```

Parameters

```
radio-qos-policy <RADIO-QOS-POLICY-NAME>
```

<RADIO-QOS-POLICY-NAME>	Specify the radio QoS policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#radio-qos-policy test
nx9500-6C8809(config-radio-qos-test)#?
Radio QoS Mode commands:
  accelerated-multicast  Configure multicast streams for acceleration
  admission-control      Configure admission-control on this radio for one or
                         more access categories
  no                     Negate a command or set its defaults
  smart-aggregation      Configure smart aggregation parameters
  wmm                    Configure 802.11e/Wireless MultiMedia parameters

  clrscr                 Clears the display screen
  commit                 Commit all changes made in this session
  do                     Run commands from Exec mode
  end                    End current mode and change to EXEC mode
  exit                   End current mode and down to previous mode
```

```
  help                    Description of the interactive help system
  revert                  Revert changes
  service                 Service Commands
  show                    Show running system information
  write                   Write running configuration to memory or terminal

nx9500-6C8809(config-radio-qos-test)#
```

Related Commands

no on page 611	Removes an existing Radio QoS policy

Note
For more information on radio qos policy, see Radio-QoS Policy on page 1588.

radius-group

Configures RADIUS user group and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
radius-group <RADIUS-GROUP-NAME>
```

Parameters

```
radius-group <RADIUS-GROUP-NAME>
```

<RADIUS-GROUP-NAME>	Specify a RADIUS user group name. The name should not exceed 64 characters. If a RADIUS user group with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#radius-group testRadiusGr
nx9500-6C8809(config-radius-group-testRadiusGr)#?
Radius user group configuration commands:
  guest       Make this group a Guest group
  no          Negate a command or set its defaults
  policy      Radius group access policy configuration
  rate-limit  Set rate limit for group

  clrscr      Clears the display screen
  commit      Commit all changes made in this session
  do          Run commands from Exec mode
  end         End current mode and change to EXEC mode
  exit        End current mode and down to previous mode
  help        Description of the interactive help system
  revert      Revert changes
  service     Service Commands
  show        Show running system information
  write       Write running configuration to memory or terminal
```

```
nx9500-6C8809(config-radius-group-testRadiusGr)#
```

Related Commands

no on page 611	Removes an existing RADIUS group

Note
For more information on RADIUS user group commands, see RADIUS Policy on page 1557.

radius-server-policy

Creates a RADIUS server policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
radius-server-policy <RADIUS-SERVER-POLICY-NAME>
```

Parameters

```
radius-server-policy <RADIUS-SERVER-POLICY-NAME>
```

<RADIUS-SERVER-POLICY-NAME>	Specify the RADIUS server policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#radius-server-policy testRadiusServerPolicy
nx9500-6C8809(config-radius-server-policy-testRadiusServerPolicy)#?
Radius Configuration commands:
  authentication           Radius authentication
  bypass                   Bypass Certificate Revocation List( CRL ) check
  chase-referral           Enable chasing referrals from LDAP server
  crl-check                Enable Certificate Revocation List( CRL ) check
  ldap-agent               LDAP Agent configuration parameters
  ldap-group-verification  Enable LDAP Group Verification setting
  ldap-server              LDAP server parameters
  local                    RADIUS local realm
  nas                      RADIUS client
  no                       Negate a command or set its defaults
  proxy                    RADIUS proxy server
  session-resumption       Enable session resumption/fast reauthentication by
                           using cached attributes
  termination              Enable Eap termination for proxy requests
  use                      Set setting to use

  clrscr                   Clears the display screen
  commit                   Commit all changes made in this session
  do                       Run commands from Exec mode
  end                      End current mode and change to EXEC mode
  exit                     End current mode and down to previous mode
  help                     Description of the interactive help system
```

```
  revert                    Revert changes
  service                   Service Commands
  show                      Show running system information
  write                     Write running configuration to memory or terminal

nx9500-6C8809(config-radius-server-policy-testRadiusServerPolicy)#
```

Related Commands

no on page 611	Removes an existing RADIUS server policy

Note
For more information on RADIUS server policy commands, see RADIUS Policy on page 1557.

radius-user-pool-policy

Configures a RADIUS user pool and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
radius-user-pool-policy <RADIUS-USER-POOL-NAME>
```

Parameters

```
radius-user-pool-policy <RADIUS-USER-POOL-NAME>
```

<RADIUS-USER-POOL-POLICY-NAME>	Specify the RADIUS user pool policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#radius-user-pool-policy testRadiusUserPool
nx9500-6C8809(config-radius-user-pool-testRadiusUserPool)#?
Radius User Pool Mode commands:
  duration  Set a guest user's access duration
  no        Negate a command or set its defaults
  user      Radius user configuration

  clrscr    Clears the display screen
  commit    Commit all changes made in this session
  do        Run commands from Exec mode
  end       End current mode and change to EXEC mode
  exit      End current mode and down to previous mode
  help      Description of the interactive help system
  revert    Revert changes
  service   Service Commands
  show      Show running system information
  write     Write running configuration to memory or terminal

vnx9500-6C8809(config-radius-user-pool-testRadiusUserPool)#
```

Related Commands

no on page 611	Removes an existing RADIUS user pool policy

Note
For more information on RADIUS user group commands, see RADIUS Policy on page 1557.

rename

Renames and existing TLO

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
rename tlo <TLO-NAME> <NEW-TLO-NAME>
```

Parameters

```
rename tlo <TLO-NAME> <NEW-TLO-NAME>
```

rename tlo <TLO-NAME> <NEW-TLO-NAME>	Renames an existing TLO object • <TLO-NAME> – Specify the TLO's name. This is the TLO that is to be renamed. • <NEW-TLO-NAME> – Specify the new name for this TLO.

Examples

The following example shows the top level objects available for renaming:

Note
Enter rename and press **Tab** to list top level objects available for renaming.

```
nx9500-6C8809(config)#rename [TAB]
aaa_policy                          aaa_tacacs_policy
address_range_alias                 aif_policy
app_policy                          application
assoc_acl                           auto_provisioning_policy
bgp_as_path_list                    bgp_community_list
bgp_extcommunity_list               bgp_ip_access_list
bgp_ip_prefix_list                  bonjour_gw_discovery_policy
bonjour_gw_forwarding_policy        bonjour_gw_query_forwarding_policy
bridging_policy                     captive_portal
centro_policy                       client_identity
client_identity_group               content_cache_policy
content_filter_policy               crypto_cmp_policy
database_client_policy              database_policy
device_categorization               dhcp_server_policy
dhcpv6_server_policy                dns_whitelist
dr_route_map                        encrypted_string_alias
event_system_policy                 ex3500_ext_ip_acl
ex3500_management_policy            ex3500_qos_class_map_policy
```

```
ex3500_qos_policy_map                ex3500_std_ip_acl
ex3500_time_range                    firewall_policy
global_assoc_list                    guest_management
hashed_string_alias                  host_alias
ip_acl                               ip_snmp_acl
--More--
nx9500-6C8809(config)#
```

The following examples first clones the existing IP access list BROADCAST-MULTICAST-CONTROL, and then renames the cloned IP access list:

```
nx9500-6C8809(config)#show context include-factory | include ip access-list
ip access-list BROADCAST-MULTICAST-CONTROL
nx9500-6C8809(config)#

nx9500-6C8809(config)#clone ip_acl BROADCAST-MULTICAST-CONTROL Test_IP_CLONED
nx9500-6C8809(config)#commit

nx9500-6C8809(config)#show context include-factory | include ip access-list
ip access-list BROADCAST-MULTICAST-CONTROL
ip access-list Test_IP_CLONED
nx9500-6C8809(config)#

nx9500-6C8809(config)#rename Test_IP_CLONED NEW_IP_CLONED
nx9500-6C8809nx9500-6C8809(config)#commit

nx9500-6C8809(config)#show context include-factory | include ip access-list
ip access-list BROADCAST-MULTICAST-CONTROL
ip access-list NEW_IP_CLONED
nx9500-6C8809(config)#
```

Related Commands

clone on page 281	Creates a replica of an existing TLO or device

replace

Selects an existing device by its MAC address or hostname and replaces it with a new device having a different MAC address. Internally, a new device is created with the new MAC address. The old device's configuration is copied to the new device, and then removed from the controller's configuration (i.e., the old device's configuration is no longer staged on the controller).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
replace device [<MAC-ADDRESS>|<HOSTNAME>] <NEW-MAC-ADDRESS>
```

Parameters

```
replace device [<MAC-ADDRESS>|<HOSTNAME>] <NEW-MAC-ADDRESS>
```

replace-device	Replaces an existing device with a new device, such that the old device's configuration is copied on to the new device
[<MAC-ADDRESS>| <HOSTNAME>]	Identifies the device to replace by its MAC address or hostname • <MAC-ADDRESS> – Identifies the device to replace by its MAC address. Specify the device's existing MAC address. • <HOSTNAME> – Identifies the device to replace by its hostname. Specify the device's hostname.
<NEW-MAC-ADDRESS>	Specifies the new device's MAC address. Both the new and old devices should of the same model type.

Examples

```
rfs4000-882A17(config)#replace device ap7161-4BF364 ?
  AA-BB-CC-DD-EE-FF New device MAC address
rfs4000-882A17(config)#replace device ap7161-4BF364 00-15-0F-BB-98-30
```

The following example shows an existing AP 7502 (MAC: DD-AA-BB-88-12-43) configuration staged on a VX 9000 controller:

```
VX9000-NOC-DE9D(config-device-DD-AA-BB-88-12-43)#show context
ap7502 DD-AA-BB-88-12-43
 use profile default-ap7502
 use rf-domain default
 hostname ap7502-881243
 interface radio1
  wlan theMOZART bss 1 primary
 interface radio2
  wlan theMOZART bss 1 primary
 interface ge1
  switchport mode access
  switchport access vlan 1
 controller host 12.12.12.2
VX9000-NOC-DE9D(config-device-DD-AA-BB-88-12-43)#
```

The following example shows AP 7502 (MAC: DD-AA-BB-88-12-43) replaced by another vAP 7502 having MAC address 11-22-33-44-55-66:

Note that the new AP 7502 device has the same configuration as the old AP 7502 device. The HOSTNAME remains the same. Consequently, objects that refer to this particular hostname need not be updated. For example, an hostname alias identifying this particular device, and TLOs using this alias, such as IP/MAC ACLs, remain unchanged.

```
VX9000-NOC-DE9D(config)#replace device DD-AA-BB-88-12-43 11-22-33-44-55-66
VX9000-NOC-DE9D(config)#ap7502 11-22-33-44-55-66
VX9000-NOC-DE9D(config-device-11-22-33-44-55-66)#show context
ap7502 11-22-33-44-55-66
 use profile default-ap7502
 use rf-domain default
 hostname ap7502-881243
 interface radio1
  wlan theMOZART bss 1 primary
 interface radio2
  wlan theMOZART bss 1 primary
 interface ge1
  switchport mode access
  switchport access vlan 1
 controller host 12.12.12.2
VX9000-NOC-DE9D(config-device-11-22-33-44-55-66)#
```

rf-domain

Creates an RF Domain or enters the RF Domain configuration context for one or more RF Domains.

The configuration of controllers (wireless controllers, service platforms, and access points) comprises of RF Domains that define regulatory, location, and other relevant policies. At least one default RF Domain is assigned to each controller. RF Domains allow administrators to assign configuration data to multiple devices deployed in a common coverage area, such as in a floor, building, or site. Each RF Domain contains policies that set the Smart RF or WIPS configuration.

RF Domains also enable administrators to override WLAN SSID name and VLAN assignments. This enables the deployment of a global WLAN across multiple sites and unique SSID name or VLAN assignments to groups of access points servicing the global WLAN. This WLAN override eliminates the need to define and manage a large number of individual WLANs and profiles.

A controller's configuration contains:

- A default RF Domain - Each controller utilizes a default RF Domain. Access Points are assigned to this default RF Domain as they are discovered by the controller. A default RF Domain can be used for single-site and multi-site deployments.
- Single-site deployment – The default RF Domain can be used for single site deployments, where regional, regulatory, and RF policies are common between devices.
- Multi-site deployment – A default RF Domain can omit configuration parameters to prohibit regulatory configuration from automatically being inherited by devices as they are discovered. This is desirable in multi-site deployments with devices spanning multiple countries. Omitting specific configuration parameters eliminates the risk of an incorrect country code from being automatically assigned to a device.
- A user-defined RF Domain - Created by administrators. A user-defined RF Domain can be assigned to multiple devices manually or automatically.
- Manually assigned – Use the CLI or UI to manually assign a user-defined RF Domain to controllers and service platforms.
- Automatically assigned – Use a AP provisioning policy to automatically assign specific RF Domains to access points based on the access point's model, serial number, VLAN, DHCP option, and IP address or MAC address. Automatic RF Domain assignments are useful in large deployments, as they enable plug-n-play access point deployments by automatically applying RF Domains to remote access points. For more information on auto provisioning policy, see Auto-Provisioning Policy on page 1326.

Configure and deploy user-defined RF Domains for single or multiple sites where devices require unique regulatory and regional configurations, or unique Smart RF and WIPS policies. User-defined RF Domains can be used to:

- Assign unique Smart RF or WIPS policies to access points deployed on different floors or buildings within in a site.
- Assign unique regional or regulatory configurations to devices deployed in different states or countries.

- Assign unique WLAN SSIDs and/or VLAN IDs to sites assigned a common WLAN without having to define individual WLANs for each site.

Note
WiNG access points only support one RF Domain, which is the **default** RF Domain. If needed, use this command to override the built-in default RF Domain configuration.

WiNG 7.1.X Interoperability with WiNG 5.9.X

Interoperability with access points running the WiNG 5.9.X OS is another salient feature of the WiNG 7.1.X OS. As part of this inter-interoperability, WiNG 7.1.X wireless controllers and service platforms will be able to deploy and manage the following WiNG 5.9.X APs:

- Access Points - AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP763, AP7662, AP8163, AP8543, AP8533.

The following output shows both WiNG 5.9.X and WiNG 7.1.X APs adopted to a WiNG 7.1.X NX9500 service platform:code

```

Note
In a mixed deployment, with access points running both WiNG 7.1.X and WiNG 5.9.X firmware, we recommend that these APs be placed in separate RF Domains.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}
```

Parameters

```
rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}
```

rf-domain	Creates a new RF Domain or enters its configuration context
<RF-DOMAIN-NAME>	Optional. Specify the RF Domain name (should not exceed 32 characters and should represent the intended purpose). Once created, the name cannot be edited.
containing <RF-DOMAIN-NAME>	Optional. Identifies an existing RF Domain that contains a specified sub-string in the domain name • <RF-DOMAIN-NAME> – Specify a sub-string of the RF Domain name.

Examples

```
nx9500-6C8809(config)#rf-domain ecospace
nx9500-6C8809(config-rf-domain-ecospace)#?
RF Domain Mode commands:
  alias               Alias
  channel-list        Configure channel list to be advertised to wireless
                      clients
  contact             Configure the contact
  control-vlan        VLAN for control traffic on this RF Domain
  controller-managed  RF Domain manager for this domain will be an adopting
                      controller
  country-code        Configure the country of operation

Related Commands

no on page 611	Removes an existing RF Domain. Specify the RF Domain's name.

rf-domain-mode-commands

The following table lists the RF Domain configuration mode commands:

Table 24: RF-Domain Config Mode Commands

Command	Description
alias on page 464	Creates various types of aliases, such as network, VLAN, network-group, network-service, encrypted-string, hashed-string, etc. at the RF Domain level
channel-list on page 471	Configures the channel list advertised by radios
contact on page 472	Configures network administrator's contact information (needed in case of any problems impacting the RF Domain)
control-vlan on page 473	Configures VLAN for traffic control on a RF Domain
controller-managed on page 473	Configures the adopting controller or service platform as this RF Domain's manager
country-code on page 474	Configures the country of operation
geo-coordinates on page 475	Configures the longitude and latitude of the RF Domain in order to fix its exact geographical location on a map
layout	Configures layout information
location on page 477	Configures the physical location of an RF Domain
location-server on page 478	Configures an ExtremeLocation server on the selected RF Domain. This command is supported only on the NX 95XX and NX 96XX series service platforms.
location-tenantid on page 479	Configures the ExtremeLocation Tenant's account number
mac-name on page 480	Maps MAC addresses to names
override-smart-rf on page 481	Configures RF Domain level overrides for Smart RF
override-wlan on page 482	Configures RF Domain level overrides for a WLAN
sensor-server on page 484	Configures an AirDefense sensor server on this RF Domain
stats on page 485	Configures stats related settings on this RF Domain. These settings define how RF Domain statistics are updated.
timezone on page 486	Configures a RF Domain's geographic time zone
tree-node on page 487	Configures the hierarchical (tree-node) structure under which this RF Domain appears
use (rf-domain-config-mode) on page 488	Enables the use of a specified Smart RF and/or WIPS policy with this RF Domain
no (rf-domain-config-mode) on page 490	Negates a command or reverts configured settings to their default

alias

Configures network, VLAN, host, string, network-service, etc. aliases at the RF Domain level

For information on aliases, see alias on page 172.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>
alias hashed-string <HASHED-STRING-ALIAS-NAME> 1 <LINE>
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
alias host <HOST-ALIAS-NAME> <HOST-IP>
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to
<ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|
network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}]
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|
ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www)}
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|
igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|
ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www)}
alias string <STRING-ALIAS-NAME> <LINE>
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

Parameters

```
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
```

address-range <ADRESS-RANGE-ALIAS-NAME>	Creates a new address-range alias for this RF Domain. Or associates an existing address-range alias with this RF Domain. An address-range alias maps a name to a range of IP addresses. • <ADRESS-RANGE-ALIAS-NAME> – Specify the address range alias name. **Note:** Alias name should begin with '$'.
<STARTING-IP> to <ENDING-IP>	Associates a range of IP addresses with this address range alias • <STARTING-IP> – Specify the first IP address in the range. • to <ENDING-IP> – Specify the last IP address in the range. **Note:** Aliases defined at any given level can be overridden at the next lower level. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

```
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>
```

encrypted-string <ENCRYPTED-STRING-ALIAS-NAME>	Creates an alias for an encrypted string. Use this alias for string configuration values that are encrypted when "password-encryption" is enabled. For example, in the management-policy, use it to define the SNMP community string. • <ENCRYPTED-STRING-ALIAS-NAME> – Specify the encrypted-string alias name. **Note:** Alias name should begin with '$'.

[0|2] <LINE>	Configures the value associated with the alias name specified in the previous step
	• [0|2] <LINE> – Configures the alias value
	
	Note, if password-encryption is enabled, in the `show > running-config` output, this clear text is displayed as an encrypted string, as shown below:
	`nx9500-6C8809(config)#show running-config`
	`!.............................`
	`alias encrypted-string $enString 2 fABMK2is7UToNiZE3MQXbgAAA`
	`AxB0ZIysdqsEJwr6AH/Da//`
	`!`
	`--More--`
	`nx9500-6C8809`
	In the above output, the '2' displayed before the encrypted-string alias value indicates that the displayed text is encrypted and not a clear text.
	However, if password-encryption is disabled the clear text is displayed as is:
	`nx9500-6C8809(config)#show running-config`
	`!.............................`
	`!`
	`alias encrypted-string $enString 0 test11223344`
	`!`
	`--More--`
	`nx9500-6C8809`
	For more information on enabling password-encryption, see password-encryption on page 427.

```
alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>
```

hashed-string <HASHED-STRING-ALIAS-NAME>	Creates an alias for a hashed string. Use this alias for configuration values that are hashed string, such as passwords. For example, in the management-policy, use it to define the privilege mode password. For more information, see privilege-mode-password on page 1534. • <HASHED-STRING-ALIAS-NAME> – Specify the hashed-string alias name. **Note:** Alias name should begin with '$'.

<LINE>	Configures the hashed-string value associated with this alias.
	`nx9500-6C8809(config)#show running-config`
	`!`
	`alias encrypted-string $WRITE 2 sBqVCDAoxs3oByF5PCSuFAAA`
	`AAd7HT2+EiT/l/BXm9c4SBDv`
	`!`
	`alias hashed-string $PriMode 1 faffdde27cb49ad634ea20df4f`
	`7c8ef2685894d10ffcb1b2efba054112ecfc75`
	`--More--`
	`nx9500-6C8809`
	In the above `show > running-config` output, the '1' displayed before the hashed-string alias value indicates that the displayed text is hashed and not a clear text.

```
alias host <HOST-ALIAS-NAME> <HOST-IP>
```

host <HOST-ALIAS-NAME>	Creates a host alias for this RF Domain. Or associates an existing host alias with this RF Domain. A host alias maps a name to a single network host. • <HOST-ALIAS-NAME> – Specify the host alias name. Note: Alias name should begin with '$'.
<HOST-IP>	Associates the network host's IP address with this host alias • <HOST-IP> – Specify the network host's IP address. Note: Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

```
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
```

network <NETWORK-ALIAS-NAME>	Creates a network alias for this RF Domain. Or associates an existing network alias with this RF Domain. A network alias maps a name to a single network address. • <NETWORK-ALIAS-NAME> – Specify the network alias name. Note: Alias name should begin with '$'.
<NETWORK-ADDRESS/MASK>	Associates a single network with this network alias • <NETWORK-ADDRESS/MASK> – Specify the network's address and mask. Note: Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

```
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-
IP>
{<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|network <NETWORK-ADDRESS/MASK>
{<NETWORK-ADDRESS/MASK>}]
```

network <NETWORK-GROUP-ALIAS-NAME>	Creates a network-group alias for this RF Domain. Or associates an existing network-group alias with this RF Domain. • <NETWORK-GROUP-ALIAS-NAME> – Specify the network-group alias name. Note: Alias name should begin with '$'. After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses. Note: Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.
address-range <STARTING-IP> to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}	Associates a range of IP addresses with this network-group alias • <STARTING-IP> – Specify the first IP address in the range. • to <ENDING-IP> – Specify the last IP address in the range. <STARTING-IP> to <ENDING-IP> – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.

host <HOST-IP> {<HOST-IP>}	Associates a single or multiple hosts with this network-group alias • <HOST-IP> – Specify the hosts' IP address. • <HOST-IP> – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured.
network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}	Associates a single or multiple networks with this network-group alias • <NETWORK-ADDRESS/MASK> – Specify the network's address and mask. • <NETWORK-ADDRESS/MASK> – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured.

```
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|igmp|
igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|
proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www)}
```

alias network-service <NETWORK-SERVICE-ALIAS-NAME>	Creates a network-service alias for this RF Domain. Or associates an existing network-service alias with this RF Domain. A network-service alias maps a name to network services and the corresponding source and destination software ports. • <NETWORK-SERVICE-ALIAS-NAME> – Specify a network-service alias name. **Note:** Alias name should begin with '$'. **Note:** Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.
proto [<0-254>| <WORD>|eigrp|gre| igmp| igp|ospf|vrrp]	Use one of the following options to associate an Internet protocol with this network-service alias: • <0-254> – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the *protocol* is identified in the Protocol field of the IPv4 header and the Next Header field of IPv6 header. For example, the *User Datagram Protocol*'s (UDP's) designated number is 17. • <WORD> – Identifies the protocol by its name. Specify the protocol name. • eigrp – Selects *Enhanced Interior Gateway Routing Protocol* (EIGRP). The protocol number 88. • gre – Selects *Generic Routing Encapsulation* (GRE). The protocol number is 47. • igmp – Selects *Internet Group Management Protocol* (IGMP). The protocol number is 2. • igp – Selects *Interior Gateway Protocol* (IGP). The protocol number is 9. • ospf – Selects *Open Shortest Path First* (OSPF). The protocol number is 89. • vrrp – Selects *Virtual Router Redundancy Protocol* (VRRP). The protocol number is 112.
<1-65535>|<WORD>| bgp| dns|ftp|ftp-data| gopher| https|ldap|nntp| ntp| pop3|proto|sip|smtp| sourceport [<1-65535>| <WORD>]|ssh|telnet| tftp| www)}	After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports. • <1-65535> – Optional. Configures a destination port number from 1 - 65535 • <WORD> – Optional. Identifies the destination port by the service name provided. For example, the SSH service uses TCP port 22. • bgp – Optional. Configures the default *Border Gateway Protocol* (BGP) services port (179) • dns – Optional. Configures the default *Domain Name System* (DNS) services port (53) • ftp – Optional. Configures the default *File Transfer Protocol* (FTP) control services port (21) • ftp-data – Optional. Configures the default FTP data services port (20) • gopher – Optional. Configures the default gopher services port (70) • https – Optional. Configures the default HTTPS services port (443) • ldap – Optional. Configures the default *Lightweight Directory Access Protocol* (LDAP) services port (389) • nntp – Optional. Configures the default *Newsgroup* (NNTP) services port (119) • ntp – Optional. Configures the default *Network Time Protocol* (NTP) services port (123) • POP3 – Optional. Configures the default *Post Office Protocol* (POP3) services port (110)

	• proto – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
	• sip – Optional. Configures the default *Session Initiation Protocol* (SIP) services port (5060)
	• smtp – Optional. Configures the default *Simple Mail Transfer Protocol* (SMTP) services port (25)
	• sourceport [<1-65535>|<WORD>] – Optional. After specifying the destination port, you may specify a single or range of source ports.
	  • <1-65535> – Specify the source port from 1 - 65535.
	  • <WORD> – Specify the source port range, for example 1-10.
	• ssh – Optional. Configures the default SSH services port (22)
	• telnet – Optional. Configures the default Telnet services port (23)
	• tftp – Optional. Configures the default *Trivial File Transfer Protocol* (TFTP) services port (69)
	• www – Optional. Configures the default HTTP services port (80)

```
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
```

alias number <NUMBER-ALIAS-NAME> <0-4294967295>	Creates a new number alias or applies an existing number, identified by the <NUMBER-ALIAS-NAME> keyword • <NUMBER-ALIAS-NAME> – Specify the number alias name. • <0-4294967295> – Specify the number, from 0 - 4294967295, assigned to the number alias created. Number aliases map a name to a numeric value. For example, 'alias number $NUMBER 100'. • The number alias name is: $NUMBER • The value assigned is: 100 **Note:** The value referenced by alias $NUMBER, wherever used, is 100.

```
alias string <STRING-ALIAS-NAME> <LINE>
```

alias string <STRING-ALIAS-NAME>	Creates a string alias for this RF Domain. Or associates an existing string alias with this RF Domain. String aliases map a name to an arbitrary string value. For example, '*alias string $DOMAIN test.example_company.com*'. In this example, the string alias name is: *$DOMAIN* and the string value it is mapped to is: *test.example_company.com*. In this example, the string alias refers to a domain name. • <VLAN-ALIAS-NAME> – Specify the string alias name. • <LINE> – Specify the string value. **Note:** Alias name should begin with '$'. **Note:** Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

```
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

alias vlan <VLAN-ALIAS-NAME>	Creates a VLAN alias for this RF Domain. Or associates an existing VLAN alias with this RF Domain. A VLAN alias maps a name to a VLAN ID. • <VLAN-ALIAS-NAME> – Specify the VLAN alias name. Note: Alias name should begin with '$'.
<1-4094>	Maps the VLAN alias to a VLAN ID • <1-4094> – Specify the VLAN ID from 1 - 4094. Note: Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

Examples

```
nx9500-6C8809(config)#show context
!
! Configuration of NX9500 version 7.1.0.0-010D

!
!
version 2.6
!
!
alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16
192.168.13.20 to 192.168.13.25
!
alias network $TestNetworkAlias 192.168.13.0/24
!
alias host $TestHostAlias 192.168.13.10
!
alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
!
alias network-service $NetworkServAlias proto udp
!
alias network-service $kerberos proto tcp 749 750 80 proto udp 68 sourceport 67
!
alias vlan $TestVLANAlias 1
--More--
nx9500-6C8809(config)#
```

In the following examples the global aliases '$kerberos' and '$TestVLANAlias' are associated with the RF Domain 'test' and overrides applied:

```
nx9500-6C8809(config-rf-domain-test)#alias network-service $kerberos proto tcp
749 750 80

nx9500-6C8809(config-rf-domain-test)#alias vlan $TestVLANAlias 10

vnx9500-6C8809(config-rf-domain-test)#show context
rf-domain test
 no country-code
 alias network-service $kerberos proto tcp 749 750 80
 alias vlan $TestVLANAlias 10
nx9500-6C8809(config-rf-domain-test)#

nx9500-6C8809(config-rf-domain-test)#alias string $test example_company.com

nx9500-6C8809(config-rf-domain-test)#show context
rf-domain test
 no country-code
```

```
 alias string $test example_company.com
nx9500-6C8809(config-rf-domain-test)#
Example 1:
```

In the following examples, the network-group alias '$test' is configured to include hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

```
nx9500-6C8809(config)#alias network-group $test host 192.168.1.10 192.168.1.11
nx9500-6C8809(config)#alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)#alias network-group $test address-range 192.168.4.10 to
192.168.4.20
```

Associate this network-group alias '$test' to the RF Domain 'test' and override the 'host' element of the alias.

```
nx9500-6C8809(config-rf-domain-test)#alias network-group $test host 192.168.10.10
nx9500-6C8809#show context
rf-domain test
 no country-code
 alias network-service $kerberos proto tcp 749 750 80
  alias network-group $test host 192.168.10.10
  alias network-group $test network 192.168.2.0/24 192.168.3.0/24
  alias network-group $test address-range 192.168.4.10 to 192.168.4.20
  alias vlan $TestVLANAlias 10
nx9500-6C8809(config-rf-domain-test)#
```

In the preceding example, the 'host' element of the network-group alias '$test' has been overridden. But the 'network' and 'address-range' elements have been retained as is.

Related Commands

no (rf-domain-config-mode) on page 490	Removes a network, network-group, network-service, VLAN, or string alias from this RF Domain

channel-list

Configures the channel list advertised by the AP radios. This command also enables dynamic update of a channel list.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
channel-list [2.4GHz|5GHz|5GHZ-Hi|5GZ-Lo|dynamic]
channel-list dynamic
channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
channel-list 5GHz-Hi <CHANNEL-LIST>
channel-list 5GHz-Lo <CHANNEL-LIST>
```

Parameters

```
channel-list dynamic
```

dynamic	Configure this setting to enable the dynamic channel listing mode for smart scans in the 2.4 and 5 GHz bands. This setting is disabled by default.

```
channel-list 5GHz-Hi <CHANNEL-LIST>
```

5GHz-Hi <CHANNEL-LIST>	In case of AP510i/e and AP56i/h access points functioning in the dual 5GHz mode, use this command to configure the channel list advertised by radios operating in 5GHz high frequency band mode. • <CHANNEL-LIST> – Specify the list of channels (100 - 165) separated by commas or hyphens. Note: Formoreinformation on the software modes supported on the AP510i/e and AP560i/h model access points, see rf-mode on page 1129.

```
channel-list 5GHz-Lo <CHANNEL-LIST>
```

5GHz-Lo <CHANNEL-LIST>	In case of AP510i/e and AP56i/h access points functioning in the dual 5GHz mode, use this command to configure the channel list advertised by radios operating in 5GHz low frequency band mode. • <CHANNEL-LIST> – Specify the list of channels (36 - 64) separated by commas or hyphens. Note: Formoreinformation on the software modes supported on the AP510i/e and AP560i/h model access points, see rf-mode on page 1129.

Examples

```
nx9500-6C8809(config-rf-domain-default)#channel-list 2.4GHz 1-10
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
 no country-code
 channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
nx9500-6C8809(config-rf-domain-default)#
```

Related Commands

no (rf-domain-config-mode) on page 490	Removes the list of channels configured on the selected RF Domain for 2.4 GHz and 5.0 GHz bands. Also disables dynamic update of a channel list.

contact

Configures the network administrator's contact details. The network administrator is responsible for addressing problems impacting the network.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
contact <WORD>
```

Parameters

```
contact <WORD>
```

contact <WORD>	Specify contact details, such as name and number.

Examples

```
nx9500-6C8809(config-rf-domain-default)#contact Bob+14082778691
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691
 no country-code
 channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
nx9500-6C8809(config-rf-domain-default)#
```

Related Commands

no (rf-domain-config-mode) on page 490	Removes the network administrator's contact details

control-vlan

Configures the VLAN designated for traffic control in this RF Domain

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
control-vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

Parameters

```
control-vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

control-vlan [<1-4094>| <VLAN-ALIAS-NAME>]	Specify the VLAN ID from 1 - 4094. Alternately, use a vlan-alias to identify the control VLAN. If using a vlan-alias, ensure that the alias is existing and configured.

Examples

```
nx9500-6C8809(config-rf-domain-default)#control-vlan 1
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691
 no country-code
 channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
 control-vlan 1
nx9500-6C8809(config-rf-domain-default)#
```

Related Commands

no (rf-domain-config-mode) on page 490	Disables the VLAN designated for controlling RF Domain traffic

controller-managed

Configures the RF Domain manager as the adopting controller.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
controller-managed
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-rf-domain-test)#controller-managed
```

```
nx9500-6C8809(config-rf-domain-test)#show context
rf-domain test
 country-code in
controller-managed
 network-alias techPubs host 192.168.13.8
 network-alias techPubs address-range 192.168.13.10 to 192.168.13.15
 service-alias testing index 10 proto 9 destination-port range 21 21
nx9500-6C8809(config-rf-domain-test)#
```

Related Commands

country-code

Configures a RF Domain's country of operation. Since device channels transmit in specific channels unique to the country of operation, it is essential to configure the country code correctly or risk using illegal operation.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
country-code <WORD>
```

Parameters

```
country-code <WORD>
```

country-code	Configures the RF Domain's country of operation
<WORD>	Specify the two (2) letter ISO-3166 country code.

Examples

```
nx9500-6C8809(config-rf-domain-default)#country-code ?
  WORD  The 2 letter ISO-3166 country code
  ae    United Arab Emirates
  ag    Antigua and Barbuda
  ai    Anguilla
  al    Albania
  an    Dutch Antilles
  ar    Argentina
  at    Austria
  au    Australia
  ba    Bosnia-Herzegovina
  bb    Barbados
  bd    Bangladesh
```

```
  be    Belgium
  bf    Burkina Faso

geo-coordinates

Configures the longitude and latitude of the RF Domain in order to fix its exact geographical location on a map. Use this command to define the geographical area where a common set of device configurations are deployed and managed by this RF Domain policy.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
geo-coordinates <-90.0000-90.0000> <-180.0000-180.0000>
```

Parameters

```
geo-coordinates <-90.0000-90.0000> <-180.0000-180.0000>
```

geo-coordinates <-90.0000-90.0000> <-180.0000-180.0000>	Configures the geo-coordinates of this RF Domain • <-90.0000-90.0000> – Specify the latitude from -90.0000 - 90.0000. • -180.0000-180.0000 – Specify the longitude from -180.0000 - 180.0000.

Examples

```
nx9500-6C8809(config-rf-domain-TechPubs)#geo-coordinates 12.971599 77.594563
nx9500-6C8809(config-rf-domain-TechPubs)#show context

Related Commands

no (rf-domain-config-mode) on page 490	Removes or resets this RF Domain's configured geo-coordinates

layout

Configures the RF Domain'sayout in terms of area, floor, and location on a map. It allows users to place APs across the deployment map. A maximum of 256 layouts is permitted.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
layout [area|description|floor|map-location] {(area|description|floor|map-location)}
layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME> {<1-4094>}|
map-location <URL> units [feet|meters]] {(area <AREA-NAME>|description <LINE>|
floor <FLOOR-NAME> {<1-4094>}|map-location <URL> units [feet|meters])}
```

Parameters

```
layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME> {<1-4094>}|
map-location <URL> units [feet|meters]] {(area <AREA-NAME>|description <LINE>|
floor <FLOOR-NAME> {<1-4094>}|map-location <URL> units [feet|meters])}
```

layout	Configures the RF Domain's layout in terms of area, floor, and location on a map These are recursive parameters and you can configure one or all of these parameters.
area <AREA-NAME>	Configures the RF Domain's layout in terms of the area of location • <AREA-NAME> – Specify the area name. After configuring the RF Domain's area of functioning, optionally specify the floor name (and number), description, and/or the location on map.
description <LINE>	Configures a description for this RF Domain • <LINE> – Specify a description that enables you to identify the RF Domain. For a multi-worded string, use double quotes.
floor <FLOOR-NAME> <1-4094>	Configures the RF Domain's layout in terms of the floor name and number • <FLOOR-NAME> – Specify the floor name. • <1-4094> – Optional. Specifies the floor number from 1 - 4094. The default floor number is 1. After configuring the RF Domain's floor name (and number), optionally specify the area name, description, and/or the location on map.
map-location <URL> units [feet|meters]	Configures the location of the RF Domain on the map • <URL> – Specify the URL to configure the map location. • units [feet|meters] – Configures the map units. The options are: feet or meters feet – Configures the map units in terms of feet meters – Configures the map units in terms of meter After configuring the location of the RF Domain on the map, optionally specify the area name, floor name (and number), and/or description.

Examples

```
nx9500-6C8809(config-rf-domain-default)#layout map-location www.firstfloor.com units
meters area HamiltonAve floor Floor1

Related Commands

no (rf-domain-config-mode) on page 490	Removes the RF Domain's layout details

location

Configures the RF Domain's physical location. The location could be as specific as the building name or floor number. Or it could be generic and include an entire site. The location defines the physical area where a common set of device configurations are deployed and managed by an RF Domain policy.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
location <WORD>
```

Parameters

```
location <WORD>
```

location <WORD>	Configures the RF Domain location by specifying the area or building name • <WORD> – Specify the location.

Examples

```

Related Commands

no (rf-domain-config-mode) on page 490	Removes the RF Domain's location configuration

location-server

Configures the ExtremeLocation server's hostname on the RF Domain. When configured, RF Domain access points use a Websocket to forward 802.11 frames and BLE beacons to the specified ExtremeLocation server.

Starting with WiNG 7.1.2, AP5XX APs will not use WIPS to collect WiFi packets and BLE (iBeacons and Eddystone) beacons. The information will be collected in the Collector Table and forwarded to the ExtremeLocation server from the Collector Table.

ExtremeLocation is a highly scalable indoor locationing platform that gathers location-related analytics, such as visitor trends, peak and off-peak times, dwell time, heat-maps, etc. to enable entrepreneurs deeper visibility at a venue. To enable the location tracking system, the ExtremeLocation server should be up and running and the RF Domain configuration should point to the ExtremeLocation server.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
location-server 1 ip <EL-SERVER-IP/HOSTNAME> {port <1-65535>}
```

Parameters

```
location-server 1 ip <IP/HOSTNAME> {port <1-65535>}
```

location-server 1 ip <IP/HOSTNAME>	Identifies the ExtremeLocation server by its hostname • 1 – Sets the server ID as 1. As of now only one ExtremeLocation server is configurable. • ip <IP/HOSTNAME> – Enter ExtremeLocation server's hostname. This is the ExtremeLocation server designated to receive RSSI scan data from a WiNG dedicated sensor. Note: Enter the server's hostname and not the IP address, as the IP address is likely to change periodically in order to balance load across multiple Location server instances.
port <1-65535>	Optional. Configures the port where the ExtremeLocation server is reachable. • <1-65535> – Specify a port from 1 - 65535. Note: By default, the ExtremeLocation server is reachable on port 443.

Examples

```
nx9500-6C8809(config-rf-domain-test)#location-server 1 ip feeds.extremelocation.com port
200
nx9500-6C8809(config-rf-domain-test)#show context
rf-domain test
 no country-code
 location-server 1 ip feeds.extremelocation.com port 200
nx9500-6C8809(config-rf-domain-test)#
```

Enabling Data (WiFi and BLE Beacons) forwarding to the ExtremeLocation Server

1 Configure sensor policy.

```
nx9500-6C8809(config-sensor-policy-ble)#rssi-interval-duration 35
```

2 In the RF Domain context:

a Use the sensor policy.

```
nx9500-6C8809(config-rf-domain-test)#use sensor-policy ble
```

b Configure the ExtremeLocation server hostname.

```
nx9500-6C8809(config-rf-domain-test)#location-server 1 ip feeds.extremelocation.com
```

c Configure the ExtremeLocation TenantID.

```
nx9500-6C8809(config-device-94-9B-2C-13-40-38)#location-tenantid 1234
```

Related Commands

no (rf-domain-config-mode) on page 490	Removes the ExtremeLocation server configurations

location-tenantid

Configures the ExtremeLocation Tenant's account number. ExtremeLocation Tenants, at the time of registration, are communicated (via, email) an account number uniquely identifying the Tenant. Configure this account number in the RF Domain context. When configured, data (802.11 frames and/or BLE beacons) pushed to the ExtremeLocation server, include the Tenant's account number along with the reporting RF Domain manager's MAC address. Including the Tenant account number reinforces the Tenant's identity.

Note
For information on enabling data forwarding to the ExtremeLocation server, see location-server on page 478.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
location-tenantid <WORD>
```

Parameters

```
location-tenantid <WORD>
```

location-tenantid <WORD>	Configures the ExtremeLocation Tenant's account number • <WORD> – Specify the account number.

Examples

```
nx9500-6C8809(config-rf-domain-ExLocTenant1)#location-tenantid 123456

nx9500-6C8809(config-rf-domain-ExLocTenant1)#show context

mac-name

Configures a relevant name for each MAC address. Use this command to associate client names to specific connected client MAC addresses for improved client management.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
mac-name <MAC> <NAME>
```

Parameters

```
mac-name <MAC> <NAME>
```

mac-name <MAC> <NAME>	Assigns a user-friendly name to this RF Domain's member access point's connected client to assist in its easy recognition • <MAC> – Specify the MAC address • <NAME> – Specify the client name for the specified MAC address. The name specified here will be used in events and statistics.

Examples

```
nx9500-6C8809(config-rf-domain-default)#mac-name 11-22-33-44-55-66 TestDevice

nsight-sensor

Enables the use of sensor module by NSight. This option is disabled by default.

Note

This option is not supported on the AP5XX model access points.

Supported in the following platforms:

- Access Points — AP7632, AP7662, AP8163, AP8432, AP8533
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX900

Syntax

```
nsight-sensor
```

Parameters

```
none
```

Examples

```
nx9500-6C8809(config-rf-domain-Test)#nsight-sensor
nx9500-6C8809(config-rf-domain-Test)#show context
nsight-sensor
nx9500-6C8809(config-rf-domain-Test)#
```

override-smart-rf

Enables dynamic channel switching for Smart RF radios. This command allows you to configure an override list of channels that Smart RF can use for channel compensations on 2.4 GHz and 5.0 GHz radios.

When a radio fails or is faulty, a Smart RF policy provides automatic recovery by instructing neighboring access points to increase their transmit power to compensate for the coverage loss. Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events and can ensure availability of adequate detector coverage.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
override-smartrf channel-list [2.4GHz|5GHZ] <CHANNEL-LIST>
```

Parameters

```
override-smartrf channel-list [2.4GHz|5GHZ] <CHANNEL-LIST>
```

override-smartrf	Enables dynamic channel switching for Smart RF radios
channel-list	Configures a list of channels for 2.4 GHz and 5.0 GHz Smart RF radios
2.4GHz <CHANNEL-LIST>	Selects the 2.4 GHz Smart RF radio channels • <CHANNEL-LIST> – Specify a list of channels separated by commas.
5GHz <CHANNEL-LIST>	Selects the 5.0 GHz Smart RF radio channels • <CHANNEL-LIST> – Specify a list of channels separated by commas.

Examples

```
nx9500-6C8809(config-rf-domain-default)#override-smartrf channel-list 2.4GHz 1,2,3
nx9500-6C8809(config-rf-domain-default)#show context

 override-smartrf channel-list 2.4GHz 1,2,3
 layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
nx9500-6C8809(config-rf-domain-default)#
```

Related Commands

no (rf-domain-config-mode) on page 490	Removes the override-smartrf list of channels configured for 2.4 GHz and 5.0 GHz radios

override-wlan

Configures RF Domain level overrides for a WLAN

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
override-wlan <WLAN-NAME> [shutdown|ssid|template|vlan-pool|wep128|wpa-wpa2-psk]
override-wlan <WLAN-NAME> [shutdown|ssid <SSID>|template <TEMPLATE-NAME>|vlan-pool
<1-4094> {limit <0-8192>}]
override-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]
override-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|transmit-key <1-4>]
```

Parameters

```
override-wlan <WLAN-NAME> [shutdown|ssid <SSID>|template <TEMPLATE-NAME>|vlan-pool
<1-4094> {limit <0-8192>}]
```

<WLAN-NAME>	Configures the WLAN name. If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN's coverage area.
shutdown	Shuts down WLAN operation on all mapped radios
ssid <SSID>	Configures a override SSID associated with this WLAN • <SSID> – Specify the SSID (should not exceed 32 characters in length). Each WLAN provides associated wireless clients with a SSID. This has limitations, because it requires wireless clients to associate with different SSIDs to obtain QoS and security policies. However, a WiNG-managed RF Domain can have WLANs assigned and advertise a single SSID, and yet allow users to inherit different QoS or security policies.
template <TEMPLATE-NAME>	Configures a template name for this RF Domain • <TEMPLATE-NAME> – Specify the template name (should not exceed 32 characters in length).
vlan-pool <1-4094> {limit <0-8192>}	Configures the override VLANs available to this WLAN • <1-4094> – Specify the VLAN ID from 1 - 4094. • limit <0-8192> – Optional. Sets a limit to the number of users on this VLAN from 0 - 8192. The default is 0. Controllers and service platforms allow the mapping of a WLAN to more than one VLAN. Wireless clients associating with a WLAN are assigned VLANs, from the pool representative of the WLAN, in a way that ensures proper load balancing across VLANs. Clients are tracked per VLAN, and assigned to the least used/loaded VLAN. Client VLAN usage is tracked on a per-WLAN basis. The maximum allowed client limit is 8192 per VLAN.

```
override-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]
```

<WLAN-NAME>	Configures the WLAN name. If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN's coverage area. After creating the WLAN, configure its override parameters.
wpa-wpa2-psk <PASSPHRASE>	Overrides a WLAN's existing WPA-WPA2 pre-shared key or passphrase at the RF Domain level. WPA2 is a newer 802.11i standard that provides wireless security that is stronger than *Wi-Fi Protected Access* (WPA) and WEP. • <PASSPHRASE> – Specify a WPA-WPA2 key or passphrase. It is an alphanumeric string of 8 to 64 ASCII characters or 64 HEX characters as the primary string, which both the transmitting and receiving authenticators must share in this new override PSK. The alphanumeric string allows character spaces. The string is converted to a numeric value. This passphrase saves the you the necessity of entering the 256-bit key each time keys are generated.

```
override-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|transmit-key <1-4>]
```

<WLAN-NAME>	Configures the WLAN name. If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN's coverage area. After creating the WLAN, configure its override parameters.
wep128	Overrides a WLAN's existing WEP128 keys at the RF Domain level (not the profile level). WEP128 uses a 104 bit key, which is concatenated with a 24-bit *initialization vector* (IV) to form the RC4 traffic key. WEP may be all a small-business user needs for the simple encryption of wireless data on the WLAN. However, networks that require more security are at risk from a WEP flaw. WEP is only recommended if there are client devices incapable of using higher forms of security. The existing 802.11 standard alone offers administrators no effective method to update keys.
key <1-4> hex [0 <WORD>| 2 <WORD>]	Configures the WEP128 key. A total of four keys can be configured. • <1-4> – Select the key index from 1- 4. • hex – Configures a hexadecimal key <WORD> – Specify the WEP128/Keyguard key (should not exceed 26 hexadecimal characters in length).
transmit-key <1-4>	Configures transmit WEP/Keyguard key settings • <1-4> – Transmit the key identified by the key index specified here. Specify the index from 1 - 4.

Examples

```
nx9500-6C8809(config-rf-domain-default)#override-wlan test vlan-pool 2 limit 20
nx9500-6C8809(config-rf-domain-default)#show context

```

Related Commands

no (rf-domain-config-mode) on page 490	Resets the override WLAN settings to default

sensor-server

Configures an AirDefense sensor server on this RF Domain. Sensor servers allow network administrators to monitor and download data from multiple sensors remote locations using Ethernet TCP/IP or serial communications. This enables administrators to respond quickly to interferences and coverage problems.

Access point radios can function as a sensor and upload information to a dedicated AirDefense server (external to the controller). Unique AirDefense server configurations can be used by RF Domains to ensure a WIPS server configuration is available to support the unique data protection needs of individual RF Domains. The access point works in conjunction with a dedicated AirDefense server forms a *Wireless Intrusion Protection System* (WIPS).

WIPS protects the controller managed network, wireless clients and access point radio traffic from attacks and unauthorized access. WIPS provides tools for standards compliance and around-the-clock wireless network security in a distributed environment. WIPS allows administrators to identify and accurately locate attacks, rogue devices and network vulnerabilities in real time and permits both a wired and wireless lockdown of wireless device connections upon acknowledgment of a threat.

WIPS is not supported on a WLAN basis, rather sensor functionality is supported on the access point radio(s) available to each controller managed WLAN. When an access point radio is functioning as a WIPS sensor, it is able to scan in sensor mode across all legal channels within the 2.4 and 5.0 GHz bands. Sensor support requires a AirDefense WIPS Server on the network. Sensor functionality is not provided by the access point alone. The access point works in conjunction with a dedicated WIPS server.

Note

Starting with the WiNG 7.2.0 release, AP5XX model access points are capable of capturing WPA3 frames in the sensor mode. For more information, see rf-mode on page 1129.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}
```

Parameters

```
sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}
```

Sensor-server <1-3>	Configures the AirDefense sensor server parameters • <1-3> – Select the server ID from 1 - 3. The server with the lowest defined ID is reached first. The default is 1.
ip <IP/HOSTNAME>	Configures the (non DNS) IPv4 address of the sensor server • <IP/HOSTNAME> – Specify the sensor server's IPv4 address or hostname.
port [443|<1-65535>]	Optional. Configures the sensor server port. The options are: • 443 – Configures port 443, the default port used by the AirDefense server • <1-6553> – Allows you to select a WIPS/AirDefense sensor server port from 1 - 65535

Examples

```
nx9500-6C8809(config-rf-domain-default)#sensor-server 2 ip 172.16.10.3 port 443

stats

Configures settings that define how RF Domain statistics are updated

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
stats update-interval
stats update-interval [<5-300>|auto]
```

Parameters

```
stats update-interval [<5-300>|auto]
```

stats	Configures stats related settings on this RF Domain
update-interval [<5-300>|auto]	Configures the interval at which RF Domain statistics are updated. The options are: • <5-300> – Specify an update interval from 5 - 300 seconds. • auto – The RF Domain manager automatically adjusts the update interval based on the load. This is the default setting.

Examples

nx9500-6C8809(config-rf-domain-default)#
```

Related Commands

no (rf-domain-config-mode) on page 490	Resets stats related settings

timezone

Configures the RF Domain's geographic time zone. By default all WiNG devices are shipped with the time zone and time format set to UTC *(Universal Time Coordinated)* and 24-hour clock respectively. If the time zone is not reset, all devices within the RF Domain will display time relative to the UTC - Greenwich Time. Resetting the time zone is recommended, especially for RF Domains deployed across different geographical locations. The time zone can either be set on a specific device or on an RF Domain. When configured as RF Domain setting, it applies to all devices within the domain. For more information on configuring the time zone on a device, see timezone on page 1299 (device config mode).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
timezone <TIMEZONE>
```

Parameters

```
timezone <TIMEZONE>
```

time <TIMEZONE>	Specify the RF Domain's time zone. The configured time zone will apply to all devices within the selected RF Domain.

Examples

```
nx9500-6C8809(config-rf-domain-default)#timezone America/Los_Angeles
```

```
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691
 timezone America/Los_Angeles
 stats update-interval 200
 country-code us
 sensor-server 2 ip 172.16.10.3
 override-smartrf channel-list 2.4GHz 1,2,3
 override-wlan test vlan-pool 2 limit 20
 layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
nx9500-6C8809(config-rf-domain-default)#
```

Use [TAB] to view the built-in timezones.

```
nx9500-6C8809(config-rf-domain-test)#timezone <TAB>
Africa/     Asia/       Atlantic/   Australia/  CET         CST6CDT
EET         EST5EDT     Etc/        Europe/     MST7MDT     Pacific/
PST8PDT     US/         America/
nx9500-6C8809(config-rf-domain-test)#
```

Each of these time zones are further differentiated into sub time zones. For example, as shown in the following example:

```
nx9500-6C8809(config-rf-domain-test)#timezone Africa/
Africa/Cairo         Africa/Casablanca    Africa/Harare
Africa/Johannesburg  Africa/Lagos         Africa/Nairobi
nx9500-6C8809(config-rf-domain-test)#
```

Related Commands

no (rf-domain-config-mode) on page 490	Removes a RF Domain's time zone

tree-node

Configures the hierarchical (tree-node) structure under which this RF Domain is located

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
tree-node [campus|city|country|region] {(campus|city|country|region)}
```

Parameters

```
tree-node [campus|city|country|region] {(campus|city|country|region)}
```

tree-node	Configures the hierarchical tree structure defining the RF Domain's location. The tree node hierarchy can be configured in any order, but will always appear as: `country > region > city > campus`. Further, a higher node, such as country, cannot be defined under a lower node, such as region. An RF Domain can be placed under any one of the tree nodes. But, an RF Domain at the country level may have all four nodes defined. Whereas, an RF Domain restricted to a campus, cannot have the country, city, and region nodes. At least one of these four nodes must be defined. This feature is disabled by default.
campus	Configures the campus name for this RF Domain • campus-description - Provide a brief decription of the campus.
city	Configures the city for this RF Domain • city-description - Provide a brief description of the city.
country	Configures the country for this RF Domain
region	Configures the region for this RF Domain

Usage Guidelines

The following points need to be taken into consideration when creating the tree-node structure:

- Adding a *country* first is a good idea since region, city, and campus can all be added as sub-nodes in the tree structure. However, the selected country is an invalid tree node until a RF Domain is mapped.
- A *city* and *campus* can be added in the tree structure as sub-nodes under a region. An RF Domain can be mapped anywhere down the hierarchy for a region and not just directly under a country. For example, a region can have city, campus, and one RF Domain mapped.
- Only a campus can be added as a sub-node under a city. The city is an invalid tree node until a RF Domain is mapped somewhere within the directory tree.
- A campus is the last node in the hierarchy before a RF Domain, and it is not valid unless it has a RF Domain mapped.
- After creating the tree structure do a commit and save for the tree configuration to take effect and persist across reboots.

Examples

```
ap505-13403B(config-rf-domain-default)#tree-node campus SanJoseUniversity
city SanJose country us
ap505-13403B(config-rf-domain-default)#show context
rf-domain default
 country-code us
 tree-node country us city SanJose campus SanJoseUniversity
ap505-13403B(config-rf-domain-default)#t
```

Related Commands

no (rf-domain-config-mode) on page 490	Removes the RF Domain's tree-node configuration

use (rf-domain-config-mode)

Associates the following with an RF Domain: database policy, NSight policy, sensor policy, Smart RF policy, WIPS policy, RTL server policy, and Web filtering license.

Syntax

```
use [ble-data-export-policy|database-policy|license|nsight-policy|
rtl-server-policy|sensor-policy|smart-rf-policy|wips-policy]
use [ble-data-export-policy <POLICY-NAME>|database-policy <DATABASE-POLICY-NAME>|
license <WEB-FILTERING-LICENSE>|nsight-policy <NSIGHT-POLICY-NAME>|
rtl-server-policy <RTL-SERVER-POLICY-NAME>|sensor-policy <SENSOR-POLICY-NAME>|
smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]
```

Parameters

```
use [ble-data-export-policy <POLICY-NAME>|database-policy <DATABASE-POLICY-NAME>|
license <WEB-FILTERING-LICENSE>|nsight-policy <NSIGHT-POLICY-NAME>|
rtl-server-policy <RTL-SERVER-POLICY-NAME>|sensor-policy <SENSOR-POLICY-NAME>|
smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]
```

use	Associates the following policies with the RF Domain: ble data export policy, database policy, NSight policy, sensor policy, Smart RF policy, WIPS policy. It also applies a Web filtering license to the selected RF Domain.
ble-data-export-policy <POLICY-NAME>	Associates a BLE data export policy with this RF Domain • <POLICY-NAME> – Specify the BLE data export policy name (should be existing and configured). When associated, access points within the RF Domain send BLE data to an external, third-party locationing-server using a Websocket and REST API. The BLE data export policy provides the external, locationing-server's URL. For more information on configuring the BLE data export policy, see ble-data-export-policy on page 216.
database-policy <DATABASE-POLICY-NAME>	Associates a database policy with the selected RF Domain • <DATABASE-POLICY-NAME> – Specify the database policy name (should be existing and configured). Note: This feature is not supported on the AP5XX model access points.
license <WEB-FILTERING-LICENSE>	Obtains the specified Web filtering license from the adopting controller • <WEB-FILTERING-LICENSE> – Specify the WEBF license name.

nsight-policy <NSIGHT-POLICY-NAME>	Associates an NSight policy with the selected RF Domain • Specify the NSight policy name (should be existing and configured). When applied, it enables the RF Domain manager to gather statistical data from access points within the domain and forward to the NOC running the NSight server.
rtl-server-policy <RTL-SERVER-POLICY-NAME>	Associates an *Real Time Locationing* (RTL) server policy with the selected RF Domain • <RTL-SERVER-POLICY-NAME> – Specify the RTL server policy name (should be existing and configured
sensor-policy <SENSOR-POLICY-NAME>	Associates a sensor policy with the selected RF Domain • <SENSOR-POLICY-NAME> – Specify the sensor policy name (should be existing and configured).
smart-rf-policy <SMART-RF-POLICY-NAME>	Associates a Smart RF policy with the selected RF Domain. When associated, the Smart RF policy provides automatic recovery from coverage loss (due to failed or faulty radio) by instructing neighboring access points to increase their transmit power. Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events to ensure availability of adequate detector coverage. • <SMART-RF-POLICY-NAME> – Specify the Smart RF policy name (should be existing and configured). Note: SMART RF is only applicable on AP510i/e and AP560i/h functioning in the dual-5GHz mode. That is, on the AP, RF mode for both radios is set to WLAN-5GHz.
wips-policy <WIPS-POLICY-NAME>	Associates a WIPS policy with the selected RF Domain. A WIPS policy provides protection against wireless threats and acts as a key layer of security complementing wireless VPNs, encryption and authentication. A WIPS policy uses a dedicated sensor for actively detecting and locating rogue AP devices. After detection, WIPS uses mitigation techniques to block the devices by manual termination, air lockdown, or port suppression. • <WIPS-POLICY-NAME> – Specify the WIPS policy name (should be existing and configured).

Examples

```
nx9500-6C8809(config-rf-domain-default)#use smart-rf-policy Smart-RF1
nx9500-6C8809(config-rf-domain-default)#use wips-policy WIPS1

Related Commands

no (rf-domain-config-mode) on page 490	Removes policies associated with this RF Domain

no (rf-domain-config-mode)

Negates a command or reverts configured settings to their default. When used in the RF Domain context, the no command removes the RF Domain settings, or reverts them to default values.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [alias|channel-list|contact|control-vlan|controller-managed|country-code|geo-coordinates|layout|location|location-server|location-tenantid|mac-name|nsight-sensor|override-smartrf|override-wlan|sensor-server|stats|timezone|tree-node|use]

no [channel-list [2.4GHz|5GHz|dynamic]|contact|control-vlan|controller-managed|country-code|location|location-server 1|location-tenantid|mac-name <MAC>|nsight-sensor|sensor-server <1-3>|stats update-interval|timezone|tree-node]

no alias [address-range|host|network|network-group [address-range|host|network]|network-service|number|string|vlan] <ALIAS-NAME>

no layout {(area <AREA-NAME>|floor <FLOOR-NAME>)}

no override-smartrf channel-list [2.4GHz|5GHz]

no override-wlan <WLAN-NAME> [shutdown|ssid|template|vlan-pool [<1-4094>|all]|wep128 [key <1-3>|transmit-key]|wpa-wpa2-psk]

no use [ble-data-export-policy|database-policy|license|nsight-policy|rtl-server-policy|sensor-policy|smart-rf-policy|wips-policy]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes or reverts this RF Domain's settings based on the parameters passed

Examples

The following example shows the default RF Domain settings before the 'no' commands are executed:

```
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default

```

nx5500

Adds an integrated NX 5500 series service platform to the network. If a profile for this service platform is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
nx5500 <DEVICE-NX5500-MAC>
```

Parameters

```
nx5500 <DEVICE-NX5500-MAC>
```

<DEVICE-NX5500-MAC>	Specifies the MAC address of a NX 5500 series service platform.

Examples

```
nx9500-6C8809(config)#nx5500 B4-C7-02-3C-FA-6E
nx9500-6C8809(config-device-B4-C7-02-3C-FA-6E)#

no	Removes an NX7500 series service platform from the network

nx9000

Adds an NX9500 series service platform to the network

Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
nx9000 <DEVICE-NX9XXX-MAC>
```

Parameters

```
nx9000 <DEVICE-NX9XXX-MAC>
```

<DEVICE-NX9000-MAC>	Specifies the MAC address of a NX9500 series service platform.

Examples

```
nx9500-6C8809(config)#nx9000 B4-C7-89-7C-81-08
nx9500-6C8809(config-device-B4-C7-89-7C-81-08)#
```

Related Commands

no on page 611	Removes a NX9500 series service platform from the network

roaming-assist-policy

Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect, etc.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
roaming-assist-policy <ROAMING-ASSIST-POLICY-NAME>
```

Parameters

```
roaming-assist-policy <ROAMING-ASSIST-POLICY-NAME>
```

<ROAMING-ASSIST-POLICY-NAME>	Specify the roaming-assist policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#roaming-assist-policy test
nx9500-6C8809(config-roaming-assist-policy-test)#?
Roaming Assist Mode commands:
  action               Configure action - action is deauth / log /
                       assisted-roam
  aggressiveness       Configure the roaming aggressiveness for a wireless
                       client
  detection-threshold  Configure the detection threshold - when exceeded,
                       client monitoring starts
  disassoc-time        Configure the disassociation time - time after which a
                       disassociation is sent
  handoff-count        Configure the handoff count - number of times client
                       can exceed handoff threshold
  handoff-threshold    Configure the handoff threshold - when exceeds an
                       action is taken.
  monitoring-interval  Configure the monitoring interval - interval at which
                       client monitoring occurs
  no                   Negate a command or set its defaults
  sampling-interval    Configure the sampling interval - interval at which
                       client rssi values are checked

  clrscr               Clears the display screen
  commit               Commit all changes made in this session
  end                  End current mode and change to EXEC mode
  exit                 End current mode and down to previous mode
  help                 Description of the interactive help system
  revert               Revert changes
  service              Service Commands
  show                 Show running system information
  write                Write running configuration to memory or terminal
```

```
nx9500-6C8809(config-roaming-assist-policy-test)#
```

Related Commands

no on page 611	Removes an existing roaming-assist-policy

Note
For more information on the Roaming Assist Policy commands, Roaming Assist Policy on page 1858.

role-policy

Creates a role-based firewall policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
role-policy <ROLE-POLICY-NAME>
```

Parameters

```
role-policy <ROLE-POLICY-NAME>
```

<ROLE-POLICY-NAME>	Specify the role policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#role-policy role1
nx9500-6C8809(config-role-policy-role1)#?
Role Policy Mode commands:
  default-role     Configuration for Wireless Clients not matching any role
  ldap-deadperiod  Ldap dead period interval
  ldap-query       Set the ldap query mode
  ldap-server      Add a ldap server
  ldap-timeout     Ldap query timeout interval
  no               Negate a command or set its defaults
  user-role        Create a role

  clrscr           Clears the display screen
  commit           Commit all changes made in this session
  do               Run commands from Exec mode
  end              End current mode and change to EXEC mode
  exit             End current mode and down to previous mode
  help             Description of the interactive help system
  revert           Revert changes
  service          Service Commands
  show             Show running system information
  write            Write running configuration to memory or terminal

nx9500-6C8809(config-role-policy-role1)#
```

Related Commands

no on page 611	Removes an existing role policy

Note
For more information on Role Policy commands, see Role Policy on page 1602.

route-map

Creates a dynamic BGP *(Border Gateway Protocol)* route map and enters its configuration mode

BGP route maps are used by network administrators to define rules controlling redistribution of routes between routers and routing processes. These route maps are also used to control and modify routing information.

Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
route-map <ROUTE-MAP-NAME>
```

Parameters

```
route-map <ROUTE-MAP-NAME>
```

route-map <ROUTE-MAP-NAME>	Creates a new BGP route map and enters its configuration mode

Examples

```
nx9500-6C8809(config)#route-map test
nx9500-6C8809(config-dr-route-map-test)#?
Route Map Mode commands:
  deny     Add a deny route map rule to deny set operations
  no       Negate a command or set its defaults
  permit   Add a permit route map rule to permit set operations

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-dr-route-map-test)#
```

Related Commands

no on page 611	Removes an existing dynamic BGP route map

routing-policy

Creates a routing policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
routing-policy <ROUTING-POLICY-NAME>
```

Parameters

```
routing-policy <ROUTING-POLICY-NAME>
```

<ROUTING-POLICY-NAME>	Specify the role policy name. If the policy does not exist, it is created.

Examples

```
nx9500-6C8809(config)#routing-policy test
nx9500-6C8809(config-routing-policy-test)#?
Routing Policy Mode commands:
  apply-to-local-packets  Use Policy Based Routing for packets generated by
                          the device
  logging                 Enable logging for this Route Map
  no                      Negate a command or set its defaults
  route-map               Create a Route Map
  use                     Set setting to use

  clrscr                  Clears the display screen
  commit                  Commit all changes made in this session
  do                      Run commands from Exec mode
  end                     End current mode and change to EXEC mode
  exit                    End current mode and down to previous mode
  help                    Description of the interactive help system
  revert                  Revert changes
  service                 Service Commands
  show                    Show running system information
  write                   Write running configuration to memory or terminal

nx9500-6C8809(config-routing-policy-test)#
```

Related Commands

no on page 611	Removes an existing routing policy

Note
For more information on Routing Policy commands, see Routing Policy on page 1750.

rtl-server-policy

Creates an RTL server policy and enters its configuration mode. When configured and applied on an access point, this policy enables the sending of RSSI feeds from the access point to a server. The RTL server policy provides the exact location (URL) of the server. The RSSI feeds sent are as per the sensor-

policy configured and applied on the access point. Therefore, ensure that a sensor-policy, with the rssi-interval-duration specified, is existing, configured, and applied on the access points.

To initiate RSSI feed posts to the Euclid locationing server, use the RTL server policy on the:

- AP's device/profile context, or
- AP's RF Domain context.

Supported in the following platforms:

- Access Points — AP 505, AP510
- Wireless Controllers — RFS4000
- Service Platforms — NX9500, NX9600, VX9000

Syntax

```
rtl-server-policy <RTL-POLICY-NAME>
```

Parameters

```
rtl-server-policy <RTL-POLICY-NAME>
```

<RTL-POLICY-NAME>	Specify the RTL server policy name. If an RTL server policy with the specified name does not exist, it is created.

```
nx9500-6C8809(config)#rtl-server-policy test
nx9500-6C8809(config-rtl-server-policy-test)#?
RTL Server Policy Mode commands:
  no       Negate a command or set its defaults
  url      Configure the url to send the real time RSSI feed to

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

nx9500-6C8809(config-rtl-server-policy-test)#
```

no on page 611	Removes an existing RTL server policy
use (profile/device-config-mode-commands) on page 1247	Documents the 'use' command in a device's profile or device configuration context. Use this option to associate this RTL server policy to an access point's profile or device.
use (rf-domain-config-mode) on page 488	Documents the 'use' command in the RF Domain configuration context. Use this option to associate this RTL server policy to an RF Domain. When associated, the policy is applied to all access points within the RF Domain.

rtl-server-policy-config-commands

The following table summarizes the RTL server policy configuration mode commands:

Table 25: RTL Server Policy Config Mode Commands

Command	Description
url on page 498	Configures the RTL server's URL
no (rtl-server-policy-config-mode-commands) on page 498	Removes the RTL server's URL configuration

url

Configures the RTL server's exact location. This is the URL at which the server can be reached.

Supported in the following platforms:

- Access Points — AP-7522, AP 7532, AP-8432, AP-8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
url <URL>
```

Parameters

```
url <URL>
```

url <URL>	Configures the RTL server's URL • <URL> – Specify the URL.

Examples

```
nx9500-6C8809(config-rtl-server-policy-test)#url https://testrtlsever.com
nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
 url https://testrtlsever.com
nx9500-6C8809(config-rtl-server-policy-test)#
```

Related Commands

no (rtl-server-policy-config-mode-commands) on page 498	Removes the RTL server's configured URL

no (rtl-server-policy-config-mode-commands)

Removes the locationing server's URL configuration

Supported in the following platforms:

- Access Points — AP-7522, AP 7532, AP-8432, AP-8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
no <URL>
```

Parameters

```
no <URL>
```

no <URL>	Removes the RTL server's URL

Examples

The following example displays the RTL server policy 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
 url https://testrtlsever.com
nx9500-6C8809(config-rtl-server-policy-test)#
nx9500-6C8809(config-rtl-server-policy-test)#no url
```

The following example displays the RTL server policy 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
nx9500-6C8809(config-rtl-server-policy-test)#
```

schedule-policy

Creates a schedule policy and enters its configuration mode. A schedule policy strategically enforces application filter policy rules during administrator assigned intervals.

Supported in the following platforms:

- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
schedule-policy <SCHEDULE-POLICY-NAME>
```

Parameters

```
schedule-policy <SCHEDULE-POLICY-NAME>
```

schedule-policy <SCHEDULE-POLICY-NAME>	Specify the Schedule policy name. If a policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length.

Examples

```
nx9500-6C8809(config)#schedule-policy test
nx9500-6C8809(config-schedule-policy-test)#?
Schedule Policy Mode commands:
  description  Schedule policy description
  no           Negate a command or set its defaults
  time-rule    Configure a time rule

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
```

```
  help          Description of the interactive help system
  revert        Revert changes
  service       Service Commands
  show          Show running system information
  write         Write running configuration to memory or terminal

nx9500-6C8809(config-schedule-policy-test)#
```

Related Commands

no on page 611	Removes an existing schedule policy

schedule-policy-config-commands

The following table summarizes schedule-policy configuration mode commands:

Table 26: Schedule Policy Config Mode Commands

Command	Description
description on page 500	Configures a description for this schedule policy that differentiates it from other policies with similar time rule configurations
time-rule on page 501	Configures a time rule specifying the days and optionally the start and end times
no (schedule-policy-config-mode-commands) on page 502	Removes the selected schedule policy's settings

description

Configures a description for this schedule policy that differentiates it from other policies with similar time rule configurations

Supported in the following platforms:

- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
description <WORD>
```

Parameters

```
description <WORD>
```

description <WORD>	Configures this schedule policy's description • <WORD> – Enter a description not exceeding 80 characters in length. The description should uniquely identify the policy from other policies with similar configuration.

Examples

```
nx9500-6C8809(config-schedule-policy-test)#description "Denies social networking
 sites on weekdays."
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
```

```
 description "Denies social networking sites on weekdays."
nx9500-6C8809(config-schedule-policy-test)#
```

Related Commands

no (schedule-policy-config-mode-commands) on page 502	Removes or modifies this schedule policy's description

time-rule

Configures a time rule specifying the days and optionally the start and end times. When applied to an application-policy rule, the schedule policy defines the enforcement time of the rule. For more information, see application-policy on page 195.

Supported in the following platforms:

- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|
weekends|weekdays] {start-time <HH:MM> [end-time <HH:MM>]}
```

Parameters

```
time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|
weekends|weekdays] {start-time <HH:MM> [end-time <HH:MM>]}
```

time-rule	Configures a time rule in days and hours and minutes A schedule policy can have more than one non-overlapping time-rules. The following time-rules, having overlapping time periods, are invalid: 'weekdays, start-time 9:30 am, end-time 11:30 pm' and 'all, start-time 12:00 am, end-time 12:00 pm'.
days [sunday|monday| tuesday|wednesday| thursday|friday| saturday|all| weekends| weekdays]	Specifies the days on which the time rule is applicable • sunday – Applicable on Sundays only • monday – Applicable on Mondays only • tuesday – Applicable on Tuesdays only • wednesday – Applicable on Wednesdays only • thursday – Applicable on Thursdays only • friday – Applicable on Fridays only • saturday – Applicable on Saturdays only • weekends – Applicable on weekends only • weekdays – Applicable on weekdays only • all – Applicable on all days

start-time <HH:MM> [end-time <HH:MM>]	After specifying the days of enforcement, specify the following:
	• start-time – Optional. Specifies the enforcement start time
	  • <HH:MM> – Specify the start time in hours and minutes in the HH:MM format.
	If no start time is specified, the time rule is enforced, on the specified days, at all time.
	• end-time – Specifies the enforcement end time
	  • <HH:MM> – Specify the time in hours and minutes in the HH:MM format.

Examples

```
nx9500-6C8809(config-schedule-policy-test)#time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
 description "Denies social networking sites on weekdays."
 time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#
```

Related Commands

no (schedule-policy-config-mode-commands) on page 502	Removes the time-rule from the schedule policy

no (schedule-policy-config-mode-commands)

Removes the selected schedule policy's settings

Supported in the following platforms:

- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [description|time-rule]
no description
no time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes the schedule policy's settings based on the parameters passed

Examples

The following example displays the schedule policy 'test' settings before the 'no' commands have been executed:

```
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
 description "Denies social networking sites on weekdays."
 time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#
```

The following example displays the schedule policy 'test' settings after the 'no' commands have been executed:

```
nx9500-6C8809(config-schedule-policy-test)#no description
nx9500-6C8809(config-schedule-policy-test)#no time-rule days weekdays
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
nx9500-6C8809(config-schedule-policy-test)#
```

self

Invokes the logged device's configuration context

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
self
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config)#self
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

sensor-policy

Creates a sensor policy and enters its configuration mode.

Access point radios, functioning as sensors, along with AirDefense WIPS servers protect networks from attacks and unauthorized access. These access point sensors scan legal channels and (based on a WIPS policy settings) identify events potential threats to the managed network. These events are reported to the AirDefense WIPS server, which determines the action taken.

In addition to WIPS support, sensor functionality has now been added for the Extreme Network's locationing system. The ExtremeLocation system for Wi-Fi locationing includes WiNG controllers, and access points functioning as sensors. Within the Locationing architecture, sensors scan for RSSI data on an administrator-defined interval and send to a dedicated ExtremeLocation Server resource, as opposed to an ADSP server. The ExtremeLocation Server collects the RSSI data from WiNG sensor devices, and calculates the location of Wi-Fi devices for ExtremeLocation administrators.

Use this command to configure a policy defining the mode of scanning, the channels to scan (in case scan-mode is set to custom-scan), and the RSSI interval. For the sensor policy to take effect, use the policy either in the access point's RF Domain context or in the access point's device context.

Note
If a dedicated sensor is utilized with WIPS for rogue detection, any sensor policy used is discarded and not utilized by the sensor. To avoid this situation, use ADSP channel settings exclusively to configure the sensor and not the WiNG interface.

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
sensor-policy <SENSOR-POLICY-NAME>
```

Parameters

```
sensor-policy <SENSOR-POLICY-NAME>
```

<SENSOR-POLICY-NAME>	Specify the Sensor policy name. If a sensor policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length. No character spaces are permitted within the name. Define a name unique to the policy's channel and scan mode configuration to help differentiate it from other policies.

Examples

```
nx9500-6C8809(config)#sensor-policy test
nx9500-6C8809(config-sensor-policy-test)#?
Sensor Policy Mode commands:
  custom-scan             Channel configuration in Custom Scan channels
  no                      Negate a command or set its defaults
  rssi-interval-duration  Configure the periodicity of sending RSSI info from
                          sensor to server
  scan-mode               Configure the Scan mode

  clrscr                  Clears the display screen
  commit                  Commit all changes made in this session
  do                      Run commands from Exec mode
  end                     End current mode and change to EXEC mode
  exit                    End current mode and down to previous mode
  help                    Description of the interactive help system
  revert                  Revert changes
  service                 Service Commands
  show                    Show running system information
  write                   Write running configuration to memory or terminal

nx9500-6C8809(config-sensor-policy-test)#
```

Related Commands

no on page 611	Removes an existing sensor policy

sensor-policy-config-commands

The following table summarizes sensor-policy configuration mode commands:

Table 27: Sensor Policy Config Mode Commands

Command	Description
custom-scan on page 505	Configures the channel scanning settings when the scan-mode is set to custom-scan
rssi-interval-duration on page 506	Configures the interval at which dedicated sensors scan channels for RSSI assessments and send the collected data to a specified MPact server resource
scan-mode on page 506	Configures the mode of scanning used by dedicated sensors (access point radios)
no (sensor-policy-config-mode-commands) on page 507	Removes or reverts to default a sensor policy's settings

custom-scan

Configures the channel scanning settings when the scan-mode is set to custom-scan

Note

If the mode of scanning is set to Custom-Scan, use this command to configure the channels to be scanned. To set the mode of scanning to custom-scan, use the scan-mode > Custom-Scan command. For more information, see scan-mode on page 506.

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
custom-scan channel-frequency <CHANNEL-FREQUENCY> width
[20MHz|40MHz-Bth|40MHz-Lower|40MHz-Upper|80MHz] scan-weight <SCAN-WEIGHT>
```

Parameters

```
custom-scan channel-frequency <CHANNEL-FREQUENCY> width
[20MHz|40MHz-Bth|40MHz-Lower|40MHz-Upper|80MHz] scan-weight <SCAN-WEIGHT>
```

custom-scan	Configures the custom-scan channel frequency, channel width, and scan weight
channel-frequency <CHANNEL-FREQUENCY>	Configures the channel frequency. A list of unique channels in the 2.4, 4.9, 5 and 6 GHz band can be collectively or individually enabled for customized channel scans and RSSI reporting. • <CHANNEL-FREQUENCY> – Specify a single or multiple, 'comma-separated' channel frequencies.
width [20MHz| 40MHz-Both| 40MHz-Lower| 40MHz-Upper| 80MHz]	Configures the channel width. When custom channels are selected for RSSI scans, each selected channel can have its own width defined. Numerous channels have their width fixed at 20MHz, 802.11a radios support 20 and 40 MHz channel widths. • 20MHz – Sets the channel width as 20 Mhz • 40Mhz-Both – Sets the channel width as 40Mhz-Both • 40Mhz-Lowe – Sets the channel width as 40Mhz-Lower • 40Mhz-Upper – Sets the channel width as 40Mhz-Upper • 80Mhz – Sets the channel width as 80Mhz
scan-weight <SCAN-WEIGHT>	Configures the scan-weight (scanning duration) for each of the selected channels. Each selected channel can have its weight prioritized in respect to the amount of time a scan is permitted within the defined RSSI scan interval. • <SCAN-WEIGHT> – Specify the scan weightage given to each selected channel.

Examples

```
nx9500-6C8809(config-sensor-policy-test)#custom-scan channel-frequency 2412 width 20MHz
scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#custom-scan channel-frequency 2417 width 20MHz
scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

Related Commands

no (sensor-policy-config-mode-commands) on page 507	Removes channels from the channels-to-scan list in case of scan-mode being set to Custom-Scan

rssi-interval-duration

Configures the interval, in seconds, at which dedicated sensors scan channels for RSSI assessments and send the RSSI data obtained to a specified server resource

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
rssi-interval-duration <1-60>
```

Parameters

```
rssi-interval-duration <1-60>
```

rssi-interval-duration <1-60>	Configures the RSSI interval duration in seconds. This is the interval at which the sensor scans channels for RSSI data and forwards the data to a dedicated server resource. The server calculates real-time locations of Wi-Fi devices based on the this data. • <1-60> – Specify the RSSI interval duration from 1 - 60 seconds. The default is 1 second. The channels scanned for RSSI assessment depends on the scan-mode selected. For more information, see scan-mode on page 506 and custom-scan on page 505. Ensure that the server's IP address or hostname has been configured in the access point sensor's RF Domain context.

Examples

```
nx9500-6C8809(config-sensor-policy-test)#rssi-interval-duration 30
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

Related Commands

no (sensor-policy-config-mode-commands) on page 507	Resets the interval at which RSSI data is collected and sent by the sensor to the MPact server host to default (1 second)

scan-mode

Configures the mode of scanning used by dedicated sensors (access point radios)

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
scan-mode [Channel-Lock|Custom-Scan|Default-Scan]
scan-mode Channel-Lock lock-frequency <LOCK-FREQUENCY>
scan-mode [Custom-Scan|Default-Scan]
```

Parameters

```
scan-mode Channel-Lock lock-frequency <LOCK-FREQUENCY>
```

scan-mode	Configures the mode of scanning used by the sensors to scan system-defined or user-defined channels for RSSI assessments. The options are: Channel-Lock, Custom-Scan, and Default-Scan.
Channel-Lock lock-frequency <LOCK-FREQUENCY>	Configures the mode of scanning as channel-lock • lock-frequency <LOCK-FREQUENCY> – Locks scanning for RSSI data to one specific channel identified by the <LOCK-FREQUENCY> parameter. • <LOCK-FREQUENCY> – Specify the channel frequency in MHz. When specified, the sensor scans only this specified channel.

```
scan-mode [Custom-Scan|Default-Scan]
```

scan-mode	Configures the mode of scanning used by the sensor. The options are: channel-lock, custom-scan, and default-scan.
Custom-Scan	Configures the mode of scanning as custom-scan Select this option to restrict scanning to user-defined channels. If selecting this option, use the custom-scan > channel-frequency command to configure the channels scanned by the dedicated sensor. For more information, see custom-scan on page 505.
Default-Scan	Configures the mode of scanning as Default-Scan. This is the default setting. By default the system has a fixed, built-in list of channels that are scanned. These channels are hard coded in a spread pattern of 1, 6, 11, 36, 40, 44, and 48. When selected, the dedicated sensor scans only these default channels.

Examples

```
nx9500-6C8809(config-sensor-policy-test)#scan-mode Custom-Scan
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

Related Commands

no (sensor-policy-config-mode-commands) on page 507	Reverts the scan-mode to default (Default-Scan)

no (sensor-policy-config-mode-commands)

Removes or reverts to default a sensor policy's settings

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
no [custom-scan|rss1-interval-duration|scan-mode]
no custom-scan channel-frequency <CHANNEL-FREQUENCY-LIST>
no rssi-interval-duration
no scan-mode
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes or reverts to default a sensor policy settings based on the parameters passed

Examples

The following example shows the sensor-policy 'test' settings before the 'no' commands are executed:

```
nx9500-6C8809nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

The scan-mode is reverted back to the default setting of 'Default-Scan', as show in the following output:

```
nx9500-6C8809(config-sensor-policy-test)#no scan-mode
nx9500-6C8809(config-sensor-policy-test)#no custom-scan channel-frequency 2412
nx9500-6C8809(config-sensor-policy-test)#no custom-scan channel-frequency 2417
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Default-Scan
nx9500-6C8809(config-sensor-policy-test)#
```

smart-rf-policy

Configures a Smart RF policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
smart-rf-policy <SMART-RF-POLICY-NAME>
```

Parameters

```
smart-rf-policy <SMART-RF-POLICY-NAME>
```

<SMART-RF-POLICY-NAME>	Specify the Smart RF policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#smart-rf-policy test
nx9500-6C8809(config-smart-rf-policy-test)#?
Smart RF Mode commands:
  area                    Specify channel list/ power for an area
  assignable-power        Specify the assignable power during power-assignment
  avoidance-time          Time to avoid a channel once dfs/adaptivity
                          avoidance is necessary
  channel-list            Select channel list for smart-rf
  channel-width           Select channel width for smart-rf
  coverage-hole-recovery  Recover from coverage hole
  enable                  Enable this smart-rf policy
  group-by                Configure grouping parameters
  interference-recovery   Recover issues due to excessive noise and
                          interference
  neighbor-recovery       Recover issues due to faulty neighbor radios
  no                      Negate a command or set its defaults
  select-shutdown         Select redundant 2.4GHz Radios to shutdown
  sensitivity             Configure smart-rf sensitivity (Modifies various
                          other smart-rf configuration items)
  smart-ocs-monitoring    Smart off channel scanning

  clrscr                  Clears the display screen
  commit                  Commit all changes made in this session
  end                     End current mode and change to EXEC mode
  exit                    End current mode and down to previous mode
  help                    Description of the interactive help system
  revert                  Revert changes
  service                 Service Commands

  write                   Write running configuration to memory or term

nx9500-6C8809(config-smart-rf-policy-test)#
```

Related Commands

no on page 611	Removes an existing Smart RF policy

Note
For more information on Smart RF policy commands, see SMART-RF Policy on page 1638.

t5

Invokes the configuration mode of a t5 wireless controller

Supported in the following platforms:

- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
t5 <T5-DEVICE-MAC>
```

Parameters

```
t5 <T5-DEVICE-MAC>
```

t5 <T5-DEVICE-MAC>	Specify the T5 device's MAC address. The system enters the identified device's configuration mode. A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs *(Customer Premises Equipments)* are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL *(Digital Subscriber Line)* as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack. After logging on to the T5 device, use the 'cpe' keyword and configure the following mandatory settings: • vlan – Set a VLAN from 1 - 4,094 used as a virtual interface for connections between the T5 controller and its managed CPE devices. • start ip – Set a starting IP address used in a range of addresses available to T5 controller connecting CPE devices. • end ip – Set an end IP address used in a range of addresses available to T5 controller connecting CPE devices.

Examples

```
nx9500-6C8809(config)#t5 B4:C7:99:ED:5C:2C
nx9500-6C8809(config-device-B4:C7:99:ED:5C:2C)#?
T5 Device Mode commands:
  adsp-sensor-server  Configure WIPS server
  bridge              Sets MAC address expiration time in the bridge address
                      table
  clock               Configure clock options
  cpe                 T5 CPE configuration
  hostname            Set system's network name
  interface           Select an interface to configure
  ip                  Internet Protocol (IP)
  no                  Negate a command or set its defaults
  ntp                 Configure NTP
  override-wlan       Configure RF Domain level overrides for wlan
  password            T5 password configuration
  qos                 QOS settings
  radius-server       Radius server settings
  t5                  T5 configuration
  t5-logging          Modify message logging facilities
  use                 Set setting to use

  clrscr              Clears the display screen
  commit              Commit all changes made in this session
  do                  Run commands from Exec mode
  end                 End current mode and change to EXEC mode
  exit                End current mode and down to previous mode
  help                Description of the interactive help system
  revert              Revert changes
  service             Service Commands
  show                Show running system information
  write               Write running configuration to memory or terminal

nx9500-6C8809(config-device-B4:C7:99:ED:5C:2C)#
```

Related Commands

no on page 611	Removes the T5 wireless controller identified by the device's MAC address

web-filter-policy

Creates a Web Filtering policy and enters its configuration mode. This policy defines rules managing the local classification database and the cached data. When configured and applied, this policy also enables caching of URL classification records in a local database in a controller-based, *hierarchically managed* (HM) deployment. Use this option to specify the following: classification server details, size of the local database, time for which records are cached in the database, the action taken in case the classification server is unavailable, etc.

The Web filter policy is applied at the profile or device level.

For more information on URL filtering, see url-filter on page 594.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
web-filter-policy <WEB-FILTER-POLICY-NAME>
```

Parameters

```
web-filter-policy <WEB-FILTER-POLICY-NAME>
```

<WEB-FILTER-POLICY-NAME>	Specify the Web filter policy name. If the policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#web-filter-policy test
nx9500-6C8809(config-web-filter-policy-test)#?
Content Filter Mode commands:
  cache-max-recs       Configure the maximum number of records in local cache
  cache-save-interval  Configure the time a record is saved in local cache
  logging              Select logging method
  no                   Negate a command or set its defaults
  server-host          Configure URL classification server if it is not the
                       adopted controller
  server-unreachable   Permission to access website when classification server
                       is unreachable (default is pass)
  uncategorized-url    Permission to website when server fails to classify the
                       URL request (default is pass)

  clrscr               Clears the display screen
  commit               Commit all changes made in this session
  do                   Run commands from Exec mode
  end                  End current mode and change to EXEC mode
  exit                 End current mode and down to previous mode
  help                 Description of the interactive help system
  revert               Revert changes
  service              Service Commands
  show                 Show running system information
  write                Write running configuration to memory or terminal

nx9500-6C8809(config-web-filter-policy-test)#
```

Related Commands

no on page 611	Removes an existing Web filter policy

web-filter-config-commands

The following table summarizes Web Filter policy configuration mode commands:

Table 28: Web Filter Config Mode Commands

Command	Description
cache-max-recs on page 512	Configures the maximum number of records (URLs and Web pages) cached in the local database
cache-save-interval on page 513	Configures the maximum time period for which a record (URL and Web page classification entry) is cached in the local database
logging on page 513	Configures the method used to log Web filtering events
server-host on page 514	Configures the URL classification server in case it is not the adopted controller
server-unreachable on page 515	Configures the action taken in case the classification server is unreachable
uncategorized-url on page 515	Configures the action taken in case the classification server fails to classify a URL/ Website
no (web-filter-policy-config-mode-commands) on page 516	Reverts the selected Web Filter policy settings to default

cache-max-recs

Configures the maximum number of records (URL and Web page classification entries) cached in the local database

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
cache-max-recs <1-1000000>
```

Parameters

```
cache-max-recs <1-1000000>
```

cache-max-recs <1-1000000>	Specify the maximum number of records cached in the local database from 1 - 1000000. When configuring this value take into consideration the type of device using the Web Filter policy. The value should approximately be as per the following information: • NX95XX – <1-1000000> (default is 100000) • NX75XX – <1-100000> (default is 10000) • RFS Switches – <1-10000> (default is 1000) • Access Points – <1-1500> (default is 500)

Examples

```
nx9500-6C8809(config-web-filter-policy-test)#cache-max-recs 9000
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
nx9500-6C8809(config-web-filter-policy-test)#
```

Related Commands

no (web-filter-policy-config-mode-commands) on page 516	Reverts the maximum number of stored records to default. Please see the parameter table for default values for the different device types.

cache-save-interval

Configures the maximum time period, in seconds, for which a record (URL and Web page classification entry) is cached in the local database. Once the specified time has expired the record is removed from the cache.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
cache-save-interval <1-86400>
```

Parameters

```
cache-save-interval <1-86400>
```

cache-save-interval <1-86400>	Specify the maximum time period, in seconds, for which a record is cached in the local database from 1 - 86400 seconds. The default is 60 seconds.

Examples

```
nx9500-6C8809(config-web-filter-policy-test)#cache-save-interval 1000
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
nx9500-6C8809(config-web-filter-policy-test)#
```

Related Commands

no (web-filter-policy-config-mode-commands) on page 516	Reverts the maximum time period for which a record (URL and Web page classification entry) is cached in the local database to default (60)

logging

Configures the method used to log Web filtering events

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
logging [logfile|syslog]
```

Parameters

```
logging [logfile|syslog]
```

logging [logfile|syslog]	Selects the method used to log Web filtering events. The options are: • logfile – Logs to a file. • syslog – Logs to the syslog server. This is the default setting.

Examples

```
nx9500-6C8809(config-web-filter-policy-test)#logging logfile
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 logging logfile
nx9500-6C8809(config-web-filter-policy-test)#
```

server-host

Configures the URL classification server in case it is not the adopted controller

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]
```

Parameters

```
server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]
```

server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]	Use one of the following options to identify the URL classification server: • host-name <SERVER-HOST-NAME> – Identifies the classification server by its hostname. • ip-address <SERVER-IPv4> – Identifies the classification server by its IP address. • mint-id <SERVER-MiNT-ID> – Identifies the classification server by its MiNT ID.

Examples

```
nx9500-6C8809(config-web-filter-policy-test)#server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

Related Commands

no (web-filter-policy-config-mode-commands) on page 516	Removes the URL classification server's configured details, such as hostname, ip-address, or MiNT ID.

server-unreachable

Configures the action taken in case the classification server is unreachable. Based on the value configured the an end user's request for a URL/Website is either blocked or passed.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
server-unreachable [block|pass]
```

Parameters

```
server-unreachable [block|pass]
```

server-unreachable [block|pass]	Configures the action taken in case the classification server is unreachable. The options are: • block – Denies access to the requested URL/Website • pass – Allows access to the requested URL/Website. This is the default value.

Examples

```
nx9500-6C8809(config-web-filter-policy-test)#server-unreachable block
```

```
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 server-unreachable block
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

Related Commands

no (web-filter-policy-config-mode-commands) on page 516	Reverts the action taken, in case the classification server is unreachable, to default (pass),

uncategorized-url

Configures the action taken in case the classification server fails to classify a URL/Website. Based on the value configured the an end user's request for a non-classified URL/Website is either blocked or passed.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
uncategorized-url [block|pass]
```

Parameters

```
uncategorized-url [block|pass]
```

uncategorized-url [block|pass]	Configures the action taken in case the classification server fails to classify a URL/Website. The options are: • block – Denies access to the requested non-classified URL/Website • pass – Allows access to the requested non-classified URL/Website. This is the default value.

Examples

```
nx9500-6C8809(config-web-filter-policy-test)#uncategorized-url block
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 uncategorized-url block
 server-unreachable block
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

Related Commands

no (web-filter-policy-config-mode-commands) on page 516	Reverts the action taken, in case the classification server fails to classify a URL/Website, to default (pass)

no (web-filter-policy-config-mode-commands)

Reverts the selected Web Filter policy settings to default, based on the parameters passed

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [cache-max-recs|cache-save-interval|server-host|server-unreachable|uncategorized-url]
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Reverts the selected Web Filter policy settings to default, based on the parameters passed. Specify the parameters to revert back to default value.

Examples

The following example shows the Web Filter policy ‘test’ settings before the ‘no’ command is executed:

```
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 uncategorized-url block
 server-unreachable block
```

```
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
nx9500-6C8809(config-web-filter-policy-test)#no cache-max-recs
nx9500-6C8809(config-web-filter-policy-test)#no server-unreachable
nx9500-6C8809(config-web-filter-policy-test)#no uncategorized-url
```

The following example shows the Web Filter policy 'test' settings after the 'no' command has been executed:

```
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-save-interval 1000
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

wips-policy

Configures a WIPS policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
wips-policy <WIPS-POLICY-NAME>
```

Parameters

```
wips-policy <WIPS-POLICY-NAME>
```

<WIPS-POLICY-NAME>	Specify the WIPS policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#wips-policy test
nx9500-6C8809(config-wips-policy-test)#?
Wips Policy Mode commands:
  ap-detection               Rogue AP detection
  enable                     Enable this wips policy
  event                      Configure an event
  history-throttle-duration  Configure the duration for which event duplicates
                             are not stored in history
  interference-event         Specify events which will contribute to smart-rf
                             wifi interference calculations
  no                         Negate a command or set its defaults
  signature                  Signature to configure
  use                        Set setting to use

  clrscr                     Clears the display screen
  commit                     Commit all changes made in this session
  do                         Run commands from Exec mode
  end                        End current mode and change to EXEC mode
  exit                       End current mode and down to previous mode
  help                       Description of the interactive help system
  revert                     Revert changes
  service                    Service Commands
```

```
  show                          Show running system information
  write                         Write running configuration to memory or terminal

nx9500-6C8809(config-wips-policy-test)#
```

Related Commands

no on page 611	Removes an existing WIPS policy

Note
For more information on WIPS Policy commands, see WIPS Policy on page 1663.

wlan

Configures a WLAN and enters its configuration mode. Use this command to modify an existing WLAN's settings.

A WLAN is a data-communications system that flexibly extends the functionality of a wired LAN. A WLAN links two or more computers or devices using spread-spectrum or OFDM *(Orthogonal Frequency Division Multiplexing)* modulation based technology. WLANs do not require lining up devices for line-of-sight transmission, and are thus, desirable for wireless networking. Roaming users can be handed off from one access point to another, like a cellular phone system. WLANs can therefore be configured around the needs of specific user groups, even when they are not in physical proximity.

WLANs can provide an abundance of services, including data communications (allowing mobile devices to access applications), e-mail, file, and print services or even specialty applications (such as guest access control and asset tracking).

Each WLAN configuration contains encryption, authentication and QoS policies and conditions for user connections. Connected access point radios transmit periodic beacons for each BSS. A beacon advertises the SSID, security requirements, supported data rates of the wireless network to enable clients to locate and connect to the WLAN.

WLANs are mapped to radios on each access point. A WLAN can be advertised from a single access point radio or can span multiple access points and radios. WLAN configurations can be defined to provide service to specific areas of a site. For example, a guest access WLAN may only be mapped to a 2.4 GHz radio in a lobby or conference room providing limited coverage, while a data WLAN is mapped to all 2.4 GHz and 5.0 GHz radios at the branch site to provide complete coverage.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
wlan {<WLAN-NAME>|containing <WLAN-NAME>}
```

Parameters

```
wlan {<WLAN-NAME>|containing <WLAN-NAME>}
```

wlan <WLAN-NAME>	Configures a new WLAN • <WLAN-NAME> – Optional. Specify the WLAN name. Note: The WLAN name could be a logical representation of its coverage area (for example, engineering, marketing etc.). The name cannot exceed 32 characters.
containing <WLAN-NAME>	Optional. Configures an existing WLAN's settings • <WLAN-NAME> – Specify a sub-string in the WLAN name. Use this parameter to filter a WLAN. This option allows you to select and enter the configuration mode of one or more WLANs.

Examples

```
nx9500-6C8809(config)#wlan wlan1
nx9500-6C8809(config-wlan-wlan1)#?
Wireless LAN Mode commands:
  802.11v                                 Configure 802.11v parameters
  accounting                              Configure how accounting records are
                                          created for this wlan
  acl                                     Actions taken based on ACL
                                          configuration [ packet drop being one
                                          of them]
  answer-broadcast-probes                 Include this wlan when responding to
                                          probe requests that do not specify an
                                          SSID
  assoc-response                          Association response threshold
  association-list                        Configure the association list for
                                          the wlan
  authentication-type                     The authentication type of this WLAN
  bridging-mode                           Configure how packets to/from this
                                          wlan are bridged
  broadcast-dhcp                          Configure broadcast DHCP packet
                                          handling
  broadcast-ssid                          Advertise the SSID of the WLAN in
                                          beacons
  captive-portal-enforcement              Enable captive-portal enforcement on
                                          the wlan
  client-access                           Enable client-access (normal data
                                          operations) on this wlan
  client-client-communication             Allow switching of frames from one
                                          wireless client to another on this
                                          wlan
  client-load-balancing                   Configure load balancing of clients
                                          on this wlan
  controller-assisted-mobility            Enable controller assisted mobility
                                          to determine wireless clients' VLAN
                                          assignment
  data-rates                              Specify the 802.11 rates to be
                                          supported on this wlan
  description                             Configure a description of the usage
                                          of this wlan
  downstream-group-addressed-forwarding   Enable downstream group addressed
                                          forwarding of packets
  dpi                                     Deep-Packet-Inspection (Application
                                          Assurance)
  dynamic-vlan-assignment                 Dynamic VLAN assignment configuration
  eap-types                               Configure client access based on
                                          eap-type used for authentication
  encryption-type                         Configure the encryption to use on
                                          this wlan
```

```
enforce-dhcp                          Drop packets from Wireless Clients
                                      with static IP address
fast-bss-transition                   Configure support for 802.11r Fast
                                      BSS Transition
http-analyze                          Enable HTTP URL analysis on the wlan
ip                                    Internet Protocol (IP)
ipv6                                  Internet Protocol version 6 (IPv6)
kerberos                              Configure kerberos authentication
                                      parameters
mac-authentication                    Configure mac-authentication related
                                      parameters
no                                    Negate a command or set its defaults
nsight                                Nsight Server
opendns                               OpenDNS related config for this wlan
protected-mgmt-frames                 Protected Management Frames (IEEE
                                      802.11w) related configuration
proxy-arp-mode                        Configure handling of ARP requests
                                      with proxy-arp is enabled
proxy-nd-mode                         Configure handling of IPv6 ND
                                      requests with proxy-nd is enabled
qos-map                               Support the 802.11u QoS map element
                                      and frame
radio-resource-measurement            Configure support for 802.11k Radio
                                      Resource Measurement
radius                                Configure RADIUS related parameters
registration                          Enable dynamic registration of device
                                      (or) user
relay-agent                           Configure dhcp relay agent info
shutdown                              Shutdown this wlan
ssid                                  Configure the Service Set Identifier
                                      for this WLAN
t5-client-isolation                   Isolate traffic among clients
t5-security                           Configure encryption and
                                      authentication
time-based-access                     Configure client access based on time
use                                   Set setting to use
vlan                                  Configure the vlan where traffic from
                                      this wlan is mapped
vlan-pool-member                      Add a member vlan to the pool of
                                      vlans for the wlan (Note:
                                      configuration of a vlan-pool
                                      overrides the 'vlan' configuration)
wep128                                Configure WEP128 parameters
wep64                                 Configure WEP64 parameters
wing-extensions                       Enable support for WiNG-Specific
                                      extensions to 802.11
wireless-client                       Configure wireless-client specific
                                      parameters
wpa-wpa2                              Modify tkip-ccmp (wpa/wpa2) related
                                      parameters

clrscr                                Clears the display screen
commit                                Commit all changes made in this
                                      session
do                                    Run commands from Exec mode
end                                   End current mode and change to EXEC
                                      mode
exit                                  End current mode and down to previous
                                      mode
help                                  Description of the interactive help
                                      system
revert                                Revert changes
service                               Service Commands
show                                  Show running system information
```

```
  write                                  Write running configuration to memory
                                         or terminal

nx9500-6C8809(config-wlan-wlan1)#
```

The following example shows how to use the 'containing' keyword to enter the configuration mode of an existing WLAN:

```
nx9500-6C8809(config)#wlan containing wlan1
nx9500-6C8809(config-wlan-{'containing': 'wlan1'})#
```

Related Commands

no on page 611	Removes an existing WLAN from the system

wlan-config-mode-commands

This section documents the WLAN configuration mode commands in detail.

Use the (config) instance to configure WLAN related parameters. To navigate to this instance, use the following command:

```
<DEVICE>(config)#wlan <WLAN-NAME>
```

The following table lists the WLAN configuration mode commands:

Table 29: WLAN Config Mode Commands

Command	Description
802.11v on page 523	Configures the IEEE 802.11v standard parameters on this WLAN
accounting (wlan-config-mode) on page 524	Defines a WLAN's accounting settings
acl on page 526	Defines the actions based on an ACL rule configuration
answer-broadcast-probes on page 527	Allows a WLAN to respond to probes for broadcast ESS
assoc-response on page 528	Configures a minimum *receive signal strength indication* (RSSI) value, below which the WLAN does not send a response to a client's association request
association-list on page 529	Attaches an existing global association list to a WLAN
authentication-type	Sets a WLAN's authentication type
bridging-mode on page 532	Configures how packets are bridged to/from this WLAN
broadcast-dhcp on page 533	Configures broadcast DHCP packet handling
broadcast-ssid on page 533	Advertises a WLAN's SSID in beacons
captive-portal-enforcement on page 534	Configures a WLAN's captive portal enforcement
client-access on page 535	Enables WLAN client access (normal data operations)
client-client-communication on page 535	Allows the switching of frames from one wireless client to another on a WLAN
client-load-balancing on page 535	Enables load balancing of WLAN clients

Table 29: WLAN Config Mode Commands (continued)

Command	Description
controller-assisted-mobility on page 537	Enables controller assisted mobility to determine wireless clients' VLAN assignment
data-rates on page 538	Specifies the 802.11 rates supported on the WLAN
description on page 540	Sets a WLAN's description
downstream-group-addressed-forwarding on page 540	Enables forwarding of downstream packets addressed to a group
dpi on page 541	Enables extraction of metadata flows on the WLAN
dynamic-vlan-assignment on page 542	Configures dynamic VLAN assignment on this WLAN
eap-types on page 543	Configures client access based on eap-type used for authentication
encryption-type on page 544	Sets the WLAN's encryption type
enforce-dhcp on page 546	Drops packets from clients with a static IP address
fast-bss-transition on page 546	Configures support for 802.11r fast BSS transition on a WLAN
http-analyze on page 547	Enables HTTP URL analysis on the WLAN
ip (wlan-config-mode) on page 549	Configures IPv4 settings on this WLAN
ipv6 (wlan-config-mode) on page 550	Configures IPv6 settings on this WLAN
kerberos on page 551	Configures Kerberos authentication parameters
mac-authentication on page 552	Configures MAC authentication parameters
nsight on page 553	Enables retention of guest client history in the NSight database
opendns on page 554	Configures the device ID, which is embedded in each DNS query packet going out from an access point, wireless controller, or service platform to the OpenDNS server
protected-mgmt-frames on page 555	Enables and configures the WLAN's frame protection mode and security association
proxy-arp-mode on page 556	Enables the proxy ARP mode for ARP requests
proxy-nd-mode on page 557	Configures the proxy ND mode for this WLAN member clients as either strict or dynamic
qos-map on page 558	Enables support for 802.11u QoS map element and frames
radio-resource-measurement on page 558	Enables support for 802.11k radio resource measurement
radius on page 559	Configures RADIUS parameters
registration on page 561	Configures settings enabling dynamic registration of devices. Use this command to specify the mode of registration and to configure corresponding parameters.
relay-agent on page 564	Enables support for DHCP relay agent information (option 82) feature on this WLAN
service (wlan-config-context) on page 565	Invokes service commands applicable in the WLAN configuration mode

Table 29: WLAN Config Mode Commands (continued)

Command	Description
shutdown on page 570	Shuts down a WLAN
ssid on page 571	Configures the WLAN's SSID
t5-client-isolation on page 572	Disallows clients connecting to the WLAN to communicate with one another
t5-security on page 573	Configures T5 PowerBroadband security settings
time-based-access on page 574	Configures time-based client access
use (wlan-config-mode) on page 575	Defines WLAN mode configuration settings
vlan on page 579	Assigns a VLAN for the WLAN
vlan-pool-member on page 580	Adds a member VLAN to the pool of VLANs for a WLAN
wep128 on page 581	Configures WEP128 parameters
wep64 on page 582	Configures WEP64 parameters
wing-extensions on page 583	Enables support for WiNG specific extensions to 802.11
wireless-client on page 585	Configures the transmit power for wireless clients transmission
wpa-wpa2 on page 588	Modifies TKIP and CCMP (WPA/WPA2) related parameters
no (wlan-config-mode) on page 590	Negates a command or reverts settings to their default

802.11v

Use this command to configure 802.11v parameters on this WLAN. The *IEEE 802.11* family of standards includes the 802.11v standard that allows client devices to exchange information about the network topology, including information about the *RF* environment, making each client network aware, facilitating overall improvement of the wireless network.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
802.11v [bss-transition|session-information-url <URL>]
```

Parameters

```
802.11v [bss-transition|session-information-url <URL>]
```

802.11v	Configures IEEE 802.11v parameters, such as 'bss-transition' and session-information-url'.
bss-transition	Enables BSS *(Base station Subsystem)* transition management capabilities on the WLAN APs. When enabled, WLAN APs send *BSS Transition Management Request* frames to 802.11v capable clients. These request frames suggest a specific AP, or a set of APs to which the client can transition to for better throughput and QoS *(Quality of Service)*. Note: This feature is disabled by default.
session-information-url <URL>	Configures the session information URL. This is the URL containing specific information about the client session. This is the URL to which the WLAN AP sends the BSS Transition Management Request frames. • <URL> - Specify the session information URL.

Examples

```
NOC-NX9500(config-wlan-test)#802.11v bss-transition

NOC-NX9500(config-wlan-test)#show context
wlan test
 ssid test123
 bridging-mode local
 encryption-type none
 authentication-type none
 802.11v bss-transition
NOC-NX9500(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables 802.11v BSS Transition Management capabilities and removes the session-information-url

accounting (wlan-config-mode)

Defines the WLAN's accounting configuration

Accounting is the method of collecting user data, such as start and stop times, executed commands (for example, PPP), number of packets and number of bytes received and transmitted. This data is sent to the security server for billing, auditing, and reporting purposes. Accounting enables wireless network administrators to track the services and network resources accessed and consumed by users. When enabled, this feature allows the network access server to report and log user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA policies.

Accounting can be enabled and applied to access point, wireless controller, or service platform managed WLANs. Once enabled, it uniquely logs accounting events specific to the managed WLAN. Accounting logs contain information about the use of remote access services by users. This information is of great assistance in partitioning local versus remote users and how to best accommodate each. Remote user information can be archived to a location outside of the access point for periodic network and user permission administration.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
accounting [radius|syslog|wait-client-ip]
accounting [radius|wait-client-ip]
accounting syslog [host|mac-address-format]
accounting syslog host <IP/HOSTNAME> {port <1-65535>}
{proxy-mode [none|through-controller|through-rf-domain-manager]}
accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|
pair-hyphen|quad-dot] case [lower|upper]
```

Parameters

```
accounting [radius|wait-client-ip]
```

accounting radius	Enables support for WLAN RADIUS accounting messages. When enabled, the WLAN uses an external RADIUS resource for accounting. This option is disabled by default. Use the `use > aaa-policy > <AAA-POLICY-NAME>` command to associate an appropriate AAA policy with this WLAN. This AAA policy should be existing and should define the accounting, authentication, and authorization parameters.
accounting wait-client-ip	Enables waiting for client's IP before commencing the accounting procedure

```
accounting syslog host <IP/HOSTNAME> {port <1-65535>}
{proxy-mode [none|through-controller|through-rf-domain-manager]}
```

accounting syslog	Enables support for WLAN syslog accounting messages in standard syslog format (RFC 3164). This option is disabled by default.
host <IP/HOSTNAME>	Configures a syslog destination hostname or IP address for accounting records • <IP/HOSTNAME> – Specify the IP address or name of the destination host.
port <1-65535>	Optional. Configures the syslog server's UDP port (this port is used to connect to the server) • <1-65535> – Specify the port from 1 - 65535. Default port is 514.
proxy-mode [none|through-controller|through-rf-domain-manager]	Optional. Configures the request proxying mode • none – Requests are directly sent to the server from the device • through-controller – Proxies requests through the controller (access point, wireless controller, or service platform) configuring the device • through-rf-domain-manager – Proxies requests through the local RF Domain manager

```
accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|
quad-dot] case [lower|upper]
```

accounting syslog	Enables support for WLAN syslog accounting messages
mac-address-format	Configures the MAC address format used in syslog messages
middle-hyphen	Configures the MAC address format with middle hyphen (AABBCC-DDEEFF)
no-delim	Configures the MAC address format without delimitors (AABBCCDDEEFF)

pair-colon	Configures the MAC address format with pair-colon delimitors (AA:BB:CC:DD:EE:FF)
pair-hyphen	Configures the MAC address format with pair-hyphen deli mi tors (AA-BB-CC-DD-EE-FF). This is the default setting.
quad-dot	Configures the MAC address format with quad-dot deli mi tors (AABB.CCDD.EEFF)

case [lower|upper]	The following keywords are common to all:
	• case – Specifies MAC address case (upper or lower)
	  • lower – Specifies MAC address is filled in lower case (for example, aa-bb-cc-dd-ee-ff)
	  • upper – Specifies MAC address is filled in upper case (for example, AA-BB-CC-DD-EE-FF)

Examples

```
nx9500-6C8809(config-wlan-test)#accounting syslog host 172.16.10.4 port 2 proxy-mode none

nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
accounting syslog host 172.16.10.4 port 2
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables sending of accounting message to the RADIUS server, disables syslog accounting, or disables waiting for client's IP before sending accounting messages

acl

Defines the actions taken based on an ACL rule configuration. Use the `use > ip-access-list <IP-ACCESS-LIST-NAME>` command to associate an ACL with the WLAN. The ACL rule is determined by the associated ACL's configuration.

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, a Firewall can be thought of as mechanisms allowing and denying data traffic in respect to administrator defined rules.

WLANs use firewalls like *Access Control Lists* (ACLs) to filter/mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of *Access Control Entries* (ACEs). Each ACE specifies an action and a set of conditions (rules) a packet must satisfy to match the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP based Firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC Firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|
disassociate}
```

Parameters

```
acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|
disassociate}
```

acl exceed-rate	Sets the action taken based on an ACL rule configuration (for example, drop a packet) • exceed-rate – Action is taken when the rate exceeds a specified value
wireless-client-denied-traffic <0-1000000>	Sets the action to deny traffic to the wireless client when the rate exceeds the specified value • <0-1000000> – Specify a allowed rate threshold of disallowed traffic in packets/sec. If enabled, this option allows an associated client, exceeding the thresholds configured for storm traffic, to be either de-authenticated or blacklisted depending on the action selected. This option is disabled by default.
blacklist <0-86400>	Optional. Sets the time period for which an offending wireless client is blacklisted. • <0-86400> – Configures the blacklist duration from 0 - 86400 seconds. Offending clients are re-authenticated once the blacklist duration, configured here, is over.
disassociate	Optional. When enabled, disassociates a blacklisted wireless client.

Examples

```
nx9500-6C8809(config-wlan-test)#acl exceed-rate wireless-client-denied-traffic
20 disassociate
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 accounting syslog host 172.16.10.4 port 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes the action (de-authenticate or blacklist) to be taken when an associated client exceeds the thresholds configured for storm traffic

answer-broadcast-probes

Allows the WLAN to respond to probe requests that do not specify an SSID. These probes are for broadcast ESS. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
answer-broadcast-probes
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-wlan-1)#answer-broadcast-probes
nx9500-6C8809(config-wlan-1)#
```

Related Commands

no (wlan-config-mode) on page 590	Does not allow this WLAN to respond to probe requests that do not specify a SSID

assoc-response

Configures the deny-threshold and rssi-threshold values. These threshold values are considered when responding to a client's association/authentication request.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]
```

Parameters

```
assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]
```

assoc-response	Configures the association response thresholds
deny-threshold <1-12>	Configures the number of times association/authentication request, from a client, is ignored if the RSSI is less than the configured RSSI threshold. This option is disabled by default. • <1-12> – Specify the deny-threshold from 1 - 12.
rssi-threshold <-100--40>	Configures an association response RSSI threshold value. If the RSSI is below the configured threshold value, the client's association/authentication request is ignored. This option is disabled by default. rssi-threshold • <-100--40> – Specify a value from -100 - -40 dBm.

Examples

```
nx9500-6C8809(config-wlan-test)#assoc-response rssi-threshold -60
nx9500-6C8809(config-wlan-test)#assoc-response deny-threshold 4
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
```

```
 assoc-response rssi-threshold -60
 assoc-response deny-threshold 4
 registration user group-name guest expiry-time 2000 agreement-refresh 14400
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes the configured deny-threshold and rssi-threshold values

association-list

Attaches an existing global association list with this WLAN. For more information on global association lists, see global-association-list on page 367.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
association-list global <GLOBAL-ASSO-LIST-NAME>
```

Parameters

```
association-list global <GLOBAL-ASSO-LIST-NAME>
```

association-list global <GLOBAL-ASSO-LIST-NAME>	Attaches an existing global association list with this WLAN • <GLOBAL-ASSO-LIST-NAME> – Specify the global association list name (should be existing and configured).

Examples

```
nx9500-6C8809(config-wlan-test)#association-list global my-clients
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 association-list global my-clients
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes the global association list associated with this WLAN

authentication-type

Sets the WLAN's mode of authentication

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none|sae|sae-psk]
```

Parameters

```
authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none|sae|sae-psk]
```

authentication-type	Configures a WLAN's authentication type The authentication types are: **EAP**, **EAP-MAC**, **EAP-PSK**, **Kerberos**, **MAC**, **SAE** , **SAE-PSK**, and **none**.
eap	Configures EAP authentication (802.1X) EAP is the de-facto standard authentication method used to provide secure authenticated access to controller managed WLANs. EAP provides mutual authentication, secured credential exchange, dynamic keying and strong encryption. 802.1X EAP can be deployed with WEP, WPA or WPA2 encryption schemes to further protect user information forwarded over controller managed WLANs. The EAP process begins when an unauthenticated supplicant (client device) tries to connect with an authenticator (in this case, the authentication server). An access point passes EAP packets from the client to an authentication server on the wired side of the Access Point. All other packet types are blocked until the authentication server (typically, a RADIUS server) verifies the client's identity. If using EAP authentication ensure that a AAA policy is mapped to the WLAN.
eap-mac	Configures EAP or MAC authentication depending on client. (This setting is valid only with the None encryption type. EAP-MAC is useful when in a hotspot environment, as some clients support EAP and an administrator may want to authenticate based on just the MAC address of the device.
eap-psk	Configures EAP authentication or pre-shared keys depending on client (This setting is only valid with *Temporal Key Integrity Protocol* (TKIP) or Counter Mode with *Cipher Block Chaining Message Authentication Code Protocol* (CCMP) encryption types. When using PSK with EAP, the controller sends a packet requesting a secure link using a pre-shared key. The controller and authenticating device must use the same authenticating algorithm and passcode during authentication. EAP-PSK is useful when transitioning from a PSK network to one that supports EAP. If using eap-psk authentication ensure that a AAA policy is mapped to the WLAN.
kerberos	Configures Kerberos authentication (encryption will change to WEP128 if it's not already WEP128 or Keyguard) Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection. Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses *Network Time Protocol* (NTP) for synchronizing the clocks of its *Key Distribution Center* (KDC) server(s).

mac	Configures MAC authentication (RADIUS lookup of MAC address) MAC is a device level authentication method used to augment other security schemes when legacy devices are deployed using static WEP. MAC authentication can be used for device level authentication by permitting WLAN access based on device MAC address. MAC authentication is typically used to augment WLAN security options that do not use authentication (such as static WEP, WPA-PSK and WPA2-PSK) MAC authentication can also be used to assign VLAN memberships, firewall policies and time and date restrictions. MAC authentication can only identify devices, not users. If using mac authentication ensure that an AAA policy is mapped to the WLAN.
none	No authentication is used or the client uses pre-shared keys
sae	Enables WPA3-Personal (SAE Authentication) on this WLAN. Note: SAE authentication is only supported with **mandatory** protected management frames. For more information, see protected-mgmt-frames on page 555. WPA3 is the latest security protocol developed by the WiFi Alliance as part of its series of *Wi-Fi Protected Access* (WPA) protocols. It is has stronger configuration, authentication, and encryption features. WPA3 is more secure and protects against offline brute force attacks that WPA2 could not provide. WPA3 offers two levels of protection: WPA3-Personal (with 128-bit encryption) and WPA3-Enterprise (with 192-bit encryption). WPA3-Personal uses *Simultaneous Authentication of Equals* (SAE) authentication method. SAE was first defined in the IEEE 802.11s standard for authentication between 802.11s enabled mesh peers. SAE is a zero-knowledge proof key exchange protocol that uses finite group cryptography. The client and access point go through an SAE handshake to negotiate a fresh *Pairwise Master Key* (PMK). This PMK is used in a traditional four-way handshake to generate a session key. Note: The 32-byte PMK negotiated through the SAE handshake cannot be guessed using offline dictionary attacks, even though it is later used in a four-way handshake. Enable this option to allow only WPA3-capable clients authenticate with the access point and access the wireless network.
sae-psk	Enables WPA3-Compatibility mode. Use this option to enable WPA2 in addition with WPA3-Personal. When enabled, both WPA3-capable and WPA2-capable clients can authenticate with the access point and access the wireless network. Note: SAE-PSK authentication is supported with **optional** management frames. For more information, see protected-mgmt-frames on page 555.

Examples

Related Commands

no (wlan-config-mode) on page 590	Resets the authentication mode used with this WLAN to default (none/pre-shared keys)

bridging-mode

Configures the mode used to bridge packets to and from a WLAN. Use this command to define which VLANs are bridged, and how local VLANs are bridged between the wired and wireless sides of the network.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
bridging-mode [local|tunnel]
```

Parameters

```
bridging-mode [local|tunnel]
```

bridging-mode	Configures bridging mode on this WLAN. The options are **local** and **tunnel**.
local	Bridges packets between WLAN and local ethernet ports. This is the default mode.
tunnel	Tunnels packets to other devices (typically a wireless controller or service platform)

Examples

```
nx9500-6C8809(config-wlan-test)#bridging-mode local
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
nx9500-6C8809(config-wlan-test)#
```

broadcast-dhcp

Configures broadcast DHCP packet handling parameters

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
broadcast-dhcp validate-offer
```

Parameters

```
broadcast-dhcp validate-offer
```

validate-offer	Enables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air. This option is disabled by default.

Examples

```
nx9500-6C8809(config-wlan-test)#broadcast-dhcp validate-offer
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
broadcast-dhcp validate-offer
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air

broadcast-ssid

Advertises the WLAN SSID in beacons. If a hacker tries to isolate and hack a SSID from a client, the SSID will display since the ESSID is in the beacon. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
broadcast-ssid
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-wlan-1)#broadcast-ssid
nx9500-6C8809(config-wlan-1)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables the broadcasting of the WLAN's SSID in beacons

captive-portal-enforcement

Configures the captive portal enforcement on this WLAN. When enabled, provides successfully authenticated guests temporary and restricted access to the network. If enforcing captive-portal authentication, associate captive-portal policy with the WLAN. For more information, see use (wlan-config-mode) on page 575.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
captive-portal-enforcement {fall-back}
```

Parameters

```
captive-portal-enforcement {fall-back}
```

captive-portal-enforcement	Enables captive portal enforcement on a WLAN. This option is disabled by default.
fall-back	Optional. Enforces captive portal validation if WLAN authentication fails (applicable to EAP or MAC authentication only)

Examples

```
nx9500-6C8809(config-wlan-test)#captive-portal-enforcement fall-back
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
captive-portal-enforcement fall-back
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables captive portal enforcement

client-access

Enables WLAN client access (for normal data operations)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
client-access
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-wlan-1)#client-access
nx9500-6C8809(config-wlan-1)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables WLAN client access

client-client-communication

Allows frame switching from one client to another on a WLAN. This option is enabled by default. It allows clients to exchange packets with other clients. It does not necessarily prevent clients on other WLANs from sending packets to this WLAN, but as long as this setting is also disabled on that WLAN, clients are not permitted to interoperate.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
client-client-communication
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-wlan-1)#client-client-communication
nx9500-6C8809(config-wlan-1)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables frame switching from one client to another on a WLAN

client-load-balancing

Enforces client load balancing on a WLAN's access point radios. When enforced, probe and association requests are not responded to, forcing a client to associate with another access point radio. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
client-load-balancing {allow-single-band-clients|band-discovery-intvl|
capability-ageout-time|max-probe-req|probe-req-invl}
client-load-balancing {allow-single-band-clients [2.4ghz|5ghz]|
band-discovery-intvl <0-10000>|capability-ageout-time <0-10000>}
client-load-balancing {max-probe-req|probe-req-intvl} [2.4ghz|5ghz] <0-10000>
```

Parameters

```
client-load-balancing {allow-single-band-clients [2.4ghz|5ghz]|
band-discovery-intvl <0-10000>|capability-ageout-time <0-10000>}
```

client-load-balancing	Configures client load balancing on a WLAN
allow-single-band-clients [2.4GHz|5GHz]	Optional. Allows single band clients to associate even during load balancing • 2.4GHz – Enables load balancing across 2.4 GHz channels • 5GHz – Enables load balancing across 5.0 GHz channels This option is enabled by default for 2.4 and 5.0 GHz bands.
band-discovery-intvl <0-10000>	Optional. Configures time interval to discover a client's band capability before connection • <0-10000> – Specify a value from 0 - 10000 seconds. The default is 10 seconds.
capability-ageout-time <0-10000>	Optional. Configures a client's capability ageout interval. This is the time for which a client's capabilities are retained in the device's internal table. Once this time is exceeded the client's capabilities are aged out. • <0-10000> – Specify a value from 0 - 10000 seconds. The default is 3600 seconds.

```
client-load-balancing {max-probe-req|probe-req-intvl} [2.4Ghz|5Ghz] <0-10000>
```

client-load-balancing	Configures WLAN client load balancing
max-probe-req [2.4GHz|5GHz] <0-10000>	Optional. Configures the maximum client probe requests allowed for 2.4 GHz and 5.0 GHz bands • 2.4GHz – Configures maximum client probe requests on 2.4 GHz radios • 5GHz – Configures maximum client probe requests on 5.0 GHz radios • <0-10000> – Specify a client probe request threshold from 0 - 10000. The default for both 2.4 and 5.0 GHz radios is 60.
probe-req-intvl 2.4GHz|5GHz] <0-10000>	Optional. Configures client probe request interval limits for device association • 2.4GHz – Configures the client probe request interval on 2.4 GHz radios • 5GHz – Configures the client probe request interval on 5.0 GHz radios • <0-10000> – Specify a value from 0 - 10000. The default for both 2.4 and 5.0 GHz radios is 10 seconds.

Examples

```
nx9500-6C8809(config-wlan-test)#client-load-balancing band-discovery-intvl 2
nx9500-6C8809(config-wlan-test)#client-load-balancing probe-req-intvl 5ghz 5

nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables client load balancing on a WLAN's access point radios

controller-assisted-mobility

Enables controller or service platform assisted mobility to determine a wireless client's VLAN assignment. When enabled, a controller or service platform's mobility database is used to assist in roaming between RF Domains. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
controller-assisted-mobility
```

Parameters

```
None
```

Examples

```
ap505-13403B(config-wlan-test)#controller-assisted-mobility
ap505-13403B(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode local
 encryption-type ccmp
 authentication-type sae-psk

basic-mcs0-7|mcs-1s|mcs2s|mcs3s|mcs4s|mcs0-15|mcs0-23|mcs0-7|mcs16-23|mcs8-15|mcs8-23]
```

Parameters

```
data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]
```

data-rates	Specifies the 802.11 rates supported when mapped to a 2.4 GHz radio
b-only	Uses rates that support only 11b clients
bg	Uses rates that support both 11b and 11g clients
bgn	Uses rates that support 11b, 11g and 11n clients
default	Uses the default rates configured for a 2.4 GHz radio
g-only	Uses rates that support operation in 11g only
gn	Uses rates that support 11g and 11n clients

```
data-rates 5GHz [a-only|an|default]
```

data-rates	Specifies the 802.11 rates supported when mapped to a 5.0 GHz radio
a-only	Uses rates that support operation in 11a only
an	Uses rates that support 11a and 11n clients
default	Uses default rates configured for a 5.0 GHz

```
data-rates 2.4GHz custom [1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|
basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|
basic-9|basic-mcs-1s|mcs-1s|mcs-2s|mcs-3s|basic-mcs-1s|basic-mcs0-7|mcs-1s|mcs-2s|
mcs-3s|mcs0-15|mcs0-23|mcs0-7|mcs16-23|mcs8-15|mcs8-23]
```

data-rates [2.4GHz|5GHz]	Specifies the 802.11 rates supported when mapped to a 2.4 GHz or 5.0 GHz radio
custom	Configures a data rates list by specifying each rate individually. Use 'basic-' prefix before a rate to indicate it is used as a basic rate (For example, 'data-rates custom basic-1 basic-2 5.5 11'). The data-rates for 2.4 GHz and 5.0 GHz channels are the same with a few exceptions. The 2.4 GHz channel has a few extra data rates: 1, 11, 2, and 5.5.

1,11,2,5.5	The following data rates are specific to the 2.4 GHz channel: • 1 – 1-Mbps • 11 – 11-Mbps • 2 – 2-Mbps • 5.5 – 5.5-Mbps
12,18,24,36,48,54,6,9, basic-1,basic-11, basic-12,basic-18, basic-2, basic-36,basic-48, basic-5.5, basic-54,basic-6, basic-9, basic-mcs0-7,mcs0-15, mcs0-7,mcs8-15	The following data rates are common to both the 2.4 GHz and 5.0 GHz channels: • 12 – 12 Mbps • 18 – 18-Mbps • 24 – 24 Mbps • 36 – 36-Mbps • 48 – 48-Mbps • 54 – 54-Mbps • 6 – 6-Mbps • 9 – 9-Mbps • basic-1 – basic 1-Mbps • basic-11 – basic 11-Mbps • basic-12 – basic 12-Mbps • basic-18 – basic 18-Mbps • basic-2 – basic 2-Mbps • basic-36 – basic 36-Mbps • basic-48 – basic 48-Mbps • basic-5.5 – basic 5.5-Mbps • basic-54 – basic 54-Mbps • basic-6 – basic 6-Mbps • basic-9 – basic 9-Mbps • basic-mcs-1s – Modulation and coding scheme data rates for 1 Spatial Stream • mcs-1s – Applicable to 1-spatial stream data rates • mcs-2s – Applicable to 2-spatial stream data rates • mcs-3s – Applicable to 3-spatial stream data rates

Examples

```

Related Commands

no (wlan-config-mode) on page 590	Resets the 802.11 data rates supported on a WLAN for the 2.4 GHz or 5.0 GHz radios

description

Configures a description for this WLAN

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
description <LINE>
```

Parameters

```
description <LINE>
```

<LINE>	Specify a description for this WLAN The WLAN's description should help differentiate it from others with similar configurations. The description should not exceed 64 characters.

Examples

```
nx9500-6C8809(config-wlan-test)#description TestWLAN
nx9500-6C8809(config-wlan-test)#show context
wlan test
 description TestWLAN
 ssid test
 bridging-mode local
 encryption-type none
 uthentication-type eap
 accounting syslog host 172.16.10.4 port 2
 data-rates 2.4GHz gn
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 captive-portal-enforcement fall-back
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes the WLAN's configured description

downstream-group-addressed-forwarding

Enables forwarding of downstream broadcast/multicast (BC/MC) packets to a group on this WLAN. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
downstream-group-addressed-forwarding
```

Parameters

```
None
```

Examples

```
ap505-13403B(config-wlan-test)#downstream-group-addressed-forwarding
ap505-13403B(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode local
 encryption-type ccmp
 authentication-type sae-psk
 dynamic-vlan-assignment allowed-vlans 1-3
 protected-mgmt-frames optional
 controller-assisted-mobility
 dpi metadata http
ap505-13403B(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables forwarding of downstream BCMC packets to a group on this WLAN

dpi

Enables DPI on this WLAN. When enabled, all traffic is subjected to DPI for detection of applications, application categories, custom applications, and metadata extraction.

DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When enabled, DPI inspects packets of all flows to identify applications (such as, Netflix, Twitter, Facebook, etc.) and extract metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dpi metadata [http|ssl|tcp-rtt|voice-video]
```

Parameters

```
dpi metadata [http|ssl|tcp-rtt|voice-video]
```

dpi metadata [http|ssl|tcp-rtt|voice-video]	Enables extraction of the following metadata flows: • http – Extracts HTTP flows. When enabled, administrators can track HTTP Websites accessed by both internal and guest clients and visualize HTTP data usage, hits, active time and total clients on the NSight application's dashboard. This setting is disabled by default. • ssl – Extracts SSL flows. When enabled, administrators can track SSL Websites accessed by both internal and guest clients and visualize SSL data usage, hits, active time and total clients on the NSight application's dashboard. This setting is disabled by default • tcp-rtt – Extracts RTT *(Round Trip Time)* information from TCP *(Transmission Control Protocol)* flows. However, this TCP-RTT metadata is viewable only on the NSight dashboard. Therefore, ensure the NSight server is up and NSight analytics data collection is enabled. • voice-video – Extracts voice and video flows. When enabled, voice and video calls can be tracked by extracting parameters, such as packets transferred and lost, jitter, and application name. Most Enterprise VoIP applications like facetime, skype for business and VoIP terminals can be monitored for call quality and visualized on the NSight dashboard in manner similar to HTTP and SSL. Call quality and metrics can only be determined from calls established unencrypted. This setting is disabled by default.

Examples

```
nx9500-6C8809(config-wlan-test)#dpi metadata http
nx9500-6C8809(config-wlan-test)#dpi metadata ssl
nx9500-6C8809(config-wlan-test)#dpi metadata voice-video
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 dpi metadata voice-video
 dpi metadata http
 dpi metadata ssl
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables extraction of metadata flows on the WLAN

dynamic-vlan-assignment

Enables dynamic VLAN assignment on this WLAN, and adds or removes VLANs for the selected WLAN. Configure this feature to allow an override to the WLAN configuration. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS Access-Accept packet, and this feature is enabled, all client traffic is forward on that VLAN. If disabled, the RADIUS server returns VLAN-ID is ignored and the WLAN's VLAN configuration is used. For more information, see vlan on page 579. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
dynamic-vlan-assignment allowed-vlan <VLAN-ID>
```

Parameters

```
dynamic-vlan-assignment allowed-vlan <VLAN-ID>
```

dynamic-vlan-assignment allowed-vlan	Enables dynamic VLAN assignment and configures a list of VLAN IDs or VLAN alias allowed access to the WLAN
<VLAN-ID>	Specify the list of VLAN IDs or the VLAN alias names. For example, 10-20, 25, 30-35, $guest. For example, 10-20, 25, 30-35, $guest. For information on VLAN aliases, see alias on page 172 .

Examples

```
ap505-13403B(config-wlan-test)#dynamic-vlan-assignment allowed-vlans 2,3,4
ap505-13403B(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode local
 encryption-type ccmp
 authentication-type sae-psk
 dynamic-vlan-assignment allowed-vlans 2-4
 protected-mgmt-frames optional
 controller-assisted-mobility
 dpi metadata http
ap505-13403B(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables dynamic VLAN assignment on this WLAN

eap-types

Configures client access based on the EAP type used

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls] {(aka|all|fast|peap|sim|tls|ttls)}
```

Parameters

```
eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls] {(aka|all|fast|peap|sim|tls|ttls)}
```

eap-types [allow|deny]	Configures a list of allowed or denied EAP types • allow – Configures a list of EAP types allowed for WLAN client authentication • deny – Configures a list of EAP types not allowed for WLAN client authentication
[aka|all|fast|peap|sim| tls|ttls]	The following EAP types are common to the 'allow' and 'deny' keywords: • aka – Configures EAP *Authentication and Key Agreement* (AKA) and EAP-AKA' (AKA Prime). EAP-AKA is one of the methods in the EAP authentication framework. It uses *Universal Mobile Telecommunications System* (UMTS) and *Universal Subscriber Identity Module* (USIM) for client authentication and key distribution. • all – Allows or denies usage of all EAP types on the WLAN • fast – Configures EAP *Flexible Authentication via Secure Tunneling* (FAST). EAP-FAST establishes a *Transport Layer Security* (TLS) tunnel, to verify client credentials, using *Protected Access Credentials* (PAC). • peap – Configures *Protected Extensible Authentication Protocol* (PEAP). PEAP or Protected EAP uses encrypted and authenticated TLS tunnel to encapsulate EAP. • sim – Configures EAP *Subscriber Identity Module* (SIM). EAP-SIM uses *Global System for Mobile Communications* (GSMC) SIM for client authentication and key distribution. • tls – Configures EAP TLS. EAP-TLS is an EAP authentication method that uses PKI to communicate with a RADIUS server or any other authentication server. • ttls – Configures *Tunneled Transport Layer Security* (TTLS). EAP-TTLS is an extension of TLS. Unlike TLS, TTLS does not require every client to generate and install a CA- signed certificate. • These options are recursive, and more than one EAP type can be selected. The selected options are added to the allowed or denied EAP types list.

Examples

```
nx9500-6C8809(config-wlan-test)#eap-types allow fast sim tls

nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 eap-types allow fast sim tls
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Reverts to default setting - eap-types allow all

encryption-type

Sets the WLAN's encryption type

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
encryption-type [ccmp|gcmp256|keyguard|none|tkip-ccmp|wep128|web128-keyguard|wep64]
```

Parameters

```
encryption-type [ccmp|gcmp256|keyguard|none|tkip-ccmp|wep128|web128-keyguard|wep64]
```

encryption-type	Configures the WLAN's data encryption parameters
ccmp	Configures *Advanced Encryption Standard Counter Mode CBC-MAC Protocol* (AES-128CCM/CCMP)
gcmp256	Configures AES-GCM *(Advanced Encryption Standard-Galois Counter Mode)* protocol (WPA3-Enterprise 192-bit) encryption mode. GCMP-256 is a block cipher which works on 256-bit blocks. Note: GCMP encryption is only supported with eap authentication-type. For more infromation, see authentication-type on page 529. Note: GCMP encryption is only supported with mandatory protected management frames. For more information, see protected-mgmt-frames on page 555.
keyguard	Configures Keyguard *Mobile Computing Mode* (MCM)
tkip-ccmp	Configures the TKIP and AES-CCM/CCMP encryption modes
wep128	Configures WEP with 128 bit keys
wep128-keyguard	Configures WEP128 as well as Keyguard-MCM encryption modes
wep64	Configures WEP with 64 bit keys. A WEP64 configuration is insecure when two WLANs are mapped to the same VLAN, and one uses no encryption while the other uses WEP.

Examples

```
nx9500-6C8809(config-wlan-test)#encryption-type tkip-ccmp

nx9500-6C8809(config-wlan-test)#show context
wlan test

```

Related Commands

no (wlan-config-mode) on page 590	Resets the WLAN's encryption type to default (none)

enforce-dhcp

Enables dropping of packets from clients with a static IP address. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
enforce-dhcp
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-wlan-test)#enforce-dhcp
nx9500-6C8809(config-wlan-test)#show context

nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables dropping of packets from clients with a static IP address

fast-bss-transition

Enables or disables support for 802.11r *Fast-BSS Transition* (FT) on the selected WLAN. This feature is disabled by default.

802.11r is an attempt to undo the burden that security and QoS added to the handoff process, and restore it back to an original four message exchange process. The central application for the 802.11r standard is VOIP using mobile phones within wireless Internet networks. 802.11r FT redefines the security key negotiation protocol, allowing parallel processing of negotiation and requests for wireless resources.

Enabling FT standards provides wireless clients fast, secure and seamless transfer from one base station to another, ensuring continuous connectivity.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
fast-bss-transition {over-ds}
```

Parameters

```
fast-bss-transition {over-ds}
```

fast-bss-transition over-ds	Enables 802.11r FT support on this WLAN • over-ds – Optional. Enables 802.11r client roaming over the *Distribution System* (DS). When enabled, all client communication with the target AP is via the current AP. This communication, carried in FT action frames, is first sent by the client to the current AP, then forwarded to the target AP through the controller.

Examples

```
nx9500-6C8809(config-wlan-test)#fast-bss-transition
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 fast-bss-transition
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables support for 802.11r FT on the WLAN

http-analyze

Enables HTTP URL analysis on the WLAN

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
http-analyze [filter|syslog]
http-analyze filter [images|post|query-string]
http-analyze syslog host <IP/HOSTNAME> {port <1-65535>}
{proxy-mode [none|through-controller|through-rf-domain-manager]}
```

Parameters

```
http-analyze filter [images|post|query-string]
```

filter	Filters URLs, based on the parameters set, before forwarding them
images	Filters out URLs referring to images (does not forward URL requesting images)
post	Filters out URLs requesting POST (does not forward POST requests). This option is disabled by default.
query-string	Removes query strings from URLs before forwarding them (forwards requests and no data). This option is disabled by default.

```
http-analyze syslog host <IP/HOSTNAME> {port <1-65535>}
{proxy-mode [none|through-controller|through-rf-domain-manager]}
```

syslog host <IP/HOSTNAME>	Forwards client and URL information to a syslog server • host <IP/HOSTNAME> – Specify the syslog server's IP address or hostname
port <1-65535>	Optional. Specifies the UDP port to connect to the syslog server from 1 - 65535
proxy-mode [none|through-controller| through-rf-domain-manager]	Optional. Specifies if the request is to be proxied through another device • none – Requests are sent directly to syslog server from device • through-controller – Proxies requests through the wireless controller configuring the device • through-rf-domain-manager – Proxies the requests through the local RF Domain manager

Examples

```
ap505-13403B(config-wlan-test)#http-analyze syslog host 10.234.160.4 port 21 proxy-mode
through-controller
ap505-13403B(config-wlan-test)#show context
wlan test

 protected-mgmt-frames mandatory
 protected-mgmt-frames sa-query attempts 1
 use aaa-policy test
 http-analyze syslog host 10.234.160.4 port 21 proxy-mode through-controller
 controller-assisted-mobility
 dpi metadata http
ap505-13403B(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables HTTP URL analysis on the WLAN

ip (wlan-config-mode)

Configures IPv4 settings

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ip [arp|dhcp]
ip arp [header-mismatch-validation|trust]
ip dhcp trust
```

Parameters

```
ip arp [header-mismatch-validation|trust]
```

ip arp	Configures the IP settings for ARP packets
header-mismatch-validation	Verifies mismatch of source MAC address in the ARP and Ethernet headers. This option is enabled by default.
trust	Sets ARP responses as trusted for a WLAN/range. This option is disabled by default.

```
ip dhcp trust
```

ip dhcp	Configures the IP settings for DHCP packets
trust	Sets DHCP responses as trusted for a WLAN/range. This option is disabled by default.

Examples

```
nx9500-6C8809(config-wlan-test)#ip dhcp trust
nx9500-6C8809(config-wlan-test)#show context
wlan test
 description TestWLAN
 ssid test
 bridging-mode local
 encryption-type tkip-ccmp
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 data-rates 2.4GHz gn
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 captive-portal-enforcement fall-back
 ip dhcp trust
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 enforce-dhcp
 broadcast-dhcp validate-offer
 http-analyze controller
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Resets IP ARP or DHCP trust parameters to default. ARP trust is disabled, ARP mismatch verification is enabled, or DHCP trust is disabled.

ipv6 (wlan-config-mode)

Sets the DHCPv6 and ICMPv6 *neighbor discovery* (ND) components for this WLAN

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]
```

Parameters

```
ipv6 dhcpv6 trust
```

ipv6 dhcpv6 trust	Enables DHCPv6 trust state for DHCPv6 responses on this WLAN. When enabled, all DHCPv6 responses received on this WLAN are trusted and forwarded. This option is disabled by default.

```
ipv6 nd [header-mismatch-validation|raguard|trust]
```

ipv6 nd	Sets the IPv6 ND settings for this WLAN
header-mismatch-validation	Checks for mismatch of source MAC address in the ICMPv6 ND message and Ethernet header (link layer option). This option is enabled by default.
raguard	Allows redirection of *router advertisements* (RAs) and ICMPv6 packets originating on this WLAN. This option is disabled by default.
trust	Enables trust state for ND requests received on this WLAN. When enabled, all ND requests on an IPv6 firewall, on this WLAN, are trusted. This option is disabled by default.

Examples

```
nx9500-6C8809(config-wlan-test)#ipv6 dhcpv6 trust
nx9500-6C8809(config-wlan-test)#ipv6 nd trust
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 ipv6 dhcpv6 trust
 ipv6 nd trust
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Resets IPv6 ND or DHCPv6 trust parameters to default. ND request trust is disabled, ND header mismatch verification is enabled, ND RA and ICMPv6 redirection is disabled, or DHCPv6 trust is disabled.

kerberos

Configures Kerberos authentication parameters on a WLAN. Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.

Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses NTP for synchronizing the clocks of its KDC server(s).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
kerberos [password|realm|server]
kerberos password [0 <LINE>|2 <LINE>|<LINE>]
kerberos realm <REALM>
kerberos server [primary|secondary|timeout]
kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}
kerberos server timeout <1-60>
```

Parameters

```
kerberos password [0 <LINE>|2 <LINE>|<LINE>]
```

kerberos	Configures a WLAN's Kerberos authentication parameters The parameters are: password, realm, and server.
password	Configures a Kerberos KDC server password. The password should not exceed 127 characters. The password options are: • 0 <LINE> – Configures a clear text password • 2 <LINE> – Configures an encrypted password • <LINE> – Specify the password.

```
kerberos realm <REALM>
```

kerberos	Configures a WLAN's Kerberos authentication parameters The parameters are: password, realm, and server.
realm <REALM>	Configures a Kerberos KDC server realm. The REALM should not exceed 127 characters.

```
kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}
```

kerberos	Configures a WLAN's Kerberos authentication parameters The parameters are: password, realm, and server.
server [primary|secondary]	Configures the primary and secondary KDC server parameters • primary – Configures the primary KDC server parameters • secondary – Configures the secondary KDC server parameters

host <IP/HOSTNAME>	Sets the primary or secondary KDC server address • <IP/HOSTNAME> – Specify the IP address or name of the KDC server.
port <1-65535>	Optional. Configures the UDP port used to connect to the KDC server • <1-65535> – Specify the port from 1 - 65535. The default is 88.

```
kerberos server timeout <1-60>
```

kerberos	Configures a WLAN's Kerberos authentication parameters The parameters are: password, realm, and server.
timeout <1-60>	Modifies the Kerberos KDC server's timeout parameters • <1-60> – Specifies the wait time for a response from the Kerberos KDC server before retrying. Specify a value from 1 - 60 seconds.

Examples

```
nx9500-6C8809(config-wlan-test)#kerberos server timeout 12
nx9500-6C8809(config-wlan-test)#kerberos server primary host 172.16.10.2 port 88

Related Commands

no (wlan-config-mode) on page 590	Removes Kerberos authentication related parameters on the WLAN

mac-authentication

Enables MAC authentication. When enabled, the system uses cached credentials (RADIUS server lookups are skipped) to authenticate clients.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
mac-authentication [cached-credentials|enforce-always]
```

Parameters

```
mac-authentication [cached-credentials|enforce-always]
```

mac-authentication	Enables MAC authentication on this WLAN and configures related parameters
cached-credentials	Uses cached credentials to skip RADIUS lookups. This option is disabled by default.
enforce-always	Enforces MAC authentication on this WLAN. When enabled, MAC authentication is enforced, each time a client logs in, even when the authentication type specified (using the authentication-type command) is not MAC authentication. This option is disabled by default.

Examples

```
rfs4000-229D58(config-wlan-test)#mac-authentication cached-credentials
rfs4000-229D58(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables MAC authentication related parameters: Disables use of cached credentials to skip RADIUS lookups, or disables enforcement of MAC authentication on this WLAN.

nsight

Enables retention of client-history. A typical NSight-server enabled, guest access environment may be visited by thousands of unique clients on a daily basis. Some of these guest clients are not regular visitors, accessing the network infrequently. However, by default, historical data of all guest clients, irrespective of their network access frequency, is retained by the NSight server for up to 180 days. This results in the database containing thousands if not millions of unique MAC addresses of infrequent guest clients. To address this potential problem it is recommended to disable client-history retention on a guest WLAN, and use the nsight-policy context to configure a separate timer (8 hours by default) specifying the guest client data lifespan in the database.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
nsight client-history
```

Parameters

```
nsight client-history
```

nsight client-history	Enables retention of client-history in the database. This option is enabled by default.

Examples

On a WLAN, the client-history option is enabled by default. When enabled, all client history (including guest-clients) is retained in the NSight server database for 180 days.

To disable this option, execute the `no > nsight > client-history` command. When disabled, guest client history is retained only for 8 hours, which is the default setting defined by the NSight policy

applied on the access point (through which the guest client accesses the WLAN) or the access point's RF Domain. However, the default historical data retention duration for regular clients and devices (access point and controllers) remains unchanged (180 days) as per the NSight policy settings.

```
nx9500-6C8809(config-wlan-test3)#no nsight client-history
nx9500-6C8809(config-wlan-test3)#show context
wlan test3
 ssid test3
 bridging-mode local
 encryption-type none
 authentication-type none
 no nsight client-history
nx9500-6C8809(config-wlan-test3)#
```

Use the NSight policy context to define separate client-history retention time for regular clients, devices, and guest clients. For more information, see nsight-policy (global-config-mode) on page 418.

Related Commands

no (wlan-config-mode) on page 590	Disables client-history retention in the NSight database

opendns

Configures the per-fetched OpenDNS device_id. Once configured, all DNS queries originating from wireless clients associating with the WLAN are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. The device ID is a sixteen (16) character hex string representing a 64 bit unsigned integer and is fetched from the OpenDNS site.

This command is part of a series of configurations that are required to integrate WiNG access points, wireless controllers, and service platforms with OpenDNS. When all the parameters have been configured, DNS queries from wireless clients, associating with the WLAN, are redirected to OpenDNS (208.67.220.220 OR 208.67.222.222). These OpenDNS resolvers act as proxy DNS servers that provide additional functionalities, such as Web filtering, reporting, and performance enhancement. For more information on the entire configuration, see opendns on page 91.

Syntax

```
opendns device-id <DEVICE-ID>
```

Parameters

```
opendns device-id <DEVICE-ID>
```

opendns device-id <DEVICE-ID>	Configures the device ID to embed in DNS queries sent to OpenDNS • <DEVICE-ID> – Specify the device ID.

Examples

The following command fetches the device_id from the OpenDNS site.

```
ap505-13403B(#opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073
device_id = 0014AADF8EDC6C59
ap505-13403B(#
```

Use this device_id in the WLAN configuration context.

```
ap505-13403B((config)#wlan opendns
ap505-13403B((config-wlan-opendns)#opendns device-id 0014AADF8EDC6C59
ap505-13403B((config-wlan-opendns)#commit
ap505-13403B((config-wlan-opendns)#show context
wlan opendns
 ssid opendns
 vlan 1
 bridging-mode local
 encryption-type none
 authentication-type none
 opendns device-id 0014AADF8EDC6C59
ap7161-E6D512(config-wlan-opendns)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes the device ID configured to be embedded in the DNS queries originating from the WiNG devices

protected-mgmt-frames

Configures the WLAN's frame protection mode and *security association* (SA) query parameters

802.11w provides protection for both unicast management frames and broadcast/multicast management frames. The 'robust management frames' are action, disassociation, and de-authentication frames. The standard provides one security protocol CCMP for protection of unicast robust management frames. The *Protected management frames* (PMF) protocol only applies to robust management frames after establishment of *Robust Security Network association Pairwise Transient Key* (RSNA PTK). Robust management frame protection is achieved by using CCMP for unicast management frames, broadcast/multicast integrity protocol for broadcast/multicast management frames and SA query protocol for protection against (re)association attacks.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]
```

Parameters

```
protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]
```

protected-mgmt-frames	Enables and configures WLAN's frame protection mode and SA query parameters. Use this command to specify whether management frame protection is mandatory or optional. **Note:** Frame protection mode is disabled by default.
mandatory	Enforces PMF on this WLAN (management frames are always protected). **Note:** This option does not allow non-PMF capable clients to associate.

optional	Provides PMF only for those clients that support PMF (that is, management frame protection is optional). Note: This option allows both PMF-capable and non-PMF capable wireless clients to associate. However, only the management frames of PMF-capable clients is protected.
sa-query [attempts <1-10>| timeout <100-1000>]	Configures the following SA parameters: • attempts <1-10> – Configures the number of SA query attempts from 1 - 10. The default is 5. • timeout <100-1000> – Configures the interval, in milliseconds, used to timeout association requests that exceed the defined interval. Specify a value from 100 - 1000 milliseconds. The default value is 201 milliseconds.

Examples

```
nx9500-6C8809(config-wlan-test)#protected-mgmt-frames mandatory
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables enforcement of protected management frames on this WLAN. And reverts protected management frames sa-query timeout and attempts to 201 milliseconds and 5 respectively.

proxy-arp-mode

Enables proxy ARP mode for handling ARP requests. Proxy ARP is the technique used to answer ARP requests intended for another system. By faking its identity, the access point accepts responsibility for routing packets to the actual destination.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
proxy-arp-mode [dynamic|strict]
```

Parameters

```
proxy-arp-mode [dynamic|strict]
```

proxy-arp-mode	Enables proxy ARP mode for handling ARP requests. The options available are dynamic and strict.
dynamic	Forwards ARP requests to the wireless side (for which a response could not be proxied)
strict	Does not forward ARP requests to the wireless side

Examples

```
nx9500-6C8809(config-wlan-test)#proxy-arp-mode strict
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 proxy-arp-mode strict
 broadcast-dhcp validate-offer
 http-analyze controller
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Reverts the proxy ARP mode to default (dynamic)

proxy-nd-mode

Configures the proxy ND mode for this WLAN member clients as either strict or dynamic. ND proxy is used in IPv6 to provide reachability by allowing a client to act as proxy. Proxy certificate signing can be done either dynamically (requiring exchanges of identity and authorization information) or statically when the network topology is defined.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
proxy-nd-mode [dynamic|strict]
```

Parameters

```
proxy-nd-mode [dynamic|strict]
```

proxy-nd-mode [dynamic| strict]	Configures the proxy ND mode for this WLAN member clients. The options are: dynamic and strict • dynamic – Forwards ND request to wireless for which a response could not be proxied. This is the default value. • strict – Does not forward ND requests to the wireless side

Examples

```
nx9500-6C8809(config-wlan-test)#proxy-nd-mode strict
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 wpa-wpa2 server-only-authentication
 proxy-nd-mode strict
```

```
 opendns device-id 44-55-66
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Reverts the proxy ND mode to default (dynamic)

qos-map

Enables support for 802.11u QoS map element and frames

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
qos-map
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-wlan-test)#qos-map
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 qos-map
 wpa-wpa2 server-only-authentication
 proxy-nd-mode strict
 opendns device-id 44-55-66
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables support for 802.11u QoS map element and frames

radio-resource-measurement

Enables support for 802.11k radio resource measurement capabilities (IEEE 802.11k) on this WLAN. 802.11k improves how traffic is distributed. In a WLAN, devices normally connect to the access point with the strongest signal. Depending on the number and location of clients, this arrangement can lead to excessive demand on one access point and under utilization of others, resulting in degradation of overall network performance. With 802.11k, if the access point with the strongest signal is loaded to its capacity, a client connects to an under-utilized access point. Even if the signal is weaker, the overall throughput is greater since it's an efficient use of the network's resources. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
radio-resource-measurement {channel-report|neighbor-report {hybrid}}
```

Parameters

radio-resource-measurement {channel-report|neighbor-report {hybrid}}

radio-resource-measurement	Enables support for 802.11k radio resource measurement capabilities
channel-report	Optional. Includes the channel-report element in beacons and probe responses
neighbor-report {hybrid}	Optional. Enables responding to neighbor-report requests • hybrid – Optional. Uses the hybrid model of smart-rf neighbors and roaming frequency to neighbors

Examples

```
ap505-13403B(config-wlan-test)#radio-resource-measurement neighbor-report hybrid
ap505-13403B(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode local
 encryption-type gcmp256
 authentication-type eap
 dynamic-vlan-assignment allowed-vlans 2-4
 protected-mgmt-frames mandatory
 protected-mgmt-frames sa-query attempts 1
 radio-resource-measurement neighbor-report hybrid
 use aaa-policy test
 http-analyze syslog host 10.234.160.4 port 21 proxy-mode through-controller
 controller-assisted-mobility
 opendns device-id 0014AADF8EDC6C59
 dpi metadata http
ap505-13403B(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables support for 802.11k radio resource measurement capabilities (IEEE 802.11k) on this WLAN

radius

Configures RADIUS related parameters

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
radius [dynamic-authorization|nas-identifier|nas-port-id|vlan-assignment]
radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|
vlan-assignment]
```

Parameters

radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|
vlan-assignment]

dynamic-authorization	Enables support for disconnect and change of authorization messages (RFC5176). When enabled, this option extends the RADIUS protocol to support unsolicited messages from the RADIUS server. These messages allow administrators to issue *change of authorization* (CoA) messages, which affect session authorization, or *disconnect messages* (DM) that terminate a session immediately. This option is disabled by default.
nas-identifier <NAS-ID>	Configures the *network access server* (NAS) identifier attribute, a value that identifies the access point or controller where the RADIUS messages originate. The value specified here is included in the RADIUS NAS-Identifier field for WLAN authentication and accounting packets. • <NAS-ID> – Specify the NAS identifier attribute (should not exceed 256 characters in length).
nas-port-id <NAS-PORT-ID>	Configures the WLAN NAS port ID sent to the RADIUS server. The NAS port identifier should not exceed 256 characters. • <NAS-PORT-ID> – Specify the NAS port ID attribute (should not exceed 256 characters in length). The profile database on the RADIUS server consists of user profiles for each connected NAS port. Each profile is matched to a username representing a physical port. When authorizing users, it queries the user profile database using a username representative of the physical NAS port making the connection. Set the numeric port value from 0 - 4294967295.
vlan-assignment	Configures the VLAN assignment of a WLAN. RADIUS VLAN assignment is disabled by default. When enabled, this option assigns clients to the RADIUS server specified VLANs, overriding the WLAN configuration. This option is disabled by default. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS access-accept packet, and this feature is enabled, all client traffic is forwarded on that VLAN. If disabled, the RADIUS server returned VLAN-ID is ignored and the VLAN specified using the vlan/vlan-pool-member options (in the WLAN config mode) is used. If both the RADIUS VLAN assignment and the post authentication VLAN options are enabled, then RADIUS VLAN assignment takes priority over post authentication VLAN configuration.

Examples

```
nx9500-6C8809(config-wlan-test)#radius vlan-assignment

nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 --More--
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables support for disconnect and change of authorization messages. Disables the use of VLAN information received in RADIUS server responses, instead uses the VLAN provided in the WLAN configuration. Removes the NAS identifier and NAS port identifiers configured.

registration

Configures settings enabling dynamic registration and validation of devices by their MAC addresses. When configured, this option registers a device's MAC address, and allows direct access to a previously registered device.

This command also configures the external guest registration and validation server details. If using an external server to perform guest registration, authentication and accounting, use this command to configure the external server's IP address/hostname. When configured, access points and controllers forward guest registration requests to the specified registration server. In case of EGuest deployment, this external resource should point to the EGuest registration server.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
registration [device|device-OTP|external|user]
registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> {agreement-refresh <0-144000>|
expiry-time <1-43800>}
registration external [follow-aaa|host]
registration external follow-aaa {send-mode [http|https|udp]}
registration external host <IP/HOSTNAME> {proxy-mode|send-mode}
registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|
through-rf-domain-manager|through-centralized-controller]|send-mode [https|https|udp]}
```

Parameters

```
registration external follow-aaa {send-mode [http|https|udp]}
```

registration	Enables dynamic guest-user registration and validation. This option is disabled by default.
external	Specifies that the guest registration is handled by an external resource. Access points/controllers send registration requests to the external registration server.

follow-aaa	Uses an AAA policy to point to the guest registration, authentication, and accounting server. When used, guest registration is handled by the RADIUS server specified in the AAA policy used in the WLAN context. In case of EGuest deployment, the RADIUS authentication and accounting server configuration in the AAA policy should point to the EGuest server. The use of 'follow-aaa' option is recommended in EGuest replica-set deployments. For more information on enabling the EGuest server, see eguest-server (VX9000 only) on page 987 (profile config mode). For more information on configuring an EGuest deployment, see configuring ExtremeGuest captive portal on page 267.
send-mode [https|https|udp]	Optional. Specifies the protocol used to forward registration requests to the external AAA policy servers. The options are: • HTTPS – Sends registration requests as HTTPS packet • HTTP – Sends registration requests as HTTP packet • UDP – Sends registration requests as UDP packet, using the UPD port 12322. This is the default setting.

```
registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|
through-rf-domain-manager|through-centralized-controller]|send-mode [https|https|udp]}
```

registration	Configures dynamic guest registration and validation parameters. This option is disabled by default.
external	Specifies that the guest registration is handled by an external resource. Access points/controllers send registration requests to the external registration server.
host <IP/HOSTNAME>	Specifies the external registration server's IP address or hostname. When configured, access points/ controllers forward guest registration requests to the external registration server specified here.
proxy-mode {none| through-controller| through-rf-domain-manager|through-centralized-controller}	Optional. Specifies the proxy mode. If a proxy is needed for connection, specify the proxy mode as through-controller, through-rf-domain. If no proxy is needed, select none. • none – Optional. Requests are sent directly to the controller from the requesting device • through-controller – Optional. Requests are proxied through the controller configuring the device • through-rf-domain-manager – Optional. Requests are proxied through the local RF Domain manager • through-centralized-controller – Optional. Requests are proxied through one of the controllers in a cluster, operating as the designated forwarder. Select this option if capture and redirection is on a cluster of wireless controller/ service platforms managing dependent/independent access points when redundancy is required. After specifying the proxy-mode, optionally specify the protocol used to send the requests to the external registration server host.
send-mode [https|https|udp]	Optional. Specifies the communication protocol used. The options are; • HTTPS – Sends registration requests as HTTPS packets • HTTP – Sends registration requests as HTTP packets • UDP – Sends registration requests as UDP packet, using the UPD port 12322. This is the default setting.

```
registration [device|device-OTP|user] group-name <RAD-GROUP-NAME>
{agreement-refresh <0-144000>|expiry-time <1-43800>}
```

registration	Configures dynamic guest registration and validation parameters. This option is disabled by default.
[device|device-OTP| user]	Configures the mode used to register guest users of this WLAN. Options include device, external, user, and device-OTP • device-OTP – Registers a device by its MAC address. During registration, the user, using the registered device, has to provide the e-mail address, mobile number, or member id, and the *one-time-passcode* (OTP)sent to the registered e-mail id or mobile number to complete registration. On subsequent logins, the user has to enter the OTP. If the MAC address of the device attempting login and the OTP combination matches, the user is allowed access. If using this option, set the WLAN authentication type as MAC authentication. • device – Registers a device by its MAC address. On subsequent logins, already registered MAC addresses are allowed access. If using this option, set the WLAN authentication type as *MAC authentication*. • user – Registers guest users using one of the following options: e-mail address, mobile-number, or member-id. If using any one of the above modes of registration, specify the RADIUS group to which the registered device or user is to be assigned post authentication.
group-name <RAD-GROUP-NAME>	Configures the RADIUS group name to which registered users are associated. When left blank, users are not associated with a RADIUS group. • <RAD-GROUP-NAME> – Specify the RADIUS group name (should not exceed 64 characters).
expiry-time <1-43800>	Optional. Configures the amount of time, in hours, before registered addresses expire and must be re-entered • <1-43800> – Specify a value from 1 - 43800 hrs. The default is 1500 hrs.
agreement-refresh <0-144000>	Optional. Sets the time, in minutes, after which an inactive user has to refresh the WLAN's terms of agreement. For example, if the agreement refresh period is set to 1440 minutes, a user, who has been inactive for more than 1440 minutes (1 day) is served the agreement page, and is allowed access only after refreshing the terms of agreement. • <0-100> – Specify a value from 0 - 144000. The default is 0 minutes.

Examples

```
nx9500-6C8809(config-wlan-test)#registration user group-name guest agreement-ref
resh 14400 expiry-time 2000
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 registration user group-name guest expiry-time 2000 agreement-refresh 14400
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables dynamic user registration and removes associated configurations. Also disables forwarding of user information to an external device.

relay-agent

Enables support for DHCP/DHCPv6 relay agent information (option 82 and DHCPv6-LDRA) feature on this WLAN. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
relay-agent [dhcp-option82|dhcpv6-ldra]
```

Parameters

```
relay-agent [dhcp-option82|dhcpv6-ldra]
```

relay-agent	Enables support for the following DHCP and DHCPv6 options: option 82 and *Lightweight DHCPv6 Relay Agent* (LDRA) respectively. When enabled, this feature allows the DHCP/DHCPv6 relay agent to insert the relay agent information option (option 82, LDRA) in client requests forwarded to the DHCP/DHCPv6 server. This information provides the following: • circuit ID suboption – Provides the SNMP port interface index • remote ID – Provides the controller's MAC address
dhcp-option82	Enables DHCP option 82. DHCP option 82 provides client physical attachment information. This option is disabled by default.
dhcpv6-ldra	Enables the DHCPv6 relay agent. The LDRA feature allows DHCPv6 messages to be transmitted on existing networks that do not currently support IPv6 or DHCPv6. This option is disabled by default.

Examples

```
ap505-13403B(config-wlan-test)#relay-agent dhcp-option82
ap505-13403B(config-wlan-test)#show context
wlan test
 ssid test

service (wlan-config-context)

Invokes service commands applicable in the WLAN configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
service [accounting-migration-on-roaming|allow-ht-only|allow-open-passpoint|
client-load-balancing|cred-cache|eap-mac-mode|eap-mac-multicopy|eap-mac-multikeys|eap-
throttle|
enforce-pmkid-validation|key-index|monitor|radio-crypto|reauthentication|session-timeout|
tx-deauth-on-roam-detection|unresponsive-client|wpa-wpa2|show]

service accounting-migration-on-roaming

service [allow-ht-only|allow-open-passpoint|cred-cache [clear-on-4way-timeout|clear-on-
disconnect]|
eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|radio-crypto|
reauthentication seamless|
session-timeout mac|tx-deauth-on-roam-detection|show cli]

service eap-mac-mode [mac-always|normal]

service eap-throttle <0-254>

service key-index eap-wep-unicast <1-4>

service monitor [aaa-server|adoption|captive-portal|dhcp|dns]

service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]

service monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>

service unresponsive-client [attempts <1-1000>|ps-detect {threshold <1-1000>}|timeout
<1-60>]

service wpa-wpa2 exclude-ccmp
```

Parameters

```
service accounting-migration-on-roaming
```

accounting-migration-on-roaming	Enables migration of accounting session information and data usage details from one AP to another for roaming clients. When a client roams from AP1 to AP2, accounting for the client stops on AP1 and is resumed only after AP2 authenticates with the accounting server. By enabling this feature, accounting session information and data usage details migrates to the new AP, and the AP does not have to re-authenticate with the accounting server. Note: Accounting session information is supported on all WiNG APs. In case of controllers, this feature is valid only when APs use the controller as a proxy.

```
service [allow-ht-only|allow-open-passpoint|cred-cache [clear-on-4way-timeout|
clear-on-disconnect]|eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|radio-
crypto|
reauthentication seamless|session-timeout mac|tx-deauth-on-roam-detection|show cli]
```

allow-ht-only	Only allows clients capable of High Throughput (802.11n) data rates to associate. This option is disabled by default.
allow-open-passpoint	Enables non-WPA2 security for passpoint WLANs. This option is disabled by default. For more information on passpoint policy and configuration, see Passpoint Policy on page 1817.
cred-cache [clear-on-4way-timeout| clear-on-disconnect]	Clears credential cache based on the parameter passed • clear-on-4way-timeout – Clears cached client credentials after the 4way handshake with a client has timed out. This option is enabled by default. • clear-on-disconnect – Clears cached client credentials after the client has disconnected from the network. This option is disabled by default.
eap-mac-multicopy	Enables sending of multiple copies of broadcast and unicast messages. This option is disabled by default.
eap-mac-multikeys	Enables configuration of different key indices for MAC authentication. This option is disabled by default.
enforce-pmkid-validation	Validates the Predictive real-time *Pairwise Master Key Identifier* (PMKID) contained in a client's association request against the one present in the wpa-wpa2 handshake. This option is enabled by default. This functionality is based on the *Proactive Key Caching* (PKC) extension of the 802.11i EEEE standard. Whenever a wireless client successfully authenticates with a AP it receives a *Pairwise Master Key* (PMK). PKC allows clients to cache this PMK and reuse it for future re-authentications with the same AP. The PMK is unique for every client and is identified by the PMKID. The PMKID is a combination of the hash of the PMK, a string, the station and the MAC addresses of the AP.
radio-crypto	Uses radio hardware for encryption and decryption. This is applicable only for devices using *Counter Cipher Mode with Block Chaining Message Authentication Code Protocol* (CCMP) encryption mode.
reauthentication seamless	Enables seamless EAP client reauthentication without disconnecting client after the session has timed out. This option is enabled by default.
session-timeout mac	Enables reauthentication of MAC authenticated clients without disconnecting client after the session has timed out. This option is enabled by default.
tx-deauth-on-roam-detection	Transmits a de-authentication on the air while disassociating a client because its roam is detected on the wired side. This option is disabled by default.
show cli	Displays the CLI tree of the current mode. When used in the WLAN mode, this command displays the WLAN CLI structure.

```
service eap-mac-mode [mac-always|normal]
```

eap-mac-mode	Configures the EAP and/or MAC authentication mode used with this WLAN. This option is enabled by default.
mac-always	Enables both EAP and MAC authentication. MAC authentication is performed first, followed by EAP authentication. Clients are granted access based on the EAP authentication result. If a client does not have EAP, the MAC authentication result is used to grant access.
normal	Grants client access if the client clears either EAP or MAC authentication. This is the default setting.

```
service eap-throttle <0-254>
```

eap-throttle <0-254>	Enables EAP request throttling. Use this command to specify the maximum number of parallel EAP sessions allowed on this WLAN. Once this specified value is exceeded, all incoming EAP session requests are throttled. This option is enabled by default. • <0-254> – Specify a value from 0 - 254. This default value is 0.

```
service key-index eap-wep-unicast <1-4>
```

key-index eap-wep-unicast <1-4>	Configures an index with each key during EAP authentication with WEP. This option is enabled by default. • <1-4> – Select a index from 1 - 4. The default value is 1.

```
service wpa-wpa2 exclude-ccmp
```

wpa-wpa2 exclude-ccmp	Configures exclusion of CCMP requests when the authentication mode is set to tkip-ccmp. When enabled, it provides compatibility for client devices not compliant with tkip-ccmp. This option is disabled by default.

```
service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]
```

monitor	Enables critical resource monitoring. In a WLAN, service monitoring enables regular monitoring of external AAA servers, captive portal servers, access point adoption, DHCP and DNS servers. When enabled, it allows administrators to notify users of a service's availability and make resource substitutions in case of unavailability of a service.
aaa-server	Enables external AAA server failure monitoring. When enabled monitors an external RADIUS server resource's AAA activity and ensures its adoption and availability. This feature is disabled by default.

adoption vlan <1-4094>	Enables adoption failure monitoring on an adopted AP. Also configures a adoption failover VLAN. This feature is disabled by default. • VLAN <1-4094> – Specify the VLAN on which clients are placed when the connectivity between the AAP and the controller is lost. Configure a DHCP pool and gateway for the failover VLAN. Ensure the DHCP server is running on the AP. Also ensure that the DHCP pool is configured to have less lease time. When this feature is enabled on a WLAN, it allows adopted APs to monitor their connectivity with the controller. If and when this connectivity is lost, all new clients are placed in the configured adoption failover VLAN. They are served an IP by the DHCP server running on the AP. In this situation if a client tries to access a Web URL, the AP redirects the client to a page stating that the service is down. When the AAP's link to the switch is restored, clients are placed back in the WLAN's configured VLAN, and are served an IP from the corresponding configured DHCP server (external or on the AP/controller).
captive-portal external-server	Enables external captive portal server failure monitoring. When enabled, monitors externally hosted captive portal activity, and user access to the controller or service platform managed network. This feature is disabled by default. When enabled, this feature enables APs to display, to an externally located captive portal's user, the no-service page when the captive portal's server is not reachable.

```
service monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>
```

monitor	Enables DHCP and/or DNS server monitoring on this WLAN.
dhcp	Enables monitoring of a specified DHCP server. When the connection to the DHCP server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default. Use the *crm* keyword to specify the DHCP server to monitor.
dns	Enables monitoring of a specified DNS server. When the connection to the DNS server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default. Use the *crm* keyword to specify the DNS server to monitor.

crm <RESOURCE-NAME>	This keyword is common to the 'dhcp' and 'dns' parameters. • crm – Identifies the DHCP and/or DNS server to monitor • <RESOURCE-NAME> – Specify the name of the DHCP or DNS server. Once enabled, the CRM server monitors the DHCP/DNS server and updates their status as 'up' or 'down' depending on the availability of the resource. When either of these resources is down the wireless client is mapped to the failover VLAN and served with the 'no-service' page through the access point.
vlan <1-4094>	This keyword is common to the 'dhcp' and 'dns' parameters. After specifying the DHCP/DNS sever resource, specify the failover VLAN. • VLAN <1-4094> – Configures the failover VLAN from 1 - 4094. When the DHCP server resource becomes unavailable, the device falls back to the VLAN defined here. This VLAN has a DHCP server configured that provides a pool of IP addresses with a lease time less than the main DHCP server. When this DNS server resource becomes unavailable, the device falls back to the VLAN defined here. This VLAN has a DNS server configured that provides DNS address resolution until the main DNS server becomes available.

```
service unresponsive-client [attempts <1-1000>|ps-detect {threshold <1-1000>}|
timeout <1-60>]
```

unresponsive	Configures handling of unresponsive clients
attempts <1-1000>	Configures the maximum number of successive packets that failed transmission • <1-1000> – Specify a value from 1 - 1000. The default is 7.
ps-detect {threshold <1-1000>}	Enables the detection of power-save mode clients, whose PS stats has not been updated on the AP. This option is enabled by default. • threshold – Optional. Configures the threshold at which power-save client detection is triggered • <1-1000> – Configures the number of successive unacknowledged packets received before power-save detection is triggered. Specify a value from 1 - 1000. The default is 3.
timeout <1-60>	Configures the interval, in seconds, for successive packets not acknowledged by the client • <1-60> – Specify a value from 1 - 60 seconds. The default is 3 seconds.

Examples

```
nx9500-6C8809(config-wlan-test)#service allow-ht-only
nx9500-6C8809(config-wlan-test)#service monitor aaa-server
nx9500-6C8809(config-wlan-test)#service accounting-migration-on-roaming
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode tunnel
 encryption-type none
```

```
 authentication-type none
 service accounting-migration-on-roaming
 service monitor aaa-server
 service allow-ht-only
 controller-assisted-mobility
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes or reverts to default WLAN settings configured using the 'service' command

shutdown

Shuts down a WLAN. The shutdown mechanism helps regulate the availability of a WLAN based on an administrator defined access period. Use this feature to shut down a WLAN on specific days and hours and restrict periods when the WLAN traffic is either not desired or cannot be properly administrated. The normal practice is to shut down WLANs when there are no users on the network, such as after hours, weekends or holidays. This allows administrators more time to manage mission critical tasks since the WLAN's availability is automated.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
shutdown {on-critical-resource <CR-NAME>|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}
```

Parameters

```
shutdown {on-critical-resource <CR-NAME>|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}
```

shutdown	Shuts down the WLAN when specified events occur. Disabled by default.
on-critical-resource <CR-NAME>	Optional. Shuts down the WLAN when critical resource failure occurs. Disabled by default. • <CR-NAME> – Specifies the name of the critical resource being monitored for this WLAN.
on-meshpoint-loss	Optional. Shuts down the WLAN when the root meshpoint link fails (is unreachable). Disabled by default.
on-primary-port-link-loss	Optional. Shuts down the WLAN when a device losses its primary Ethernet port (ge1/up1) link. Disabled by default.
on-unadoption	Optional. Shuts down the WLAN when an adopted device becomes unadopted. Disabled by default.

Usage Guidelines

If the shutdown on-meshpoint-loss feature is enabled, the WLAN status changes only if the meshpoint and the WLAN are mapped to the same VLAN. If the meshpoint is mapped to VLAN 1 and the WLAN is mapped to VLAN 2, then the WLAN status does not change on loss of the meshpoint.

Examples

```
nx9500-6C8809(config-wlan-test)#shutdown on-unadoption
```

```
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 proxy-arp-mode strict
 broadcast-dhcp validate-offer
 shutdown on-unadoption
 http-analyze controller
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Disables auto shut down WLAN. Use the optional keywords provided to disable auto shut down of the WLAN upon critical resource failure, when meshpoint links fail, when the primary Ethernet port (e1/up1) loses link, or when the WLAN gets unadopted.

ssid

Configures the WLAN's SSID

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ssid <SSID>
```

Parameters

```
ssid <SSID>
```

<SSID>	Specify the WLAN's SSID. The WLAN SSID is case sensitive and alphanumeric. It's length should not exceed 32 characters.

Examples

```
nx9500-6C8809(config-wlan-test)#ssid testWLAN1
```

```
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 bridging-mode local
 encryption-type none
authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment

 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
```

```
 proxy-arp-mode strict
 broadcast-dhcp validate-offer
 shutdown on-unadoption
 http-analyze controller
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes the WLAN's SSID

t5-client-isolation

Disallows clients connecting to the WLAN to communicate with one another. This setting applies exclusively to CPE devices managed by a T5 controller and is disabled by default.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within the WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

Note
This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Supported in the following platforms:

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
t5-client-isolation
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config-wlan-test)#t5-client-isolation
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 t5-client-isolation
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Allows clients connecting to the WLAN to communicate with one another

t5-security

Configures T5 PowerBroadband security settings. A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within the WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

Note
This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Supported in the following platforms:

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
t5-security [static-wep|wpa-enterprise|wpa-personal]
t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]
t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp]
version [mixed|wpa|wpa2]
```

Parameters

```
t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]
```

t5-security static-wep	Configures the T5 WLAN security type as static-wep
encryption-type [wep128| wep64]	Applies one of the following encryption algorithms to the T5 support WLAN configuration: WEP64 or WEP128
hex <STRING>	Configures the hex password (used to derive the security key) • <STRING> – Specify the hex password (should not exceed the 10 - 26 characters).
passphrase <STRING>	Configures the passphrase shared by both transmitting and receiving authenticators • <STRING> – Specify the passphrase. It could either be an alphanumeric string of 8 to 63 ASCII characters or 64 HEX characters. The alphanumeric string allows character spaces. This string is converted to a numeric value. Configuring a passphrase saves you the need to create a 256-bit key each time keys are generated.

```
t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp]
version [mixed|wpa|wpa2]
```

t5-security [wpa-enterprise| wpa-personal]	Configures the T5 WLAN security type as: wpa-enterprise OR wpa-personal
encryption-type [ccmp|tkip|tkip-ccmp]	The following parameters are common to the *wpa-enterprise* and *wpa-personal* keywords: • [ccmp|tkip|tkip-ccmp] – Applies one of the following encryption algorithms to the T5 support WLAN configuration: **CCMP**, **TKIP**, or **TKIP-CCMP**.
version [mixed|wpa|wpa2]	The following parameters are common to the *wpa-enterprise* and *wpa-personal* keywords: • version – Applies one of the following encryption schemes to the vT5 support WLAN configuration: **WPA**, **WPA2**, or **mixed**.

Examples

```
nx9500-6C8809(config-wlan-test)#t5-security wpa-enterprise encryption-type ccmp version
wpa
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 t5-security wpa-enterprise encryption-type ccmp version wpa
 t5-client-isolation
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes the configured T5 PowerBroadband security settings

time-based-access

Configures time-based client access to the network resources. Use this feature to assign fixed days and time of WLAN access for wireless clients.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|
all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]
```

Parameters

```
time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|
all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]
```

day <option>	Specifies the day or days on which the client can access the WLAN • sunday – Allows access on Sundays only • monday – Allows access on Mondays only • Tuesdays – Allows access on Tuesdays only • wednesday – Allows access on Wednesdays only • thursday – Allows access on Thursdays only • friday – Allows access on Fridays only • saturday – Allows access on Saturdays only • weekends – Allows access on weekends only • weekdays – Allows access on weekdays only • all – Allows access on all days
start <START-TIME>	Optional. Specifies the access start time in hours and minutes (HH:MM)
end <END-TIME>	Specifies the access end time in hours and minutes (HH:MM)

Examples

```
nx9500-6C8809(config-wlan-test)#time-based-access days weekdays start 10:00 end 16:30
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 time-based-access days weekdays start 10:00 end 16:30
 --More--
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes the configured time-based-access settings

use (wlan-config-mode)

This command associates an existing captive portal and other policies with a WLAN.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
use [aaa-policy|application-policy|association-acl-policy|bonjour-gw-discovery-policy|
captive-portal|ip-access-list|ipv6-access-list|mac-access-list|passpoint-policy|
purview-application-policy|roaming-assist-policy|url-filter|wlan-qos-policy]
use [aaa-policy <AAA-POLICY-NAME>|application-policy <APP-POLICY-NAME>|
association-acl-policy <ASSOCIATION-POLICY-NAME>|bonjour-gw-discovery-policy <POLICY-
NAME>|
captive-portal <CAPTIVE-PORTAL-NAME>|passpoint-policy <PASSPOINT-POLICY-NAME>|
```

```
purview-application-policy <POLICY-NAME>|roaming-assist-policy <POLICY-NAME>|
url-filter <URL-FILTER-NAME>|wlan-qos-policy <WLAN-QOS-POLICY-NAME>]

use ip-access-list [in|out] <IP-ACCESS-LIST-NAME>

use ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>

use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>
```

Parameters

```
use [aaa-policy <AAA-POLICY-NAME>|application-policy <APP-POLICY-NAME>|
association-acl-policy <ASSOCIATION-POLICY-NAME>|bonjour-gw-discovery-policy <POLICY-
NAME>|
captive-portal <CAPTIVE-PORTAL-NAME>|passpoint-policy <PASSPOINT-POLICY-NAME>|
purview-application-policy <POLICY-NAME>|roaming-assist-policy <POLICY-NAME>|
url-filter <URL-FILTER-NAME>|wlan-qos-policy <WLAN-QOS-POLICY-NAME>]
```

aaa-policy <AAA-POLICY-NAME>	Uses an existing AAA policy with a WLAN • <AAA-POLICY-NAME> – Specify the AAA policy name.
association-acl <ASSOCIATION-POLICY-NAME>	Uses an existing association ACL policy with a WLAN • <ASSOCIATION-POLICY-NAME> – Specify the association ACL policy name.
application-policy <APP-POLICY-NAME>	Uses an existing application policy with the WLAN. WLAN traffic is inspected and access control and quality of service actions applied based on the rules defined in the application policy. • <APP-POLICY-NAME> - Specify the Application policy name. The policy should be existing and configured. Note: The WiNG 5.9.X enabled devices use a third-party, DPI engine to detect pre-defined application definitions. To enable AVC and app-usage stats reporting in a WiNG 5.9.X network, see application-group on page 191 and application-policy on page 195.
bonjour-gw-discovery-policy <POLICY-NAME>	Uses an existing Bonjour GW Discovery policy with a WLAN. When associated, the Bonjour GW Discovery policy defines a list of Apple services clients can discover across subnets. Bonjour enables discovery of services on a LAN. Bonjour allows the setting up a network (without any configuration) in which services such as printers, scanners and file-sharing servers can be found using Bonjour. Bonjour only works within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains. • <POLICY-NAME> – Specify the Bonjour GW Discovery policy name. Should be existing and configured.
captive-portal <CAPTIVE-PORTAL-NAME>	Specifies the captive-portal policy to use if enforcing captive-portal authentication on this WLAN • <CAPTIVE-PORTAL-NAME> – Specify the captive-portal policy name. Should be existing and configured.

passpoint-policy <PASSPOINT-POLICY-NAME>	Associates a passpoint policy (Hotspot2 configuration) with this WLAN. • <PASSPOINT-POLICY-NAME> – Specify the Passpoint policy name. Should be existing and configured. Map a passpoint policy to a WLAN. Since the configuration gets applied to the radio by BSS, only the Hotspot 2.0 configuration of primary WLANs on a BSSID is used. Incoming Hotspot 2.0 GAQ/ANQP requests from clients are identified by their destination MAC addresses and are handled by the passpoint policy from the primary WLAN on that BSS. Define one passpoint policy for every WLAN configured.
purview-application-policy <PURVIEW-APP-POLICY-NAME>	Uses an existing Purview application policy with the WLAN. WLAN traffic is inspected and access control and quality of service actions applied based on the rules defined in the Purview application policy. • <PURVIEW-APP-POLICY-NAME> - Specify the Purview Application policy name. The policy should be existing and configured. Note: The WiNG 7.1.X enabled devices use Extreme Networks' *EAA* (Purview™) DPI engine to detect pre-defined application definitions. To enable AVC in a WiNG 7.1.X network, see purview-application-group on page 432 and purview-application-policy on page 436.
roaming-assist-policy <POLICY-NAME>	Associates an existing roaming assist policy with this WLAN • <POLICY-NAME> – Specify the Roaming Assist policy name. Should be existing and configured.
url-filter <URL-FILTER-NAME>	Associates an existing URL list with this WLAN • <URL-FILTER-NAME> – Specify the URL filter name. Should be existing and configured.
wlan-qos-policy <WLAN-QOS-POLICY-NAME>	Uses an existing WLAN QoS policy with a WLAN • <WLAN-QOS-POLICY-NAME> – Specify the WLAN QoS policy name. Should be existing and configured.

```
use ip-access-list [in|out] <IP-ACCESS-LIST-NAME>
```

ip-access-list [in|out] <IP-ACCESS-LIST-NAME>	Applies an IP access list to incoming and outgoing packets • in – Applies the IP ACL to incoming packets • out – Applies IP ACL to outgoing packets • <IP-ACCESS-LIST-NAME> – Specify the IP access list name.

```
use ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>
```

ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>	Applies an IPv6 access list to incoming and outgoing packets • in – Applies the IPv6 ACL to incoming packets • out – Applies IPv6 ACL to outgoing packets • <IPv6-ACCESS-LIST-NAME> – Specify the IPv6 access list name.

```
use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>
```

mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>	Applies a MAC access list to incoming and outgoing packets. • in – Applies the MAC ACL to incoming packets • out – Applies MAC ACL to outgoing packets • <MAC-ACCESS-LIST-NAME> – Specify the MAC access list name.

Usage Guidelines

IP and MAC ACLs act as firewalls within a WLAN. WLANs use ACLs as firewalls to filter or mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of *Access Control Entries* (ACEs). Each ACE specifies a set of conditions (rules) and the action taken in case of a match. The action can be permit, deny, or mark. Therefore, when a packet matches an ACE's conditions, it is either forwarded, dropped, or marked depending on the action specified in the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP ACLs contain deny and permit rules specifying source and destination IP addresses. Each rule has a precedence order assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny, or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Examples

```

Related Commands

no (wlan-config-mode) on page 590	Removes the following policies associated with a WLAN: aaa-policy, application-policy, association-acl-policy, bonjour-gw-discovery-policy, captive-portal, ip-access-list, ipv6-access-list, mac-access-list, passpoint-policy, roaming-assist-policy, url-filter, or wlan-qos-policy.

vlan

Sets the VLAN where traffic from this WLAN is mapped

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

Parameters

```
vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

<1-4094>	Sets a WLAN's VLAN ID. This command starts a new VLAN assignment for a WLAN index. All prior VLAN settings are erased. Use this command to assign just one VLAN to the WLAN. Utilizing a single VLAN per WLAN is a more typical deployment scenario than using a VLAN pool.
<VLAN-ALIAS-NAME>	Assigns a VLAN alias to the WLAN. The VLAN alias should be pre-existing and configured. A VLAN alias maps a name to a VLAN ID. When applied to ports (for example GE ports) using the trunk mode, a VLAN alias denies or permits traffic, on the port, to and from the VLANs specified in the alias. For more information on aliases, see alias on page 172.

Examples

```
nx9500-6C8809(config-wlan-test)#vlan 4
```

```
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 vlan 4
 bridging-mode local
 encryption-type none
 authentication-type none

 shutdown on-unadoption
 http-analyze controller
nx9500-6C8809(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Removes a WLAN's default VLAN mapping

vlan-pool-member

Adds a member VLAN to a WLAN's VLAN pool. Use this option to define the VLANs available to this WLAN. Additionally, define the number of wireless clients supported by each VLAN.

Note
Configuration of a VLAN pool overrides the 'vlan' configuration.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
vlan-pool-member <WORD> {limit <0-8192>}
```

Parameters

```
vlan-pool-member <WORD> {limit <0-8192>}
```

vlan-pool-member	Adds a member VLAN to a WLAN's VLAN pool Since users belonging to separate VLANs can share the same WLAN, it is not necessary to create a new WLAN for every VLAN in the network.
<WORD>	Define the VLANs available to this WLAN. It is either a single index, or a list of VLAN IDs (for example, 1,3,7), or a range (for example, 1-10)
limit <0-8192>	Optional. Is ignored if the number of clients are limited and well within the limits of the DHCP pool on the VLAN • <0-8192> – Specifies the number of users allowed

Examples

```
nx9500-6C8809(config-wlan-test)#vlan-pool-member 1-10 limit 1
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 vlan-pool-member 1 limit 1
 vlan-pool-member 2 limit 1
 vlan-pool-member 3 limit 1
 vlan-pool-member 4 limit 1
 vlan-pool-member 5 limit 1
 vlan-pool-member 6 limit 1
 vlan-pool-member 7 limit 1
 vlan-pool-member 8 limit 1
 vlan-pool-member 9 limit 1
 vlan-pool-member 10 limit 1
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 time-based-access days weekdays start 10:00 end 16:30
```

```

Related Commands

no (wlan-config-mode) on page 590	Removes the list of VLANs mapped to a WLAN

wep128

Configures WEP128 parameters

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
wep128 [key|keys-from-passkey|transmit-key]
wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep128 keys-from-passkey <WORD>
wep128 transmit-key <1-4>
```

Parameters

```
wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
```

wep128	Configures WEP128 parameters. The parameters are: key, key-from-passkey, and transmit-key.
key <1-4>	Use to configure the key number • <1-4> – Specify the key number from 1 - 4.
ascii [0 <WORD>| 2 <WORD>| <WORD>]	Sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128) • 0 <WORD> – Configures a clear text key • 2 <WORD> – Configures an encrypted key • <WORD> – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters
hex [0 <WORD>| 2 <WORD>| <WORD>]	Sets keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128) • 0 <WORD> – Configures a clear text key • 2 <WORD> – Configures an encrypted key • <WORD> – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters

```
wep128 keys-from-passkey <WORD>
```

keys-from-passkey <WORD>	Specifies a pass key. The pass key can be any alphanumeric string. Controllers, service platforms, Access Points and their connected clients use the algorithm to convert an ASCII string to the same hexadecimal number. Clients without adapters need to use WEP keys manually configured as hexadecimal numbers. • <WORD> – Specify a pass key from 4 - 32 characters.

```
wep128 transmit-key <1-4>
```

transmit-key <1-4>	Configures the key index used for transmission from an AP to a wireless client or service platform • <1-4> – Specify a key index from 1 - 4.

Examples

```
NOC-NX9500(config-wlan-test)#wep128 key 1 ascii 123456789abcd
NOC-NX9500(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 wep128 key 1 hex 0 313233343536373839616263 64
NOC-NX9500(config-wlan-test)#
```

Related Commands

no (wlan-config-mode) on page 590	Resets the WEP128 parameters to factory-default values.

wep64

Configures WEP64 parameters

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
wep64 [key|keys-from-passkey|transmit-key]
wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep64 keys-from-passkey <WORD>
wep64 transmit-key <1-4>
```

Parameters

```
wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
```

wep64	Configures WEP64 parameters The parameters are: key, key-from-passkey, and transmit-key.
key <1-4>]	Configures pre-shared hex keys • <1-4> – Configures a maximum of four key indexes. Select a key index from 1 - 4.

ascii [0 <WORD>| 2 <WORD>| <WORD>]	Sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128) • 0 <WORD> – Configures a clear text key • 2 <WORD> – Configures an encrypted key • <WORD> – Configures key (10 hex or 5 ASCII characters for WEP64, 26 hex or 13 ASCII characters for WEP128).
hex [0 <WORD>| 2 <WORD>| <WORD>]	Sets keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128) • 0 <WORD> – Configures a clear text key • 2 <WORD> – Configures an encrypted key • <WORD> – Configures the key (10 hex or 5 ASCII characters for WEP64, 26 hex or 13 ASCII characters for WEP128)

```
wep64 keys-from-passkey <WORD>
```

keys-from-passkey <WORD>	Specifies a pass key from which keys are derived • <WORD> – Specify a pass key from 4 - 32 characters.

```
wep64 transmit-key <1-4>
```

transmit-key <1-4>	Configures the key index used for transmission from an AP to a wireless client or service platform • <1-4> – Specify a key index from 1 - 4.

Examples

```
NOC-NX9500(config-wlan-test2)#wep64 key 1 hex 1CBF427D50
NOC-NX9500(config-wlan-test2)#wep64 transmit-key 1
NOC-NX9500(config-wlan-test2)#show context
wlan test2
 ssid test2
 bridging-mode local
 encryption-type none
 authentication-type none
 wep64 key 1 hex 0 1CBF427D50
NOC-NX9500(config-wlan-test2)#
```

Related Commands

no (wlan-config-mode) on page 590	Resets the WEP64 parameters to factory-default values

wing-extensions

Enables support for WiNG-specific client extensions to the IEEE 802.11x WLAN standards that potentially increase client roaming reliability and handshake speed

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
wing-extensions [ap-attributes-information {include-hostname}|
coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60}|
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}|
smart-scan|wing-load-information|wmm-load-information]
```

Parameters

```
wing-extensions [ap-attributes-information {include-hostname}|
coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60}|
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}|
smart-scan|wing-load-information|wmm-load-information]
```

wing-extensions	Enables support for inclusion of WiNG-specific client extensions in radio transmissions
ap-attributes-information {include-hostname}	Enables support for AP attributes IE *(information element)* • include-hostname – Optional. When enabled, includes AP's hostname, as a sub-element, in the AP attributes IE. The AP attributes IE is vendor-specific and, when enabled, is added to beacons and probe responses. Inclusion of AP attributes IE allows Extreme Networks terminals to: • - Recognize Extreme APs • - Determine if the AP supports PAN BU features, irrespective of whether these features are enabled or not. AP attributes IE is not added to beacons and probe responses by default.
overage-hole-detection {11k-clients| offset <5-20>| threshold <-80--60>}	Enables *coverage hole detection* (CHD) and configures CHD parameters. When enabled, allows clients (MUs) to inform an access point when it experiences a coverage hole. A coverage hole is an area of poor wireless coverage not supported by a WiNG managed access point radio. Enable radio resource measurement prior to enabling CHD. For enabling radio resource measurement, see radio-resource-measurement on page 558. CHD is disabled by default. After enabling CHD, optionally configure the following parameters: • 11k-clients – Optional. Provides coverage hole detection to 802.11k-only-capable clients. This is a reduced set of coverage hole detection capabilities (standard 11k messages and behaviors). This option is disabled by default. • offset <5-20> – Optional. Configures the offset added to the threshold to obtain the access point's signal strength (as seen by the client) considered adequate. • <5-20> – Specify the offset value from 5 - 20. The default is 5. • threshold – Optional. Configures the access point's signal strength threshold. When Radio Resource Measurement and CVG Hole are enabled, specify a threshold for the AP's signal strength (as seen by the client) below which a coverage hole incident is reported by the client. • <-80--60> – Specify the threshold from -80 - -60 dBm. The default is -70 dBm.
ft-over-ds-aggregate	Enables *fast-transition* (FT) aggregation of action frames. When enabled, increases roaming speed by eliminating separate key exchange handshake frames with potential roam candidates. Enable fast transition to complete an initial FT over *distribution system* (DS) handshake with multiple roam candidates (up to 6) at once, eliminating the need to send separate FT over DS handshakes to each roam candidate. This option is disabled by default.

move-command	Enables use of *Hyper Fast Secure Roaming* (HFSR) for clients on this WLAN. This feature applies only to certain client devices. This option is disabled by default.
scan-assist {channel-info-interval <6-9>}	Enables support for scanning assist. When enabled, allows faster roams on *Dynamic Frequency Selection* (DFS) channels by eliminating passive scans. Clients get channel information directly from possible roam candidates. This option is disabled by default. • channel-info-interval <6-9> – Optional. Configures the interval at which channel information is periodically retrieved from potential roam candidates without requesting scan assist. • <6-9> – Specify the interval from 6 - 9 seconds. When enabled, the default value is 8 seconds.
smart-scan	Enables a smart scan to refine a clients channel scans to just a few channels as opposed to all available channels. This option is disabled by default.
wing-load-information	Enables support for the WiNG load information element (Element ID 173) with legacy Symbol Technology clients, thus making them optimally interoperable with the latest Extreme Networks access points. This option is enabled by default.
wmm-load-information	Enables support for WiNG *Wi-Fi MultiMedia* (WMM) Load Information Element in radio transmissions with legacy clients. This option is disabled by default.

Examples

```
nx9500-6C8809(config-wlan-test)#wing-extensions wmm-load-information
nx9500-6C8809(config-wlan-test)#show context

```

Related Commands

no (wlan-config-mode) on page 590	Disables support for WiNG-specific client extensions to the IEEE 802.11x WLAN standards. Use the keywords provided to disable a specific wing-extension.

wireless-client

Configures the transmit power indicated to clients

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
wireless-client [count-per-radio|cred-cache-ageout|hold-time|inactivity-timeout|
max-firewall-sessions|reauthentication|roam-notification|tx-power|t5-inactivity-timeout|
vlan-cache-out]

wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|
hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
vlan-cache-ageout <60-86400>]

wireless-client roam-notification [after-association|after-data-ready|auto]
```

Parameters

```
wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|
hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
vlan-cache-ageout <60-86400>]
```

wireless-client	Configures the transmit power indicated to wireless clients for transmission
count-per-radio <0-256>	Configures the maximum number of clients allowed on this WLAN per radio • <0-256> – Specify a value from 0 - 256.
cred-cache-ageout <60-86400>	Configures the timeout period for which client credentials are cached across associations • <60-86400> – Specify a value from 60 - 86400 seconds.
hold-time <1-86400>	Configures the time period for which wireless client state information is cached post roaming • <1-86400> – Specify a value from 1 - 86400 seconds.
inactivity-timeout <60-86400>	Configures an inactivity timeout period in seconds. If a frame is not received from a wireless client for this period of time, the client is disassociated. • <60-86400> – Specify a value from 60 - 86400 seconds.
max-firewall-sessions <10-10000>	Configures the maximum firewall sessions allowed per client on a WLAN • <10-10000> – Specify the maximum number of firewall sessions allowed from 10 - 10000.
reauthentication <30-86400>	Configures periodic reauthentication of associated clients • <30-86400> – Specify the client reauthentication interval from 30 - 86400 seconds.
t5-inactivity-timeout <60-86400>	Configures and inactivity timeout, in seconds, for T5 devices. When configured, the T5 device is disassociated if the time lapsed after the last frame received from it exceeds the value specified here. • <60-86400> – Specify a value from 60 - 86400 seconds. The default is 60 seconds.

tx-power <0-20>	Configures the transmit power indicated to clients • <0-20> – Specify a value from 0 - 20 dBm.
vlan-cache-ageout <60-86400>	Configures the timeout period for which client VLAN information is cached across associations. • <60-86400> – Specify a value from 60 - 86400 seconds.

```
wireless-client roam-notification [after-association|after-data-ready|auto]
```

wireless-client	Configures the transmit power indicated to wireless clients for transmission
roam-notification	Configures when a roam notification is transmitted
after-association	Transmits a roam notification after a client has associated
after-data-ready	Transmits a roam notification after a client is data-ready (after completion of authentication, handshakes etc.)
auto	Transmits a roam notification upon client association (if the client is known to have authenticated to the network)

Examples

wpa-wpa2

Modifies TKIP-CCMP (WPA/WPA2) related parameters

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
wpa-wpa2 [exclude-wpa2-tkip|handshake|key-rotation|opp-pmk-caching|pmk-caching|
preauthentication|server-only-authentication|psk|tkip-countermeasures|use-sha256-akm]

wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|
server-only-authentication|use-sha256-akm]

wpa-wpa2 handshake [attempts|init-wait|priority|timeout]

wpa-wpa2 handshake [attempts <1-5>|init-wait <5-1000000>|priority [high|normal]|
timeout <10-5000> {10-5000}]

wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>

wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]

wpa-wpa2 tkip-countermeasures holdtime <0-65535>
```

Parameters

```
wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|
server-only-authentication|use-sha256-akm]
```

wpa-wpa2	Modifies TKIP-CCMP (WPA/WPA2) related parameters
exclude-wpa2-tkip	Excludes the *Wi-Fi Protected Access II* (WPA2) version of TKIP. It supports the WPA version of TKIP only. This option is disabled by default.
opp-pmk-caching	Uses opportunistic key caching (same *Pairwise Master Key* (PMK) across APs for fast roaming with EAP.802.1x. This option is enabled by default.
pmk-caching	Uses cached pair-wise master keys (fast roaming with eap/802.1x). This option is enabled by default.
preauthentication	Uses pre-authentication mode (WPA2 fast roaming)
use-sha256-akm	Uses sha256 authentication key management suite

```
wpa-wpa2 handshake [attempts <1-5>|init-wait <5-1000000>|priority [high|normal]|
timeout <10-5000> {10-5000}]
```

wpa-wpa2	Modifies TKIP-CCMP (WPA/WPA2) related parameters
handshake	Configures WPA/WPA2 handshake parameters
attempts <1-5>	Configures the total number of times a message is transmitted towards a non-responsive client • <1-5> – Specify a value from 1 - 5. The default is 2.

init-wait <5-1000000>	Configures a minimum wait-time period, in microseconds, before the first handshake message is transmitted from the AP. This option is disabled by default. • <5-1000000> – Specify a value from 5 - 1000000 microseconds.
priority [high|normal]	Configures the relative priority of handshake messages compared to other data traffic • high – Treats handshake messages as high priority packets on a radio. This is the default setting. • normal – Treats handshake messages as normal priority packets on a radio
timeout <10-5000> <10-5000>	Configures the timeout period, in milliseconds, for a handshake message to retire. Once this period is exceeded, the handshake message is retired. • <10-5000> – Specify a value from 10 - 5000 millisceonds. The default is 500 milliseconds. • <10-5000> – Optional. Configures a different timeout between the second and third attempts'

```
wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>
```

wpa-wpa2	Modifies TKIP-CCMP (WPA/WPA2) related parameters
key-rotation	Configures parameters related to periodic rotation of encryption keys. The periodic key rotation parameters are broadcast, multicast, and unicast traffic.
broadcast <30-86400>	Configures the periodic rotation of keys used for broadcast and multicast traffic. This parameter specifies the interval, in seconds, at which keys are rotated. This option is disabled by default. • <30-86400> – Specify a value from 30 - 86400 seconds.
unicast <30-86400>	Configures a periodic interval for the rotation of keys, used for unicast traffic. This option is disabled by default. • <30-86400> – Specify a value from 30 - 86400 seconds.

```
wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]
```

wpa-wpa2	Modifies TKIP-CCMP (WPA/WPA2) related parameters
psk	Configures a pre-shared key.
0 <LINE>	Configures a clear text key
2 <LINE>	Configures an encrypted key
<LINE>	Enter the pre-shared key either as a passphrase not exceeding 8 - 63 characters, or as a 64 character (256bit) hexadecimal value.

```
wpa-wpa2 tkip-countermeasures holdtime <0-65535>
```

wpa-wpa2	Modifies TKIP-CCMP (WPA/WPA2) parameters
tkip-countermeasures	Configures a hold time period for implementation of TKIP counter measures
holdtime <0-65535>	Configures the amount of time a WLAN is disabled when TKIP counter measures are invoked • <0-65535> – Specify a value from 0 - 65536 seconds. <0-65535> – Specify a value from 0 - 65535 seconds. The default is 60 seconds.

Examples

```
nx9500-6C8809(config-wlan-test)#wpa-wpa2 tkip-countermeasures hold-time 2

Related Commands

no (wlan-config-mode) on page 590	Removes or reverts to default TKIP-CCMP (WPA/WPA2) related parameters

no (wlan-config-mode)

Negates WLAN mode commands and reverts values to their default

Syntax

```
no <PARAMETERS>
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes this WLAN's settings or reverts them to default values, based on the parameters passed.

Usage Guidelines

The *no* command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

```
nx9500-6C8809(config-wlan-test)#no ?
  802.11v                                Configure 802.11v parameters
  accounting                             Configure how accounting records are
                                         created for this wlan
  acl                                    Actions taken based on ACL
                                         configuration [ packet drop being one
                                         of them]
  answer-broadcast-probes                Do not Include this wlan when
                                         responding to probe requests that do
                                         not specify an SSID
  assoc-response                         Association response threshold
  association-list                       Configure the association list for
                                         the wlan
  authentication-type                    Reset the authentication to use on
                                         this wlan to default (none/Pre-shared
                                         keys)
  broadcast-dhcp                         Configure broadcast DHCP packet
                                         handling
  broadcast-ssid                         Do not advertise the SSID of the WLAN
                                         in beacons
  captive-portal-enforcement             Configure how captive-portal is
                                         enforced on the wlan
  client-access                          Disallow client access on this wlan
                                         (no data operations)
  client-client-communication            Disallow switching of frames from one
                                         wireless client to another on this
                                         wlan
  client-load-balancing                  Disable load-balancing of clients on
                                         this wlan
  controller-assisted-mobility           Disable configure assisted mobility
  data-rates                             Reset data rate configuration to
                                         default
  description                            Reset the description of the wlan
  downstream-group-addressed-forwarding  Disable downstream group addressed
                                         forwarding of packets
  dpi                                    Deep-Packet-Inspection (Application
                                         Assurance)
  dynamic-vlan-assignment                Dynamic VLAN assignment configuration
  eap-types                              Allow all EAP types on this wlan
  encryption-type                        Reset the encryption to use on this
                                         wlan to default (none)
  enforce-dhcp                           Drop packets from Wireless Clients
                                         with static IP address
  fast-bss-transition                    Disable support for 802.11r Fast BSS
                                         Transition
  http-analyze                           Enable HTTP URL analysis on the wlan
  ip                                     Internet Protocol (IP)
  ipv6                                   Internet Protocol version 6 (IPv6)
  kerberos                               Configure kerberos authentication
                                         parameters
  mac-authentication                     Configure mac-authentication related
                                         parameters
  nsight                                 Nsight Server
  opendns                                OpenDNS related config for this wlan
  protected-mgmt-frames                  Disable support for Protected
                                         Management Frames (IEEE 802.11w)
  proxy-arp-mode                         Configure handling of ARP requests
                                         with proxy-arp is enabled
  proxy-nd-mode                          Configure handling of IPv6 ND
                                         requests with proxy-nd is enabled
```

```
  qos-map                                 Disable the 802.11u QoS map element
                                          and frame
  radio-resource-measurement              Disable support for 802.11k Radio
                                          Resource Measurement
  radius                                  Configure RADIUS related parameters
  registration                            Dynamic registration of device (or)
                                          user
  relay-agent                             Configure dhcp relay agent info
  shutdown                                Enable the use of this wlan
  ssid                                    Configure ssid
  t5-client-isolation                     Do not Isolate traffic among clients
  t5-security                             Configure encryption and
                                          authentication
  time-based-access                       Reset time-based-access parameters to
                                          default
  use                                     Set setting to use
  vlan                                    Map the default vlan (vlan-id 1) to
                                          the wlan
  vlan-pool-member                        Delete a mapped vlan from this wlan
  wep128                                  Reset WEP128 parameters

wlan-qos-policy

Configures a WLAN QoS policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
wlan-qos-policy <WLAN-QOS-POLICY-NAME>
```

Parameters

```
wlan-qos-policy <WLAN-QOS-POLICY-NAME>
```

<WLAN-QOS-POLICY-NAME>	Specify the WLAN QoS policy name. If a policy with the specified name does not exist, it is created.

Examples

```
nx9500-6C8809(config)#wlan-qos-policy test
nx9500-6C8809(config-wlan-qos-test)#?
WLAN QoS Mode commands:
  accelerated-multicast  Configure accelerated multicast streams address and
```

```
                          forwarding QoS classification
  classification          Select how traffic on this WLAN must be classified
                          (relative prioritization on the radio)
  multicast-mask          Egress multicast mask (frames that match bypass the
                          PSPqueue. This permits intercom mode operation
                          without delay even in the presence of PSP clients)
  no                      Negate a command or set its defaults
  qos                     Quality of service
  rate-limit              Configure traffic rate-limiting parameters on a
                          per-wlan/per-client basis
  svp-prioritization      Enable spectralink voice protocol support on this
                          wlan
  voice-prioritization    Prioritize voice client over other client (for
                          non-WMM clients)
  wmm                     Configure 802.11e/Wireless MultiMedia parameters

  clrscr                  Clears the display screen

  do                      Run commands from Exec mode
  end                     End current mode and change to EXEC mode
  exit                    End current mode and down to previous mode
  help                    Description of the interactive help system
  revert                  Revert changes
  service                 Service Commands
  show                    Show running system information
  write                   Write running configuration to memory or terminal

nx9500-6C8809(config-wlan-qos-test)#
```

Related Commands

no on page 611	Removes an existing WLAN QoS POLICY

Note
For more information on WLAN QoS policy commands, see WLAN-QoS Policy on page 1685.

url-filter

Creates a new URL filter (Web filter) and enters its configuration mode. URL filtering is a licensed feature. When applied to a WiNG device the license allows you to enable URL filtering on the device, create and apply a URL filter defining the banned and/or allowed URLs. When enabled, the URL filter is applied to all user-initiated URL requests to determine if the requested URL is banned or allowed. Only if allowed is the user's request (in the form of a HTTP request packet) forwarded to the Web server.

URL filters can be applied at any of the following points: the user's application (browser/email reader), the network's gateway, at the *Internet service provider* (ISP) end, and also on a Web portal. For wireless clients, the WLAN infrastructure is the best place to implement these filters.

A URL filter is a set of whitelist and/or blacklist rules. The whitelist allows access only to those Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the whitelist, are banned. On the other hand, the blacklist bans all Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the blacklist, are allowed.

To simplify URL filter configuration, Websites have been classified into pre-defined category-types and categories. The system provides 12 category-types and 64 categories. To further simplify configuration,

these 12 category-types have been grouped into five (5) pre-defined levels. (See Usage Guidelines section for the list of category-types, categories, and levels). The actual classification of URLs (on the basis of the pre-defined factors mentioned above) is done by the classification server. A local database also helps by caching URL records for a user-defined time period. The classification server host is specified in the Web filter policy. The Web filter policy also defines the URL database parameters. For more information, see web-filter-policy on page 511 .

The WiNG software also allows you to create URL lists. Each URL list contains a list of user-defined URLs. Use the URL list in a URL filter (whitelist or blacklist rule) to identify the URLs to ban or allow. For example, a URL list named SocialNetworking is created listing the following three sites: Facebook, Twitter, and LinkedIn. When applied to a URL filter's blacklist these three sites are banned. Where as, when applied to a whitelist only these three sites are allowed. For more information on configuring a URL list, see url-list on page 604.

Note

URL filtering is a licensed feature. Procure and install the license in the device configuration mode. For more information, see license on page 1280 (device config mode).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
url-filter <URL-FILTER-NAME>
```

Parameters

```
url-filter <URL-FILTER-NAME>
```

<URL-FILTER-NAME>	Creates a new URL filter and enters its configuration mode. Specify the URL filter name. If a filter with the specified name does not exist, it is created.

Usage Guidelines

Sl No.	Category Type	Category
1	Adult Content	Alcohol & Tobacco, Dating & Personals, Gambling, Nudity, Pornography/Sexually Explicit, Sex Education, Weapons
2	Business	Web-based Email
3	Communication	Chat, Instant Messaging
4	Entertainment	Streaming Media & Downloads
5	File Sharing and Backup	Download Sites
6	Gaming	Games

Sl No.	Category Type	Category
7	News Sports and General	Arts, Business, Computer & Technology, Education, Entertainment, Fashion & Beauty, Finance, Forum & Newsgroups, General, Government, Greeting Card, Health & Medicine, Information Security, Job Search, Leisure & Recreation, Network Errors, News, Non-Profits & NGO, Personal Sites, Politics, Private IP Addresses, Real Estates, Religion, Restaurants & Dinning, Search Engine & Portals, Shopping, Sports, Transportation, Translators, Travel
8	Peer-to-Peer (P2P)	Peer to Peer
9	Questionable/Unethical	Child Abuse Images, Cults, Hacking, Hate & Intolerance, Illegal Drug, Illegal Sharing, Illegal Software, School Cheating, Tasteless, Violence
10	Security Risk	Advertisement & Pop-ups, Anonymizers, Botnets, Compromised, Criminal Activity, Malware, Parked Domains, Phishing & Fraud, Spam Sites
11	Social and Photo Sharing	Social Networking
12	Software Update	N/A

Sl No.	Level	Description
1	Basic	Blocks sites/URL categorized as Security Risk
2	Low	Blocks sites/URL categorized as Adult Content + Basic
3	Medium	Blocks sites/URL categorized as File Sharing and Backup, P2P, Questionable / Unethical + Low
4	Medium High	Blocks sites/URL categorized as Gaming + Medium
5	High	Blocks sites/URL categorized as Communication, Entertainment, Social and Photo Sharing + Medium High

Examples

```
nx9500-6C8809(config-url-filter-test)#?
URL Filter Mode commands:
  blacklist    Block access to URL
  blockpage    Configure blocking page parameters
  description  Url filter description
  no           Negate a command or set its defaults
  whitelist    Allow access to URL

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-url-filter-test)#
```

Related Commands

no on page 611	Removes an existing URL filter policy

url-filter-config-commands

The following table summarizes URL filter configuration mode commands:

Table 30: URL Filter Config Mode Commands

Command	Description
blacklist on page 597	Creates a blacklist rule defining a list of banned Websites and URLs
blockpage on page 599	Configures the parameters that retrieve the page or content displayed by the client's browser when a requested URL is blocked and cannot be viewed
description on page 601	Configures an appropriate description for this URL filter
whitelist on page 602	Creates a whitelist rule defining a list of Websites and URLs allowed access by clients.
no (url-filter-config-mode-commands) on page 603	Removes this URL filter's configured parameters

blacklist

Creates a blacklist rule. A blacklist is a list of Websites and URLs denied access by clients. Clients requesting blacklisted URLs are presented with a page displaying the 'Web page blocked' message. Parameters relating to this page are configured using the 'blockpage' option.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the URL category-types and categories to include in the blacklist.

In addition to identifying URLs by the categories and category-types they are classified into, the system also provides five (5) levels of Web filtering (basic, high, low, medium, and medium-high). Each level identifies a specific set of URL categories to blacklist. For more information on category-types, categories, and URL filtering levels, see url-filter on page 594.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
blacklist [category-type|level|url-list]
blacklist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
blacklist level [basic|high|low|medium|medium-high] precedence <1-500>
{description <LINE>}
blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

Parameters

```
blacklist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-
photo-sharing|
software-updates] precedence <1-500> {description <LINE>}
```

blacklist category-type <SELECT-CATEGORY-TYPE>	Selects the category-type to blacklist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can created with the URL List and added to the database. Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates Select 'all' to blacklist all category-types. Some of the category-types are further classified into categories. For example, the 'adult-content' category-type is differentiated into the following categories: • alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons. The system blocks all categories (URLs falling within their limits) within the selected category-type.
precedence <1-500>	Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.
description <LINE>	Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

```
blacklist level [basic|high|low|medium|medium-high] precedence <1-500> {description
<LINE>}
```

blacklist level [basic|high|low|medium|medium-high]	Configures the Web filtering level as basic, high, low, medium, or medium-high. Each of these filter-levels are pre-configured to use a set of category types and this mapping cannot be modified.
precedence <1-500>	Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.
description <LINE>	Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

```
blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

blacklist url-list <URL-LIST-NAME>	Associates a URL list with this URL filter. When associated with a blacklist rule, all URLs listed in the specified URL list are blacklisted. URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see url-list on page 604 . • <URL-LIST-NAME> – Enter URL list name (should be existing and configured)
precedence <1-500>	Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.
description <LINE>	Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

Examples

```
nx9500-6C8809(config-url-filter-test)#blacklist level medium-high precedence 10
nx9500-6C8809(config-url-filter-test)#blacklist category-type adult-content category alcohol-tobacco precedence 1
nx9500-6C8809(config-url-filter-test)#blacklist category-type security-risk category botnets precedence 3
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
 blacklist level medium-high precedence 10
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
nx9500-6C8809(config-url-filter-test)#
```

Related Commands

no (url-filter-config-mode-commands) on page 603	Removes a blacklist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed form the URL filter.

blockpage

Configures the parameters that retrieve the page or content displayed by the client's browser when a requested URL is blocked and cannot be viewed

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
blockpage [external|internal|path]
blockpage path [external|internal]
blockpage external url <URL>
blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL>
```

Parameters

```
blockpage path [external|internal]
```

blockpage path [external|internal]	Specifies if the location of the page displayed, to the client when a requested URL is blocked, is external or internal • external – Indicates the page displayed is hosted on an external Web server resource. If selecting this option, use the `blockpage > external > url <URL>` command to provide the path to the external Web server hosting the page. • internal – Indicates the page displayed is hosted internally. This is the default setting. If selecting this option, use the `blockpage > internal > <SELECT-PAGE-TYPE> > <LINE/IMAGE-URL>` command to define the page configuration.

```
blockpage external url <URL>
```

blockpage external url <URL>	Configures the URL of the external Web server hosting the page (displayed to the client when a requested URL is blocked). • url <URL> – Specify the URL of the Web server and the blocking page name Valid URLs should begin with http:// or https:// The URL can contain query strings. Use '&' or '?' character to separate field-value pair. Enter 'ctrl-v' followed by '?' to configure query strings

```
blockpage internal [content|footer|header|main-logo|org-name|org-signature|
small-logo|title] <LINE/IMAGE-URL>
```

blockpage internal [content|footer|header|main-logo|org-name|org-signature| small-logo|title] <LINE/IMAGE-URL>	Configures the internally hosted blocking page parameters, such as the content displayed, page footer and header, organization (the organization enforcing the Web page blocking) details (name, signature, and logo), and page title • content – Configures the text (message) displayed on the blocking page • footer – Configures the text displayed as the blocking page footer • header – Configures the text displayed as the blocking page header • org-name – Configures the organization's name displayed on the blocking page • org-signature – Configures the organization's signature displayed on the blocking page • title – Configures the title of the blocking page. • main-logo – Configures the location of the main logo (organization's large logo) • small-logo – Configures the location of the small logo (organization's small logo) The following keyword is common to all of the above parameters: • <LINE/IMAGE-URL> – Specify the location of the logo (main and small) image file. The image is retrieved and displayed from the location configured here. If you are using this option to provide content, such as organization name, footer, header, etc. enter a text string not exceeding 255 characters in length.

Examples

```
nx9500-6C8809(config-url-filter-test)#blockpage internal content "The requested Web page
is blocked and cannot be displayed for viewing"
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
 blacklist level medium-high precedence 10
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
 blockpage internal content "The requested Web page is blocked and cannot be displayed
for viewing"
nx9500-6C8809(config-url-filter-test)#
```

Related Commands

no (url-filter-config-mode-commands) on page 603	Removes the blocking page configurations

description

Configures a description for this URL filter. Provide a description that enables you to identify the purpose of this URL filter.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
description <LINE>
```

Parameters

```
description <LINE>
```

description <LINE>	Enter an appropriate description for this URL filter. The description should identify the URL filter's purpose and should not exceed 80 characters in length.

Examples

```
nx9500-6C8809(config-url-filter-test)#description "Blacklists sites inappropriate for
children and are security risks."
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
 description "Blacklists sites inappropriate for children and are security risks."
 blacklist level medium-high precedence 10
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
 blockpage internal content "The requested Web page is blocked and cannot be displayed
for viewing"
nx9500-6C8809(config-url-filter-test)#
```

Related Commands

no (url-filter-config-mode-commands) on page 603	Removes this URL filter's description

whitelist

Creates a whitelist rule. A whitelist is a list of Websites and URLs allowed access by clients. URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the category-types and categories to include in the whitelist.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
whitelist [category-type|url-list]
whitelist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
```

Parameters

```
whitelist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
```

whitelist category-type <SELECT-CATEGORY-TYPE>	Selects the category-type to add to this whitelist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can created with the URL List and added to the database. Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates. Select 'all' to whitelist all category-types. Some of the category-types are further classified into categories. For example, the 'adult-content' category-type is differentiated into the following categories: • alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons. The system allows all categories (URLs falling within their limits) within the selected category-type.
precedence <1-500>	Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.
description <LINE>	Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.

```
whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

whitelist url-list <URL-LIST-NAME>	Associates a URL list with this URL filter. When associated with a whitelist rule, all URLs listed in the specified URL list are allowed access. URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see url-list on page 604. • <URL-LIST-NAME> – Enter URL list name (should be existing and configured)
precedence <1-500>	Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.
description <LINE>	Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.

Examples

```
nx9500-6C8809(config-url-filter-test)#whitelist category-type communication category chat
precedence 7
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
 description "Blacklists sites inappropriate for children and are security risks."
 blacklist level medium-high precedence 10
 whitelist category-type communication category chat precedence 7
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
 blockpage internal content "The requested Web page is blocked and cannot be displayed
for viewing"
nx9500-6C8809(config-url-filter-test)#
```

Related Commands

no (url-filter-config-mode-commands) on page 603	Removes a whitelist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed form the URL filter.

no (url-filter-config-mode-commands)

Use the no command to remove this URL filter's configured parameters

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [blacklist|blockpage|description|whitelist]

no blacklist [category-type|level|url-list]

no blacklist [category-type <SELECT-CATEGORY-TYPE>|level <SELECT-LEVEL>|
url-list <URL-LIST-NAME>] precedence <1-500>

no blockpage [external|internal [content|footer|header|main-logo|org-name|
org-signature|small-logo|title]|path]

no description

no whitelist [category-type|url-list]

no whitelist [category-type <SELECT-CATEGORY-TYPE>|url-list <URL-LIST-NAME>]
precedence <1-500>
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes this URL filter's configured parameters based on the values passed here

Examples

The following example displays the URL filter 'test' settings before the 'no' is executed:

```
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
 description "Blacklists sites inappropriate for children and are security risks."
 blacklist level medium-high precedence 10
 whitelist category-type communication category chat precedence 7
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
 blockpage internal content "The requested Web page is blocked and cannot be displayed
for viewing"
nx9500-6C8809(config-url-filter-test)#

nx9500-6C8809(config-url-filter-test)#no description

nx9500-6C8809(config-url-filter-test)#no blacklist category-type adult-content
category alcohol-tobacco precedence 1

nx9500-6C8809(config-url-filter-test)#no whitelist category-type communication
category chat precedence 7
```

The following example displays the URL filter 'test' settings after the 'no' is executed:

```
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
 blacklist level medium-high precedence 10
 blacklist category-type security-risk category botnets precedence 3
 blockpage internal content "The requested Web page is blocked and cannot be displayed
for viewing"
nx9500-6C8809(config-url-filter-test)#
```

url-list

Creates a URL list and enters its configuration mode. URL lists are a means of categorizing URLs on the basis of various criteria, such as frequently used, not-permitted, etc. It is used in URL filters to identify whitelisted/blacklisted URLs. Web requests are blocked or approved based on URL filter whitelist/blacklist rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
url-list <URL-LIST-NAME>
```

Parameters

```
url-list <URL-LIST-NAME>
```

<URL-LIST-NAME>	• Specify the URL list name. The URL list is created if another list with the same name does not exist.

Examples

```
nx9500-6C8809(config)#url-list URLlist1
nx9500-6C8809(config-url-list-URLlist1)#?
URL List Mode commands:
  description  Description of the category
  no           Negate a command or set its defaults
  url          Add a URL entry

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

```

Related Commands

no on page 611	Removes an existing URL list

url-list-config-commands

The following table summarizes URL list configuration mode commands:

Table 31: URL List Config Mode Commands

Command	Description
url on page 606	Adds URL entries to this URL list
description on page 606	Creates a blacklist rule defining a list of banned Web sites and URLs
no (url-list-config-mode-commands) on page 607	Removes this URL list's settings

url

Adds URL entries to this URL list

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
url <WORD> {depth <1-10>}
```

Parameters

```
url <WORD> {depth <1-10>}
```

url <WORD> {depth <1-10>}	Adds a URL entry • <WORD> – Specify the URL to add. • depth – Optional. Sets number of levels to be cached. Since Web sites have different parameters to uniquely identify specific content, the same content may be stored on multiple origin servers. Smart caching uses subsets of these parameters to recognize that the content is the same and serves it from cache. <1-10> – Specify the depth from 1 - 10.

Examples

```
nx9500-6C8809(config-url-list-test)#url http://www.facebook.com depth 5
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social media URLs."
 url https://www.facebook.com depth 5
nx9500-6C8809(config-url-list-test)#
```

Related Commands

no (url-list-config-mode-commands) on page 607	Removes a URL entry from this URL list

description

Configures a description for this URL list. The description should be unique and enable you to identify the type of URLs listed in the URL list.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
description <LINE>
```

Parameters

```
description <LINE>
```

description <LINE>	Provide a unique description for this URL list (should not exceed 500 characters in length).

Examples

```
nx9500-6C8809(config-url-list-test)#description ""This URL list contains social media URLs.""
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social media URLs."
nx9500-6C8809(config-url-list-test)#
```

Related Commands

no (url-list-config-mode-commands) on page 607	Removes this URL list's description

no (url-list-config-mode-commands)

Removes this URL list's settings

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no [description|url]
no description
no url <WORD>
```

Parameters

```
no <PARAMETERS>
```

no <PARAMETERS>	Removes this URL's settings based on the parameters passed

Examples

The following example displays the URL list 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social media URLs."
 url https://www.facebook.com depth 5
nx9500-6C8809(config-url-list-test)#
nx9500-6C8809(config-url-list-test)#no url www.facebook.com
```

The following example displays the URL list 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social communication URLS"
nx9500-6C8809(config-url-list-test)#
```

vx9000

Configures a *Virtual WLAN Controller* (V-WLC) in a *virtual machine* (VM) environment. V-WLC can be deployed on a shared, third-party server hardware, thereby reducing overhead costs of procuring and maintaining dedicated appliances. The external, third-party hardware needs to have installed hypervisors, such as VmWare, Xen, VirtualBox, KVM, Amazon EC2 or Hyper-V, enabling it to communicate with V-WLC software.

The V-WLC controls and manages access points and other controllers (at NOC or as a site-controller) in the network. The traffic between the access points and the V-WLC is over the layer-3 MINT protocol.

V-WLC is a licensed feature, and the WiNG software provides the following two new licenses:

- VX – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.
- VX – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.

To install the VX or VX-DEMO license on an existing V-WLC instance, use the license command. For more information, see the examples provided in this section.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX

Syntax

```
vx9000 <MAC>
```

Parameters

```
vx9000 <MAC>
```

vx9000 <MAC>	Configures a V-WLC and enters its configuration mode. The V-WLC configuration is the same as that of a normal controller.

Examples

```
nx9500-6C8809(config)#vx9000 11-22-33-44-55-66
nx9500-6C8809(config-device-11-22-33-44-55-66)#?

Related Commands

no on page 611	Removes a VX 9000 wireless controller

no

Negates a command, or reverts configured settings to their default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

schedule-policy                     Delete a schedule policy
sensor-policy                       Delete a sensor policy
smart-rf-policy                     Delete a smart-rf-policy
t5                                  Delete an T5 DSL switch
```

```
  url-filter                          Delete a url filter
  url-list                            Delete a URL list
  vx9000                              Delete an VX9000 wireless controller
  web-filter-policy                   Delete a web filter policy
  wips-policy                         Delete a wips policy
  wlan                                Delete a wlan object
  wlan-qos-policy                     Delete a wireless lan QoS configuration
                                      policy

  service                             Service Commands

<DEVICE>(config)#
```

6 Common Commands

common-commands

This chapter describes the CLI commands common to the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes.

The PRIV EXEC command set contains commands available within the USER EXEC mode. Some commands can be entered in either mode. Commands entered in either the USER EXEC or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

common-commands

The following table summarizes the commands common to the User Exec, Priv Exec, Global Config modes, and all other configuration contexts:

Table 32: Common Commands

Command	Description
clrscr on page 616	Clears the display screen
commit on page 617	Commits (saves) changes made in the current session
exit on page 618	Ends and exits the current mode. In the Global cnfiguration mode, this command and moves to the PRIV EXEC mode.
help on page 618	Displays the interactive help system
no on page 620	Negates a command or reverts values to their default settings
revert on page 623	Reverts changes to their last saved configuration
service on page 623	Invokes service commands to troubleshoot or debug (config-if) instance configurations
show on page 674	Displays running system information
write on page 676	Writes the system's running configuration to memory or terminal

clrscr

Clears the screen and refreshes the prompt, irrespective of the mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
clrscr
```

Parameters

```
None
```

Examples

The following example shows the terminal window or screen before the clrscr command is executed:

```
ap505-13403B>device-upgrade ?
  DEVICE-NAME     Name/MAC address of device
  all             Upgrade all devices
  ap505           Upgrade AP505 Device
  ap510           Upgrade AP510 Device
  cancel-upgrade  Cancel upgrading the device
  containing      Specify devices that contain a sub-string in the hostname
  load-image      Load the device images to controller for device-upgrades
  rf-domain       Upgrade all devices belonging to an RF Domain

ap505-13403B>
ap505-13403B>clrscr [ENTER]
```

The terminal window or screen after the clrscr command is executed:

```
ap505-13403B>
```

commit

Commits changes made in the active session. Use the commit command to save and invoke settings entered during the current transaction.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
commit {write}{memory}
```

Parameters

```
commit {write}{memory}
```

write	Optional. Commits changes made in the current session
memory	Optional. Writes to memory. This option ensures current changes persist across reboots.

Examples

```
nx9500-6C8809#commit write memory
[OK]
nx9500-6C8809#
```

exit

The exit command works differently in the User Exec, Priv Exec, and Global Config modes. In the Global Config mode, it ends the current mode and moves to the previous mode, which is Priv Exec mode. The prompt changes from *(config)#* to #. When used in the Priv Exec and User Exec modes, the exit command ends the current session, and connection to the terminal device is terminated. If the current session has changes that have not been committed, the system will prompt you to either do a commit or a revert before terminating the session.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
exit
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config)#exit
nx9500-6C8809#
```

help

Describes the interactive help system. Use this command to access the advanced help feature. Use "**?**" anytime at the command prompt to access the help topic

Two kinds of help are provided:

- Full help is available when ready to enter a command argument
- Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example 'show ve?').

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
help {search|show}
help {search <WORD>} {detailed|only-show|skip-no|skip-show}
```

Parameters

```
help {search <WORD>} {detailed|only-show|skip-no|skip-show}
```

search <WORD>	Optional. Searches for CLI commands related to a specific target term • <WORD> – Specify a target term (for example, a feature or a configuration parameter). After specifying the term, select one of the following options: detailed, only-show, skip-no, or skip-show. The system displays information based on the option selected.
detailed	Optional. Searches and displays help strings in addition to mode and commands
only-show	Optional. Displays only "show" commands. Does not display configuration commands.
skip-no	Optional. Displays only configuration commands. Does not display "no" commands
skip-show	Optional. Displays only configuration commands. Does not display "show" commands

Examples

```

nx9500-6C8809>
```

no

Negates a command or sets its default. Though the no command is common to the User Exec, Priv Exec, and Global Config modes, it negates a different set of commands in each mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
no <PARAMETER>
```

Parameters

no <PARAMETERS>	The no command is common across all configuration modes and sub modes. It resets or reverts settings based on the mode in which executed. For example, when executed in the AAA policy configuration mode, it allows you to reset or revert a specific AAA policy settings. Similarly, when executed in the global configuration mode, it only resets or reverts settings configured in the global configuration mode.

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Global Config mode: No command options

```
ap8432-070235(config)#no ?
  aaa-policy                          Delete a aaa policy

  management-policy                   Delete a management policy
  meshpoint                           Delete a meshpoint object
  meshpoint-qos-policy                Delete a mesh point QoS configuration
                                      policy
  nac-list                            Delete an network access control list
  nsight-policy                       Delete a nsight policy
  passpoint-policy                    Delete a passpoint configuration policy
  password-encryption                 Disable password encryption in
                                      configuration
  profile                             Delete a profile and all its associated
                                      configuration
  radio-qos-policy                    Delete a radio QoS configuration policy
  radius-group                        Local radius server group configuration
  radius-server-policy                Remove device onboard radius policy
  radius-user-pool-policy             Configure Radius User Pool
  rf-domain                           Delete one or more RF-domains and all
                                      their associated configurations
  roaming-assist-policy               Delete a roaming-assist policy
  role-policy                         Role based firewall policy
  routing-policy                      Policy Based Routing Configuratino
  rtl-server-policy                   Delete a rtl server policy
  schedule-policy                     Delete a schedule policy
  sensor-policy                       Delete a sensor policy
  smart-rf-policy                     Delete a smart-rf-policy
  url-filter                          Delete a url filter
  url-list                            Delete a URL list
  web-filter-policy                   Delete a web filter policy
  wips-policy                         Delete a wips policy
  wlan                                Delete a wlan object
  wlan-qos-policy                     Delete a wireless lan QoS configuration
                                      policy

revert

Reverts changes made, in the current session, to their last saved configuration

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
revert
```

Parameters

```
None
```

Examples

```
nx9500-6C8809revert
nx9500-6C8809
```

service

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode. The *User Exec mode* and *Priv Exec mode* commands provide same functionalities with a few minor changes. The Global Config service command sets the size of history files. It also enables viewing the current mode's CLI tree.

This topic is organized into the following sections:

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax (User Exec Mode)

Parameters (User Exec Mode)

Service Commands - Intro

```
service [block-adopter-config-update|request-full-config-from-adopter]
```

block-adopter-config- update	Blocks the configuration updates pushed from the *Network Operations Center* (NOC) server to adopted devices
request-full-config-from- adopter	Configures a request for full configuration updates from the adopter device In an *hierarchically managed* (HM) network devices are deployed in two levels. The first level consists of the NOC controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (Access Points and site controllers) are referred to as the adoptee. The devices adopting the adoptee are the 'adopters'.

```
service clear adoption history {on <DEVICE-NAME>}
```

clear adoption history	Clears adoption history on this device and its adopted Access Points
on <DEVICE-NAME>	Optional. Clears adoption history on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service clear device-upgrade history {on <DOMAIN-NAME>}
```

clear device-upgrade history	Clears device upgrade history
on <DOMAIN-NAME>	Optional. Clears all firmware upgrade history on a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
service clear diag pkts
```

clear diag pkts	Clears the looped packets queue logged by the dataplane. The dataplane logs up to 16 looped packets at a time in a separate queue, which has to be manually cleared to make space for new packet logging. For more information on viewing logged looped packet information execute the `service > show > diag > pkts` command.

```
service clear dpi [all|app|app-category] stats {on <DEVICE-OR-DOMAIN-NAME>}
```

clear dpi	Clears *Deep Packet Inspection* (DPI) statistics When enabled, DPI allows application and/or application category recognition. The DPI statistics are maintained by the system for every hit registered by the DPI engine.
[all|app|app-category] stats	Use the following filter options to clear all or specific DPI statistics: • all – Clears all DPI related (application and app-category) statistics • app – Clears only application related statistics • app-category – Clears only app-category related statistics
on <DEVICE-OR-DOMAIN-NAME>	Optional. Clears DPI statistics based on the parameters passed on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the access point, controller, service platform, or RF Domain.

```
service clear file-sync history {on <DOMAIN-NAME>}
```

clear file-sync history	Clears client-bridge certificate synchronization statistics When an AP 6522/AP 6562 access point is configured as a client bridge, the EAP-TLS X.509 (PKCS#12) certificate is synchronized between the staging-controller and adoptee AP 6522/AP 6562 client-bridge access points. This command allows you to clear client-bridge certificate synchronization statistics.
on <DOMAIN-NAME>	Optional. Clears file synchronization history on all devices within a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
service clear captive-portal-page-upload history {on <DOMAIN-NAME>}
```

clear captive-portal-page- upload-history	Clears captive portal page upload history
on <DOMAIN-NAME>	Optional. Clears captive portal page upload history on a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
service clear [command-history|reboot-history|upgrade-history|virtual-machine-history]
{on <DEVICE-NAME>}
```

clear [command-history| reboot-history| upgrade-history]	Clears command history, reboot history, and/or device upgrade history
clear virtual-machine-history	Clears virtual-machine history on the logged device or a specified device This command is applicable only on the NX 95XX and NX 96XX series service platforms.
on <DEVICE-NAME>	Optional. Clears history on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform Note: When executing the clear virtual-machine-history command, provide the name of the service platform running the VMs.

```
service clear noc statistics
```

clear noc statistics	Clears NOC applicable statistics counters

```
service clear unsanctioned aps {on <DEVICE-OR-DOMAIN-NAME>}
```

clear unsanctioned aps	Clears the list of unsanctioned APs
on <DEVICE-OR-DOMAIN-NAME>	Optional. Clears the list of unsanctioned APs on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service clear wireless [ap|client] {<MAC>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

clear wireless [ap|client] statistics	Clears wireless statistics counters based on the parameters passed • ap statistics – Clears applicable AP statistics counters • client statistics – Clears applicable wireless client statistics counters
<MAC> {on <DEVICE-OR-DOMAIN-NAME>}	The following keywords are common to the 'ap' and 'client' parameters: • <MAC> – Optional. Clears statistics counters for a specified AP or client. Specify the AP/client MAC address. • on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears AP/client statistics counters on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service clear wireless controller-mobility-database
```

clear wireless controller-mobility-database	Clears the controller assisted mobility database

```
service clear web-filter cache {on <DEVICE-NAME>}
```

clear web-filter cache	Clears the cache used for Web filtering
on <DEVICE-NAME>	Optional. Clears the Web filtering cache on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service clear wireless radio statistics {<MAC/HOSTNAME> {<1-3>}}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

clear wireless radio statistics	Clears applicable wireless radio statistics counters
<MAC/HOSTNAME> <1-3>	Optional. Specify the MAC address or hostname of the radio, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX format. • <1-3> – Optional. Specify the radio interface index, if not specified as part of the radio ID.
on <DEVICE-OR-DOMAIN-NAME>	Optional. This is a recursive parameter, which clears wireless radio statistics on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service clear wireless wlan statistics {<WLAN-NAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

clear wireless wlan statistics	Clears WLAN statistics counters
<WLAN-NAME>	Optional. Clears statistics counters on a specified WLAN. Specify the WLAN name.
on <DEVICE-OR-DOMAIN-NAME>	Optional. This is a recursive parameter, which clears WLAN statistics on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service clear xpath requests {<1-100000>}
```

clear xpath	Clears XPATH related information
requests	Clears pending XPATH get requests
<1-100000>	Optional. Specifies the session number (cookie from show sessions) • <1-100000> – Specify the session number from 1 - 100000. Note: Omits clearing the current session's pending XPATH get requests.

```
service cli-tables-skin [ansi|hashes|minimal|none|percent|stars|thick|thin|utf-8]
{grid}
```

cli-tables-skin [ansi|hashes| minimal|none|percent|stars| thick| thin|uf-8]	Selects a formatting layout or skin for CLI tabular outputs • ansi – Uses ANSI characters for borders • hashes – Uses hashes (#) for borders • minimal – Uses one horizontal line between title and data rows • none – Displays space separated items with no decoration • percent – Uses the percent sign (%) for borders • stars – Uses asterisks (*) for borders • thick – Uses thick lines for borders • thin – Uses thin lines for borders • utf-8 – Uses UTF-8 characters for borders
grid	Optional. Uses a complete grid instead of just title lines

```
service cluster force [active|configured-state|standby]
```

cluster	Enables cluster protocol management
force	Forces action commands on a cluster (active, configured-state, and standby)
active	Changes the cluster run status to active
configured-state	Restores a cluster to the configured state
standby	Changes the cluster run status to standby

```
service database authentication create-user username <USER-NAME> password <PASSWORD>
```

database	Performs database related actions
authentication create-user username <USER-NAME> password <PASSWORD>	Creates users having access rights to the database. Execute this command on the database host. However, before creating users, on the database, generate the database keyfile. For more information on generating the keyfile, see database on page 66 (user/priv exec modes). • username <USER-NAME> – Configures database username • password <PASSWORD> – Configures a password for the username specified above In the database-policy ensure that authentication is enabled and username and password is configured. The database-client-policy also should have the same username and password configured. For more information on database-policy and database-client-policy, see database-policy global config on page 299 and database-client-policy global-config on page 296.

```
service database authentication delete-user username <USER-NAME>
```

database	Performs database related actions This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
database authentication delete-user username <USER-NAME>	Deletes the username requires to access rights the captive-portal/NSight database • username <USER-NAME> – Deletes the username identified by the <USER-NAME> keyword Once deleted, the database cannot be accessed using the specified combination of username and password.

```
service database start-shell
```

database	Performs database related actions This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
start-shell	Starts the database shell

```
service delete-offline-aps all
```

delete-offline-aps all	Deletes all off-line Access Points

```
service delete-offline-aps offline-for days <0-999> {time <TIME>}
```

delete-offline-aps	Deletes Access Points that have been off-line for a specified number of days and time period
day <0-999>	Specifies the number of days an Access Point stays off-line to be deleted • <0-999> – Specify the number of off-line days from 0 - 999.
time <TIME>	Optional. Specifies the off-line time period. Access Points off-line for this period of time are deleted. • <TIME> – Specify the time in HH:MM:SS format.

```
service eguest remove-data [deleted-devices|offline-for days <0-999> {time <HH:MM:SS>}]
```

service eguets	Enables ExtremeGuest server data maintenance
remove-data	Removes offline and/or deleted devices from the ExtremeGuest server database Note: When enabled, the device configuration and database collection is removed permanently. Note: If a controller is removed, then its adopted APs are also removed,

deleted-devices	Removes deleted devices
offline-for days <0-999> {time <HH:MM:SS>}	Removes offline devices from the ExtremeGuest server database. Offline devices are devices that have not been reporting to the ExtremeGuest server for a specified number of days. Use this option to configure that threshold value. Devices that have not reported to the ExtremeGuest server for the number of days specified here are considered to be offline and removed. • days <0-999> – Specify the threshold, in days, from 0 - 999. • time <HH:MM:SS> – Option. In addition to the number of days, you can also specify the time in hours, minutes, and seconds. If specified, a device is removed if it has not reported to the server for the specified number of days and time.

```
service eguest restore factory-default
```

eguest	Enables ExtremeGuest server data maintenance
restore factory-default	Reinitializes the ExtremeGuest server to factory-default settings. Use this option to stop the ExtremeGuest server and database. Note: Extreme caution is recommended, as this command deletes data related to ExtremeGuest server and database. Debug log files are also deleted.

```
service force-send-config {on <DEVICE-OR-DOMAIN-NAME>}
```

force-send-config	Resends configuration to device(s)
on <DEVICE-OR-DOMAIN-NAME>	Optional. Resends configuration to a specified device or all devices in a specified RF Domain • <DEVICE-OR-DOMAIN-NAME> – Optional. Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service force-update-vm-stats {on <DEVICE-NAME>}
```

force-update-vm-stats	Forcefully pushes VM statistics on to the NOC
on <DEVICE-NAME>	Optional. Executes the command on a specified device • <DEVICE-NAME> – Specify the name of the device.

```
service guest-registration backup [delete|restore]
```

service guest-registration backup [delete|restore]	Deletes or restores all guest registration backup snapshots based on the parameter passed • delete – Deletes all guest registration backup snapshots • restores – Restores all guest registration backup snapshots Note: To view the status of the restore process, use the `service > show > guest-registration > restore-status` command.

```
service guest-registration delete [all|email <EMAIL-ADD>|group <RAD-GROUP-NAME>|
mac <MAC>|mobile <MOBILE-NUMBER>|name <CLIENT-FULL-NAME>|non-social|
offline-for days <1-999>|wlan <WLAN-NAME>|otp-incomplete-for days <1-999>|
social [facebook|google]]
```

service guest-registration delete	Deletes a specified user or all user records from the guest-registration database To delete a specific user, use one of the following options as an identification parameter: email, group, mac, mobile number, name, offline-for, wlan, otp-incomplete-for, or social.

[all|email <EMAIL-ADD>|group <RAD-GROUP-NAME>| mac <MAC>|mobile <MOBILE-NUMBER>| name <CLIENT-FULL-NAME>]|non-social| offline-for days <1-999>|wlan <WLAN-NAME>|otp-incomplete-for days <1-999>| social [facebook|google]	Following are the user filtering options: The user identified by one of the following parameters is deleted from the guest-registration database.
	• email <EMAIL-ADD> – Identifies user by the e-mail address
	  • <EMAIL-ADD> – Provide the user's e-mail address.
	• mac <MAC> – Identifies user by the MAC address
	  • <MAC> – Provide the user's MAC address.
	• group <RAD-GROUP-NAME> – Identifies users by their RADIUS group association
	  • <RAD-GROUP-NAME> – Specify the RADIUS group name.
	• mobile <MOBILE-NUMBER> – Identifies user by the registered mobile number
	  • <MOBILE-NUMBER> – Provide the user's mobile number.
	• name <CLIENT-FULL-NAME> – Identifies user by the registered full name
	  • <CLIENT-FULL-NAME> – Provide the user's full name.
	• non-social – Identifies users that have not registered through social authentication
	• offline-for days <1-999> – Filters users who have not accessed the network for a specified number of days
	  • days <1-999> – Specify the number of days from 1 - 999.
	• wlan <WLAN-NAME> – Identifies users accessing a specified WLAN
	  • <WLAN-NAME> – Specify the WLAN name.
	• otp-incomplete-for days <1-999> – Identifies records of users that have not used their OTP to complete registration within a specified number of days
	  • days <1-999> – Specify the number of days from 1 - 999.
	• social [facebook|google] – Identifies users using either Facebook or Google credentials to access the network
	  • facebook – Identifies users using Facebook authentication
	  • google – Identifies users using Google authentication

```
service guest-registration export format [csv|json] <DEST-URL> {(rfdomain <DOMAIN-NAME>|
time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]|wlan <WLAN-NAME>)}
```

service guest-registration export	Exports guest registration user data files in the *Comma-Separated Values* (CSV) or JSON *(JavaScript Object Notation)* format Use the '**rfdomain'**, '**wlan'**, and '**time**' options to filter users for a specified RF Domain, WLAN, and/or time period. These are recursive parameters and you can apply all or any of these three filters.
format [csv|json]	Specifies the file format. The options are: • csv – Exports user data files in the CSV format • json – Exports user data files in the JSON format

<DEST-URL>	Configures the destination URL. The files are exported to the specified location. Both IPv4 and IPv6 address formats are supported. • IPv4 URLs: tftp://<hostname|IP>[:port]/path/file ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file sftp://<user>:<passwd>@<hostname|IP>[:port]>/path/file • IPv6 URLs: tftp://<hostname|[IPv6]>[:port]/path/file ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]>/path/file
rfdomain <DOMAIN-NAME>	Optional. Filters user data based on RF Domain name. Only the filtered data are exported. • <DOMAIN-NAME> – Specify the RF Domain name.
wlan <WLAN-NAME>	Optional. Filters user data based on WLAN name. Only the filtered data are exported. • <WLAN-NAME> – Specify the WLAN name.
time [1-Day|1-Month| 1-Week|2-Hours| 30-Mins|5-Hours|all]	Optional. Filters user data for a specified time period. Only the filtered data are exported. • 1-Day – Filters and exports previous day's data • 1-Month – Filters and exports previous month's data • 1-Week – Filters and exports previous week's data • 2-Hours – Filters and exports last 2 hours data • 30-Mins – Filters and exports last 30 minutes data • 5-Hours – Filters and exports last 5 hours data • all – Exports the entire database

```
service guest-registration import format json <SOURCE-URL>
```

service guest-registration import	Imports user data from a specified location
format json	Specifies the file format • json – Imports user data files in the JSON format
<SOURCE-URL>	Configures the Source URL. The files are imported from the specified location. Both IPv4 and IPv6 address formats are supported. • IPv4 URLs: tftp://<hostname|IP>[:port]/path/file ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file sftp://<user>:<passwd>@<hostname|IP>[:port]>/path/file • IPv6 URLs: tftp://<hostname|[IPv6]>[:port]/path/file ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]>/path/file

```
service load-balancing clear-client-capability [<MAC>|all] {on <DEVICE-NAME>}
```

load-balancing	Enables wireless load balancing by clearing client capability records
clear-client-capability [<MAC>| all]	Clears a specified client or all client capability records • <MAC> – Clears capability records of a specified client. Specify the client's MAC address in the AA-BB-CC-DD-EE-FF format. • all – Clears the capability records of all clients
on <DEVICE-NAME>	Optional. Clears client capability records on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service load-ssh-authorized-keys <PUBLIC-KEY> {on <DEVICE-NAME>}
```

load-ssh-authorized-keys	Loads SSH public (client) key on a device
<PUBLIC-KEY>	Enter the public key. The public key should be in the OpenSSH rsa/dsa format.
on <DEVICE-NAME>	Optional. Loads the specified public key on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service locator {<1-60>} {(on <DEVICE-NAME>)}
```

locator	Enables LEDs
<1-60>	Sets LED flashing time from 1 - 60 seconds.
on <DEVICE-NAME>	The following keyword is recursive and common to the <1-60> parameter: • on <DEVICE-NAME> – Optional. Enables LEDs on a specified device • <DEVICE-NAME> – Specify name of the AP, wireless controller, or service platform.

```
service nsight clear-offline [all|offline-for days <0-999> {time <TIME>}]
```

nsight clear-offline [all|offline-for days <0-999> {time <TIME>}]	Clears NSight data received from offline controllers, based on the parameters passed. Select one of the following options: • all – Clears NSight data received from all offline controllers • offline-for days <0-999> time <TIME> – Clears NSight data received from controllers that have been offline for a specified time period • days <0-999> – Specifies the number of days controllers have been offline <0-999> – Specify the number of days from 0 - 999 days. Select "0" to identify controllers offline less than 24 hours. time <TIME> – Optional. Specifies the total time for which controllers have been offline <TIME> – Specify the time in HH:MM:SS format. Note: This command is applicable only to the NX 95XX, NX 96XX, and VX 9000 platforms.

```
service radio <1-3> adaptivity
```

radio <1-3>	Configures radio parameters • <1-3> – Specify the radio index from 1 - 3.
adaptivity	Simulates the presence of interference on the current channel

```
service radio <1-3> channel-switch <36-196> [160|20|40|80|80-80]
```

radio <1-3>	Configures radio parameters • <1-3> – Specify the radio index from 1 - 3.
channel-switch <36-196> [160|20|40|80| 80-80]	Enables channel switching • <36-196> – Specifies the channel to switch to from 36 - 196. • 160|20|40|80|80-80] – Specifies the bandwidth for the above specified channel. Select the appropriate option.

```
service radio <1-3> dfs simulate-radar [extension|primary]
```

radio <1-3>	Configures radio parameters • <1-3> – Specify the radio index from 1 - 3.
dfs	Enables *Dynamic Frequency Selection* (DFS)
simulate-radar [extension|primary]	Simulates the presence of a radar on a channel. Select the channel type from the following options: • extension – Simulates a radar on the radio's current extension channel • primary – Simulates a radar on the radio's current primary channel

```
service radius test [<IP>|<HOSTNAME>] <WORD> <USERNAME> <PASSWORD>
{wlan <WLAN-NAME> ssid <SSID>} {(on <DEVICE-NAME>)}
```

radius test	Tests RADIUS server's account. This command sends an access-request packet to the RADIUS server. Use this command to confirm time and data/bandwidth parameters for valid wireless clients. • test – Tests the RADIUS server's account with user provided parameters
[<IP>|<HOSTNAME>]	Sets the RADIUS server's IP address or hostname • <IP> – Specifies the RADIUS server's IP address • <HOSTNAME> – Specifies the RADIUS server's hostname
<WORD>	Specify the RADIUS server's shared secret.
<USERNAME>	Specify username for authentication.
<PASSWORD>	Specify the password.
wlan <WLAN-NAME> ssid <SSID>	Optional. Tests the RADIUS server on the local WLAN. Specify the local WLAN name. • ssid <SSID> – Specify the WLAN SSID.
on <DEVICE-NAME>	Optional. This is a recursive parameter also applicable to the WLAN parameter. Performs tests on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service radius test [<IP>|<HOSTNAME>] <PORT> <1024-65535> <WORD> <USERNAME>
<PASSWORD> {wlan <WLAN-NAME> ssid <SSID>} {(on <DEVICE-NAME>)}
```

radius test	Tests a RADIUS server's account. This command sends an access-request packet to the RADIUS server. Use this command to confirm time and data/bandwidth parameters for valid wireless clients. • test – Tests the RADIUS server's account with user provided parameters
[<IP>|<HOSTNAME>]	Sets the IP address or hostname of the RADIUS server • <IP> – Specify the RADIUS server's IP address. • <HOSTNAME> – Specify the RADIUS server's hostname.
<PORT> <1024-65535>	Specify the RADIUS server port from 1024 - 65535. The default port is 1812.
<WORD>	Specify the RADIUS server's shared secret.
<USERNAME>	Specify username for authentication.
<PASSWORD>	Specify the password.

wlan <WLAN-NAME> ssid <SSID>	Optional. Tests the RADIUS server on the local WLAN. Specify the local WLAN name. • ssid <SSID> – Specify WLAN SSID.
on <DEVICE-NAME>	Optional. This is a recursive parameter also applicable to the WLAN parameter. Performs tests on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service set validation-mode [full|partial] {on <DEVICE-NAME>}
```

set	Sets the validation mode for running configuration validation
validation-mode [full|partial]	Sets the validation mode • full – Performs a full configuration validation • partial – Performs a partial configuration validation
on <DEVICE-NAME>	Optional. Performs full or partial configuration validation on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show block-adopter-conflict-update
```

show	Displays running system statistics based on the parameters passed
block-adopter-config-update	Displays NOC configuration blocking status

```
service show captive-portal log-internal
```

show	Displays running system statistics based on the parameters passed
captive-portal	Displays captive portal information
log-internal	Displays recent captive portal debug logs (information and above severity level)

```
service show captive-portal [servers|user-cache] {on <DEVICE-NAME>}
```

show	Displays running system statistics based on the parameters passed
captive-portal	Displays captive portal information
servers	Displays server information for active captive portals
user-cache	Displays cached user details for a captive portal
on <DEVICE-NAME>	Optional. Displays server information or cached user details on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show [cli|client-identity-defaults|configuration-revision|mac-user-import-status|
mac-vendor <OUI/MAC>|noc diag|snmp session|xpath-history]
```

show	Displays running system statistics based on the parameters passed
cli	Displays CLI tree of the current mode
client-identity-defaults	Displays default client-identities and their configuration
configuration-revision	Displays current configuration revision number
mac-user-import-status	Displays status of file import initiated by a MAC-user
mac-vendor <OUI/MAC>	Displays vendor name for a specified MAC address or *Organizationally Unique Identifier* (OUI) part of the MAC address • <OUI/MAC> – Specify the MAC address or its OUI. The first six digits of the MAC address is the OUI. Use the AABBCC or AA-BB-CC format to provide the OUI.
noc diag	Displays NOC diagnostic details
snmp session	Displays SNMP session details
xpath-history	Displays XPath history

```
service show [command-history|crash-info|info|mem|process|reboot-history|
startup-log|ssh-authorized-keys|sysinfo|top|upgrade-history|watchdog] {on <DEVICE-NAME>}
```

show	Displays running system statistics based on the parameters passed
command-history	Displays command history (lists all commands executed)
crash-info	Displays information about core, panic, and AP dump files
info	Displays snapshot of available support information
mem	Displays a system's current memory usage (displays the total memory and available memory)
process	Displays active system process information (displays all processes currently running on the system)
reboot-history	Displays the device's reboot history
startup-log	Displays the device's startup log
sysinfo	Displays system's memory usage information
top	Displays system resource information
upgrade-history	Displays the device's upgrade history (displays details, such as date, time, and status of the upgrade, old version, new version, etc.)
watchdog	Displays the device's watchdog status
on <DEVICE-NAME>	The following keywords are common to all of the above: • on <DEVICE-NAME> – Optional. Displays information for a specified device. If no device is specified, the system displays information for logged device(s) • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show ip-access-list wlan <WLAN-NAME> status {detail} {on <DEVICE-OR-DOMAIN-NAME>}
```

show ip-access-list	Displays status of IP ACL to WLAN mappings on a specified device or all devices within a specified RF Domain. This command also displays if IP ACLs are properly applied in the dataplane.
wlan <WLAN-NAME>	Specifies the WLAN, for which the IP ACL to WLAN mapping status is required • <WLAN-NAME> – Specify the WLAN name.
status detail	Displays only failed IP ACL to WLAN mappings • details – Optional. Displays all (failed as well as successful) IP ACL to WLAN mapping status
on <DEVICE-OR-DOMAIN-NAME>	Optional. Specifies the device name or the RF Domain name. • <DEVICE-OR-DOMAIN-NAME> – Specify the device name or the RF Domain. When specified, the system displays IP ACL to WLAN mapping status on the specified device or all devices within the specified RF Domain.

```
service show dhcp-lease {<INTERFACE-NAME>|on|pppoe1|vlan <1-4094>|wwan1}
{(on <DEVICE-NAME>)}
```

show	Displays running system statistics based on the parameters passed
dhcp-lease	Displays DHCP lease information received from the server
<INTERFACE>	Optional. Displays DHCP lease information for a specified router interface • <INTERFACE> – Specify the router interface name.
on	Optional. Displays DHCP lease information for a specified device
pppoe1	Optional. Displays DHCP lease information for a PPP over Ethernet interface
vlan <1-4094>	Optional. Displays DHCP lease information for a VLAN interface • <1-4094> – Specify a VLAN index from 1 - 4094.
wwan1	Optional. Displays DHCP lease information for a Wireless WAN interface
on <DEVICE-NAME>	The following keywords are common to all of the above: • on <DEVICE-NAME> – Optional. Displays DHCP lease information for a specified device. If no device is specified, the system displays information for the logged device. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show diag [fds|pkts]
```

show diag [fds|pkts]	Displays diagnostic statistics, such as LED status, fan speed, sensor temperature, open file descriptors, looped packets, etc.
fds	Displays the number of *file descriptors* (fds) opened by key processes, such as the CFGD. When executed, the command displays only the file name and FD.
pkts	Displays details of looped packets captured by the dataplane and pushed to a separate queue. These queued packets are written to a log file (named loop_pkt_info.log) available at the /var2/log/ directory. Use the `service > start-shell` command and enter the path 'cat /var2/log/' to view if the loop_pkt_info.log file exists. However, looped packet logging has to be enabled in the profile/device context. For more information, see diag on page 980 (profile config mode). The dataplane can log up to 16 looped packets at a time. Once the queue is full, no new loop packet is logged until the existing queue is cleared. To clear the logged looped packet queue execute the `service > clear > diag > pkts` command. Following are the loop codes and the corresponding loop reasons: • (5) - "pkt looping in dataplane" • (51) - "loop in packet path" • (367) - "wispe encapsulation loop" • (432) - "mcx loop prevention" • (532) - "Port loop detected" • (536) - "packet loop detected by wireless bridge" • (41) - "IPv4 TTL exceeded" • (493) - "IPv6 TTL exceeded" • (540) - "mint TTL exceeded"

```
service show diag [led-status|psu|stats] {(on <DEVICE-NAME>)}
```

show	Displays running system statistics based on the parameters passed
diag	Displays diagnostic statistics, such as LED status, fan speed, and sensor temperature
led-status	Displays LED state variables and the current state
psu	Displays power supply information
stats	Displays fan speed and sensor temperature statistics
on <DEVICE-NAME>	Optional. Displays diagnostic statistics for a specified device. If no device is specified, the system displays information for the logged device. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show guest-registration [export-status|import-status|restore-status]
```

show	Displays running system statistics based on the parameters passed
guest-registration	Displays status of the guest-registration database snapshot related processes (export, import, and restore) Note: To export, import, or restore a guest-registration database, use the `service > guest-registration > [backup|export|import]` command.]

export-status	Displays the status of the latest export process initiated
import-status	Displays the status of the latest import process initiated
export-status	Displays the status of the latest restore process initiated

```
service show fast-switching {on <DEVICE-NAME>}
```

show	Displays running system statistics based on the parameters passed
fast-switching	Displays fast switching state (enabled or disabled)
on <DEVICE-NAME>	Optional. Displays fast switching state for a specified device. If no device is specified, the system displays information for the logged device. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show [fib|fib6] {table-id <0-255>}
```

show	Displays running system statistics based on the parameters passed
fib	Displays entries in the *Forwarding Information Base* (FIB)
fib6	Displays FIB IPv6 static routing entries The WiNG software allows the IPv6 FIB to maintain only IPv6 static and interface routes. FIB is a collection of routing entries. A route entry consists of IPv6 network (which can also be a host) address, the prefix length for the network (for IPv6 routes this is between 0 - 128), and the next hop's (gateway) IPv6 address. Since a destination can be reached through multiple next hops, you can configure multiple routes to the same destination with multiple next hops.
table-id <0-255>	Optional. Displays FIB information maintained by the system based on the table ID • <0-255> – Specify the table ID from 0 - 255.

```
service show mint [adopted-devices {on <DEVICE-NAME>}|ports]
```

show	Displays running system statistics based on the parameters passed
mint	Displays MiNT protocol details
adopted-devices on <DEVICE-NAME>	Displays adopted devices status in dpd2 • on <DEVICE-NAME> – Optional. Displays MiNT protocol details for a specified device. If no device is specified, the system displays information for the logged device. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
ports	Displays MiNT ports used by various services and features

```
service show pm {history} {(on <DEVICE-NAME>)}
```

show	Displays running system statistics based on the parameters passed
pm	Displays the *Process Monitor* (PM) controlled process details

history	Optional. Displays process change history (the time at which the change was implemented, and the events that triggered the change)
on <DEVICE-NAME>	Optional. Displays process change history for a specified device. If no device is specified, the system displays information for the logged device. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show rf-domain-manager [diag|info] {<MAC/HOSTNAME>}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

show	Displays running system statistics based on the parameters passed
rf-domain-manager	Displays RF Domain manager information
diag	Displays RF Domain manager related diagnostics statistics
info	Displays RF Domain manager related information
<MAC/HOSTNAME>	The following keyword is common to the 'diag' and 'info' parameters: Optional. Specify the MAC address or hostname of the RF Domain manager.
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is common to the 'diag' and 'info' parameters: Optional. Displays diagnostics statistics on a specified device or domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service show sites
```

show	Displays running system statistics based on the parameters passed
sites	Displays NOC sites related information

```
service show virtual-machine-history {(on <DEVICE-NAME>)}
```

show virtual-machine-history	Displays virtual machine history based on the parameters passed This command is applicable only to the NX 95XX and NX 96XX series service platforms. It is also available on the Privilege Executable Mode of these devices.
on <DEVICE-NAME>	Optional. Displays virtual machine history on a specified device. If no device is specified, the system displays information for the logged device. • <DEVICE-NAME> – Specify the name of the service platform.

```
service show wireless [aaa-stats|adaptivity-status|credential-cache|dns-cache|
radar-status|vlan-usage] {on <DEVICE-NAME>}
```

show	Displays running system statistics based on the parameters passed
wireless	Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN assignment, etc.)
aaa-stats	Displays AAA policy statistics
adaptivity-status	Displays the current list of channels (with interference levels exceeding the configured threshold resulting in adaptivity kicking in) and time when adaptivity kicked in on a device
credential-cache	Displays clients cached credentials statistics (VLAN, keys, etc.)

dns-cache	Displays cache of resolved names of servers related to wireless networking
radar-status	Displays radar discovery status. This option displays following information: • If a radar has been discovered by the AP • The time of discovery
vlan-usage	Displays VLAN statistics across WLANs
on <DEVICE-NAME>	The following keywords are common to all of the above: • on <DEVICE-NAME> – Optional. Displays running system statistics on a specified device. If no device is specified, the system displays information for the logged device. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show wireless [config-internal|log-internal|neighbors]
```

show	Displays running system statistics based on the parameters passed
wireless	Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.)
config-internal	Displays internal configuration parameters
log-internal	Displays recent internal wireless debug logs (info and above severity)
neighbors	Displays neighboring device statistics for roaming and flow migration

```
service show wireless [client|meshpoint neighbor] proc [info|stats] {<MAC>}
{(on <DEVICE-OR-DOMAIN-NAME)}
```

show	Displays running system statistics based on the parameters passed
wireless	Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.)
client	Displays WLAN client statistics
meshpoint neighbor	Displays meshpoint related proc entries
proc	The following keyword is common to client and meshpoint neighbor parameters: • proc – Displays dataplane proc entries based on the parameter selected Note: These proc entries provide statistics on each wireless client on the WLAN. Note: For the meshpoint parameter, it displays proc entries about neighbors.
info	This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain.
stats	This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain.

<MAC>	Displays information for a specified device (wireless client or neighbor) or RF Domain.
on <DEVICE-OR-DOMAIN-NAME>	This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service show wireless radio-internal [radio1|radio2] <LINE>
```

show	Displays running system statistics based on the parameters passed
wireless	Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.)
radio-internal [radio1|radio2]	Displays radio internal debug logs. Select the radio from the following options: • radio1 – Selects radio 1 • radio2 – Selects radio 2.
<LINE>	Specify the radio internal debug command to enable.

```
service show wireless reference [channels|frame|handshake|mcs-rates|reason-codes|
status-codes]
```

show	Displays running system statistics based on the parameters passed
wireless	Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.)
reference	Displays look up reference information related to standards, protocols, etc.
channels	Displays 802.11 channels information
frame	Displays 802.11 frame structure
handshake	Displays a flow diagram of 802.11 handshakes
mcs-rates	Displays MCS rate information
reason-codes	Displays 802.11 reason codes (for deauthentication, disassociation, etc.)
status-codes	Displays 802.11 status codes (for association response)

```
service show wireless stats-client diag {<MAC/HOSTNAME>}
{(on <DEVICE-OR-DOMAIN-NAME)}
```

show	Displays running system statistics based on the parameters passed
wireless	Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.)
stats-client	Displays managed AP statistics

<MAC/HOSTNAME>	Optional. Specify the MAC address or hostname of the AP.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays statistics on a specified AP, or all APs on a specified domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service smart-rf clear-config {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>}
```

smart-rf	Enables Smart RF management
clear-config	Clears WLAN Smart RF configuration on a specified device or on all devices
<MAC>	Optional. Clears WLAN Smart RF configuration on a device identified by its MAC address. Specify the device's MAC address in the AA-BB-CC-DD-EE-FF format.
<DEVICE-NAME>	Optional. Clears WLAN Smart RF configuration on a device identified by its hostname. Specify the device's hostname.
on <DOMAIN-NAME>	Optional. Clears WLAN Smart RF configuration on all devices in a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
service smart-rf [clear-history|clear-interfering-aps|save-config] {on <DOMAIN-NAME>}
```

smart-rf	Enables Smart RF management
clear-history	Clears WLAN Smart RF history on all devices
clear-interfering-aps	Clears Smart-RF interfering APs
save-config	Saves the Smart RF configuration on all devices, and also saves the history on the RF Domain Manager
on <DOMAIN-NAME>	Optional. Clears WLAN Smart RF configuration on all devices in a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
service snmp sysoid wing5
```

service snmp sysoid wing5	Configures a new *sysObjectID* (sysoid), in the MIB, for devices running WiNG 5.X devices When configured, the SNMP manager returns sysoid for WiNG 5.X OS. Hardwares running the WiNG 4.X and WiNG 5.X images have different sysoids. For example, the sysoid for a RFS 4000 using the WiNG 4.X image differs from another RFS 4000 running the WiNG 5.X image. This command is applicable only to RFS 4000 platform, since it has the same sysoid supported in WiNG 4.X and WiNG 5.X. The WiNG 4.X sysoids are: • RFS 4000 – 1.3.6.1.4.1.388.18 The WiNG 5.X sysoids are: • RFS 4000 – 1.3.6.1.4.1.388.50.1.1.35

```
service ssm dump-core-snapshot
```

service ssm dump-core-snapshot	Triggers a debug core dump of the SSM module

```
service syslog test {level [<0-7>|alerts|critical|debugging|emergencies|
errors|informational|notifications|warnings]} {(on <DEVICE-NAME>)}
```

syslog test	Sends a test message to the syslog server to confirm server availability
	
	Optional. Sets the logging level. In case syslog server is unreachable, an event is logged based on the logging level defined. This is an optional parameter, and the system configures default settings, if no logging severity level is specified.
	• <0-7> – Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:
	  • alerts – Optional. Immediate action needed (severity=1)
	  • critical – Optional. Critical conditions (severity=2)
	  • debugging – Optional. Debugging messages (severity=7)
	  • emergencies – Optional. System is unusable (severity=0)
	  • errors – Optional. Error conditions (severity=3)
	  • informational – Optional. Informational messages (severity=6)
	  • notifications – Optional. Normal but significant conditions (severity=5)
	  • warnings – Optional. Warning conditions (severity=4). This is the default setting.

on <DEVICE-NAME>	Optional. Executes the command on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service ssm trace pattern <WORD> {on <DOMAIN-NAME>}
```

ssm trace	Displays the SSM module trace based on parameters passed
pattern <WORD>	Configures the pattern to match • <WORD> – Specify the pattern to match.
on <DEVICE-NAME>	Optional. Displays the SSM module trace on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service wireless client beacon-request <MAC> mode [active|passive|table]
ssid [<SSID>|any] channel-report [<CHANNEL-LIST>|none] {on <DEVICE-NAME>}
```

wireless client beacon-requests	Sends beacon measurement requests to a wireless client
<MAC>	Specify the wireless client's MAC address.
mode [active|passive|table]	Specifies the beacon measurement mode. The following modes are available: • Active – Requests beacon measurements in the active mode • Passive – Requests beacon measurements in the passive mode • Table – Requests beacon measurements in the table mode
ssid [<SSID>|any]	Specifies if the measurements have to be made for a specified SSID or for any SSID • <SSID> – Requests beacon measurement for a specified SSID • any – Requests beacon measurement for any SSID

channel-report [<CHANNEL-LIST>| none]	Configures channel report in the request. The request can include a list of channels or can apply to all channels. • <CHANNEL-LIST> – Request includes a list of channels. The client has to send beacon measurements only for those channels included in the request. • none – Request applies to all channels
on <DEVICE-NAME>	Optional. Sends requests on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service wireless client quiet-element [start|stop]
```

wireless client trigger-bss-transition	Enables the quite-element information in beacons sent to wireless clients
start	Enables the quite-element information in beacons sent to wireless clients. This is the start of the time period when wireless clients are to remain quiet.
stop	Disables the quite-element information in beacons sent to wireless clients. Once disabled, this information is no longer included in beacons.

```
service wireless client trigger-bss-transition mac <MAC> {timeout <0-65535}
{url <URL>} {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless client trigger-bss-transition	Sends a 80211v-Wireless Network Management BSS transition request to a client
<MAC>	Specifies the wireless client's MAC address
timeout <0-65535>	Specifies the time remaining, for this client. before BSS transition is initiated. In other words on completion of the specified time period, BSS transition is triggered. • <0-65535> – Specify a time from 0 -65535 seconds.
url <URL>	Specifies session termination URL
on <DEVICE-OR-DOMAIN-NAME>	Optional. Sends request on a specified device • <DEVICE-OR_DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
service wireless client trigger-wnm mac <MAC> type [deauth-imminent|
subscription-remediation] {uri <WORD>}
```

wireless client trigger-wnm	Sends a WNM notification (action frame) to a wireless client
mac <MAC>	Specifies the wireless client's MAC address
type [deauth-imminent| subscription-remediation]	Configures the WNM notification type • deauth-imminent – Sends a de-authentication imminent frame • subscription-remediation – Sends a subscription remediation needed frame
uri <WORD>	Optional. Specifies the unique resource identifier (URI)

```
service wireless dump-core-snapshot
```

wireless dump-core-snapshot	Triggers a debug core dump of the wireless module

```
service wireless meshpoint zl <MESHPOINT-NAME> [on <DEVICE-NAME>] {<ARGS>|
timeout <1-65535>}
```

service wireless meshpoint zl	Triggers a zonal level debug of a specified meshpoint's modules
<MESHPOINT-NAME>	Specify the meshpoint name
on <DEVICE-NAME>	Triggers zonal level debug of a specified meshpoint's modules on a specified device • <DEVICE-NAME> – Specify the name of the device (AP, wireless controller, or service platform)
<ARGS>	Optional. Specifies the zonal arguments. These zonal arguments represent the meshpoint modules identified by the zonal and subzonal arguments passed here. Also specify the debug level from 0 -7. Please see the Examples section, at the end of this topic, for more information.
timeout <1-65535>	Optional. Specifies a timeout value from 1 - 65535 seconds. When specified, meshpoint logs are debugged for the time specified here.

```
service wireless qos delete-tspec <MAC> tid <0-7>
```

wireless qos delete-tspec	Sends a delete TSPEC request to a wireless client
<MAC>	Specify the MAC address of the wireless client.
tid <0-7>	Deletes the *Traffic Identifier* (TID) • <0-7> – Select the TID from 0 - 7.

```
service wireless trace pattern <WORD> {on <DEVICE-NAME>}
```

wireless trace	Displays the wireless module trace based on parameters passed
pattern <WORD>	Configures the pattern to match • <WORD> – Specify the pattern to match.
on <DEVICE-NAME>	Optional. Displays the wireless module trace on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service wireless unsanctioned ap air-terminate <MAC> {on <DOMAIN-NAME>}
```

wireless unsanctioned ap air-terminate	Enables unsanctioned access points termination
<MAC>	Configures the unsanctioned access points' BSSID (MAC address)
on <DOMAIN-NAME>	Optional. Specifies the RD Domain of the access point • <DOMAIN-NAME> – Specify the name of the RF Domain.

```
service wireless wips clear-client-blacklist [all|mac <MAC>]
```

wireless wips	Enables management of WIPS parameters
clear-client-blacklist [all|mac <MAC>]	Removes a specified client or all clients from the blacklist • all – Removes all clients from the blacklist • mac <MAC> – Removes a specified client form the blacklist • <MAC> – Specify the wireless client's MAC address.

```
service wireless wips clear-event-history {on <DEVICE-OR-DOMAIN-NAME}
```

wireless wips	Enables management of WIPS parameters
clear-event-history	Clears event history
on <DEVICE-OR-DOMAIN-NAME>	Optional. Clears event history on a device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Syntax (Privilege Exec Mode)

Service Commands - Intro

Note

The "service" command of the Priv Exec Mode is the same as the service command in the User Exec Mode. There a few modifications that have been documented in this section. For the syntax and parameters of the other commands refer to the Syntax (User Exec Mode) and Parameters (User Exec Mode) sections of this chapter.

```
service [block-adopter-config-updates|clear|cli-tables-skin|cluster|copy|
database|delete|delete-offline-aps|force-send-config|force-update-vm-stats|
guest-registration|load-balancing|locator|mint|pktcap|pm|radio|radius|
```

```
request-full-config-from-adopter|restore|set|show|signal|smart-rf|snmp|ssm|
start-shell|syslog|trace|wireless]
service clear crash-info {on <DEVICE-NAME>}
service copy [stats-report|tech-support]
service copy stats-report [global|rf-domain <DOMAIN-NAME>] (<FILE>|<URL>)
service copy tech-support [<FILE>|<URL>]
service database [authentication|compact|drop|maintenance-mode|primary-stepdown|
remove-all-files|replica-set|server|start-shell]
service database authentication [create-user|delete-user]
service database authentication create-user username <USER-NAME> password <PASSWORD>
service database authentication delete-user username <USER-NAME>
service database compact [all|captive-portal|nsight]
service database [maintenance-mode|primary-stepdown|remove-all-files|start-shell]
service database replica-set [add|delete|force-configured-state]
service database replica-set add member [<IP>|<FQDN>] [arbiter|priority <0-255>]
service database replica-set delete member [<IP>|<FQDN>]
service database replica-set force-configured-state
service database server [restart|start|stop]
service delete sessions <SESSION-COOKIES>
service mint [clear|debug-log|expire|flood]
service mint [clear [lsp-db|mlcp]|debug-log [flash-and-syslog|flash-only]|
expire [lsp|spf]|flood [csnp|lsp]]
service pktcap on [bridge|deny|drop|ext-vlan|interface|radio|rim|router|vpn|wireless]
service pktcap on [bridge|deny|drop|ext-vlan|rim|router|vpn|wireless]
{(acl-name <ACL>,count <1-1000000>,direction [any|inbound|outbound],filter <LINE>,
hex,rate <1-100>,snap <1-2048>,tcpdump,verbose,write [file|url|
tzsp [<IP/TZSP-HOSTNAME>])}
service pktcap on interface [<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|
pppoe1|vlan <1-4094>|wwan1] {(acl-name <ACL>,count <1-1000000>,
direction [any|inbound|outbound],filter <LINE>,hex,rate <1-100>,snap <1-2048>,
tcpdump,verbose,write [file|url|tzsp [<IP/TZSP-HOSTNAME>])}
service pktcap on radio [<1-1024>|all] {(acl-name <ACL>,count <1-1000000>,
direction [any|inbound|outbound],filter <LINE>,hex,promiscuous,rate <1-100>,
snap <1-2048>,tcpdump,verbose,write [file|url|tzsp [<IP/TZSP-HOSTNAME>])}
service pm stop {on <DEVICE-NAME>}
service restore analytics-support [<FILE>|<URL>]
service show last-passwd
service signal [abort <PROCESS-NAME>|kill <PROCESS-NAME>]
service start-shell
service trace <PROCESS-NAME> {summary}
```

Parameters (Privilege Exec Mode)

Service Commands - Intro

```
service copy tech-support <FILE> <URL>
```

copy tech-support	Copies extensive system information used for troubleshooting
<FILE>	Specify the location of the file to be copied, using the following format: • usbX:/path/file
<URL>	Specify the location URL of the file to be copied. Both IPv4 andIPv6 address formats are supported. • tftp://<hostname|IPv4/IPv6>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]/path/file • sftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]>/path/file

```
service copy stats-report [global|rf-domain <DOMAIN-NAME>] (<FILE>|<URL>)
```

copy stats-report	Copies extensive statistical data useful for troubleshooting
[global|rf-domain <DOMAIN-NAME>]	Identifies the RF Domain to copy statistical data • global – Copies extensive statistical data of all configured RF Domains • rf-domain <DOMAIN-NAME> – Copies extensive statistical data of a specified RF Domain. Specify the domain name.
<FILE>	Specify the location to copy file using the following format: • usbX:/path/file
<URL>	Specify the location URL of the file to be copied. Both IPv4 andIPv6 address formats are supported. • tftp://<hostname|IPv4/IPv6>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]/path/file • sftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]>/path/file

```
service clear crash-info {on <DEVICE-NAME>}
```

clear crash-info	Clears all crash files
on <DEVICE-NAME>	Optional. Clears crash files on a specified device. These crash files are core, panic, and AP dump • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service database authentication create-user username <USER-NAME> password <PASSWORD>
```

database	Performs database related actions Note: This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
authentication create-user username <USER-NAME> password <PASSWORD>	Creates users having access rights to the database. Execute this command on the database host. However, before creating users, on the database, generate the database keyfile. For more information on generating the keyfile, see database on page 66 (user exec mode). • username <USER-NAME> – Configures database username • password <PASSWORD> – Configures a password for the username specified above In the database-policy ensure that authentication is enabled and username and password is configured. The database-client-policy also should have the same username and password configured. For more information on database-policy and database-client-policy, see database-policy global config on page 299 and database-client-policy global-config on page 296.

```
service database authentication delete-user username <USER-NAME>
```

database	Performs database related actions Note: This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
database authentication delete-user username <USER-NAME>	Deletes the username requires to access rights the captive-portal/NSight database • username <USER-NAME> – Deletes the username identified by the <USER-NAME> keyword Once deleted, the database cannot be accessed using the specified combination of username and password.

```
service database compact [all|captive-portal|nsight]
```

database	Performs database related actions Note: This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
compact [all| captive-portal| nsight]	Compacts collections within the database. Each database (captive-portal and NSight) contains one or more collection, where each collection is a set of records. Use this command to make a single compact set of all collections within a database. • all – Compacts collections within all databases (captive-portal and NSight) being maintained • captive-portal – Compacts all collections within the captive portal database only • nsight – Compacts all collections within the NSight database only

```
service database [maintenance-mode|primary-stepdown|remove-all-files|start-shell]
```

database	Performs database related actions Note: This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
maintenance-mode	Places the database server in the maintenance mode
primary-stepdown	Requests the primary replica-set to step down. For more information on replica-sets and its creation, see database-policy (global config mode).
remove-all-files	Removes all database-server related files (captive-portal and NSight). Use in a scenario where complete removal of all database related files is necessary, such as when downgrading to 5.8.1 or 5.8.0 version. Extreme caution is recommended when using this command.
start-shell	Starts the database shell

```
service database replica-set add member [<IP>|<FQDN>] [arbiter|priority <0-255>]
```

database	Performs database related actions Note: This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
replica-set	Adds members to the database replica set. A replica set is a group of devices running the database instances that maintain the same data set. Replica sets provide redundancy and high availability, and are the basis for all production deployments. The replica set can contain a maximum of fifty (50) members, with each member (with the exception of the arbiter) hosting an instance of the database. For more information on creating replica sets, see database-policy (global config mode) .

add member [<IP>|<FQDN>]	Adds members to the database replica set • <IP> – Identifies the member by its IP address. Specify the member's IP address. • <FQDN> – Identifies the member by its FQDN. Specify the member's FQDN address. Note: Ensure that the identified members have the database instance running prior to being added to the replica set.
[arbiter| priority <0-255>]	After identifying the new member, optionally specify if the member is the arbiter or not. If not the arbiter, specify the member's priority value. • arbiter – Identifies the new member as the arbiter. The arbiter does not maintain a data set and is added to the replica set to facilitate the election of the fall-back primary member. It provides that one extra vote required in the election of the primary member. • priority <0-255> – Identifies the new member as not being the arbiter and configures its priority value. • <0-255> – Specify the priority value from 0 - 255. Not applicable for the arbiter. The priority value determines the member's position within the replica set as primary or secondary. It also helps in electing the fall-back primary member in the eventuality of the current primary member being unreachable. All identified members should have the database instances running prior to being added to the replica set.

```
service database replica-set delete member [<IP>|<FQDN>]
```

database	Performs database related actions Note: This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
replica-set	Allows deletion of members in a database replica set. For each database a single three-member replica-set can be created and maintained. For more information on creating replica sets, see database-policy (global config mode) .
delete member [<IP>|<FQDN>]	Deletes members from an existing database replica set • <IP> – Identifies the member by its IP address. Specify the member's IP address. • <FQDN> – Identifies the member by its FQDN. Specify the member's FQDN address.

```
service database replica-set force-configured-start
```

database	Performs database related actions **Note:** This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
replica-set	Allows deletion of members in a database replica set. For each database a single three-member replica-set can be created and maintained. For more information on creating replica sets, see database-policy (global config mode) .
force-configured-start	Forces the replica-set to move to the configured state

```
service database server [restart|start|stop]
```

database	Performs database related actions **Note:** This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.
server [restart|start|stop]	Performs the following actions on the database server: • restart – Restarts the server • start – Starts the server • stop – Stops the server

```
service delete sessions <SESSION-COOKIES>
```

delete sessions <SESSION-COOKIES>	Deletes session cookies • <SESSION-COOKIES> – Provide a list of cookies to delete.

```
service mint [clear [lsp-db|mlcp]|debug-log [flash-and-syslog|flash-only]|
expire [lsp|spf]|flood [csnp|lsp]]
```

mint	Enables MiNT protocol management (clears LSP database, enables debug logging, enables running silence etc.)
clear [lsp-db|mlcp]	Clears LSP database and *MiNT Link Control Protocol* (MLCP) links • lsp-db – Clears MiNT Label *Switched Path* (LSP) database • mlcp – Clears MLCP links
debug-log [flash-and-syslog| flash-only]	Enables debug message logging • flash-and-syslog – Logs debug messages to the flash and syslog files • flash-only – Logs debug messages to the flash file only
expire [lsp|spf]	Forces expiration of LSP and recalculation of *Shortest Path First* (SPF) • lsp – Forces expiration of LSP • spf – Forces recalculation of SPF
flood [csnp|lsp]	Floods control packets • csnp – Floods our *Complete Sequence Number Packets* (CSNP) • lsp – Floods our LSP

```
service pm stop {on <DEVICE-NAME>}
```

pm	Stops the PM
stops	Stops the PM from monitoring all daemons
on <DEVICE-NAME>	Optional. Stops the PM on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service pktcap on [bridge|deny|drop|ext-vlan|rim|router|vpn|wireless]
{(acl-name <ACL>,count <1-1000000>,direction [any|inbound|outbound],filter,hex,rate
<1-100>,
snap <1-2048>,tcpdump,verbose,write [file|url|tzsp <IP/TZSP-HOSTNAME>])}
```

pktcap on	Captures data packets crossing at a specified location • on – Defines the packet capture location
bridge	Captures packets transiting through the Ethernet bridge
deny	Captures packets denied by an ACL
drop	Captures packets at the drop locations
ext-vlan	Captures packets forwarded to or from an extended VLAN
rim	Captures packets at the *Radio Interface Module* (RIM)
router	Captures packets transiting through an IP router
vpn	Captures packets forwarded to or from a VPN link
wireless	Captures packets forwarded to or from a wireless device
acl-name <ACL>	Optional. Specify the ACL that matches the ACL name for the 'deny' location
count <1-1000000>	Optional. Limits the captured packet count. Specify a value from 1 -1000000.
direction [any|inbound|outbound]	Optional. Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound.

filter [<LINE>|arp|capwap| cdp| dot11|dropreason| dst|ether|host| icmp| igmp|ip|ipv6|l2|l3|l4| lldp| mint|net|not|port| priority|radio|src| tcp|udp| vlan|wlan]	Optional. Filters packets based on the option selected (must be used as a last option). The filter options are: • <LINE> – Defines user defined packet capture filter • arp – Matches ARP packets • capwap – Matches CAPWAP packets • cdp – Matches CDP packets • dot11 – Matches 802.11 packets • dropreason – Matches packet drop reason • dst – Matches IP destination • ether – Matches Ethernet packets • failed – Matches failed 802.11 transmitted frames • host – Matches host destination • icmp – Matches ICMP packets • icmp6 – Matches ICMPv6 frames • ip – Matches IPV4 packets • ipv6 – Matches IPV6 packets • l2 – Matches L2 header • l3 – Matches L3 header • l4 – Matches L4 header • mint – Matches MiNT packets • lldp – Matches LLDP packets • net – Matches IP in subnet • not – Filters out any packet that matches the filter criteria (For example, if not TCP is used, all tcp packets are filtered out) • port – Matches TCP or UDP port • priority – Matches packet priority • radio – Matches radio • rssi – Matches Received Signal Strength Indication (RSSI) of received radio signals • src – Matches IP source • stp – Matches STP packets • tcp – Matches TCP packets • tcp6 – Matches TCP over IPv6 packets • udp – Matches UDP packets • udp6 – Matches UDP over IPv6 packets • vlan – Matches VLAN • wlan – Matches WLAN
hex	Optional. Provides binary output of the captured packets
rate <1-100>	Optional. Specifies the packet capture rate • <1-100> – Specify a value from 1 - 100 seconds.
snap <1-2048>	Optional. Captures the data length • <1-2048> – Specify a value from 1 - 2048 characters.
tcpdump	Optional. Decodes tcpdump. The tcpdump analyzes network behavior, performance, and infrastructure. It also analyzes applications that generate or receive traffic.

verbose	Optional. Displays full packet body
write	Captures packets to a specified file. Provide the file name and location in the following format: FILE – flash:/path/file • flash:/path/file • usbX:/path/file URL – Specify the location URL to capture file. Both IPv4 and IPv6 address formats are supported. • nvram:startup-config • tftp://<hostname|IP>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file • sftp://<user>@<hostname|IP>[:port]>/path/file • tzsp – *Tazman Sniffer Protocol* (TZSP) host. Specify the TZSP host's IP address or hostname.

```
service pktcap on radio [<1-1024>|all] {(acl-name <ACL>,count <1-1000000>,
direction [any|inbound|outbound],filter <LINE>,hex,promiscuous,rate <1-100>,
snap <1-2048>,tcpdump,verbose,write [file|url|tzsp <IP/TZSP-HOSTNAME>])}
```

pktcap on radio	Captures data packets on a radio (802.11)
<1-1024>	Captures data packets on a specified radio • <1-1024> – specify the radio index from 1 - 1024.
all	Captures data packets on all radios
acl-name <ACL>	Optional. Specify the ACL that matches the ACL name for the 'deny' location
count <1-1000000>	Optional. Sets a specified number of packets to capture • <1-1000000> – Specify a value from 1 - 1000000.
direction [any|inbound|outbound]	Optional. Changes the packet direction with respect to a device. The direction can be set as **any**, **inbound**, or **outbound**.
filter <LINE>	Optional. Filters packets based on the option selected (must be used as a last option) • <LINE> – Define a packet capture filter or select any one of the available options.
hex	Optional. Provides binary output of the captured packets
rate <1-100>	Optional. Specifies the packet capture rate • <1-100> – Specify a value from 1 - 100 seconds.
snap <1-2048>	Optional. Captures the data length • <1-2048> – Specify a value from 1 - 2048 characters.
tcpdump	Optional. Decodes the TCP dump

verbose	Optional. Displays full packet body
write	Captures packets to a specified file. Provide the file name and location in the following format: • flash:/path/file • usbX:/path/file URL – Specify the location URL to capture file. Both IPv4 and IPv6 address formats are supported. • nvram:startup-config • tftp://<hostname|IP>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file • sftp://<user>@<hostname|IP>[:port]>/path/file • tzsp – TZSP host. Specify the TZSP host's IP address or hostname.

```
service pktcap on interface [<INTERFACE>|ge <1-4>|me|port-channel <1-2>|vlan
<1-4094>] {(acl-name <ACL>,count <1-1000000>,direction [any|inbound|outbound],
filter <LINE>,hex,rate <1-100>,snap <1-2048>,tcpdump,verbose,
write [file|url|tzsp <IP/TZSP-HOSTNAME>])}
```

pktcap on	Captures data packets at a specified interface • on – Specify the capture location.
interface [<INTERFACE>| ge <1-4>| me1| port-channel <1-2>| vlan <1-4094>]	Captures packets at a specified interface. The options are: • <INTERFACE> – Specify the interface name. • ge <1-4> – Selects a GigabitEthernet interface index from 1 - 4 • me1 – Selects the FastEthernet interface • port-channel <1-2> – Selects a port-channel interface index from 1- 2 • vlan <1-4094> – Selects a VLAN ID from 1 - 4094
acl-name <ACL>	Optional. Specify the ACL that matches the ACL name for the 'deny' location
count <1-1000000>	Optional. Sets a specified number of packets to capture • <1-1000000> – Specify a value from 1 - 1000000.
direction [any|inbound|outbound]	Optional. Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound.
filter <LINE>	Optional. Filters packets based on the option selected (must be used as a last option) • <LINE> – Define a packet capture filter or select any one of the available options.
hex	Optional. Provides binary output of the captured packets
rate <1-100>	Optional. Specifies the packet capture rate • <1-100> – Specify a value from 1 - 100 seconds.
snap <1-2048>	Optional. Captures the data length • <1-2048> – Specify a value from 1 - 2048 characters.
tcpdump	Optional. Decodes the TCP dump

verbose	Optional. Displays full packet body
write	Captures packets to a specified file. Provide the file name and location in the following format: • flash:/path/file • usbX:/path/file URL – Specify the location URL to capture file. Both IPv4 and IPv6 address formats are supported. • nvram:startup-config • tftp://<hostname|IP>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file • sftp://<user>@<hostname|IP>[:port]>/path/file • tzsp – TZSP host. Specify the TZSP host's IP address or hostname.

```
service show last-passwd
```

show	Displays running system statistics based on the parameters passed
last-passwd	Displays the last password used to enter shell

```
service signal [abort <PROCESS-NAME>|kill <PROCESS-NAME>]
```

signal	Sends a signal to a process • tech-support – Copies extensive system information useful for troubleshooting
abort	Sends an abort signal to a process, and forces it to dump to core • <PROCESS-NAME> – Specify the process name.
kill	Sends a kill signal to a process, and forces it to terminate without a core • <PROCESS-NAME> – Specify the process name.

```
service start-shell
```

start-shell	Provides shell access

```
service trace <PROCESS-NAME> {summary}
```

trace	Traces a process for system calls and signals
<PROCESS-NAME>	Specifies the process name
summary	Optional. Generates summary report of the specified process

Syntax (Privilege Exec Mode: NX 95XX)

Service Commands - Intro

The following service commands are specific to the NX 95XX series service platforms:

```
service copy analytics-support [<FILE>|<URL>]
```

Parameters(Privilege Exec Mode: NX 95XX)

Service Commands - Intro

```
service copy analytics-support [<FILE>|<URL>]
```

copy analytics-support	Enables copying of analytics information to a specified. Use one of the following options to specify the file: **Note:** This information is useful to troubleshoot issues by the Technical Support team.
<FILE>	Specify the file name and location using one of the following formats: • usb1:/path/file • usb2:/path/file
<URL>	Specify the location URL to copy file. Both IPv4 and IPv6 formats are supported. • tftp://<hostname|IPv4/IPv6>[:port]/path/file • ftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]/path/file • sftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]>/path/file

Usage Guidelines

The NX 95XX service platforms provide granular and robust analytic reporting for a managed network. The data analyzed is collected at intervals specified by the administrator.

To enable data analytics, procure and apply a separate hot spare analytics license at the NOC. The license restricts the number of Access Point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP at the NOC controller.

In an NOC managed network, the analytics engine parses and processes Smart RF events as they are received. The analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves. analytics licenses available.

Syntax (Global Config Mode)

Service Commands - Intro

```
service [set|show cli]

service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100>|
virtual-machine-history <10-200>] {on <DEVICE-NAME>}

service show cli
```

Parameters (Global Config Mode)

Service Commands - Intro

```
service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100>|
virtual-machine-history <10-200>] {on <DEVICE-NAME>}
```

set	Sets the size of history files
command-history <10-300>	Sets the size of the command history file • <10-300> – Specify a value from 10 - 300. The default is 200.
upgrade-history <10-100>	Sets the size of the upgrade history file • <10-100> – Specify a value from 10 - 100. The default is 50.
reboot-history <10-100>	Sets the size of the reboot history file • <10-100> – Specify a value from 10 - 100. The default is 50.
virtual-machine-history <10-200>	Sets the size of the virtual-machine history file • <10-200> – Specify a value from 10 - 200. The default is 100. This command is applicable only to the NX 95XX and NX 96XX series service platforms. Use the `no > service > set > virtual-machine-history > {on <DEVICE-NAME>}` command to revert the history file size to 100.
on <DEVICE-NAME>	Optional. Sets the size of history files on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
service show cli
```

show cli	Displays running system configuration details • cli – Displays the CLI tree of the current mode

Examples for the `service > wireless > meshpoint` command.

The following example displays meshpoint modules:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C
       | SUBZONE
       | 0    1    2    3    4    5    6    7
-------+-----------------------------------------
  ZONE |
       | GEN  TX   RX   BEA  TXF
 2-LLC | 0    0    0    0    0
       | GEN  TX   RX   NBR  LQM  LSA
 3-ND  | 0    0    0    0    0    0
       | GEN
 4-ORL | 0
       | GEN  TX   RX   HEL  PRO
 5-LQ  | 0    0    0    0    0
       | GEN
 6-PS  | 0
       | GEN  ROOT NBR  REC
 7-RS  | 0    0    0    0
       | GEN
 8-IA  | 0
       | GEN  SET  GET
11-MGT | 0    0    0
       | GEN  RX   TX   R0   LMST LSUP LKEY KEY
13-LSA | 0    0    0    0    0    0    0    0
       | GEN  SCAN TRIG
```

```
14-ACS | 0    0    0
       | GEN
15-EAP | 0
       | GEN
16-L2P | 0

ROOT1-ap81xx-71174C#
```

In the preceding example,

- The meshpoint name is mesh_root
- The device on which the command is executed is ROOT1-ap81xx-71174C
- The vertical ZONE column represents meshpoint modules. For example, 3-ND presents the Neighbor Discovery module.
- The SUBZONE 0 to 7 represents the available processes for each of the zonal modules.
- Debugging is disabled for all modules for the mesh-root meshpoint. A value of 0 (Zero) represents debugging disabled.

To enable meshpoint module debugging, specify the module number and the process number separated by a period (.). And then specify the debugging level from 0 - 7.

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 3.2 7
```

In the preceding command,

- The meshpoint module number provided is 3 (ND)
- The process number provided is 2 (RX - Received signals from neighbors)
- The debugging level provided is 7 (highest level - warning)

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C
       | SUBZONE
       | 0    1    2    3    4    5    6    7
-------+-----------------------------------------
  ZONE |
       | GEN  TX   RX   BEA  TXF
 2-LLC | 0    0    0    0    0
       | GEN  TX   RX   NBR  LQM  LSA
 3-ND  | 0    0    7(D) 0    0    0
       | GEN
 4-ORL | 0
       | GEN  TX   RX   HEL  PRO
 5-LQ  | 0    0    0    0    0
       | GEN
 6-PS  | 0
       | GEN  ROOT NBR  REC
 7-RS  | 0    0    0    0
       | GEN
 8-IA  | 0
       | GEN  SET  GET
11-MGT | 0    0    0
       | GEN  RX   TX   R0   LMST LSUP LKEY KEY
13-LSA | 0    0    0    0    0    0    0    0
       | GEN  SCAN TRIG
14-ACS | 0    0    0
       | GEN
15-EAP | 0
       | GEN
16-L2P | 0

ROOT1-ap81xx-71174C#
```

In the preceding example, level 7 debugging has been enabled only for the ND module's received signals. Note that debugging for all other modules and processes are still disabled.

To disable debugging for all modules, specify 0 (zero) in the command. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 0
```

To enable debugging for all modules, specify the debugging level number. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 5

ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C
       | SUBZONE
       | 0    1    2    3    4    5    6    7
-------+-----------------------------------------
  ZONE |
       | GEN  TX   RX   BEA  TXF
 2-LLC | 5(N) 5(N) 5(N) 5(N) 5(N)
       | GEN  TX   RX   NBR  LQM  LSA
 3-ND  | 5(N) 5(N) 5(N) 5(N) 5(N) 5(N)
       | GEN
 4-ORL | 5(N)
       | GEN  TX   RX   HEL  PRO
 5-LQ  | 5(N) 5(N) 5(N) 5(N) 5(N)
       | GEN
 6-PS  | 5(N)
       | GEN  ROOT NBR  REC

nx9500-6C8809#
```

```
nx9500-6C8809#service show diag psu
PSU1 (upper):
 status unplugged
PSU2 (lower):
 status normal
nx9500-6C8809#
```

The following examples show the purging of users from the guest-registration database:

```
nx7500-112233#service guest-registration delete ?
  all                 Delete all users
  email               Email address
  group               Group
  mac                 MAC address
  mobile              Mobile phone number
  name                Full name
  offline-for         Specify minimum amount of time offline
  otp-incomplete-for  Specify minimum amount of time registration with
                      one-time-passcode incomplete
  social              Social site used to log in
  wlan                Wireless LAN

nx7500-112233#
```

Purges users belonging to a specified RADIUS group.

```
nx7500-112233#service guest-registration delete group mac_reg_gr1
delete user status: delete users matching a group will take time, please wait
nx7500-112233#
```

Purges users using social-site (Facebook or Google) credentials to login.

```
nx7500-112233#service guest-registration delete social facebook
delete user status: delete users matching a social category will take time, please wait
nx7500-112233#
```

Purges users inactive for a specified time period.

```
nx7500-112233#service guest-registration delete offline-for days 5
delete user status: Deleting users offline for minimum 5 days. This will take time,
please wait
nx7500-112233#
```

Purges users who have failed to complete registration using the OTP within a specified time period.

```
nx7500-112233#service guest-registration delete otp-incomplete-for days 5
delete user status: Deleting registration with one-time-passcode incomplete for minimum 5
days. This will take time, please wait
nx7500-112233#
```

The following example displays IP ACLs to WLAN mapping summary on the 'TechPubs' RF Domain:

```
nx9500-6C8809#service show ip-access-list wlan TechPubs status
Reporting Device: ap7161-99BB7C - success
Reporting Device: ap7532-80C2AC - success
Reporting Device: ap7562-84A224 - success
Reporting Device: nx9500-6C8809 - success
Reporting Device: ap8163-74B45C - success
Total reporting devices: 5
nx9500-6C8809#
```

Consider an RF Domain (name guest-domain) with 3 APs adopted to a controller. The CLI output for the `service > show > ip-access-list` command in this set up varies for different scenarios, as shown in the following examples:

- Scenario 1: Executing the command on a device (access point).

```
AP01#service show ip-access-list wlan status
Reporting Device: AP01 - fail
WLAN: XPO-Guest-PSK
  use ip-access-list in guest_access_inbound : fail
Total reporting devices: 1
AP01#

AP01#service show ip-access-list wlan status detail
================================================================================
Reporting Device: AP01
--------------------------------------------------------------------------------
WLAN: XPO-Guest-PSK
  use ip-access-list in guest_access_inbound : fail
  use ip-access-list out BC-MC-CONTROL : success
--------------------------------------------------------------------------------
WLAN: PartnerNet
  use ip-access-list in default : success
  use ip-access-list out default : success
--------------------------------------------------------------------------------
Total reporting devices: 1
AP01#
```

- Scenario 2: IP ACL to WLAN mapping is successful for all APs in a specified RF Domain.

```
SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - success
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
SW01#
```

- Scenario 3: IP ACL has failed in dataplane due to unknown reasons.

```
SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - fail
WLAN: XPO-Guest-PSK
  use ip-access-list in guest_access_inbound : fail
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
SW01#

SW01#service show ip-access-list wlan status detail on guest-domain
```

```
================================================================================
Reporting Device: AP01
--------------------------------------------------------------------------------
WLAN: XPO-Guest-PSK
  use ip-access-list in guest_access_inbound : fail
  use ip-access-list out BC-MC-CONTROL : success
--------------------------------------------------------------------------------
WLAN: PartnerNet
  use ip-access-list in guest_access_inbound : success
  use ip-access-list out BC-MC-CONTROL : success
--------------------------------------------------------------------------------

================================================================================
Reporting Device: AP02
--------------------------------------------------------------------------------
WLAN: PartnerNet
  use ip-access-list in guest_access_inbound : success
  use ip-access-list out BC-MC-CONTROL : success
--------------------------------------------------------------------------------

================================================================================
Reporting Device: AP03
--------------------------------------------------------------------------------
WLAN: PartnerNet
  use ip-access-list in guest_access_inbound : success
  use ip-access-list out BC-MC-CONTROL : success
--------------------------------------------------------------------------------
Total reporting devices: 3
SW01#
```

- Scenario 4: AP in RF Domain is unreachable or does not support this functionality.

```
SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - unreachable
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
SW01#
SW01#service show ip-access-list wlan status detail on guest-domain

================================================================================
Reporting Device: AP01
Timed out waiting for remote device: xpath=wing-stats/device/00-23-68-0B-86-38/

SW01#
```

show

Displays specified system component settings. There are a number of ways to invoke the show command.

- When invoked without any arguments, it displays information about the current context. If the current context contains instances, the show command (usually) displays a list of these instances.
- When invoked with the display parameter, it displays information about that component.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show <PARAMETERS>
```

Parameters

```
show <PARAMETERS>
```

show <PARAMETERS>	The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy's current settings. The example below shows the configuration details that can be viewed in the Priv Executable mode.

Examples

```
nx9500-6C8809#show ?
  adoption                    Adoption related information
  bluetooth                   Bluetooth Configuration/Statistics commands
  bonjour                     Bonjour Gateway related commands
  boot                        Display boot configuration.
  captive-portal              Captive portal commands
  captive-portal-page-upload  Captive portal internal and advanced page upload
  cdp                         Cisco Discovery Protocol
  classify-url                Query the category of an URL
  clock                       Display system clock
  cluster                     Cluster Protocol
  cmp-factory-certs           Display the CMP certificate status
  commands                    Show command lists
  context                     Information about current context
  critical-resources          Critical Resources
  crypto                      Encryption related commands
  database                    Database
  debug                       Debugging functions
  debugging                   Debugging functions
  device-upgrade              Device Upgrade
  dot1x                       802.1X
  dpi                         Deep Packet Inspection
  eguest                      Registration EGuest process
  environmental-sensor        Display Environmental Sensor Module status
  event-history               Display event history
  event-system-policy         Display event system policy
  ex3500                      EX3500 device details
  extdev                      External device (T5, Ex3500..)
  file                        Display filesystem information
  file-sync                   File sync between controller and adoptees
  firewall                    Wireless Firewall
```

```
  global                        Global-level information
  gre                           Show l2gre tunnel info
  guest-notification-config     Show guest-notification information
  guest-registration            Guest registration commands
  interface                     Interface Configuration/Statistics commands
  ip                            Internet Protocol (IP)
  ip-access-list                IP ACL
  ipv6                          Internet Protocol version 6 (IPv6)
  ipv6-access-list              IPV6 ACL
  l2tpv3                        L2TPv3 information
  lacp                          LACP commands
  ldap-agent                    LDAP Agent Configuration
  licenses                      Show installed licenses and usage
  lldp                          Link Layer Discovery Protocol
  logging                       Show logging information
  mac-access-list               MAC ACL
  mac-address-table             Display MAC address table
  mac-auth                      MAC authentication
  mac-auth-clients              MAC authenticated clients
  mint                          MiNT protocol
  mirroring                     Show mirroring sessions
  nsight                        Nsight Server Module
  ntp                           Network time protocol
  password-encryption           Pasword encryption
  pppoe-client                  PPP Over Ethernet client
  privilege                     Show current privilege level
  radius                        RADIUS statistics commands
  raid                          Show RAID status
  reload                        Scheduled reload information
  remote-debug                  Show details of remote debug sessions
  rf-domain-manager             Show RF Domain Manager selection details
  role                          Role based firewall
  route-maps                    Display Route Map Statistics
  rtls                          RTLS Statistics
  running-config                Current operating configuration
  session-changes               Configuration changes made in this session
  session-config                This session configuration
  sessions                      Display sessions
  site-config-diff              Difference between site configuration on the NOC
                                and actual site configuration
  slot                          Expansion slots stats
  smart-rf                      Smart-RF Management Commands
  spanning-tree                 Display spanning tree information
  startup-config                Startup configuration
  t5                            Display T5 inventory information
  terminal                      Display terminal configuration parameters
  timezone                      The timezone
  traffic-shape                 Display traffic shaping
  upgrade-status                Display last image upgrade status
  version                       Display software & hardware version
  virtual-machine               Virtual Machine
  vrrp                          VRRP protocol
  web-filter                    Web filter
  what                          Perform global search
  wireless                      Wireless commands
  wwan                          Display wireless WAN Status

nx9500-6C8809#
```

Note

For more information on the show command, see Show Commands on page 677.

write

Writes the system running configuration to memory or terminal

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
write [memory|terminal]
```

Parameters

```
write [memory|terminal]
```

memory	Writes to the *non-volatile* (NV) memory
terminal	Writes to the terminal

Examples

```
nx9500-6C8809>write memory
[OK]
nx9500-6C8809>
```

7 Show Commands

show-commands

Show commands displays configuration settings and statistical information. Use this command to view the current running configuration as well as the start-up configuration. The show command also displays the current context configuration.

This chapter describes the 'show' CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. Commands entered in either USER EXEC mode or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

This chapter also describes the 'show' commands in the 'GLOBAL CONFIG' mode. The commands can be entered in all three modes, except commands like file, IP access list statistics, MAC access list statistics, and upgrade statistics, which cannot be entered in the USER EXEC mode.

show-commands

The following table summarizes the show commands:

Table 33: Show Commands

Command	Description
show on page 680	Displays settings for the specified system component
adoption on page 686	Displays adoption related information
bluetooth on page 689	Displays Bluetooth radio statistics for RF Domain member access points
boot on page 691	Displays a device's boot configuration
bonjour on page 692	Displays the configured Bonjour services available on local and remote sites
captive-portal on page 693	Displays WLAN hotspot functions
captive-portal-page-upload (show commands) on page 694	Displays captive portal Web pages upload related information
cdp on page 696	Displays a CDP *(Cisco Discovery Protocol)* neighbor table
classify-url on page 697	Queries a specified global data center or a pre-configured classification server for the category of a specified URL.
clock on page 697	Displays the system clock
cluster on page 698	Displays device-cluster related statistics
cmp-factory-certs on page 699	Displays factory installed CMP certificates
commands on page 700	Displays command list
context on page 700	Displays information about the current context

Table 33: Show Commands (continued)

Command	Description
critical-resources on page 701	Displays critical resources deployed within the managed network and associated statistics
crypto on page 702	Displays encryption mode information
database on page 705	Displays database-related statistics and status
device-upgrade on page 706	Displays device firmware upgradation information for devices adopted by a wireless controller or access point
dot1x on page 708	Displays dot1x information on interfaces
dpi on page 710	Displays statistics for all configured and canned applications
environmental-sensor on page 714	Displays environmental sensor's historical data (applicable only to AP 8132)
event-history on page 716	Displays event history
event-system-policy on page 717	Displays event system policy configuration information
ex3500 on page 718	Displays EX3500-related statistical data
extdev on page 720	Displays external device (T5 or EX3500) configuration error history
fabric-attach on page 721	Displays the current status of VLAN to I-SID assignments for all ports
file on page 722	Displays file system information
file-sync on page 723	Displays file synchronization settings and status on a controller. The file-sync command syncs trustpoint/wireless-bridge certificate between the staging-controller and its adopted access points
firewall on page 725	Displays wireless firewall information
global on page 729	Displays global information for network devices based on the parameters passed
gps (show command) on page 730	Displays the geographical coordinates (latitude and longitude) of the device for which the GPS coordinates search process has been triggered
gre on page 731	Displays GRE tunnel related information
guest-registration on page 732	Displays guest registration statistics based on the option and time entered
interface on page 740	Displays interface status
iot-device-type-imagotag on page 743	Displays the configuration of ESL communicator on a specified AP or on all APs within an RF Domain.
ip on page 744	DisplaysIP related information
ip-access-list-stats on page 751	Displays IP access list statistics
ipv6 on page 752	Displays IPv6 related information
ipv6-access-list on page 756	Displays IPv6 access list statistics
l2tpv3 on page 756	Displays L2TPv3 *(Layer 2 Tunnel Protocol Version 3)* information
lacp on page 759	Displays LACP *(Link Aggregation Control Protocol)* related information
ldap-agent on page 762	Displays an LDAP agent's join status (join status to a LDAP server domain)

Table 33: Show Commands (continued)

Command	Description
licenses on page 762	Displays installed licenses and usage information
lldp on page 764	Displays LLDP *(Link Layer Discovery Protocol)* information
logging on page 765	Displays logging information
mac-access-list-stats on page 766	Displays MAC access list statistics
mac-address-table on page 767	Displays MAC address table entries
macauth on page 768	Displays details of wired ports that have MAC address-based authentication enabled
mac-auth-clients on page 770	Displays MAC-authenticated clients based on the parameters passed
mint on page 771	Displays MiNT protocol configuration commands
ntp on page 774	Displays NTP server related information
password-encryption on page 775	Displays password encryption status
pppoe-client on page 775	Displays PPPoE *(Point to Point Protocol over Ethernet)* client information
privilege on page 776	Displays current privilege level information
radius on page 777	Displays the amount of access time consumed and the access time remaining for all guest users configured on a RADIUS server
reload on page 779	Displays scheduled reload information
rf-domain-manager on page 779	Displays RF Domain manager selection details
role on page 780	Displays role-based firewall information
route-maps on page 781	Display route map statistics
rtls on page 781	Displays RTLS *(Real Time Location Service)* statistics of access points
running-config on page 782	Displays configuration file contents
session-changes on page 790	Displays configuration changes made in the current session
session-config on page 791	Displays configurations made in the current session
sessions on page 792	Displays a list of currently active open sessions on the device
site-config-diff on page 792	Displays the difference between site configuration available on NOC and the actual site configuration
smart-rf on page 793	Displays Smart RF management statistics
snmpv3 (show command) on page 798	Displays the SNMPv3 Engine ID
spanning-tree on page 799	Displays spanning tree information
startup-config on page 801	Displays complete startup configuration script on the console
t5 on page 802	Displays adopted T5 controller details. This command is applicable only on the RFS 4000, NX 95XX, NX 96XX, and VX 9000.
terminal on page 810	Displays terminal configuration parameters
timezone on page 810	Displays timezone information for the system and managed devices
traffic-shape on page 810	Displays traffic-shaping related configuration details and statistics

Table 33: Show Commands (continued)

Command	Description
tron (show command) on page 812	Displays the TRON-capable and TRON-enabled WiNG AP's operating configuration.
upgrade-status on page 813	Displays image upgrade status
version on page 814	Displays a device's software and hardware version
vrrp on page 815	Displays VRRP details
virtual-machine on page 816	Displays the VM *(virtual-machine)* configuration, logs, and statistics
web-filter on page 844	Displays pre-configured, in-built Web filter options available. These options are: category (URL category), category-types, filter-level, etc. This command also displays Web filter statistics and status.
what on page 846	Displays details of a specified search phrase
wireless on page 819	Displays wireless configuration parameters
wwan on page 847	Displays the wireless WAN status

Note

The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

show

The show command displays the following information:

- A device's current configuration
- A device's start-up configuration
- A device's current context configuration, such as profiles and policies

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show <PARAMETER>
```

Parameters

show <PARAMETERS>	The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy's current settings. The examples below show the configuration parameters that can be viewed in the User Executable, Priv Executable, and Global Configurable modes.

Examples

The following examples list the `show` commands in the User Exec, Priv Exec, and Global Config modes:

Global Config Mode:

```
<DEVICE>(config)#show ?
  adoption                      Adoption related information
  bluetooth                     Bluetooth Configuration/Statistics commands
  bonjour                       Bonjour Gateway related commands
  boot                          Display boot configuration.
  captive-portal                Captive portal commands
  captive-portal-page-upload    Captive portal internal and advanced page upload
  cdp                           Cisco Discovery Protocol
  classify-url                  Query the category of an URL
  clock                         Display system clock
  cluster                       Cluster Protocol
  cmp-factory-certs             Display the CMP certificate status
  commands                      Show command lists
  context                       Information about current context
  critical-resources            Critical Resources
  crypto                        Encryption related commands
  database                      Database
  debug                         Debugging functions
  debugging                     Debugging functions
  device-upgrade                Device Upgrade
  dot1x                         802.1X
  dpi                           Deep Packet Inspection
  environmental-sensor          Display Environmental Sensor Module status
  event-history                 Display event history
  event-system-policy           Display event system policy
  ex3500                        EX3500 device details
  extdev                        External device (T5, Ex3500..)
  fabric-attach                 Fabric attach
  file                          Display filesystem information
  file-sync                     File sync between controller and adoptees
  firewall                      Wireless Firewall

adoption

Displays adoption related information, and is common to the User Exec, Priv Exec, and Global Config modes.

Use this command to view details of devices adopted by the logged device.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show adoption [config-errors|controllers|history|info|log|offline|pending|status|timeline]
show adoption offline {all|on <DEVICE-NAME>}
show adoption config-errors <DEVICE-NAME>
show adoption log [adoptee|adopter {<MAC>}] {on <DEVICE-NAME>}
show adoption [controllers {include-ipv6}|history|info|pending|status {summary}|timeline]
{on <DEVICE-NAME>}
```

Parameters

```
show adoption offline
```

adoption	Displays AP adoption history and status. It also displays configuration errors.
offline	Displays status of offline devices (unadopted devices) Note: The `show → adoption → offline` command displays the following information regarding offline (unadopted) devices: MAC Address, Host-Name, Type, RF-Domain, Time Offline, Connected-To, and Last-Know-IP.

```
show adoption config-errors <DEVICE-NAME>
```

adoption	Displays AP adoption history and status. It also displays configuration errors.
config-errors <DEVICE-NAME>	Displays configuration errors for a specified adopted device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show adoption log [adoptee|adopter] {on <DEVICE-NAME>}
```

adoption	Displays adoption related information. It also displays configuration errors.
log [adoptee| adopter {MAC}] {on <DEVICE-NAME>} {on <DEVICE-NAME>}	Displays adoption logs, for the specified device. If no device name is specified, the system displays logs for the logged device. • adoptee – Displays adoption logs for adoptee devices (APs, wireless controllers, and service platforms). To view logs for a specific adoptee, specify the device's name. If no device name is specified, the system displays logs for the logged device. If the logged device is not an adoptee, the system states that the device is a controller. `2013-01-19 22:00:13:MLCP_TAG_CLUSTER_MASTER not present and this device is a controller. Ignoring` • on <DEVICE-NAME> – Optional. Displays adoptee status and details for the device identified by the <DEVICE-NAME> keyword <DEVICE-NAME> – Specify the device's name. • adopter – Displays adoption logs for adopter devices (APs, wireless controllers, and service platforms). To view logs for a specified adopter, specify the device's name. If no device name is specified, the system displays logs for the logged device. • <MAC> – Optional. Filters adopters by the adoptee device's MAC address. Specify the adoptee device's MAC address. The system displays logs for the device that has adopted the device identified by the <MAC> keyword. on <DEVICE-NAME> – Optional. Displays adopter status and details for the device identified by the <DEVICE-NAME> keyword. Specify the adopter device's name. <DEVICE-NAME> – Specify the adopter device's name. Note: A wireless controller or service platform cannot be configured as an adoptee and an adopter simultaneously. In other words, an adopted wireless controller or service platform cannot be configured to adopt another device and vice versa.

`show adoption [history|controllers {include-ipv6}|info|pending|status {summary}|timeline] {on <DEVICE-NAME>}`

adoption	Displays AP adoption history and status. It also displays configuration errors.
controllers {include-ipv6}	Displays information about adopted controllers. This is applicable in a Hierarchically managed network, where site controllers are adopted by the NOC controllers. • include-ipv6 – Optional. Displays the controller's IPv6 address, if assigned, in the output
history	Displays the adoption history of the logged device and its adopted access points
info	Displays adopted device information
pending	Displays information for devices pending adoption

status {summary}	Displays adoption status for the logged device. When executed without using the 'on <DEVICE-NAME>' parameter, this command displays detailed information of all devices adopted by the logged device. • summary – Optional. Displays a summary of all devices or specific adopted by the logged device. Note: The `show → adoption → status` command displays the following adopted device status information: Device Name, Version, CFG-Stat, Msgs, Adopted-By, Last-adoption, Up-Time, and IP-Address.
timeline	Displays the logged device's adoption timeline. It also shows the adoption time for the logged device's adopted APs. To view the adoption timeline of a specific device, use the 'on <DEVICE-NAME>' option to specify the device.
on <DEVICE-NAME>	The following keywords are common to all of the above parameters: • on <DEVICE-NAME> – Optional. Displays a device's adoption information, based on the parameter passed. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809#show adoption status

bluetooth

Displays Bluetooth radio statistics for RF Domain member access points. The AP-8432 and AP-8533 model access points utilize a built-in Bluetooth chip for specific Bluetooth functional behaviors in a WiNG managed network. Both these model access points support the *Bluetooth classic* and *Bluetooth low energy* (BLE) technology. These platforms use their Bluetooth classic enabled radio to sense other Bluetooth enabled devices and report device data (MAC address, RSSI and device calls) to an ADSP server for intrusion detection. If the device presence varies in an unexpected manner, ADSP can raise an alarm.

The AP-8432 and AP-8533 model access points support Bluetooth beaconing to emit either iBeacon or Eddystone-URL beacons. The access point's Bluetooth radio sends non-connectable, undirected *low-energy* (LE) advertisement packets periodically. These advertisement packets are short and sent on Bluetooth advertising channels that conform to already-established iBeacon and Eddystone-URL standards.

Supported in the following platforms:

- Access Points — AP-8432, AP-8533

Syntax

```
show bluetooth radio {detail|on}
show bluetooth radio {detail {<DEVICE-NAME> <1-1>|filter bluetooth-radio-mac <BT-RADIO-MAC>}}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

Parameters

```
show bluetooth radio {detail {<DEVICE-NAME> <1-1>|filter bluetooth-radio-mac <BT-RADIO-MAC>}}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

bluetooth radio	Displays Bluetooth radio utilization statistics based on the parameters passed
detail <DEVICE-NAME> <1-1>	Optional. Displays detailed Bluetooth radio utilization statistics. Optionally, to view detailed information for a specific access point's Bluetooth radio, specify the access point's and the radio's MAC addresses. • <DEVICE-NAME> <1-1> – Optional. Specify the access point's hostname or MAC address. • <1-1> – Specify the bluetooth radio interface index number from 1 - 1. As of now only one Bluetooth radio interface is supported. The Interface index number is appended to the AP's hostname or MAC address in the following format: ap8533-06FBE1:B1 OR 74-67-F7-06-FB-E1:B1 The following information is displayed: • access point's hostname as its network identifier • access point's alias. If an alias has been defined for the access point its listed here. The alias value is expressed in the form of *<hostname>:B<Bluetooth_radio_number>*. If the access point has a administrator assigned hostname, it is used in place of the access point's default hostname. • access point's factory encoded MAC address • access point and bluetooth radio's administrator assigned area of deployment (the AP's geographical location) • bluetooth radio's state (on/off) • bluetooth radio's reason for inactivity (in case the radio is off) • bluetooth radio's factory encoded MAC address serving as this device's hardware identifier on the network • bluetooth radio's functional mode: bt-sensor or le-beacon • bluetooth radio's beacon period • bluetooth radio's beacon type • descriptive text on any error that's preventing the Bluetooth radio from operating
filter bluetooth-radio-mac <BT-RADIO-MAC>	Optional. Specifies additional filters to get table values. Filters data based on the Bluetooth radio's MAC address. • <BT-RADIO-MAC> – Specify the Bluetooth radio's MAC address. The system only displays statistics related to the specified Bluetooth radio.
on <DEVICE-OR-DOMAIN-NAME>	The following keywords are recursive and common to all of the above. • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays Bluetooth radio statistics on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the device or RF Domain. If the device name is explicitly given, the results display data for the specified AP only. If the RF Domain is explicitly given, the results display data for all APs within the specified RF Domain. If no device/RF Domain is specified, the results include data for all Bluetooth radios within the controller's RF Domain. If the controller is in the "on rf-domain all" mode, the results include data for all Bluetooth radios for all APs in each domain known to the controller.

Examples

```
nx9500-6C8809(config)#show bluetooth radio on ap8533-06F808

boot

Displays a device's boot configuration. Use this command to view the primary and secondary image details, such as Build Date, Install Date, and Version. This command also displays the current boot and next boot information.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show boot {on <DEVICE-NAME>}
```

Parameters

```
show boot {on <DEVICE-NAME>}
```

boot	Displays primary and secondary image boot configuration details (build date, install date, version, and the image used to boot the current session)
on <DEVICE-NAME>	Optional. Displays a specified device's boot configuration • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. Note: Use the *on <DEVICE-NAME>* option to view a remote device's boot configuration.

Examples

```
ap510-133B38#show boot
------------------------------------------------------------------------------

bonjour

Displays the configured Bonjour services available on local and remote sites

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show bonjour services {on <DEVICE-NAME>}
```

Parameters

```
show bonjour services {on <DEVICE-NAME>}
```

bonjour services	Displays the configured Bonjour services available on local and remote sites
on <DEVICE-NAME>	Optional. Displays Bonjour services available on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809#show bonjour services onap7161-11E6C4

nx9500-6C8809#
```

captive-portal

Displays WLAN captive portal information. Use this command to view a configured captive portal's client information.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show captive-portal sessions {include-ipv6|on <DEVICE-OR-DOMAIN-NAME>|statistics}
{(filter [captive-portal [<CAPTIVE-PORTAL>|not <CAPTIVE-PORTAL>]|ip [<IPv4>|not <IPv4>]|
ipv6 [<IPv6>|not <IPv6>]|state [pending|success|not [pending|success]|vlan [<VLAN-ID>|
not <VLAN-ID>]|wlan [<WLAN-NAME>|not <WLAN-NAME>]])}
```

Parameters

```
show captive-portal sessions {include-ipv6|on <DEVICE-OR-DOMAIN-NAME>|statistics}
{(filter [captive-portal [<CAPTIVE-PORTAL>|not <CAPTIVE-PORTAL>]|ip [<IPv4>|not <IPv4>]|
ipv6 [<IPv6>|not <IPv6>]|state [pending|success|not [pending|success]|vlan [<VLAN-ID>|
not <VLAN-ID>]|wlan [<WLAN-NAME>|not <WLAN-NAME>]])}
```

captive-portal sessions	Displays active captive portal client session details
include-ipv6	Optional. Includes IPv6 address (if known) of captive portal clients. By default the system only displays IPv4 addresses. The include-ipv6 parameter includes IPv6 address (if known) of each client.
statistics	Optional. Displays statistical information regarding client sessions
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays active captive portal session details on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.
filter	This parameter is recursive and can be used with any of the above parameters to define additional filters. Optional. Defines additional filters. Use one of the following options: **captive-portal**, **ip**, **ipv6**, **state**, **vlan**, or **wlan**.
captive-portal [<CAPTIVE-PORTAL>| not <CAPTIVE-PORTAL>]	Optional. Displays captive portal client and client session information, based on the captive portal name passed • <CAPTIVE-PORTAL> – Specify the captive portal name. Displays client details for the specified captive portal. • not <CAPTIVE-PORTAL> – Inverts the match selection. Displays client details for all captive portals other than the specified captive portal.
ip [<IPv4>|not <IPv4>]	Optional. Displays captive portal client/client sessions information, based on the IPv4 address passed • <IPv4> – Specify the client's IPv4 address. Displays information of the client identified by the <IPv4> parameter. • not <IPv4> – Inverts the match selection. Displays client details for all clients other than the one identified by the <IPv4> parameter.

ipv6 [<IPv6>|not <IPv6>]	This filter option is available only for the 'include-ipv6' keyword. Optional. Displays captive portal client/client sessions information, based on the IPv6 address passed • <IPv6> – Specify the client's IPv6 address. Displays information of the client identified by the <IPv6> parameter • not <IPv6> – Inverts the match selection. Displays client details for all clients other than the one identified by the <IPv6> parameter.

state [pending| success| not [pending|success]]	Optional. Filters clients/client sessions based on the client's authentication state
	• pending – Displays information of clients redirected for authentication
	• success – Displays information of successfully authenticated clients
	• not [pending|success] – Inverts match selection
	  • pending – Displays information of successfully authenticated clients (opposite of pending authentication)
	  • success – Displays information of clients redirected for authentication (opposite of successful authentication)

vlan [<VLAN-ID>| not <VLAN-ID>]	Optional. Displays captive portal client/client sessions information based on the VLAN ID passed • <VLAN-ID> – Specify the VLAN ID. Displays client details for the specified VLAN. • not <VLAN-ID> – Inverts match selection. Displays client details for all VLANs other than the one identified by the <VLAN-ID> parameter.
wlan [<WLAN-NAME>| not <WLAN-NAME>]	Optional. Displays captive portal client/client sessions information based on the WLAN name passed • <WLAN-NAME> – Specify the WLAN name. Displays client details for the specified WLAN. • not <WLAN-NAME> – Inverts match selection. Displays client details for all WLANs other than the one identified by the <WLAN-NAME> parameter.

Examples

```
rfs4000-229D58#show captive-portal sessions

captive-portal-page-upload (show commands)

Displays captive portal page information, such as upload history, upload status, and page file download status

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show captive-portal-page-upload [history|list-files|load-image-status|status]
show captive-portal-page-upload load-image-status
show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}
show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]}
show captive-portal-page-upload list-files <CAPTIVE-PORTAL-NAME>
```

Parameters

```
show captive-portal-page-upload load-image-status
```

load-image-status	Displays captive portal advanced page file upload status on the logged device

```
show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}
```

history {on <RF-DOMAIN-NAME>}	Displays captive portal page upload history • on <RF-DOMAIN-NAME> – Optional. Displays captive portal page upload history within a specified RF Domain. Specify the RF Domain name.

```
show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]}
```

status {on [<RF-DOMAIN-NAME>| <RF-DOMAIN-MANAGER>]}	Displays captive portal page upload status • on <RF-DOMAIN-NAME> – Optional. Displays captive portal page upload status within a specified RF Domain. Specify the RF Domain name. • on <RF-DOMAIN-MANAGER> – Optional. Displays captive portal page upload status for a specified RF Domain Manager. Specify the RF Domain Manager name.

```
show captive-portal-page-upload list-files <CAPTIVE-PORTAL-NAME>
```

list-files <CAPTIVE-PORTAL-NAME>	Displays a list of all captive portal Web page files, of a specified captive portal, uploaded (internal and advanced page files) • <CAPTIVE-PORTAL-NAME> – Specify the captive portal name.

Examples

```

cdp

Displays the CDP neighbor table

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show cdp [neighbors|report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

Parameters

```
show cdp [neighbors|report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

cdp [neighbors|report]	Displays CDP neighbors table or aggregated CDP neighbors table
detail {on <DEVICE-NAME>}	Optional. Displays detailed CDP neighbors table or aggregated CDP neighbors table • on <DEVICE-NAME> – Optional. Displays table details on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
on <DEVICE-NAME>	Optional. Displays table details on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

The following example shows detailed CDP neighbors table:

```
nx9500-6C8809#show cdp neighbors detail
-------------------------
Device ID: ap8163-74B45C
Entry address(es):
  IP Address: 192.168.13.26

-------------------------------------------------------------------------------
nx9500-6C8809#
```

classify-url

Displays a specified URL's category. Use this command to query the category of a specific URL. The query is sent to a configured classification server. This option is available only if a valid URL filter license is available.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]
```

Parameters

```
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]
```

classify-url	Queries the category of a specified URL
<URL-TO-QUERY>	Specify the URL to query. The query is sent to the configured classification server.
datacenter <URL-TO-QUERY>	The query is sent to a global classification datacenter • <URL-TO-QUERY> – Specify the URL to query.

Examples

```
nx9500-6C8809#show classify-url www.google.com
  Categories: search-engines-portals,
  Custom Categories:
nx9500-6C8809#

```

clock

Displays system clock on the logged device or on a specified device

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show clock {on <DEVICE-NAME>}
```

Parameters

```
show clock {on <DEVICE-NAME>}
```

clock	Displays a system's clock
on <DEVICE-NAME>	Optional. Displays system clock on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

```
ap8432-070235>show clock
2018-01-09 02:34:22 UTC
ap8432-070235>
```

cluster

Displays cluster information (cluster configuration parameters, members, status, etc.)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show cluster [configuration|history|members|status]
show cluster [configuration|history {on <DEVICE-NAME>}|members {detail}|status]
```

Parameters

```
show cluster [configuration|history {on <DEVICE-NAME>}|members {detail}|status]
```

cluster	Displays cluster information
configuration	Displays cluster configuration details
history on <DEVICE-NAME>	Displays cluster history status • <DEVICE-NAME> – Optional. Specify the controller or access point name. If the device name is not specified, the system displays all cluster history.
members {detail}	Displays cluster members configured on the logged device • detail – Optional. Displays detailed information of known cluster members
status	Displays cluster status

Examples

```
nx9500-6C8809(config)#show cluster configuration
Cluster Configuration Information
 Name                          : SiteConRFS6k
 Configured Mode               : Active
 Master Priority               : 128
 Force configured state        : Disabled
 Force configured state delay : 5 minutes
 Handle STP                    : Disabled
 Radius Counter DB Sync Time   : 5 minutes

```

cmp-factory-certs

Displays factory installed CMP certificates

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show cmp-factory-certs {all}
```

Parameters

```
show cmp-factory-certs {all}
```

cmp-factory-certs {all}	Displays factory installed CMP certificates on the logged device. Optionally use the 'all' keyword to view certificate details.

Examples

```
nx9500-6C8809>show cmp-factory-certs
No CMP factory certificate exist
nx9500-6C8809>
```

commands

Displays commands available for the current mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show commands
```

Parameters

```
None
```

Examples

```
v(config)#show commands
  help
  help search WORD (|detailed|only-show|skip-show|skip-no)
  show commands
  show adoption log adoptee(|on DEVICE-NAME)
  show adoption log adopter (|mac AA-BB-CC-DD-EE-FF)(|on DEVICE-NAME)

context

Displays the current context details

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show context {include-factory|session-config {include-factory}}
```

Parameters

```
show context {include-factory|session-config {include-factory}}
```

include-factory	Optional. Includes factory defaults
session-config include-factory	Optional. Displays running system information in the current context • include-factory – Optional. Includes factory defaults

Examples

```
nx9500-6C8809>show context

critical-resources

Displays critical resource information. Critical resources are resources vital to the network.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show critical-resources {on <DEVICE-NAME>}
```

Parameters

```
show critical-resources {on <DEVICE-NAME>}
```

critical-resources	Displays critical resources information
on <DEVICE-NAME>	Optional. Displays critical resource information on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
rfs4000-229D58(config)#show critical-resources
-------------------------------------------------------------------------
CRITICAL RESOURCE IP        VLAN          PING-MODE            STATE
-------------------------------------------------------------------------
172.168.1.103                1             arp-icmp             up
-------------------------------------------------------------------------
rfs4000-229D58(config)#
```

crypto

Displays encryption mode information

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show crypto [cmp|ike|ipsec|key|pki]
show crypto cmp request status
show crypto ike sa {detail|on|peer|version}
show crypto ike sa {detail|peer <IP>} {on <DEVICE-NAME>}
show crypto ike sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}
show crypto ipsec sa {detail|on|peer}
show crypto ipsec sa {detail} {on <DEVICE-NAME>}
show crypto ipsec sa {peer <IP>} {detail} {(on <DEVICE-NAME>)}
show crypto key rsa {on|public-key-detail}
show crypto key rsa {public-key-detail} {(on <DEVICE-NAME>)}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all|on}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {(on <DEVICE-NAME>)}
```

Parameters

```
show crypto cmp request status
```

crypto cmp request status	Displays current status of in-progress *certificate management protocol* (CMP) requests For more information, see Crypto-CMP Policy on page 1846.

```
show crypto ike sa {detail|peer <IP>} {on <DEVICE-NAME>}
```

crypto ike sa	Displays *Internet Key Exchange* (IKE) SA *(security association)* statistics
detail	Displays detailed IKE SA statistics

peer <IP>	Optional. Displays IKE SA statistics for a specified peer • <IP> – Specify the peer's IP address in the A.B.C.D format
on <DEVICE-NAME>	Optional. Displays IKE SA statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show crypto ike sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}
```

crypto ike sa	Displays IKE SA details
version [1|2]	Optional. Displays IKE SA version statistics • 1 – Displays IKEv1 statistics • 2 – Displays IKEv2 statistics
peer <IP>	Optional. Displays IKE SA version statistics for a specified peer • <IP> – Specify the peer's IP address in the A.B.C.D format
on <DEVICE-NAME>	The following keyword is recursive and common to the 'peer ip' parameter: • on <DEVICE-NAME> – Optional. Displays IKE SA statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show crypto ipsec sa {detail} {on <DEVICE-NAME>}
```

crypto ipsec sa	Displays *Internet Protocol Security* (IPSec) SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session
detail	Optional. Displays detailed IPSec SA statistics
on <DEVICE-NAME>	Optional. Displays IPSec SAs on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show crypto ipsec sa {peer <IP>} {detail} {(on <DEVICE-NAME>)}
```

crypto ipsec sa	Displays IPSec SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session
peer <IP> detail	Optional. Displays IPSec SA statistics for a specified peer • <IP> – Specify the peer's IP address in the A.B.C.D format. • detail – Displays detailed IPSec SA statistics for the specified peer
on <DEVICE-NAME>	The following keyword is recursive: • on <DEVICE-NAME> – Optional. Displays IPSec SAs on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show crypto key rsa {public-key-detail} {(on <DEVICE-NAME>)}
```

crypto key rsa	Displays RSA public keys
public-key-detail	Optional. Displays public key in the *Privacy-Enhanced Mail* (PEM) format
on <DEVICE-NAME>	The following keyword is recursive: • on <DEVICE-NAME> – Optional. Displays public key on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {(on <DEVICE-NAME>)}
```

crypto pki	Displays PKI related information
trustpoints	Displays WLAN trustpoints This command displays all trustpoints including CMP-generated trustpoints.
<TRUSTPOINT-NAME>	Optional. Displays a specified trustpoint details. Specify the trustpoint name.
all	Optional. Displays details of all trustpoints
on <DEVICE-NAME>	The following keyword is recursive and common to the 'trustpoint-name' and 'all' parameters: • on <DEVICE-NAME> – Optional. Displays trustpoints configured on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809(config)#show crypto key rsa public-key-detail

database

Displays database-related statistics and status

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
show database [backup-status|keyfile|restore-status|statistics|status|users]
{on <DEVICE-NAME>}
```

Parameters

```
show database [backup-status|keyfile|restore-status|statistics|status|users]
{on <DEVICE-NAME>}
```

database	Displays all configured database-related statistics and status
backup-status	Displays the last database backup status
keyfile	Displays the keyfiles generated on the database host to enable authenticated database access
back-restore	Displays the last database restore status
statistics	Displays database-related statistics, such as name of the database (NSight or captive portal), data size, storage size, free disk space available, etc.
status	Displays database status, such as online time.
users	Displays database users created. These are the users that can access the databases.
on <DEVICE-NAME>	Optional. Displays database-related information on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
vx9000-D031F2(config)#show database backup-status detail

device-upgrade

Displays firmware upgradation information for devices adopted by a wireless controller or access point

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show device-upgrade [history|load-image-status|status|versions]
show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|
versions {on <DEVICE-OR-DOMAIN-NAME>}
show device-upgrade status {on [<DOMAIN-NAME>|rf-domain-manager]|
summary {on <DOMAIN-NAME>}}
```

Parameters

```
show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|
versions {on <DEVICE-OR-DOMAIN-NAME>}]
```

device-upgrade	Displays firmware upgrade information based on the parameters passed
history {on <DOMAIN-NAME>}	Displays firmware upgrade history • on <DOMAIN-NAME> – Optional. Displays upgrade history for all devices within a specified RF Domain. Specify the RF Domain name.

load-image-status	Displays firmware image loading status. The output displays the <DEVICE> image loading status in percentage.
	For example,
	`#show device-upgrade load-image-status`
	`Download of ap81xx firmware file is 47 percent complete`

versions {on <DEVICE-OR-DOMAIN-NAME>}	Displays firmware image versions • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays firmware image versions loaded on specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the AP, wireless controller, service platform, or RF Domain name.

```
show device-upgrade status {on [<DOMAIN-NAME>|rf-domain-manager]|
summary {on <DOMAIN-NAME>}]}
```

device-upgrade	Displays firmware upgrade information based on the parameters passed
status	Displays in-progress device upgrade status
on [<DOMAIN-NAME>| rf-domain-manager]	Optional. Displays in progress upgrade status of all devices within a specified RF Domain, or all devices upgraded by the RF Domain manager. Use this option to view upgrade status of multiple devices. • <DOMAIN-NAME> – Specify the RF Domain name. • rf-domain-manager – Select to view devices upgraded by the RF Domain manager.
summary {on <DOMAIN-NAME>}	Displays a summary of in-progress upgrade processes • on <DOMAIN-NAME> – Optional. Displays in-progress upgrade processes within a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

Examples

```

dot1x

Displays dot1x information on interfaces. Dot1x (or 802.1x) is an IEEE standard for network authentication. Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

However, dot1x-enabled devices can be configured either as:

- supplicants only – Devices seeking network access
- authenticators only – Devices authenticating the supplicants, or

- supplicants as well authenticators

Note

Dot.1x supplicant configuration is supported on the following platforms:

- Access Points – AP 6522, AP 6562, AP 7161, AP 7502, AP-7522, AP 7532, AP 7562, AP-8163, AP-8432, AP-8533
- Wireless Controllers – RFS 4000
- Service Platforms – NX 5500, NX 75XX

Note

Dot.1x authenticator configuration is supported on the following platforms:

- Access Points – AP 6522, AP 7161, AP 7161, AP 7502, AP-8163
- Wireless Controllers – RFS 4000
- Service Platforms – NX 5500, NX 75XX

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show dot1x {all|interface|on}
show dot1x {all {on <DEVICE-NAME>}|on <DEVICE-NAME>}
show dot1x {interface [<INTERFACE-NAME>|ge <1-4>|port-channel <1-2>} {on <DEVICE-NAME>}
```

Parameters

```
show dot1x {all {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

dot1x all {on <DEVICE-NAME>}	Optional. Displays dot1x information for all interfaces • on <DEVICE-NAME> – Optional. Displays dot1x information for all interfaces on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
dot1x {on <DEVICE-NAME>}	Optional. Displays dot1x information for interfaces on a specified device • <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

```
show dot1x {interface [<INTERFACE-NAME>|ge <1-4>|port-channel <1-2>]} {on <DEVICE-NAME>}
```

dot1x interface	Optional. Displays dot1x information for a specified interface or interface type
<INTERFACE-NAME>	Displays dot1x information for the layer 2 (Ethernet port) interface specified by the <INTERFACE-NAME> parameter
ge <1-4>	Displays dot1x for a specified GigabitEthernet interface • <1-4> – Select the interface index from 1 - 4.

port-channel <1-2>	Displays dot1x for a specified port channel interface • <1-2> – Select the interface index from 1 - 2.
on <DEVICE-NAME>	The following keywords are common to all of the above parameters: • on <DEVICE-NAME> – Optional. Displays dot1x interface information on a specified device • <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

Examples

```
ap8432-070235>show dot1x all

  Guest Vlan    : None

ap8432-070235>
```

dpi

Displays *Deep Packet Inspection* (DPI) statistics for all configured and canned applications. DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When DPI is enabled, packets of all flows are subjected to DPI to get accurate results. DPI identifies applications (such as, Netflix, Twitter, Facebook, etc.) and also extracts metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

Note

The `show > dpi` command returns results only if executed on a device that supports DPI and has DPI logging enabled. DPI logging can be enabled either on the device or on the profile applied to the device. For more information, see dpi on page 983 (profile config mode).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show dpi [app|per-purview-category|purview-app-category|purview-application|
purview-application-policy]
show dpi app [stats|wireless-clients|wlan]
show dpi app stats [<APPLICATION-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}
show dpi app wireless-clients stats <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
show dpi app wlan stats [<WLAN-NAME>|all] on <RF-DOMAIN-NAME>
show dpi per-purview-category stats <PURVIEW-APP-CATEGORY-NAME>
[bytes-in|bytes-out|total-bytes] {on <DEVICE-OR-DOMAIN-NAME>}
show dpi purview-application brief
show dpi purview-application-policy stats <PURVIEW-APP-POLICY-NAME>
{on <DEVICE-NAME>}
```

Parameters

```
show dpi app wireless-clients stats <MAC> {<DEVICE-OR-DOMAIN-NAME>}
```

dpi app wireless-clients <MAC>	Displays application-usage statistics for all wireless clients or a specified wireless client • <MAC> – Displays application usage stats for a specified wireless client. To view applications used by a specific wireless client, specify the client's MAC address. **Note:** If no MAC address is specified, application usage stats is displayed for all wireless clients within the network (i.e., all RF Domains)
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays application-usage stats for wireless clients associated with a specified device or within a specified RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the access point, wireless controller, service platform, or RF Domain. **Note:** If you specify an access point name, the application usage stats for wireless clients associated with the specified AP is displayed. In case of an RF Domain, application usage stats for all wireless clients associated with APs within the specified RF Domain is displayed.

```
show dpi app stats [<APPLICATION-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}
```

dpi app stats	Displays statistics for an application or application category • app – Displays statistics for a specified application or all applications Note: The applications are the RF Domain member allowed applications whose data (bytes) are passing through the WiNG 7.X.X managed network.
[<APPLICATION-NAME>|all]	This parameter is common to the 'app' and 'app-category' keywords. • <APPLICATION-NAME> – Displays statistics for a specified application • all – Displays statistics for all applications
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays statistical data on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the access point, wireless controller, service platform, or RF Domain.

```
show dpi app wlan stats [<WLAN-NAME>|all] on <RF-DOMAIN-NAME>
```

dpi app wlan stats [<WLAN-NAME>|all]	Displays application-usage statistics for all wireless clients associating with a specified network or all networks • <WLAN-NAME> – Displays application usage stats for a specified wireless network. • all - Displays application usage stats for all wireless networks configured within the system.
on <RF-DOMAIN-NAME>	Optional. Displays application-usage stats for wireless clients within a specified RF Domain • <RF-DOMAIN-NAME> – Specify the name of the RF Domain.

```
show dpi purview-application-policy stats <PURVIEW-APP-POLICY-NAME>
{on <DEVICE-NAME>}
```

dpi purview-application-policy stats	Displays statistics for an existing Purview application policy
<PURVIEW-APP-POLICY-NAME>	Displays statistics for a specified Purview application-policy. Specify the policy name.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays Purview application-policy related statistical data on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the access point, wireless controller, service platform, or RF Domain.

```
show dpi purview-application brief
```

dpi purview-application brief	Displays a brief summary of purview-applications their status and configuration

```
show dpi per-purview-category stats <PURVIEW-APP-CATEGORY-NAME>
[bytes-in|bytes-out|total-bytes] {on <DEVICE-OR-DOMAIN-NAME>}
```

dpi per-purview-category stats	Displays statistics for the top ten applications based on the application category and the Sort ID specified. The Sort ID options are: bytes-in, bytes-out or total-bytes.
<PURVIEW-APP-CATEGORY-NAME>	Specify the Purview application category name. The system displays statistics for the top ten applications in this category.

[bytes-in|bytes-out| total-bytes]	Filters and displays statistical data for the top ten utilized applications in respect to the following: • bytes-in – Displays total data bytes uploaded through the controller managed network. If this application data is not aligned with application utilization expectations, consider allowing or denying additional applications and categories or adjusting their precedence (priority). • bytes-out – Displays total data bytes downloaded through the controller managed network. If this application data is not aligned with application utilization expectations, consider allowing or denying additional applications and categories or adjusting their precedence (priority). • total-bytes – Displays total data bytes (uploaded and downloaded) through the controller managed network. These are only the administrator allowed applications approved for proliferation within the managed network.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays statistical data on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the access point, wireless controller, service platform, or RF Domain.

environmental-sensor

Displays environmental sensor's recorded data. The environmental sensor has to be enabled and configured in order to collect data related to humidity, light, motion, and temperature.

Note

The environmental senor is supported only on an AP 8132. When executed on any controller (other than an AP 8132), the `show > environmental-sensor > <parameters>` command displays environmental-sensor details for adopted AP 8132s (if any).

Supported in the following platforms:

- AP 8132

Syntax

```
show environmental-sensor [history|humidity|light|motion|summary|temperature|
version]
show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}
show environmental-sensor [humidity|light|motion|summary|temperature|version]
```

Parameters

```
show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}
```

environmental-sensor history	Displays environmental sensor history once in every hour, 20 minutes, or 24 hours History includes the humidity, light, motion, and temperature data recorded by the sensor at specified time interval.
1 hour	Optional. Displays environmental sensor history once in every 1 (one) hour
20-minute	Optional. Displays environmental sensor history once in every 20 minutes
24-hour	Optional. Displays environmental sensor history once in every 24 hours

```
show environmental-sensor [humidity|light|motion|summary|temperature|version]
```

environmental-sensor	Displays environmental sensor's recorded data, based on the parameters passed. The system displays the specified recorded data. The environmental sensor records data at the following intervals: 20 minutes, 1 hour, and 24 hours
humidity	Displays the minimum, average, and maximum humidity recorded
light	Displays the minimum, average, and maximum light recorded
motion	Displays the minimum, average, and maximum motion recorded
temperature	Displays the minimum, average, and maximum temperature recorded
version	Displays the hardware and firmware versions
summary	Displays a summary of the data recorded at following intervals:

Examples

<DEVICE-NAME>#
```

event-history

Displays event history report

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show event-history {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
show event-history {on <DEVICE-OR-DOMAIN-NAME>}
```

event-history	Displays event history report
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays event history report on a device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

```
nx9500-6C8809#show event-history

event-system-policy

Displays detailed event system configuration

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>
```

Parameters

```
show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>
```

event-system-policy	Displays event system policy configuration
config	Displays configuration for a specified policy
detail	Displays detailed configuration for a specified policy
<EVENT-SYSTEM- POLICY-NAME>	Specify the event system policy name.

Examples

```
nx9500-6C8809(config)#show event-system-policy config testpolicy
--------------------------------------------------------------------------------
MODULE          EVENT            SYSLOG    SNMP   FORWARD        EMAIL

--------------------------------------------------------------------------------
nx9500-6C8809(config)#
```

ex3500

Displays EX3500-related statistical data

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX

Syntax

```
show ex3500 [dir|interfaces|system|upgrade|version|whichboot]
show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>}
{on <EX3500-DEVICE-NAME>}
show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|
ext-if-table stats|if-table stats|portUtil stats|rmon stats]
{on <EX3500-DEVICE-NAME>}
show ex3500 [system|upgrade|version|whichboot]
{on <EX3500-DEVICE-NAME>}
```

Parameters

```
show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>}
{on <EX3500-DEVICE-NAME>}
```

ex3500 dir	Displays EX3500 directory information based on the option selected. The options are: boot-rom, config, opcode **Note:** If none of the specified options is selected, all EX3500 system-related information is displayed.
boot-rom	Optional. Displays only the Boot-ROM information
config	Optional. Displays only the configuration file
opcode	Optional. Displays only the run-time operation code
<FILE-NAME>	Displays the contents of a specified file identified by the <FILE-NAME> keyword. This is the name of configuration file or code image.
on <EX3500-DEVICE-NAME>	Optional. Executes the command on a specified EX3500 device • <DEVICE-NAME> – Specify the device's name.

```
show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|
ext-if-table stats|if-table stats|portUtil stats|rmon stats]
{on <EX3500-DEVICE-NAME>}
```

ex3500 interfaces counters	Displays EX3500 interface counters based on the option selected. The options are: **ether-like**, **ethernet**, **ext-if-table**, **if-table**, **portUtil**, **rmon**
ether-like stats	Displays *Managed Information Base* (MIB) object statistics for Ethernet-like interfaces
ethernet <1-1> <1-52>	Displays the Ethernet port statistics based on the unit identifier and port number selected • <1-1> – Specify the EX3500 unit's identifier from 1 - 1. • <1-52> – Specify the port number from 1 - 52. This range varies for the EX3524 (1-28) and EX3548 (1-52) devices. Note: This option displays the following for the selected Ethernet interface: extended interface table stats, interface table stats, port utilization information, and remote monitoring stats.
ext-if-table stats	Displays only the extended interface table statistics
if-table stats	Displays only the interface table statistics
portUtil stats	Displays only the port utilization information
rmon stats	Displays only *remote monitoring* (RMon) statistics
on <EX3500-DEVICE-NAME>	Optional. Executes the command on a specified EX3500 device • <DEVICE-NAME> – Specify the device's name.

```
show ex3500 [system|upgrade|version|whichboot] {on <EX3500-DEVICE-NAME>}
```

ex3500	Displays the following information for a specified EX3500 device or all EX3500 devices in the managed network
system	Displays EX3500 system information, such as device description, OID string, up time, name, location, contact, MAC address, etc. Some of these information (example, system name) are configurable items, and if not configured are left blank.
upgrade	Displays the opcode upgrade configuration settings
version	Displays hardware and software version information for a EX3500 system
whichboot	Displays boot information
on <EX3500-DEVICE-NAME>	Optional. Executes the command on a specified EX3500 device • <DEVICE-NAME> – Specify the device's name.

Examples

```
nx9500-6C8809#show ex3500 interfaces counters ethernet 1 17
Ethernet 1/ 17

```

extdev

Displays external device (T5 or EX3500) configuration error history

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 95XX, NX 96XX

Syntax

```
show extdev error history {on <T5/EX3500-DEVICE-NAME>}
```

Parameters

```
show extdev error history {on <T5/EX3500-DEVICE-NAME>}
```

extdev error history	Displays external device error history. This command is applicable only to the external devices T5, and EX3500 series switches. Use this command to view configuration error history for all or a specified external device adopted and managed by a WiNG NX series service platform.
on <T5/EX3500-DEVICE-NAME>	Optional. Displays configuration error history on a specified T5 or EX3500 device • <T5/EX3500-DEVICE-NAME> – Specify the name of the device.

Examples

```
nx9500-6C8809#show extdev error history on t5-ED5EAC
%% No History for this device
nx9500-6C8809#
```

fabric-attach

Displays the current status of FA *(Fabric Attach)* VLAN to I-SID *(Individual Service Identifier)* assignments for all ports.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show fabric-attach assignments {on <DEVICE-NAME>}
```

Parameters

```
show fabric-attach assignments {on <DEVICE-NAME>}
```

fabric-attach	Displays the status of VLAN to I-SID mappings, if configured, on the Ethernet ports of an FA Client. The status displays as: • active – If the VLAN to I-SID mapping is accepted by the FA Server and applied to the VLAN traffic from the client. • pending – If the VLAN to I-SID mapping acceptance is not achieved (i.e, pending acceptance)
on <DEVICE-NAME>	Optional. Displays VLAN to I-SID mappings on a specified FA client. If executing this command on a controller, you may, optionally, specify the device for which the FA VLAN to I-SID assignments is to be displayed. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Example

The Following example shows the fabric-attach VLAN to ISID assignment configured on the ap510-13403B access point:

```
nx9600-7F3B2C#
ap510 94-9B-2C-13-40-38
 use profile default-ap510
 use rf-domain default
 hostname ap510-13403B
 interface ge1
  switchport mode trunk
  switchport trunk fabric-attach vlan 110 isid 10180110
  switchport trunk native vlan 110
  switchport trunk native tagged
  switchport trunk allowed vlan 110
 interface vlan110
  ip address dhcp
  ip dhcp client request options all
nx9600-7F3B2C#
```

The following example shows the fabric-attach assignment status for the ap7532-000100 access point:

```
nx9600-7F3B2C#show fabric-attach assignments on ap505-13403B

 Assignment status for port : ge1
 VLAN    ISID       STATUS
 ----    ----       ------
 110     10180110   Accepted

nx9600-7F3B2C#
```

file

Displays file system information

Note
This command is not available in the USER EXEC mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show file [information <FILE>|systems]
```

Parameters

```
show file [information <FILE>|systems]
```

information <FILE>	Displays file information • <FILE> – Specify the file name.
systems	Lists all file systems present in the system

Examples

```
ap8432-070235#show file systems
File Systems:

      Size(Mb)      Free(Mb)  Use%    Type  Prefix
            64            62     3   flash  nvram:
            84            81     2   flash  flash:
           137            82    40       -  vmsdb:
ap8432-070235#
```

```
nx9500-6C8809#show file information startup-config
nvram:startup-config:
  type is configuration file
nx9500-6C8809#
```

file-sync

Displays file synchronization settings and status on a controller. The `file-sync` command syncs wireless-bridge certificate and trustpoint between the staging-controller and its adopted access points. The `show > file-sync` command displays information related to this process.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show file-sync [configuration|history|load-file-status|status]
{on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
show file-sync [configuration|history|load-file-status|status]
{on <DEVICE-OR-DOMAIN-NAME>}
```

file-sync	Displays the following file-synchronization (trustpoint and wireless-bridge certificate) related information: configuration, history, load-file-status, and status
configuration	Displays the following file-synchronization configuration details: • automatic file-syncing enabled or disabled. The default setting is disabled. The X.509 certificate needs synchronization only if the access point's radio2 is configured to use EAP-TLS authentication. In which case PKCS#12 certificate needs to be pushed on AP adoption. To enable automatic file syncing, in the controller's device/profile configuration mode, execute the `file-sync > auto` command. For more information, see file-sync on page 995 (profile config mode). • Number of access points to which the certificate can be simultaneously uploaded. The default is 10. To modify the number of simultaneous uploads, in the controller's device/profile configuration mode, execute the `file-sync > count <1-20>` command. For more information, see file-sync on page 995 (profile config mode). • Scheduled certificate upload, if any, details, such time and date of upload. To schedule certificate upload, use the `file-sync > wireless-certificate` command. For more information, see file-sync on page 995 (profile config mode).
history	Displays file synchronization history. Use this option to view statistical data relating to wireless-bridge certificate synchronization between staging controller and its access points. When executed, a list of all certificate transfers made to the APs is displayed, with the latest transfer listed at the top.
load-file-status	Displays the status of the file upload to the controller. Use this command to view the status of a in-progress certificate upload. For more information on initiating a PKCS#12 certificate upload, see file-sync on page 995 (profile config mode).
status	Displays status of the file synchronization between the controller and its adopted access point.
on <DEVICE-OR-DOMAIN- NAME>	Optional. Displays file synchronization settings and status on a specified device or RF Domain • <DEVICE-OR-DOMAIN- NAME> – Specify the name of the controller, service platform, or RF Domain.

Examples

```
nx9500-6C8809#show file-sync configuration
File Sync Configuration Information
  Auto                          : Disabled
  Simultaneous Upload Count     : 128
```

```

firewall

Displays wireless firewall information, such as *Dynamic Host Configuration Protocol* (DHCP) snoop table entries, denial of service statistics, active session summaries, etc.

Note
This command is not available in the USER EXEC mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show firewall [dhcp|flows|neighbors]
show firewall dhcp snoop-table {on <DEVICE-NAME>}
show firewall flows {filter|management|on|stats|wireless-client}
show firewall flows {filter} {(dir|dst port <1-65535>|ether|flow-type|icmp|
icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)}
show firewall flows {management {on <DEVICE-NAME>}|stats {on <DEVICE-NAME>}|
wireless-client <MAC>|on <DEVICE-NAME>}
show firewall neighbors snoop-table {on <DEVICE-NAME>}
```

Parameters

```
show firewall dhcp snoop-table {on <DEVICE-NAME>}
```

firewall dhcp snoop-table {on <DEVICE-NAME>}	Displays DHCP snoop table entries • snoop-table – Displays DHCP snoop table entries DHCP snooping acts as a firewall between non-trusted hosts and the DHCP server. Snoop table entries contain MAC address, IP address, lease time, binding type, and interface information of non-trusted interfaces.
on <DEVICE-NAME>	The following keyword is common to the 'DHCP snoop table' and 'DoS stats' parameters: • on <DEVICE-NAME> – Optional. Displays snoop table entries, or DoS stats on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show firewall flows {filter} {(dir|dst|ether|flow-type|icmp|icmpv6|igmp|ip|
ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)}
```

firewall flows	Notifies a session has been established
filter	Optional. Defines additional firewall flow filter parameters
dir [wired-wired| wired-wireless| wireless-wired| wireless-wireless]	Optional. Matches the packet flow direction • wired-wired – Wired to wired flows • wired-wireless – Wired to wireless flows • wireless-wired – Wireless to wired flows • wireless-wireless – Wireless to wireless flows
dst port <1-65535>	Optional. Matches the destination port with the specified port • port <1-65535> – Specifies the destination port number from 1 - 65535
ether [dst <MAC>| host <MAC>| src <MAC>| vlan <1-4094>]	Optional. Displays Ethernet filter options • dst <MAC> – Matches only the destination MAC address • host <MAC> – Matches flows containing the specified MAC address • src <MAC> – Matches only the source MAC address • vlan <1-4094> – Matches the VLAN number of the traffic with the specified value. Specify a value from 1- 4094.
flow-type [bridged|natted|routed| wired|wireless]	Optional. Matches the traffic flow type • bridged – Bridged flows • natted – Natted flows • routed – Routed flows • wired – Flows belonging to wired hosts • wireless – Flows containing a mobile unit
icmp {code|type}	Optional. Matches flows with the specified *Internet Control Message Protocol* (ICMP) version 4 code and type • code – Matches flows with the specified ICMPv4 code • type – Matches flows with the specified ICMPv4 type
icmpv6 {code|type}	Optional. Matches flows with the specified ICMP version 6 code and type • code – Optional. Matches flows with the specified ICMPv6 code • type – Optional. Matches flows with the specified ICMPv6 type
igmp	Optional. Matches *Internet Group Management Protocol* (IGMP) flows

ip [dst <IP>| host <IP>| proto <0-254>| src <IP>]	Optional. Filters firewall flows based on the IPv4 parameters passed • dst <IP> – Matches destination IP address • host <IP> – Matches flows containing IPv4 address • proto <0-254> – Matches the IPv4 protocol number with the specified number • src <IPv4> – Matches source IP address
ipv6 [dst <IPv6>| host <IPv6>| proto <0-254>| src <IPv6>]	Optional. Filters firewall flows based on the IPv6 parameters passed • dst <IPv6> – Matches destination IPv6 address • host <IPv6> – Matches flows containing IPv6 address • proto <0-254> – Matches the IPv6 protocol number with the specified number • src <IPv6> – Matches source IPv6 address
max-idle <1-4294967295>	Optional. Filters firewall flows idle for at least the specified duration. Specify a max-idle value from 1 - 4294967295 bytes.
min-bytes <1-4294967295>	Optional. Filters firewall flows with at least the specified number of bytes. Specify a min-bytes value from 1 - 4294967295 bytes.
min-idle <1-4294967295>	Optional. Filters firewall flows idle for at least the specified duration. Specify a min-idle value from 1 - 4294967295 bytes.
min-pkts <1-4294967295>	Optional. Filters firewall flows with at least the given number of packets. Specify a min-bytes value from 1 - 4294967295 bytes.
not	Optional. Negates the filter expression selected
port <1-65535>	Optional. Matches either the source or destination port. Specify a port from 1 - 65535.
src <1-65535>	Optional. Matches only the source port with the specified port. Specify a port from 1 - 65535.
tcp	Optional. Matches TCP flows
udp	Optional. Matches UDP flows

```
show firewall flows {management {on <DEVICE-NAME>}|stats {on <DEVICE-NAME>}|
wireless-client <MAC>|on <DEVICE-NAME>}
```

firewall flows	Notifies a session has been established
management {on <DEVICE-NAME>}	Optional. Displays management traffic firewall flows • on <DEVICE-NAME> – Optional. Displays firewall flows on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
stats {on <DEVICE-NAME>}	Optional. Displays active session summary • on <DEVICE-NAME> – Optional. Displays active session summary on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

wireless-client <MAC>	Optional. Displays wireless clients firewall flows • <MAC> – Specify the MAC address of the wireless client.
on <DEVICE-NAME>	Optional. Displays all firewall flows on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show firewall neighbors snoop-table {on <DEVICE-NAME>}
```

firewall neighbors snoop-table	Displays IPv6 neighbors snoop table entries
on <DEVICE-NAME>	Optional. Displays IPv6 neighbors snoop table entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809(config)#show fi
file-sync  firewall   file

global

Displays global information for network devices based on the parameters passed

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show global [device-list|domain]
show global device-list {filter {offline|online|rf-domain}}
show global device-list {filter {offline|online}}
show global device-list {filter rf-domain [<DOMAIN-NAME>|not <DOMAIN-NAME>]}
show global domain managers
```

Parameters

```
show global device-list {filter {offline|online}}
```

global device -list	Displays global information for all network devices. Use the following keywords to specify additional filters: **offline**, **online**, and **rf-domain**.
filter{offline|online}	Optional. Specifies additional filters • offline – Optional. Displays global information for offline devices only • online – Optional. Displays global information for online devices only

```
show global device-list {filter rf-domain [<DOMAIN-NAME>|not <DOMAIN-NAME>]}
```

global device -list	Displays global information for all network devices. Use the following keywords to specify additional filters: **offline**, **online**, and **rf-domain**.

filter rf-domain [<DOMAIN-NAME>| not <DOMAIN-NAME>]	Optional. Specifies additional filters
	• rf-domain – Optional. Displays global information for all devices in a specified RF Domain
	  • <DOMAIN-NAME> – Optional. Displays information for all devices within the domain identified by the <DOMAIN-NAME> keyword
	  • not <DOMAIN-NAME> – Optional. Displays information for all devices in domains not matching the <DOMAIN-NAME> keyword

```
show global domain managers
```

global domain managers	Displays global information for all RF Domains managers in the network.

Examples

```
vnx9500-6C8809(config)#show global device-list filter rf-domain TechPubs

```

gps (show command)

Displays the geographical coordinates (latitude and longitude) of the device for which the GPS coordinates search process has been triggered. The system displays the last recorded GPS coordinates of the device.

This feature is supported only on AP7662, which has a built-in, GPS hardware that starts and stops the GPS coordinates search process. To view the GPS coordinates of an AP7622, initiate GPS coordinates search and then execute the 'show > gps' command.

Note

For more information on starting and stopping the GPS coordinate search process, see #unique_622.

Supported in the following platforms:

- AP 7622

Syntax

```
show gps coordinates {on <DEVICE-NAME>}
```

Parameters

```
show gps coordinates {on <DEVICE-NAME>}
```

show gps coordinates	Displays the GPS coordinates of a device Note: The command displays the last recorded GPS coordinates of the device.
on <DEVICE-NAME>	Optional. Specifies the name of the AP whose GPS coordinates are to be displayed. Use this option if executing the command on the controller or virtual controller to which the AP is adopted. Note: If you do not specify a device name, the system initiates the search on the logged device. And if the logged device is not an AP7662 model access point, an error message returns. If

Examples

```
ap7662-8BDE4D#show gps coordinates
GPS Search is in progress.
Last location recorded at UTC time : Mon Apr 23 22:10:54 2018 :  Latitude : 13.036N
Longitude : 77.3827E
ap7662-8BDE4D#
```

gre

Displays layer 2 *Generic Routing Encapsulation* (GRE) tunnel traffic flow information

GRE is one of the available tunneling mechanisms which uses IP as the transport protocol and can be used for carrying many different passenger protocols. The tunnels behave as virtual point-to-point links that have two endpoints identified by the tunnel source and tunnel destination addresses at each endpoint.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show gre info {detail} {(on <DEVICE-NAME>)}
```

Parameters

```
show gre info {detail} {(on <DEVICE-NAME>)}
```

gre info	Displays GRE tunnel related information and stats.
detail	Optional. Displays GRE tunnel information in detail, such as tunnel state, tunnel's remote-end peer device's IP address, session ID of an operational tunnel, total number of packets received and transmitted through the tunnel, and the number of dropped packets during tunneled exchanges between access point and a peer at the remote end of the tunnel.
on <DEVICE-NAME>	Optional. Executes the command on a specified device • <DEVICE-NAME> – Specify the name of the access point, controller, or service platform.

Examples

```
nx9500-6C8809#show gre info
Gre Tunnel info:
 Tunnel info not found
nx9500-6C8809#
```

guest-registration

Displays information on the performance of clients using guest access permissions to obtain network resources within the WiNG network. The reporting timeline can be adjusted as needed, as can the RF Domain(s) and WLAN(s) used to filter and report guest client statistics.

Supported in the following platforms:

- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
show guest-registration [age-range|backup-snapshots|browsers|client|devices|
gender|loyalty-app-status|notification-status|os|social|user-trends|visitors]
{on <DEVICE-NAME>}

show guest-registration backup-snapshots

show guest-registration [age-range|browsers|devices|gender|os|user-trends|
visitors] time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]
{(rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>)}

show guest-registration client [email|mac|member|mobile|name|time]

show guest-registration client [email <EMAIL-ADDRESS>|mac <MAC>|
member <MEMBER-ID>|mobile <MOBILE-NUMBER>|name <NAME>]

show guest-registration client time [1-Hour|10-Mins|15-Mins|2-Mins|30-Mins|
30-Secs|5-Mins] {(rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>)}

show guest-registration loyalty-app-status time [1-Day|1-Month|1-Week|2-Hours|
30-Mins|5-Hours|all] {rfdomain <RF-DOMAIN-NAME>|wlan <WLAN-NAME>}

show guest-registration notification-status

show guest-registration social time [1-Day|1-Month|1-Week|2-Hours|30-Mins|
5-Hours|all] {(facebook|rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>|google)}
```

Parameters

```
show guest-registration backup-snapshots
```

guest-registration	Displays guest registration statistics based on the parameters passed
backup-snapshots	Displays a list of periodically backed up snapshots of the database. By default, the system maintains a snapshot of the database on a daily basis. Note: Use the `service > guest-registration > backup [delete|restore]` command to delete these snapshots and to restore deleted snapshots. For more information, see service on page 623 (common commands).

```
show guest-registration [age-range|browsers|devices|gender|os|user-trends|visitors]
time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {(rfdomain <DOMAIN-NAME>|
wlan <WLAN-NAME>)}
```

guest-registration	Displays guest registration statistics based on the parameters and time entered. Optionally, use the 'rfdomain' and/or 'wlan' keywords to view guest registration statistics for a specified RF Domain and/or WLAN.
age-range	Displays the age ranges of logged guest users for a selected time period
browser	Displays the browsers used by guest users logged in within a selected time period
devices	Displays the device types used by guest users logged in within a selected time period
gender	Displays the gender of guest users logged in within a selected time period
os	Displays the *operating system* (OS) of devices logged in within a selected time period
user-trends	Displays guest user login trends for a selected time period. It displays statistical data, such as number of new users, number of return users, and total of number users.

visitors	Displays type of visitors logged in within a selected time period
time [1-Day|1-Month| 1-Week|2-Hours| 30-Mins|5-Hours|all]	Displays guest registration statistics, for a specified time period. The stats displayed depends on the option selected in the previous step. Specify the time period using one of the following options: • 1-Day – Displays previous day's statistics • 1-Month – Displays previous month's statistics • 1-Week – Displays previous week's statistics • 2-Hours – Displays last 2 hours statistics • 30-Mins – Displays last 30 minutes statistics • 5-Hours – Displays last 5 hours statistics • all – Displays statistics from the day the database was created

[rfdomain <DOMAIN-NAME| wlan <WLAN-NAME>]	Use the following options as additional filters:
	• rfdomain <DOMAIN-NAME> – Optional. Displays guest registration statistics for a specified RF Domain.
	  • <DOMAIN-NAME> – Specify the RF Domain name.
	• wlan <WLAN-NAME> – Optional. Displays guest registration statistics for a specified WLAN.
	  • <WLAN-NAME> – Specify the WLAN name.

```
show guest-registration client [email <EMAIL-ADDRESS>|mac <MAC>|member <MEMBER-ID>|
mobile <MOBILE-NUMBER>|name <NAME>]
```

guest-registration	Displays guest registration statistics based on the parameters and time entered. Optionally, use the 'rfdomain' and/or 'wlan' keywords to view guest registration statistics for a specified RF Domain and/or WLAN.
client	Displays statistical data for a specific client. Use the e-mail, mac, member, mobile, name to provide a match criteria.
email <EMAIL-ADDRESS>	Displays statistical data for the client with e-mail address matching the <EMAIL-ADDRESS> parameter • <EMAIL-ADDRESS> – Specify the client's e-mail address.
mac <MAC>	Displays statistical data for the client with MAC address matching the <MAC> parameter • <MAC> – Specify the client's MAC address
member <MEMBER-ID>	Displays statistical data for the client with member ID matching the <MEMBER-ID> parameter • <MEMBER-ID> – Specify the client's member ID.
mobile <MOBILE-NUMBER>	Displays statistical data for the client with mobile number matching the <MOBILE-NUMBER> parameter • <MOBILE-NUMBER> – Specify the client's mobile number.
name <NAME>	Displays statistical data for the client with name matching the <NAME> parameter • <MOBILE-NUMBER> – Specify the client's name.

```
show guest-registration client time [1-Hour|10-Mins|15-Mins|2-Mins|30-Mins|30-Secs|5-
Mins]
{(rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>)}
```

guest-registration	Displays guest registration statistics based on the parameters and time entered. Optionally, use the 'rfdomain' and/or 'wlan' keywords to view guest registration statistics for a specified RF Domain and/or WLAN.
client	Displays statistical data for all clients logged in within a specified time period
time [1-Day|1-Month| 1-Week|2-Hours| 30-Mins|5-Hours|all]	Use one of the following options to specify the time period • 1-Day – Displays previous day's statistics • 1-Month – Displays previous month's statistics • 1-Week – Displays previous week's statistics • 2-Hours – Displays last 2 hours statistics • 30-Mins – Displays last 30 minutes statistics • 5-Hours – Displays last 5 hours statistics • all – Displays statistics from the day the database was created

[rfdomain <DOMAIN-NAME| wlan <WLAN-NAME>]	Use the following options as additional filters:
	• rfdomain <DOMAIN-NAME> – Optional. Displays guest registration statistics for a specified RF Domain.
	  • <DOMAIN-NAME> – Specify the RF Domain name.
	• wlan <WLAN-NAME> – Optional. Displays guest registration statistics for a specified WLAN.
	  • <WLAN-NAME> – Specify the WLAN name.

```
show guest-registration loyalty-app-status time [1-Day|1-Month|1-Week|2-Hours|
30-Mins|5-Hours|all] {rfdomain <RF-DOMAIN-NAME>|wlan <WLAN-NAME>}
```

guest-registration	Displays guest registration statistics based on the parameters and time entered
loyalty-app-status	Displays captive portal clients' Loyalty Application analytics, such as the number of guest clients with loyalty application detection enabled, associating with the captive portal's access point during a specified time period. Loyalty application detection occurs on the access point to which the guest client is associated, allowing a retail administrator to assess whether a captive portal client is using specific retail (loyalty) applications in their captive portal. For more information on enabling loyalty application detection on a captive portal, see report-royalty-application on page 245 (captive portal config mode).

time [1-Day|1-Month| 1-Week|2-Hours| 30-Mins|5-Hours|all]	Use one of the following options to specify the time period • 1-Day – Displays previous day's captive portal clients' Loyalty Application analytics • 1-Month – Displays previous month's captive portal clients' Loyalty Application analytics • 1-Week – Displays previous week's captive portal clients' Loyalty Application analytics • 2-Hours – Displays last 2 hours captive portal clients' Loyalty Application analytics • 30-Mins – Displays last 30 minutes captive portal clients' Loyalty Application analytics • 5-Hours – Displays last 5 hours captive portal clients' Loyalty Application analytics • all – Displays the entire Loyalty Application analytics, from the day the database was created

{rfdomain <RF-DOMAIN-NAME>| wlan <WLAN-NAME>}	Optional. Specifies the 'rfdomain' and/or 'wlan' to view guest registration statistics for a specified RF Domain and/or WLAN
	• rfdomain <RF-DOMAIN-NAME> – Displays Loyalty App analytics for a specified RF Domain
	  • <RF-DOMAIN-NAME> – Specify the RF Domain name.
	• wlan <WLAN-NAME> – Displays Loyalty App analytics for a specified WLAN
	  • <WLAN-NAME> – Specify the WLAN name.

```
show guest-registration notification-status
```

guest-registration	Displays guest registration statistics based on the parameters and time entered. Optionally, use the 'rfdomain' and/or 'wlan' keywords to view guest registration statistics for a specified RF Domain and/or WLAN.
notification-status	Displays guest registration notification status

```
show guest-registration social time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]
 {(facebook|rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>|google)}
```

guest-registration social	Displays the social sites used by guests to register. Optionally, use the 'rfdomain' and/or 'wlan' keywords to view social site used by guests of a specified RF Domain and/or WLAN.
time [1-Day|1-Month| 1-Week|2-Hours| 30-Mins|5-Hours|all]	Displays social site statistics for a specified time period. Use one of the following time options: • 1-Day – Displays previous day's statistics • 1-Month – Displays previous month's statistics • 1-Week – Displays previous week's statistics • 2-Hours – Displays last 2 hours statistics • 30-Mins – Displays last 30 minutes statistics • 5-Hours – Displays last 5 hours statistics • all – Displays statistics from the day the database was created
facebook	Displays guest users using Facebook to log in
rfdomain <DOMAIN-NAME>	Displays guest users for a specific RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

wlan <WLAN-NAME>	Displays guest users for a specific WLAN • <WLAN-NAME> – Specify the WLAN name.
google	Displays guest users using Google to log in

interface

Displays configured system interfaces and their status

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show interface {<INTERFACE-NAME>|brief|counters|ge|me1|port-channel|pppoe1|switchport|
vlan|wwan1}
show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|
pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}
```

Parameters

```
show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|
pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}
```

interfaces	Optional. Displays system interface status based on the parameters passed
<INTERFACE-NAME>	Optional. Displays status of the interface specified by the <INTERFACE-NAME> parameter. Specify the interface name.
brief	Optional. Displays a brief summary of the interface status and configuration
counters	Optional. Displays interface Tx or Rx counters
ge <1-4>	Optional. Displays Gigabit Ethernet interface status and configuration • <1-4> – Select the Gigabit Ethernet interface index from 1 - 4.
me1	Optional. Displays Fast Ethernet interface status and configuration
port-channel <1-2>	Optional. Displays port channel interface status and configuration • <1-2> – Specify the port channel index from 1 - 2.
pppoe1	Optional. Displays PPP over Ethernet interface status and configuration
switch port	Optional. Displays layer 2 interface status
vlan <1-4094>	Optional. Displays VLAN interface status and configuration • <1-4094> – Specify the *Switch Virtual Interface* (SVI) VLAN ID from 1 - 4094.
wwan1	Optional. Displays Wireless WAN interface status, configuration, and counters
on <DEVICE-NAME>	The following keywords are common to all of the above interfaces: • on <DEVICE-NAME> – Optional. Displays interface related information on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809(config)#show interface switchport

nx9500-6C8809(config)#
```

The following command shows the state of Energy-efficient Ethernet, where:

- **`Enable`**: Indicates if Energy-Efficient Ethernet is *enabled* or *disabled* on the selected physical port. A value of '1' indicates enabled and '0' indicates disabled.
- **`Active`**: Indictaes if Energy-Efficient Ethernet is *active* or *inactive* on the selected physical port. A value of '1' indicates EEE is active and '0' indicates inactive. Note, will be active only if the devices on both ends of the phhysical link support EEE.

```

ap505-13403B#
```

iot-device-type-imagotag

Displays the configuration of ESL communicator on a specified AP or on all APs within an RF Domain.

Supported in the following platforms:

- Access Points — AP-8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
show iot-device-type-imagotag status {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
show iot-device-type-imagotag status {on <DEVICE-OR-DOMAIN-NAME>}
```

iot-device-type-imagotag status	Displays Imagotags ESL communicator configuration at device or domain level
on <DEVICE-NAME>	Optional. Displays configuration on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP or RF Domain.

Example

```
ap8432-9A5BD8#show iot-device-type-imagotag status

show ip nat translations verbose {on <DEVICE-NAME>}
show ip route {<INTERFACE-NAME>|ge|me1|on|port-channel|pppoe1|vlan|wwan1}
show ip route {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|
pppoe1|wwan1} {(on <DEVICE-NAME>)}
show ip ospf {border-router|interface|neighbor|on|route|state}
show ip ospf {border-router|neighbor|route|on|state} {on <DEVICE-NAME>}
show ip ospf {interface} {vlan|on}
show ip ospf {interface} {vlan <1-4094>} {(on <DEVICE-NAME>)}
```

Note
The `show > ip > ospf` command is also available under the 'profile' and 'device' modes.

Parameters

```
show ip arp {<VLAN-NAME>} {(on <DEVICE-NAME>)}
```

ip arp	Displays *Address Resolution Protocol* (ARP) mappings
<VLAN-NAME>	Optional. Displays ARP mapping on a specified VLAN. Specify the VLAN name.
on <DEVICE-NAME>	The following keyword is recursive and common to the 'vlan-name' parameter: • on <DEVICE-NAME> – Optional. Displays ARP configuration details on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip bgp {<IP>|<IP/M>|community|community-list|filter-list|neighbors|on|
paths|prefix-list|regexp|route-map|state|summary}
```

ip bgp	Displays BGP routing table statistics based on the match criteria specified here. Routes matching the specified criteria are filtered. Use available options to filter the information displayed. This command is applicable to the RFS 4000, NX 95XX, and NX 96XX model devices.
<IP>	Optional. Filters routes matching the specified IP address
<IP/M>	Optional. Filters routes matching the specified network
community	Optional. Filters routes based on the community attribute specified. The options are: • AA:NN – Filters routes based on the community number (AA: is the autonomous system number (ASN), NN: is the community number within the specified ASN) • local-as – Filters routes carrying the local-as attribute (these routes are not sent outside the local AS) • no-advertise – Filters routes carrying the no-advertise attribute (these routes are not advertised to any peers) • no-export – Filters routes carrying no-export attribute (these routes are not exported to next AS)
community-list	Optional. Displays routes that are members of communities included in the specified BGP community-list • <1-500> – Specify the community-list number. • <WORD> – Specify the community-list name.
filter-list	Optional. Filters routes having AS-path matching the specified AS-path access list. Specify the AS-path ACL name.
neighbors	Optional. Displays BGP neighbor details. Specify the IP address, to view a specific neighbor details. Use one of the following options to filter information: • advertised-routes – Displays route information for routes advertised to the selected neighbor device • received-routes – Displays route information for routes received from the selected neighbor device • routes – Displays the route information for routes learned from the selected neighbor device If no neighbor IP address is specified, the system displays all neighbor-related routes on the logged device.
on <DEVICE-NAME>	Optional. Displays BGP routing table statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
paths	Optional. Displays BGP path details
prefix-list <PREFIX-LIST-NAME>	Optional. Displays routes confirming to the specified prefix-list • <PREFIX-LIST-NAME> – Specify the prefix list name.

regexp <LINE>	Optional. Displays routes matching the specified AS path regular expression • <LINE> – Specify the regular expression.
route-map <ROUTE-MAP-NAME>	Optional. Displays routes matching the specified route map • <ROUTE-MAP-NAME> – Specify the route map name.

```
show ip ddns bindings {on <DEVICE-NAME>}
```

ip ddns	Displays *Dynamic Domain Name Server* (DDNS) configuration details
bindings {on <DEVICE-NAME>}	Displays DDNS address bindings • on <DEVICE-NAME> – Optional. Displays address bindings on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip dhcp [networks|status] {on <DEVICE-NAME>}
```

ip dhcp	Displays the DHCP server configuration details
networks	Displays DHCP server network details
status	Displays DHCP server status
on <DEVICE-NAME>	The following keyword is common to all of the above parameters: • on <DEVICE-NAME> – Optional. Displays server status and network details on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip dhcp binding {manual} {(on <DEVICE-NAME>)}
```

ip dhcp	Displays the DHCP server configuration details
bindings	Displays DHCP address bindings
manual	Displays static DHCP address bindings
on <DEVICE-NAME>	The following keyword is recursive and common to the 'manual' parameter: • on <DEVICE-NAME> – Optional. Displays DHCP address bindings on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip extcommunity-list [<1-500>|<NAME>]
```

ip extcommunity-list [<1-500>| <NAME>]	Displays the specified extended community list details • <1-500> – Specify the extended community number from 1 - 500. • <NAME> – Specify the extended community name. This command is applicable to the RFS 4000, NX 95XX, and NX 96XX model devices.

```
show ip [default-gateways|dhcp-vendor-options|domain-name|name-server|routing]
{on <DEVICE-NAME>}
```

ip default-gateways	Displays all learnt default gateways
ip dhcp-vendor-options	Displays DHCP 43 parameters received from the DHCP server. This output includes the interface from which the option was learned.
ip domain-name	Displays the DNS default domain
ip name-server	Displays the DNS name server details
ip routing	Displays routing status
on <DEVICE-NAME>	The following keywords are common to all of the above parameters: • on <DEVICE-NAME> – Optional. Displays IP related information, based on the parameters passed, on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip igmp snooping [mrouter|querier] vlan <1-4095> {on <DEVICE-NAME>}
```

ip igmp snooping	Displays the IGMP snooping configuration
mrouter	Displays the IGMP snooping multicast router (mrouter) configuration
querier	Displays the IGMP snooping multicast querier configuration
vlan <1-4095> {on <DEVICE-NAME>}	Displays the IGMP snooping multicast router configuration for a VLAN • <1-4095> – Specify the VLAN ID from 1 - 4095. • on <DEVICE-NAME> – Optional. Displays the IGMP snooping mrouter configuration on a specified device <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip igmp snooping vlan <1-4095> {<IP>} {(on <DEVICE-NAME>)}
```

ip igmp snooping	Displays the IGMP snooping configuration
vlan <1-4095>	Displays the VLAN IGMP snooping configuration • <1-4095> – Specify the VLAN ID from 1 - 4095.
<IP>	Optional. Specifies the multicast group IP address
on <DEVICE-NAME>	The following keyword is recursive and common to the 'ip' parameter: • on <DEVICE-NAME> – Optional. Displays configuration details on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip interface {<INTERFACE-NAME>|brief} {(on <DEVICE-NAME>)}
```

ip interface	Displays an administrative and operational status of all layer 3 interfaces or a specified layer 3 interface
<INTERFACE-NAME>	Displays a specified interface status. Specify the interface name.

brief	Displays a brief summary of all interface status and configuration
on <DEVICE-NAME>	The following keyword is recursive and common to the 'interface-name' and 'brief' parameters: • on <DEVICE-NAME> – Optional. Displays interface status and summary, based on the parameters passed, on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip nat translations verbose {on <DEVICE-NAME>}
```

ip nat translations	Displays *Network Address Translation* (NAT) translations
verbose	Displays detailed NAT translations • on <DEVICE-NAME> – Optional.Displays NAT translations on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip route {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|pppoe1|
wwan1}
{(on <DEVICE-NAME>)}
```

ip route	Displays route table details. The route tables use flags to distinguish between routes. The different flags are: • C – Connected • G – Gateway • O – OSPF route • S – Static route Note: Flags 'S' and 'O' identify static learned routes and dynamic learned routes respectively.
<INTERFACE-NAME>	Optional. Displays route table details for a specified interface. Specify the interface name
ge <1-4>	Displays GigabitEthernet interface route table details • <1-4> – Specify the GigabitEthernet interface index from 1 - 4.
me1	Displays FastEthernet interface route table details
port-channel <1-2>	Displays port channel interface route table details. Specify the port channel index from 1 - 2.
vlan <1-4095>	Displays VLAN interface route table details. Select the VLAN interface ID from 1 - 4094.
pppoe1	Displays PPPoE interface route table details

wwan1	Displays Wireless WAN route table details
on <DEVICE-NAME>	The following keywords are recursive and common to all of the above parameters: • on <DEVICE-NAME> – Displays route table details, based on the parameters passed, on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ip ospf {border-router|interface|neighbor|route|on|state}{on <DEVICE-NAME>}
```

ip ospf	Displays overall OSPF information
border-router	Optional. Displays details of all the border routers connected
interface {on| vlan <1-4094>} {on <DEVICE-NAME>}	Optional. Displays details of all the interfaces with OSPF enabled • on <DEVICE-NAME> – Optional. Displays specified device details • vlan <1-4094> – Displays VLAN interface details • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
neighbor	Optional. Displays an OSPF neighbors list
route	Optional. Displays OFPS routes information
state	Optional. Displays an OSPF process state
on <DEVICE-NAME>	The following keywords are recursive and common to all of the above parameters: • on <DEVICE-NAME> – Optional. Displays overall OSPF information, based on the parameters passed, on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809(config)#show ip arp
-------------------------------------------------------------------------------
          IP                   MAC              INTERFACE           TYPE
-------------------------------------------------------------------------------
  192.168.13.10        00-02-B3-28-D1-55        vlan1          dynamic

192.168.13.0/24   direct          C         vlan192     0        0
-------------------------------------------------------------------------------
Flags:  C - Connected G - Gateway O - OSPF  B - BGP  S - Static
Gateway: N - Normalized Gateway Address
nx9500-6C8809(config)#
nx9500-6C8809(config)#show ip routing on rfs6000-81742D
IP routing is enabled.
nx9500-6C8809(config)#
nx9500-6C8809(config)#show ip dhcp status
State of DHCP server: not-running
nx9500-6C8809(config)#
nx9500-6C8809(config)#show ip ospf state
 Maximum number of OSPF routes allowed: 9216
   Number of OSPF routes received: 0
   Ignore-count allowed: 5, current ingore-count: 0
   Ignore-time 60 seconds, reset-time 360 seconds
   Current OSPF process state: Running
nx9500-6C8809(config)#
```

ip-access-list-stats

Displays IP access list statistics

Note
This command is not available in the USER EXEC Mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show ip-access-list-stats {<IP-ACCESS-LIST-NAME>|detail|on}
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}
{(on <DEVICE-NAME>)}
```

Parameters

```
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}
{(on <DEVICE-NAME>)}
```

ip-access-list-stats	Displays IP access list statistics
<IP-ACCESS-LIST-NAME>	Optional. Displays statistics for a specified IP access list. Specify the IP access list name.
detail <IP-ACCESS -LIST-NAME>	Optional. Displays detailed statistics for a specified IP access list. Specify the IP access list name.
on <DEVICE-NAME>	The following keyword is recursive and common to the 'IP-ACCESS-LIST-NAME' parameter: • on <DEVICE-NAME> – Optional. Displays all or a specified IP access list statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809(config)#show ip-access-list stats
IP Access-list: # Restrict Management ACL #
  permit tcp any any eq ftp rule-precedence 1        Hitcount: 0
  permit tcp any any eq www rule-precedence 2        Hitcount: 4
  permit tcp any any eq ssh rule-precedence 3        Hitcount: 448
  permit tcp any any eq https rule-precedence 4        Hitcount: 0
  permit udp any any eq snmp rule-precedence 5       Hitcount: 0
  permit tcp any any eq telnet rule-precedence 6       Hitcount: 4
nx9500-6C8809(config)#
```

The following example displays the 'auto-tunnel-acl' IP ACL configuration:

```
nx9500-6C8809(config)#ip access-list auto-tunnel-acl
nx9500-6C8809(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
permit ip host 200.200.200.99 any rule-precedence 3
nx9500-6C8809(config-ip-acl-auto-tunnel-acl)#
```

The following example dispalys the statistics for the 'auto-tunnel-acl' ACL:

```
nx9500-6C8809#show ip-access-list stats
IP Access-list: auto-tunnel-acl
  permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2        Hitcount: 0
  permit ip host 200.200.200.99 any rule-precedence 3        Hitcount: 0

nx9500-6C8809#
```

ipv6

Displays IPv6 related information and statistical data

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show ipv6 [default-gateways|delegated-prefix|dhcp|hop-limit|interface|mld|
name-server|neighbors|route]
show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server]
{on <DEVICE-NAME>}
show ipv6 dhcp [client received-options|relay status|status]
{on <DEVICE-NAME>}
show ipv6 interface {<IF-NAME>|brief} {(on <DEVICE-NAME>)}
show ipv6 mld snooping [mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>]
{on <DEVICE-NAME>}
show ipv6 neighbors <VLAN-NAME> {(on <DEVICE-NAME>)}
show ipv6 route {<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|ppppoe1|serial <1-4>|
t1e1 <1-4> <1-1>|up|vlan <1-4095>|wwan1|xge} {(on <DEVICE-NAME>)}
```

Parameters

```
show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server]
{on <DEVICE-NAME>}
```

ipv6	Displays IPv6 related information and statistical data
default-gateways	Displays all learnt default gateways
delegated-prefix	Displays prefix delegation information
hop-limit	Displays the configured IPv6 hop count value
name-server	Displays DNS name servers
on <DEVICE-NAME>	This parameter is common to all of the above keywords. • on <DEVICE-NAME> – Optional. Displays the specified information on a device (access point, wireless controller, or service platform) • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}
```

ipv6	Displays IPv6 related information and statistical data
dhcp	Displays DHCPv6 related information
client received-options	Displays DHCP options received from clients
relay status	Displays the DHCPv6 relay agent's running status
status	Displays the DHCPv6 stateless server daemon's status. In case the DHCPv6 server is up and running, it also displays interface names.
on <DEVICE-NAME>	This parameter is common to all of the above keywords. • on <DEVICE-NAME> – Optional. Displays the specified information on a device (access point, wireless controller, or service platform) • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ipv6 interface {<IF-NAME>|brief} {(on <DEVICE-NAME>)}
```

ipv6	Displays IPv6 related information and statistical data
interface {<IF-NAME>|brief}	Displays IPv6 status and configuration on a specified interface related information • <IF-NAME> – Optional. Specify the interface name. • brief – Optional. Displays a brief summary of IPv6 status and configuration on the specified interface
on <DEVICE-NAME>	This parameter is common to all of the above keywords. • on <DEVICE-NAME> – Optional. Displays the specified information on a device (access point, wireless controller, or service platform) • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ipv6 mld snooping [mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>]
{on <DEVICE-NAME>}
```

ipv6	Displays IPv6 related information and statistical data
mld snooping	Displays *Multicast Listener Discovery Protocol* (MLD) snooping related information
mrouter vlan <1-4095>	Displays IPv6 multicast router information on the specified VLAN
querier vlan <1-4095>	Displays IPv6 multicast querier information on the specified VLAN
vlan <1-4095>	Displays MLD snooping related information on the specified VLAN
on <DEVICE-NAME>	This parameter is common to all of the above keywords. • on <DEVICE-NAME> – Optional. Displays the specified information on a device (access point, wireless controller, or service platform) • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ipv6 neighbors <VLAN-NAME> {(on <DEVICE-NAME>)}
```

ipv6	Displays IPv6 related information and statistical data
neighbors <VLAN-NAME>	Displays IPv6 neighbors on the specified VLAN
on <DEVICE-NAME>	Optional. Displays IPv6 neighbors on a specified device (access point, wireless controller, or service platform) • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show ipv6 route {<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|ppppoe1|serial <1-4>|
t1e1 <1-4> <1-1>|up|vlan <1-4095>|wwan1|xge} {(on <DEVICE-NAME>)}
```

ipv6	Displays IPv6 related information and statistical data
route	Displays IPv6 route table
<IF-NAME>	Optional. Displays IPv6 route table for the interface identified by the <IF-NAME> keyword
ge <1-X>	Optional. Displays IPv6 route table for the selected GigabitEthernet interface

me1	Optional. Displays IPv6 route table for the FastEthernet interface
port-channel <1-2>	Optional. Displays IPv6 route table for the selected port-channel interface
pppoe1	Optional. Displays IPv6 route table for the PPP over Ethernet interface
vlan <1-4095>	Optional. Displays IPv6 route table for the selected VLAN interface
up	Optional. Displays IPv6 route table for the WAN Ethernet interface
wwan	Optional. Displays IPv6 route table for the wireless WAN interface
xge <1-4>	Optional. Displays IPv6 route table for the selected TenGigabitEthernet interface
on <DEVICE-NAME>	This parameter is common to all of the above keywords. • on <DEVICE-NAME> – Optional. Displays the specified information on a device (access point, wireless controller, or service platform) • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
rfs4000-229D58(config)#show ipv6 route
--------------------------------------------------------------------------------
      DESTINATION            GATEWAY           FLAGS            INTERFACE

rfs4000-229D58#
```

ipv6-access-list

Displays IPv6 access list related information and statistics

Note
This command is not available in the USER EXEC Mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}
```

Parameters

```
show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}
```

ipv6-access-list stats	Displays IPv6 access list related information and statistics
<IPv6-ACCESS-LIST-NAME>	Optional. Displays statistics for a specified IPv6 access list. Specify the IPv6 access list name. If IPv6 ACL name is not provided, the system displays statistics for all ACLs configured and applied.
on <DEVICE-NAME>	Optional. Displays all or a specified IPv6 access list statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809#show ipv6-access-list stats
IPV6 Access-list: test
  deny ipv6 any any rule-precedence 20        Hitcount: 4

nx9500-6C8809#
```

l2tpv3

Displays a L2TPv3 session information

Note
This command is not available in the USER EXEC mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show l2tpv3 {on|statistics|tunnel|tunnel-summary}
show l2tpv3 {on <DEVICE-NAME>}
show l2tpv3 statistics {on <DEVICE-NAME>)}
show l2tpv3 {tunnel <L2TPv3-TUNNEL-NAME>} {session <L2TPv3-SESSION-NAME>} {on <DEVICE-NAME>)}
show l2tpv3 {tunnel-summary} {down|on|up}
show l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}
show l2tpv3 {tunnel-summary} {down|up} {on <DEVICE-NAME>}
```

Parameters

```
show l2tpv3 {on <DEVICE-NAME>}
```

l2tpv3 {on <DEVICE-NAME>}	Displays L2TPv3 tunnel and session details or summary • on <DEVICE-NAME> – Optional. Displays L2TPv3 information on a specified device • <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

```
show l2tpv3 statistics {on <DEVICE-NAME>)}
```

show l2tpv3 statistics	Displays L2TPv3 Tunnel and session statistics. It displays the information, such as the number of packets transmitted and received, the rate of transmission, number of packets dropped, etc.
on <DEVICE-NAME>	Optional. Executes the command on a specified device • <DEVICE-NAME> - Specify the name of the access point, wireless controller, or service platform. Note: If you do not specify a device name, the system executes the command on the logged device.

```
show l2tpv3 {tunnel <L2TPv3-TUNNEL-NAME>} {session <L2TPv3-SESSION-NAME>} {(on <DEVICE-NAME>)}
```

l2tpv3	Displays L2TPv3 tunnel and session details or summary
tunnel <L2TPv3-TUNNEL- NAME>	Optional. Displays a specified L2TPv3 tunnel information • <L2TPv3-TUNNEL-NAME> – Specify the L2TPv3 tunnel name.

session <L2TPv3-SESSION- NAME>	Optional. Displays a specified L2TPv3 tunnel session information • <L2TPv3-SESSION-NAME> – Specify the session name.
on <DEVICE-NAME>	The following keyword is recursive and common to the 'session <L2TPv3-SESSION-NAME>' parameter. • on <DEVICE-NAME> – Optional. Displays a L2TPv3 tunnel and session details, based on the parameters passed, on a specified device. • <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

```
show l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}
```

l2tpv3	Displays L2TPv3 tunnel and session details or summary Note: For an L2TPv3 tunnel over Auto IPSec, the tunnel status is displayed as: Established (secured by ipsec)
tunnel-summary {on <DEVICE-NAME>}	Optional. Displays L2TPv3 tunnel summary • on <DEVICE-NAME> – Optional. Displays L2TPv3 tunnel summary on a specified device • <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

```
show l2tpv3 {tunnel-summary} {down|up} {on <DEVICE-NAME>}
```

l2tpv3	Displays L2TPv3 tunnel and session details or summary
tunnel-summary	Optional. Displays L2TPv3 tunnel summary, based on the parameters passed
down	Optional. Displays un-established tunnels summary
up	Optional. Displays established tunnels summary
on <DEVICE-NAME>	The following keyword is common to the 'down' and 'up' parameters: • on <DEVICE-NAME> – Optional. Displays summary, for un-established or established tunnels, on a specified device • <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

Examples

```
ap7161-11E6C4#show l2tpv3 tunnel-summary
-------------------------------------------------------------------------------------------

lacp

Displays *Link Aggregation Control Protocol* (LACP) related information

Note

For more information on enabling dynamic LACP, see lacp on page 1027 (profile - inf - ge - config mode), lacp-channel-group on page 1028 (profile - inf - ge - config mode), and lacp on page 1279 (device config mode).

Supported in the following platforms:

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX

Syntax

```
show lacp [<1-4>|counters|details|sys-id]
show lacp <1-4> ([counters|details])
show lacp sys-id
```

Parameters

```
show lacp <1-4> ([counters|details])
```

show lacp <1-4>	Shows the LACP related information for a specified port-channel or all port-channels using LACP • <1-4> – Select the port-channel index number from 1 - 4. Note, LACP is supported only on the NX 5500, NX 75XX, NX 95XX, NX 96XX model service platforms. If the port-channel index number is not specified, the system displays LACP counters and details for all port-channels configured on the device.
counters	Shows LACP counters for LACP-enabled port-channels. When passed without the <1-4> keyword, the system displays LACP counters for all configured port-channels. However, if the port-channel index number is specified, the system displays LACP counters only for the specified port-channel.
details	Shows details for LACP-enabled port-channels. When passed without the <1-4> keyword, the system displays LACP details for all configured port-channels. However, if the port-channel index number is specified, the system displays LACP details only for the specified port-channel.

```
show lacp sys-id
```

show lacp sys-id	Shows the LACP related information for all LACP-enabled port-channels • sys-id – Shows the LACP system identifier and priority. This is the identifier assigned to the LACP peers (devices).

Examples

```
NOC-controller#show interface port-channel 1
Interface port-channel1 is UP
  Hardware-type: aggregate, Mode: Layer 2, Address: 84-24-8D-7F-35-C8
  Index: 2018, Metric: 1, MTU: 1500
  Speed: Admin Auto, Operational 20G, Maximum 20G
  Duplex: Admin Auto, Operational Full
  Active-medium: n/a
  Channel-members: xge1 xge2
  Switchport settings: trunk, access-vlan: n/a
    Input packets 5121052, bytes 807510883, dropped 0
    Received 5121052 unicasts, 0 broadcasts, 516544 multicasts
    Input errors 0, runts 0, giants 0
    CRC 0, frame 0, fragment 0, jabber 0
    Output packets 4804420, bytes 1053174746, dropped 0
    Sent 4804420 unicasts, 0 broadcasts, 0 multicasts
    Output errors 0, collisions 0, late collisions 0
    Excessive collisions 0

NOC-controller#
```

```
NOC-controller#show interface port-channel 4
Interface port-channel4 is UP

NOC-controller#
```

ldap-agent

Displays an LDAP agent's join status (join status to a LDAP server domain). Use this command When LDAP is specified the external resource (as opposed to local RADIUS resources) to validate PEAP-MS-CHAP v2 authentication requests, user credentials, and password information needs to be made available locally to successfully connect to the external LDAP server. Up to two LDAP Agents (primary and secondary external resources) can be defined as external resources for PEAP-MS-CHAP v2 authentication requests.

Note
This command is not available in USER EXECUTABLE ,mode

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show ldap-agent join-status {on <DEVICE-NAME>}
```

Parameters

ldap-agent	Displays LDAP agent related configuration
join-status	Displays if the LDAP agent has successfully joined a LDAP server's domain
on <DEVICE-NAME>	Optional. Displays if the LDAP agent has successfully joined a specified LDAP server's domain. • <DEVICE-NAME> – Specify the name of the device running the LDAP server (access point, wireless controller, or service platform).

Examples

```
nx9500-6C8809#show ldap-agent join-status
Primary LDAP Server's agent join-status : Joined domain TEST.

Secondary LDAP Server's agent join-status : Not Configured
nx9500-6C8809#
```

licenses

Displays installed licenses and usage information

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show licenses {borrowed|lent}
```

Parameters

```
show licenses {borrowed|lent}
```

licenses {borrowed|lent}	Displays installed licenses and usage information • borrowed – Optional. Displays information on licenses borrowed • lent – Optional. Displays information on licenses lent.

Usage Guidelines

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single NOC controller, The NOC and the site controllers constitute the first and second tiers of the hierarchy respectively. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy. The site controllers may or may not be grouped to form clusters.

At the time of adoption, access points and adaptive access points are provided license by the adopting controller. These license packs can be installed on both the NOC and site controllers. When a AP/AAP is adopted by a controller, the controller pushes a license on to the device. At this point the various possible scenarios are:

- AP/AAP license packs installed on the NOC controller only. The NOC controller provides the site controllers with the AP licenses, ensuring that per platform limits are not exceeded.
- AP/AAP license packs installed on the NOC and site controllers. The site controller uses its installed licenses and, in case of a shortage, the site controller borrows additional licenses from the NOC. If the NoC controller is unable to allocate sufficient licenses, the site controller unadopts some of the AP/AAPs.
- AP/AAP license packs installed on one controller within a cluster. The site controller shares its installed and borrowed licenses with other cluster controllers.

Examples

```
rfs4000-229D58#show licenses
Serial Number : 9184521800027

Device Licenses:
  AP-LICENSE
    String     : DEFAULT-6AP-LICENSE

lldp

Displays *Link Layer Discovery Protocol* (LLDP) related information

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show lldp [neighbors|report]
show lldp neighbors {on <DEVICE-NAME>}
show lldp report {detail|on}
show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

Parameters

```
show lldp neighbors {on <DEVICE-NAME>}
```

lldp	Displays L2TPv3 neighbors table or aggregated LLDP neighbors table
neighbors	Displays LLDP neighbors table
on <DEVICE-NAME>	Optional. Displays L2TPv3 neighbors table on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

lldp	Displays L2TPv3 neighbors table or aggregated LLDP neighbors table
report detail	Displays aggregated LLDP neighbors table • detail – Optional. Displays detailed aggregated LLDP neighbors table Note: If the 'on' keyword is used without the 'detail' keyword, the system displays LLDP neighbors table summary on the specified device or RF Domain.
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is recursive and common to the 'report detail' parameter: • on <DEVICE-OR-DOMAIN-NAME> – Displays aggregated LLDP neighbors table on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

```
nx9500-6C8809#show lldp neighbors
-------------------------
Chassis ID: 00-18-71-D0-0B-00
System Name: TechPubs-ProCurve-Switch
Platform: ProCurve J8697A Switch 5406zl, revision K.12.1X, ROM K.11.03 (/sw/code/build/
btm(sw_esp1))
Capabilities: Bridge  Router
Enabled Capabilities: Bridge
Local Interface: ge1, Port ID(Port Description) (outgoing port): 5(A5)
TTL: 113 sec
Management Addresses: 192.168.13.40
nx9500-6C8809#
```

logging

Displays the network's activity log

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show logging {on <DEVICE-NAME>}
```

Parameters

```
show logging {on <DEVICE-NAME>}
```

logging {on <DEVICE-NAME>}	Displays logging information on a specified device • <DEVICE-NAME> – Optional. Specify the name of the AP or wireless controller.

Examples

```
NOC-NX9500#show logging

Logging module: enabled
    Aggregation time: disabled
    Console logging: level debugging
    Monitor logging: disabled
    Buffered logging: level warnings
    Syslog logging: level warnings
        Facility: local7

Log Buffer (2096166 bytes):

NOC-NX9500#
```

mac-access-list-stats

Displays MAC access list related statistics

Note
This command is not present in USER EXEC mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show mac-access-list-stats {<MAC-ACCESS-LIST-NAME>|on}
show mac-access-list-stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}
```

Parameters

```
show mac-access-list-stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}
```

mac-access-list-stats	Displays MAC access list statistics
<MAC-ACCESS-LIST>	Optional. Displays statistics for a specified MAC access list. Specify the MAC access list name. **Note:** The system displays all configured ACL statistics if no ACL name is specified.
on <DEVICE-NAME>	Optional. Displays all or a specified MAC access list statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809#show mac-access-list stats scalemacacl | i 311
  permit D0-67-E5-3F-C0-00 FF-FF-FF-FF-F0-00  host 00-1E-EC-F2-0A-76 rule-precedence 311
Hitcount: 0   Hardware Hitcount: 0
nx9500-6C8809#
```

mac-address-table

Displays MAC address table entries

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show mac-address-table {on <DEVICE-NAME>}
```

Parameters

```
show mac-address-table {on <DEVICE-NAME>}
```

mac-address-table	Displays MAC address table entries
on <DEVICE-NAME>	Optional. Displays MAC address table entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
NOC-NX9500#show mac-address-table
--------------------------------------------------------

NOC-NX9500#
```

macauth

Displays details of wired ports that have MAC address authentication enabled.

Use this command to view MAC authentication configuration and authentication state. The command displays the current authentication state of the wired host, the authorization state of the Ge1 port, and the wired hosts' MAC address. The port status displays as Authorized if the wired host has successfully authenticated and Not Authorized if the wired host has not authenticated or has failed MAC authentication.

For more information on enabling MAC address authentication on a wired port, see mac-auth on page 1197 (profile-config-mode).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show mac-auth {all|interface|on}
show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|
t1e1 <1-4>|up <1-2>|xge <1-4>]} {(on <DEVICE-NAME>)}
```

Parameters

```
show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|
t1e1 <1-4>|up <1-2>|xge <1-4>]} {(on <DEVICE-NAME>)}
```

macauth	Displays MAC authentication related information for all interfaces or a specified interface
all	• Displays MAC authentication related information for all interfaces

interface [<INTERFACE-NAME>| ge <1-5>| port-channel <1-3>| t1e1 <1-4>|up <1-2>| xge <1-4>]	Optional. Displays MAC authentication related information for a specified interface. Specify the interface using one of the following options: • <INTERFACE-NAME> – Selects the interface identified by the <INTERFACE-NAME> keyword • ge <1-5> – Selects the GigabitEthernet interface identified by the index number • port-channel <1-3> – Selects the port channel interface identified by the index number • t1e1 <1-4> – Selects the layer 2 interface (Ethernet port) • up <1-2> – Selects the WAN Ethernet interface identified by the index number • xge <1-4> – Selects the TenGigabitEthernet interface identified by the index number
on <DEVICE-NAME>	The following keywords are common to the 'all' and 'interface' parameters: • on <DEVICE-NAME> – Optional. Displays MAC authentication related information on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. Note: When the 'on' keyword is used exclusively, without the 'all' and 'interface' options, the system displays MAC authentication related information for interfaces configured on the specified device.

Examples

```
rfs4000-229D58(config)#show mac-auth all
AAA-Policy is none

Mac Auth info for interface GE1
-----------------------------------
 Mac Auth Enabled
 Mac Auth Not Authorized

Mac Auth info for interface GE2

rfs4000-229D58(config)#
```

mac-auth-clients

Displays MAC authenticated clients

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show mac-auth-clients [all|interface]
show mac-auth-clients all {on <DEVICE-NAME>}
show mac-auth-clients interface {<INF-NAME>|ge <1-X>|port-channel <1-2>|
xge <1-4>}
```

Parameters

```
show mac-auth-clients all {on <DEVICE-NAME>}
```

mac-auth-clients	Displays MAC authenticated clients based on the parameters passed. The options are: all and interface.
all	Displays MAC authenticated clients for all interfaces
on <DEVICE-NAME>	Optional. Displays MAC authenticated clients for all interfaces on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show mac-auth-clients interface {<INF-NAME>|ge <1-X>|port-channel <1-2>|
xge <1-4>}
```

mac-auth-clients	Displays MAC authenticated clients based on the parameters passed. The options are: all and interface.
interface [<INF-NAME>| ge <1-X>| port-channel <1-2>| xge <1-4>]	Displays MAC authenticated clients for the specified interface. Select the interface type from the following options: • <INF-NAME> – Optional. Displays MAC authenticated clients for the interface identified by the <INF-NAME> keyword. Specify the layer 2 (ethernet port) interface name. • ge <1-X> – Optional. Displays MAC authenticated clients for the selected GigabitEthernet interface. Specify the GE interface index from 1 - X. This will vary for different device types. • port-channel <1-2> – Optional. Displays MAC authenticated clients for the selected port channel interface. Specify the port channel interface index from 1 - 2. • xge <1-4> – Optional. Displays MAC authenticated clients for the selected TenGigabitEthernet interface. Specify the interface index from 1 - 4.
on <DEVICE-NAME>	Optional. Displays MAC authenticated clients for the specified interface on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
rfs4000-229D58(config-device-B4-C7-99-22-9D-58)#show mac-auth-clients interface ge 1
-----------------------------------------------
 MAC               STATE            INTERFACE
-----------------------------------------------
-----------------------------------------------
Total number of MACs displayed: 0
rfs4000-229D58(config-device-B4-C7-99-22-9D-58)#
```

mint

Displays MiNT protocol related statistics and configuration

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show mint [config|dis|id|info|known-adopters|links|lsp|lsp-db|mlcp|neighbors|route|
 stats|tunnel-controller|tunneled-vlans]
show mint [config|id|info|known-adopters|route|stats|tunneled-vlans]
{on <DEVICE-NAME>}
show mint [dis|links|neighbors|tunnel-controller] {details} {(on <DEVICE-NAME>)}
show mint lsp
show mint lsp-db {details <MINT-ADDRESS>} {(on <DEVICE-NAME>)}
show mint mlcp {history} {(on <DEVICE-NAME>)}
```

Parameters

```
show mint [config|id|info|known-adopters|route|stats|tunneled-vlans]
{on <DEVICE-NAME>}
```

mint	Displays MiNT protocol information based on the parameters passed
config	Displays MiNT configuration
id	Displays local MiNT ID
info	Displays MiNT status
known-adopters	Displays known, possible, or reachable adopters
route	Displays MiNT route table details
stats	Displays MiNT related statistics
tunneled-vlans	Displays MiNT tunneled VLAN details
on <DEVICE-NAME>	The following keywords are common to all of the above parameters: • on <DEVICE-NAME> – Optional. Displays MiNT protocol details on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show mint [dis|links|neighbors|tunnel-controller] {details} {(on <DEVICE-NAME>)}
```

mint	Displays MiNT protocol information based on the parameters passed
dis	Displays MiNT network *Designated Intermediate Systems* (DISes) and *Ethernet Virtualization Interconnects* (EVISes)
links	Displays MiNT networking link details
neighbors	Displays adjacent MiNT peer details
tunnel-controller	Displays details of MiNT VLAN network tunnel wireless controllers for extended VLAN load balancing
details {(on <DEVICE-NAME>)}	The following keywords are common to the 'dis', 'links', 'neighbors', and 'tunnel-controller' parameters: • details – Optional. Displays detailed MiNT information • on <DEVICE-NAME> – Optional. This is a recursive parameter, which displays MiNT information on a specified device <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show mint lsp
```

mint	Displays MiNT protocol information based on the parameters passed
lsp	Displays this router's MiNT *Label Switched Paths* (LSPs)

```
show mint lsp-db {details <MINT-ADDRESS>} {(on <DEVICE-NAME>)}
```

mint	Displays MiNT protocol information based on the parameters passed
lsp-db	Displays MiNT LSP database entries
details <MINT_ADDRESS>	Optional. Displays detailed MiNT LSP database entries • <MINT_ADDRESS> – Specify the MiNT address in the AA.BB.CC.DD format.
on <DEVICE-NAME>	The following keyword is recursive and common to the 'details' parameter: • on <DEVICE-NAME> – Optional. Displays MiNT LSP database entries on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show mint mlcp {history} {(on <DEVICE-NAME>)}
```

mint	Displays MiNT protocol information based on the parameters passed This command displays the 'hello-interval' and 'hold-time' default values for both IP and VLAN links.
mlcp	Displays *MiNT Link Creation Protocol* (MLCP) status
history	Optional. Displays MLCP client history
on <DEVICE-NAME>	The following keyword is recursive and common to the 'history' parameter: • on <DEVICE-NAME> – Optional. Displays MLCP client history on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
NOC-NX9500#show mint stats
2 Level-1 neighbors
Level-1 LSP DB size 5 LSPs (1 KB)
Last Level-1 SPFs took 0.000s
Level-1 SPF (re)calculated 6 times.
5 Level-1 paths.
0 Level-2 neighbors
Level-2 LSP DB size 0 LSPs (0 KB)
Last Level-2 SPFs took 0.000s
Level-2 SPF (re)calculated 0 times.
0 Level-2 paths.

NOC-NX9500#
```

ntp

Displays *Network Time Protocol* (NTP) information. NTP enables clock synchronization within a network.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show ntp [associations|status]
show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]
```

Parameters

```
show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]
```

ntp associations {detail|on}	Displays existing NTP associations. The interaction between the controller or service platform and a SNTP server constitutes an association. SNTP associations are of two kinds: • peer associations - where a controller or service platform synchronizes to another system or allows another system to synchronize to it, or • - server associations - where only the controller or service platform synchronizes to the SNTP resource, not the other way around. Specify the following parameters to view NTP association details: • detail – Optional. Displays detailed NTP associations • on <DEVICE-NAME> – Optional. Displays NTP associations on a specified device <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. **Note:** If the 'on' keyword is used without the 'detail' keyword, the system displays a summary of existing NTP associations on the specified device or RF Domain.
ntp status {on <DEVICE-NAME>}	Displays the performance (status) information relative to the NTP association status. Use this command to view the access point, controller, or service platform's current NTP resource. • on <DEVICE-NAME> – Optional. Displays NTP association status on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform

Examples

```
nx9500-6C8809#show ntp associations
-------------------------------------------------------------------------------------------
-------------------------

nx9500-6C8809#
```

password-encryption

Displays password encryption status (enabled/disabled)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show password-encryption status
```

Parameters

```
show password-encryption status
```

password-encryption status	Displays password encryption status (enabled/disabled)

Examples

```
nx9500-6C8809(config)#show password-encryption status
Password encryption is enabled
nx9500-6C8809(config)#
```

pppoe-client

Displays PPPoE client information. Use this command to view PPPoE statistics derived from access to high-speed data and broadband networks. PPPoE uses standard encryption, authentication, and compression methods as specified by the PPPoE protocol. PPPoE enables point-to-points connection to an ISP over existing Ethernet interface.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show pppoe-client [configuration|status] {on <DEVICE-NAME>}
```

Parameters

```
show pppoe-client [configuration|status] {on <DEVICE-NAME>}
```

pppoe-client	Displays PPPoE client information (configuration and status)
configuration	Displays detailed PPPoE client configuration
status	Displays detailed PPPoE client status
on <DEVICE-NAME>	The following keywords are common to 'configuration' and 'status' parameters: • on <DEVICE-NAME> – Optional. Displays detailed PPPoE client status or configuration on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809#show pppoe-client configuration
 PPPoE Client Configuration:
+-----------------------------------------
|  Mode          : Disabled
|  Service Name  :
|  Auth Type     : pap
|  Username      :
|  Password      : fJx5O+5duPjaOaPuXmtLDQAAAAAmvgEXcQ1+eUK4ByHK4aRi
|  Idle Time     : 600
|  Keepalive     : Disabled
|  Local n/w     : vlan1
|  Static IP     : __wing_internal_not_set__
|  MTU           : 1492
+-----------------------------------------

nx9500-6C8809#
```

privilege

Displays the logged-in user's privilege level

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show privilege
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config)#show privilege
Current user privilege: superuser
nx9500-6C8809(config)#
```

radius

Displays the amount of access time consumed and the amount of access time remaining for all guest users configured on a RADIUS server

Every captive portal guest user can access the captive portal for a specified duration. This results in following three scenarios:

- Scenario 1: Access duration not specified (in this case the default of 1440 minutes is applied)
- Scenario 2: Access duration is specified and is greater than 0
- Scenario 3: Access duration is specified and equals to 0 (in this case the guest user has unlimited access)

In all the three scenarios the access time consumed is the duration for which the guest user has logged.

But the access time remaining varies. It is calculated as follows:

- Scenarios 1 & 2 - It is the lesser of the following two values: difference between the configured access duration and the time consumed AND the time until user account expiration.
- Scenario 3 - It is the time until user account expiration.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show radius [guest-users|server]
show radius guest-users {brief|<GUEST-USER-NAME>}
show radius server
```

Parameters

```
show radius guest-users {brief|<GUEST-USER-NAME>}
```

radius guest-users {brief|<GUEST-USER-NAME>}	Displays RADIUS server's guest user's access details: total time for which the user has logged in, and the amount of access time remaining. • brief – Displays the total number of guest users provided RADIUS access • <GUEST-USER-NAME> – Optional. Provide the name of the guest user (whose access details are to be viewed). If no name is provided, the system displays details of all guest users who have successfully logged in at least once. Use this command in the captive-portal context to view time and data statistics for guest user(s) having bandwidth-based or time-based vouchers configured. In such a scenario, the system displays the following information: data configured, data remaining, configured and current bandwidths (for both downlink and uplink), time configured, and time remaining. If bandwidth-based voucher is not applicable to a guest user, the data configured and data remaining values are displayed as 'unlimited'. The bandwidth columns are blank. If time-based voucher is not applicable to a guest user, the only value displayed is the time remaining (which is the time till the expiration of the guest user's account). **Note:** For more information on configuring bandwidth-based and time-based vouchers, see user on page 1584 (radius user policy config mode).

```
show radius server
```

radius server	Displays RADIUS server related statistical data

Examples

```
rfs4000-229D58#show radius guest-users
         TIME (min:sec)
       USED    REMAINING   GUEST USER
       0:00         9:00   time9
       0:00         5:00   time5
       0:00        15:00   time15
       0:00    305416:35   notime
       2:31         7:29   time10
rfs4000-229D58#
```

The following example shows a RADIUS user pool with guest users having bandwidth-based, time-based, bandwidth and time based, and no bandwidth or time based vouchers:

```
rfs4000-229D58(config-captive-portal-wdws)#show context
radius-user-pool-policy wdws
 user time_and_data password 0 both group wdws guest expiry-time 12:00 expiry-date
12/31/2015 access-duration  8000 data-limit  500 committed-downlink  3000 committed-
uplink  2000 reduced-downlink  1000 reduce4
 user neither password 0 nine group wdws guest expiry-time 12:00 expiry-date 12/31/2015
 user data_only password 0 data group wdws guest expiry-time 12:00 expiry-date 12/31/2015
data-limit  125 committed-downlink  1000 committed-uplink  800 reduced-downlink  500
reduced-uplink  400
rfs4000-229D58(config-captive-portal-wdws)#
```

The following example shows the captive portal access details for the above mentioned RADIUS user pool users:

```
rfs4000-229D58(config-captive-portal-wdws)#show radius guest-users
                      TIME (DD:HH:MM:SS)            DATA (kilobytes)
BANDWIDTH (kbps)

Current time: 17:15:07
rfs4000-229D58(config-captive-portal-wdws)#
```

reload

Displays scheduled reload information for a specific device

Note
This command is not present in the USER EXEC mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show reload {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
show reload {on <DEVICE-OR-DOMAIN-NAME>}
```

reload {on <DEVICE-OR-DOMAIN-NAME>}	Displays scheduled reload information for a specified device • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays configuration on a specified device • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

```
nx9500-6C8809(config)#show reload
No reload is scheduled.
nx9500-6C8809(config)#
```

rf-domain-manager

Displays RF Domain manager selection details

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}
```

rf-domain-manager	Displays RF Domain manager selection details
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays RF Domain manager selection details on a specified device or domain • <DEVICE-OR-DOMAIN-NAME> – specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

```
nx9500-6C8809#show rf-domain-manager
 RF Domain TechPubs
 RF Domain Manager:
    ID: 19.6C.88.09
 Controller Managed
 Device under query:
    Priority: 220
    Has IP MiNT links
    Has wired MiNT links
nx9500-6C8809#
```

role

Displays role based firewall information

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show role [ldap-stats|wireless-clients]
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}
```

Parameters

```
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}
```

role ldap-stats	Displays LDAP server status and statistics
role wireless-clients	Displays clients associated with roles
on <DEVICE-NAME>	The following parameters are common to the 'ldap-stats' and 'wireless-clients' keywords: • on <DEVICE-NAME> – Optional. Displays clients associated with roles on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, and service platform.

Examples

```
nx9500-6C8809(config)#show role wireless-clients
No ROLE statistics found.
nx9500-6C8809(config)#
```

route-maps

Displays route map statistics for defined routes

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show route-maps {on <DEVICE-NAME>}
```

Parameters

```
show route-maps {on <DEVICE-NAME>}
```

route-maps	Displays configured route map statistics for all defined routes For more information on route maps, see route-map on page 1752.
on <DEVICE-NAME>	Optional. Displays route map statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809(config)#show route-maps
nx9500-6C8809(config)#
```

rtls

Displays *Real Time Location Service* (RTLS) statistics for Access Points contributing locationing information

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show rtls [aeroscout|ekahau|omnitrail] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

Parameters

```
show rtls [aeroscout|ekahau|omnitrail] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

rtls	Displays Access Point RTLS statistics
aeroscout	Displays Access Point Aeroscout statistics

ekahau	Displays Access Point Ekahau statistics
omnitrail	Displays access point Omnitrail statistics
<MAC/HOSTNAME>	Optional. Displays Aeroscout or Ekahau statistics for a specified Access Point. Specify the MAC address or hostname of the Access Point.
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is recursive and common to all of the above parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays Aeroscout or Ekahau statistics on a specified device or domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

```
rfs4000-229D58(config)#show rtls aeroscout

 Aeroscout Engine IP: 0.0.0.0 Port: 0
 Send Count           : 0

running-config

Displays configuration files (where all configured MAC and IP access lists are applied to an interface)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show running-config {aaa-policy|application|application-group|application-policy|
association-acl-policy|auto-provisioning-policy|captive-portal-policy|device|database-
```

```
client-policy|
database-policy|device|device-overrides|dhcp-server-policy|dhcpv6-server-policy|
ex3500-management-policy|ex3500-qos-class-map-policy|ex3500-qos-policy-map|exclude-
devices|

show running-config url-filter <URL-FILTER-NAME>

show running-config url-list <URL-LIST-NAME> {include-factory}
```

Parameters

```
show running-config {flag-unwritten-changes}
```

running-config flag-unwritten-changes	Flags unsaved changes in the `show > running-config` command output. Optionally use the flag-unwritten-changes keyword to view changes that have been committed but not saved in the startup configuration. When used, all unsaved changes are marked with a "===" marker, as shown in the following show > running-config > flag-unwritten-changes output:
	`nx9500-6C8809(config)#show running-config flag-unwritten-changes`
	`!`
	`! Configuration of NX9500 version 7.1.0.0-114D`
	
	`!`
	`!`
	`version 2.6`
	`!`
	`!`
	`client-identity-group default`
	`load default-fingerprints`
	`!`
	`client-identity-group test2`
	`load default-fingerprints`
	`!`
	`===alias encrypted-string $WRITE 2 o5gA2zqj/q/REWi8rTa7vQAAAAh4yA1YNBjqTVf4mMBsGA4i`
	`!`
	`===alias encrypted-string $enAlias2 2 JI4lPuMaCdMMx7rfBeyIAwAAAAoZ6tR1FfTlFXWvSicTMVZc`
	`!`
	`--More--`
	`nx9500-6C8809(config)#`
	Execute the `write > memory` command to save these changes.

```
show running-config {aaa-policy|application-policy|association-acl-policy|
auto-provisioning-policy|captive-portal-policy|database-client-policy|database-policy|
dhcp-server-policy|dhcpv6-server-policy|ex3500-management-policy|ex3500-qos-class-map-
policy|
ex3500-qos-policy-map|guest-management-policy|firewall-policy|management-policy|nsight-
policy|
radio-qos-policy|roaming-assist-policy|rtl-server-policy|schedule-policy|smart-rf-policy|
web-filter-policy|wlan-qos-policy} <POLICY-NAME> {include-factory}
```

running-config	Displays current running configuration Optionally, execute the command along with one of the associated keywords to view the running configuration for that top-level object. For example, to view a policy and its configuration, specify the policy type and provide the policy name. Note: If the command is executed without a keyword, the system displays the entire running configuration.
<POLICY-TYPE> <POLICY-NAME>	Optional. Select the policy type, for example, aaa-policy, auto-provisioning-policy, captive-portal-policy, etc. and then specify the policy name. The system displays the selected policy's configuration. • <POLICY-NAME> – Specify the name of the policy (should be existing and configured).
include-factory	The following keyword is common to all policies: • include-factory – Optional. Includes factory defaults

```
show running-config {application <APPLICATION-NAME>|apllication-group <APPLICATION-GROUP-NAME>}
```

running-config	Displays current running configuration Optionally, execute the command along with one of the associated keywords to view the running configuration for that top-level object. For example, to view a policy and its configuration, specify the policy type and provide the policy name. Note: If the command is executed without a keyword, the system displays the entire running configuration.
application <APPLICATION-NAME>	Displays an application's configuration. The application can be system-provided or user-defined. • <APPLICATION-NAME> – Specify the application name (should be existing).
application-group <APPLICATION-GROUP-NAME>	Displays an application-group's configuration • <APPLICATION-GROUP-NAME> – Specify the application-group name (should be existing and configured).

```
show running-config {device [<MAC>|self]} {include-factory}
```

running-config	Displays current running configuration Optionally, execute the command along with one of the associated keywords to view the running configuration for that top-level object. For example, to view a policy and its configuration, specify the policy type and provide the policy name. Note: If the command is executed without a keyword, the system displays the entire running configuration.
device [<MAC>|self]	Optional. Displays device configuration • <MAC> – Displays a specified device configuration. Specify the MAC address of the device. • self – Displays the logged device's configuration
include-factory	This keyword is common to all of the above keywords: • include-factory – Optional. Includes factory defaults

```
show running-config {hide-encrypted-values {exclude-devices|include-factory}}
```

running-config	Displays current running configuration Optionally, execute the command along with one of the associated keywords to view the running configuration for that top-level object. For example, to view a policy and its configuration, specify the policy type and provide the policy name. Note: If the command is executed without a keyword, the system displays the entire running configuration.
hide-encrypted-values {exclude-devices|include-factory}	Optional. Replaces all encrypted passwords with the standard characters ****** in the `show > running-config` output • exclude-devices – Optional. Excludes devices from the running configuration displayed • include-factory – Optional. Includes factory default values in the running configuration displayed

```
show running-config {device-overrides {brief}}
```

running-config	Displays current running configuration
device-overrides brief	Optional. Displays overrides applied at the device's configuration • brief – Optional. Displays a brief summary of device overrides

```
show running-config {exclude-devices}
```

running-config	Displays current running configuration
exclude-devices	Optional. Excludes device configuration details from the running configuration displayed

```
show running-config {include-factory}
```

running-config	Displays current running configuration
include-factory	Optional. Includes factory defaults

```
show running-config {interface} {<INTERFACE-NAME>|ge <1-4>|include-factory|
me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {include-factory}
```

running-config	Displays current running configuration
interface	Optional. Displays interface configuration
<INTERFACE-NAME>	Optional. Displays a specified interface configuration. Specify the interface name.
ge <1-4>	Optional. Displays GigabitEthernet interface configuration • <1-4> – Specify the GigabitEthernet interface index from 1 - 4.
me1	Optional. Displays FastEthernet interface configuration
port-channel <1-2>	Optional. Displays port channel interface configuration • <1-2> – Specify the port channel interface index from 1 - 2.
pppoe1	Optional. Displays PPP over Ethernet interface configuration
vlan <1-4094>	Displays VLAN interface configuration • <1-4094> – Specify the VLAN interface number from 1 - 4094.
wwan1	Optional. Displays Wireless WAN interface configuration
include-factory	The following keyword is common to all interfaces: • include-factory - Optional. Includes factory defaults

```
show running-config {ip-access-list <IP-ACCESS-LIST-NAME>|ipv6-access-list
<IPv6-ACCESS-LIST-NAME>|mac-access-list <MAC-ACCESS-LIST-NAME} {include-factory}
```

running-config	Displays current running configuration Optionally, execute the command along with one of the associated keywords to view the running configuration for that top-level object. For example, to view a policy and its configuration, specify the policy type and provide the policy name. Note: If the command is executed without a keyword, the system displays the entire running configuration.
ip-access-list <IP-ACCESS-LIST-NAME>	Optional. Displays IP access list configuration • <IP-ACCESS-LIST-NAME> – Specify the IP access list name

<ACL-TYPE> <IP/IPv6/MAC-ACL-NAME>	Optional. Select the ACL type, for example, ip-access-list, ipv6-access-list, or mac-access-list, and then specify the ACL name. The system displays the selected ACL's configuration. • <IP/IPv6/MAC-ACL-NAME> – Specify the name of the ACL (should be existing and configured).
include-factory	The following keyword is common to the 'ip-access-list' and 'mac-access-list' parameters: • include-factory - Optional. Includes factory defaults

```
show running-config {meshpoint <MESHPOINT-NAME>} {include-factory}
```

running-config	Displays current running configuration
meshpoint <MESHPOINT-NAME>	Optional. Displays meshpoint configuration • <MESHPOINT-NAME> – Specify the meshpoint name
include-factory	Optional. Includes factory defaults along with running configuration details

```
show running-config {profile [anyap|ap505|ap510|rfs4000|nx5500|nx75xx|
nx9000|nx9600] <PROFILE-NAME>} {include-factory}
```

running-config	Displays current running configuration
profile <DEVICE-TYPE> <PROFILE-NAME>	Optional. Displays current configuration for a specified profile. Select the device type, and then specify the profile name. • <DEVICE-TYPE> – Select the device type. The options are: AP505, AP510, RFS4000, NX5500, NX7500, NX9500, NX9600, and VX9000 • <PROFILE-NAME> – Specify the profile name for the selected <DEVICE-TYPE>. Note: Select the 'anyap' option to view the running configuration of any type of device.
include-factory	Optional. This parameter is common to all profiles. When selected, it includes factory defaults in the output.

```
show running-config {rf-domain <DOMAIN-NAME>} {include-factory}
```

running-config	Displays current running configuration
rf-domain <DOMAIN-NAME>	Optional. Displays current configuration for a RF Domain • <DOMAIN-NAME> – Displays current configuration for a specified RF Domain. Specify the RF Domain name.
include-factory	Optional. Includes factory defaults

```
show running-config {wlan <WLAN-NAME>}{include-factory}
```

running-config	Displays current running configuration
wlan <WLAN-NAME>	Optional. Displays current configuration for a WLAN • <WLAN-NAME> – Displays current configuration for a specified WLAN. Specify the WLAN name.
include-factory	Optional. Includes factory defaults

```
show running-config url-filter <URL-FILTER-NAME>
```

running-config	Displays current running configuration
url-filter <URL-FILTER-NAME>	Optional. Displays current configuration for the URL filter identified by the <URL-FILTER-NAME> keyword • <URL-FILTER-NAME> – Specify the URL filter's name.

```
show running-config url-list <URL-LIST-NAME> {include-factory}
```

running-config	Displays current running configuration
url-list <URL-LIST-NAME>	Optional. Displays current configuration for the URL list identified by the <URL-LIST-NAME> keyword • <URL-LIST-NAME> – Specify the URL list's name.
include-factory	Optional. Includes factory defaults

session-changes

Displays configuration changes made in the current session

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show session-changes
```

Parameters

```
None
```

Examples

```
nx9500-6C8809#show session-changes

No changes in this session

nx9500-6C8809#
```

session-config

Lists active open sessions on a device

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show session-config {exclude-devices|include-factory}
```

Parameters

```
show session-config {exclude-devices|include-factory}
```

session-config {exclude-devices| include-factory}	Displays current session configuration • exclude-devices – Optional. Excludes device configuration details from the output • include-factory – Optional. Includes factory defaults

Examples

```
nx9500-6C8809>show session-config
!
! Configuration of NX9500 version 7.1.0.0-010D

sessions

Displays CLI sessions initiated on a device

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show sessions all {on <DEVICE-NAME>}
```

Parameters

```
show sessions all {on <DEVICE-NAME>}
```

sessions	Displays CLI sessions initiated on a device
all	Displays all sessions including internal
on <DEVICE-NAME>	Optional. This is a recurring keyword and is common to the 'all' parameter. Displays CLI sessions on a specified device. • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809#show sessions
INDEX   COOKIE  NAME            START TIME              FROM                ROLE
1       2       snmp            2018-02-02 08:39:28     127.0.0.1           superuser
2       3       snmp2           2018-02-02 08:39:28     127.0.0.1           superuser
3       53      admin           2018-02-09 14:43:19     134.141.244.24      superuser

nx9500-6C8809#
```

site-config-diff

Displays the difference in site configuration available on the NOC and a site.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single NOC controller, The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage Access Points that form the third tier of the hierarchy.

NOC controllers possess default site configuration details. Overrides applied at the site level result in a mismatch of configuration at the site and the default site configuration available on the NOC controller. Use this command to view this difference.

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Note
This command returns an output only when executed on a NOC controller.

Syntax

```
show site-config-diff <SITE-NAME>
```

Parameters

```
show site-config-diff <SITE-NAME>
```

site-config-diff <SITE-NAME>	Displays the configuration difference for the specified site • <SITE-NAME> – Specify the site name.

Examples

```
nx9500-6C8809#show site-config-diff 5C-0E-8B-18-06-F4
---- Config diff for switch 5C-0E-8B-18-06-F4 ----
rfs4000 5C-0E-8B-18-06-F4
interface pppoe1
  no shutdown
nx9500-6C8809#
```

smart-rf

Displays *Self-Monitoring At Run Time RF* (Smart RF) statistical history to assess adjustments made to device configurations to compensate for detected coverage holes or device failures

When invoked by an administrator, Smart RF instructs access point radios to change to a specific channel and begin beaconing using the maximum available transmit power. Within a well-planned deployment, any RF Domain member access point radio should be reachable by at least one other radio. Smart RF records signals received from its neighbors as well as signals from external, un-managed radios. AP-to-AP distance is recorded in terms of signal attenuation. The information from external radios is used during channel assignment to minimize interference.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show smart-rf [ap|channel-distribution|history|history-timeline|interfering-ap|
interfering-neighbors|radio|select-shutdown]
show smart-rf ap {<MAC>|<DEVICE-NAME>|activity|energy|neighbors|on <DOMAIN-NAME>}
show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}
show smart-rf ap (activity|energy|neighbors) [<MAC>|<DEVICE-NAME>] {(on <DOMAIN-NAME>)}
show smart-rf [channel-distribution|history|history-timeline] {on <DOMAIN-NAME>}
show smart-rf radio {<MAC>|activity|all-11an|all-11bgn|channel|energy|neighbors|
on <DOMAIN-NAME>}
show smart-rf radio {<MAC>|all-11an|all-11bgn|energy <MAC>} {on <DOMAIN-NAME>}
show smart-rf radio {activity|neighbors} {<MAC>|all-11an|all-11bgn}
{on <DOMAIN-NAME>}
show smart-rf interfering-ap {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>}
show smart-rf interfering-neighbors {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>|
threshold <50-100>}
show smart-rf select-shutdown {AP-MAC|<AP-DEVICE-NAME>|on <RF-DOMAIN-NAME>}
```

Parameters

```
show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}
```

smart-rf	Displays Smart RF related information
ap	Displays access point related Smart RF information
<MAC>	Optional. Uses MAC addresses to identify access points. Displays all access points, if no MAC address is specified.
<DEVICE-NAME>	Optional. Uses an administrator defined name to identify an access point
on <DOMAIN-NAME>	Optional. Displays access point details on a specified RF Domain • <DOMAIN-NAME> – Specify the domain name.

```
show smart-rf ap (activity|energy|neighbors) [<MAC>|<DEVICE-NAME>]
{(on <DOMAIN-NAME>)}
```

smart-rf	Displays Smart RF related information
ap	Displays AP related Smart RF information

activity	Optional. Displays Smart RF activity related information Use this option to view the following: • Time-period – Lists the frequency Smart RF activity is trended for the RF Domain. Trending periods include the current hour, last 24 hours, or the last seven days. Comparing Smart RF adjustments versus the last seven days enables an administrator to assess whether periods of interference and poor performance were relegated to just specific periods. • Power changes – Displays the number of Smart RF initiated power level changes needed for RF Domain member devices during each of the three trending periods. Determine whether power compensations were relegated to known device outages or if compensations were consistent over the course of a day or week. • Channel changes – Lists the number of Smart RF initiated channel changes needed for RF Domain member devices during each of the three trending periods. Determine if channel adjustments were relegated to known device count increases or decreases over the course of a day or week. • Coverage changes – Displays the number of Smart RF initiated coverage changes needed for RF Domain member devices during each of the three trending periods. Determine if coverage changes were relegated to known device failures or known periods of interference over the course of a day or week.
energy	Optional. Displays AP energy for a specified AP or all APs Use this option to view an RF Domain member access point's operating channels, noise level and neighbor count. This information helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing access points.
neighbors	Optional. Displays AP neighbors Use this option to view attributes of neighbor radio resources available for Smart RF radio compensations for other RF Domain member device radios.
{<MAC>| <DEVICE-NAME>}	The following keywords are common to all of the above parameters: • <MAC> – Displays all of the above mentioned information for a specified AP, identified by its MAC address. Specify the AP's MAC address. • <DEVICE-NAME> – Displays all of the above mentioned information for a specified AP, identified by its hostname. Specify the AP's hostname.
on <DOMAIN-NAME>	Optional. Displays Access Point details on a specified RF Domain. • <DOMAIN-NAME> – Specify the domain name.

```
show smart-rf [channel-distribution|history|history-timeline] {on <DOMAIN-NAME>}
```

smart-rf	Displays Smart RF related information
channel-distribution	Displays Smart RF channel distribution information. This provides an overview of how RF Domain member devices are utilizing different channels to optimally support connect devices and avoid congestion and interference with neighboring devices. Assess whether the channel spectrum is being effectively utilized and whether channel changes are warranted to improve RF Domain member device performance.
history	Displays Smart RF calibration history. Use this option to view description and types of Smart RF events impacting RF Domain member devices.

history-timeline	Displays extended Smart RF calibration history on an hourly or daily timeline. Use this option to view the time stamp when Smart RF status was updated on behalf of a Smart RF adjustment within the selected RF Domain.
on <DOMAIN-NAME>	This parameter is common to all of above smart RF options: • on <DOMAIN-NAME> – Optional. Displays Smart RF configuration, based on the parameters passed, on a specified RF Domain • on <DOMAIN-NAME> – Specify the RF Domain name.

```
show smart-rf radio {<MAC>|all-11an|all-11bgn|energy <MAC>} {on <DOMAIN-NAME>}
```

smart-rf	Displays Smart RF related information
radio	Displays radio related commands
<MAC>	Optional. Displays details of a specified radio. Specify the radio's MAC address in the AA-BB-CC-DD-EE-FF format.
all-11an	Optional. Displays all 11a radios currently in the configuration
all-11bgn	Optional. Displays all 11bg radios currently in the configuration
energy {<MAC>}	Optional. Displays radio energy Specify the MAC address of the radio • <MAC> – Optional. Specify the radio's MAC address in the AA-BB-CC-DD-EE-FF format. Use this option to view an RF Domain member access point radio's operating channel, noise level and neighbor count. This information helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing radios.
on <DOMAIN-NAME>	The following keyword is common to all of the above parameters: • on <DOMAIN-NAME> – Optional. Displays radio details on a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
show smart-rf radio {activity|neighbors} {<MAC>|all-11an|all-11bgn}
{on <DOMAIN-NAME>}
```

smart-rf	Displays Smart RF related information
radio	Displays radio related commands
activity	Optional. Displays changes related to radio power, number of radio channels, or coverage holes. Use additional filters to view specific details.
<MAC>	Optional. Displays radio activity for a specified radio • <MAC> – Specify the radio's MAC address.
all-11an	Optional. Displays radio activity of all 11a radios in the configuration
all-11bgn	Optional. Displays radio activity of all 11bg radios in the configuration
on <DOMAIN-NAME>	Optional. Displays radio activity of all radios within a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
show smart-rf interfering-ap {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>}
```

smart-rf	Displays Smart RF related information
interfering-ap	Displays interfering access points (requiring potential isolation) information
<MAC>	Optional. Displays information of a specified interfering access point • <MAC> – Specify the Access Point's MAC address. Note: Considers all APs if this parameter is omitted
<DEVICE-NAME>	Optional. Displays interfering Access Point information on a specified device • <DEVICE-NAME> – Specify the device name. Note: Considers all APs if this parameter is omitted
on <DOMAIN-NAME>	Optional. Displays all interfering Access Point information within a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
show smart-rf interfering-neighbors {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>|
threshold <50-100>}
```

smart-rf	Displays Smart RF related information
interfering-ap	Displays interfering neighboring Access Point information
<MAC>	Optional. Displays interfering neighboring Access Point information • <MAC> – Specify the Access Point's MAC address. Note: Considers all APs if this parameter is omitted
<DEVICE-NAME>	Optional. Displays all interfering neighboring Access Point information on a specified device • <DEVICE-NAME> – Specify the device name. Note: Considers all APs if this parameter is omitted
threshold <50-100>	Optional. Specifies the maximum attenuation threshold of interfering neighbors • <50-100> – Specify a value from 50 -100 dB. Attenuation is a measure of the reduction of signal strength during transmission. Attenuation is the opposite of amplification, and is normal when a signal is sent from one point to another. If the signal attenuates too much, it becomes unintelligible. Attenuation is measured in decibels.
on <DOMAIN-NAME>	Optional. Displays radio activity of all radios within a specified RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
show smart-rf select-shutdown {AP-MAC|<AP-DEVICE-NAME>|on <RF-DOMAIN-NAME>}
```

smart-rf	Displays Smart RF related information
select-shutdown	Displays 2.4 GHz APs shutdown to maintain *co-channel interference* (CCI) levels within specified limits. Note, this information is displayed only if select-shutdown is enabled in the smart-rf policy context. For more information, see select-shutdown on page 1653.
<AP-MAC>	Optional. Displays if a specified AP, identified by its MAC address, was shutdown as part of the select-shutdown feature. • <AP-MAC> – Specify the access point's MAC address. **Note:** Considers all APs if this parameter is omitted.
<AP-DEVICE-NAME>	Optional. Displays if a specified AP, identified by its device name, was shutdown as part of the select-shutdown feature. • <DEVICE-NAME> – Specify the AP's device name. **Note:** Considers all APs if this parameter is omitted.
on <RF-DOMAIN-NAME>	Optional. Displays APs, within a specified RF Domain, that were shutdown as part of the select-shutdown feature. • <RF-DOMAIN-NAME> – Specify the RF Domain name.

snmpv3 (show command)

Displays the SNMPv3 engineID

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7532, AP 7562, AP 7602, AP-7612, AP 7622, AP7632, AP7662, AP-8163, AP-8432, AP-8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
show snmpv3 engineID
```

Parameters

```
show snmpv3 engineID
```

show snmpv3 engineID	displays the SNMPv3 engineID

Examples

```
NOC-NX9500>show snmpv3 engineID
SNMPv3 EngineID: 8000018480e3a66a6699599451
NOC-NX9500>
```

spanning-tree

Displays spanning tree utilization information

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show spanning-tree mst {configuration|detail|instance|on}
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
show spanning-tree mst {detail} {interface|on}
show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|
port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>}
{(on <DEVICE-NAME>)}
```

Parameters

```
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
```

spanning-tree	Displays spanning tree utilization information
mst	Displays *Multiple Spanning Tree* (MST) related information
configuration {on <DEVICE-NAME>}	Optional. Displays MST configuration • on <DEVICE-NAME> – Optional. Displays MST configuration on a specified device • <DEVICE-NAME> – Specify the name of the AP,wireless controller, or service platform.

```
show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|
port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}
```

spanning-tree	Displays spanning tree information
mst	Displays MST configuration
detail	Optional. Displays detailed MST configuration, based on the parameters passed

interface [<INTERFACE>| age <1-4>| me1| port-channel <1-2>| pppoe1| vlan <1-4094> wwan1]	Displays detailed MST configuration for a specified interface
	• <INTERFACE> – Displays detailed MST configuration for a specified interface. Specify the interface name.
	• age <1-4> – Displays GigabitEthernet interface MST configuration
	  • <1-4> – Select the GigabitEthernet interface index from 1 - 4.
	• me1 – Displays FastEthernet interface MST configuration
	• port-channel – Displays port channel interface MST configuration
	  • <1-2> – Select the port channel interface index from 1 - 2.
	• pppoe1 – Displays PPP over Ethernet interface MST configuration
	• vlan – Displays VLAN interface MST configuration
	  • <1-4094> – Select the SVI VLAN ID from 1 - 4094.
	• wwan1 – Displays Wireless WAN interface MST configuration

on <DEVICE-NAME>	The following keyword is common to all interfaces: Optional. Displays detailed MST configuration on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>}
{(on <DEVICE-NAME>)}
```

spanning-tree	Displays spanning tree information
mst	Displays MST configuration. Use additional filters to view specific details.
instance <1-15>	Optional. Displays information for a particular MST instance • <1-15> – Specify the instance ID from 1 - 15.
interface <INTERFACE-NAME>	Optional. Displays MST configuration for a specific interface instance. The options are: • <INTERFACE-NAME> – Displays MST configuration for a specified interface. Specify the interface name.
on <DEVICE-NAME>	Optional. Displays MST configuration on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```

startup-config

Displays complete startup configuration script

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show startup-config {include-factory}
```

Parameters

```
show startup-config {include-factory}
```

startup-config include-factory	Displays startup configuration script • include-factory – Optional. Includes factory defaults

Examples

```
nx9500-6C8809#show startup-config

t5

Displays adopted T5 controller statistics

Note
This command is applicable only on WiNG controllers with adopted and managed T5 controllers.

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
show t5 [boot|clock|cpe|interface|mac|system|temperature|uptime|version|
wireless] {on <T5-DEVICE-NAME>}

show t5 [boot|clock|system|temperature|uptime|version]
{on <T5-DEVICE-NAME>}

show t5 cpe [address|boot|ether port status|led|reset|system|uptime|version]
{on <T5-DEVICE-NAME>}

show t5 interface [dsl|fe|ge|radio]

show t5 interface [dsl|fe|ge] [counter|description|errors|status|utilization]
{on <T5-DEVICE-NAME>}

show t5 interface dsl custom [avg|dses|dsses|peak|uses|usses]
{on <T5-DEVICE-NAME>}

show t5 interface radio [stats|status|wlam-map]
{on <T5-DEVICE-NAME>}

show t5 mac table [filter name [dsl<1-24>|ge <1-2>|vlan <1-4094>|wlan <1-24>]
{on <T5-DEVICE-NAME>}

show t5 wireless [client|wlan]

show t5 wireless client {filter name [association-status|authentication-status|
bss|mac-address|retry-percentage|rssi-value]} {on <T5-DEVICE-NAME>}

show t5 wireless wlan counters [qos|rate|size]
{on <T5-DEVICE-NAME>}
```

Parameters

```
show t5 [boot|clock|system|temperature|uptime|version]
{on <T5-DEVICE-NAME>}
```

t5	Displays adopted T5 controller statistics
boot	Displays the T5 device's boot details. Use this option to view the primary and secondary image files available to use for booting up.
clock	Displays the T5 controller's system time, as reported from the controller itself or its remote NTP time resource
system	Displays T5 controller's system information, which includes the T5 controller's hostname, MAC address, RF Domain, system clock, uptime
temperature	Displays T5 controller's current temperature
uptime	Displays the T5 controller's uptime (the time it has been actively deployed and operational)

version	Displays the T5 controller's primary and secondary firmware images
on <T5-DEVICE-NAME>	Optional. Executes the command on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 cpe [address|boot|ether port status|led|reset|system|uptime|version]
{on <T5-DEVICE-NAME>}
```

t5	Displays adopted T5 controller statistics
cpe	Displays the T5 controller managed *Customer Premises Equipment* (CPE) statistics based on the parameters passed. Use this command to verify each CPE address credentials and whether currently disconnected or ready for radio coverage area support.
address	Displays each linked CPE's current IP address used as its network identifier
boot	Displays the primary and secondary firmware versions available to each CPE, along with status of the most recent upgrade operation details
ether port status	Displays Ethernet port status
led	Displays whether the CPEs currently have their LEDs enabled or disabled. In places like hospitals, its not uncommon for access points to be operational, but their LEDs off as to not disturb patients.
reset	Displays the number times a CPE has been reset
system	Displays device hardware and SKU information for each CPE. Use this information to assess whether a controller is managing the correct CPE devices out of the total number of CPEs available.
uptime	Displays the time each CPE device has been actively deployed and operational
version	Displays the application and boot versions utilized by the CPE devices
on <T5-DEVICE-NAME>	Optional. Executes the command on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 interface [dsl|fe|ge] [counter|description|errors|status|utilization]
{on <T5-DEVICE-NAME>}
```

t5	Displays adopted T5 controller statistics
interface	Displays T5 interface-related statistics based on the interface selected

[dsl|fe|ge|radio] [counter| description| errors|status| utilization]	Select the interface type. The options are: **dsl**, **fe**, and **ge**.
	• dsl – Displays *Digital Subscriber Line* (DSL) interface related information
	• fe – Displays *Fast Ethernet* (FE) interface related information
	• ge – Displays *Gigabit Ethernet* (GE) interface related information
	
	The system displays the following information for the DSL, GE, and FE ports:
	• counter – Displays the following:
	  • Number of octets (bytes) received and transmitted on this port
	  • Number of data packets received and transmitted on this port
	  • Number of flow control (layer 2) packets received and transmitted on this port
	• description – Displays the following:
	  • The selected port's name
	  • The numeric index assignable to each port
	  • The 64 character maximum, unique, administrator-assigned description to each port
	• errors – Displays the following DSL interface related errors:
	  • The name of the DSL utilized by each T5 controller connected CPE device
	  • The number of FECs detected in the downstream direction. *Forward Error Correction* (FEC) or channel coding is used for controlling errors over unreliable or noisy communication channels.
	  • The number of CPE DSL coding violations (badly coded packets) detected in the downstream direction.
	  • The number of FECs detected in the upstream direction.
	  • The number of CPE DSL coding violations (badly coded packets) detected in the upstream direction.
	• status – Displays the following:
	  • The selected port's name
	  • Whether the port is currently up or down as a T5 controller transmit and receive resource
	  • The port's current speed in MB
	  • Whether pause packet utilization is currently off or on for the selected port
	  • Whether each listed port is enabled or disabled by the administrator
	• utilization – Displays the following:
	  • The selected port's name
	  • The port's receive and transmit data rates (in Kbps)
	  • The packet per second port receive and transmit rates (p/s)
	  • Each port's receive and transmit direction utilization as a percentage of the total transmit bandwidth available.

on <T5-DEVICE-NAME>	Optional. Executes the command on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 interface dsl custom [avg|dses|dsses|peak|uses|usses]
{on <T5-DEVICE-NAME>}
```

t5	Displays adopted T5 controller statistics
interface	Displays T5 interface-related statistics based on the interface selected
dsl	Selects A T5 controller's DSL interface. A T5 controller uses the operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.
custom [avg|dses|dsses|peak|uses|usses]	Displays following custom CPE DSL data: • avg – Each DSL's average response time in microseconds • dses – The number of seconds downstream DSL transmissions were negatively impacted by code violations. • dsses – The number of seconds downstream DSL transmissions were severely negatively impacted by code violations. • peak – Each DSL's maximum (best to date since the screen was refreshed) response time in microseconds. • uses – The number of seconds upstream DSL transmissions were negatively impacted by code violations. • usses – The number of seconds upstream DLS transmissions were severely negatively impacted by code violations.
on <T5-DEVICE-NAME>	Optional. Executes the command on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 interface radio [stats|status|wlam-map] {on <T5-DEVICE-NAME>}
```

t5	Displays adopted T5 controller statistics
interface	Displays T5 interface-related statistics based on the interface selected

radio [stats|status| wlan-map]	Displays following radio interface related information:
	• stats – Displays T5 radio interface statistics. A T5 controller uses the operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the operating system. Use this option to view the following:
	  • name – The administrator assigned name of each listed CPE radio as its unique identifier
	  • Rx (Kbps) – The listed CPE radio's receive data rate (in Kbps). Use this information to assess RF activity versus other T5 managed CPE radios in the same radio coverage area.
	  • Rx Octets – The number of octets (bytes) received with no errors by the listed T5 controller managed CPE radio.
	  • Rx Packets – The number of data packets received for the listed T5 managed CPE radio since this screen was last refreshed.
	  • Tx (Kbps) – The listed CPE radio's transmit data rate (in Kbps). Use this information to assess RF activity versus other T5 managed CPE radios in the same radio coverage area.
	  • Tx Octets – Displays the number of octets (bytes) transmitted with no errors by the listed T5 controller managed CPE radio.
	  • Tx Packets – The number of data packets transmitted from the listed T5 managed CPE radio since this screen was last refreshed.
	• status – Displays T5 radio interface status information
	  • name – The administrator assigned name of each listed CPE radio as its unique identifier.
	  • Operational status – The radio interface's operational status (enabled/disabled).
	  • mac – The T5 radio interface's MAC address.
	  • transmit power – The T5 radio interface's transmit power.
	  • Channel – The T5 radio interface's channel of operation.
	• wlan-map – Displays WLAN map membership data for T5 controller managed CPE radio devices. Use this option to view the following:
	  • name – The administrator assigned name of each listed CPE radio as its unique identifier.
	  • status – Whether a CPE radio is currently enabled or disabled as a radio resource for the WLAN(s) the CPE radio has been mapped to.
	  • wlan-radio-mapping – The managed WLAN(s) each listed radio has been mapped to.

on <T5-DEVICE-NAME>	Optional. Executes the command on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 mac table [filter name [dsl<1-24>|ge <1-2>|vlan <1-4094>|wlan <1-24>]
{on <T5-DEVICE-NAME>}
```

t5	Displays adopted T5 controller statistics
mac table [dsl<1-24>|ge <1-2>| vlan <1-4094>| wlan <1-24>]	Displays T5 MAC address table. The T5 MAC table displays a dynamic list of MAC addresses learned by the T5 controller over its ethernet interfaces. Use this information to identify devices and the interfaces on which they can be found. Use the following additional filters to filter on the basis of the VLAN or DSL interface: • dsl <1-24> – Filters information on the basis of the selected DSL port • ge <1-2> – Filters information on the basis of the selected GE port • vlan <1-4094 – Filters information on the basis of the selected VLAN port • wlan <1-24> – Filters on the basis of the selected CPE
on <T5-DEVICE-NAME>	Optional. Executes the command on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 wireless client {filter name [association-status|authentication-status|bss|
mac-address|retry-percentage|rssi-value]} {on <T5-DEVICE-NAME>}
```

t5	Displays adopted T5 controller statistics
wireless client	Displays the T5 wireless client and WLAN related statistics • client – Displays read-only device information for wireless clients associated with the selected T5 controller and its connected CPE device radios. Use this information to assess if configuration changes are required to improve client performance. Use the additional filters available to view specific client-related information. The options are: • association-status • authentication-status • bss • retry-percentage • rssi-value
on <T5-DEVICE-NAME>	Optional. Executes the command on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 wireless wlan counters [qos|rate|size] {on <T5-DEVICE-NAME>}
```

t5	Displays adopted T5 controller statistics
wireless wlan [qos|rate|size]	Displays the T5 wireless WLAN related statistics • wlan – Displays following T5 controller traffic counter statistics: • qos – Displays T5 controller WLAN QoS utilization. Displays the number of background (low priority) and best-effort packets received and transmitted on each listed T5 controller managed WLANs • rates – Displays T5 controller's WLAN utilization data rate statistics Lists the number of data packets received and transmitted in the WLAN that have been relegated to a 1 Mbps data rate Lists the number of data packets received and transmitted in the WLAN by T5 controller connected devices at 54Mbps • size – Displays the number of data packets received and transmitted, in each listed WLAN, greater than 1024 bytes
on <T5-DEVICE-NAME>	Optional. Executes the command on a specified T5 device • <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

Examples

The following examples are for show commands executed on the 't5-ED7C6C' controller adopted by the 'nx9500-6C8809' wireless controller:

```
nx9500-6C8809(config)#show t5 boot on t5-ED7C6C

terminal

Displays terminal configuration parameters

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show terminal
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config)#show terminal
Terminal Type: xterm
Length: 24     Width: 200
nx9500-6C8809(config)#
```

timezone

Displays a device's timezone

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show timezone
```

Parameters

```
None
```

Examples

```
nx9500-6C8809(config)#show timezone
Timezone is America/Los_Angeles
nx9500-6C8809(config)#
```

traffic-shape

Displays traffic-shaping related configuration details and statistics. Traffic shaping regulates network data transfers to ensure a specific performance level. Traffic shaping delays the flow of packets defined as less important than prioritized traffic streams. Traffic shaping enables traffic control out an interface

to match its flow to the speed of a remote target's interface and ensure traffic conforms applied policies. Traffic can be shaped to meet downstream requirements and eliminate network congestion when data rates are in conflict.

Apply traffic shaping to specific applications to apply application categories. When application and ACL rules are conflicting, ACL rules take precedence for the traffic shaping class. Using traffic shaping, an application takes precedence over an application category.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}
```

Parameters

```
show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}
```

traffic-shape	Displays traffic-shaping related configuration details and statistics
priority-map	Displays the traffic shaper queue priority. There are 8 queues (0 - 7), and traffic is queued in each based on incoming packets 802.1p markings.
statistics class <1-4>	Displays traffic-shaping related statistics for all traffic shaper classes or for a selected class • class <1-4> – Optional. Specify the traffic class from 1 - 4. The system displays traffic shaping statistics for the selected class. If not selected, the system statistics for all classes.
status	Displays the controller or service platform's traffic shaping status (whether running or not)
on <DEVICE-NAME>	Optional. Displays traffic-shaping related configuration details and statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
ap7532-DEB9B0#show traffic-shape priority-map
----------------------------------------

tron (show command)

Displays the TRON-capable and TRON-enabled, WiNG AP's operating configuration.

Note

This command is applicable on TRON-capable, WiNG APs and controllers. And, the controller should have the TRON license applied, and TRON-capable and enabled AP(s) adopted to it.

Supported in the following platforms

- Access Points — AP-8533
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
show tron operating-config {on <DEVICE-NAME>}
```

Parameters

```
show tron operating-config {on <DEVICE-NAME>}
```

show tron operating-config	Displays the operating configuration parameters
on <DEVICE-NAME>	Optional. Executes the command on a specified AP, controller, or service platform Following are the error outputs of this command: • `% Error: Not available under current working mode` **Note:** You will get this message, if the device (AP or controller) on which you have executed the command does not have TRON up and running, or does not support the TRON feature. • `TRON Operating Configuration: (none)` **Note:** You will get this message, when the FedEx backend server has not yet pushed the operating configuration to the WiNGAP. For more information on configuring TRON parameters, see tron on page 1161.

Examples

```
NOC-NX9500#show tron operating-config on ap8533-070154
TRON Operating Configuration:
  Device_Master_Type:                  0x00 (Fixed)

NOC-NX9500#
```

upgrade-status

Displays the last image upgrade status

Note
This command is not available in the USER EXEC Mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show upgrade-status {detail|on}
show upgrade-status {detail} {(on <DEVICE-NAME>)}
```

Parameters

```
show upgrade-status {detail} {(on <DEVICE-NAME>)}
```

upgrade-status	Displays last image upgrade status and log
detail	Optional. Displays last image upgrade status in detail
on <DEVICE-NAME>	The following keyword is recursive and common to the 'detail' parameter: • on <DEVICE-NAME> – Optional. Displays last image upgrade status on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. Note: If the 'on' keyword is used without the 'detail' keyword, the system displays a summary of upgrade status and log on the specified device.

Examples

```
nx9500-6C8809#show upgrade-status
Last Image Upgrade Status :In_Progress(17 percent completed)
Last Image Upgrade Time   : 2017-02-11 12:26:29
nx9500-6C8809#
nx9500-6C8809#show upgrade-status detail

version

Displays a device's software and hardware version

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show version {on <DEVICE-NAME>}
```

Parameters

```
show version {on <DEVICE-NAME>}
```

version {on <DEVICE-NAME>}	Displays software and hardware versions on all devices or a specified device • on <DEVICE-NAME> – Optional. Displays software and hardware versions on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809#show version

vrrp

Displays *Virtual Router Redundancy Protocol* (VRRP)protocol details

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show vrrp [brief|details|error-stats|stats]
show vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}
show vrrp error-stats {on <DEVICE-NAME>}
```

Parameters

```
show vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}
```

vrrp	Displays VRRP related statistics in brief or in detail depending on the option selected
brief	Displays virtual router information in brief
details	Displays virtual router information in detail
stats	Displays virtual router statistics
<1-255>	The following keyword is common to all of the above parameters: • <1-255> – Optional. Displays information for a specified Virtual Router. Specify the router's ID from 1 -255.
on <DEVICE-NAME>	The following keyword is recursive and common to the '<1-255>' parameter: • on <DEVICE-NAME> – Optional. Displays specified router information on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show vrrp error-stats {on <DEVICE-NAME>}
```

vrrp	Displays VRRP related statistics in brief or in detail depending on the option selected
error-stats {on <DEVICE-NAME>}	Displays global error statistics • on <DEVICE-NAME> – Optional. Displays global error statistics on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809(config)#show vrrp error-stats
Last protocol error reason: none
IP TTL errors: 0
Version mismatch: 0
Packet Length error: 0
Checksum error: 0

  virtual mac address 00-00-5E-00-01-01
  sync group disable
nx9500-6C8809(config)#
```

virtual-machine

Displays the *virtual-machine* (VM) configuration, logs, and statistics

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX

Syntax

```
show virtual-machine [configuration|debugging|export|statistics]
show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|
team-vowlan} {(on <DEVICE-NAME>)}
show virtual-machine debugging {level|on}
show virtual-machine debugging {level [debug|error|info|warning]} {on <DEVICE-NAME>}
show virtual-machine export <VM-NAME> {on <DEVICE-NAME>}
show virtual-machine [configuration|statistics] {<VM-NAME>|adsp|team-cmt}
```

Parameters

```
show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|
team-vowlan} {(on <DEVICE-NAME>)}
```

virtual-machine	Displays the following VM-related information: configuration or statistics
configuration	Displays detailed VM configuration
statistics	Displays VM statistics
[<VM-NAME>| team-urc|team-rls| team-vowlan]	The following keywords are common to the 'configuration' and 'statistics' parameters: • VM-NAME> – Optional. Displays VM configuration or statistics for the virtual machine identified by the <VM-NAME> keyword. Specify the VM name. • team-urc – Optional. Displays TEAM-URC (IP-PBX) VM configuration/statistics • team-rls – Optional. Displays TEAM-RLS (Radio Link Server) VM configuration/statistics • team-vowlan – Optional. Displays TEAM-VoWLAN (Voice over WLAN) VM configuration/statistics
on <DEVICE-NAME>	Specifies the name of the device on which the command is executed • <DEVICE-NAME> – Specify the name of the service platform.

```
show virtual-machine [configuration|statistics] {<VM-NAME>|adsp|team-cmt}
{(on <DEVICE-NAME>)}
```

virtual-machine	Displays the following VM-related information: configuration or statistics
configuration	Displays detailed VM configuration
statistics	Displays VM statistics

[<VM-NAME>|adsp| team-cmt]	The following keywords are common to the 'configuration' and 'statistics' parameters: • VM-NAME> – Optional. Displays VM configuration or statistics for the virtual machine identified by the <VM-NAME> keyword. Specify the VM name. • adsp – Optional. Displays *Air-Defense Services Platform* (ADSP) VM configuration/statistics • team-cmt – Optional. Displays TEAM-CMT VM configuration/statistics
on <DEVICE-NAME>	Specifies the name of the device on which the command is executed • <DEVICE-NAME> – Specify the name of the service platform.

```
show virtual-machine debugging {level[debug|error|info|warning]}
{on <DEVICE-NAME>}
```

virtual-machine	Displays the following VM-related information: configuration or statistics
debugging	Displays VM debugging logs
level [debug| error|info|warning]	Optional. Displays VM debugging logs based on the level selected. The available options are: • debug – Displays VM logs of level debug and above • error – Displays VM logs of level error • info – Displays VM logs of level Info and above • warning – Displays logs of level warning and above
on <DEVICE-NAME>	Specifies the name of the device on which the command is executed • <DEVICE-NAME> – Specify the name of the service platform.

```
show virtual-machine export <VM-NAME> {on <DEVICE-NAME>}
```

virtual-machine	Displays the following VM-related information: configuration or statistics
export	Displays VM configuration export related information
<VM-NAME>]	Displays VM configuration export related information for the virtual machine identified by the <VM-NAME> keyword. Specify the VM name. The NX 95XX and NX 96XX series service platforms will display ADSP and TEAM-CMT VM configuration export information.
on <DEVICE-NAME>	Specifies the name of the device on which the command is executed • <DEVICE-NAME> – Specify the name of the service platform.

Examples

```
nx9500-6C874D#show virtual-machine statistics
--------------------------------------------------------------------------------
       NAME         STATE   VCPUS MEM (MB)    BRIDGE-IF             IP

 Install Status  : not_installed
nx9500-6C874D>
```

wireless

Displays wireless configuration information and statistics

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show wireless [ap|bridge|client|coverage-hole-incidents|location-server|mint|mobility-database|
radio|regulatory|rf-domain|sensor-server|unsanctioned|wips|wlan]

show wireless ap {configured|detail|load-balancing|on <DEVICE-NAME>}

show wireless ap {configured}

Parameters

```
show wireless ap {configured}
```

wireless	Displays wireless configuration parameters
ap	Displays managed access point information
configured	Optional. Displays configured AP information, such as name, MAC address, profile, RF Domain and adoption status.

```
show wireless ap {detail} {<MAC/HOST-NAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
ap	Displays managed access point information

detail <MAC/HOST-NAME>	Optional. Displays detailed information for all APs or a specified AP • <MAC/HOST-NAME> – Optional. Displays information for a specified AP. Specify the AP's MAC address.
on <DEVICE-OR-DOMAIN-NAME>}	The following keyword is recursive and common to the 'detail <MAC/HOST-NAME>' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays information on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless ap {load-balancing} {client-capability|events|neighbors} {(on <DEVICE-NAME>)}
```

wireless	Displays wireless configuration parameters
ap	Displays managed access point information
load-balancing {client-capability| events|neighbors}	Optional. Displays load balancing status. Use additional filters to view specific details. • client-capability – Optional. Displays client band capability • events – Optional. Displays client events • neighbors – Optional. Displays neighboring clients
on <DEVICE-NAME>	The following keyword is recursive and common to the 'client-capability', 'events', and 'neighbors' parameters: • on <DEVICE-NAME> – Optional. Displays load balancing information, based on the parameters passed, on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
show wireless bridge {candidate-ap} {<MAC/HOSTNAME> {<1-3>}} {(filter radio-mac <RADIO-MAC>)}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration statistics
bridge candidate-ap	Optional. Displays information about the candidate infrastructure access points as well as the infrastructure access point that the client-bridge radio has selected. Note: When enabled, the client-bridge radio scans its defined channels to locate the best candidate access point servicing the infrastructure WLAN.
<MAC/HOSTNAME> <1-3>	Optional. Specify the client-bridge access point's hostname or MAC address. Optionally append the radio interface's number to form client-bridge in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX. • <1-3> – Optional. Radio interface index if not specified as part of mesh ID.

filter radio-mac <RADIO-MAC>	This is a recursive parameter and common to all of the above options. • filter radio-mac – Optional. Provides additional filters to specifically identify the radio by its MAC address • <RADIO-MAC> – Specify the radio's MAC address.
on <DEVICE-OR-DOMAIN-NAME>	This is a recursive parameter and common to all of the above options. • on <DEVICE-OR-DOMAIN-NAME> – Optional. Executes the command on a specified device or devices within a specified RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the AP, controller, service platform, or RF Domain name.

```
show wireless bridge {certificate} status {on <DEVICE-NAME>}
```

wireless	Displays wireless configuration statistics
bridge certificate status	Optional. Displays all client bridges in configuration and the status of their PKCS#12 certificates
on <DEVICE-NAME>	Optional. Executes the command on a specified device • <DEVICE-NAME> – Specify the AP, controller, service platform name.

```
show wireless bridge {config}
```

wireless	Displays wireless configuration statistics
bridge config	Optional. Displays all client bridges in configuration The output displays the configured client-bridges' hostname, MAC address, profile, RF Domain, SSID, band, encryption, authentication, and EAP username.

```
show wireless bridge {hosts} {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration statistics
bridge hosts	Optional. Displays the client bridge host information The output displays the configured client-bridges' host's MAC Address, bridge MAC address, IPv4 address, bridging status, and activity. Note: The HOST MAC column displays real MAC addresses of wired hosts, while the BRIDGE MAC column displays the translated MAC addresses. The BRIDGE MAC column is based on the radio 2 base MAC address and increments by 1 for each wired host connected to the client bridges Ge1 port.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Executes the command on a specified device or devices within a specified RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Optional. Specify the AP, controller, service platform, or Domain name.

```
show wireless bridge {statistics} {rf|traffic} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration statistics
bridge statistics	Optional. Displays the client-bridge related statistics

rf	Optional. Displays the client-bridge related RF statistics The output displays the signal, noise, SNR, TX/RX rates, retries, and errors.
traffic	Optional. Displays the client-bridge related traffic statistics The output displays TX/RX bytes, TX/RX packets, TX/RX bits/second, and dropped packets.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Executes the command on a specified device or devices within a specified RF Domain • on <DEVICE-OR-DOMAIN-NAME> – Optional. Specify the AP, controller, service platform, or Domain name.

```
show wireless client {association-history <MAC>} {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
client	Displays client information based on the parameters passed
association-history <MAC>	Optional. Displays association history for a specified client • <MAC> – Specify the MAC address of the client.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays association history on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless client {detail <MAC>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
client	Displays client information based on the parameters passed
detail <MAC>	Optional. Displays detailed wireless client(s) information • <MAC> – Optional. Displays detailed information for a specified wireless client. Specify the MAC address of the client.
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is recursive and common to the 'detail <MAC>' parameter: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays detailed information on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless client {filter ip [<IP>|not <IP>]} {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
client	Displays client information based on the parameters passed

filter IP [<IP>|not <IP>]	Optional. Uses IP addresses to filter wireless clients • <IP> – Selects clients with IP address matching the <IP> parameter • not <IP> – Inverts the match selection
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is common to the 'IP' and 'not IP' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays selected wireless client information on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless client {filter} {state [data-ready|not [data-ready|roaming]|roaming]} {on
<DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
client	Displays client information based on the parameters passed
filter state [data-ready| not [data-ready| roaming]| roaming]	Optional. Filters clients based on their state • data-ready – Selects wireless clients in the data-ready state • not [data-ready|roaming] – Inverts match selection. Selects wireless clients neither ready nor roaming • Roaming – Selects roaming clients
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is common to the 'ready', 'not', and 'roaming' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays selected client details on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless client {filter} {wlan [<WLAN-NAME>|not <WLAN-NAME>]} {on <DEVICE-OR-DOMAIN-
NAME>}
```

wireless	Displays wireless configuration parameters
client	Displays client information based on the parameters passed
filter wlan [<WLAN-NAME>| not <WLAN-NAME>]	Optional. Filters clients on a specified WLAN • <WLAN-NAME> – Specify the WLAN name. • not <WLAN-NAME> – Inverts the match selection
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is common to the 'WLAN and 'not' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Filters clients on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless client {statistics} {detail <MAC>|rf|window-data <MAC>} {(on <DEVICE-OR-
DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
client	Displays client information based on the parameters passed

statistics {detail <MAC>|rf| window-data <MAC>}	Optional. Displays detailed client statistics. Use additional filters to view specific details.
	• detail <MAC> – Optional. Displays detailed client statistics
	  • <MAC> – Optional. Displays detailed statistics for a specified client. Specify the client's MAC address.
	• rf – Optional. Displays detailed RF statistics on a specified device or RF Domain
	• window-data <MAC> – Optional. Displays historical data, for a specified client
	  • <MAC> – Optional. Specify the client's MAC address

on <DEVICE-OR-DOMAIN-NAME>	The following keyword is recursive and common to the 'detail <MAC>', 'RF', and 'window-data <MAC>' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays client statistics, based on the parameters passed, on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless client {tspec} {<MAC>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
client	Displays client information based on the parameters passed
tspec <MAC>	Optional. Displays detailed TSPEC *(traffic specification)* information for all clients or a specified client • <MAC> – Optional. Displays detailed TSPEC information for a specified client. Specify the MAC address of the client.
on <DEVICE-OR-DOMAIN- NAME>	The following keyword is recursive and common to the 'tspec <MAC>' parameter: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays detailed TSPEC information for wireless clients on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless client {include-ipv6} {detail <MAC>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
client	Displays client information based on the parameters passed
include-ipv6	Includes IPv6 address (if known) of wireless clients

detail <MAC>	Optional. Displays detailed wireless client(s) information • <MAC> – Optional. Displays detailed information for a specified wireless client. Specify the MAC address of the client.
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is recursive and common to the 'detail <MAC>' parameter: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays detailed information on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless client {include-ipv6} {filter {ip|ipv6|state|wlan}}
```

wireless	Displays wireless configuration parameters
client	Displays wireless client information based on the parameters passed
include-ipv6 {filter}	Optional. Includes IPv6 address (if known) of wireless clients • filter – Optional. Defines additional filters. Use one of the following options to filter clients: ip, ipv6, state, and wlan. By default the system only displays the IPv4 address of clients. The include-ipv6 parameter includes the known IPv6 address of each client.
ip [<IPv4>|not <IPv4>]	Optional. Displays wireless client information based on the IPv4 address passed • <IPv4> – Displays information of the client identified by the <IPv4> parameter • not <IPv4> – Inverts the match selection
ipv6 [<IPv6>| not <Pv6>]	Optional. Displays wireless client information based on the IPv6 address passed • <IPv6> – Displays information of the client identified by the <IPv6> parameter • not <IPv6> – Inverts the match selection
filter state [data-ready|not [data-ready|roaming]|roaming]	Optional. Filters wireless client information based on their state • data-ready – Displays information of wireless clients in the data-ready state • not [data-ready|roaming] – Inverts match selection. Displays information of wireless clients neither ready nor roaming • Roaming – Displays information of roaming clients
wlan [<WLAN-NAME>| not <WLAN-NAME>]	Optional. Displays wireless client information based on the WLAN name passed • <WLAN-NAME> – Specify the WLAN name. • not <WLAN-NAME> – Inverts match selection

```
show wireless coverage-hole-incidents {detail} {filter [ap <MAC/HOSTNAME>|
client-mac <MAC>]|summary} {(on <DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters. Use this option to view coverage-hole related incidents encountered by wireless clients and reported to associated access points.
coverage-hole-incidents	Displays coverage-hole related statistics

detail filters [ap <MAC/ HOSTNAME>| client-mac <MAC>]	Optional. Displays detailed coverage-hole related statistics • filters – Optional. Displays detailed coverage-hole related statistics on a per access point or wireless-client basis • ap <MAC/HOSTNAME> – Displays detailed coverage-hole related statistics for a specified access point <MAC/HOSTNAME> – Specify the access point's device name or MAC address. • client-mac <MAC> – Displays detailed coverage-hole related statistics encountered by a specified wireless client <MAC> – Specify the wireless client's MAC address Note: If the command is executed without any parameters being included, the system displays all coverage-hole related statistics.
summary	Optional. Displays a summary of coverage-hole related statistics
on <DOMAIN-NAME>	This parameter is recursive and is common to the 'detail' and 'summary' keywords: • on <DOMAIN-NAME> – Optional. Displays detailed or summary coverage-hole related statistics on a specified RF Domain • <DOMAIN-NAME> – Specify the domain name.

```
show wireless location-server {on <AP-NAME>}
```

show wireless location-server on <AP-NAME>	Displays location server connection status on a specified access point • <DEVICE-NAME> - Specify the AP name.

```
show wireless meshpoint {config} {filter [device <DEVICE-NAME>|rf-domain <DOMAIN-NAME>]}
```

wireless	Displays wireless configuration parameters.
meshpoint	Displays meshpoint related information. Use this option to view detailed statistics on each Mesh-capable client available within controller's adopted access point's radio coverage area. A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes.
config	Optional. Displays all meshpoint configuration
filters [device <DEVICE-NAME>| rf-domain <DOMAIN-NAME>]	Optional. Provides additional filter options, such as device name and RF Domain name. • device <DEVICE-NAME> – Displays meshpoints applied to a specified device • <DEVICE-NAME> – Specify the device name • rf-domain <DOMAIN-NAME> – Displays meshpoints applied to a specified RF Domain • <DOMAIN-NAME> – Specify the domain name

```
show wireless meshpoint {detail} {<MESHPOINT-NAME>}
```

wireless	Displays wireless configuration parameters
meshpoint	Displays meshpoint related information. Use this option to view detailed statistics on each Mesh-capable client available within controller's adopted access point's radio coverage area. A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes.
detail <MESHPOINT-NAME>	Optional. Displays detailed information for all meshpoints or a specified meshpoint • <MESHPOINT-NAME> – Optional. Displays detailed information for a specified meshpoint. Specify the meshpoint name.

```
show wireless meshpoint {multicast|path|proxy|root|security|statistics}
[<MESHPOINT-NAME>|detail] {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
meshpoint	Displays meshpoint related information. Use this option to view detailed statistics on each Mesh-capable client available within controller's adopted access point's radio coverage area. A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes.
multicast	Optional. Displays meshpoint multicast information
path	Optional. Displays meshpoint path information
proxy	Optional. Displays meshpoint proxy information
root	Optional. Displays meshpoint root information
security	Optional. Displays meshpoint security information
statistics	Optional. Displays meshpoint statistics
[<MESHPOINT-NAME>| detail]	The following keywords are common to all of the above parameters: • <MESHPOINT-NAME> – Displays meshpoint related information for a specified meshpoint. Specify the meshpoint name. • detail – Displays detailed multicast information for all meshpoints
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is common to all of the above parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays detailed multicast information on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless meshpoint {neighbor} [<MESHPOINT-NAME>|detail|statistics {rf}]
{on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
meshpoint	Displays meshpoint related information. Use this option to view detailed statistics on each Mesh-capable client available within controller's adopted access point's radio coverage area. A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes.
neighbor	Optional. Displays meshpoint neighbor information, based on the parameters passed
[<MESHPOINT-NAME>| detail| statistics {rf}]	Select one of the following parameter to view neighbor related information • <MESHPOINT-NAME> – Displays detailed multicast information for a specified meshpoint. Specify the meshpoint name. • detail – Displays detailed multicast information for all meshpoints • statistics – Displays neighbors related statistics • rf – Optional. Displays RF related statistics for neighbors
on <DEVICE-OR-DOMAIN- NAME>	The following keyword is common to all of the above parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays meshpoint neighbor information, based on the parameters passed, on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless meshpoint {tree} {on <DEVICE-OR-DOMAIN- NAME>}
```

wireless	Displays wireless configuration parameters
meshpoint	Displays meshpoint related information **Note:** The `show > wireless > meshpoint > tree` command can be executed only from a wireless controller.
tree	Optional. Displays meshpoint network tree
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays meshpoint network tree on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Optional. Specify the name of AP, wireless controller, service platform, or RF Domain

```
show wireless meshpoint {usage-mappings|on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
meshpoint	Displays meshpoint related information

usage-mappings	Optional. Lists all devices and profiles using the meshpoint
on <DEVICE-OR-DOMAIN- NAME>	Optional. Displays meshpoint applied to a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Optional. Specify the name of AP, wireless controller, service platform, or RF Domain

```
show wireless mobility-database {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
mobility-database	Displays controller-assisted mobility database
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is recursive and common to the 'filter <RADIO-MAC>' parameter: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays detailed radio operation status for all or a specified radio on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless mint [client|detail] {portal-candidates {<DEVICE-NAME>|filter <RADIO-MAC>}|
statistics} (on <DEVICE-OR-DOMAIN-NAME>)
```

wireless mint [client|detail]	Displays radio MiNT-mesh related statistics • client – Displays MiNT-mesh client related information. Use the 'client' option to view detailed statistics on each Mesh capable client available within the selected access point's radio coverage area. • detail – Displays detailed MiNT-mesh related information
portal-candidates	Displays detailed information about portal candidates for a MiNT-mesh. Mesh points connected to an external network and forwarding traffic in and out are Mesh portals. Mesh points must find paths to a portal to access the Internet. When multiple portals exist, the mesh point must select one. Use the additional filter option to view specific portal candidate details.
statistics	This option is common to the 'client' and 'detail' keyword. Displays MiNT-mesh client statistical data.
on <DEVICE-OR-DOMAIN-NAME>	This option is common to the 'client' and 'detail' keyword. Displays MiNT-mesh client related information on a specific device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the access point, controller, or RF Domain name.

```
show wireless mint portal statistics {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless mint	Displays radio MiNT-mesh related statistics
links	Displays MiNT-mesh links related information. MiNT Links are automatically created between controllers and access points during adoption using MLCP (MiNT Link Creation Protocol). They can also be manually created between a controller and access point (or) between access points. MiNT links are manually created between controllers while configuring a cluster. Level 2 (or) remote MiNT links are controller aware links, and requires IP network for communication. This level 2 MiNT links at access points are intended for remote adaptive AP deployment and management from NOC. With Level2 MiNT links, access points are only aware of the controllers and not about other access points. Level 2 MiNT links also provide partitioning, between access points deployed at various remote sites.
on <DEVICE-OR-DOMAIN-NAME>	Displays MiNT-mesh links on a specific device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the access point, controller, or RF Domain name.

```
show wireless mint portal statistics {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless mint	Displays radio MiNT-mesh related statistics
portal	Displays legacy client on MiNT-mesh portal
on <DEVICE-OR-DOMAIN-NAME>	Displays legacy client on MiNT-mesh portal on a specific device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the access point, controller, or RF Domain name.

```
show wireless radio {detail} {<DEVICE-NAME> {<1-3>|filter|on}}
```

wireless	Displays wireless configuration parameters
radio	Displays radio operation status and other related information. Use this option to view radio association data, including radio ID, connected APs, radio type, quality index and *Signal to Noise Ratio* (SNR). This data is reported to the managing controller or service platform from connected access point radios and should be refreshed periodically. A radio's RF Mode displays as: • 2.4GHz-wlan – If it is configured to provide 2.4 GHz WLAN service • 5GHz-wlan – If it is configured to provide 5.0 GHz WLAN service • bridge – If it is configured to provide client-bridge operation
detail	Optional. Displays detailed radio operation status
<DEVICE-NAME>	Optional. Displays detailed information for a specified radio. Specify the MAC address or hostname, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX format.
<1-3>	Optional. Specify the radio interface index from 1 - 3 (if not specified as part of the radio ID)

filter <RADIO-MAC>	Optional. Provides additional filters • <RADIO-MAC> – Optional. Filters based on the radio MAC address
on <DEVICE-OR-DOMAIN-NAME>	Optional. After specifying the radio MAC address, further refine the search by specifying a device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless radio {detail} {filter <RADIO-MAC>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
radio	Displays radio operation status and other related information. Use this option to view radio association data, including radio ID, connected APs, radio type, quality index and SNR. This data is reported to the managing controller or service platform from connected access point radios and should be refreshed periodically. A radio's RF Mode displays as: • 2.4GHz-wlan – If it is configured to provide 2.4 GHz WLAN service • 5GHz-wlan – If it is configured to provide 5.0 GHz WLAN service • bridge – If it is configured to provide client-bridge operation
detail	Optional. Displays detailed radio operation status
filter <RADIO-MAC>	Optional. Provides additional filter options • <RADIO-MAC> – Uses MAC address to filter radios
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is recursive and common to the 'filter <RADIO-MAC>' parameter: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays detailed radio operation status for all or a specified radio on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless radio {statistics} {on <DEVICE-OR-DOMAIN-NAME>|rf {on <DEVICE-OR-DOMAIN-
NAME>}}
```

wireless	Displays wireless configuration parameters
radio	Displays radio operation status and other related information. Use this option to view radio association data, including radio ID, connected APs, radio type, quality index and SNR. This data is reported to the managing controller or service platform from connected access point radios and should be refreshed periodically. A radio's RF Mode displays as: • 2.4GHz-wlan – If it is configured to provide 2.4 GHz WLAN service • 5GHz-wlan – If it is configured to provide 5.0 GHz WLAN service • bridge – If it is configured to provide client-bridge operation
statistics	Optional. Displays radio traffic and RF statistics

on <DEVICE-OR-DOMIAN- NAME>	Optional. Displays traffic and RF related statistics on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.
rf {on <DEVICE-OR-DOMAIN-NAME>}	Optional. Displays RF statistics on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless radio {statistics} {detail|window-data} {<DEVICE-NAME>} {<1-3>|filter
<RADIO-MAC>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
radio	Displays radio operation status and other related information. Use this option to view radio association data, including radio ID, connected APs, radio type, quality index and SNR. This data is reported to the managing controller or service platform from connected access point radios and should be refreshed periodically. A radio's RF Mode displays as: • 2.4GHz-wlan – If it is configured to provide 2.4 GHz WLAN service • 5GHz-wlan – If it is configured to provide 5.0 GHz WLAN service • bridge – If it is configured to provide client-bridge operation
statistics {detail|window-data}	Optional. Displays radio traffic and RF statistics. Use additional filters to view specific details. The options are: are: • detail – Displays detailed traffic and RF statistics of all radios • window-data – Displays historical data over a time window
<1-3>	Optional. Specify the radio interface index from 1- 3, if not specified as part of the radio ID using the preceding parameter.
filter <RADIO-MAC>	Optional. Provides additional filters • <RADIO-MAC> – Optional. Filters based on the radio MAC address
on <DEVICE-OR-DOMAIN- NAME>	Optional. After specifying the radio MAC address, further refine the search by specifying a device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless radio {tspec} {<DEVICE-NAME>|filter|on <DEVICE-OR-DOMAIN-NAME>|option}
```

wireless	Displays wireless configuration parameters
radio	Displays radio operation status and other related information. Use this option to view radio association data, including radio ID, connected APs, radio type, quality index and SNR. This data is reported to the managing controller or service platform from connected access point radios and should be refreshed periodically. A radio's RF Mode displays as: • 2.4GHz-wlan – If it is configured to provide 2.4 GHz WLAN service • 5GHz-wlan – If it is configured to provide 5.0 GHz WLAN service • bridge – If it is configured to provide client-bridge operation
tspec	Optional. Displays TSPEC information on a radio

<DEVICE-NAME>	Optional. Specify the MAC address or hostname, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX format.
filter	Optional. Provides additional filters • <RADIO-MAC> – Optional. Filters based on the radio MAC address
on <DEVICE-OR-DOMAIN- NAME>	Optional. After specifying the radio MAC address, further refine the search by specifying a device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless regulatory [channel-info <CHANNEL-NUMBER>|country-code <COUNTRY-CODE>]
```

wireless regulatory	Displays wireless regulatory information
channel-info <WORD>	Displays channel information based on the channel number specified. • <WORD> – Specify the channel number.
country-code <WORD>	Lists the supported country codes • <WORD> – Specify the two letter ISO-3166 country code.

```
show wireless regulatory device-type [ap505|ap510i|ap510e|ap560i|ap560h]
[<COUNTRY-CODE>|avail-ant]
```

wireless regulatory	Displays wireless regulatory information
device-type <DEVICE-TYPE>	Displays supported antenna types based on the device type selected. • <DEVICE-TYPE> - Specify the device type. The options are: ap505, ap510i, ap510e, ap560i, and ap560h.
<COUNTRY-CODE> <ANTENNA-TYPE>	Displays channel-wise power and DFS settings based on the country code and antenna-type selected. • <ANTENNA-TYPE> - Configures the antenna type. Displays the supported power based on the country code and antenna type specified. Note: The <ANTENNA-TYPE> parameter is applicable only for the AP510i/e and AP560i/h model access points.
avail-ant	Displays the antenna types available for the selected device type.

```
show wireless rf-domain statistics {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
rf-domain statistics	Displays RF Domain statistics

details	Optional. Displays detailed RF Domain statistics
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is recursive and common to the 'detail' parameter: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays RF Domain statistics on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless sensor-server {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
sensor- server {on <DEVICE-OR-DOMAIN- NAME>}	Displays AirDefense sensor server configuration details • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays AirDefense sensor server configuration on a specified device or RF Domain

```
show wireless unsanctioned aps {detailed|statistics} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
unsanctioned aps	Displays unauthorized APs. Use additional filters to view specific details.
detailed	Optional. Displays detailed unauthorized APs information
statistics	Optional. Displays channel statistics
on <DEVICE-OR-DOMAIN- NAME>	The following keyword is common to the 'detailed' and 'statistics' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Specify the name of the AP, wireless controller, service platform, or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wireless wips [client-blacklist|event-history] {on <DEVICE-OR-DOMAIN-NAME>}
```

wireless	Displays wireless configuration parameters
wips [client-blacklist|event- history]	Displays the WIPS details • client-blacklist – Displays blacklisted clients • event-history – Displays event history
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is common to the 'client-blacklist' and 'event-history' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays the WIPS details on a specified device or RF Domain. • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
show wlan {detail <WLAN>|on <DEVICE-OR-DOMAIN-NAME>|policy-mappings|usage-mappings}
```

wireless	Displays wireless configuration parameters
wlan	Displays WLAN related information based on the parameters passed

detail <WLAN>	Optional. Displays WLAN configuration • <WLAN> – Specify the WLAN name.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays WLAN configuration on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.
policy-mappings	Optional. Displays WLAN policy mappings
usage-mappings	Optional. Lists all devices and profiles using the WLAN

```
show wlan {config filter {device <DEVICE-NAME>|rf-domain <DOMAIN-NAME>}}
```

wireless	Displays wireless configuration parameters
wlan	Displays WLAN related information based on the parameters passed
config filter	Optional. Filters WLAN information based on the device name or RF Domain
device <DEVICE-NAME>	Optional. Filters WLAN information based on the device name • <DEVICE-NAME> – Specify the device name.
rf-domain <DOMAIN-NAME>	Optional. Filters WLAN information based on the RF Domain • <DOMAIN-NAME> – Specify the RF Domain name.

```
show wlan {detail <WLAN>|on <DEVICE-OR-DOMAIN-NAME>|policy-mappings|usage-mappings}
```

wireless	Displays wireless configuration parameters
wlan	Displays WLAN related information based on the parameters passed
detail <WLAN>	Optional. Displays WLAN configuration • <WLAN> – Specify the WLAN name.
on <DEVICE-OR-DOMAIN-NAME>	Optional. Displays WLAN configuration on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.
policy-mappings	Optional. Displays WLAN policy mappings
usage-mappings	Optional. Lists all devices and profiles using the WLAN

```
show wlan {config filter {device <DEVICE-NAME>|rf-domain <DOMAIN-NAME>}}
```

wireless	Displays wireless configuration parameters
wlan	Displays WLAN related information based on the parameters passed
config filter	Optional. Filters WLAN information based on the device name or RF Domain
device <DEVICE-NAME>	Optional. Filters WLAN information based on the device name • <DEVICE-NAME> – Specify the device name.
rf-domain <DOMAIN-NAME>	Optional. Filters WLAN information based on the RF Domain <DOMAIN-NAME> – Specify the RF Domain name.

```
show wlan {statistics {<WLAN>|detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

wireless	Displays wireless configuration parameters
wlan	Displays WLAN related information based on the parameters passed
statistics {<WLAN>|detail}	Optional. Displays WLAN statistics. Use additional filters to view specific details • <WLAN> – Optional. Displays WLAN statistics. Specify the WLAN name. • detail – Optional. Displays detailed WLAN statistics
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is common to the 'WLAN' and 'detail' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays WLAN statistics on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

web-filter

Displays Web filtering related information. Use this command to view information on Web requests for content and whether the requests were blocked or approved based on URL filter settings defined for the selected controller or service platform. A URL filter is comprised of several filter rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist.

Supported in the following platforms:

- Access Points — AP 6522, AP 7161, AP 7502, AP-7522, AP 7532, AP 7562
- Wireless Controllers — RFS 4000
- Service Platforms — NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
show web-filter [category|category-type|config|filter-level [basic|high|low|
medium|medium-high]|statistics {on <DEVICE-NAME>}|status]
```

Parameters

```
show web-filter [category|category-type|config|filter-level [basic|high|low|
medium|medium-high]|statistics {on <DEVICE-NAME>}|status]
```

web-filter	Displays an existing and configured Web filter details
category	Displays Web filter categories. A category is a pre-defined URL list available in the WiNG software.
category-type	Displays the Web filter category types. This is a pre-configured list of categories and sub-categories in to which commonly accessed URLs have been classified.
config	Displays all existing Web filters and their configuration details

filter-level [basic| high|low| medium| medium-high]	Displays category types for the selected filter-level. Each filter level is pre-configured to use a set of category types. You cannot change the categories in the category types used for these pre-configured filter-level setting. Nor can you add, modify, or remove the category types mapped to a filter-level setting. The options are: • basic – Displays all category types configured for the basic filter-level • high – Displays all category types configured for the high filter-level • low – Displays all category types configured for the low filter-level • medium – Displays all category types configured for the medium filter-level • medium-high – Displays all category types configured for the medium-high filter-level
statistics {on <DEVICE-NAME>}	Displays Web filter statistics on a specified device • on <DEVICE-NAME> – Optional. Specifies the device name • <DEVICE-NAME> – Specify the name of the AP, controller, or service platform. Note: Web filtering is a licensed feature, and only when enforced can the system display Web filtering statistics.
status {on <DEVICE-NAME>}	Displays Web filter status on a specified device • on <DEVICE-NAME> – Optional. Specifies the device name • <DEVICE-NAME> – Specify the name of the AP, controller, or service platform. Note: Web filtering is a licensed feature, and only when enforced can the system display Web filtering status.

Examples

```
nx9500-6C8809(config)#show web-filter category
    advertisement-popups
        Sites that provide advertising graphics or other ad content
        files such as banners and pop-ups.
    alcohol-tobacco
        Sites that promote or sell alcohol- or tobacco-related
        products or services.
    anonymizers
        Sites and proxies that act as an intermediary for surfing to
        other websites in an anonymous fashion, whether to
        circumvent web filtering or for other reasons.
    arts
        Sites with artistic content or relating to artistic
        institutions such as theaters, museums, galleries, dance
        companies, photography, and digital graphic resources.
    botnets
        Sites that use bots (zombies) including command-and-control
        sites.
--More--
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show web-filter config
URL filters configured for this device are:
    WebFilter_ShoppingSites
        Blacklisted categories:
            shopping,
        Whitelisted categories:
```

```
            <AllowedShopping>,
nx9500-6C8809(config)#
```

what

Displays details of a specified search phrase (performs global search)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}
```

contain <WORD>	Searches for all items that contain a specified word • <WORD> – Specify the string to use as match criteria (for example, MAC address, hostname, etc.).
is <WORD>	Searches for items exactly matching a specified string • Specify the string to use as match criteria (for example, MAC address, hostname, etc.).
on <DEVICE-OR-DOMAIN-NAME>	Optional. Performs global search on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

```
rfs4000-229D58#show what contain default

wwan

Displays wireless WAN status

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

```
show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

wwan	Displays wireless WAN configuration and status details
configuration	Displays wireless WAN configuration information
status	Displays wireless WAN status information
on <DEVICE-OR-DOMAIN-NAME>	The following keyword is common to the 'configuration' and 'status' parameters: • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays configuration or status details on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the AP, wireless controller, service platform, or RF Domain name.

Examples

```
rfs4000-229D58(config-device-00-23-68-22-9D-58)#show wwan configuration
>>> WWAN Configuration:
+-----------------------------------------
|  Access Port Name : isp.cingular
|  User Name        : testuser
|  Cryptomap        : map1
+-----------------------------------------
rfs4000-229D58(config-device-00-23-68-22-9D-58)#
rfs4000-229D58(config-device-00-23-68-22-9D-58)#show wwan status
>>> WWAN Status:
+-----------------------------------------
|  State : ACTIVE
|  DNS1  : 209.183.54.151
|  DNS2  : 209.183.54.151
+-----------------------------------------
rfs4000-229D58(config-device-00-23-68-22-9D-58)#
```

8 Profiles

Profile Config Commands
Device Config Commands

Profiles enable administrators to assign a common set of configuration parameters, policies, and WLANs to service platforms, controllers, and access points across a large, multi segment, site. The configuration parameters within a profile are based on the hardware model the profile was created to support.

The service platforms, wireless controllers, and access points support both default and user-defined profiles. Each default and user-defined profile contains policies and configurations that are applied to devices assigned to the profile. Changes made to these configurations are automatically inherited by the devices. The central benefit of a profile is its ability to update devices collectively without having to modify individual device configurations.

Default profiles are system maintained and are automatically applied to service platforms and wireless controllers. The default AP profile is automatically applied to a AP (discovered by a wireless controller or service platform), unless an AP auto-provisioning policy is defined specifically to assign APs to a user-defined profile. After adoption, changes made to a profile's parameters are reflected across all devices using the profile. Default profiles are ideal for single site deployments where service platforms, wireless controllers, and access points share a common configuration.

User-defined profiles, on the other hand, are manually created for each supported service platform, wireless controller, and access point model. User-defined profiles are recommended for larger deployments using centralized controllers and service platforms when groups of devices on different floors, buildings or sites share a common configuration. These user-defined profiles can be manually, or automatically assigned to through an auto provisioning policy. An auto provisioning policy provides the means to assign profiles to access points based on model, serial number, VLAN ID, DHCP options, IP address (subnet) and MAC address. For more information, see Auto-Provisioning Policy on page 1326.

A user-defined profile can be created for each of the following device type:

- AP505 - Adds an AP505 access point profile
- AP510 - Adds an AP510 access point profile
- AP560 - Adds an AP560 access point profile
- NX5500 – Adds an NX5500 wireless controller profile
- NX75XX – Adds an NX7500 series service platform profile
- NX9000 – Adds an NX9500 series service platform profile
- NX9600 – Adds an NX9600 series service platform profile
- VX9000 – Adds a VX9000 virtual controller profile

Although profiles assign a common set of configuration parameters across devices, individual devices can still be assigned unique configuration parameters that follow the flat configuration model. As individual device updates are made, these devices no longer share the profile based configuration they originally supported. Therefore, changes made to a profile are not automatically inherited by devices

who have had their configuration customized. These devices require careful administration, as they cannot be tracked as profile members. Their customized configurations overwrite their profile configurations until the profile is re-applied.

Note
The commands present under 'Profiles' are also available under the 'Device mode'. The additional commands specific to the 'Device mode' are listed separately.

This chapter is organized into the following topics:

- Profile Config Commands on page 853
- Device Config Commands on page 1265

To view the list of device profiles supported, use the following command:

```
<DEVICE>(config)#profile ?

nx9500-6C8809#configure
Enter configuration commands, one per line.  End with CNTL/Z.
nx9500-6C8809(config)#profile ?
  anyap       Any access point profile
  ap505       AP505 access point profile
  ap510       AP510 access point profile
  ap560       AP560 access point profile
  ap621       AP621 access point profile
  ap622       AP622 access point profile
  ap650       AP650 access point profile
  ap6511      AP6511 access point profile
  ap6521      AP6521 access point profile
  ap6522      AP6522 access point profile
  ap6532      AP6532 access point profile
  ap6562      AP6562 access point profile
  ap71xx      AP71XX access point profile
  ap7502      AP7502 access point profile
  ap7522      AP7522 access point profile
  ap7532      AP7532 access point profile
  ap7562      AP7562 access point profile
  ap7602      AP7602 access point profile
  ap7612      AP7612 access point profile
  ap7622      AP7622 access point profile
  ap7632      AP7632 access point profile
  ap7662      AP7662 access point profile
  ap81xx      AP81XX access point profile
  ap82xx      AP82XX access point profile
  ap8432      AP8432 access point profile
  ap8533      AP8533 access point profile
  containing  Specify profiles that contain a sub-string in the profile name
  ex3524      EX3524 wireless controller profile
  ex3548      EX3548 wireless controller profile
  filter      Specify addition selection filter
  nx45xx      NX45XX integrated services platform profile
  nx5500      NX5500 wireless controller profile
  nx65xx      NX65XX integrated services platform profile
  nx75xx      NX75XX wireless controller profile
  nx9000      NX9000 wireless controller profile
  rfs4000     RFS4000 wireless controller profile
  rfs6000     RFS6000 wireless controller profile
  rfs7000     RFS7000 wireless controller profile
  t5          T5 DSL switch profile
  vx9000      VX9000 wireless controller profile
  <cr>

  diag                                     Diagnosis of packets
  dot1x                                    802.1X
  dpi                                      Enable Deep-Packet-Inspection
                                           (Application Assurance)
  dscp-mapping                             Configure IP DSCP to 802.1p
                                           priority mapping for untagged
                                           frames
  eguest-server                            Configure ExtremeGuest server
  email-notification                       Email notification configuration
  enforce-version                          Check the firmware versions of
                                           devices before interoperating
  events                                   System event messages
  export                                   Export a file
  file-sync                                File sync between controller and
                                           adoptees
  floor                                    Set the floor within a area where
                                           the system is located
  gre                                      GRE protocol
  http-analyze                             Specify HTTP-Analysis configuration
  interface                                Select an interface to configure
  ip                                       Internet Protocol (IP)
  ipv6                                     Internet Protocol version 6 (IPv6)
  l2tpv3                                   L2tpv3 protocol
  led                                      Turn LEDs on/off on the device
  legacy-auto-downgrade                    Enable device firmware to auto
                                           downgrade when other legacy devices
```

```
                                        are detected
lldp                                    Link Layer Discovery Protocol
load-balancing                          Configure load balancing parameter
logging                                 Modify message logging facilities
mac-address-table                       MAC Address Table
mac-auth                                802.1X
management-server                       Configure management server address
memory-profile                          Memory profile to be used on the
                                        device
min-misconfiguration-recovery-time      Time interval to check controller
                                        connectivity after configuration is
                                        received
mint                                    MiNT protocol
misconfiguration-recovery-time          Check controller connectivity after
                                        configuration is received
neighbor-inactivity-timeout             Configure neighbor inactivity
                                        timeout
neighbor-info-interval                  Configure neighbor information
                                        exchange interval
no                                      Negate a command or set its
                                        defaults
noc                                     Configure the noc related setting
ntp                                     Ntp server WORD
offline-duration                        Set duration for which a device
                                        remains unadopted before it
                                        generates offline event
power-config                            Configure power mode
preferred-controller-group              Controller group this system will
                                        prefer for adoption
preferred-tunnel-controller             Tunnel Controller Name this system
                                        will prefer for tunneling extended
                                        vlan traffic
purview-application-policy              Purview application policy
                                        configuration
radius                                  Configure device-level radius
                                        authentication parameters
remote-debug                            Configure remote debug parameters
remove-override                         Remove configuration item override
                                        from the device (so profile value
                                        takes effect)
rf-domain-manager                       RF Domain Manager
router                                  Dynamic routing
spanning-tree                           Spanning tree
traffic-class-mapping                   Configure IPv6 traffic class to
                                        802.1p priority mapping for
                                        untagged frames
trustpoint                              Assign a trustpoint to a service
tunnel-controller                       Tunnel Controller group this
                                        controller belongs to
use                                     Set setting to use
virtual-controller                      Enable Controller AP
vrrp                                    VRRP configuration
vrrp-state-check                        Publish interface via OSPF/BGP only
                                        if the interface VRRP state is not
                                        BACKUP
wep-shared-key-auth                     Enable support for 802.11 WEP

The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

Profile Config Commands

The following table summarizes profile configuration mode commands:

Table 34: Profiles Config Mode Commands

Command	Description
adopter-auto-provisioning-policy-lookup on page 857	Enables the use of a centralized auto provisioning policy on this profile
adoption on page 857	Configures a minimum and maximum delay time in the initiation of the device adoption process
adoption-mode on page 858	Sets the adoption mode for access points to Controller, cloud, or Extreme Services
alias on page 865	Creates various types of aliases, such as network, VLAN, network-group, network-service, encrypted-string, hashed -string, etc. at the profile level
antenna-id (ap510e) on page 861	Configures the antenna ID in the AP510e model access point profile and device contexts. Use this command to specify the antenna group and enable the access point radios.
antenna-id (ap560h) on page 864	Configures the antenna ID in the AP560h model access point profile and device contexts. Use this command to specify which internal antenna to use (30/70 degree) and enable the access point radios.
application-policy on page 875	Enables the RADIUS *Change of Authorization* (CoA) mechanism. Reinitiates authentication and changes attributes of active AAA session based on the rules defined by the application policy specified here. Note: Supported only on WiNG 5.9.X devices.
area on page 876	Sets the system's area of location (the area name)
arp on page 877	Configures static address resolution protocol
auto-learn on page 879	Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. The command also enables learning of a device's host name via DHCP options.
autogen-uniqueid on page 880	Auto-generates a unique local ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.
autoinstall on page 881	Configures the automatic install feature
bridge on page 883	Configures bridge specific parameters
captive-portal on page 910	Configures captive portal advanced Web page upload on a device profile
cdp on page 911	Enables *Cisco Discovery Protocol* (CDP) on a device

Table 34: Profiles Config Mode Commands (continued)

Command	Description
cluster on page 912	Configures a cluster name
configuration-persistence on page 914	Enables persistence of configuration across reloads
controller on page 915	Configures a wireless controller or service platform
critical-resource on page 920	Monitors resources that are critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses.
crypto on page 929	Configures data encryption related protocols and settings
database on page 976	Backs up captive-portal and/or NSight database to a specified location and file and configures a low-disk-space threshold value
device-onboard on page 977	Configures the logo image file name and title displayed on the ExtremeGuest device-onboarding portal. This is the portal a vendor-admin user uses to onboard devices.
device-upgrade on page 978	Configures device firmware upgrade settings on this profile
diag on page 980	Enables looped packet logging
dot1x on page 981	Configures 802.1x standard authentication controls
dpi on page 983	Enables *Deep Packet Inspection* (DPI) on this profile
dscp-mapping on page 986	Configures an IP DSCP to 802.1p priority mapping for untagged frames
eguest-server (VX9000 only) on page 987	Enables the EGuest daemon when executed without the 'host' option
eguest-server (NOC Only) on page 988	Points to the EGuest server, when executed along with the 'host' option
email-notification on page 989	Configures e-mail notification settings
enforce-version on page 991	Enables checking of a device's firmware version before attempting adoption or clustering
environmental-sensor on page 992	Configures the environmental sensor settings on this profile (applicable to AP8132 model access point only)
events on page 994	Enables system event logging and message generation. This command also configures event message forwarding settings.
export on page 994	Enables export of startup.log file after every boot
file-sync on page 995	Configures parameters enabling synching of trustpoint and/or wireless-bridge certificate between the staging-controller and adopted access point
floor on page 997	Sets the floor name where the system is located
gre on page 997	Enables *Generic Routing Encapsulation* (GRE) tunneling on this profile
http-analyze on page 1007	Configures HTTP analysis settings
interface on page 1009	Configures an interface (VLAN, radio, GE, etc.)
ip on page 1167	Configures IPv4 components
ipv6 on page 1175	Configures IPv6 components

Table 34: Profiles Config Mode Commands (continued)

Command	Description
l2tpv3 on page 1180	Defines the *Layer 2 Tunnel Protocol* (L2TP) for tunneling layer 2 payloads using *Virtual Private Networks* (VPNs)
l3e-lite-table on page 1182	Configures L3e Lite Table with this profile
led on page 1183	Turns device LEDs on or off
led-timeout on page 1184	Configures LED-timeout timer. This command is specific to the NX9500 series service platforms.
legacy-auto-downgrade on page 1185	Auto downgrades a legacy device firmware
legacy-auto-update on page 1185	Auto upgrades a legacy device firmware
lldp on page 1186	Configures *Link Layer Discovery Protocol* (LLDP) settings
load-balancing on page 1187	Configures load balancing parameters
logging on page 1193	Modifies message logging settings
mac-address-table on page 1195	Configures the MAC address table
mac-auth on page 1197	Enables 802.1x user authentication protocol on this profile
management-server on page 1199	Configures a management server with this profile
meshpoint-device on page 1200	Configures meshpoint device parameters
meshpoint-monitor-interval on page 1201	Configures meshpoint monitoring interval
min-misconfiguration-recovery-time on page 1202	Configures the minimum device connectivity verification time
mint on page 1203	Configures MiNT protocol settings
misconfiguration-recovery-time on page 1211	Verifies device connectivity after a configuration is received
neighbor-inactivity-timeout on page 1212	Configures neighbor inactivity timeout
neighbor-info-interval on page 1213	Configures neighbor information exchange interval
no on page 1214	Removes or reverts settings to their default. The no command, when used in the profile configuration mode, removes the selected profile's settings or reverts them to their default.
noc on page 1216	Configures NOC settings
nsight on page 1217	Configures NSight database related parameters
ntp on page 1221	Configures NTP server settings
otls on page 1224	Configures support for detection and forwarding of OmniTrail beacon tags
offline-duration on page 1226	Sets the duration, in minutes, for which a device remains un-adopted before it generates offline event
power-config on page 1227	Configures the power mode
preferred-controller-group on page 1229	Specifies the wireless controller or service platform group preferred for adoption

Table 34: Profiles Config Mode Commands (continued)

Command	Description
preferred-tunnel-controller on page 1230	Configures the tunnel wireless controller or service platform preferred by the system to tunnel extended VLAN traffic
purview-application-policy on page 1230	Enables the RADIUS *Change of Authorization* (CoA) mechanism. Reinitiates authentication and changes attributes of active AAA session based on the rules defined by the purview application policy specified here. Note: Supported only on WiNG 7.1.2 APs.
radius on page 1231	Configures device-level RADIUS authentication parameters
raid on page 1301	Enables alarm on the array. This command is supported only on the NX9500 series service platform profile/device config modes.
rf-domain-manager on page 1232	Enables devices using this profile to be elected as RF Domain manager. Also sets the priority value for devices using this profile in the RF Domain manager election process.
router on page 1233	Configures dynamic router protocol settings
spanning-tree on page 1235	Configures spanning tree related settings
traffic-class-mapping on page 1238	Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority
traffic-shape on page 1239	Enables traffic shaping and configures traffic shaping parameters
trustpoint (profile-config-mode) on page 1245	Configures the trustpoint assigned for validating a CMP auth Operator
tunnel-controller on page 1246	Configures the name of tunneled WLAN (extended VLAN) wireless controller or service platform
use (profile/device-config-mode-commands) on page 1247	Uses pre configured policies with this profile
vrrp on page 1253	Configures *Virtual Router Redundancy Protocol* (VRRP) group settings
vrrp-state-check on page 1257	Publishes interface via OSPF or BGP based on VRRP status
wep-shared-key-auth on page 1257	Enables support for 802.11 WEP shared key authentication
ws-controller on page 1258	Configures multiple ws-controller hosts and enables rediscovery of new controllers. This option is required for WiNG APs with 'adoption-mode' set to 'ws-controller'. That is WiNG APs adopting to the ExtremeCloud Appliance controller.
service on page 1259	Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode.
zone on page 1265	Configures the zone for devices using this profile. The zone can also be configured on the device's self context.

Note

For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Common Commands on page 616.

Note
The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

adopter-auto-provisioning-policy-lookup

Profile Config Commands on page 853

Enables the use of a centralized auto provisioning policy on this profile. When enabled, the auto-provisioning policy applied on the NOC gets precedence over the one applied at the site controller level. Optionally, use the 'evaluate-always' option to set flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted. The device's previous adoption status is not taken into consideration.

This command is also applicable in the device configuration context.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
adopter-auto-provisioning-policy-lookup {evaluate-always}
```

Parameters

```
adopter-auto-provisioning-policy-lookup {evaluate-always}
```

adopter-auto-provisioning-policy-lookup {evaluate-always}	Enables the use of a centralized auto provisioning policy on this profile or device • evaluate-always – Optional. Sets flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted.

Examples

```
nx9500-6C8809(config-profile-test4K)#adopter-auto-provisioning-policy-lookup evaluate-always
nx9500-6C8809(config-profile-test4K)#show context include-factory | include adopter-auto-provisioning-policy-lookup
 adopter-auto-provisioning-policy-lookup evaluate-always
nx9500-6C8809(config-profile-test4K)#
```

Related Commands

no on page 1214	Disables the application of centralized auto provisioning policy on this profile or device

adoption

Profile Config Commands on page 853

Configures a minimum and maximum delay time in the initiation of the device adoption process. When configured, devices do not attempt adoption immediately on coming up. The process is initiated after the lapse of a specified period of time (configured using this command as the start-delay minimum time).

Once configured and applied, this setting is applicable on all devices using this profile. This option is also available in the device-configuration mode.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
adoption start-delay min <0-30> max <0-30>
```

Parameters

```
adoption start-delay min <0-30> max <0-30>
```

adoption start-delay min <0-30> max <0-30>	Delays start of the device adoption process • min <0-30> – Configures the minimum time to lapse before a device attempts adoption. Specify a value from 0 - 30 seconds. A device, on coming up, attempts adoption only after the lapse of the time specified here. The default is 5 seconds. • max <0-30> – Configures the maximum time to lapse before a device attempts adoption. Specify a value from 0 - 30 seconds. The default is 20 seconds.

Example

```
nx9500-6C8809(config-profile-test4K)#adoption start-delay min 10 max 30
nx9500-6C8809(config-profile-test4K)#show context include-factory | include  adoption
 enforce-version adoption strict
 controller adoption
 adoption start-delay min 10 max 30
 adoption-mode controller
nx9500-6C8809(config-profile-test4K)#
```

Related Commands

no on page 1214	Removes the configured minimum start-delay value. When removed, devices attempt adoption immediately on coming up.

adoption-mode

Profile Config Commands on page 853

Configures the mode of adoption in an access point profile. This command is also applicable to the device configuration context.

By default, any WiNG AP, on being powered-up for the first time, starts the following auto-discovery process. The AP:

1 Moves to MLCP_DISCOVERY state and tries to discover a local controller. If a local controller is found, it
   a adopts to the controller, and
   b marks itself as “local-controller” adopted, and
   c moves to the MLCP_MODE.
2 If a local controller is not found, the AP switches to the CLOUD_DISCOVERY state, and tries connecting to the ExtremeCloud. If the AP succeeds in connecting to the cloud, it
   a marks itself as “cloud-adopted”, and
   b moves to the CLOUD_MODE.
3 If the AP is unable to discover and adopt to the ExtremeCloud, it switches to the WS_CONTROLLER_DISCOVERY state, and tries connecting to the WebSocket (WS) Controller. If it succeeds in connecting to the ws_controller, it
   a marks itself as “ws-controller-adopted”, and
   b moves to the WS_CONTROLLER_MODE.
4 The AP continues to switch between the three discovery states (local controller, cloud, and ws_controller) until it gets adopted.
5 Once adopted, an AP’s adoption mode does not change unless,
   a It is changed from the controller’s CLI (using the adoption-mode command), the Cloud dashboard, or the WS controller dashboard.
   b If the AP is reverted to factory settings, in which case the AP starts the auto-discovery process on bootup.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
adoption-mode [cloud|controller|ws-controller]
```

Parameters

```
adoption-mode [cloud|controller|ws-controller]
```

adoption-mode [cloud|controller|ws-controller]	Use to set the adoption-mode to:
	• cloud – Sets the adoption-mode to Extreme Cloud. The factory-default, management server setting, in WiNG AP profiles contexts, points to the Extreme Cloud Web address. If the adoption-mode is set to cloud, the AP on coming up, will search for and adopt to the ExtremeCloud.
	• controller – Sets the adoption mode to the local WiNG controller. This is the default setting. Note, APs with the 'controller > host > configuration' specified are marked as local-controller APs and never try adopting to the CLOUD or WS-Controller
	• ws-controller – Sets the adoption mode to the EAE *(Edge Application Engine)* ws-controller. If selecting this option, use the 'management-server' command to configure the EAE controller's IP address or hostname. For information on configuring the management-server, see management-server on page 1199.
	
	Note: Alternately, the AP auto-adopts to the WS controller, if its receives DHCP IP address, and the DHCP option 191 pool string configuration is as shown in the following examples:
	In the DHCP server policy, define an alias for option 191:
	`VX(config-dhcp-policy-DHCP)#`
	` dhcp-server-policy DHCP`
	`  option AP-adoption 191 ascii`
	In the DHCP pool config, define the option 191 string:
	`dhcp-pool AP`
	`  option AP-adoption pool1=<ws-controller-ip-adress>;`
	`adoption-mode=ws-controller`

Examples

```
nx9500-6C8809(config-profile-testAP8432)#adoption-mode cloud

Related Commands

no on page 1214	Reverts the adoption-mode to default (controller)

antenna-id (ap510e)

Profile Config Commands on page 853

Configures the antenna ID on an AP510e model access point profile and device. Use this command to specify the antenna types used with the external antennas.

The ExtremeMobility AP510e access point is a dual-radio access point, with eight, external Wi-Fi antennas grouped into: group-1 (antenna ports 1 to 4) and group-2 (antenna ports 5 to 8).

To enable the AP510e radio, configure the country code, map a WLAN to the radio, and configure the *antenna-id* for the 'group-1' and 'group-2' antenna ports. The antenna-id parameter, specifies the antenna type used in the group-1 and/or group-2 antenna ports.

	Antenna Ports	
Software Mode	**2.4/5G Antennas: 1, 2, 3, 4**	**5G Antennas: 5, 6, 7, 8**

Mode 1 • Radio 1 - 2.4 GHz WLAN • Radio 2 - 5 GHz WLAN Note: This mode requires only *FOUR, dual-band* antennas connected to ANT sockets 1 to 4. Note: If using this mode, configure antenna-id only for the group 1 antennas.	Dual-band 2.4 GHz/5 GHz	None
Mode 2 • Radio 1 - 2.4/5 GHz Sensor • Radio 2 - 5 GHz WLAN Note: This mode requires *FOUR, dual-band* antennas connected to ANT sockets 1 to 4, and *FOUR, 5G-band* antennas connected to ANT sockets 5 to 8. Note: If using this mode, configure antenna-id for both group 1 and group 2 antennas.	Dual-band 2.4 GHz/5 GHz	5 GHz
Mode 3 • Radio 1 - 5 GHz WLAN • Radio 2 - 5 GHz WLAN Note: Requires *FOUR, 5G-band* antennas connected to ANT sockets 1 to 4, and *FOUR, 5G-band* antennas connected to ANT sockets 5 to 8. Note: If using this mode, configure antenna-id for both group 1 and group 2 antennas.	5 GHz	5 GHz

Supported in the following platform

- Access Point — AP510e

Syntax

```
antenna-id external [group-1|group-2] <ANTENNA-TYPE>
```

Parameters

```
antenna-id external [group-1|group-2] <ANTENNA-TYPE>
```

antenna-id	Selects the antenna group to use and enables the access point radio.
external	States the antenna is external

group-1	Configures the antenna type used in the group-1 antenna ports (1 to 4). Note: Group-1 antenna configuration is required for all three software modes. Note: Refer to the table above for the supported software modes and the corresponding antenna configurations.
group-2	Configures the antenna type used in the group-2 antenna ports (5 to 8). Note: Group-2 antenna configuration is ONLY required for software modes 2 & 3. Note: Refer to the table above for the supported software modes and the corresponding antenna configurations.
antenna-type	Configures the antenna type used The antenna types supported for 'group-1' and 'group-2' antenna ports are: **ai-dq04360s**, **ml-2452-apa2-01**, **ml-2452-apa2-02**, **ml-2452-hpa5-036**, **ml-2452-hpag4a6-01**, **ml-2452-hpag5a8-01**, **ml-2452-pna5-01r**, **ml-2452-pna7-01r**, **ml-2452-pta4m4-036**, **ml-2452-sec6m4-036**, **ws-ai-dq05120**. By default *no* antenna-type is associated with the grouo-1 and group-2 antenna ports and the radio is disabled.

Usage Guidelines:

Following is the supported software modes for the AP510e access point radios:

Software Mode 1	• Radio 1: Set to 2.4 GHz WLAN, Channels 1 - 11 in the 20 MHz /40 MHz bandwidths • Radio 2: Set to 5 GHz WLAN, Channels 36 - 165 in the 20 MHz /40 MHz /80 MHz /160 MHz
Software Mode 2	• Radio 1: Set to 2.4/5 GHz Sensor • Radio 2: Set to 5 GHz WLAN, Channels 36 - 165 in the 20 MHz /40 MHz /80 MHz /160 MHz
Software Mode 3	• Radio 1: Set to 5 GHz, Channels 36 - 64 in the 20 MHz /40 MHz /80 MHz /160 MHz bandwidths • Radio 2: Set to 5 GHz, Channels 100 - 165 in the 20 MHz /40 MHz /80 MHz /160 MHz bandwidths

Example

```
ap510-133C9B(config-device-94-9B-2C-13-3C-9B)#antenna-id ?

antenna-id (ap560h)

Profile Config Commands on page 853

Configures the antenna ID on an AP560h model access point profile and device. This command allows you to select the internal antenna modes.

The ExtremeMobility AP560h access point is a dual-radio access point, with eight, internal Wi-Fi antennas, supporting two internal antenna modes: *30 degree* and *70 degree*.

To enable the AP560h radio, configure the country code, map a WLAN to the radio, and configure the internal antenna mode as '30 degree' or '70 degree'.

Supported in the following platform

- Access Point — AP560h

Syntax

```
antenna-id internal [internal-560h-30|internal-560h-70|default]
```

Parameters

```
antenna-id internal [internal-560h-30|internal-560h-70|default]
```

antenna-id	Allows you to configure the functional mode for the AP560h access point's internal antennas.
internal	States the antenna is internal.
internal-560h-30	Configures the internal antenna mode as 30 degree.
internal-560h-70	Configure the internal antenna mode as 70 degree.
default	Sets the antenna mode to default. In this mode, *no* the antenna-mode is not specified and the radio is disabled. You must set the antenna mode to either 30 degree or 70 degree to turn-on the radios.

Radio Modes Supported

The AP560h supports the following radio modes:

Software Mode 1	• Radio 1: Set to 2.4 GHz WLAN, Channels 1 - 11 in the 20 MHz /40 MHz bandwidths • Radio 2: Set to 5 GHz WLAN, Channels 36 - 165 in the 20 MHz /40 MHz /80 MHz /160 MHz
Software Mode 2	• Radio 1: Set to 2.4/5 GHz Sensor • Radio 2: Set to 5 GHz WLAN, Channels 36 - 165 in the 20 MHz /40 MHz /80 MHz /160 MHz
Software Mode 3	• Radio 1: Set to 5 GHz, Channels 36 - 64 in the 20 MHz /40 MHz /80 MHz /160 MHz bandwidths • Radio 2: Set to 5 GHz, Channels 100 - 165 in the 20 MHz /40 MHz /80 MHz /160 MHz bandwidths

Example

```
nx9500-6C8809(config-profile-ap560h)#antenna-id internal internal-560h-70
nx9500-6C8809(config-profile-ap560h)#show context include-factory | include antenna-id
 antenna-id external group-1 default
 antenna-id external group-2 default
 antenna-id internal internal-560h-70
nx9500-6C8809(config-profile-ap560h)#
```

Related Commands

no on page 1214	Reverts the antenna mode to default on the selected AP560h profile and device.

alias

Profile Config Commands on page 853

Configures network, VLAN, and service aliases. The aliases defined on this profile applies to all devices using this profile. Aliases can be also defined at the device level.

Note

You can apply overrides to aliases at the device level. Overrides applied at the device level take precedence. For more information on aliases, see alias on page 172 (global config mode).

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> <LINE>
alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>
alias host <HOST-ALIAS-NAME> <HOST-IP>
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME>
[address-range <STARTING-IP> to <ENDING-IP>|host <HOST-IP>|network <NETWORK-ADDRESS/MASK>]
alias network-service <NETWORK-SERVICE-ALIAS-NAME>
proto [<0-254>|<WORD>|eigrp| gre|igmp|igp|ospf|vrrp]
 {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|
sourceport|ssh|telnet|tftp|www)}
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
alias string <STRING-ALIAS-NAME> <LINE>
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

Parameters

```
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
```

address-range <ADDRESS-RANGE-ALIAS-NAME>	Creates a new address-range alias for this profile. Or associates an existing address-range alias with this profile. An address-range alias maps a name to a range of IP addresses. Use this option to create unique address-range aliases for different deployment scenarios.
	For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location's network range is 172.16.13.20 through 172.16.13.110, the remote location's ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location. • <ADDRESS-RANGE-ALIAS-NAME> – Specify the address range alias name. Note: Alias name should begin with '$'.
<STARTING-IP> to <ENDING-IP>	Associates a range of IP addresses with this address range alias • <STARTING-IP> – Specify the first IP address in the range. • to <ENDING-IP> – Specify the last IP address in the range. Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

```
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> <LINE>
```

encrypted-string <ENCRYPTED-STRING-ALIAS-NAME>	Creates an alias for an encrypted string. Use this alias for string configuration values that are encrypted when "password-encryption" is enabled. For example, in the management-policy, use it to define the SNMP community string. For more information, see snmp-server on page 1539 (management policy config mode). • <ENCRYPTED-STRING-ALIAS-NAME> – Specify the encrypted-string alias name. Alias name should begin with '$'.

<LINE>	Configures the value associated with the alias name specified in the previous step
	• <LINE> – Configures the alias value
	Note: If password-encryption is enabled, in the `show > running-config` output, this clear text is displayed as an encrypted string, as shown below:
	`nx9500-6C8809(config)#show running-config`
	`!.............................`
	`alias encrypted-string $enString 2`
	`fABMK2is7UToNiZE3MQXbgAAAAxB0ZIysdqsEJwr6AH/Da//`
	`!`
	`--More--`
	`nx9500-6C8809`
	`In the above output, the '2' displayed before the encrypted-string alias value indicates that the displayed text is encrypted and not a clear text.`
	`However, if password-encryption is disabled the clear text is displayed as is:`
	`nx9500-6C8809(config)#show running-config`
	`!.............................`
	`!`
	`alias encrypted-string $enString 0 test11223344`
	`!`
	`--More--`
	`nx9500-6C8809`
	For more information on enabling password-encryption, see password-encryption on page 427.

```
alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>
```

hashed-string <HASHED-STRING-ALIAS-NAME>	Creates an alias for a hashed string. Use this alias for configuration values that are hashed strings, such as passwords. For example, in the management-policy, use it to define the privilege mode password. For more information, see privilege-mode-password on page 1534 (management-policy mode). • <HASHED-STRING-ALIAS-NAME> – Specify the hashed-string alias name. Alias name should begin with '$'.

<LINE>	Configures the hashed-string value associated with this alias.
	`nx9500-6C8809(config)#show running-config`
	`!`
	`alias encrypted-string $WRITE 2`
	`sBqVCDAoxs3oByF5PCSuFAAAAAd7HT2+EiT/l/BXm9c4SBDv`
	`!`
	`alias hashed-string $PriMode 1`
	`faffdde27cb49ad634ea20df4f7c8ef2685894d10ffcb1b2efba054112e`
	`cfc75`
	`--More--`
	`nx9500-6C8809`
	In the above `show > running-config` output, the '1' displayed before the hashed-string alias value indicates that the displayed text is hashed and not clear text.

```
alias host <HOST-ALIAS-NAME> <HOST-IP>
```

host <HOST-ALIAS-NAME>	Creates a new host alias for this profile. Or associates an existing host alias with this profile. A host alias configuration is for a particular host device's IP address. Use this option to create unique host aliases for different deployment scenarios. For example, if a central network DNS server is set a static IP address, and a remote location's local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements. • <HOST-ALIAS-NAME> – Specify the host alias name. Alias name should begin with '$'.
<HOST-IP>	Associates the network host's IP address with this host alias • <HOST-IP> – Specify the network host's IP address. Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

```
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
```

network <NETWORK-ALIAS-NAME>	Creates a new network alias for this profile. Or associates an existing network alias with this profile. A network alias configuration is utilized for an IP address on a particular network. Use this option to create unique Network aliases for different deployment scenarios. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location's network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements. • <NETWORK-ALIAS-NAME> – Specify the network alias name. Alias name should begin with '$'.
<NETWORK-ADDRESS/MASK>	Associates a single network with this network alias • <NETWORK-ADDRESS/MASK> – Specify the network's address and mask. Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

```
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>
 {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}| network <NETWORK-ADDRESS/
MASK>
{<NETWORK-ADDRESS/MASK>}]
```

network <NETWORK-GROUP-ALIAS-NAME>	Creates a new network-group alias for this profile. Or associates an existing network-group alias with this profile. • <NETWORK-GROUP-ALIAS-NAME> – Specify the network-group alias name. Alias name should begin with '$'. The network-group aliases are used in ACLs, to define the network-specific components. ACLs using aliases can be used across sites by re-defining the network-group alias elements at the device or profile level. After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses. Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.
address-range <STARTING-IP> to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}	Associates a range of IP addresses with this network-group alias • <STARTING-IP> – Specify the first IP address in the range. • to <ENDING-IP> – Specify the last IP address in the range. <STARTING-IP> to <ENDING-IP> – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.

host <HOST-IP> {<HOST-IP>}	Associates a single or multiple hosts with this network-group alias • <HOST-IP> – Specify the host's IP address. • <HOST-IP> – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured.
network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}	Associates a single or multiple networks with this network-group alias • <NETWORK-ADDRESS/MASK> – Specify the network's address and mask. • <NETWORK-ADDRESS/MASK> – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured.

```
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|
ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www)}
```

alias network-service <NETWORK-SERVICE-ALIAS-NAME>	Creates a new network-service alias for this profile. Or associates an existing network-service alias with this profile. A network service alias is a set of configurations that consist of protocol and port mappings. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network service alias. <NETWORK-SERVICE-ALIAS-NAME> – Specify a network-service alias name. Note: Alias name should begin with '$'. The network-service aliases are used in ACLs, to define the service-specific components. ACLs using aliases can be used across sites by re-defining the network-service alias elements at the device or profile level. Note: Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.
proto [<0-254>| <WORD>|eigrp|gre| igmp|igp|ospf|vrrp]	Use one of the following options to associate an Internet protocol with this network-service alias: • <0-254> – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the Protocol field of the IPv4 header and the Next Header field of IPv6 header. For example, the UDP *(User Datagram Protocol)* designated number is 17. • <WORD> – Identifies the protocol by its name. Specify the protocol name. • eigrp – Selects EIGRP *(Enhanced Interior Gateway Routing Protocol)*. The protocol number 88. • gre – Selects GRE *(Generic Routing Encapsulation)*. The protocol number is 47. • igmp – Selects IGMP *(Internet Group Management Protocol)*. The protocol number is 2. • igp – Selects IGP *(Interior Gateway Protocol)*. The protocol number is 9. • ospf – Selects OSPF *(Open Shortest Path First)*. The protocol number is 89. • vrrp – Selects VRRP *(Virtual Router Redundancy Protocol)*. The protocol number is 112.
{(<1-65535>| <WORD>|bgp|dns| ftp| ftp-data|gopher| https|ldap|nntp| ntp| pop3|proto|sip|smtp| sourceport [<1-65535>| <WORD>]| ssh|telnet| tftp|www)}	After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports. • <1-65535> – Optional. Configures a destination port number from 1 - 65535 • <WORD> – Optional. Identifies the destination port by the service name provided. For example, the SSH *(secure shell)* service uses TCP port 22. • bgp – Optional. Configures the default BGP *(Border Gateway Protocol)* services port (179) • dns – Optional. Configures the default DNS *(Domain Name System)* services port (53) • ftp – Optional. Configures the default FTP *(File Transfer Protocol)* control services port (21)

	• ldap – Optional. Configures the default LDAP *(Lightweight Directory Access Protocol)* services port (389)
	• ftp-data – Optional. Configures the default FTP data services port (20)
	• gopher – Optional. Configures the default gopher services port (70)
	• https – Optional. Configures the default HTTPS services port (443)
	• nntp – Optional. Configures the default Newsgroup (NNTP) services port (119)
	• ntp – Optional. Configures the default NTP *(Network Time Protocol)* services port (123)
	• proto – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
	• sip – Optional. Configures the default SIP *(Session Initiation Protocol)* services port (5060).
	• sourceport [<1-65535>|<WORD>] – Optional. After specifying the destination port, you may specify a single or range of source ports.
	  • <1-65535> – Specify the source port from 1 - 65535.
	  • <WORD> – Specify the source port range, for example 1-10.
	• ssh – Optional. Configures the default SSH services port (22)
	• telnet – Optional. Configures the default Telnet services port (23)
	• tftp – Optional. Configures the default TFTP *(Trivial File Transfer Protocol)* services port (69)
	• www – Optional. Configures the default HTTP services port (80)

```
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
```

alias number <NUMBER-ALIAS-NAME> <0-4294967295>	Creates a number alias identified by the <NUMBER-ALIAS-NAME> keyword. Number aliases map a name to a numeric value. For example, 'alias number $NUMBER 100'. In this exmple, • The number alias name is: $NUMBER • The value assigned is: 100 The value d by alias $NUMBER, wherever used, is 100. • <NUMBER-ALIAS-NAME> – Specify the number alias name. • <0-4294967295> – Specify the number, from 0 - 4294967295, assigned to the number alias created. Note: Alias name should begin with '$'.

```
alias string <STRING-ALIAS-NAME> <LINE>
```

alias string <STRING-ALIAS-NAME>	Creates a new string alias for this profile. Or associates an existing string alias with this profile. String aliases map a name to an arbitrary string value. Use this option to create unique string aliases for different deployment scenarios. For example, if the main domain at a remote location is called loc1.domain.com and at another deployment location it is called loc2.domain.com, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the loc1.domain.com domain and at the other with the loc2.domain.com domain. • <STRING-ALIAS-NAME> – Specify the string alias name. • <LINE> – Specify the string value. Note: Alias name should begin with '$'. Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

```
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

alias vlan <VLAN-ALIAS-NAME>	Creates a new VLAN alias for this profile. Or associates an existing VLAN alias with this profile. A VLAN alias maps a name to a VLAN ID. A VLAN alias is a configuration for optimal VLAN re-use and management for local and remote deployments. Use this option to create unique VLANs aliases for different deployment scenarios. For example, if a VLAN ID is set as 10 for the central network, and the VLAN is set as 26 at a remote location, the VLAN can be overridden at the remote location using an alias. At the remote location, the network is functional with an ID of 26, but utilizes the name defined at the central local network. A new VLAN need not be created specifically at the remote location. • <VLAN-ALIAS-NAME> – Specify the VLAN alias name. Note: Alias name should begin with '$'.
<1-4094>	Maps the VLAN alias to a VLAN ID • <1-4094> – Specify the VLAN ID from 1 - 4094. Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

Example

The following example shows the global aliases configured. Note the network-service alias '$kerberos' settings:

```
nx9500-6C8809(config)#show running-config | include alias
alias network-group $NetGrpAlias address-range 192.168.13.7 to 192.168.13.16
192.168.13.20 to 192.168.13.25
alias network-group $NetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network $NetworkAlias 192.168.13.0/24
alias host $HostAlias 192.168.13.10
alias address-range $AddRanAlias 192.168.13.10 to 192.168.13.13
alias network-service $kerberos proto tcp 23 proto udp 25
alias vlan $VlanAlias 1
alias string $AREA Ecospace
```

```
alias string $IN-Blr-EcoSpace-Floor-4 IBEF4
alias encrypted-string $READ 2 CdO6glQ9w29hybKxfbd6JwAAAAa7lKMBMk9EiDQfFRf9kegO
alias hashed-string $PriMode 1
faffdde27cb49ad634ea20df4f7c8ef2685894d10ffcb1b2efba054112ecfc75
nx9500-6C8809(config)#
```

The following examples show the overrides applied to the network-service alias '$kerberos' at the profile level:

```
nx9500-6C8809(config-profile-testRFS4k)#alias network-service $kerberos proto tcp 22
proto udp 389
```

The following example shows the overrides applied to the network-service alias '$kerberos' at the profile level:

```
nx9500-6C8809(config-profile-testRFS4k)#show running-config | include alias
alias network-group $NetGrpAlias address-range 192.168.13.7 to 192.168.13.16
192.168.13.20 to 192.168.13.25
alias network-group $NetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network $NetworkAlias 192.168.13.0/24
alias host $HostAlias 192.168.13.10
alias address-range $AddRanAlias 192.168.13.10 to 192.168.13.13
alias network-service $kerberos proto tcp 22 proto udp 389
alias vlan $VlanAlias 1
alias string $AREA Ecospace
alias string $IN-Blr-EcoSpace-Floor-4 IBEF4
alias encrypted-string $READ 2 /Mfbt1Et8XRhybKxfbd6JwAAAAZ9yrIYq7mNl4+gNNiiMIZI
alias hashed-string $PriMode 1
faffdde27cb49ad634ea20df4f7c8ef2685894d10ffcb1b2efba054112ecfc75
alias network-service $kerberos proto tcp 88 proto udp 389
nx9500-6C8809(config-profile-testRFS4k)#
```

Related Commands

no on page 1214	Removes a specified alias configuration

application-policy

Profile Config Commands on page 853

Associates a RADIUS server provided application policy with this profile. This command is also applicable to the device configuration mode. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane.

An application policy defines the actions executed on recognized HTTP (Facebook), enterprise (Webex) and peer-to-peer (gaming) applications or application-categories. The following are the actions that can be applied in an application policy:

- Allow - Allows packets for a specific application and its defined category type (for e.g., social networking)
- Deny - Denies (restricts) packets to a specific application and its defined category type
- Mark - Marks recognized packets with DSCP/8021p value
- Rate-limit - Rate limits packets from specific application type

For more information on configuring an application policy, see application-policy on page 195.

Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
application-policy radius <APP-POLICY-NAME>
```

Parameters

```
application-policy radius <APP-POLICY-NAME>
```

application-policy radius <APP-POLICY-NAME>	Associates a RADIUS server provided application policy with this profile • <APP-POLICY-NAME> – Specify the application policy name (should be existing and configured).

Example

```
nx9500-6C8809(config-profile-testNX9500)#application-policy radius Bing

nx9500-6C8809(config-profile-testNX9500)#show context include-factory | include

area

Profile Config Commands on page 853

Sets the system's area of location (the physical area of deployment)

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
area <WORD>
```

Parameters

```
area <WORD>
```

area <WORD>	Sets the system's area of location • <WORD> – Specify the area name (should not exceed 64 characters).

Example

```
nx9500-6C8809(config-profile-default-rfs4000)#area Ecospace

nx9500-6C8809(config-profile-default-rfs4000)#show context

arp

Profile Config Commands on page 853

Adds a static ARP *(Address Resolution Protocol)* IP address in the ARP cache

The ARP protocol maps an IP address to a hardware MAC address recognized on the network. ARP provides protocol rules for making this correlation and providing address conversion in both directions.

When an incoming packet destined for a host arrives, ARP finds a physical host or MAC address that matches the IP address. ARP looks in its ARP cache and, if it finds the address, provides it so the packet can be converted to the right packet length, formatted, and sent to its destination. If no entry is found for the IP address, ARP broadcasts a request packet in a special format on the LAN to locate a device that recognizes the IP address. A device that recognizes the IP address as its own returns a reply indicating it. ARP updates the ARP cache for future reference and then sends the packet to the MAC address that replied.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
arp [<IP>|timeout]
arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|
serial <1-4> <1-1> <1-1>] {dhcp-server|router}
arp timeout <15-86400>
```

Parameters

```
arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1>
<1-1>] {dhcp-server|router}
```

arp <IP>	Adds a static ARP IPv4 address in the ARP cache • <IP> – Specify the static IP address.
<MAC>	Specify the MAC address associated with the IP and the Switch Virtual Interface (SVI).
arpa	Sets ARP encapsulation type to ARPA
<L3-INTERFACE-NAME>	Configures static ARP entry for a specified router interface • <L3-INTERFACE-NAME> – Specify the router interface name.
pppoe1	Configures static ARP entry for PPP over Ethernet interface
vlan <1-4094>	Configures static ARP entry for a VLAN interface • <1-4094> – Specify a SVI VLAN ID from 1 - 4094.
wwan1	Configures static ARP entry for Wireless WAN interface
{dhcp-server|router}	The following keywords are common to all off the above interface types: • dhcp-server – Optional. Sets ARP entries for a DHCP server • router – Optional. Sets ARP entries for a router

```
arp timeout <15-86400>
```

arp timeout <15-86400>	Sets ARP entry timeout • <TIME> – Sets the ARP entry timeout in seconds. Specify a value from 15 - 86400 seconds. The default is 3600 seconds.

Example

```
nx9500-6C8809(config-profile-default-rfs4000)#arp timeout 2000

nx9500-6C8809(config-profile-default-rfs4000)#show context

nx9500-6C8809(config-profile-default-rfs4000)#
```

Related Commands

no on page 1214	Removes an entry from the ARP cache

auto-learn

Profile Config Commands on page 853

Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. The command also enables learning of a device's host name via DHCP options.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
auto-learn [host-name-via-dhcp <WORD>|staging-config]
```

Parameters

```
auto-learn [host-name-via-dhcp <WORD>|staging-config]
```

auto-learn [host-name-via-dhcp <WORD>| staging-config]	Enables auto-learning of: • host-name-via-dhcp – A device's host name via DHCP option. • <WORD> – Provide the optional template with substitution token. For example, 'outdoor-$DHCP[1:3]-ap', where the $DHCP token references DHCP Option value received by the adopting device. The $DHCP token should be present. This option is disabled by default. • staging-config – The network configuration of devices requesting adoption. This option is enabled by default. For dependent access points that are pre-staged prior to deployment, it is recommended that the auto-learn-staging-config parameter remains enabled so that hostnames, VLAN and IP addressing configuration can be maintained upon initial adoption. However, if dependent access points are to be centrally managed and configured, it is recommended that the auto-learn-staging-config parameter be disabled

Example

```
nx9500-6C8809(config-profile-test)#auto-learn staging-config

nx9500-6C8809(config-profile-test)#show context include-factory | include auto-learn
```

```
 auto-learn staging-config
 no auto-learn host-name-via-dhcp
nx9500-6C8809(config-profile-test)#
```

Related Commands

no on page 1214	Disables automatic recognition of devices' hostname and devices pending adoption

autogen-uniqueid

Profile Config Commands on page 853

Auto-generates a unique ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device. A device's unique ID is a combination of a user-defined string (prefix, suffix, or both) and a substitution token. The WiNG implementation provides two built-in substitution tokens: $SN and $MiNT-ID that represent the device's serial number and MiNT-ID respectively. The value referenced by these substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for the device.

The general format of this command is: <PREFIX><SUBSTITUTION-TOKEN><SUFFIX>. You can provide both (prefix and suffix) or just a prefix or suffix.

For example, given the following set of inputs:

- user-defined prefix – TestAP505
- substitution token – $SN

The unique ID is generated using TestAP505$SN, where $SN is replaced with the device's serial number.

When executed on an AP505 (having serial number 1902W-2013400000), the autogen-uniqueid TestAP505$SN command generates the unique ID: TestAP5051902W-2013400000. When configured on an AP505 profile, all AP505s using the profile auto-generate a unique ID in which the device's serial number is preceded by the string 'TestAP505'.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
autogen-uniqueid <WORD>
```

Parameters

```
autogen-uniqueid <WORD>
```

autogen-uniqueid <WORD>	Auto-generates a device's unique ID (not exceeding 64 characters in length) The ID generated is a combination of the text provided and the value referenced through the substitution token $SN or $MiNT-ID. Where ever the autogen-uniqueid is used the device's serial number OR MiNT-ID is referenced depending on the substitution token used. • <WORD> – Specify a auto generate unique ID format using one of the following substitution tokens: Available tokens: • $SN - references SERIAL NUMBER of the device • $MINT-ID - references MINT-ID of the device For example, Test-$SN-TechPubs. In this example 'Test' and 'TechPubs' represent the user-defined prefix and suffix respectively. And $SN is the substitution token.

Example

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#autogen-uniqueid Test-$MiNT-ID-TechPubs

autoinstall

Profile Config Commands on page 853

Automatically installs firmware image and startup configuration parameters on to the selected device.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
autoinstall [configuration|firmware|start-interval <WORD>]
```

Parameters

```
autoinstall [configuration|firmware|start-interval <WORD>]
```

configuration	Autoinstalls startup configuration. Setup parameters are automatically configured on devices using this profile. This option is disabled by default.
firmware	Autoinstalls firmware image. Firmware images are automatically installed on devices using this profile. This option is disabled by default.
start-interval <WORD>	Configures the interval between system boot and start of autoinstall process (this is the time, from system boot, after which autoinstall should start) • <WORD> – Specify the interval in minutes. The default is 10 minutes. **Note:** Zero (0) implies firmware or startup configuration installation can start any time.

Example

```
nx9500-6C8809(config-profile-default-rfs4000)#autoinstall configuration

nx9500-6C8809(config-profile-default-rfs4000)#autoinstall firmware

bridge

Configures VLAN Ethernet bridging parameters. Use this command to configure a Bridge NAT or Bridge VLAN settings

Configuring bridge NAT *(Network Address Translation)* parameters, allows management of Internet traffic originating at a remote site. In addition to traditional NAT functionality, bridge NAT provides a means of configuring NAT for bridged traffic through an access point. NAT rules are applied to bridged traffic through the access point, and matching packets are NATed to the WAN link instead of being bridged on their way to the router. Using bridge NAT, a tunneled VLAN (extended VLAN) is created between the NOC and a remote location. When a remote client needs to access the Internet, Internet traffic is routed to the NOC, and from there routed to the Internet. This increases the access time for the end user on the client. To resolve latency issues, bridge NAT identifies and segregates traffic heading towards the NOC and outwards towards the Internet. Traffic towards the NOC is allowed over the secure tunnel. Traffic towards the Internet is switched to a local WLAN link with access to the Internet.

A VLAN *(Virtual LAN)* is a separately administrated virtual network within the same physical managed network. VLANs are broadcast domains defined within wireless controllers or service platforms to allow control of broadcast, multicast, unicast, and unknown unicast within a layer 2 device. Administrators often need to route traffic between different VLANs. Bridging VLANs are only for non-routable traffic, like tagged VLAN frames destined to some other device, which will untag it. When a data frame is received on a port, the VLAN bridge determines the associated VLAN based on the port of reception. Using forwarding database information, the bridge VLAN forwards the data frame on the appropriate port(s). VLANs are useful to set separate networks to isolate some computers from others, without actually having to have separate cabling and Ethernet switches. Controllers can do this on their own, without need for the computer or other gear to know itself what VLAN it is on (this is called port-based VLAN, since it is assigned by port of the switch). Another common use is to put specialized devices like VoIP Phones on a separate network for easier configuration, administration, security, or service quality.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

`bridge [nat|vlan]`

```
bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500>
interface [<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1]
[(address|interface| overload|pool <NAT-POOL-NAME>)]

bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

Parameters

```
bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface
[<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address|interface|overload|
pool <NAT-POOL-NAME>)]
```

nat	Configures bridge NAT parameters
source	Configures NAT source addresses

list <IP-ACCESS-LIST-NAME> precedence <1-500>	Associates an access control list (ACL) with this bridge NAT policy. The ACL specifies the IP address permit/deny rules applicable to this bridge NAT policy. • <IP-ACCESS-LIST-NAME> – Specify access list name. • precedence <1-500> – Specifies a precedence value for this bridge NAT policy.
interface [<LAYER3-INTERFACE-NAME>| pppoe1|vlan <1-4094>| wwan1]	Selects one of the following as the primary interface (between the source and destination points): • <LAYER3-INTERFACE-NAME> – A router interface. Specify interface name. • pppoe1 – A PPP over Ethernet interface. • vlan <1-4094> – A VLAN interface. Specify the VLAN interface index from 1 - 4094. • wwan1 – A Wireless WAN interface.
[(address|interface| overload|pool <NAT-POOL-NAME>)]	The following keywords are recursive and common to all interface types: • address – Configures the interface IP address used for NAT • interface – Configures the failover interface (default setting) • overload – Enables use of one global address for multiple local addresses (terminates command) • pool <NAT-POOLNAME> – Configures the NAT pool used with this bridge NAT policy. Specify the NAT pool name. For more information on configuring a NAT pool, see nat-pool-config-instance on page 1173.

```
bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

vlan <1-4094>	Configures the numerical identifier for the Bridge VLAN when it was initially created. • <1-4094> – Specify a VLAN index from 1 - 4094.
vlan <VLAN-ALIAS-NAME>	Configures the VLAN alias (should be existing and configured) identifying the bridge VLAN • <VLAN-ALIAS-NAME> – Specify a VLAN alias name.

Usage Guidelines

Creating customized filter schemes for bridged networks limits the amount of unnecessary traffic processed and distributed by the bridging equipment.

If a bridge does not hear Bridge Protocol Data Units (BPDUs) from the root bridge within the specified interval, defined in the max-age (seconds) parameter, assume the network has changed and recomputed the spanning-tree topology.

Example

```
nx9500-6C8809(config-profile-default-rfs4000)#bridge vlan 1
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#?

bridge-vlan-mode commands

The following table summarizes bridge VLAN configuration mode commands:

Table 35: Bridge VLAN Config Mode Commands

Command	Description
bridging-mode on page 886	Configures how packets on this VLAN are bridged
captive-portal on page 887	Enables IP packet snooping on wired captive portals, and also configures the subnet to snoop
captive-portal-enforcement on page 888	Enables auto-enforcement of captive portal rules on this extended VLAN interface
description on page 889	Configures VLAN bridge description
edge-vlan on page 890	Enables edge VLAN mode

Table 35: Bridge VLAN Config Mode Commands (continued)

Command	Description
firewall on page 890	Enables firewall on this bridge VLAN interface
http-analyze on page 891	Enables the analysis of URLs and data traffic on this Bridge VLAN
ip on page 891	Configures IP components
ipv6 on page 895	Configures IPv6 components
l2-tunnel-broadcast-optimization on page 897	Enables broadcast optimization
l2-tunnel-forward-additional-packet-types on page 898	Enables forwarding of WNMP *(Wireless Network Management Protocol)* packets across L2 tunnels. These WNMP packets are normally not forwarded if L2 tunnel broadcast optimization is enabled.
mac-auth on page 899	Enables MAC authentication for Extended VLAN and Tunneled traffic (both MiNT and L2TPv3)
name on page 900	Configures a name for the selected Bridge VLAN
no on page 906	Negates a command or reverts settings to their default
stateful-packet-inspection-l2 on page 903	Enables stateful packet inspection in the layer 2 fire wall
registration on page 901	Enables forwarding of bridge-vlan information (such as, name and vlan) to the ExtremeGuest (EGuest) server.
tunnel on page 904	Enables tunneling of unicast messages to unknown MAC destinations, on the selected VLAN bridge
tunnel-over-level2 on page 905	Enables extended VLAN traffic over level 2 MiNT links
use on page 908	Associates a captive-portal, access control list (IP, IPv6, or MAC), and a URL filter with this bridge VLAN

bridging-mode

bridge on page 883

Configures how packets are bridged on the selected VLAN

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
bridging-mode [auto|isolated-tunnel|local|tunnel]
```

Parameters

```
bridging-mode [auto|isolated-tunnel|local|tunnel]
```

bridging-mode	Configures the VLAN bridging mode
auto	Automatically selects the bridging mode to match the WLAN, VLAN and bridging mode configurations. When selected, the controller or access point determines the best bridging mode for the VLAN. (default setting)

isolated-tunnel	Bridges packets between local Ethernet ports and local radios, and passes tunneled packets through without de-tunneling Select this option for a dedicated tunnel for bridging VLAN traffic.
local	Bridges packets normally between local Ethernet ports and local radios (if any) Local mode is typically configured in remote branch offices where traffic on remote private LAN segments need to be bridged locally. Local mode implies that traffic, wired and wireless, is to be bridged locally.
tunnel	Bridges packets between local Ethernet ports, local radios, and tunnels to other APs, wireless controllers, or service platforms Select this option to use a shared tunnel for bridging VLAN traffic. In tunnel mode, the traffic at the AP is always forwarded through the best path. The APs decide the best path to reach the destination and forward packets accordingly. Setting the VLAN to tunnel mode ensures packets are bridged between local Ethernet ports, any local radios, and tunnels to other APs, wireless controllers, and service platforms.

Usage Guidelines

ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#bridging-mode isolated-tunnel

nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#show context
 bridge vlan 1
 bridging-mode isolated-tunnel
 ip igmp snooping
 ip igmp snooping querier
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

Related Commands

no on page 906	Resets bridging mode to auto

captive-portal

bridge on page 883

Enables IP (IPv4 and IPv6) packet snooping on wired captive portals, and also configures the subnet to snoop. When enabled, IP packets received from wired captive portal clients, on the specified subnet, are snooped to learn IP to MAC mapping.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address
<IPv4|IPv6>}
```

Parameters

```
captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address
<IPv4|IPv6>}
```

captive-portal [ipv4-snooping| ipv6-snooping]	Enables snooping of IPv4 or IPv6 packets (based on the option selected) for wired captive portal clients
subnet <IPv4/M| IPv6/M>	Enables IPv4 or IPv6 packet snooping on a specified subnet • <IPv4/M|IPv6/M> – Specify the subnet address in the A.B.C.D/M or X:X::X:X/M format to identify an IPv4 or IPv6 subnet respectively. When specified, this is the IPv4/IPv6 subnet on which IP packets are to be snooped.
excluded-address <IPv4|IPv6>	Optional. Configures the IPv4 or IPv6 address excluded from snooping within the specified IPv4|IPv6 subnet. • <IPv4|IPv6> – Specify the IPv4 or IPv6 address. Use this parameter to configure the gateway's address.

Example

```
nx9500-6C8809(config-profile NX9500Test-bridge-vlan-4)#captive-portal ip-snooping subnet
192.168.13.0/24 excluded-address 192.168.13.7

nx9500-6C8809(config-profile NX9500Test-bridge-vlan-4)#show context
 bridge vlan 4
  captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
  ip igmp snooping
  ip igmp snooping querier
  ipv6 mld snooping
  ipv6 mld snooping querier
nx9500-6C8809(config-profile NX9500Test-bridge-vlan-4)#
```

Related Commands

no on page 906	Disables IP packet snooping on wired captive portals

captive-portal-enforcement

bridge on page 883

Enables auto-enforcement of captive portal rules on this extended VLAN interface. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
captive-portal-enforcement {fall-back}
```

Parameters

```
captive-portal-enforcement {fallback}
```

captive-portal-enforcement	Enables auto-enforcement of captive portal access permission rules to data transmitted over this extended VLAN interface. When enforced, wired network users can pass traffic through the captive portal without being redirected to an authentication page. Authentication instead takes place when the RADIUS server is queried against the wired user's MAC address. If the MAC address is in the RADIUS server's user database, the user is allowed access. A captive portal is an access policy for providing temporary and restrictive access using a standard Web browser. Captive portals capture and re-direct a wired/wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access the network.
fall-back	Optional. If enabling source MAC authentication for Extended VLAN and tunneled traffic on this bridge VLAN, use this option to enforce captive-portal authentication as the fall-back mode of authentication in case MAC authentication fails.

Example

```
nx9500-6C8809(config-profile testAP7602-bridge-vlan-20)#show context
 bridge vlan 20
  captive-portal-enforcement
  ip igmp snooping
  ip igmp snooping querier
  ipv6 mld snooping
  ipv6 mld snooping querier
nx9500-6C8809(config-profile testAP7602-bridge-vlan-20)#
```

Related Commands

no on page 906	Disables auto-enforcement of captive portal rules on this extended VLAN interface

description

bridge on page 883

Configures this extended VLAN's description

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
description <WORD>
```

Parameters

```
description <WORD>
```

description <WORD>	Configures a description for this VLAN bridge • <WORD> – Enter a description. The description should be unique to the VLAN's specific configuration to help differentiate it from other VLANs with similar configurations.

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#description "This is a
description for the bridged VLAN"
```

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#show context
 bridge vlan 1
 description "This is a description for the bridged VLAN"
 bridging-mode isolated-tunnel
 ip igmp snooping
 ip igmp snooping querier
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

Related Commands

no on page 906	Removes VLAN's description

edge-vlan

bridge on page 883

Enables the edge VLAN mode. In the edge VLAN mode, a protected port does not forward traffic to another protected port on the same wireless controller or service platform. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
edge-vlan
```

Parameters

```
None
```

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#edge-vlan
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

Related Commands

no on page 906	Disables the edge VLAN mode

firewall

bridge on page 883

Enables IPv4 firewall on this Bridge VLAN. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
firewall
```

Parameters

```
None
```

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#firewall
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

Related Commands

no on page 906	Disables firewall on this bridge VLAN interface

http-analyze

bridge on page 883

Enables the analysis of URLs and data traffic on this Bridge VLAN. When enabled, URLs and data are forwarded to the controller running the HTTP analytics engine.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
http-analyze {filter [images|post|query-string]}
```

Parameters

```
http-analyze {filter [images|post|query-string]}
```

http-analyze filter [images|post|query-string]	Enables URL and HTTP data analysis. Optionally use the filter keyword to filter out specific URLs
	• filter – Optional. Filters out specific URLs
	  • images – Filters out URLs referring to images
	  • post – Filters out URLs referring to POSTs
	  • query-string – Filters out query strings received from URLs

Example

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#http-analyze filter images

rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#show context
 bridge vlan 4
  http-analyze filter images
rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#
```

Related Commands

no on page 906	Disables forwarding of URLs and data to the controller running the HTTP analytics engine

ip

bridge on page 883

Configures this Bridge VLAN's IP components

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h

- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ip [arp|dhcp|igmp]
ip [arp|dhcp] trust
ip igmp snooping {fast-leave|forward-unknown-multicast|last-member-query-count| mrouter| querier}
ip igmp snooping {fast-leave|forward-unknown-multicast|last-member-query-count <1-7>}
ip igmp snooping {mrouter [interface|learn]}
ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
ip igmp snooping {querier} {address|max-response-time|timer|version}
ip igmp snooping {querier} {address <IP>|max-response-time <1-25>|timer expiry <60-300>| version <1-3>}
```

Parameters

```
ip [arp|dhcp] trust
```

ip	Configures the VLAN bridge IP parameters
arp trust	Configures the ARP trust parameter. Trusted ARP packets are used to update the DHCP snoop table to prevent IP spoof and arp-cache poisoning attacks. This option is disabled by default. • trust – Trusts ARP responses on the VLAN bridge
dhcp trust	Configures the DHCP trust parameter. Uses DHCP packets, from a DHCP server, as trusted and permissible within the access point, wireless controller, or service platform managed network. DHCP packets are used to update the DHCP snoop table to prevent IP spoof attacks. This feature is enabled by default. • trust – Trusts DHCP responses on the VLAN bridge

```
ip igmp snooping {fast-leave|forward-unknown-multicast|last-member-query-count <1-7>}
```

ip	Configures the VLAN bridge IP parameters
igmp snooping	Configures Internet Group Management Protocol (IGMP) snooping parameters. IGMP snooping is enabled by default. IGMP establishes and maintains multicast group memberships for interested members. Multicasting allows a networked device to listen to IGMP network traffic and forward IGMP multicast packets to radios on which the interested hosts are connected. The device also maintains a map of the links that require multicast streams, there by reducing unnecessary flooding of the network with multicast traffic.
fast-leave	Optional. Enables fast leave processing. When enabled, layer 2 LAN interfaces are removed from the IGMP snooping forwarding table entry without initially sending IGMP group-specific queries to the interface. When receiving a group specific IGMPv2 leave message, IGMP snooping removes the interface from the Layer 2 forwarding table entry for that multicast group, unless a multicast router was learned on the port. Fast-leave processing enhances bandwidth management for all hosts on the network. This option is disabled by default. This feature is supported only on the AP7502, AP8533 model access points.

forward-unknown-multicast	Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.
last-member-query-count <1-7>	Optional. Configures the last member query count used in determining the number of group-specific queries sent before removing the snoop entry • <1-7> – Specify the count from 1 - 7. The default value is 2.

```
ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
```

ip	Configures the VLAN bridge IP parameters
igmp snooping	Configures the IGMP snooping parameters
mrouter	Optional. Configures the multicast router parameters
interface <INTERFACE-LIST>	Configures the multicast router interfaces. This option is disabled by default. • <INTERFACE-LIST> – Specify a comma-separated list of interface names.
learn pim-dvmrp	Configures the multicast router learning protocols. This option is disabled by default. • pim-dvmrp – Enables Protocol-Independent Multicast (PIM) and Distance-Vector Multicast Routing Protocol (DVMRP) snooping of packets

```
ip igmp snooping {querier} {address <IP>|max-response-time <1-25>| timer expiry <60-300>|
version <1-3>}
```

ip	Configures the VLAN bridge IP parameters
igmp snooping	Configures the IGMP snooping parameters
querier	Optional. Configures the IGMP querier parameters. This option is disabled by default. Enables IGMP querier. IGMP snoop querier keeps host memberships alive. It is primarily used in a network where there is a multicast streaming server and hosts subscribed to the server and no IGMP querier present. The access point, wireless controller, or service platform performs the IGMP querier role. An IGMP querier sends out periodic IGMP query packets. Interested hosts reply with an IGMP report packet. IGMP snooping is only conducted on wireless radios. IGMP multicast packets are flooded on wired ports. IGMP multicast packet are not flooded on the wired port. IGMP membership is also learnt on it and only if present, then it is forwarded on that port.
address <IP>	Optional. Configures the IGMP querier source IP address. This address is used as the default VLAN querier IP address. • <IP> – Specify the IGMP querier source IP address.

max-response-time <1-25>	Optional. Configures the IGMP querier maximum response time. This option is disabled by default. • <1-25> – Specify the maximum response time from 1 - 25 seconds. The access point, wireless controller, or service platform forwards multicast packets only to radios present in the snooping table. IGMP reports from wired ports are forwarded to the multicast router ports. If no reports are received from a radio, it is removed from the snooping table. The radio then stops receiving multicast packets.
timer expiry <60-300>	Optional. Configures the IGMP querier expiry time. The value specified is used as the timeout interval for other querier resources. This option is disabled by default. • expiry – Configures the IGMP querier timeout • <60-300> – Specify the IGMP querier timeout from 60 - 300 seconds.
version <1-3>	Optional. Configures the IGMP version. This option is disabled by default. • <1-3> – Specify the IGMP version. The versions are 1- 3.

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#ip arp trust

nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#ip dhcp trust

nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#ip igmp snooping mrouter
interface ge1 ge2

  ip igmp snooping querier
  ip igmp snooping querier version 2
  ip igmp snooping querier max-response-time 24
  ip igmp snooping querier timer expiry 100
  ip igmp snooping mrouter interface ge2 ge1
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

Related Commands

no on page 906	Disables or reverts the VLAN Ethernet bridge parameters

ipv6

bridge on page 883

Configures this Bridge VLAN's IPv6 components

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ipv6 [dhcpv6|firewall|mld|nd]
ipv6 dhcpv6 trust
ipv6 firewall
ipv6 mld snooping {forward-unknown-multicast|mrouter|querier}
ipv6 mld snooping {forward-unknown-multicast}
ipv6 mld snooping {mrouter [interface|learn]}
ipv6 mld snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
ipv6 mld snooping {querier} {max-response-time|timer|version}
ipv6 mld snooping {querier} {max-response-time <1-25000>|timer expiry <60-300>| version <1-2>}
ipv6 nd raguard
```

Parameters

```
ipv6 dhcpv6 trust
```

ipv6	Configures the VLAN bridge IPv6 parameters
dhcpv6 trust	Enables the DHCPv6 trust option. When enabled all DHCPv6 responses are trusted on this bridge VLAN. This option is enabled by default. • trust – Trusts DHCPv6 responses on this bridge VLAN

```
ipv6 firewall
```

ipv6	Configures the VLAN bridge IPv6 parameters
firewall	Enables IPv6 firewall on this bridge VLAN. This option is enabled by default. Devices utilizing IPv6 addressing require firewall protection unique to IPv6 traffic. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons. IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the ND *(neighbor discovery)* protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters. Routers respond to such a request with a RA *(router advertisement)* packet that contains Internet layer configuration parameters.

```
ipv6 mld snooping {forward-unknown-multicast}
```

ipv6	Configures the VLAN bridge IPv6 parameters
mld snooping	Configures MLDP *(Multicast Listener Discovery Protocol)* snooping parameters MLD snooping enables a access point, wireless controller, or service platform to examine MLD packets and make forwarding decisions based on the content. MLD is used by IPv6 devices to discover devices wanting to receive multicast packets destined for specific multicast addresses. MLD uses multicast listener queries and multicast listener reports to identify which multicast addresses have listeners and join multicast groups. MLD snooping caps the flooding of IPv6 multicast traffic on controller, service platform or access point VLANs. When enabled, MLD messages between hosts and multicast routers are examined to identify the hosts receiving multicast group traffic. The access point, wireless controller, or service platform forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces. This option is enabled by default.
forward-unknown-multicast	Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.

```
ipv6 mld snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
```

ipv6	Configures the VLAN bridge IPv6 parameters
mld snooping	Configures MLD snooping parameters. This option is enabled by default.
mrouter	Optional. Configures the multicast router parameters, such as interfaces and learning protocol used.
interface <INTERFACE-LIST>	Configures the multicast router interfaces. This option is disabled by default. • <INTERFACE-LIST> – Specify a comma-separated list of interface names.
learn pim-dvmrp	Configures the multicast router learning protocols. This option is disabled by default. • pim-dvmrp – Enables PIM and DVMRP snooping of packets

```
ipv6 mld snooping {querier} {max-response-time <1-25000>|timer expiry <60-300>| version
<1-2>}
```

ipv6	Configures the VLAN bridge IPv6 parameters
mld snooping	Configures IPv6 MLD snooping parameters. This option is disabled by default.
querier	Optional. Enables and configures the MLD querier parameters. When enabled, the device (access point, wireless controller, and service platform) sends query messages to discover which network devices are members of a given multicast group. This option is disabled by default.
max-response-time <1-25000>	Optional. Configures the IPv6 MLD querier's maximum response time. This option is disabled by default. • <1-25000> – Specify the maximum response time from 1 - 25000 milliseconds.

timer expiry <60-300>	Optional. Configures the IPv6 MLD other querier's timeout. This option is disabled by default. • <60-300> – Specify the MLD other querier's timeout from 60 - 300 seconds.
version <1-2>	Optional. Configures the IPv6 MLD querier version. This option is disabled by default. • <1-2> – Specify the MLD version. The versions are 1- 2.

```
ipv6 nd raguard
```

ipv6	Configures the VLAN bridge IPv6 parameters
nd raguard	Allows RA or ICMPv6 redirects on this VLAN bridge. This option is enabled by default.

Example

```
rfs7000-37FABE(config-profile test-bridge-vlan-2)#ipv6 dhcpv6 trust

Related Commands

no on page 906	Disables WNMP packet forwarding across L2 tunnel

mac-auth

bridge on page 883

Enables source MAC authentication for Extended VLAN and tunneled traffic (MiNT and L2TPv3) on this bridge VLAN. When enabled, it provides fast path authentications of clients, whose captive portal session has expired.

Supported in the following platforms:

- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
mac-auth {attempts <1-5>|throttle <0-255>}
```

Parameters

```
mac-auth {attempts <1-5>|throttle <0-255>}]
```

mac-auth	Enables MAC Authentication
attempts <1-5>	Optional. Configures the maximum number of retries allowed for MAC authentication requests. • <1-5> – Specify the maximum allowed authentication retries from 1 - 5. The default is 3.
throttle <0-255>	Optional. Configures the throttle value for MAC authentication requests • <0-255> – Specify the MAC authentication request throttle value from 0 -255. The default is 64.

Usage Guidelines : Applying AAA Policy for MAC Authentication

To enable MAC authentication,

- Create an AAA policy.

  ```
  nx9500-6C8809(config)#aaa-policy MAC-Auth
  ```

- Use the AAA policy on the device for MAC Authentication.

  ```
  nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#mac-auth use aaa-policy MAC-Auth
  ```

- In the bridge VLAN context, enable MAC Authentication,

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth
```

- Optionally, configure the following MAC Authentication parameters. If not specified, default values are applied.

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth attempts 2
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth throttle 100
```

Usage Guidelines: Enabling Fall-back Captive Portal Authentication

To enable fall-back captive-portal authentication on the bridge VLAN,

- apply a captive-portal policy to the bridge VLAN.

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#use captive-portal test
```

- enable captive-portal authentication as the fall-back authentication mode.

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#captive-portal-
enforcement fall-back
```

Example

```
nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#mac-auth attempts 2

nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#mac-auth throttle 80

nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#show context
 bridge vlan 20
  mac-auth attempts 2
  mac-auth throttle 80
  ip igmp snooping
  ip igmp snooping querier
  ipv6 mld snooping
  ipv6 mld snooping querier
nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#
```

Related Commands

no on page 906	Disables MAC authentication for Extended VLAN and Tunneled traffic on this bridge VLAN

name

bridge on page 883

Configures a name for this Bridge VLAN. This name uniquely identifies the bridge-vlan interface, and is forwarded to the EGuest server along with configuration details.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
name <NAME>
```

Parameters

```
name <NAME>
```

name <NAME>	Provide a name for this Bridge VLAN, uniquely identifying it from other Bridge VLAN interfaces with similar configurations. It should exceed 32 characters in length.

```
nx9500-6C8809(config-profile testNX5500-bridge-vlan-200)#name InterLabs1-2

nx9500-6C8809(config-profile testNX5500-bridge-vlan-200)#show context
 bridge vlan 200
  name InterLabs1-2
  ip igmp snooping
  ip igmp snooping querier
  ipv6 mld snooping
  ipv6 mld snooping querier
nx9500-6C8809(config-profile testNX5500-bridge-vlan-200)#
```

Related Commands

no on page 906	Removes or modifies this Bridge VLANs configured name

registration

bridge on page 883

Enables forwarding of bridge-vlan information (such as, name and vlan) to the ExtremeGuest (EGuest) server. The EGuest server updates its WLAN information collection with the received wired-network information.

Note
Ensure that the bridge-vlan interface has a name that uniquely identifies it from other bridge-vlan interfaces with similar configurations. For more information, see name on page 900.

Captive-portal Web pages for wired clients are hosted on the gateway controller's bridge-vlan interface. By updating the EGuest server with bridge-vlan information, you enable the EGuest server to apply of captive-portal's Splash templates to the bridge-vlan interface.

This command also configures the external guest registration and validation server details. If using an external server to perform wired client registration, authentication and accounting, use this command to configure the external server's IP address/hostname. When configured, the gateway controller forwards guest registration requests to the specified registration server. In case of EGuest deployment, this external resource should point to the EGuest server.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
registration [device|device-OTP|external|user]
registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> {expiry-time <1-43800>}
registration external follow-aaa send-mode [http|https|udp]
```

Parameters

```
registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> {expiry-time <1-43800>}
```

registration	Enables wired guest-user registration and validation. This option is disabled by default. Use to configure registration and validation parameters for wired captive-portal clients. Specify the client registration mode used. If using an external resource as authenticating server, use this command to point to the external resource.
[device|device-OTP| user]	Configures the mode used to register wired clients on this bridge-vlan interface. The options are: device, user, and device-OTP. • device-OTP – Registers device by its MAC address. During registration the user, provides e-mail address or mobile number, and an OTP *(one-time-passcode)* is sent to the registered e-mail id or mobile number to complete registration. • device – Registers device by its MAC address, and allows access to already registered clients. Note: If using the above two options, ensure MAC authentication is enabled on the bridge-vlan interface. • user – Registers guest users using one of the following options: e-mail address, mobile-number, or member-id. If using any one of the above modes of registration, specify the RADIUS group to which the registered device or user is to be assigned post authentication.
group-name <RAD-GROUP-NAME>	Configures the RADIUS group name in which registered users are placed. When left blank, users are not associated with a RADIUS group. • <RAD-GROUP-NAME> – Specify the RADIUS group name (should not exceed 64 characters).
expiry-time <1-43800>	Optional. Configures the duration in hours, or which registered MAC addresses are retained. Once this duration is over, registered MAC addresses expire and need to be re-entered. • <1-43800> – Specify a value from 1 - 43800 hrs. The default is 1500 hrs.

```
registration external follow-aaa send-mode [http|https|udp]
```

registration	Enables wired guest-user registration and validation. This option is disabled by default. Use to configure registration and validation parameters for wired captive-portal clients. Specify the client registration mode used. If using an external resource as authenticating server, use this command to point to the external resource.
external	Specifies that the wired client registration is handled by an external resource. Registration requests are forwarded to the external registration server by the captive-portal gateway controller.

follow-aaa	Uses an AAA policy to point to the guest registration, authentication, and accounting server. When used, guest registration is handled by the RADIUS server specified in the AAA policy. This is the AAA policy used in the captive-portal applied on the bridge-vlan interface. In case of EGuest deployment, in the AAA policy, the RADIUS authentication and accounting server configuration should point to the EGuest server. The use of 'follow-aaa' option is recommended in EGuest replica-set deployments. For more information on enabling the EGuest server, see eguest-server (VX9000 only) on page 987 (profile config mode).
send-mode [https|https|udp]	Specifies the protocol used to forward registration requests to the external AAA policy server. The options are: • HTTPS – Sends registration requests as HTTPS packet • HTTP – Sends registration requests as HTTP packet • UDP – Sends registration requests as UDP packet. This is the default setting.

Example

```
nx9500-6C8809(config-profile testNX9500-bridge-vlan-20)#registration device
group-name test expiry-time 200
nx9500-6C8809(config-profile testNX9500-bridge-vlan-20)#registration external

```

Related Commands

no on page 906	Disables self-registration of captive-portal users on this bridge-vlan interface.

stateful-packet-inspection-l2

bridge on page 883

Enables a SIP *(stateful packet inspection)* at the layer 2 firewall. SPI, also referred to as dynamic packet filtering, is a security feature that tracks the operating state and characteristics of network connections traversing it. It distinguishes legitimate packets for different types of connections, and only allows packets matching a known active connection to pass.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
stateful-packet-inspection-l2
```

Parameters

```
None
```

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#stateful-packet-ins
inspection-l2
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

Related Commands

no on page 906	Disables stateful packet inspection at the layer 2 firewall

tunnel

bridge on page 883

Enables tunneling of unicast messages, to unknown MAC destinations, on the selected VLAN bridge

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
tunnel [rate-limit|unknown-unicast]
tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024> {red-threshold
[background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}
tunnel unknown-unicast
```

Parameters

```
tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024> {red-threshold
[background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}
```

tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024>	Configures a rate-limit parameters (max-burst-size and rate) for tunneled VLAN traffic over level 2 MiNT links
	• rate – Optional. Configures the data rate, in kilobits per second, for the incoming and outgoing extended VLAN traffic tunneled over MiNT level 2 links
	  • <50-1000000> – Specify a value from 50 - 1000000 Kbps. The default is 5000 Kbps.
	• max-burst-size – Optional. Configures the maximum burst size
	  • <2-1024> – Specify the maximum burst size from 2 - 1024 kbytes. The default is 320 kbytes.
	
	After specifying the max-burst-size, optionally specify the red-threshold value for the different traffic types. The red-threshold is configured as a % of the specified max-burst-size.
	• red-threshold – Optional. Configures the random early detection (red) threshold for the different traffic types
	  • background – Configures the red-threshold for low priority traffic from 0 - 100. The default is 50% of the specified max-burst-size.
	  • best-effort – Configures the red-threshold for normal priority traffic from 0 - 100. The default is 50% of the specified max-burst-size.
	  • video – Configures the red-threshold for video traffic from 0 - 100. The default is 25% of the specified max-burst-size.
	  • voice – Configures the red-threshold for voice traffic from 0 - 100. The default is 0% of the specified max-burst-size.

```
tunnel unknown-unicast
```

tunnel unknown-unicast	Enables tunneling of unicast packets destined for unknown MAC addresses

Example

```
nx9500-6C8809(config-profile TestAP81xx-bridge-vlan-1)#tunnel unknown-unicast

nx9500-6C8809(config-profile TestAP81xx-bridge-vlan-1)#no tunnel unknown-unicast

use

bridge on page 883

Associates a captive-portal, access control list (IPv4, IPv6, or MAC), and/or a URL filter with this bridge VLAN

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
use [application-policy|captive-portal|ip-access-list|ipv6-access-list|mac-access-list|
purview-application-policy|url-filter]

use application-policy <APP-POLICY-NAME>

use captive-portal <CAPTIVE-PORTAL-NAME>

use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/ipv6/MAC-ACCESS-LIST-
NAME>

use url-filter <URL-FILTER-NAME>

use purview-application-policy <PURVIEW-APP-POLICY-NAME>
```

Parameters

```
use application-policy <APP-POLICY-NAME>
```

use application-policy <APP-POLICY-NAME>	Enforces application detection on this VLAN bridge • <APP-POLICY-NAME> – Specify the application policy name (should be existing and configured). • For more information on application definitions and application policy, see application on page 183 and application-policy on page 195.

```
use captive-portal <CAPTIVE-PORTAL-NAME>
```

use captive-portal	Applies an existing captive portal configuration to restrict access to the bridge VLAN configuration A captive portal is an access policy for providing temporary and restrictive access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access to the network. Once logged into the captive portal, additional terms and agreement, welcome, fail, and no-service pages provide the administrator with a number of options on captive portal screen flow and user appearance. • <CAPTIVE-PORTAL-NAME> – Specify the captive portal name.

```
use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/IPv6/MAC-ACCESS-LIST-NAME>
```

use	Sets this VLAN bridge policy to use an IPv4/IPv6 access list or a MAC access list
ip-access-list	Associates a pre-configured IPv4 access list with this VLAN-bridge interface
ipv6-access-list	Associates a pre-configured IPv6 access list with this VLAN-bridge interface
mac-access-list	Associates a pre-configured MAC access list with this VLAN- bridge interface
tunnel out <IP/IPv6/MAC-ACCESS-LIST-NAME>	The following keywords are common to the 'IPv4/IPv6 access list' and 'MAC access list' parameters: • tunnel – Applies IPv4/IPv6 access list or MAC access list to all packets going into the tunnel • out – Applies IPv4/IPv6 access list or MAC access list to all outgoing packets <IP/IPv6/MAC-ACCESS-LIST-NAME> – Specify the IP/IPv6 access list or MAC access list name.

```
use url-filter <URL-FILTER-NAME>
```

use url-filter	Sets this VLAN bridge to use a URL filter
<URL-FILTER-NAME>	Specify the URL filter name. It should be existing and configured. This option enforces URL filtering on the VLAN bridge.

```
use purview-application-policy <PURVIEW-APP-POLICY-NAME>
```

use purview-application-policy <PURVIEW-APP-POLICY-NAME>	Enforces application detection on this VLAN bridge • <PURVIEW-APP-POLICY-NAME> – Specify the Purview application policy name (should be existing and configured). Note: *EAA (Extreme Application Analytics)* (Purview™) is supported only on the WiNG 7.1.2 APs. Note: For information on Purview application policy, see purview-application-policy on page 436.

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#use mac-access-list tunnel
out PERMIT-ARP-AND-IPv4

nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#show context
 bridge vlan 1
  ip igmp snooping
  ip igmp snooping querier
  use mac-access-list tunnel out PERMIT-ARP-AND-IPv4
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

Related Commands

no on page 906	Disables or reverts VLAN Ethernet bridge settings

captive-portal

Profile Config Commands on page 853

Configures captive portal advanced Web page uploads on this profile

A captive portal is a means of providing guests temporary and restrictive access to the controller managed wireless network. A captive portal provides secure authenticated controller access by capturing and re-directing a wireless user's Web browser session to a captive portal login page, where the user must enter valid credentials. Once the user is authenticated and logged into the controller managed network, additional agreement, welcome, and fail pages provide the administrator with options to control the captive portal's screen flow and user appearance.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
captive-portal page-upload count <1-20>
```

Parameters

```
captive-portal page-upload count <1-20>
```

page-upload	Enables captive portal advanced Web page upload
count <1-20>	Sets the maximum number of APs that can be uploaded concurrently • <1-20> – Set a value from 1 - 20. The default is 10.

Example

```
nx9500-6C8809(config-profile-testNX9500)#captive-portal page-upload count 15

nx9500-6C8809(config-profile-testNX9500)#show context include-factory | include

cdp

Profile Config Commands on page 853

Enables CDP *(Cisco Discovery Protocol)*, a proprietary data link layer network protocol implemented in Cisco networking equipment and used to share network information amongst different vendor wireless devices

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
cdp [holdtime|run|timer]
cdp [holdtime <10-1800>|run|timer <5-900>]
```

Parameters

```
cdp [holdtime <10-1800>|run|timer <5-900>]
```

holdtime <10-1800>	Specifies the holdtime after which transmitted packets are discarded • <10-1800> – Specify a value from 10 - 1800 seconds. The default is 180 seconds.
run	Enables CDP sniffing and transmit globally. This feature is enabled by default.
timer <5-900>	Specifies the interval, in seconds, between successive CDP packet transmission • <5-900> – Specify a value from 5 - 900 seconds. The default is 60 seconds.

Example

```
nx9500-6C8809(config profile-default-rfs4000)#cdp run

cluster

Profile Config Commands on page 853

Sets the cluster configuration

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
cluster [force-configured-state|force-configured-state-delay|handle-stp|master-priority|
member|mode|name|radius-counter-db-sync-time]

cluster [force-configured-state|force-configured-state-delay <3-1800>|handle-stp| master-
priority <1-255>]

cluster member [ip|vlan]

cluster member [ip <IP> {level [1|2]}|vlan <1-4094>]

cluster mode [active|standby]

cluster name <CLUSTER-NAME>

cluster radius-counter-db-sync-time <1-1440>
```

Parameters

```
cluster [force-configured-state|force-configured-state-delay <3-1800>|handle-stp|master-
priority <1-255>]
```

force-configured-state	Forces adopted APs to auto revert when a failed wireless controller or service platform (in a cluster) restarts When an active controller (wireless controller, or service platform) fails, a standby controller in the cluster takes over APs adopted by the failed active controller. If the failed active controller were to restart, it starts a timer based on the 'force-configured-state-delay' interval specified. At the expiration of this interval, the standby controller releases all adopted APs and goes back to a monitoring mode. If the active controller fails during this interval, the 'force-configured-state-delay' timer is stopped. The timer restarts as soon as the active controller comes back up. This feature is disabled by default.
force-configured-state-delay <3-1800>	Forces cluster transition to the configured state after a specified interval • <3-1800> – Specify a delay from 3 - 1800 minutes. The default is 5 minutes. This is the interval a standby controller waits before releasing adopted APs when a failed primary controller becomes active again.

handle-stp	Enables STP *(Spanning Tree Protocol)* convergence handling. This feature is disabled by default. In layer 2 networks, this protocol is enabled to prevent network looping. If enabled, the network forwards data only after STP convergence. Enabling STP convergence delays the redundancy state machine execution until the STP convergence is completed (the standard protocol value for STP convergence is 50 seconds). Delaying the state machine is important to load balance APs at startup.
master-priority <1-255>	Configures cluster master priority • <1-255> – Specifies cluster master election priority. Assign a value from 1 - 255. Higher the value higher is the precedence. The default is 128. In a cluster environment one device from the cluster is elected as the cluster master. A device's master priority value decides the device's priority to become cluster master.

```
cluster member [ip <IP> {level [1|2]}|vlan <1-4094>]
```

member	Adds a member to the cluster. It also configures the cluster VLAN where members can be reached.
ip <IP> level [1|2]	Adds IP address of the new cluster member • <IP> – Specify the IP address. • level – Optional. Configures routing level for the new member. Select one of the following routing levels: 1 – Level 1, local routing 2 – Level 2, In-site routing
vlan <1-4094>	Configures the cluster VLAN where members can be reached • <1-4094> – Specify the VLAN ID from 1- 4094.

```
cluster mode [active|standby]
```

mode [active|standby]	Configures cluster member's mode as active or standby • active – Configures cluster mode as active. This is the default setting. • standby – Configures cluster mode as standby A member can be in either an Active or Standby mode. All active member controllers can adopt access points. Standby members only adopt access points when an active member has failed or sees an access point not adopted by a controller.

```
cluster name <CLUSTER-NAME>
```

name <CLUSTER-NAME>	Configures the cluster name • <CLUSTER-NAME> – Specify the cluster name.

```
cluster radius-counter-db-sync-time <1-1440>
```

radius-counter-db-sync-time <1-1440>	Configures the interval, in minutes, at which the RADIUS counter database is synchronized with the dedicated NTP server resource. • <1-1440> – Specify a value from 1 - 1440 minutes. The default is 5 minutes. Use the `show > cluster > configuration` command to view RADIUS counter DB sync time.

Example

```
nx9500-6C8809(config-profile-default-rfs4000)#cluster name cluster1

nx9500-6C8809(config-profile-default-rfs4000)#cluster member ip 172.16.10.3

configuration-persistence

Profile Config Commands on page 853

Enables configuration persistence across reloads. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
configuration-persistence {auto|secure}
```

Parameters

```
configuration-persistence {auto|secure}
```

auto	Optional. Assigns default value based on the device type
secure	Optional. Ensures parts of a file that contain security information are not written during a reload

Example

```
nx9500-6C8809(config-profile-default-rfs4000)#configuration-persistence secure

controller

Profile Config Commands on page 853

Configures the WiNG controller (wireless controller or service platform) adoption settings

Adoption is the process a controller or service platform uses to discover available access points and/or peer controllers/service platforms, establish an association and provision the adopted device. Adoption settings are configurable and supported within a profile and applied to all devices supported by the profile.

Use this command to add a controller to a pool and group. This command also enables and disables adoption on controllers, and specifies the device types that can be adopted by a controller.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
controller [adopted-devices|adoption|group|hello-interval|vlan|host]
controller adopted-devices [aps {controllers}|controllers {aps}|external-devices|external-devices-monitoring-only]
controller adoption
controller [group <CONTROLLER-GROUP-NAME>|vlan <1-4094>]
controller hello-interval <1-120> adjacency-hold-time <2-600>
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure|level|pool|remote-vpn-client}
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure} {gw [<IP>|<HOSTNAME>]}
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {level [1|2]|pool <1-2> level [1|2]} {ipsec-secure {gw [<IP>|<HOSTNAME>]}|remote-vpn-client}
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {remote-vpn-client}
```

Parameters

```
controller adopted-devices [aps {controllers}|controllers {aps}|external-devices|external-devices-monitoring-only]
```

controller	Configures the WLAN's controller adoption settings
adopted-devices	Configures the types of device (AP/controller) this controller can adopt
aps {controllers}	Enables the adoption of network access points by this controller. This option is enabled by default. • controllers – Optional. Enables the adoption of peer controllers by this controller All adopted devices (referred to as adoptee) receive complete configuration from the adopting controller (referred to as adopter).
controllers {aps}	Enables the adoption of peer controllers by this controllers • aps – Optional. Enables the adoption of network access points by this controller A controller cannot be configured as an adoptee and an adopter simultaneously. In other words, an adopted controller (adoptee) cannot be configured to adopt another controller. Use the `no > controller > adopted-devices` command to remove this setting.
external-devices	Enables adoption of external devices by this controller. This option is disabled by default. When enabled, a WiNG controller can adopt and manage T5 controllers and EX3500 switches (using the IPX operating system) within a WiNG managed device subnet. This setting is disabled by default. To disable T5 or EX3500 adoption, use the no > controller > external-devices command. This feature is supported only on RFS4000, NX9500, NX9510, NX9600, and VX9000 platforms.
external-devices-monitoring-only	Enables only monitoring of external devices by this controller or service platform. This option is disabled by default.

```
controller adoption
```

controller adoption	Enables the adoption of the logged device (wireless controller or service platform) by other controllers. This option is disabled by default. Use the `no > controller > adoption` command to disable adoption.

```
controller [group <CONTROLLER-GROUP-NAME>|vlan <1-4094>]
```

controller	Configures the WLAN's controller adoption settings
group <CONTROLLER-GROUP-NAME>	Configures the wireless controller or service platform group • <CONTROLLER-GROUP-NAME> – Specify the wireless controller or service platform group name.
vlan <1-4094>	Configures the wireless controller or service platform VLAN • <1-4094> – Specify the VLAN ID from 1 - 4094.

```
controller hello-interval <1-120> adjacency-hold-time <2-600>
```

controller	Configures the WLAN's controller settings
hello-interval <1-120>	Configures the hello-interval in seconds. This is the interval between consecutive hello packets exchanged between AP and wireless controller or service platform. • <1-120> – Specify a value from 1 - 120 seconds.
adjacency-hold-time <2-600>	Configures the adjacency hold time in seconds. This is the time since the last received hello packet, after which the adjacency between wireless controller or service platform and AP is lost, and the link is re-established. • <2-600> – Specify a value from 2 - 600 seconds.

```
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure} {gw [<IP>|<HOSTNAME>]}
```

controller	Configures the WLAN's controller adoption settings
host [<IPv4>|<IPv6>|<HOSTNAME>]	Configures wireless controller or service platform's IPv4/IPv6 address or hostname • <IPv4> – Configures wireless controller or service platform's IPv4 address • <IPv6> – Configures wireless controller or service platform's IPv6 address • <HOSTNAME> – Configures wireless controller or service platform's hostname

ipsec-secure {gw [<IP>|<HOSTNAME>]}	Optional. Enables Internet Protocol Security (IPSec) peer authentication on the connection (link) between the adopting devices. This option is disabled by default.
	• gw – Optional. Specifies a IPSec gateway other than the wireless controller or service platform
	  • <IP> – Use this option to specify the IPSec gateway's IP address.
	  • <HOSTNAME> – Use this option to specify the IPSec gateway's hostname.
	If the gateway's IP address or hostname is not specified, the system assumes the logged controller as the IPSec gateway.

```
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {level [1|2]|pool <1-2> level [1|2]} {ipsec-
secure {gw [<IP>|<HOSTNAME>]}|remote-vpn-client}
```

controller	Configures the WLAN's controller adoption settings
host [<IPv4>|<IPv6>|<HOSTNAME>]	Configures wireless controller or service platform's IPv4/IPv6 address or name • <IPv4> – Configures wireless controller or service platform's IPv4 address • <IPv6> – Configures wireless controller or service platform's IPv6 address • <HOSTNAME> – Configures wireless controller or service platform's name
level [1|2]	The following keywords are common to the 'IP', 'IPv6', and 'hostname' parameters: Optional. After providing the wireless controller or service platform's address, optionally select one of the following routing levels: • 1 – Optional. Level 1, local routing • 2 – Optional. Level 2, inter-site routing Note: After specifying the routing level, you can, optionally enable IPSec Secure authentication and remote VPN client.

pool <1-2> level [1|2]	The following keywords are common to the 'IP', 'IPv6', and 'hostname' parameters:
	Optional. Sets the wireless controller or service platform's pool
	• <1-2> – Select either 1 or 2 as the pool. The default is 1. After selecting the pool, optionally select one of the following two routing levels:
	  • 1 – Optional. Level 1, local routing
	  • 2 – Optional. Level 2, inter-site routing

{ipsec-secure {gw [<IP>|<HOSTNAME>]}| remote-vpn-client}	After specifying the routing level and or device's pool, you can optionally specify the following:
	• ipsec-secure – Optional. Enables IPSec peer authentication on the connection (link) between the adopting devices. This option is disabled by default.
	• gw – Optional. Specifies a IPSec gateway other than the wireless controller or service platform
	  • <IP> – Use this option to specify the IPSec gateway's IP address.
	  • <HOSTNAME> – Use this option to specify the IPSec gateway's hostname.
	
	  Note: If the gateway's IP address or hostname is not specified, the system assumes the logged controller as the IPSec gateway.
	• remote-vpn-client – Forces MiNT link creation protocol (MLCP) to use remote VPN connection on the controller
	
	The controller uses remote VPN tunnel for this traffic. If multiple controller hosts are configured, either all the hosts should use remote-vpn-client or none.
	When enabled, an MLCP connection is not initiated until remote VPN connection is UP and virtual IP, DNS server, source route, etc. are installed on the AP.

```
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {remote-vpn-client}
```

controller	Configures the WLAN's controller settings
host [<IPv4>|<IPv6>|<HOSTNAME>]	Configures wireless controller or service platform's IPv4/IPv6 address or hostname • <IP> – Configures wireless controller or service platform's IPv4 address • <IPv6> – Configures wireless controller or service platform's IPv6 address • <HOSTNAME> – Configures wireless controller or service platform's name
remote-vpn-client	Forces MLCP to use remote VPN connection on the controller The controller uses remote VPN tunnel for this traffic. If multiple controller hosts are configured, either all the hosts should use remote-vpn-client or none. When enabled, an MLCP connection is not initiated until remote VPN connection is UP and virtual IP, DNS server, source route, etc. are installed on the AP.

Example

```
nx9500-6C8809(config-profile-default-rfs4000)controller group test

Related Commands

no on page 1214	Disables or reverts settings to their default

critical-resource

Profile Config Commands on page 853

Enables monitoring of resources critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses. When enabled, the system monitors these devices regularly and logs their status. Use this command to create a CRM *(critical resource monitoring)* policy.

A critical resource can be a gateway, AAA server, WAN interface, any hardware, or a service on which the stability of the network depends. Monitoring these resources is therefore essential. When enabled, this feature pings critical resources regularly to ascertain their status. If there is a connectivity issue, an event is generated stating a critical resource is unavailable. By default, there is no enabled critical resource policy and one needs to be created and implemented.

Critical resources can be monitored directly through the interfaces on which they are discovered. For example, a critical resource on the same subnet as an AP8132 access point can be monitored by its IP address. However, a critical resource located on a VLAN must continue to be monitored on that VLAN.

Critical resource monitoring can be enabled on service platforms, wireless controllers, and access points through their respective device profiles.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
critical-resource [<CR-NAME>|monitor|retry-count]

critical-resource <CR-NAME> [monitor|monitor-using-flows]

critical-resource <CR-NAME> monitor [direct|via]

critical-resource <CR-NAME> monitor direct [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees]
{<IP/HOST-ALIAS-NAME>|arp-only vlan [<1-4094>|<VLAN-ALIAS-NAME>] {<IP/HOST-ALIAS-NAME>|
port [<LAYER2-IF-NAME>|ge <1-4>|port-channel <1-2>]}}

critical-resource <CR-NAME> monitor via [<IP/HOST-ALIAS-NAME>|<LAYER3-INTERFACE-NAME>|
pppoe1|vlan|wwan1]

critical-resource <CR-NAME> monitor via [<IP/HOST-ALIAS-NAME>|<LAYER3-INTERFACE-NAME>|
pppoe1|vlan <1-4094>|wwan1] [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees] {<IP/HOST-
ALIAS-NAME>|arp-only [vlan <1-4094>|<VLAN-ALIAS-NAME>] {<IP/HOST-ALIAS-NAME>|port
[<LAYER2-IF-NAME>|ge <1-4>|port-channel <1-2>]}}

critical-resource <CR-NAME> monitor-using-flows [all|any] [criteria|dhcp|dns|sync-
adoptees]

critical-resource <CR-NAME> monitor-using-flows [all|any] criteria [all|cluster-master|rf-
domain-manager] (dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>) {dhcp
vlan [<1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}

critical-resource <CR-NAME> monitor-using-flows [all|any] dhcp vlan <1-4094> {dhcp vlan
[<1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}

critical-resource <CR-NAME> monitor-using-flows [all|any] dns <IP/HOST-ALIAS-NAME> {dhcp
[vlan <1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}

critical-resource <CR-NAME> monitor-using-flows [all|any] sync-adoptees criteria [all|
cluster-master|rf-domain-manager] (dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-
ALIAS-NAME>) {dhcp [vlan <1-4094>| <VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}

critical-resource monitor interval <5-86400>

critical-resource retry-count <0-10>
```

Parameters

```
critical-resource <CR-NAME> monitor direct [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees]
{<IP/HOST-ALIAS-NAME>|arp-only [vlan <1-4094>|<VLAN-ALIAS-NAME>] {<IP/HOST-ALIAS-NAME>|
port [<LAYER2-IF-NAME>|ge <1-4>|port-channel <1-2>]}}
```

<CR-NAME>	Identifies the critical resource to be monitored. Provide the name of the critical resource.
monitor	Enables critical resource(s) monitoring

direct [all|any] [<IP/HOST-ALIAS-NAME>| sync-adoptees]	Monitors critical resources using the default routing engine • all – Monitors all resources that are going down (generates an event when all specified critical resources are unreachable) • any – Monitors any resource that is going down (generates an event when any one of the specified critical resource is unreachable) • <IP/HOST-ALIAS-NAME> – Configures the IP address of the critical resource being monitored (for example, the DHCP or DNS server). Specify the IP address in the A.B.C.D format. You can use a host-alias to identify the critical resource. If using a host-alias, ensure that the host-alias is existing and configured. • sync-adoptees – Syncs adopted access points with the controller. In the stand-alone AP scenario, where the CRM policy is running on the AP, the AP is directly intimated in case a critical resource goes down. On the other hand, when an AP is adopted to a controller (running the CRM policy), it is essential to enable the sync-adoptees option in order to sync the AP with the controller regarding the latest CRM status.
arp-only vlan [<1-4094>|<VLAN-ALIAS-NAME>] {<IP/HOST-ALIAS-NAME>| port [<LAYER2-IFNAME>| ge| port-channel]}	The following keywords are common to the 'all' and 'any' parameters: • arp-only vlan <1-4094> – Optional. Uses ARP to determine if the IP address is reachable (use this option to monitor resources that do not have IP addresses). ARP is used to resolve hardware addresses when only the network layer address is known. • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Specifies the VLAN ID on which to send the probing ARP requests. Specify the VLAN ID from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured. <IP/HOST-ALIAS-NAME> – Optional. Limits ARP to a device specified by the <IP> parameter. You can use a host-alias to specify the IP address. If using a host-alias, ensure that the host-alias is existing and configured. port [<LAYER2-IF-NAME>|ge|port-channel] – Optional. Limits ARP to a specified port

```
critical-resource <CRM-POLICY-NAME> monitor via [<IP/HOST-ALIAS-NAME>|<LAYER3-INTERFACE-
NAME>|pppoe1|vlan <1-4094>|wwan1] [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees] {<IP/
HOST-ALIAS-NAME>|arp-only vlan [<1-4094>|<VLAN-ALIAS-NAME>] {<IP>|port [<LAYER2-IFNAME>|
ge|port-channel]}}
```

<CR-NAME>	Identifies the critical resource to be monitored. Provide the name of the critical resource.
monitor	Enables critical resource(s) monitoring
via	Specifies the interface or next-hop via which the ICMP pings should be sent. Configures the interface or next-hop via which ICMP pings are sent. This does not apply to IP addresses configured for arp-only. For interfaces which learn the default-gateway dynamically (like DHCP clients and PPP interfaces), use an interface name for VIA, or use an IP address.
<IP/HOST-ALIAS-NAME>	Specify the IP address of the next-hop via which the critical resource(s) are monitored. Configures up to four IP addresses for monitoring. All the four IP addresses constitute critical resources. You can use a host-alias to specify the IP address. If using a host-alias, ensure that the host-alias is existing and configured.

<LAYER3-INTERFACE-NAME>	Specify the layer 3 Interface name (router interface)
pppoe1	Specifies PPP over Ethernet interface
vlan [<1-4094>|<VLAN-ALIAS-NAME>]	Specifies the wireless controller or service platform's VLAN interface. Specify VLAN ID from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured.
wwan1	Specifies Wireless WAN interface
[all|any] [<IP/HOST-ALIAS-NAME>| sync-adoptees]	Monitors critical resources using the default routing engine • all – Monitors all resources that are going down (generates an event when all specified critical resource IP addresses are unreachable) • any – Monitors any resource that is going down (generates an event when any one of the specified critical resource IP address is unreachable) • <IP/HOST-ALIAS-NAME> – Configures the IP address of the critical resource being monitored (for example, the DHCP or DNS server). Specify the IP address in the A.B.C.D format. You can use a host-alias to specify the IP address. If using a host-alias, ensure that the host-alias is existing and configured. • sync-adoptees – Syncs adopted access points with the controller. In the stand-alone AP scenario, where the CRM policy is running on the AP, the AP is directly intimated in case a critical resource goes down. On the other hand, when an AP is adopted to a controller (running the CRM policy), it is essential to enable the sync-adoptees option in order to sync the AP with the controller regarding the latest CRM status.
arp-only vlan [<1-4094>|<VLAN-ALIAS-NAME>] {<IP/HOST-ALIAS-NAME>| port [<LAYER2-IFNAME>| ge| port-channel]}	The following keywords are common to the 'all' and 'any' parameters: • arp-only vlan <1-4094> – Optional. Uses ARP to determine if the IP address is reachable (use this option to monitor resources that do not have IP addresses). ARP is used to resolve hardware addresses when only the network layer address is known. • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Specifies the VLAN ID to send the probing ARP requests. Specify the VLAN ID from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured. • <IP'HOST-ALIAS-NAME> – Optional. Limits ARP to a device specified by the <IP> parameter. You can use a host-alias to specify the IP address. If using a host-alias, ensure that the host-alias is existing and configured. • port [<LAYER2-IF-NAME>|ge|port-channel] – Optional. Limits ARP to a specified port

```
critical-resource <CRM-POLICY-NAME> monitor-using-flows [all|any] criteria [all|cluster-
master|rf-domain-manager] (dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-
NAME>) {dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}
```

<CR-NAME>	Identifies the critical resource to be monitored. Provide the name of the critical resource.
monitor-using-flows	Enables critical resource(s) monitoring using message flows for DHCP or DNS (DHCP discover, DHCP offer, etc.) instead of ICMP or ARP packets in order to reduce the amount of traffic on the network.

[all|any]	Configures how critical resource event messages are generated. Options include all and any. • all – Monitors all resources that are going down (generates an event when all specified critical resources are unreachable) • any – Monitors any resource that is going down (generates an event when any one of the specified critical resource is unreachable)
criteria [all|cluster-master| rf-domain-manager]	Configures the resource that will monitor critical resources and update the rest of the devices in a group. Options include all, rf-domain-manager, or cluster-master. • all – Configures all devices within a group (cluster or RF Domain) as the monitoring resource • cluster-master – Configures the cluster master as the monitoring resource • rf-domain-manager – Configures the RF Domain manager as the monitoring resource
dhcp vlan [<1-4094>| <VLAN-ALIAS-NAME>]	The following parameters are recursive and common to the 'all', 'cluster-master', and 'rf-domain-manager' keywords: • dhcp – Configures DHCP as the mode of monitoring critical resources. When configured, DHCP message flows (DHCP Discover, DHCP Offer, etc.) are used instead of ICMP or ARP packets to confirm critical resource availability. • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Configures the VLAN on which the critical resource(s) is available. Specify the VLAN from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured.

dns <IP/HOST-ALIAS-NAME>	The following parameters are recursive and common to the 'all', 'cluster-master', and 'rf-domain-manager' keywords: • dns – Configures DNS as the mode of monitoring critical resources. When configured, DNS message flows are used instead of ICMP or ARP packets to confirm critical resource availability. • <IP/HOST-ALIAS-NAME> – Configures the IPv4 address or host alias of the critical resource. Specify the IPv4 address or host alias name (should be existing and configured).

{dhcp [vlan <1-4094>| <VLAN-ALIAS-NAME>]| dns <IP/HOST-ALIAS-NAME>}	The 'dhcp' and 'dns' parameters are recursive and you can optionally configure multiple VLANs and critical resource IPv4 addresses (or host alias names).
	• dhcp – Optional. Configures DHCP as the mode of monitoring critical resources. When configured, DHCP message flows (DHCP Discover, DHCP Offer, etc.) are used instead of ICMP or ARP packets to confirm critical resource availability.
	  • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Configures the VLAN on which the critical resource(s) is available. Specify the VLAN from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured.
	• dns – Optional. Configures DNS as the mode of monitoring critical resources. When configured, DNS message flows are used instead of ICMP or ARP packets to confirm critical resource availability.
	  • <IP/HOST-ALIAS-NAME> – Configures the IPv4 address or host alias of the critical resource. Specify the IPv4 address or host alias name (should be existing and configured).

```
critical-resource <CRM-POLICY-NAME> monitor-using-flows [all|any] dhcp vlan [<1-4094>|
<VLAN-ALIAS-NAME>] {dhcp vlan [<1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}
```

<CR-NAME>	Identifies the critical resource to be monitored. Provide the name of the critical resource.
monitor-using-flows	Enables critical resource(s) monitoring using message flows for DHCP or DNS (DHCP Discover, DHCP Offer, etc.) instead of ICMP or ARP packets in order to reduce the amount of traffic on the network.
[all|any]	Configures how critical resource event messages are generated. Options include all and any. • all – Monitors all resources that are going down (generates an event when all specified critical resources are unreachable) • any – Monitors any resource that is going down (generates an event when any one of the specified critical resource is unreachable)

dhcp vlan [<1-4094>| <VLAN-ALIAS-NAME>]	Configures DHCP as the mode of monitoring critical resources. When configured, DHCP message flows (DHCP Discover, DHCP Offer, etc.) are used instead of ICMP or ARP packets to confirm critical resource availability. • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Configures the VLAN on which the critical resource(s) is available. Specify the VLAN from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured.

{dhcp vlan [<1-4094>| <VLAN-ALIAS-NAME>]| dns <IP/HOST-ALIAS-NAME>}	The following parameters are recursive and optional. Use them to configure multiple VLANs and critical resource IPv4 addresses (or host alias names):
	• dhcp – Optional. Configures DHCP as the mode of monitoring critical resources. When configured, DHCP message flows (DHCP Discover, DHCP Offer, etc.) are used instead of ICMP or ARP packets to confirm critical resource availability.
	  • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Configures the VLAN on which the critical resource(s) is available. Specify the VLAN from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured.
	• dns – Optional. Configures DNS as the mode of monitoring critical resources. When configured, DNS message flows are used instead of ICMP or ARP packets to confirm critical resource availability.
	  • <IP/HOST-ALIAS-NAME> – Configures the IPv4 address or host alias of the critical resource. Specify the IPv4 address or host alias name (should be existing and configured).

```
critical-resource <CRM-POLICY-NAME> monitor-using-flows [all|any] dns <IP/HOST-ALIAS-
NAME> {dhcp vlan [<1-4094><VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}
```

<CR-NAME>	Identifies the critical resource to be monitored. Provide the name of the critical resource.
monitor-using-flows	Enables critical resource(s) monitoring using message flows for DHCP or DNS (DHCP Discover, DHCP Offer, etc.) instead of ICMP or ARP packets in order to reduce the amount of traffic on the network.
[all|any]	Configures how critical resource event messages are generated. Options include all and any. • all – Monitors all resources that are going down (generates an event when all specified critical resources are unreachable) • any – Monitors any resource that is going down (generates an event when any one of the specified critical resource is unreachable)

dns <IP/HOST-ALIAS-NAME>	Configures DNS as the mode of monitoring critical resources. When configured, DNS message flows are used instead of ICMP or ARP packets to confirm critical resource availability. • <IP/HOST-ALIAS-NAME> – Configures the IPv4 address or host alias of the critical resource. Specify the IPv4 address or host alias name (should be existing and configured).

{dhcp vlan [<1-4094>| <VLAN-ALIAS-NAME>| dns <IP/HOST-ALIAS-NAME>}	The following parameters are recursive and optional. Use them to configure multiple VLANs and critical resource IPv4 addresses (or host alias names):
	• dhcp – Optional. Configures DHCP as the mode of monitoring critical resources. When configured, DHCP message flows (DHCP Discover, DHCP Offer, etc.) are used instead of ICMP or ARP packets to confirm critical resource availability.
	  • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Configures the VLAN on which the critical resource(s) is available. Specify the VLAN from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured.
	• dns – Optional. Configures DNS as the mode of monitoring critical resources. When configured, DNS message flows are used instead of ICMP or ARP packets to confirm critical resource availability.
	  • <IP/HOST-ALIAS-NAME> – Configures the IPv4 address or host alias of the critical resource. Specify the IPv4 address or host alias name (should be existing and configured).

```
critical-resource <CRM-POLICY-NAME> monitor-using-flows [all|any] sync-adoptees criteria
[all|cluster-master|rf-domain-manager] (dhcp vlan [<1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/
HOST-ALIAS-NAME>) {dhcp vlan [<1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}
```

<CR-NAME>	Identifies the critical resource to be monitored. Provide the name of the critical resource.
monitor-using-flows	Enables critical resource(s) monitoring using message flows for DHCP or DNS (DHCP Discover, DHCP Offer, etc.) instead of ICMP or ARP packets in order to reduce the amount of traffic on the network.
[all|any]	Configures how critical resource event messages are generated. Options include all and any. • all – Monitors all resources that are going down (generates an event when all specified critical resources are unreachable) • any – Monitors any resource that is going down (generates an event when any one of the specified critical resource is unreachable)
syn-adoptees	Syncs adopted access points with the controller. In the stand-alone AP scenario, where the CRM policy is running on the AP, the AP is directly intimated in case a critical resource goes down. On the other hand, when an AP is adopted to a controller (running the CRM policy), it is essential to enable the sync-adoptees option in order to sync the AP with the controller regarding the latest CRM status.

criteria [all|cluster-master| rf-domain-manager]	Configures the resource that will monitor critical resources and update the rest of the devices in a group. Options include all, rf-domain-manager, or cluster-master. • all – Configures all devices within a group (cluster or RF Domain) as the monitoring resource • cluster-master – Configures the cluster master as the monitoring resource • rf-domain-manager – Configures the RF Domain manager as the monitoring resource
dhcp vlan [<1-4094>| <VLAN-ALIAS-NAME>]	The following parameters are recursive and common to the 'all', 'cluster-master', and 'rf-domain-manager' keywords: • dhcp – Configures DHCP as the mode of monitoring critical resources. When configured, DHCP message flows (DHCP Discover, DHCP Offer, etc.) are used instead of ICMP or ARP packets to confirm critical resource availability. • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Configures the VLAN on which the critical resource(s) is available. Specify the VLAN from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured.
dns <IP/HOST-ALIAS-NAME>	The following parameters are recursive and common to the 'all', 'cluster-master', and 'rf-domain-manager' keywords: • dns – Configures DNS as the mode of monitoring critical resources. When configured, DNS message flows are used instead of ICMP or ARP packets to confirm critical resource availability. • <IP/HOST-ALIAS-NAME> – Configures the IPv4 address or host alias of the critical resource. Specify the IPv4 address or host alias name (should be existing and configured).

{dhcp vlan {<1-4094>| <VLAN-ALIAS-NAME>]| dns <IP/HOST-ALIAS-NAME>}	The 'dhcp' and 'dns' parameters are recursive and you can optionally configure multiple VLANs and critical resource IPv4 addresses (or host alias names).
	• dhcp – Optional. Configures DHCP as the mode of monitoring critical resources. When configured, DHCP message flows (DHCP Discover, DHCP Offer, etc.) are used instead of ICMP or ARP packets to confirm critical resource availability.
	  • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Configures the VLAN on which the critical resource(s) is available. Specify the VLAN from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured.
	• dns – Optional. Configures DNS as the mode of monitoring critical resources. When configured, DNS message flows are used instead of ICMP or ARP packets to confirm critical resource availability.
	  • <IP/HOST-ALIAS-NAME> – Configures the IPv4 address or host alias of the critical resource. Specify the IPv4 address or host alias name (should be existing and configured).

```
critical-resource monitor interval <5-86400>
```

monitor interval <5-86400>	Configures the critical resource monitoring frequency. This is the interval between two successive pings to the critical resource being monitored. • <5-86400> – Specifies the frequency in seconds. Specify the time from 5 - 86400 seconds. The default is 30 seconds.

```
critical-resource retry-count <0-10>
```

retry-count <0-10>	Configures the maximum number of failed attempts allowed to connect to a critical resource, using DHCP/DNS message flows, before marking it as down • <0-10> – Specifies the maximum number of retries from 0 - 10. The default value is 3 attempts.

Example

```
NOC-NX9500(config-profile-testNX9000)#critical-resource test monitor direct any
19.234.160.5 arp-only vlan 1

NOC-NX9500(config-profile-testNX9000)#show context include-factory | include cri
tical-resource
 critical-resource monitor interval 30
 service critical-resource port-mode-source-ip 0.0.0.0
 critical-resource test monitor direct any 19.234.160.5 arp-only vlan 1
 critical-resource retry-count 3
NOC-NX9500(config-profile-testNX9000)#
```

crypto

Profile Config Commands on page 853

Use the crypto command to define a system-level local ID for Internet Security Association and Key Management Protocol (ISAKMP) negotiation and to enter the ISAKMP policy, ISAKMP client, or ISAKMP peer command set.

The following table summarizes crypto configuration mode commands:

Command	Description
crypto on page 930	Invokes commands used to configure ISAKMP policy, ISAKMP client, and ISAKMP peer
crypto-auto-ipsec-tunnel commands on page 936	Creates an auto IPSec VPN tunnel and enters its configuration mode
crypto-ikev1/ikev2-policy commands on page 942	Creates a crypto IKEv1/IKEv2 policy and enters its configuration mode
crypto-ikev1/ikev2-peer commands on page 947	Creates a IKEv1/IKEv2 peer and enters its configuration mode

Command	Description
crypto-map-config-commands on page 954	Creates a crypto map and enters its configuration mode
crypto-remote-vpn-client commands on page 971	Creates a remote VPN client and enters its configuration mode

crypto

crypto on page 929

Use the crypto command to define a system-level local ID for ISAKMP negotiation and enter the ISAKMP policy, ISAKMP client, or ISAKMP peer configuration mode.

A crypto map entry is a single policy that describes how certain traffic is secured. There are two types of crypto map entries: ipsec-manual and ipsec-ike entries. Each entry is given an index (used to sort the ordered list).

When a non-secured packet arrives on an interface, the crypto map associated with that interface is processed (in order). If a crypto map entry matches the non-secured traffic, the traffic is discarded.

When a packet is transmitted on an interface, the crypto map associated with that interface is processed. The first crypto map entry that matches the packet is used to secure the packet. If a suitable SA *(Security Association)* exists, it is used for transmission. Otherwise, IKE is used to establish a SA with the peer. If no SA exists (and the crypto map entry is “respond only”), the packet is discarded.

When a secured packet arrives on an interface, its SPI *(Security Parameter Index)* is used to look up a SA. If a SA does not exist (or if the packet fails any of the security checks), it is discarded. If all checks pass, the packet is forwarded normally.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
crypto [auto-ipsec-secure|enable-ike-uniqueids|ike-version|ikev1|ikev2|ipsec|
load-management|map|pki|plain-text-deny-acl-scope|remote-vpn-client]

crypto [auto-ipsec-secure|enable-ike-uniqueids|load-management]

crypto ike-version [ikev1-only|ikev2-only]

crypto ikev1 [dpd-keepalive <10-3600>|dpd-retries <1-100>|nat-keepalive <10-3600>|
peer <IKEV1-PEER>|policy <IKEV1-POLICY-NAME>|remote-vpn]

crypto ikev2 [cookie-challenge-threshold <1-100>|dpd-keepalive <10-3600>|dpd-retries
<1-100>|
nat-keepalive <10-3600>|peer <IKEV2-PEER>|policy <IKEV2-POLICY-NAME>|remote-vpn]

crypto ipsec [df-bit|security-association|transform-set]

crypto ipsec df-bit [clear|copy|set]

crypto ipsec security-association lifetime [kilobytes <500-2147483646>|seconds
<120-86400>]

crypto ipsec transform-set <TRANSFORM-SET-TAG> [esp-3des|esp-aes|esp-aes-192|esp-aes-256|
esp-des|esp-null] [esp-aes-xcbc-mac|esp-md5-hmac|esp-sha-hmac|esp-sha256-hmac]

crypto map <CRYPTO-MAP-TAG> <1-1000> [ipsec-isakmp {dynamic}|ipsec-manual]

crypto pki import crl <TRUSTPOINT-NAME> URL <1-168>

crypto plain-text-deny-acl-scope [global|interface]

crypto remote-vpn-client
```

Parameters

```
crypto [auto-ipsec-secure|enable-ike-uniqueids|load-management]
```

auto-ipsec-secure	Configures the Auto IPSec Secure parameter settings. For Auto IPSec tunnel configuration commands, see crypto-auto-ipsec-tunnel commands on page 936.
enable-ike-uniqueids	Enables IKE *(Internet Key Exchange)* unique ID check. For more information on IKE unique IDs, see remotegw on page 940.
load-management	Configures load management for platforms using software cryptography

```
crypto ike-version [ikev1-only|ikev2-only]
```

ike-version [ikev1-only|ikev2-only]	Selects and starts the IKE daemon • ikev1-only – Enables support for IKEv1 tunnels only • ikev2-only – Enables support for IKEv2 tunnels only

```
crypto ikev1 [dpd-keepalive <10-3600>|dpd-retries <1-100>|nat-keepalive <10-3600>|peer
<IKEV1-PEER>|policy <IKEV1-POLICY-NAME>|remote-vpn]
```

ikev1	Configures the IKE version 1 parameters
dpd-keepalive <10-3600>	Sets the global DPD *(Dead Peer Detection)* keep alive interval from 10 - 3600 seconds. This is the interval between successive IKE keep alive messages sent to detect if a peer is dead or alive. The default is 30 seconds.
dpd-retries <1-1000>	Sets the global DPD retries count from 1 - 1000. This is the number of keep alive messages sent to a peer before the tunnel connection is declared as dead. The default is 5.

nat-keepalive <10-3600>	Sets the global NAT keep alive interval from 10 - 3600 seconds. This is the interval between successive NAT keep alive messages sent to detect if a peer is dead or alive. The default is 20 seconds.
peer <IKEV1-PEER>	Specify the name/Identifier for the IKEv1 peer. For IKEV1 peer configuration commands, see crypto-ikev1/ikev2-peer commands on page 947.
policy <IKEV1-POLICY-NAME>	Configures an ISKAMP policy. Specify the name of the policy. The local IKE policy and the peer IKE policy must have matching group settings for successful negotiations. For IKEV1 policy configuration commands, see crypto-ikev1/ikev2-policy commands on page 942.
remote-vpn	Specifies the IKEV1 remote-VPN server configuration (responder only)

```
crypto ikev2 [cookie-challenge-threshold <1-100>|dpd-keepalive <10-3600>|dpd-retries
<1-100>|nat-keepalive <10-3600>|peer <IKEV2-PEER>|policy <IKEV2-POLICY-NAME>|remote-vpn]
```

ikev2	Configures the IKE version 2 parameters
cookie-challenge-threshold <1-100>	Starts the cookie challenge mechanism after the number of half open IKE SAs exceeds the specified limit. Specify the limit from 1 - 100. The default is 5.
dpd-keepalive <10-3600>	Sets the global DPD keepalive interval from 10 - 3600 seconds. The default is 30 seconds.
dpd-retries <1-100>	Sets the global DPD retries count from 1 - 100. The default is 5.
nat-keepalive <10-3600>	Sets the global NAT keepalive interval from 10 - 3600 seconds. The default is 20 seconds.
peer <IKEV2-PEER>	Specify the name/Identifier for the IKEv2 peer
policy <IKEV2-POLICY-NAME>	Configures an ISKAMP policy. Specify the policy name. The local IKE policy and the peer IKE policy must have matching group settings for successful negotiations.
remote-vpn	Specifies an IKEv2 remote-VPN server configuration (responder only)

```
crypto ipsec df-bit [clear|copy|set]
```

ipsec	Configures the IPSec policy parameters
df-bit [clear|copy|set]	Configures DF *(Don't-Fragment)* bit handling for encapsulating header. The options are: • clear – Clears the DF bit in the outer header and ignores in the inner header • copy – Copies the DF bit from the inner header to the outer header. This is the default setting. • set – Sets the DF bit in the outer header

```
crypto ipsec security-association lifetime [kilobytes <500-2147483646>|seconds
<120-86400>]
```

ipsec	Configures the IPSec policy parameters
security-association	Configures the IPSec SAs parameters

lifetime [kilobyte |seconds]	Defines the IPSec SAs lifetime (in kilobytes and/or seconds). Values can be entered in both kilobytes and seconds, which ever limit is reached first, ends the SA. When the SA lifetime ends it is renegotiated as a security measure.
	• kilobytes – Specifies a volume-based key duration (minimum is 500 KB and maximum is 2147483646 KB)
	  • <500-2147483646> – Specify a value from 500 - 2147483646 KB. The default is 4608000 KB.
	• seconds – Specifies a time-based key duration (minimum is 120 seconds and maximum is 86400 seconds)
	  • <120-86400> – Specify a value from 120 - 86400 seconds. The default is 3600 seconds.
	The security association lifetime can be overridden under crypto maps.

```
crypto ipsec transform-set <TRANSFORM-SET-TAG> [esp-3des|esp-aes|esp-aes-192| esp-aes-256|
esp-des|esp-null] [esp-aes-xcbc-mac|esp-md5-hmac|esp-sha-hmac|            esp-sha256-hmac]
```

ipsec	Configures the IPSec policy parameters
transform-set <TRANSFORM-SET-TAG>	Defines the transform set configuration (authentication and encryption) for securing data. A transform set is a combination of security protocols, algorithms and other settings applied to IPSec protected traffic. • <TRANSFORM-SET-TAG> – Specify the transform set name. After specifying the transform set used by the IPSec transport connection, set the encryption method and the authentication scheme used with the transform set. The encryption methods are: **DES**, **3DES**, **AES**, **AES-192** and **AES-256**. Note: The authentication schemes available are: esp-md5-hmac and esp-sha-hmac.
esp-3des	Configures the ESP transform using 3DES cipher (168 bits). The transform set is assigned to a crypto map using the map's `set > transform-set` command.
esp-aes	Configures the ESP transform using AES *(Advanced Encryption Standard)* cipher. The transform set is assigned to a crypto map using the map's set > transform-set command.
esp-aes-192	Configures the ESP transform using AES cipher (192 bits). The transform set is assigned to a crypto map using the map's `set > transform-set` command.
esp-aes-256	Configures the ESP transform using AES cipher (256 bits). The transform set is assigned to a crypto map using the map's `set > transform-set` command. This is the default setting.
esp-des	Configures the ESP transform using DES *(Data Encryption Standard)* cipher (56 bits). The transform set is assigned to a crypto map using the map's `set > transform-set` command.

esp-null	Configures the ESP transform with no encryption
[esp-aes-xcbc-mac| esp-md5-hmac| esp-sha-hmac| esp-sha256-hmac]	The following keywords are common to all of the above listed transform sets. After specifying the transform set type, configure the authentication scheme used to validate identity credentials. The options are: • esp-aes-xcbc-mac – Configures ESP transform using AES-XCBC authorization • esp-md5-hmac – Configures ESP transform using HMAC-MD5 authorization • esp-sha-hmac – Configures ESP transform using HMAC-SHA authorization. This is the default setting. • esp-sha256-hmac – Configures ESP transform using HMAC-SHA256 authorization

```
crypto map <CRYPTO-MAP-TAG> <1-1000> [ipsec-isakmp {dynamic}|ipsec-manual]
```

map <CRYPTO-MAP-TAG>	Configures the crypto map, a software configuration entity that selects data flows that require security processing. The crypto map also defines the policy for these data flows. • <CRYPTO-MAP-TAG> – Specify a name for the crypto map. The name should not exceed 32 characters. For crypto map configuration commands, see crypto-map-ipsec-manual-instance on page 955.
<1-1000>	Defines the crypto map entry sequence. Each crypto map uses a list of entries, each entry having a specific sequence number. Specifying multiple sequence numbers within the same crypto map provides the flexibility to connect to multiple peers from the same interface. Specify a value from 1 - 1000.
ipsec-isakmp {dynamic}	Configures IPSEC w/ISAKMP. • dynamic – Optional. Configures dynamic map entry (remote VPN configuration) for XAUTH with mode-config or ipsec-l2tp configuration
ipsec-manual	Configures IPSEC w/manual keying. Remote configuration is not allowed for manual crypto map.

```
crypto pki import crl <TRUSTPOINT-NAME> <URL> <1-168>
```

pki	Configures certificate parameters. The PKI *(Public Key Infrastructure)* protocol creates encrypted public keys using digital certificates from certificate authorities.
import	Imports a trustpoint related configuration
crl <TRUSTPOINT-NAME>	Imports a CRL *(Certificate Revocation List)*. Imports a trustpoint including either a private key and server certificate or a certificate authority (CA) certificate or both. A CRL is a list of revoked certificates that are no longer valid. A certificate can be revoked if the CA had improperly issued a certificate, or if a private-key is compromised. The most common reason for revocation is the user no longer being in sole possession of the private key. • <TRUSTPOINT-NAME> – Specify the trustpoint name.

<URL>	Specify the CRL source address in the following format. Both IPv4 and IPv6 address formats are supported. tftp://<hostname|IPv4 or IPv6>[:port]/path/file ftp://<user>:<passwd>@<hostname|IPv4 or IPv6>[:port]/path/file sftp://<user>:<passwd>@<hostname|IPv4 or IPv6>[:port]>/path/file http://<hostname|IPv4 or IPv6>[:port]/path/file cf:/path/file usb<n>:/path/file
<1-168>	Sets command replay duration from 1 - 168 hours. This is the interval (in hours) after which devices using this profile copy a CRL file from an external server and associate it with a trustpoint.

```
crypto plain-text-deny-acl-scope [global|interface]
```

plain-text-deny-acl-scope	Configures plain-text-deny-acl-scope parameters
global	Applies the plain text deny ACL globally. This is the default setting.
interface	Applies the plain text deny ACL to the interface only

```
crypto remote-vpn-client
```

remote-vpn-client	Configures remote VPN client settings. For more information, see crypto-remote-vpn-client commands on page 971.

Example

```
nx9500-6C8809(config-profile-default-rfs4000)#crypto ipsec transform-set tpsec-tag1 esp-

crypto-auto-ipsec-tunnel commands

crypto on page 929

Creates an auto IPSec VPN tunnel and changes the mode to auto-ipsec-secure mode for further configuration

Auto IPSec tunneling provides a secure tunnel between two networked peer controllers or service platforms and associated access points that are within a range of valid IP addresses. You can define which packets are sent within the tunnel, and how they are protected. When a tunneled peer sees a sensitive packet, it creates a secure tunnel and sends the packet through the tunnel to its remote peer destination or associated access point.

Tunnels are sets of SA between two peers. SAs define the protocols and algorithms applied to sensitive packets and specify the keying mechanisms used by tunneled peers. SAs are unidirectional and exist in both the inbound and outbound direction. SAs are established per the rules and conditions of defined security protocols (AH or ESP).

The IKE protocol is a key management protocol used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE enables secure communications without time consuming manual pre-configuration for auto IPSec tunneling.

```
nx9500-6C8809(config-profile-default-rfs4000)#crypto auto-ipsec-secure
nx9500-6C8809(config-profile-default-rfs4000-crypto-auto-ipsec-secure)#?
Crypto Auto IPSEC Tunnel commands:
  groupid       Local/Remote identity and Authentication credentials for Auto
                IPSec Secure IKE negotiation
  ike-lifetime  Set lifetime for ISAKMP security association
  ikev2         IKEv2 configuration commands
  ip            Internet Protocol config commands
  no            Negate a command or set its defaults
  remotegw      Auto IPSec Secure Remote Peer IKE

```

The following table summarizes the crypto IPSec auto tunnel configuration mode commands:

Command	Description
groupid on page 937	Specifies the identity string used for IKE authentication
ip on page 938	Enables the controller or service platform to uniquely identify APs and the hosts present in the AP's subnet
ike-lifetime on page 939	Configures the IKE SA's key lifetime in seconds
ikev2 on page 940	Enables the forced re-authentication of IKEv2 peer
remotegw on page 940	Defines the IKE version used for an auto IPSec tunnel using secure gateways
no on page 941	Removes or reverts the crypto auto IPSec tunnel settings

groupid

crypto-auto-ipsec-tunnel commands on page 936

Specifies the identity string used for IKE authentication

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
groupid <WORD> [psk|rsa]
groupid <WORD> [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]
```

Parameters

```
groupid <WORD> [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]
```

<WORD>	Specify a string not exceeding 64 characters. This is the group identity used for IKE exchange for auto IPSec secure peers. After providing a group ID, specify the authentication method used to authenticate peers on the auto IPSec secure tunnel. The options are: psk and rsa.
psk [0 <WORD>| 2 <WORD>| <WORD>]	Configures the PSK *(pre-shared key)* as the authentication type for secure peer authentication on the auto IPSec secure tunnel • 0 <WORD> – Configures a clear text key • 2 <WORD> – Configures an encrypted key • <WORD> – Specify a string value from 8 - 21 characters.
rsa	Configures the RSA *(Rivest-Shamir-Adleman)* key. RSA is an algorithm for public key cryptography. It is the first algorithm known to be suitable for signing, as well as encryption. This is the default setting.

Note
Only one group ID is supported on the controller or service platform. All APs, controllers, and service platform must use the same group ID.

Example

```
nx9500-6C8809(config-profile-default-rfs4000-crypto-auto-ipsec-secure)#groupid
 testgroup@123 rsa

nx9500-6C8809(config-profile-default-rfs4000-crypto-auto-ipsec-secure)#show context
 crypto auto-ipsec-secure
  groupid testgroup@123 rsa
nx9500-6C8809(config-profile-default-rfs4000-crypto-auto-ipsec-secure)#
```

ip

crypto-auto-ipsec-tunnel commands on page 936

Enables the controller to uniquely identify APs and the hosts present in the AP's subnet. This allows the controller to correctly identify the destination host and create a dynamic site-to-site VPN tunnel between the host and the private network behind the controller.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ip nat crypto
```

Parameters

```
ip nat crypto
```

ip nat crypto	Enables unique identification of APs and the hosts present in each AP's subnet Providing a unique ID enables the access point, wireless controller, or service platform to uniquely identify the destination device. This is essential in networks where there are multiple APs behind a router, or when two (or more) APs behind two (or more) different routers have the same IP address. Further, the same subnet exists behind these APs. For example, let us consider a scenario where there are two APs (A and B) behind two routers (1 and 2). AP 'A' is behind router '1'. And AP 'B' is behind router '2'. Both these APs have the same IP address (192.168.13.8). The subnet behind APs A and B is also the same (100.1.1.0/24). In such a scenario the controller fails to uniquely identify the hosts present in either AP's subnet. For more information, see remotegw on page 940 and crypto on page 930.

Example

```
rfs4000-229D58config-profile-testRFS4000-crypto-auto-ipsec-secure)#ip nat crypto

rfs4000-229D58config-profile-testRFS4000-crypto-auto-ipsec-secure)#show context
 crypto auto-ipsec-secure
  remotegw ike-version ikev2 uniqueid
  ip nat crypto
rfs4000-229D58config-profile-testRFS4000-crypto-auto-ipsec-secure)#
```

ike-lifetime

crypto-auto-ipsec-tunnel commands on page 936

Configures the IKE SA's key lifetime in seconds

The lifetime defines how long a connection (encryption/authentication keys) should last, from successful key negotiation to expiration. Two peers need not exactly agree on the lifetime, though if they do not, there is some clutter for a superseded connection on the peer defining the lifetime as longer.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ike-lifetime <600-86400>
```

Parameters

```
ike-lifetime <600-86400>
```

ike-lifetime <600-86400>	Sets the IKE SA's key lifetime in seconds • <600-86400> – Specify a value fro m 600 - 86400 seconds. The default is 8600 seconds.

Example

```
rfs4000-229D58(config-profile-testRFS4000-crypto-auto-ipsec-secure)#ike-lifetime 800

rfs4000-229D58(config-profile-testRFS4000-crypto-auto-ipsec-secure)#show context crypto
auto-ipsec-secure
```

```
  ike-lifetime 800
rfs4000-229D58(config-profile-testRFS4000-crypto-auto-ipsec-secure)#
```

ikev2

crypto-auto-ipsec-tunnel commands on page 936

Enables the forced IKEv2 peer re-authentication. This option is disabled by default.

In most IPSec tunnel configurations, the lifetime of IKE SAs between peers is limited. Once the IKE SA key expires it is renegotiated. In such a scenario, the IKEv2 tunnel peers may or may not re-authenticate themselves. When enabled, IKE tunnel peers have to re-authenticate each time the IKE SA is renegotiated.

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
ikev2 peer reauth
```

Parameters

```
ikev2 peer reauth
```

ikev2 peer reauth	Enables IKEv2 peer re-authentication. When enabled, IKE tunnel peers are forced to re-authenticate each time the IKE key is renegotiated.

Example

```
rfs4000-229D58(config-profile-testRFS4000-crypto-auto-ipsec-secure)#ikev2 peer reauth
```

remotegw

crypto-auto-ipsec-tunnel commands on page 936

Defines the IKE version used for auto IPSEC tunnel negotiation with the IPSec remote gateway other than the controller

Supported in the following platforms:

- Access Points — AP505i, AP510i/e, AP560i/h
- Service Platforms — NX5500, NX7500, NX9500, NX9600, VX9000

Syntax

```
remotegw ike-version [ikev1-aggr|ikev1-main|ikev2] {uniqueid}
```

Parameters

```
remotegw ike-version [ikev1-aggr|ikev1-main|ikev2] {uniqueid}
```

remotegw ike-version	Configures the IKE version used for initiating auto IPSec tunnel with secure gateways other than the controller
ikev1-aggr	Aggregation mode is used by the auto IPSec tunnel initiator to set up the connection
ikev1-main	Main mode is used by the auto IPSec tunnel initiator to establish the connection

ikev2	IKEv2 is the preferred method when wireless controller/AP only is used
uniqueid	This keyword is common to all of the above parameters. • uniqueid – Optional. Enables the assigning of a unique ID to APs (using this profile) behind a router by prefixing the MAC address to the group ID Providing a unique ID enables the access point, wireless controller, or service platform to uniquely identify the destination device. This is essential in networks where there are multiple APs behind a router, or when two (or more) APs behind two (or more) different routers have the same IP address. For example, let us consider a scenario where there are two APs (A and B) behind two routers (1 and 2). AP 'A' is behind router '1'. And AP 'B' is behind router '2'. Both these APs have the same IP address (192.168.13.8). In such a scenario, the controller fails to establish an Auto IPSec VPN tunnel to either APs, because it is unable to uniquely identify them. After enabling unique ID assignment, enable IKE unique ID check. For more information, see crypto on page 930.

Example

```
nx9500-6C8809(config-profile-default-rfs4000-crypto-auto-ipsec-secure)#remotegw
ike-version ikev2 uniqueid

nx9500-6C8809(config-profile-default-rfs4000-crypto-auto-ipsec-secure)#show context
 crypto auto-ipsec-secure
  remotegw ike-version ikev2 uniqueid
nx9500-6C8809(config-profile-default-rfs4000-crypto-auto-ipsec-secure)#
```
