Moved the identity \"%identity%\" with MAC address %mac%, detected by %authMethod%, from Identity management enabled port %prevPort% to disabled port %newPort%.

Message Parameters

| Name | Type |
|------------|----------|
| identity | String |
| mac | MAC |
| prevPort | SlotPort |
| newPort | SlotPort |
| authMethod | String |

IdMgr.FDBAgeOutForId

Description

The FDB entry for this identity has aged out. For Kerberos authenticated Identities if the Aging timer is configured it will be started else the identities will be deleted immediately. The undetect event will be triggered for the identities detected using other detection methods as specified below. The Identity can be detected by one of the following methods, 1) FDB 2) Netlogin 3) LLDP 4) IPARP 5) Kerberos 6) IP-Security

Remedy

No action required - Informational message only.

Severity

Info

Message Text

FDB Aged out for Identity \"%identity%\" with MAC %mac%, detected by %authMethod%.

Message Parameters

| Name | Type |
|------------|--------|
| identity | String |
| mac | MAC |
| authMethod | String |

IdMgr.RxPktBuf

Description

This is a packet received by Identity Manager.

Remedy

No action required - Information message only.

Severity

Debug-Data

Message Text

Dump of received packet buffer:\n%buffer%

Message Parameters

| Name | Type |
|--------|---------|
| buffer | Buf-ptr |
| length | Buf-len |

IdMgr.CauseEntRedun

Description

A new entry is being added to the blacklist/whitelist that renders an existing list entry superfluous. This condition can happen when the entry that is being added has a wider match criteria than the existing entry as the set of identities that can match the existing entry is a subset of the set of identities that can match the newly added entry. For example adding an entry with IP address 10.10.10.0/24 to the blacklist followed by adding a second entry with IP address 10.10.0.0/16 renders the 10.10.10.0/24 entry redundant.

Remedy

White this is not an error condition, it can result in inefficient use of system resources like ACLs, memory and CPU cycles. It is recommended that the user delete the entry that has the narrower match criteria to free up unnecessary resources that are consumed by the redundant entry.

Severity

Notice

Message Text

Adding %entry2% to list results in %entry1% becoming redundant

Message Parameters

| Name | Type |
|--------|--------|
| entry1 | String |
| entry2 | String |

IdMgr.ParmNull

Description

An internal function was called with a NULL pointer. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on Identity Manager configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% is NULL

Message Parameters

| Name | Type |
|------|--------|
| arg | String |

IdMgr.ParmInv

Description

An internal function was called with an invalid value. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on Identity Manager configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% has an invalid value %val%

Message Parameters

| Name | Type |
|------|---------|
| arg | String |
| val | ulInt32 |

IdMgr.AllocMemFail

Description

Memory for the displayed object could not be allocated which may be due to the system running low on memory. This will result in incorrect operation of the Identity Management feature.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory.

Severity

Error

Message Text

Memory allocation failed when trying to allocate a %obj% structure of size %size%.

Message Parameters

| Name | Type |
|------|---------|
| obj | String |
| size | ulInt32 |

IdMgr.DelStrucFldNotNull

Description

Delete of the displayed container structure instance failed as the displayed field was not empty. This is an internal error and can indicate either a memory corruption or a software bug that can cause a memory leak.

Remedy

If this condition persists provide technical support information on Identity management configuration and details of the error message. Also, check the scalability limit and compare this with the current configuration.

Severity

Error

Message Text

Failed to delete %cont% with non-empty field %field%

Message Parameters

| Name | Type |
|-------|--------|
| cont | String |
| field | String |

IdMgr.AllocIndxFail

Description

Index allocation for the displayed list entry failed. This can indicate either a leak in index allocation or a software bug that can cause blacklist and whitelist feature in Identity management to not work as intended.

Remedy

If this condition persists provide technical support information on Identity management configuration and details of the error message. Also, check the scalability limit and compare this with the current configuration.

Severity

Error

Message Text

Index allocation for %entry% failed

Message Parameters

| Name | Type |
|-------|--------|
| entry | String |

IdMgr.DeVIdFDBIdAgeOutList

Description

Identity management creates an identity for the FDB entry learned on the ports where identity management is enabled. When the FDB entries are cleared the identity manager will place the FDB identity in a temporary list. The identity manager will clear this temporary list (containing aged out FDB identities) once in 60 seconds. This EMS event denotes that a valid FDB identity was removed after it was added to the FDB age-out list.

Remedy

If this condition persists review the output of the "show fdb ports <port_list>" and "show identity-management entries ports <port_list>" commands. (The portlist should include the identity-management-enabled port specified in the EMS event). Also, check the scalability limit and compare this with the current configuration.

Severity

Error

Message Text

The valid FDB identity %user% with MAC %mac% port %port% is being removed because it is on the FDB age-out list.

Message Parameters

| Name | Type |
|------|----------|
| user | String |
| mac | MAC |
| port | SlotPort |

IdMgr.GreyListUserDtect

Description

This event is generated when a user configured in Greylist, logs in using one of the following authentication method. 1. netloginDot1x 2. netloginMac 3. netloginWeb 4. kerberos User indicates username that is configured in Greylist.

Remedy

No action required - Information message only.

Severity

Info

Message Text

A grey-listed user \"%user%\" with MAC %mac% is detected by authentication method %authMethod% on port %port%

Message Parameters

| Name | Type |
|------------|----------|
| user | String |
| mac | MAC |
| authMethod | String |
| port | SlotPort |

IdMgr.PriorityHeirarchyFail

Description

All the child roles listed here have lesser priority (higher priority value) than their parent role. Due to which Match Criteria Inheritance could not be enabled.

Remedy

Change the priority of the child roles higher than their parent role. (lesser priority value)

Severity

Error

Message Text

List of Parent-Child not following Priority Hierarchy: %roleList%

Message Parameters

| Name | Type |
|----------|--------|
| roleList | String |

IdMgr.SendLDAPGrpQuery

Description

This event occurs when LDAP query is sent to search for user's group information. This LDAP query is sent when a user is detected by Identity Manager.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Sent LDAP query to search user's group for \"%userName%\" at base=\"%searchBase%\" with filter=\"%searchFilter%\".

Message Parameters

| Name | Type |
|--------------|--------|
| userName | String |
| searchBase | String |
| searchFilter | String |

IdMgr.SrchUserGrpLDAPSrvrOK

Description

LDAP search operation to get user's group information was successful.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Search for user's group for \"%userName%\" at base=\"%searchBase%\" in LDAP server %serverIP% was successful.

Message Parameters

| Name | Type |
|------------|--------|
| userName | String |
| searchBase | String |
| serverIP | IP |

IdMgr.SrchUserGrpLDAPSrvrFail

Description

LDAP search for user's group failed for the username in the configured LDAP server(s). Either the user was not found in the LDAP server directory or the LDAP connection to the server(s) could not be established.

Remedy

Check the LDAP configuration on the switch. Confirm the reachability of the LDAP server(s) from the switch. Also ensure that the user information is configured in the LDAP server(s). Following CLI commands can be used to configure and verify LDAP settings. 1. configure {identity-management} ldap {domain <domain_name>} add server 2. configure {identity-management} ldap {domain [<domain_name>|all]} bind-user 3. configure {identity-management} ldap {domain [<domain_name>|all]} base-dn 4. configure {identity-management} ldap {domain [<domain_name>|all]} [enable|disable] netlogin 5. show ldap domain

Severity

Error

Message Text

LDAP Search for user's group failed for \"%userName%\" at base=\"%searchBase%\".

Message Parameters

| Name | Type |
|------------|--------|
| userName | String |
| searchBase | String |

IdMgr.DecryptMaxStrSizExcd

Description

An invalid encrypted input string is received. Unable to decrypt the received encrypted input string as it is not in the EXOS encrypted string format resulting decrypting string exceeds maximum size.

Remedy

Retry configuration with expected encrypted string format. Encrypted string should be one of the following format " configure identity-management ldap bind-user <user-name> encrypted "#<char1>#<char2>.....#<char32>" or " configure identity-management ldap bind-user <user-name> encrypted "<char1><char2>.....<char32>".

Severity

Warning

Message Text

Unable to decrypt the encrypted string. The decrypted string size exceeded the maximum of %size%.

Message Parameters

| Name | Type |
|------|------|
| size | ulnt |

IdMgr.RoleBasedVLANTrace

Description

This event is for debugging problems related to IdMgr Role based VLAN . This is normal and does not indicate a problem.

Remedy

No action required - Informational message intended to help debug problems related to Dynamic VLAN bind.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

IdMgr.AssocIdToRoleVLAN

Description

This event occurs when an identity is associated to a role VLAN Tag.

Remedy

No action required - Information message only.

Severity

Info

Message Text

The identity \"%IdentityName%\" detected on port %port% with MAC %mac% has been associated to role \"%roleName%\" VLAN Tag %tag%

Message Parameters

| Name | Type |
|--------------|----------|
| IdentityName | String |
| port | SlotPort |
| mac | MAC |
| roleName | String |
| tag | uInt32 |

IdMgr.IdRoleVRMismatch

Description

If a Identity's role has a VR onfigured for dynamic VLAN creation, the VR should be the same as the VR to which the port (on which the Identity is detected) belongs to. If the port does not belong to any VR and if VLAN with the dynamic VLAN tag configured for the Identity's role already exists, the configured VR should match the VR to which the dynamic VLAN belongs to. Hence the identity will not be dynamically associated to any VLAN.

Remedy

Misconfiguration needs to be corrected. Use "configure identity-management role <role_name> vr <vr_name>" command to correct the misconfiguration.

Severity

Error

Message Text

VR %roleVrCfg% configured for role %roleName% for identity %IdentityName% with mac %mac% is not same as VR %vrPortVLAN% of the Identity's port or existing dynamic VLAN

Message Parameters

| Name | Type |
|--------------|--------|
| IdentityName | String |
| roleName | String |
| roleVrCfg | String |
| vrPortVLAN | String |
| mac | MAC |

IPMC.RxIGMPQueryCfgMisMatch

Description

An IGMP query has been received whose version is different from the configured version; but the query is not dropped. Each query is examined and compared to the configured version; but the event is made to occur only once per minute. Whether the event gets logged depends on the log configuration. If the configured version is IGMPv3 but a lower version of query is received, IGMPv3 hosts gracefully continue to operate but in a less-than-optimal manner using lower version compatibility mode.

Remedy

Configure IGMPv3 in all switches to utilize IGMPv3 protocol's full capability. If any of the switches doesn't support IGMPv3, then configure same lower IGMP version in all switches. To disable logging of the event, use the command: configure log filter "DefaultFilter" add exclude events "IPMC.RxIGMPQueryCfgMismatch"

Severity

Notice

Message Text

Received an IGMPv%ver% query on VLAN %vlan% configured for IGMPv%cfgVer% from %srcAddr%

Message Parameters

| Name | Type |
|---------|-------|
| ver | uInt8 |
| vlan | VLAN |
| cfgVer | uInt8 |
| srcAddr | IPN |

IPMC.RxMLDQueryCfgMismatch

Description

A MLD query has been received whose version is different from the configured version; but the query is not dropped. Each query is examined and compared to the configured version; but the event is made to occur only once per minute. Whether the event gets logged depends on the log configuration. If the configured version is MLDv2 but a MLDv1 query is received, MLDv2 hosts gracefully continue to operate but in a less-than-optimal manner using MLDv1 compatibility mode.

Remedy

Configure MLDv2 in all switches to utilize MLDv2 protocol's full capability. If any of the switches doesn't support MLDv2, then configure MLDv1 in all switches. To disable logging of the event, use the command: configure log filter "DefaultFilter" add exclude events "IPMC.RxMLDQueryCfgMismatch"

Severity

Notice

Message Text

Received a MLDv%ver% query on VLAN %vlan% configured for MLDv%cfgVer% from %srcAddr%

Message Parameters

| Name | Type |
|---------|-------|
| ver | uInt8 |
| vlan | VLAN |
| cfgVer | uInt8 |
| srcAddr | IPv6 |

IPMC.mrinfo.RxReq

Description

This log is displayed when mrinfo request (DVMRP Ask Neighbors 2 control packet) is received by the switch.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received DVMRP Ask Neighbors2 packet from %fromAddr% to %toAddr% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| fromAddr | IPN |
| toAddr | IPN |
| vrId | uInt32 |

IPMC.mrinfo.RxRspns

Description

This log is displayed when mrinfo response (DVMRP Neighbors 2 control packet) is received by the switch.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received DVMRP Neighbors2 packet from %fromAddr% to %toAddr% of size %pktLen% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| fromAddr | IPN |
| toAddr | IPN |
| pktLen | uInt32 |
| vrId | uInt32 |

IPMC.mrinfo.SendReqToPIM

Description

Information required for filling mrinfo response block is obtained from PIM. This log is displayed when received mrinfo request (DVMRP Neighbors 2 control packet) is sent to PIM.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending mrinfo request to PIM received from %fromAddr% to %toAddr% for VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| fromAddr | IPN |
| toAddr | IPN |
| vrId | uInt32 |

IPMC.mrinfo.RecvRspnsFmPIM

Description

This log is displayed when response is received from PIM by the multicast manager for the mrinfo request. There may be multiple responses from PIM for a single request. This log also indicates whether this response is the last one or not.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received response from PIM for the mrinfo request from %fromAddr% toAddr %toAddr% of size %pktLen% on VR %vrId%. This is %status% the last response packet.

Message Parameters

| Name | Type |
|----------|--------|
| fromAddr | IPN |
| toAddr | IPN |
| pktLen | uInt16 |
| vrlId | uInt32 |
| status | String |

IPMC.mrinfo.TxReq

Description

This log is displayed when mrinfo request (DVMRP Ask Neighbors 2 control packet) is being sent out by the switch when "mrinfo" command is executed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending DVMRP Ask Neighbors2 packet to %toAddr% from %fromAddr% on VR %vrlId%

Message Parameters

| Name | Type |
|----------|--------|
| toAddr | IPN |
| fromAddr | IPN |
| vrlId | uInt32 |

IPMC.mrinfo.TxRspns

Description

This log is displayed when mrinfo response (DVMRP Neighbors 2 control packet) is being sent out by the switch in response to mrinfo request.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending DVMRP Neighbors2 packet to %toAddr% from %fromAddr% of size %pktLen% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| toAddr | IPN |
| fromAddr | IPN |
| pktLen | uInt16 |
| vrId | uInt32 |

IPMC.mrinfo.DropRspns

Description

This log is displayed when received mrinfo response (DVMRP Neighbors 2 control packet) is dropped.

Remedy

Error string displays the reason. If the response was discarded with error "session not found", increase the timeout value in the mrinfo command.

Severity

Debug-Summary

Message Text

Dropping DVMRP Neighbors2 packet to %toAddr% from %fromAddr% of size %pktLen% on VR %vrId% due to %errString%

Message Parameters

| Name | Type |
|-----------|--------|
| toAddr | IPN |
| fromAddr | IPN |
| pktLen | uInt16 |
| vrlId | uInt32 |
| errString | String |

IPMC.mrinfo.DropReq

Description

This log is displayed when received mrinfo request (DVMRP Neighbors 2 control packet) is dropped in EXOS switch.

Remedy

Error string displays the reason.

Severity

Debug-Summary

Message Text

Dropping DVMRP Neighbors2 packet to %toAddr% from %fromAddr% on VR %vrlId% due to %errString%

Message Parameters

| Name | Type |
|-----------|--------|
| toAddr | IPN |
| fromAddr | IPN |
| vrlId | uInt32 |
| errString | String |

IPMC.mrinfo.TxReqFail

Description

This log is displayed when the mrinfo client could not send mrinfo request (DVMRP Neighbors 2) control packet.

Remedy

Error string gives more information. If sending fails due to unavailability of route to the multicast router address being queried, add the route.

Severity

Debug-Summary

Message Text

Sent failed for DVMRP Ask Neighbors2 packet to %toAddr% from %fromAddr% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| toAddr | IPN |
| fromAddr | IPN |
| vrId | uInt32 |

IPMC.mrinfo.TxRspnsFail

Description

This log is displayed when sending mrinfo response (DVMRP Neighbors 2 control packet) packet failed.

Remedy

Error string gives more information. If sending fails due to unavailability of route to the mrinfo request initiator, add the route.

Severity

Debug-Summary

Message Text

Sent failed for DVMRP Neighbors2 packet to %toAddr% from %fromAddr% of size %pktLen% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| toAddr | IPN |
| fromAddr | IPN |
| pktLen | uInt16 |
| vrId | uInt32 |

IPMC.mrinfo.CIntSessnTmout

Description

This log is displayed when mrinfo client (query initiator) node timesout.

Remedy

Could try increasing the timeout value.

Severity

Debug-Summary

Message Text

mrinfo Client session from %fromAddr% to %toAddr% timesout with sent request count %sentPkt% and received response count %rcvPkt% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| fromAddr | IPN |
| toAddr | IPN |
| sentPkt | uInt32 |
| rcvPkt | uInt32 |
| vrId | uInt32 |

IPMC.mtrace.RxRspns

Description

This log is displayed when mtrace response is received by the switch.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received mtrace response with source %srcAddr% group Address %grpAddr% destination address %destAddr% queryId %queryId% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |
| queryId | uInt32 |
| vrId | uInt32 |

IPMC.mtrace.RxReq

Description

This log is displayed when mtrace query or request is received by the switch

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received mtrace %type% with source %srcAddr% group Address %grpAddr% destination address %destAddr% response address %respAddr% TTL %ttl% hops %hops% QueryId %queryId% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| type | String |
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |
| respAddr | IPN |
| ttl | uInt8 |
| hops | uInt8 |
| queryId | uInt32 |
| vrId | uInt32 |

IPMC.mtrace.SendReqToPIM

Description

This log message is displayed when the Multicast manager module sends the received mtrace query/request message to PIM protocol to get the information to fill the response block.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending mtrace %type% with source address %srcAddr% group address %grpAddr% destination address %destAddr% queryId %queryId% to PIM for VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| type | String |
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |
| queryId | uInt32 |
| vrId | uInt32 |

IPMC.mtrace.RecvRspnsFmPIM

Description

When mtrace query or request is received on switch, after preprocessing, request is sent to PIM to get the information to fill the response. This message is displayed when multicast manager receives the response from PIM

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received response from PIM for %srcAddr% %grpAddr% %queryId% with previous hop address %prevHopAddr% incoming interface address %iifAddr% srcMask %srcMask% forwarding code %fwdCode% on VR %vrId%

Message Parameters

| Name | Type |
|-------------|--------|
| srcAddr | IPN |
| grpAddr | IPN |
| queryId | uInt32 |
| prevHopAddr | IPN |
| iifAddr | IPN |
| srcMask | uInt8 |
| fwdCode | uInt8 |
| vrId | uInt32 |

IPMC.mtrace.TxReq

Description

This is displayed when a mtrace query or request is sent by mtrace client.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending mtrace %type% with source %srcAddr% group Address %grpAddr% destination address %destAddr% response address %respAddr% TTL %ttl% hops %hops% QueryId %queryId% to %toAddr% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| type | String |
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |
| respAddr | IPN |
| tTl | uInt8 |
| hops | uInt8 |
| queryId | uInt32 |
| toAddr | IPN |
| vrId | uInt32 |

IPMC.mtrace.FwdReq

Description

If there is a valid previous hop router for the requested multicast trace, a response block is added to the request packet and forwarded to the previous hop router. This message is displayed when the request is forwarded to previous hop router.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Forwarding mtrace request to previous hop %prevHopAddr% for %srcAddr% %grpAddr% %queryId% with incoming interface address %iifAddr% srcMask %srcMask% forwarding code %fwdCode% on VR %vrId%

Message Parameters

| Name | Type |
|-------------|------|
| prevHopAddr | IPN |
| srcAddr | IPN |
| grpAddr | IPN |

| Name | Type |
|---------|--------|
| queryId | uInt32 |
| iifAddr | IPN |
| srcMask | uInt8 |
| fwdCode | uInt8 |
| vrlId | uInt32 |

IPMC.mtrace.TxRspns

Description

This message is displayed when the mtrace response is sent by a switch to the mtrace query initiator.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending mtrace response to %ipDestAddr% for %srcAddr% %grpAddr% %queryId% with incoming interface address %iifAddr% srcMask %srcMask% forwarding code %fwdCode% on VR %vrlId%

Message Parameters

| Name | Type |
|------------|--------|
| ipDestAddr | IPN |
| srcAddr | IPN |
| grpAddr | IPN |
| queryId | uInt32 |
| iifAddr | IPN |
| srcMask | uInt8 |
| fwdCode | uInt8 |
| vrlId | uInt32 |

IPMC.mtrace.DropReq

Description

This log is displayed when mtrace query or request is dropped.

Remedy

Based on the error, new query can be initiated with different parameters.

Severity

Debug-Summary

Message Text

Dropping mtrace %type% with source %srcAddr% group Address %grpAddr% destination address %destAddr% QueryId %queryId% due to %errString% on VR %vrId%

Message Parameters

| Name | Type |
|-----------|--------|
| type | String |
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |
| queryId | uInt32 |
| errString | String |
| vrId | uInt32 |

IPMC.mtrace.DropRspns

Description

This log is displayed when mtrace response received is dropped.

Remedy

Based on the error, new query can be initiated with different parameters.

Severity

Debug-Summary

Message Text

Dropping mtrace response with source %srcAddr% group Address %grpAddr% destination address %destAddr% QueryId %queryId% due to %errString% on VR %vrId%

Message Parameters

| Name | Type |
|-----------|--------|
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |
| queryId | uInt32 |
| errString | String |
| vrId | uInt32 |

IPMC.mtrace.TxReqFail

Description

This log is displayed when sending mtrace query or request is failed due to some reason.

Remedy

Based on the error, new query can be initiated with different parameters.

Severity

Debug-Summary

Message Text

Sent failed for mtrace %type% with source %srcAddr% group Address %grpAddr% destination address %destAddr% QueryId %queryId% on VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| type | String |
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |

| Name | Type |
|---------|--------|
| queryId | ulnt32 |
| vrId | ulnt32 |

IPMC.mtrace.TxRspnsFail

Description

This log is displayed when sending mtrace response is failed due to some reason.

Remedy

Based on the error, new query can be initiated with different parameters.

Severity

Debug-Summary

Message Text

Sent failed for mtrace response to %ipDestAddr% with source %srcAddr% group Address %grpAddr% destination address %destAddr% QueryId %queryId% on VR %vrId%

Message Parameters

| Name | Type |
|------------|--------|
| ipDestAddr | IPN |
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |
| queryId | ulnt32 |
| vrId | ulnt32 |

IPMC.mtrace.CIntSessnTmout

Description

This log is displayed when mtrace client (query initiator) node timesout.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

mtrace Client session for source %srcAddr% group Address %grpAddr% destination address %destAddr% QueryId %queryId% timeout on VR %vrId%. %sentpkt% sent and %rcvpkt% received

Message Parameters

| Name | Type |
|----------|--------|
| srcAddr | IPN |
| grpAddr | IPN |
| destAddr | IPN |
| queryId | uInt32 |
| vrId | uInt32 |
| sentpkt | uInt32 |

IPMC.Snoop.routerPortAge

Description

Router port has been aged out

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

Router port aged out on %vlanname%/%port%

Message Parameters

| Name | Type |
|----------|--------|
| vlanname | String |
| port | String |

IPMC.Snoop.igmpQuerier

Description

The switch is becoming IGMP querier on specified vlan.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Vlan %name% is becoming IGMP querier

Message Parameters

| Name | Type |
|------|--------|
| name | String |

IPMC.Snoop.nigmpQuerier

Description

The switch is no longer IGMP querier on specified vlan. This is mostly because another router with lower IP address wins election.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Vlan %name% is becoming a non-IGMP querier

Message Parameters

| Name | Type |
|------|--------|
| name | String |

IPMC.Snoop.newReceiver

Description

A new reciver for specified group has been created. This normally results from receiving IGMP report on that port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

Create a new receiver (%name%/port%/vid%) for group %group%

Message Parameters

| Name | Type |
|-------|---------|
| name | String |
| port | String |
| vid | uint |
| group | IPAddrN |

IPMC.Snoop.newRouterPort

Description

The specified virtual port is becoming router port, because switch sees local multicast packets used by routing protocols coming from that port or IGMP/MLD report subscribing the multicast group address used by routing protocols.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

Create a new router port (%name%/port%/vid%)

Message Parameters

| Name | Type |
|------|--------|
| name | String |
| port | String |
| vid | ulnt |

IPMC.Snoop.ageReceiver

Description

Specified receiver has been aged out on specified virtual port. This is mostly because the host is no longer reporting the IGMP membership.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

Age out a receiver (%name%/port%/vid%) for group %group%

Message Parameters

| Name | Type |
|-------|--------|
| name | String |
| port | String |
| vid | ulnt |
| group | IPN |

IPMC.Snoop.l2CacheMiss

Description

A L2 cache miss even is received from Kernel Snooping Module

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

L2 Cache Miss src=%srcAddr% group=%grpAddr% interface=%vlan%

Message Parameters

| Name | Type |
|---------|---------|
| srcAddr | IPAddrN |
| grpAddr | IPAddrN |
| vlan | String |

IPMC.Snoop.ageSource

Description

The specified source has been timed out from INCLUDE list of the group, which is in IGMPv3 mode.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

Age out %src% on %name%/slot%/port%/vid% for group %group%

Message Parameters

| Name | Type |
|-------|---------|
| name | String |
| slot | Slot |
| port | Port |
| vid | uInt |
| group | IPAddrN |
| src | IPAddrN |

IPMC.Snoop.recvData

Description

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

recv %len% bytes msgType = %type% from interface %instance%/%slot%/%port%

Message Parameters

| Name | Type |
|----------|------|
| instance | ulnt |
| slot | Slot |
| port | Port |
| len | ulnt |
| type | ulnt |

IPMC.Snoop.l3CacheMiss

Description

A L3 cache miss even is received from Kernel Module

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

L3 Cache Miss src=%srcAddr% group=%grpAddr% interface=%vlan% encaps-
dataLen=%dataLen%

Message Parameters

| Name | Type |
|---------|---------|
| srcAddr | IPAddrN |
| grpAddr | IPAddrN |
| vlan | String |
| dataLen | uInt |

IPMC.Snoop.cacheError

Description

No description is available.

Remedy

No remedy is available.

Severity

Warning

Message Text

%msg% src=%srcAddr% group=%grpAddr% interface=%ifIndex% vId=%vId%

Message Parameters

| Name | Type |
|---------|---------|
| srcAddr | IPAddrN |
| grpAddr | IPAddrN |
| ifIndex | Port |
| vId | uInt |
| msg | String |

IPMC.Snoop.modeSwIn

Description

No description is available.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Group %grpAddr% mode switching to INCLUDE on vlan %vlan%

Message Parameters

| Name | Type |
|---------|---------|
| vlan | String |
| grpAddr | IPAddrN |

IPMC.Snoop.recvdQueryMsg

Description

An IGMP query is received on specified virtual port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received IGMP v%ver% query for %group% from %srcAddr% on %vlan% port %port%

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| port | String |
| srcAddr | IPN |
| group | IPN |
| ver | uInt8 |

IPMC.Snoop.recvdVlReportMsg

Description

An IGMP report is received on specified virtual port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received IGMP v%ver% report for %group% from %srcAddr% on %vlan% port %port%

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| port | String |
| srcAddr | IPN |
| group | IPN |
| ver | uInt8 |

IPMC.Snoop.recvdLeaveMsg

Description

An IGMP LEAVE message is received on specified virtual port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received IGMP v%ver% Leave for %group% from %srcAddr% on %vlan% port %port%

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| port | String |
| srcAddr | IPN |
| group | IPN |
| ver | uInt8 |

IPMC.Snoop.sendQueryMsg

Description

An IGMP QUERY message is being sent out on specified vlan

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Send IGMP v%ver% query for %group% from %srcAddr% on %vlan%

Message Parameters

| Name | Type |
|---------|-------|
| vlan | VLAN |
| srcAddr | IPN |
| group | IPN |
| ver | ulnt8 |

IPMC.Snoop.recvdMLDQueryMsg

Description

An MLD query is received on specified virtual port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received MLD v%ver% query for %group% from %srcAddr% on %vlan% port
%slot%:%port%

Message Parameters

| Name | Type |
|---------|-------|
| vlan | VLAN |
| slot | Slot |
| port | Port |
| srcAddr | IPv6 |
| group | IPv6 |
| ver | ulnt8 |

IPMC.Snoop.recvdMLDReportMsg

Description

An MLD report is received on specified virtual port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received MLDv%ver% report for %group% from %srcAddr% on %vlan% port
%slot%:%port%

Message Parameters

| Name | Type |
|---------|-------|
| vlan | VLAN |
| slot | Slot |
| port | Port |
| srcAddr | IPv6 |
| group | IPv6 |
| ver | ulnt8 |

IPMC.Snoop.recvdMLDReductionMsg

Description

An MLD Reduction message is received on specified virtual port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received MLD v%ver% Reduction for %group% from %srcAddr% on %vlan% port
%slot%:%port%

Message Parameters

| Name | Type |
|---------|-------|
| vlan | VLAN |
| slot | Slot |
| port | Port |
| srcAddr | IPv6 |
| group | IPv6 |
| ver | ulnt8 |

IPMC.Snoop.ageMLDReceiver

Description

Specified receiver has been aged out on specified virtual port. This is mostly because the host is no longer reporting the MLD membership.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

Age out a MLD receiver (%name%/%slot%/%port%/%vid%) for group %group%

Message Parameters

| Name | Type |
|-------|--------|
| name | String |
| slot | Slot |
| port | Port |
| vid | ulnt |
| group | IPv6 |

IPMC.Snoop.v1bypassedPim

Description

An IGMP report is received on specified virtual port. This created a new group in IGMP, but information was not propagated to PIM.

Remedy

The IGMP group's snooping entry needs to be cleared. The next time a IGMP Report comes in, we should establish the correct state in IGMP as well as PIM.

Severity

Debug-Summary

Message Text

New IGMP group not sent to PIM. V1 Report for %group% from %srcAddr% on %vlan% port %port%. L2vlan:%l2vlan%, vlanState:%vlanSt%, igmpEnabled:%igmpEn%

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| port | String |
| srcAddr | IPN |
| group | IPN |
| l2vlan | ulnt |
| vlanSt | ulnt8 |
| igmpEn | ulnt8 |

IPMC.Snoop.v2bypassedPim

Description

An IGMP report is received on specified virtual port. This created a new group in IGMP, but information was not propagated to PIM.

Remedy

The IGMP group's snooping entry needs to be cleared. The next time a IGMP Report comes in, we should establish the correct state in IGMP as well as PIM.

Severity

Debug-Summary

Message Text

New IGMP group not sent to PIM. V2 Report for %group% from %srcAddr% on %vlan% port %port%. L2vlan:%l2vlan%, vlanState:%vlanSt%, igmpEnabled:%igmpEn%

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| port | String |
| srcAddr | IPN |
| group | IPN |
| l2vlan | uInt |
| vlanSt | uInt8 |
| igmpEn | uInt8 |

IPMC.Snoop.recvdV2ReportMsg

Description

An IGMP report is received on specified virtual port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received IGMP v%ver% report for %group% from %srcAddr% on %vlan% port %port%

Message Parameters

| Name | Type |
|------|--------|
| vlan | VLAN |
| port | String |

| Name | Type |
|---------|-------|
| srcAddr | IPN |
| group | IPN |
| ver | uInt8 |

IPMC.Snoop.recvdV3ReportMsg

Description

An IGMP report is received on specified virtual port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received IGMP v%ver% report for %group% of type %type% from %srcAddr% on %vlan% port %port%

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| port | String |
| srcAddr | IPN |
| group | IPN |
| ver | uInt8 |
| type | uInt8 |

IPMC.Snoop.recvdV3NewGroup

Description

An IGMP report is received on specified virtual port. New IGMP group entry in MCMGR.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received IGMP v%ver% report for %group% from %srcAddr% on %vlan% port %port%

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| port | String |
| srcAddr | IPN |
| group | IPN |
| ver | uInt8 |

IPMC.Snoop.membersNotSent

Description

IGMP membership reports not sent.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

IGMP membership reports not sent

IPMC.Snoop.processIgmReport

Description

This function should not be called. Adding this EMS log message to see if it ever gets invoked.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Function %msg% called

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

IPMC.Snoop.PimSnoopPktRcv

Description

No description is available.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

PIM %type% pkt of length %len% rxd on vlan=%name% port=%slot%:%port% with src addr %src%

Message Parameters

| type | uInt |
| name | String |
| grp | IPAddrN |
| port | String |

IPMC.Snoop.setReceiverTimer

Description

No description is available.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Setting receiver timer at %location% to value=%timerVal%

Message Parameters

| Name | Type |
|----------|--------|
| location | String |
| timerVal | ulnt |

IPMC.Snoop.receivedWholePacket

Description

A Whole multicast packet is received from Kernel Module.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Received a whole packet src=%srcAddr% group=%grpAddr% total length=%len%

Message Parameters

| Name | Type |
|---------|---------|
| srcAddr | IPAddrN |
| grpAddr | IPAddrN |
| len | uInt |

IPMC.Snoop.wholePktLenMismatch

Description

A Whole multicast packet is received from Kernel Module, but there is a mismatch in the IP packet length field and the actual packet length received.

Remedy

.

Severity

Warning

Message Text

Mismatch in whole packet src=%srcAddr% group=%grpAddr% IP Length=%len1% but Actual Length=%len2%

Message Parameters

| Name | Type |
|---------|---------|
| srcAddr | IPAddrN |
| grpAddr | IPAddrN |
| len1 | uInt |
| len2 | uInt |

IPMC.Snoop.delOif

Description

No description is available.

Remedy

.

Severity

Debug-Data

Message Text

Deleting oif for cache entry: src=%srcAddr% group=%grpAddr% inVlan=%inVlan%
oif=%oif%

Message Parameters

| Name | Type |
|---------|---------|
| srcAddr | IPAddrN |
| grpAddr | IPAddrN |
| inVlan | ulnt |
| oif | ulnt |

IPMC.Snoop.addOif

Description

No description is available.

Remedy

.

Severity

Debug-Data

Message Text

Adding oif for cache entry: src=%srcAddr% group=%grpAddr% inVlan=%inVlan%
oif=%oif%

Message Parameters

| Name | Type |
|---------|---------|
| srcAddr | IPAddrN |
| grpAddr | IPAddrN |
| inVlan | ulnt |
| oif | ulnt |

IPMC.Snoop.KernDelL2Cache

Description

No description is available.

Remedy

.

Severity

Debug-Data

Message Text

Deleting L2 Kernel Cache: src=%srcAddr% group=%grpAddr% inVlan=%inVlan%

Message Parameters

| Name | Type |
|---------|---------|
| srcAddr | IPAddrN |
| grpAddr | IPAddrN |
| inVlan | String |

IPMC.Snoop.sendMLDQueryMsg

Description

An MLD QUERY message is being sent out on specified vlan.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Send MLD v%ver% query for %grp% from %srcAddr% on %vlan%

Message Parameters

| Name | Type |
|---------|-------|
| vlan | VLAN |
| srcAddr | IPv6 |
| grp | IPv6 |
| ver | uInt8 |

IPMC.Snoop.MLDQuerier

Description

The switch is becoming MLD querier on specified vlan.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Vlan %name% is becoming MLD querier

Message Parameters

| Name | Type |
|------|--------|
| name | String |

IPMC.Snoop.nMLDQuerier

Description

The switch is no longer MLD querier on specified vlan. This is mostly because another router with lower IP address wins election.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

Vlan %name% is becoming a non-MLD querier

Message Parameters

| Name | Type |
|------|--------|
| name | String |

IPMC.VSM.CIntInitFail

Description

Initialization of MCMGR with VSM module has failed. In such a case MLAG functionality with respect to multicast traffic will not function properly.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

VSM client initialization failed, Error = %err%

Message Parameters

| Name | Type |
|------|------|
| err | sInt |

IPMC.VSM.SetAppDataFail

Description

Setting application-specific data for the ISC has failed. In such a case MLAG functionality with respect to multicast traffic will not function properly.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Unable to set application-specific data for ISC %isc%, Error = %err%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| err | sInt |

IPMC.VSM.AllocBufFail

Description

Allocation of checkpoint buffer has failed. In such a case MLAG functionality with respect to multicast traffic will not function properly.

Remedy

Check the system parameters and scale down the configuration if necessary.

Severity

Error

Message Text

Unable to allocate IPML buffer for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.AllocAppDataFail

Description

Allocation of buffer for application-specific data has failed. In such a case MLAG functionality with respect to multicast traffic will not function properly.

Remedy

Check the system parameters and scale down the configuration if necessary.

Severity

Error

Message Text

Unable to allocate ISC-specific global information for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.GetISCStateFail

Description

An attempt to get the state of the ISC port from VSM client failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Unable to get ISC state for ISC %isc%, Error = %err%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| err | sInt |

IPMC.VSM.CreatISC

Description

This is a debug message indicating that an ISC is being created.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Create ISC for index %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.CreatCkptTxTimer

Description

This is a debug message indicating that a timer which is used for transmitting checkpoint messages is created. This message will appear when the first ISC is being created.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Checkpoint Tx timer created

IPMC.VSM.DelISC

Description

This is a debug message indicating that an ISC is being deleted.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Deleting ISC for index %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.DelCkptTxTimer

Description

This is a debug message indicating that the timer used for transmitting checkpoint messages is deleted. This message will appear when the last ISC is being deleted.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Checkpoint Tx timer deleted

IPMC.VSM.UpdtISC

Description

This is a debug message indicating that an update of ISC-related parameters is being attempted. The parameters that can be modified are ISC state, ISC port instance and IP address.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Update ISC for ISC %isc%, change mask %mask%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| mask | xInt32 |

IPMC.VSM.StateChgNtfn

Description

This is a debug message indicating that the state of an ISC has changed.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

State change notification for ISC %isc%, state = %state%

Message Parameters

| Name | Type |
|-------|--------|
| isc | uInt16 |
| state | sInt |

IPMC.VSM.ISCUp

Description

This is a debug message indicating that the state of an ISC has changed to UP.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

State changed to UP for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.AppDataNull

Description

This is a debug message indicating that application data specific to an ISC is NULL.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

ISC %isc% is UP but application-specific data is NULL

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.ISCDown

Description

This is a debug message indicating that the state of an ISC has changed to DOWN.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

ISC %isc% is DOWN, re-initialize application-specific data

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.AllocISCNodeFail

Description

This message indicates that an attempt to allocate an ISC node, which includes ISC-related information per VLAN, has failed. VLAN-related checkpointing with respect to multicast will not function properly.

Remedy

Check the system parameters and scale down the configuration if necessary.

Severity

Error

Message Text

Unable to allocate ISC node for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.ISCPortInstcInv

Description

This is a debug message which indicates that the port instance for the given ISC is invalid. Port instance value for an ISC will be invalid until ISC state transitions to UP.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Port instance for ISC %isc% is invalid

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.GetISCPortInstcFail

Description

This message indicates that an attempt to get the port instance value, for the specified ISC, from VSM has failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Unable to get port instance for ISC %isc%, Error %err%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| err | sInt |

IPMC.VSM.CreatMLAG

Description

This is a debug message which indicates that an MLAG has been created.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Created MLAG for index %mlag%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |

IPMC.VSM.GetLocMLAGPortInstcFail

Description

This message indicates that an attempt to get the port instance value for an MLAG from VSM has failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Unable to get local port instance for MLAG %mlag%, Error = %err%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| err | sInt |

IPMC.VSM.GetRmtMLAGPortStateFail

Description

This message indicates that an attempt to get the remote state for a given MLAG port from VSM has failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Unable to get remote port state for MLAG %mlag%, Error %err%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| err | sInt |

IPMC.VSM.GetLocMLAGPortStateFail

Description

This message indicates that an attempt to get the local MLAG port state from VSM has failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Unable to get local port state for MLAG %mlag%, Error = %err%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| err | sInt |

IPMC.VSM.MLAGPortInstcInv

Description

This message indicates that the port instance value for the specified MLAG is invalid.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Invalid port instance for MALG %mlag%

Message Parameters

| Name | Type |
|------|--------|

IPMC.VSM.DeIMLAG

Description

This is a debug message indicating that the specified MLAG is deleted.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Deleted Mlag for index %mlag%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |

IPMC.VSM.NtfyMLAGStateChg

Description

This is a debug message indicating that parameters relating to an MLAG have changed.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

MLAG state change notification for index %mlag%, ISC %isc%, remote port state %state%

Message Parameters

| Name | Type |
|-------|--------|
| mlag | uInt16 |
| isc | uInt16 |
| state | sInt |

IPMC.VSM.RmtMLAGPortDown

Description

This is a debug message indicating that the port state corresponding to the specified MLAG has changed to DOWN on the remote switch.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Remote MLAG port down for MLAG %mlag%, VLAN %vlan%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| vlan | String |

IPMC.VSM.GetISCPortFail

Description

This message indicates that an attempt to get the ISC port for the given MLAG has failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Debug-Summary

Message Text

Unable to get ISC port corresponding to MLAG %mlag%, VLAN %vlan%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| vlan | String |

IPMC.VSM.RemMLAGIndxFmRecvr

Description

This is a debug message which indicates that an MLAG index is being deleted from the list maintained in the specified receiver (port) for the given group.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

MLAG Port %mslot%:%mport% %reason%, removing MLAG index %mlag% from port %islot%:%iport% for group %grp%

Message Parameters

| Name | Type |
|--------|---------|
| mlag | uInt16 |
| mslot | uInt16 |
| mport | uInt16 |
| islot | uInt16 |
| iport | uInt16 |
| grp | IPAddrN |
| reason | String |

IPMC.VSM.RemRecvrFmGrp

Description

This is a debug message which indicates that the specified receiver is being removed from the group.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Port %mslot%:%mport% %reason%, removing receiver %rslot%:%rport% from VLAN %vlan%, group %grp%

Message Parameters

| Name | Type |
|--------|---------|
| mslot | uInt16 |

| rslot | uInt16 |
| rport | uInt16 |
| vlan | String |
| grp | IPAddrN |
| reason | String |

IPMC.VSM.RemMLAGIndxFmRtrPort

Description

This is a debug message which indicates that an MLAG index maintained in the specified router port is being deleted.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

MLAG port %mslot%:%mport% %reason%, removing MLAG index %mlag% from router port %rslot%:%rport%

Message Parameters

| Name | Type |
|--------|--------|
| mslot | uInt16 |
| mport | uInt16 |
| mlag | uInt16 |
| rslot | uInt16 |
| rport | uInt16 |
| reason | String |

IPMC.VSM.StrtFastAgeOut

Description

This is a debug message which indicates that the specified router port, which is an ISC port, is being aged out faster. This is due to the fact that this port was added as router port when V3 receivers are present on an MLAG port whose state changed to DOWN. When the MLAG port changes to UP (or remote MLAG port state changes to DOWN) again, such a router port will be aged out faster to avoid unnecessary traffic over the ISC.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Summary

Message Text

MLAG port %mslot%:%mport% %reason%, fast aging started for router port
%rslot%:%rport%

Message Parameters

| Name | Type |
|--------|--------|
| mslot | uInt16 |
| mport | uInt16 |
| rslot | uInt16 |
| rport | uInt16 |
| reason | String |

IPMC.VSM.GetISCIndxFail

Description

This message indicates that an attempt to get the ISC index from VSM has failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Unable to get ISC Index for MLAG %mlag%, Error = %err%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| err | sInt |

IPMC.VSM.IgnRecvr

Description

This is a debug message which indicates that a receiver is being ignored and not removed since it has snooped reports directly on the port.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Direct reports exist, ignoring receiver %rslot%:%rport%, for VLAN %vlan%, group %grp%

Message Parameters

| Name | Type |
|-------|---------|
| rslot | uInt16 |
| rport | uInt16 |
| vlan | String |
| grp | IPAddrN |

IPMC.VSM.SendQuery

Description

This is a debug message which indicates that an IGMP query message is being sent on the specified VLAN.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Sending query for VLAN %vlan%

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |

IPMC.VSM.LeakIGMPGrp

Description

This is a debug message which indicates that IGMP group information is being leaked on to ISC port because a local MLAG port has gone DOWN.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

MLAG port %mslot%:%mport% down, leaking group %grp% on ISC port %islot%:%iport%

Message Parameters

| Name | Type |
|-------|--------|
| mslot | uInt16 |
| mport | uInt16 |
| grp | IPN |
| islot | uInt16 |
| iport | uInt16 |

IPMC.VSM.AllocMLAGNodeFail

Description

This message indicates that an attempt to allocate memory for an MLAG node has failed.

Remedy

Check the system parameters and scale down the configuration if necessary.

Severity

Error

Message Text

Unable to allocate mlagNode

IPMC.VSM.AddMLAGIndxToISC

Description

This is a debug message which indicates that an MLAG index is being added to an ISC receiver. This will happen when an MLAG port goes DOWN and groups from such a port are leaked on to the corresponding ISC port. To indicate that the ISC receiver has groups leaked from MLAG port, the MLAG index will be added to the receiver.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

MLAG port %mslot%:%mport% down, adding MLAG index %mlag% to ISC %islot%:%iport% for group %grp%

Message Parameters

| Name | Type |
|-------|---------|
| mlag | uInt16 |
| mslot | uInt16 |
| mport | uInt16 |
| islot | uInt16 |
| iport | uInt16 |
| grp | IPAddrN |

IPMC.VSM.FndISCRcvrFail

Description

This message indicates that an attempt to find the ISC receiver for the specified group in the given VLAN has failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

ISC receiver not found for VLAN %vlan%, group %grp%, ISC %islot%:%iport%

Message Parameters

| Name | Type |
|-------|---------|
| vlan | String |
| grp | IPAddrN |
| islot | uInt16 |
| iport | uInt16 |

IPMC.VSM.FndGrpFail

Description

This message indicates that an attempt to find a group in the specified VLAN has failed.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Group %grp% not found for VLAN %vlan%

Message Parameters

| Name | Type |
|------|---------|
| vlan | String |
| grp | IPAddrN |

IPMC.VSM.AddISCRtrPort

Description

This is a debug message which indicates that the specified ISC port is being added as a router port. This will happen when an MLAG port goes DOWN and there are V3 receivers on that port. To ensure that traffic goes to such receivers through the remote switch, ISC port will be added as a router port (if not already added).

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Summary

Message Text

MLAG port %mslot%:%mport% down, adding ISC port %islot%:%iport% as router port for group %grp%

Message Parameters

| Name | Type |
|-------|---------|
| mslot | uInt16 |
| mport | uInt16 |
| islot | uInt16 |
| iport | uInt16 |
| grp | IPAddrN |

IPMC.VSM.FndMLAGPortFail

Description

This message indicates that an attempt to find the specified MLAG port in the given VLAN has failed.

Remedy

Check the configuration and ensure that MLAG port is part of the specified vlan. Also make sure that the IPMC configuration on MLAG peer switches is consistent. On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Unable to find MLAG port for VLAN %vlan%, port %mslot%:%mport%

Message Parameters

| Name | Type |
|-------|--------|
| vlan | String |
| mslot | uInt16 |
| mport | uInt16 |

IPMC.VSM.ISCPortInstcChg

Description

This is a debug message that indicates that the port instance corresponding to the given ISC has changed and all groups that have been learned or leaked on old ISC port are being moved to the new port.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Snooping group %grp% on new ISC port %nslot%:%nport%, old ISC port %oslot%:%oport%, VLAN %vlan%

Message Parameters

| Name | Type |
|-------|---------|

IPMC.VSM.SnoopLeaveOnISC

Description

This is a debug message which indicates that a checkpointed IGMP leave message is being snooped on local ISC port.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Snooping IGMP Leave on ISC Port %islot%:%iport%

Message Parameters

| Name | Type |
|-------|--------|
| islot | uInt16 |
| iport | uInt16 |

IPMC.VSM.LeakIGMPLeave

Description

This is a debug message which indicates that a checkpointed IGMP leave message is being leaked on the local ISC port since the specified MLAG port is down.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Leaking IGMP Leave on ISC port %islot%:%iport% for MLAG %mlag%

Message Parameters

| Name | Type |
|-------|--------|
| islot | uInt16 |
| iport | uInt16 |
| mlag | uInt16 |

IPMC.VSM.FndISCPortFail

Description

This message indicates that an attempt to find an ISC port while leaking IGMP leave messages has failed.

Remedy

Check the configuration on MLAG peer switches and ensure that it is consistent. Specifically check the IPMC configuration related to MLAG. On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

ISC port not found for VLAN %vlan%, ignore checkpoint message

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |

IPMC.VSM.LeakIGMPJoin

Description

This is a debug message which indicates that a checkpointed IGMP join message is being leaked on the local ISC port since the specified MLAG port is down.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Leaking IGMP join on local ISC port %islot%:%iport%

Message Parameters

| Name | Type |
|-------|--------|
| islot | uInt16 |
| iport | uInt16 |

IPMC.VSM.IgnCkptMsgPortStateUnk

Description

This is a debug message which indicates that a checkpoint message included group information which had a port whose state is unknown and such a group is not being processed

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Ignore Checkpoint message, local port state unknown for portId %port%

Message Parameters

| Name | Type |
|------|--------|
| port | uInt16 |

IPMC.VSM.PortInstcInv

Description

This message indicates that a received checkpoint message included a port whose instance is invalid on the local switch.

Remedy

This kind of problems could arise due to erroneous configuration. Check IPMC configuration related to MLAG on the peer switches and ensure that it is consistent.

Severity

Error

Message Text

Invalid port instance for ID %port%

Message Parameters

| Name | Type |
|------|--------|
| port | uInt16 |

IPMC.VSM.SnoopIGMPMsg

IPMC.VSM.IgnCkptMsgISCPortDown

Description

This is a debug message which indicates that the received checkpoint message is being ignored since the message is received on an ISC port whose state is down.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Local ISC port %islot%:%iport% down, ignoring checkpoint message

Message Parameters

| Name | Type |
|-------|--------|
| islot | uInt16 |
| iport | uInt16 |

IPMC.VSM.IgnCkptMsgPortInv

Description

This is a debug message which indicates that the received checkpoint message is being ignored since the message is received on a port which does not belong to the specified VLAN.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Port %slot%:%port% not found for VLAN %vlan%, ignoring checkpoint message

Message Parameters

| Name | Type |
|------|--------|
| slot | uInt16 |
| port | uInt16 |
| vlan | String |

IPMC.VSM.FndVLANFail

Description

This is a debug message which indicates that the received checkpoint message included information relating to a VLAN and an attempt to find such a VLAN on the local switch failed.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Summary

Message Text

VLAN not found for vlanId %vlanId%, portId %portId%, isIdx %isc%

Message Parameters

| Name | Type |
|--------|--------|
| vlanId | uInt16 |
| portId | uInt16 |
| isc | uInt16 |

IPMC.VSM.SnoopIGMPV3Msg

Description

This is debug message which indicates that a received checkpoint message included IGMP V3 information and that is being snooped on a local port.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Snooping V3 Report on VLAN %vlan%, port %port%, ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |
| port | uInt16 |
| isc | uInt16 |

IPMC.VSM.ProcPullMsg

Description

This is a debug message which indicates that a PULL message is received from the peer and is being processed.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

PULL message received for VLAN %vlan%, portId %port%, skipMlag %skip%

Message Parameters

| Name | Type |
|------|--------|
| vlan | uInt16 |
| port | uInt16 |
| skip | uInt16 |

IPMC.VSM.IgnCkptMsgUnkOwner

Description

This message indicates that the received checkpoint message is being ignored since the owner field in the packet header is not valid.

Remedy

Ensure the EXOS versions on the M-LAG peers are compatible. One of the M-LAG may require an upgrade to a more recent version of EXOS.

Severity

Debug-Data

Message Text

Ignore checkpoint message with invalid owner, role = %role%

Message Parameters

| Name | Type |
|------|-------|
| role | ulnt8 |

IPMC.VSM.SkipRecvrRmtStateUnk

Description

This is a debug message which indicates that a particular MLAG receiver is being skipped since the remote port state for the MLAG is unknown.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Remote state unknown for MLAG %mlag%, receiver not added

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |

IPMC.VSM.AllocCkptMsgFail

Description

This message indicates that an attempt to allocate a buffer to hold the checkpoint message has failed..

Remedy

Check the system parameters and scale down the configuration if required.

Severity

Error

Message Text

Failed to allocate checkpoint message buffer for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.AddPullMsg

Description

This is a debug message which indicates that a PULL message is being added to the checkpoint message.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Adding PULL message for ISC %isc%, VLAN %vlan%, port %port%, skip %skip%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| vlan | String |
| port | uInt16 |
| skip | uInt16 |

IPMC.VSM.IgnStaticRecvr

Description

This is a debug message which indicates that a static receiver is being ignored and not added to the checkpoint message.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Ignoring static receiver %rslot%:%rport% for group %grp% on VLAN %vlan%

Message Parameters

| Name | Type |
|-------|---------|
| rslot | uInt16 |
| rport | uInt16 |
| grp | IPAddrN |
| vlan | String |

IPMC.VSM.SkipAddMsgISCDown

Description

This is a debug message which indicates that the specified group information is not added to the checkpoint message since the ISC port is down.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Not adding group %grp% received on port %slot%:%port% on VLAN %vlan% to checkpoint buffer, ISC %isc% is down

Message Parameters

| Name | Type |
|------|---------|
| isc | uInt16 |
| slot | uInt16 |
| port | uInt16 |
| grp | IPAddrN |
| vlan | String |

IPMC.VSM.SkipAddV3MsgISCDown

Description

This is a debug message which indicates that IGMP V3 information is not added to the checkpoint message since the ISC port is down.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Not adding IGMP V3 information to checkpoint buffer, ISC %isc% is down

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.SkipAddV3MsgRmtStateUnk

Description

This is a debug message which indicates that information from received IGMP V3 message is not added to the checkpoint message since the ISC port is down.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Remote state unknown for MLAG %mlag%, skipping V3 message add to checkpoint buffer

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |

IPMC.VSM.SkipBulkCkptISCPortDown

Description

This is a debug message which indicates that a bulk checkpoint is skipped since the ISC port is down.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

ISC is not Up, skipping bulk checkpoint for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.StrtCkpt

Description

This is a debug message which indicates that bulk checkpoint has started for the specified VLAN.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Data

Message Text

Start Checkpoint for ISC %isc%, VLAN %vlan%, MLAG %mlag%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| vlan | String |
| mlag | uInt16 |

IPMC.VSM.FndVPifFail

Description

This is a debug message which indicates that an attempt to find a VPIF based on the given vlan-id and port-id information has failed.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Summary

Message Text

ISC Vpif not found for vlanInst %vinst%, ISC portInst %pinst%

Message Parameters

| Name | Type |
|-------|--------|
| vinst | uInt32 |
| pinst | uInt32 |

IPMC.VSM.LeakMLDJoin

Description

This is a debug message which indicates that a checkpointed MLD join message is being leaked on the local ISC port since the specified MLAG port is down.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Leaking MLD join on local ISC port %islot%:%iport%

Message Parameters

| Name | Type |
|-------|--------|
| islot | uInt16 |
| iport | uInt16 |

IPMC.VSM.LeakMLDGrp

Description

This is a debug message which indicates that MLD group information is being leaked on the local ISC port since the specified MLAG port is down.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

MLAG port %mslot%:%mport% down, leaking group %grp% on ISC port %islot%:%iport%

Message Parameters

| Name | Type |
|-------|--------|
| mslot | uInt16 |
| mport | uInt16 |
| grp | IPv6 |
| islot | uInt16 |
| iport | uInt16 |

IPMC.VSM.SnoopMLDLeaveOnISC

Description

This is a debug message which indicates that a checkpointed MLD leave message is being snooped on local ISC port.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Snooping MLD Leave on ISC Port %islot%:%iport%

Message Parameters

| Name | Type |
|-------|--------|
| islot | uInt16 |
| iport | uInt16 |

IPMC.VSM.LeakMLDLeave

Description

This is a debug message which indicates that a checkpointed MLD leave message is being leaked on the local ISC port since the specified MLAG port is down.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Leaking MLD Leave on ISC port %islot%:%iport% for MLAG %mlag%

Message Parameters

| Name | Type |
|-------|--------|
| islot | uInt16 |
| iport | uInt16 |
| mlag | uInt16 |

IPMC.VSM.SnoopMLDMsg

Description

This is a debug message which indicates that a checkpointed MLD message is being snooped on local port.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Snooping MLD message on VLAN %vlan%, port %slot%:%port%

Message Parameters

| Name | Type |
|------|--------|
| vlan | VLAN |
| slot | uInt16 |
| port | uInt16 |

IPMC.VSM.SnoopMLDv2Msg

Description

This is debug message which indicates that a received checkpoint message included MLDv2 information and that is being snooped on a local port.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Snooping MLDv2 Report on VLAN %vlan%, port %port%, ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| vlan | VLAN |
| port | uInt16 |
| isc | uInt16 |

IPMC.VSM.SkipAddMLDv2MsgISCDown

Description

This is a debug message which indicates that MLDv2 information is not added to the checkpoint message since the ISC port is down.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Not adding MLDv2 information to checkpoint buffer, ISC %isc% is down

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

IPMC.VSM.SkipAddMLDv2RmtStateUnk

Description

This is a debug message which indicates that information from received MLDv2 message is not added to the checkpoint message since the MLAG peer state is unknown.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Remote state unknown for MLAG %mlag%, skipping MLDv2 message add to checkpoint buffer

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |

IPMC.VSM.SendMLDQuery

Description

This is a debug message which indicates that an MLD query message is being sent on the specified VLAN.

Remedy

This is an informational message and no remedy is required.

Severity

Debug-Verbose

Message Text

Sending MLD query for VLAN %vlan%

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |

ipSecur.dhcpViol

Description

A rogue DHCP server packet was received.

Remedy

No remedy is available.

Severity

Warning

Message Text

A Rogue DHCP server on VLAN %vlan% with IP %ipAddr% was detected on port %port%

Message Parameters

| Name | Type |
|--------|----------|
| ipAddr | IP |
| port | SlotPort |
| vlan | VLAN |

ipSecur.arpViol

Description

No description is available.

Remedy

No remedy is available.

Severity

Warning

Message Text

An ARP violation was detected on vlan %vlan% port %port% violating IP %ipAddr%
violating MAC %mac% violation type %violation%

Message Parameters

| Name | Type |
|-----------|----------|
| vlan | String |
| port | SlotPort |
| ipAddr | IP |
| mac | MAC |
| violation | String |

ipSecur.blkPort

Description

A DHCP or ARP violation has occurred due to which the ingress port on which the bad packet was received is being disabled.

Remedy

No remedy is available.

Severity

Warning

Message Text

%violType% violation occurred. Disabling port %port% %duration%

Message Parameters

| Name | Type |
|----------|----------|
| violType | String |
| port | SlotPort |
| duration | String |

ipSecur.blkMac

Description

A DHCP or ARP violation has occurred due to which the transgressor MAC is being blocked.

Remedy

No remedy is available.

Severity

Warning

Message Text

%violType% violation occurred. Blocking MAC %mac% %duration%

Message Parameters

| Name | Type |
|----------|--------|
| violType | String |
| mac | MAC |
| duration | String |

ipSecur.drpPkt

Description

No description is available.

Remedy

No remedy is available.

Severity

Warning

Message Text

%violType% violation occurred on port %port%. Packet was dropped.

Message Parameters

| Name | Type |
|----------|----------|
| violType | String |
| port | SlotPort |

ipSecur.fdbLkup

Description

No description is available.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Doing FDB lookup for %mac% on vlan %vlan%

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |
| vlan | ulnt |

ipSecur.fdbCbK

Description

No description is available.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Got FDB callback for %mac% on vlan %vlan%

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |
| vlan | ulnt |

ipSecur.ipAnomaly

Description

Detect IP address anomaly: Sourec IP = Detination DIP

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

IP address anomaly detected on port %inPort% vlan %vlanName%: SMAC=%smac%
DMAC=%dmac% SIP=%sip% DIP=%dip% %info%

Message Parameters

| Name | Type |
|----------|----------|
| inPort | SlotPort |
| vlanName | String |
| smac | srcMAC |
| dmac | dstMAC |
| sip | String |
| dip | String |
| info | String |

ipSecur.l4portAnomaly

Description

Detect L4 port anomaly: Source Port = Destination Port

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

L4 port anomaly detected on port %inPort% vlan %vlanName%: SMAC=%smac%
DMAC=%dmac% SIP=%sip% DIP=%dip% SPORT=%sport% DPORT=%dport% %info%

Message Parameters

| Name | Type |
|----------|----------|
| inPort | SlotPort |
| vlanName | String |
| smac | srcMAC |
| dmac | dstMAC |
| sip | String |
| dip | String |
| sport | L4port |
| dport | L4port |
| info | String |

ipSecur.tcpFlagAnomaly

Description

Detect TCP flags anomaly:

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

TCP flags anomaly detected on port %inPort% vlan %vlanName%: SMAC=%smac%
DMAC=%dmac% SIP=%sip% DIP=%dip% SPORT=%sport% DPORT=%dport% %info%

Message Parameters

| Name | Type |
|----------|----------|
| inPort | SlotPort |
| vlanName | String |
| smac | srcMAC |
| dmac | dstMAC |
| sip | String |
| dip | String |
| sport | L4port |
| dport | L4port |
| info | String |

ipSecur.tcpHeaderSizeAnomaly

Description

Detect TCP header size anomaly:

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

TCP Header size anomaly detected on port %inPort% vlan %vlanName%: SMAC=%smac%
DMAC=%dmac% SIP=%sip% DIP=%dip% SPORT=%sport% DPORT=%dport% %info%

Message Parameters

|----------|----------|
| inPort | SlotPort |
| vlanName | String |
| smac | srcMAC |
| dmac | dstMAC |
| sip | String |
| dip | String |
| sport | L4port |
| dport | L4port |
| info | String |

ipSecur.tcpFragmentAnomaly

Description

Detect TCP header size anomaly:

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

TCP Header size anomaly detected on port %inPort% vlan %vlanName%: SMAC=%smac%
DMAC=%dmac% SIP=%sip% DIP=%dip% %info%

Message Parameters

| Name | Type |
|----------|----------|
| inPort | SlotPort |
| vlanName | String |
| smac | srcMAC |
| dmac | dstMAC |
| sip | String |

| Name | Type |
|------|--------|
| dip | String |
| info | String |

ipSecur.icmpAnomaly

Description

Detect ICMP anomaly:

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

ICMP anomaly detected on port %inPort% vlan %vlanName%: SMAC=%smac%
DMAC=%dmac% SIP=%sip% DIP=%dip% %info%

Message Parameters

| Name | Type |
|----------|----------|
| inPort | SlotPort |
| vlanName | String |
| smac | srcMAC |
| dmac | dstMAC |
| sip | String |
| dip | String |

ISIS.NoISIS

Description

ISIS was not initialized properly on the specified VR

Remedy

Ensure the ISIS protocol was added to the specified VR. The VRID is displayed in the "show virtual-router" command. Try restarting the ISIS process in this VR. If the problem persists, capture "show tech" output and contact customer support.

Severity

Warning

Message Text

A key ISIS structure on VR %VRID% is missing

Message Parameters

| Name | Type |
|------|------|
| VRID | uint |

ISIS.InitFail

Description

ISIS could not be started on the specified VR.

Remedy

This indicates that the switch is running low on memory resources. Reducing the size or complexity of the switch configuration may alleviate this issue. The ISIS process will need to be restarted. If the problem persists capture "show tech" output and contact customer support.

Severity

Warning

Message Text

ISIS failed to initialize on VR %VRName% VRID %VRID% error code %errCode%

Message Parameters

| Name | Type |
|---------|--------|
| VRID | ulnt |
| VRName | String |
| errCode | ulnt |

ISIS.LockInitFail

Description

ISIS could not create and initialize the specified thread lock. The process failed to start as a result.

Remedy

This indicates that the switch is running low on memory resources. Reducing the size or complexity of the switch configuration may alleviate this issue. The ISIS process will need to be restarted. If the problem persists capture "show tech" output and contact customer support.

Severity

Error

Message Text

ISIS failed to initialize thread lock: %lockName%

Message Parameters

| Name | Type |
|----------|--------|
| lockName | String |

ISIS.CLIAsyncFailVRNull

Description

An asynchronous CLI operation failed. ISIS is not running on the specified VRID.

Remedy

Capture "show tech" output and contact customer support.

Severity

Error

Message Text

Async CLI %operation% operation could not be performed on VRID %VRID%, missing VR structure

Message Parameters

| Name | Type |
|-----------|--------|
| operation | String |
| VRID | uint |

ISIS.CLIAsyncFailMstrNull

Description

An asynchronous CLI operation failed. ISIS is not running on the specified VRID.

Remedy

Capture "show tech" output and contact customer support.

Severity

Error

Message Text

Async CLI %operation% operation could not be performed on VRID %VRID%, missing master structure

Message Parameters

| Name | Type |
|-----------|--------|
| operation | String |
| VRID | uint |

ISIS.CLIAsyncExpCntxtNull

Description

An operation requiring asynchronous CLI communication timed out. Further action could not be taken due to missing information.

Remedy

Capture "show tech" output and contact customer support.

Severity

Error

Message Text

Asynch CLI request timer expired but is missing context

ISIS.CLIAsyncAllocFail

Description

An operation requiring asynchronous CLI communication could not be performed due to lack of memory resources.

Remedy

This is a symptom of low memory resources. A reduction in configuration size or complexity may be required to carry out the operation.

Severity

Error

Message Text

Asynch CLI request failed due to lack of memory

ISIS.TermStrt

Description

ISIS has been instructed to shutdown and has begun the process of doing so.

Remedy

None. This is an informational message.

Severity

Notice

Message Text

ISIS has begun shutting down

ISIS.TermDone

Description

ISIS has been instructed to shutdown and has completed the process of doing so.

Remedy

None. This is an informational message.

Severity

Notice

Message Text

ISIS has completed shutting down

ISIS.ClientInitFail

Description

The ISIS process could not initialize a client for the specified EXOS services.

Remedy

Timing conditions during boot may cause some attempts to fail, in which case the process will generally re-attempt initialization. If the services initialization continues to fail, the ISIS process or the module providing the services may need to be restarted or the switch rebooted. If the problem persists, gather "show tech" output and contact customer support.

Severity

Warning

Message Text

Client initialization for %service% services failed

Message Parameters

| Name | Type |
|---------|--------|
| service | String |

ISIS.IfsNotFwd

Description

An isis area has been enabled but has no interfaces associated with it that is forwarding.

Remedy

In order for an isis routing instance to do something meaningful, it should have at least one forwarding interface added to it.

Severity

Info

Message Text

Warning: No IP interface bound to area %area% is enabled for IP forwarding

Message Parameters

| Name | Type |
|------|--------|
| area | String |

ISIS.IPv4IfNotFwd

Description

The specified interface is not performing IPv4 forwarding. Until forwarding is enabled, this interface will not send or receive ISIS PDUs, nor will its IPv4 address be advertised in ISIS.

Remedy

Enable IPv4 forwarding on the specified interface in order for it to participate in ISIS.

Severity

Info

Message Text

IPv4 interface %name% is not in forwarding mode

Message Parameters

| Name | Type |
|------|--------|
| name | String |

ISIS.IPv6IfNotFwd

Description

The specified interface is not performing IPv6 forwarding. Until forwarding is enabled, this interface will not send or receive ISIS PDUs, nor will its IPv6 address be advertised in ISIS.

Remedy

Enable IPv6 forwarding on the specified interface in order for it to participate in ISIS.

Severity

Info

Message Text

IPv6 interface %name% is not in forwarding mode

Message Parameters

| Name | Type |
|------|--------|
| name | String |

ISIS.DeIFDBFail

Description

An FDB resource for the specified MAC/VLANID pair could not be freed. This may indicate a problem with switch infrastructure or the ability to deprogram hardware.

Remedy

The consequence of this event is that there is likely an FDB entry left in hardware for one of the ISIS L2 multicast MAC DAs. It is possible this entry might be freed if the VLAN associated with the operation is added back to ISIS and deleted again. If the error persists, a reboot is required to free the resource. If this problem persists, capture "show tech" output and contact customer support.

Severity

Warning

Message Text

FDB deletion for %mac% on VLAN tag %vid% failed

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| vid | VLAN-tag |

ISIS.AddFDBFail

Description

An FDB resource for the specified MAC/VLANID pair could not be added. This may indicate a problem with switch infrastructure or the ability to deprogram hardware. It could also indicate that hardware resources are full.

Remedy

Remove the specified interface from ISIS and re-add it. If the log appears again, there may not be sufficient resources on the switch to include this interface in ISIS.

Severity

Warning

Message Text

FDB addition for %mac% on VLAN tag %vid% failed

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| vid | VLAN-tag |

ISIS.BndMACFiltFail

Description

A filter could not be created for the specified MAC/VLANID pair. The ISIS interface with the specified VLAN ID will be unable to receive ISIS PDUs destined to the specified MAC as a result.

Remedy

This could indicate that the system is low on resources or that it is too busy to perform the filter bind operation. Delete the interface from ISIS and re-add it. If the problem persists, capture "show tech" output and contact customer support.

Severity

Warning

Message Text

Failed to bind MAC filter %mac% to vlan %vid%

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| vid | VLAN-tag |

ISIS.UnbndMACFiltFail

Description

A filter could not be removed for the specified MAC/VLANID pair. This is likely due to the filter not being present in the kernel to begin with. As a result, this event will likely accompany the deletion of an ISIS interface that, when added to ISIS, triggered the BndMACFiltFail event.

Remedy

Rebooting the switch may be necessary as this may be indicative of a kernel database or resource problem. If the problem persists, gather "show tech" output and contact customer support.

Severity

Warning

Message Text

Failed to unbind MAC filter %mac% from vlan %vid%

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| vid | VLAN-tag |

ISIS.InitSockFail

Description

An internal error has prevented ISIS from initializing its communications sockets.

Remedy

ISIS will fail to start under these conditions and may need to be restarted. The switch may need to be rebooted.

Severity

Error

Message Text

Socket initialization failed while trying to %oper%, with error: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| oper | String |
| errmsg | String |

ISIS.CreatMACFiltFail

Description

A filter for the specified MAC address could not be created. The accompanying error message may provide more specifics as to why.

Remedy

ISIS will fail to start under these conditions and may need to be restarted. The switch may need to be rebooted.

Severity

Error

Message Text

Failed to create MAC filter for %mac%, error: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| mac | MAC |
| errmsg | String |

ISIS.DeIMACFiltFail

Description

A filter for the specified MAC address could not be deleted. The accompanying error message may provide more specifics as to why.

Remedy

None. This is an informational message only.

Severity

Info

Message Text

Failed to delete MAC filter for %mac%, error: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| mac | MAC |
| errmsg | String |

ISIS.BndMACFiltInitNotDone

Description

A MAC filter could not be bound to a VLAN. Process initialization did not complete properly.

Remedy

Restart the ISIS process. If the message still appears, gather "show tech" output and contact customer support.

Severity

Error

Message Text

Failed to bind filter - initialization did not complete

ISIS.BndMACFiltReqFail

Description

An internal error occurred while attempting to bind a MAC to a VLAN. The accompanying error message text may provide more details as to the cause.

Remedy

This could indicate that the system is low on resources or that it is too busy to perform the filter bind operation. Delete the interface from ISIS and re-add it. If the problem persists, capture "show tech" output and contact customer support.

Severity

Error

Message Text

Request for MAC filter binding failed with error: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| errmsg | String |

ISIS.UnbndMACFiltInitNotDone

Description

A MAC filter could not be unbound from a VLAN. Prior initialization did not complete properly.

Remedy

Restart the ISIS process. If the message still appears, gather "show tech" output and contact customer support.

Severity

Error

Message Text

Failed to unbind filter - initialization did not complete

ISIS.UnbndMACFiltReqFail

Description

An internal error occurred while attempting to unbind a MAC to a VLAN. The accompanying error message text may provide more details as to the cause. This is likely due to the filter not being present in the kernel to begin with. As a result, this event will likely accompany the deletion of an ISIS interface that, when added to ISIS, triggered the BndMACFiltReqFail event.

Remedy

Rebooting the switch may be necessary as this may be indicative of a kernel database or resource problem. If the problem persists, gather "show tech" output and contact customer support.

Severity

Error

Message Text

Request for MAC filter unbinding failed with error: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| errmsg | String |

ISIS.PollSockFail

Description

An internal error occurred while polling on a socket for activity. The accompanying error message may provide more specific information.

Remedy

ISIS may need to be restarted or the switch rebooted. If the problem persists, gather "show tech" output and contact customer support.

Severity

Warning

Message Text

Socket %oper% poll failed with error %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| oper | String |
| errmsg | String |

ISIS.IIH.RxSrcIdSame

Description

A Hello packet of the specified type was received from a neighbor whose system ID is identical to the system ID assigned to the receiving switch.

Remedy

No IS-IS router in an IS-IS routing domain should have the same system ID configured. Either change the system ID of the receiving router or change the system ID of the transmitting router.

Severity

Warning

Message Text

%pduType% with same system ID from %srcMac% (%vlanName%)

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| srcMac | srcMAC |
| vlanName | VLAN |

ISIS.IIH.RxSrcIdNoMatch

Description

A Hello packet of the specified type was received from a neighbor whose system ID has changed. This check is only performed on point-to-point adjacencies.

Remedy

This is likely due to a change in configuration on the transmitting neighboring router. Hello packets will continue to be discarded until the adjacency is declared dead or until the system ID on the transmitting router is reverted.

Severity

Notice

Message Text

%pduType% system ID mismatch from %srcMac% (%vlanName%)

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| srcMac | srcMAC |
| vlanName | VLAN |

ISIS.IIH.RxMacNoMatch

Description

The MAC address of the specified neighbor changed.

Remedy

Check the configuration of the transmitting router(s) on this interface. It is possible that multiple routers are configured with the same system ID on this VLAN - which is illegal. If the change in MAC address is legitimate, the adjacency needs to time out. To expedite this, remove the interface from this router and re-add it. Note that this may result in a temporary blackhole.

Severity

Warning

Message Text

%vlanName%-%sysId% MAC address changed (%srcMac%)

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | VLAN |
| sysId | String |
| srcMac | srcMAC |

ISIS.IIH.RxAuthFail

Description

A Hello PDU of the specified type either did not include an authentication TLV or included an authentication TLV but the password was incorrect.

Remedy

This error message may result from transitioning to different passwords in the topology. If the message persists and authentication is desired ensure the correct password has been configured on the neighboring routers. If authentication is not desired disable IIH authentication on this switch using the unconfigure area [area_name] area-password command.

Severity

Warning

Message Text

%pduType% authentication failure

Message Parameters

| Name | Type |
|---------|--------|
| pduType | String |

ISIS.IIH.RxCirCidNoMatch

Description

The circuit ID in the specified type of Hello PDU changed. The packet was discarded. This is applicable to point-to-point adjacencies only. This may occur after a neighboring switch reboots or has a process restart.

Remedy

If the messages persists, the adjacency should ultimately reset after the neighbor is timed out. During adjacency re-establishment, the new circuit ID will be learned and message will no longer appear. If for some reason the message continues, try removing the local interface from ISIS and adding it back. This effectively erases the neighbor table for that interface.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) circuit ID mismatch

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxCircTypeNoMatch

Description

Either a LAN hello packet was received on an interface configured as a point-to-point interface or vice versa.

Remedy

Check the configuration of the interface in question as well as the neighboring router(s). Both or all interfaces that comprise this adjacency must be configured as the same type - broadcast or point-to-point.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) circuit type mismatch

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxCircTypeChg

Description

A hello packet of a type (broadcast or hello) differing from prior hellos was received.

Remedy

Check the configuration of the interface in question as well as the neighboring router(s). Both or all interfaces that comprise this adjacency must be configured as the same type - broadcast or point-to-point.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) circuit type changed

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxAreaNoMatch

Description

A hello packet was received with the incorrect area address.

Remedy

All routers participating in the same L1 area must be assigned with the same area address to us in hello pdu transmissions. Check the configuration of the routers in this area to be sure this is the case.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) area address mismatch

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxNoProto

Description

A hello packet was received with neither IPv4 nor the IPv6 NLPID set in the protocols supported TLV.

Remedy

Extreme's implementation of IS-IS only supports IPv4 or IPv6. Be sure the neighboring router's interface has either IPv4 or IPv6 configured and enabled.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) no protocols support TLV

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxProtoNoMatch

Description

A hello packet was received and includes indication that no protocols supported by the neighbor are also supported by this router.

Remedy

In a multi-topology environment, point-to-point adjacencies require that the neighbors have at least one protocol in common. This message indicates that no protocols are common to the neighbors. This may occur during a transitional period of configuration. If not, check the configuration on both neighbors to ensure at least one common protocol is in use on either side of the adjacency.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) protocols supported mismatch

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxIPv4NoMatch

Description

A hello packet was received that indicates this router and the transmitting neighbor differ in their support for IPv4.

Remedy

When adjacency checking for IPv4 is enabled, this check occurs before verifying the adjacency subnet. If this is undesirable, disable adjacency checking. Otherwise, ensure that the interfaces on either side of the adjacency are enabled for IPv4.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) IPv4 protocols supported mismatch

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxIPv4IfNoMatch

Description

A hello packet was received that indicates the sending interface address is not on the same subnet as the receiving interface.

Remedy

This check is performed when adjacency checking for IPv4 is enabled. If this is undesirable, disable adjacency checking. Otherwise, ensure that the interfaces on either side of the adjacency are configured for the same IPv4 subnet.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) IPv4 interface address mismatch

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxIPv6NoMatch

Description

A hello packet was received that indicates this router and the transmitting neighbor differ in their support for IPv6.

Remedy

When adjacency checking for IPv6 is enabled, this check occurs before verifying the adjacency link local subnet. If this is undesirable, disable adjacency checking. Otherwise, ensure that the interfaces on either side of the adjacency are enabled for IPv6.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) IPv6 protocols supported mismatch

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxIPv6IfNoMatch

Description

A hello packet was received that indicates the sending interface address is not on the same link-local subnet as the receiving interface.

Remedy

This check is performed when adjacency checking for IPv6 is enabled. If this is undesirable, disable adjacency checking. Otherwise, ensure that the interfaces on either side of the adjacency are configured for the same IPv6 subnet.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) IPv6 interface address mismatch

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.Rx3WayInv

Description

The 3-way handshake state contained in a received point-to-point hello PDU is invalid.

Remedy

This indicates the point-to-point neighbor has included an invalid value in its hello PDU. The software on the neighbor may have a bug, or the neighbors may be incompatible. Check the neighbor to be sure its supports the point-to-point three way handshake.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) Invalid 3-way handshake state

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxSysIdNoMatch

Description

A 3-way handshake TLV in a point-to-point Hello PDU did not contain the correct neighbor (this router's) system ID.

Remedy

This could result from a network misconfiguration or an invalid point-to-point topology. Check the network configuration to ensure that no more than two ISIS routers are active on the connecting VLAN. No more than two ISIS routers may operate in a point-to-point adjacency.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) Neighbor System ID mismatch in 3-way TLV

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxExtCirIdNoMatch

Description

A 3-way handshake TLV in a point-to-point Hello PDU did not contain the correct neighbor (this router's) circuit ID.

Remedy

Packets may be leaking to the wrong VLAN and ISIS interface via a network misconfiguration. Confirm that only two ISIS routers are participating in this point-to-point adjacency and that hello packets cannot cross to other VLANs.

Severity

Notice

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) Extended Circuit ID mismatch in 3-way TLV

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxNbrAddLocalFail

Description

While attempting to add a new neighbor to the receiving interface's neighbor database, the system ID was already associated with the interface.

Remedy

This is a "should never" happen scenario because the receiving interface's database is checked for the neighbor system id before attempting to add it. If the problem persists and/or an adjacency fails to form on the interface, try removing the afflicted from ISIS and re-adding it.

Severity

Notice

Message Text

[%vlanName%-%sysId%] Local Neighbor Database insertion failed

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxNbrAddGlobalFail

Description

While attempting to add a new neighbor to the neighbor database, the system ID was already in the database.

Remedy

This could occur as a result of an illegal topology in which two IS-IS routers have formed more than one adjacency between them. Check the topology and configurations to be sure this is not the case.

Severity

Notice

Message Text

[%vlanName%-%sysId%] Global Neighbor Database insertion failed

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxIPv4IfNotFwd

Description

A hello packet with v4 support was received on an interface that does not have v4 forwarding enabled.

Remedy

This check is performed when adjacency checking for IPv4 is enabled. If this is undesirable, disable adjacency checking. Otherwise, ensure that the interfaces on either side of the adjacency have ipv4 forwarding enabled.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) IPv4 interface is not forwarding

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.IIH.RxIPv6IfNotFwd

Description

A hello packet with v6 support was received on an interface that does not have v6 forwarding enabled.

Remedy

This check is performed when adjacency checking for IPv6 is enabled. If this is undesirable, disable adjacency checking. Otherwise, ensure that the interfaces on either side of the adjacency have ipv6 forwarding enabled.

Severity

Warning

Message Text

%pduType% IS-Neighbor(%vlanName%-%sysId%) IPv6 interface is not forwarding

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| vlanName | VLAN |
| sysId | String |

ISIS.Import.AddIPv4Fail

Description

An attempt to add the specified IPv4 route to route table failed.

Remedy

This system is running low on memory resources. The local or network configuration should be reduced to free up memory resources. ISIS should be disabled and enabled in order to re-acquire the route that could not be installed.

Severity

Error

Message Text

IPv4 route add request for %ipAddr%/%mask% failed with error %rc%

Message Parameters

| Name | Type |
|--------|------|
| ipAddr | IP |
| mask | sInt |
| rc | sInt |

ISIS.Import.DellIPv4Fail

Description

An attempt to delete the specified IPv4 route to route table failed.

Remedy

This system is running low on memory resources. The local or network configuration should be reduced to free up memory resources. ISIS should be disabled and enabled in order to re-synchronize the local routing table with its peers once memory resources are freed.

Severity

ISIS.LSP.Add

Description

This is an informational message indicating that an LSP with the specified ID has been added to the the LSP database.

Remedy

There is no remedy - this message is informational.

Severity

Debug-Summary

Message Text

%lspId%: added to LSPDB

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.AddSelf

Description

The switch generated an LSP and added it to the LSP database.

Remedy

There is no remedy - this is an informational message

Severity

Debug-Summary

Message Text

%lspId%: self-generated LSP added to LSPDB

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.AddSNP

Description

A new LSP ID was received from a SNP. As a result, an entry in the LSP DB was created and a PSNP is generated.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: new LSP created from received SNP

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.UpdtSelf

Description

The LSPDB entry for this switch is being updated.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: updating LSPDB with self-generated LSP

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.Del

Description

The specified LSP was deleted from the LSP database.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: delete from LSPDB

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.DelSelf

Description

The specified LSP, which was originated on this switch, was deleted from the LSPDB.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: self-generated LSP deleted from LSPDB

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.RxZeroLife

Description

The specified LSP contains a remaining lifetime of zero. As a result, this LSP will be purged if it hasn't already.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: received LSP's remaining lifetime of zero

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.RxNewer

Description

The specified LSP is newer than the copy in the LSP database. As a result, the database will be updated, the LSP will be flooded and an SPF calculation will be performed.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: received LSP is newer than DB copy

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.RxSame

Description

The specified LSP that was just received is the same as the copy in the LSP database. No action is taken.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: received LSP is same as DB copy

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.RxOlder

Description

The received LSP is older than the copy in the LSP database. The copy in the database will be flooded out of the receiving interface as a result.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: received LSP is older than DB copy

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.RxPrevSNP

Description

A prior PSNP was sent for the specified LSP. The complete LSP was expected, but an SNP was received instead. As a result, the LSP will be requested again with a PSNP.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: same LSP entry received, sending PSNP again

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.AgeOut

Description

The duration of this LSPs remaining lifetime plus the zero age lifetime of 60 seconds has been reached without receipt of a refreshed version of this LSP. As a result, this LSP has aged out and is being purged from the database.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: Zero Age reached, purging in process

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |

ISIS.LSP.NoFloodSRM

Description

The specified LSP was queued for flooding on the specified interface but the SRM flags were already cleared. The LSP was not flooded on the specified interface as a result.

Remedy

None. This is an informational message.

Severity

Debug-Summary

Message Text

%lspId%: SRM flag is already cleared on %ifName%

Message Parameters

| Name | Type |
|--------|--------|
| lspId | String |
| ifName | String |

ISIS.LSP.NoFloodNbr

Description

The specified LSP was queued for flooding but was not flooded since there no neighbors present on the LSP's level.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: no valid L%level% neighbor, not flooding

Message Parameters

| Name | Type |
|-------|--------|
| lspId | String |
| level | ulnt |

ISIS.LSP.NoFloodSize

Description

The specified LSP is larger than the specified interface's MTU. As a result, the LSP cannot be propagated over that interface.

Remedy

The MTU on this adjacency may not be sufficient for ISIS to operate over. The topology may need to be redesigned to use a larger MTU, or LSPs in general may need to be reduced in size by using fewer or smaller TLVs.

Severity

Notice

Message Text

%lspId%: LSP too large to propagate on %ifName%

Message Parameters

| Name | Type |
|--------|--------|
| Ispld | String |
| ifName | String |

ISIS.LSP.RxSelfCSNP

Description

An SNP was received containing an LSP originated from this switch.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

L%level%-CSNP received self-originated LSP entry

Message Parameters

| Name | Type |
|-------|------|
| level | ulnt |

ISIS.LSP.Proc

Description

The specified LSP is being processed.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

%lspId%: processing L%level% length(%length%), lifetime(%lifetime%), seqnum(%seqNum%), cksum(%ckSum%)

Message Parameters

| Name | Type |
|----------|--------|
| lspId | String |
| level | ulnt |
| length | ulnt |
| lifetime | ulnt |
| seqNum | xInt32 |
| ckSum | xInt16 |

ISIS.LSP.AuthFail

Description

The specified PDU type (LSP, CSNP, or PSNP) on the specified level failed authentication.

Remedy

Check the authentication configuration of the nodes in the appropriate area (or L2 domain) to ensure that the correct nodes are enabled (or disabled) for authentication and are using the correct password(s).

Severity

Info

Message Text

L%level%->type%: authentication failed

Message Parameters

| Name | Type |
|-------|--------|
| type | String |
| level | ulnt |

ISIS.LSP.CksumFail

Description

The specified LSP was determined to be corrupt based on a checksum computation on the LSP. As a result, the LSP was discarded.

Remedy

Corrupted packets could indicate hardware issues on this switch or elsewhere in the network. Check other nodes in the network for checksum errors to help narrow down where the errors are originating.

Severity

Notice

Message Text

%lspId%: checksum error: supplied %supplied% / computed %computed%

Message Parameters

| Name | Type |
|----------|--------|
| lspId | String |
| supplied | xInt16 |
| computed | xInt16 |

ISIS.LSP.LifetimeInv

Description

The specified LSP includes a remaining lifetime that exceeds the configured maximum age.

Remedy

None. This is an informational message.

Severity

Debug-Summary

Message Text

%lspId%: lifetime (%lifetime%) is greater than maxage (%maxAge%)

Message Parameters

| Name | Type |
|----------|--------|
| lspId | String |
| lifetime | ulnt |
| maxAge | ulnt |

ISIS.LSP.RxSelfPSNP

Description

An SNP was received containing an LSP originated from this switch.

Remedy

None. This is an informative message.

Severity

Debug-Summary

Message Text

L%level%-PSNP received self-originated LSP entry

Message Parameters

| Name | Type |
|-------|------|
| level | ulnt |

ISIS.LSP.TLV_Data

Description

The specified that a tlv entry for a LSP is being processed.

Remedy

None. This is an informative message.

Severity

Debug-Data

Message Text

Tlv entry: %ptype% tlv: %tlvType% length= %length%

Message Parameters

| Name | Type |
|---------|---------|
| ptype | String |
| tlvType | String |
| length | uInt |
| bufptr | Buf-ptr |
| datalen | Buf-len |

ISIS.NFSM.LANHoldTimerExp

Description

The adjacency with the specified neighbor expired.

Remedy

If this was not planned, the neighbor may have failed or is restarting. Check the health of the neighbor. It is also possible that a link after the first L2 hop to the neighbor has gone down.

Severity

Info

Message Text

%nbr% (LAN): Level %level% hold timer expired

Message Parameters

| Name | Type |
|-------|--------|
| nbr | String |
| level | ulnt |

ISIS.NFSM.LANRxFirstHello

Description

A hello packet was received on a broadcast interface from a neighbor that does not have an existing adjacency on that interface.

Remedy

Unless an adjacency should not be formed with the specified neighbor, no action should be taken. This is an informational message.

Severity

Info

Message Text

%nbr% (LAN): initial level %level% Hello received

Message Parameters

| Name | Type |
|-------|--------|
| nbr | String |
| level | ulnt |

ISIS.NFSM.LANRxHello

Description

A hello packet was received on a broadcast interface from the specified neighbor.

Remedy

None. This is an informational message.

Severity

Debug-Summary

Message Text

%nbr% (LAN): level %level% Hello received

Message Parameters

| Name | Type |
|-------|--------|
| nbr | String |
| level | ulnt |

ISIS.NFSM.LANIfDown

Description

An adjacency has gone down as a result of the interface going down.

Remedy

If this was not planned, check the health of the first hop link to the specified neighbor.

Severity

Info

Message Text

%nbr% (LAN): Level %level% interface down

Message Parameters

| Name | Type |
|-------|--------|
| nbr | String |
| level | ulnt |

ISIS.NFSM.LANAdjUp

Description

A broadcast adjacency with the specified neighbor has transitioned to UP. A DIS will now be elected.

Remedy

None. This is an informational message.

Severity

Info

Message Text

%nbr% (LAN): level %level% adjacency is UP

Message Parameters

| Name | Type |
|-------|--------|
| nbr | String |
| level | ulnt |

ISIS.NFSM.IgnEvent

Description

An event occurred that has no bearing on the current state of the adjacency with the specified neighbor.

Remedy

None. This is an informational message.

Severity

Debug-Summary

Message Text

%nbr% (%ifType%): level %level% event ignored

Message Parameters

| Name | Type |
|--------|--------|
| nbr | String |

ISIS.PDU.RxProtoInv

Description

An IS is sending ISIS PDU's to the switch using a protocol not supported by this switch. The sender is using the mac address specified and the PDU's are arriving on the specified vlan. These packets are being ignored by this switch.

Remedy

Neighboring ISIS routers should not be configured to send PDU's using the specified protocol as the protocol is not supported on this switch.

Severity

Notice

Message Text

Dropping %protoName% PDU from %srcMac% (%srcIf%)

Message Parameters

| Name | Type |
|-----------|--------|
| protoName | String |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.RxProtoUnk

Description

An IS is sending ISIS PDU's to the switch using a protocol not supported by this switch. The sender is using the mac address specified and the PDU's are arriving on the specified vlan. These packets are being ignored by this switch.

Remedy

Neighboring ISIS routers should not be configured to send PDU's using the specified protocol as the protocol is not supported on this switch.

Severity

Notice

Message Text

Dropping PDU with unknown proto %proto% from %srcMac% (%srcIf%)

Message Parameters

| Name | Type |
|--------|--------|
| proto | xInt8 |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.RxLvlMismatch

Description

A PDU was received on a level in which the receiving interface was not enabled.

Remedy

Either configure the receiving interface to accept the level of the PDU or configure the source router to not send PDU's at that level.

Severity

Notice

Message Text

%pduType% PDU from %srcMac% (%srcIf%) mismatch with circuit type %level%

Message Parameters

| Name | Type |
|---------|--------|
| pduType | String |
| srcMac | srcMAC |
| srcIf | VLAN |
| level | String |

ISIS.PDU.RxProtoVerInv

Description

A PDU was received from the specified MAC address with an incorrect protocol/version id extension.

Remedy

The source router may be incompatible with this switch.

Severity

Notice

Message Text

%pduType% protocol/version id extension %protoVerId% from %srcMac% (%srcIf%)
incorrect

Message Parameters

| Name | Type |
|------------|--------|
| pduType | String |
| protoVerId | xInt8 |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.RxVerInv

Description

A PDU was received from the specified MAC address with an unsupported ISIS version.

Remedy

The source router may be incompatible with this switch.

Severity

Notice

Message Text

%pduType% version %version% from %srcMac% (%srcIf%) incorrect

Message Parameters

| Name | Type |
|---------|--------|
| pduType | String |
| version | xInt8 |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.RxSysIdInv

Description

An ISIS PDU was received from the specified MAC on the specified VLAN using an incorrect system ID length. The PDU was dropped.

Remedy

An IS is sending PDU's with an invalid system ID length. This may indicate a bug in the implementation of ISIS on the source switch.

Severity

Notice

Message Text

Dropping %pduType% with incorrect system ID len %sysIdLen% from %srcMac% (%srcIf%)

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| sysIdLen | uInt8 |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.RxMaxAddrMisMatch

Description

An ISIS PDU was received from the specified MAC on the specified VLAN using a different max area address configuration than this switch. The PDU was dropped.

Remedy

All switches exchanging L1 PDUs must be configured with the same number of max area addresses.

Severity

Notice

Message Text

Dropping %pduType% with max area address mismatch %maxAddr% from %srcMac% (%srcIf%)

Message Parameters

| Name | Type |
|---------|--------|
| pduType | String |
| maxAddr | uInt8 |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.RxTypeUnk

Description

An ISIS PDU of unknown type was received from the specified MAC on the specified VLAN.

Remedy

This could indicate use of an extension to the ISIS protocol that is unsupported on this switch. It could also indicate a bug in the source switch's implementation of the ISIS protocol.

Severity

Notice

Message Text

Dropping PDU with unknown type %pduType% from %srcMac% (%srcIf%)

Message Parameters

| Name | Type |
|---------|--------|
| pduType | uInt8 |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.RxLenInv

Description

An ISIS PDU was received from the specified MAC on the specified VLAN with an invalid length. The PDU was dropped.

Remedy

The PDU length either exceeds the length of the max MTU for this interface, or is smaller than the minimum ISIS PDU size. The mtu for this interface may be configured to be too small or the mtu on the source switch may be configured to be too large.

Severity

Notice

Message Text

Dropping %pduType% with invalid length %pduLen% from %srcMac% (%srcIf%)

Message Parameters

| Name | Type |
|---------|--------|
| pduType | String |
| pduLen | uInt32 |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.RxTypeInv

Description

An ISIS PDU was received from the specified MAC on the specified VLAN. This type of PDU is invalid for the receiving interface (broadcast vs point-to-point).

Remedy

LAN (broadcast) Hello PDU's should not be sent to interfaces configured to be point-to-point. Similarly, point-to-point Hello PDU's should not be sent to interfaces configured to be broadcast. Check the configuration of the receiving interface and the sending switch to ensure the neighboring interfaces are configured to be of the same type (broadcast or point-to-point).

Severity

Notice

Message Text

Dropping invalid %pduType% from %srcMac% (%srcIf%)

Message Parameters

| Name | Type |
|---------|--------|
| pduType | String |
| srcMac | srcMAC |
| srcIf | VLAN |

ISIS.PDU.TxFail

Description

A PDU transmission failed due to the error contained in the message.

Remedy

A transmission failure is due to an internal error which could range from loss of connectivity and a full transmission buffer to software bugs. The error message string in quotes should help indicate that nature of the transmission error.

Severity

Warning

Message Text

%pduType% on %egressIf% length %length% failed \"%err%\"

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| egressIf | VLAN |
| length | sInt |
| err | String |

ISIS.PDU.Tx

Description

A PDU of the specified type was sent on the specified interface. Note that this message is reported after a system call returns success and may not necessarily indicate that a PDU has been put on the wire.

Remedy

This is an informational message.

Severity

Debug-Summary

Message Text

%pduType% on %egressIf% length %length%

Message Parameters

| Name | Type |
|----------|--------|
| pduType | String |
| egressIf | VLAN |
| length | sInt |

ISIS.PDU.Rx

Description

A PDU of the specified type was received on the specified interface from the specified source MAC.

Remedy

This is an informational message.

Severity

Debug-Summary

Message Text

%pduType% from %srcMac% on %srcIf%, length %length%

Message Parameters

| Name | Type |
|---------|--------|
| pduType | String |
| srcMac | srcMAC |
| srcIf | VLAN |
| length | sInt |

ISIS.PDU.TxNull

Description

An internal error indicating that a buffered PDU was empty and therefore could not be transmitted. This likely means that there was nothing to transmit in the first place, not that the PDU was lost.

Remedy

This indicates an internal bug but should not be critical to proper operation of the protocol.

Severity

Notice

Message Text

PDU for %egressIf% is NULL

Message Parameters

| Name | Type |
|----------|------|
| egressIf | VLAN |

ISIS.PDU.LanHelloTlv

Description

This indicates that a TLV entry for a Lan Hello PDU is processing.

Remedy

This is not an error. This information is used by software engineering.

Severity

Debug-Data

Message Text

TLV Entry: %pType% TLV: %tlvType% length = %length%

Message Parameters

| Name | Type |
|---------|---------|
| pType | String |
| tlvType | String |
| length | uint |
| bufp | Buf-ptr |
| buflen | Buf-len |

ISIS.PDU.P2pHelloTlv

Description

ISIS.Policy.RfrshFailRtTypeInv

Description

The specified policy was not properly installed. An invalid route type was found in the policy.

Remedy

None. This is a software bug.

Severity

Error

Message Text

%type% policy %name% failed to refresh - invalid route type %rtType%

Message Parameters

| Name | Type |
|--------|--------|
| type | String |
| name | String |
| rtType | sInt |

ISIS.Policy.RfrshFailVRIDUnk

Description

A request to refresh the specified policy was received, but ISIS has no record of the specified VR ID.

Remedy

None. This is a software bug.

Severity

Error

Message Text

%type% policy %name% could not be refreshed - ISIS is not running on VRID %VRID%

Message Parameters

| Name | Type |
|------|--------|
| type | String |
| name | String |
| VRID | uInt |

ISIS.Policy.RfrshFailDataNull

Description

A request to refresh the specified policy was received but did not include any data.

Remedy

None. This is a software bug.

Severity

Error

Message Text

policy %name% could not be refreshed - missing data

Message Parameters

| Name | Type |
|------|--------|
| name | String |

ISIS.Policy.BndFailDataNull

Description

A request to refresh the specified policy was received but did not include any data.

Remedy

None. This is a software bug.

Severity

Error

Message Text

policy %name% could not be refreshed - missing data

Message Parameters

| Name | Type |
|------|--------|
| name | String |

ISIS.Policy.RfrshImpprtDebug

Description

Import policy refresh debug message.

Remedy

None. This message is for debug purposes only.

Severity

ISIS.Restart.T1Exp

Description

A restart acknowledgement was not received on the specified interface before the T1 timer expired. Another restart request will be sent as a result.

Remedy

If the neighbor attached to the specified interface does not support graceful restart helper mode, this switch may not be able to perform restart. Otherwise, congestion or other network issues may be responsible for the lack of receipt of a hello with the restart acknowledgement bit set.

Severity

Info

Message Text

%ifName%:%level%: T1 hello timer expire

Message Parameters

| Name | Type |
|--------|--------|
| ifName | String |
| level | String |

ISIS.Restart.Success

Description

ISIS Graceful restart completed successfully.

Remedy

None. This is an informational message.

Severity

Info

Message Text

restart succeeded

ISIS.Restart.Fail

Description

ISIS Graceful failed to complete before the global T3 expired.

Remedy

Check the configuration and supported of all neighbors to ensure that graceful restart helper mode support is available. Restart timers may need to be increased to accomodate this environment.

Severity

Notice

Message Text

restart failed

ISIS.Restart.T3ExpNoSync

Description

The global restart timer expired, but the LSP DB was not completely synchronized.

Remedy

Check neighboring nodes to ensure restart helper mode support is available. Restart timers may need to be increased.

Severity

Notice

Message Text

T3 expired before sync finished(T2)

ISIS.Restart.IfNotReady

Description

The specified interface had not yet received a restart acknowledgment or is waiting for DIS election.

Remedy

Check neighboring nodes to ensure restart helper mode support is available. Restart timers may need to be increased.

Severity

Debug-Summary

Message Text

%area%:L%level%: interface %ifName% is not ready to sync

Message Parameters

| Name | Type |
|--------|--------|
| area | String |
| level | ulnt |
| ifName | String |

ISIS.Restart.LSPNotSync

Description

The specified LSP ID was not synched during restart.

Remedy

Check neighboring nodes to ensure restart helper mode support is available. Restart timers may need to be increased.

Severity

Info

Message Text

%area%:L%level%: LSP %lspId% is not synched

Message Parameters

| Name | Type |
|-------|--------|
| area | String |
| level | ulnt |
| lspId | String |

ISIS.Restart.TrigSyncCall

Description

The specified LSPDB is about to be checked to see if it is synchronized.

Remedy

None. This is an informational message only.

Severity

Debug-Summary

Message Text

%area%:L%level%: triggered LSPDB sync called

Message Parameters

| Name | Type |
|-------|--------|
| area | String |
| level | uInt |

ISIS.Restart.TrigSyncSuccess

Description

The specified LSPDB was verified as being synched.

Remedy

None. This is an informational message only.

Severity

Debug-Summary

Message Text

%area%:L%level%: triggered LSPDB sync succeeded

Message Parameters

| Name | Type |
|-------|--------|
| area | String |
| level | uInt |

ISIS.Restart.T2Exp

Description

The T2 timer for the specified LSPDB expired. The database will now be checked for synchronization.

Remedy

None. This is an informational message.

Severity

Debug-Summary

Message Text

%area%:L%level%: T2 level timer expire

Message Parameters

| Name | Type |
|-------|--------|
| area | String |
| level | ulnt |

ISIS.Restart.SyncSuccess

Description

The specified LSPDB was verified as being synched.

Remedy

None. This is an informational message only.

Severity

Info

Message Text

%area%:L%level%: LSPDB sync succeeded

Message Parameters

| Name | Type |
|-------|--------|
| area | String |
| level | ulnt |

ISIS.Restart.SyncFail

Description

The specified LSPDB failed to synchronize during restart. This could be due to a T2 timeout or a DIS re-election on this level.

Remedy

Check neighboring nodes to ensure restart helper mode support is available. Restart timers may need to be increased.

Severity

Notice

Message Text

%area%:L%level%: triggered LSPDB sync failed

Message Parameters

| Name | Type |
|-------|--------|
| area | String |
| level | ulnt |

ISIS.Restart.DisChg

Description

A DIS re-election occurred on the specified level, causing restart to fail.

Remedy

It is possible that a second failure occurred in the network during restart which caused the re-election to occur. It could also be that the configuration of a neighbor node changed the priority of interface, causing a DIS re-election.

Severity

Notice

Message Text

%ifName%:L%level%: DIS change, restart failed

Message Parameters

| Name | Type |
|--------|--------|
| ifName | String |
| level | ulnt |

ISIS.Restart.DisElect

Description

The specified helper DIS was elected on the specified interface and level.

Remedy

None. This is an informational message only.

Severity

Debug-Summary

Message Text

%ifName%:L%level%: restarting helper DIS is now %disId%

Message Parameters

| Name | Type |
|--------|--------|
| ifName | String |
| level | ulnt |
| disId | String |

ISIS.Restart.T3Exp

Description

The T3 - grace period - timer expired. The LSPDBs will now be checked for synchronization.

Remedy

None. This is an informational event only.

Severity

Info

Message Text

T3 Timer Expired

ISIS.Restart.LANIDNolf

Description

A LANID was preserved for the specified vlan instance, but the instance was not found to be enabled for ISIS.

Remedy

This is a debug message only.

Severity

Debug-Summary

Message Text

ObjID %objID% circID %circID%: vlan inst %vlanInst% not enabled

Message Parameters

| Name | Type |
|----------|--------|
| objID | uInt |
| circID | uInt8 |
| vlanInst | xInt32 |

ISIS.Restart.LANIDTrc

Description

Generic debug message for LAN ID preservation and restoration.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

%s%

Message Parameters

| Name | Type |
|------|--------|
| s | Printf |

ISIS.Restart.LANIDCircIDChg

Description

The specified interface and level was assigned with the specified circuit ID. When restoring LAN IDs, the preserved LAN ID used a different circuit ID. As a result, the interface circuit ID is being changed to match the preserved ID.

Remedy

None. This is an informational message.

Severity

Debug-Summary

Message Text

%ifName%:L%level%: interface has circuit ID %ifCircID% but preserved circuit ID %preservedCircID%

Message Parameters

| Name | Type |
|-----------------|--------|
| ifName | String |
| level | ulnt |
| ifCircID | ulnt |
| preservedCircID | ulnt |

ISIS.Restart.MaxT1ExpExcd

Description

During a graceful restart the specified interface sent the maximum amount of hello packets with the RR bit set without receiving an RA bit from its neighbor. The switch will now send "normal" hellos without the RR bit set for the rest of the restart interval. As a result, the restarting switch may not completely repopulate its LSP database during the restart interval. Ultimately the LSP database will be repaired, but it will take longer than would otherwise and may trigger temporary routing table changes in its peers.

Remedy

This is a normal occurrence if a neighboring switch is not enabled for graceful restart helper support, or if the neighbor does not support graceful restart helper mode at all. If the neighbor supports graceful restart helper mode but is not enabled, enable it.

Severity

Info

Message Text

%ifName%:%level%: T1 timer cancelled, expired more than maximum of
%maxT1Expires% time(s)

Message Parameters

| ifName | String |

ISIS.VLAN.IfAddrAdd

Description

An address is being added to the specified interface and interface index.

Remedy

None, this is an informational message only.

Severity

Debug-Summary

Message Text

%ifName%: interface address add index %index%

Message Parameters

| Name | Type |
|--------|--------|
| ifName | String |
| index | ulnt |

ISIS.VLAN.IfAddrDel

Description

An address is being deleted from the specified interface and interface index.

Remedy

None, this is an informational message only.

Severity

Debug-Summary

Message Text

%ifName%: interface address delete index %index%

Message Parameters

| Name | Type |
|--------|--------|
| ifName | String |
| index | ulnt |

ISIS.VLAN.NoVR

Description

An event occurred requiring the accessing of a VR-specific structure. The structure is missing, indicating IS-IS did not properly initialize or a software bug.

Remedy

The ISIS process may need to be restarted. If the problem persists, contact TAC.

Severity

Warning

Message Text

%action%: no VR structure for id %vrId%

Message Parameters

| Name | Type |
|--------|--------|
| action | String |
| vrId | ulnt |

ISIS.VLAN.VRIDMismatch

Description

An internal error occurred.

Remedy

The ISIS process may need to be restarted. If the problem persists, contact TAC.

Severity

Warning

Message Text

VR ID mismatch - expected %have%, received %got%

Message Parameters

| Name | Type |
|------|------|
| got | ulnt |
| have | ulnt |

ISIS.VLAN.IfNameNotFound

Description

An internal lookup failed while processing an event for the specified VLAN.

Remedy

This indicates a software bug. The ISIS process may need to be restarted. Please contact TAC if the problem persists.

Severity

Warning

Message Text

%vlanName% not found in VLAN lib

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | String |

ISIS.VLAN.IfCreateFail

Description

The specified interface could not be created in the IS-IS database. As a result, the interface will not work properly with IS-IS.

Remedy

If there is no other log message indicating that the vlan name was not found, the switch may be running low on memory.

Severity

Warning

Message Text

Failed to create %ifName%

Message Parameters

| Name | Type |
|--------|--------|
| ifName | String |

ISIS.VLAN.IfUnbindFail

Description

An internal error occurred while unbinding an interface from the specified area. The supplied error message should provide more details as to the specific problem.

Remedy

This could indicate a software bug.

Severity

Warning

Message Text

Error unbinding %ifName% from area %areaName%: %errMsg%

Message Parameters

| Name | Type |
|----------|--------|
| ifName | String |
| areaName | String |
| errMsg | String |

ISIS.VLAN.IfNotFound

Description

The specified interface could not be found in the ISIS interface database.

Remedy

If this is an interface that is desired to be ISIS-enabled, try unconfiguring the interface and reconfiguring it. The ISIS process may need to be restarted. The switch's resources may be low, preventing the addition of the interface to the database. If the problem persists, contact TAC.

Severity

Warning

Message Text

%ifName% not found in ISIS ifdb

Message Parameters

| Name | Type |
|--------|--------|
| ifName | String |

ISIS.VLAN.IfInstNotFound

Description

An internal lookup failed while processing an event for the specified VLAN.

Remedy

This indicates a software bug. The ISIS process may need to be restarted. Please contact TAC if the problem persists.

Severity

Warning

Message Text

VLAN inst %vlanInst% not found in VLAN lib

Description

This event occurs when memory allocation fails for specific object types. object: Object to allocate

Remedy

System is out of memory. Reducing system configuration may help reclaim memory. Use output of "show memory" to determine which processes are using the most memory.

Severity

Error

Message Text

Failed to allocate memory for %object%.

Message Parameters

| Name | Type |
|--------|--------|
| object | String |

KeychainMgr.RegCIntOK

Description

This event occurs when a client successfully registers with a keychain. The client will receive key event notifications for the keychain until it unregisters. client: Client name
name: Keychain name

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Client %client% successfully registered with keychain %name%.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| name | String |

KeychainMgr.RegCIntFail

Description

This event occurs when a client fails to register with a keychain. client: Client name
name: Keychain name

Remedy

The keychain could not be found or the client process is not initialized correctly. Check "show keychain" output to see if keychain exists. Restart the client process to reset client connection to Keychain Manager. If the issue persists, contact technical support with "show tech" output.

Severity

Error

Message Text

Client %client% failed to register with keychain %name%.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| name | String |

KeychainMgr.UnregClntOK

Description

This event occurs when a client successfully unregisters from a keychain. The client will stop receiving key event notifications for this keychain. client: Client name name: Keychain name

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Client %client% successfully unregistered from keychain %name%.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| name | String |

KeychainMgr.UnregClntFail

Description

This event occurs when a client fails to unregister from a keychain because the keychain could not be found. client: Client name name: Keychain name

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Warning

Message Text

Client %client% failed to unregister from keychain %name%.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| name | String |

KeychainMgr.KeyActv

Description

This event occurs when a key in a keychain becomes active. id: Key identifier name: Keychain name

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Key %id% in keychain %name% is active.

Message Parameters

| Name | Type |
|------|--------|
| id | ulnt |
| name | String |

KeychainMgr.KeyExp

Description

This event occurs when a key in a keychain expires. id: Key identifier name: Keychain name

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Key %id% expired in keychain %name%.

Message Parameters

| Name | Type |
|------|--------|
| id | ulnt |
| name | String |

KeychainMgr.SendCIntKeyNtfyFail

Description

This event occurs when a key event notification could not be sent to some or all keychain clients using IPML group send. msg: Key event name: Keychain name failed: Number of failed clients count: Total number of clients of keychain

Remedy

If send failed to some clients but not all then unregister the clients from the keychain and register them again or restart the client processes. If that does not work or send failed for all clients then reboot the switch.

Severity

Error

Message Text

Failed to send key event notification message %msg% for keychain %name% to %failed% out of %count% clients.

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| name | String |
| failed | sInt |
| count | sInt |

KeychainMgr.SendSvrReplyFail

Description

This event occurs when the server fails to send a reply using IPML send to a client request. msg: Server message name: Keychain name peer: IPML peer ID code: IPML error code

Remedy

Unregister from keychain and register again. If that does not work then restart the client process or reboot the switch.

Severity

Error

Message Text

Failed to send %msg% for keychain %name% to peer %peer%, IPML error code %code%.

Message Parameters

| Name | Type |
|------|--------|
| msg | String |
| name | String |

| Name | Type |
|------|------|
| peer | ulnt |
| code | slnt |

Kern.Emergency

Description

The EXOS kernel has logged a message of severity 'Emergency'. This event is due to a problem that should not happen during normal operation. The EXOS kernel is the lowest level of software, but handles a wide range of responsibilities. Protocols, hardware device management, filesystems, and low-level memory management, are just a few of those responsibilities. Many different messages and causes map to this one EMS event.

Remedy

Look to the message that accompanies this event for a description of the underlying problem. You will often find other related, and relevant, events before and after this one. The following items are required to further investigate the event: kernel panic messages and any other anomalous messages seen on the serial console, a record of all log messages (show tech all), and any core dump files (which will need to be transferred off the switch).

Kern.IPv6Mc.Error

Description

IPv6 multicast processing on the specified slot logged a message of severity 'Error'. The text included in the log message describes the error and the extent of the possible impact.

Remedy

Use "debug hal show ipv6mc" to further troubleshoot the issue. If this issue appears to impact network performance, a slot reboot might clear the condition.

LACP.CreatUnackTimerFail

Description

The value of unacknowledgement timerID returned a NULL while trying to create a LACP timer. The timer is needed to detect liveness.

Remedy

Check if aggregator is set. Also, check if the connection to the VLAN mgr is maintained. Otherwise, reboot switch. show switch show lacp

Severity

Critical

Message Text

Failed to create the unacknowledgement timer for LAG with group Id: %grpId%

Message Parameters

| Name | Type |
|-------|--------|
| grpId | String |

LACP.CreatVLANMsgFail

Description

The VLAN Message returned NULL. Could not allocate memory for object to set aggregator.

Remedy

Check is sufficient memory is available and memory is not occupied by other processes. show memory show memory process lacp

Severity

Critical

Message Text

Failed to create a message to be sent to VLAN manager from port%port% to set aggregator

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.CreatVLANInfoFail

Description

The LACP VLAN information returned NULL. Attach to netTx filter failed. Could not allocate memory

Remedy

Check is sufficient memory is available and memory is not occupied by other processes.
show memory show memory process lacp

Severity

Critical

Message Text

Failed to create VLAN-info %vlan%

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |

LACP.CreatFineGranTimerFail

Description

The LACP fine timer obj returned NULL. Could not allocate memory

Remedy

Check if LACP module was started without errors and all parameters are initialized. Otherwise, reboot switch. show memory show memory process lacp

Severity

Critical

Message Text

Failed to create LACP Fine Granularity timer

LACP.CreatPeriodTimerFail

Description

The periodic timer value returned NULL. Could not allocate memory

Remedy

Check timer parameters for LACP module. Check the memory statistics. Otherwise reboot switch. show memory process lacp show lacp member-port <port> {detail}

Severity

Critical

Message Text

Failed to create LACP periodic timer. port: %portId%

Message Parameters

| Name | Type |
|--------|--------|
| portId | String |

LACP.CreatCurWhileTimerFail

Description

The current-while timer value returned NULL. Could not allocate memory

Remedy

Check if the receiver machine parameters are initialized correctly for the LACP module.
Check for the switch memory statistics. show memory show memory process lacp

Severity

Critical

Message Text

Failed to create create LACP current while timer. port: %portId%

Message Parameters

| Name | Type |
|--------|--------|
| portId | String |

LACP.GetLastPortFail

Description

The port returned a NULL value. Not able to retrieve it.

Remedy

Check the aggregator list of ports that have been added, make sure there is atleast one valid port that is currently enabled. show lacp show lacp member-port <port> {detail}

Severity

Critical

Message Text

Failed to get the last port from the aggregator list %port%

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.CreatWaitWhileTimerFail

Description

The wait-while timer value returned NULL. Could not allocate memory

Remedy

Check for a valid LAG group ID. Check for any available memory. Otherwise reboot switch. show memory show memory process lacp show lacp member-port <port> {detail}

Severity

Critical

Message Text

Failed to create LACP wait-while timer. port: %portId%

Message Parameters

| Name | Type |
|--------|--------|
| portId | String |

LACP.CreatChurnTimerFail

Description

The churn timer value returned NULL. Could not allocate memory

Remedy

Check if the churn timer already exists. Check for any out-of-sync condition. Also, check for memory usage. show memory show memory process lacp show lacp member-port <port> {detail}

Severity

Critical

Message Text

Failed to create LACP churn timer. port: %portId% Type %type%

Message Parameters

| Name | Type |
|--------|--------|
| portId | String |
| type | String |

LACP.CreatLAGFail

Description

Malloc returned a null pointer while creating the LAG port

Remedy

Check for memory statistics. Otherwise reboot switch. show memory show memory process lacp

Severity

Critical

Message Text

Failed to create LACP LAG instance for port%port%.

Message Parameters

| Name | Type |
|------|--------|
| port | uint32 |

LACP.AddPortFail

Description

The port returned a NULL value. Not able to malloc and add a LACP port.

Remedy

Check the validity of the port instance. Check memory statistics. Otherwise, reboot switch. show lacp show lacp memmer-port <port> {detail}

Severity

Critical

Message Text

Failed to add port to the aggregator. Port: %port%

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.CreatAggrPortFail

Description

The agg port returned a NULL value. Not able to malloc it.

Remedy

Check validity of the port and the LACP port aggregator list. Check memory statistics. Otherwise reboot switch. show memory show memory process lacp

Severity

Critical

Message Text

Failed to create aggregator port. %data%

Message Parameters

| Name | Type |
|------|------|
| data | Ptr |

LACP.CreatPDUFail

Description

The LACP PDU could not be allocated memory. The LACP frame returned NULL.

Remedy

Check memory statistics. Otherwise reboot switch. show memory show memory process lacp

Severity

Critical

Message Text

Failed to create LACP PDU. %data%

Message Parameters

| Name | Type |
|------|------|
| data | Ptr |

LACP.CreatCkptMsgFail

Description

The LACP check point data returned NULL. Could not allocate memory.

Remedy

Checkpoint message size to be kept within limits. Check memory statistics. Otherwise reboot switch. show lacp show lacp counter

Severity

Critical

Message Text

Failed to create LACP checkpoint msg of size: %size%

Message Parameters

| Name | Type |
|------|--------|
| size | uInt32 |

LACP.AttachExpktFiltFail

Description

Unable to attach the netTx filter as the filter Id returned a negative value.

Remedy

Check filter statistics before rebooting Switch show lacp show lacp member-port <port>; {detail}

Severity

Error

Message Text

Failed to attach the Expkt filter for any vlan to socket %sockId%.

Message Parameters

| Name | Type |
|--------|--------|
| sockId | uInt32 |

LACP.GetVLANNameFail

Description

Could not locate the instance using the VLAN name from the VLAN lib resulting in failure to add LACP FDB and ExPkt filter.

Remedy

Check validity of VLAN name that is queried show vlan <vlan_name>;

Severity

Error

Message Text

Failed to locate VLAN %vlan%

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |

LACP.RxPDUFail

Description

Failed to receive the LACP PDU due to an unsuccessful socket read

Remedy

Check connection liveness between the sender and receiver stations show lacp counters

Severity

Error

Message Text

Failed to receive LACP PDU. socket ID: %sockId%

Message Parameters

| Name | Type |
|--------|--------|
| sockId | uInt32 |

LACP.RxPDULenInv

Description

The PDU on verification was found that the size was smaller than it should be.

Remedy

The LACP packet must contain the necessary fields. Check the received PDU size. show lacp counters

Severity

Error

Message Text

Received PDU is of invalid length. Size %size% Required size %reqSize%

Message Parameters

| Name | Type |
|---------|---------|
| size | ulInt32 |
| reqSize | ulInt32 |

LACP.RxPDUSizExcd

Description

The received PDU on verification was found that the size exceeded than it should be.

Remedy

Only the necessary parameters must be included in the switch. Check the received length of PDU. show lacp counters

Severity

Error

Message Text

Received PDU %name% size exceeded. Incoming Port: %portId% PDU size: %size%
required size: %reqSize%

Message Parameters

| Name | Type |
|---------|---------|
| name | String |
| portId | String |
| size | ulInt32 |
| reqSize | ulInt32 |

LACP.DestAddrInv

Description

Destination IP address on the PDU failed to match the LACP destination address. The length did not match.

Remedy

Check the destination address. Use a matching IP address.

Severity

Error

Message Text

Destination address %destAddr% invalid

Message Parameters

| Name | Type |
|----------|--------|
| destAddr | String |

LACP.PDULenNotMatchProto

Description

The length type does not match the slow protocol type thereby displaying an error message.

Remedy

Check the received PDU length type. show lacp show lacp counters

Severity

Error

Message Text

PDU length %len% does not match Slow-Protocols-Type

Message Parameters

| Name | Type |
|------|--------|
| len | uInt16 |

LACP.LAGInstcOutOfRange

Description

The instance is out of range as a result of exceeding the max possible number of LAG instances or if the instance returned a negative value.

Remedy

Check if the instance's range is valid. show lacp lag <group-id> {detail}

Severity

Error

Message Text

LAG instance %lagInst% out of range

Message Parameters

| Name | Type |
|---------|--------|
| lagInst | uInt32 |

LACP.SendPDUFail

Description

The LACP port could not be sent. Socket error.

Remedy

Check socket connection. Check the port address. show lacp show lacp counter

Severity

Error

Message Text

Failed to send LACP Port %port% PDU

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.LAGGrpIdInv

Description

Invalid LACP group ID.

Remedy

Check LAG group ID and validity of the LAG. show lacp lag <group-id> {detail} jerry
lacp enable lag <group-id>

Severity

Error

Message Text

LACP Group ID %grpId% Invalid

Message Parameters

| Name | Type |
|-------|--------|
| grpId | String |

LACP.CreatNetTxSockFail

Description

Raw socket for LACP to interface with netTx could not be created.

Remedy

Check if the ports on the switch are up and enabled. show lacp counters

Severity

Error

Message Text

Failed to create socket %sockId%

Message Parameters

| Name | Type |
|--------|--------|
| sockId | uInt32 |

LACP.IncrsSendBufSizFail

Description

Failed to increase buffer size to 1M

Remedy

Check if there is sufficient size in the switch to handle the increment. show switch show memory show memory process lacp

Severity

Warning

Message Text

Failed to increase the netTx transmit buffer socket: %sockId%

Message Parameters

| Name | Type |
|--------|--------|
| sockId | uInt32 |

LACP.IncrsRxBufSizFail

Description

Failed to increase buffer size to 1M

Remedy

Check if there is sufficient size in the switch to handle the increment. show switch show memory show memory process lacp

Severity

Warning

Message Text

Failed to increase the netTx receive buffer socket: %sockId%

Message Parameters

| Name | Type |
|--------|--------|
| sockId | uInt32 |

LACP.OpenNetTxConnFail

Description

Failed to initialize netTx - Packet interface.

Remedy

Check socket connections show lacp counters

Severity

Warning

Message Text

Failed to open connection to netTx services. Aborted.

LACP.InitTimerFail

Description

Failed to initialize the LACP timers.No timers allocated.

Remedy

Check for the timers to be properly initialized. Check if LACP module has been initialized and is up and running. show process lacp {detail} show lacp member-port <port> {detail}

Severity

Warning

Message Text

Failed to initialize timers. Aborted.

LACP.SysMACActorKeyCombInv

Description

The actor key is similar to the system MAC. The PDU is dropped.

Remedy

Check port configuration `show lacp member-port <port> {detail}`

Severity

Warning

Message Text

Invalid system MAC and actor key combination. LACP port %port%

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.ModLAGId

Description

The LAG ID was modified while updating the LAG ID.

Remedy

Check the current LAG id and the previous LAG id before the update on the port. `show lacp show lacp member-port <port> {detail} show lacp lag <group-id> {detail}`

Severity

Warning

Message Text

LAG ID Modified for LACP port %port%. PDU MAC %pdumac%

Message Parameters

| Name | Type |
|--------|--------|
| port | String |
| pdumac | String |

LACP.NoFreeUnackEntAvail

Description

Unable to process any unack entries. All request entries are currently in use.

Remedy

Check the number of entries show lacp show lacp lag <group-id> {detail}

Severity

Warning

Message Text

No free unack entries %unackMax% available for LAG ID %lagId%. Unack entry current count %count%

Message Parameters

| Name | Type |
|----------|--------|
| lagId | String |
| unackMax | uInt32 |
| count | uInt32 |

LACP.LAGInstcNotExist

Description

LAG returned a NULL pointer while converting from corresponding LAG instance. The LAG timer expired eventually.

Remedy

Check LAG instance show lacp show lacp lag <group-id> {detail} jerry lacp enable lag <group-id>

Severity

Warning

Message Text

LAG instance does not exist.Context %context% Instance %inst% index %index%

Message Parameters

| Name | Type |
|---------|--------|
| context | uInt32 |
| inst | uInt32 |
| index | uInt32 |

LACP.UnackTimerExp

Description

LAG unack timer expired

Remedy

Check if the switch and the port connections are healthy. show lacp lag <group-id> {detail}

Severity

Debug-Summary

Message Text

Unack timer expired for LAG %lagId% %context% Instance %inst% index %index%

Message Parameters

| Name | Type |
|---------|--------|
| lagId | String |
| context | uInt32 |
| inst | uInt32 |
| index | uInt32 |

LACP.SetAggrErr

Description

Returned an Error code when VLAN client tried to set aggregator

Remedy

Check VLAN message to set aggregator. Check the LAG group Id to be valid. show lacp show lacp lag <group-id> {detail} jerry lacp enable lag <group-id>

Severity

Warning

Message Text

Error setting the aggregator for LAG %lagId% context: %context%

Message Parameters

| Name | Type |
|---------|--------|
| lagId | String |
| context | uInt32 |

LACP.DtachExpktFiltFail

Description

Unable to detach filter because filter Id is not a valid one.

Remedy

Check if the VLAN instance and tag is valid. show vlan {detail} show lacp

Severity

Warning

Message Text

Failed to detach the Expkt filter for any vlan from socket %sockId%.

Message Parameters

| Name | Type |
|--------|--------|
| sockId | uInt32 |

LACP.VLANIDAlrdyExist

Description

VLAN ID already exists. Can not add FDB entry

Remedy

Check VLAN instance if it already exists. Try with a new valid VLAN ID show vlan <vlan_name> create vlan <new_name> configure vlan <new_name> tag <tagId>

Severity

Warning

Message Text

VLAN ID already exists. Value:%value%

Message Parameters

| Name | Type |
|-------|--------|
| value | uInt32 |

LACP.VLANIDNotExist

Description

VLAN ID doesn't exist.

Remedy

Check VLAN instance. Use an existing VLAN ID show vlan <vlan_name>

Severity

Warning

Message Text

VLAN ID doesn't exist. Value:%value%

Message Parameters

| Name | Type |
|-------|--------|
| value | uint32 |

LACP.InitPortFail

Description

Port receive state is not idle.

Remedy

Check port validity. Repeat process with a new and valid port instance. show port <portId>; show lacp member-port <port>; {detail}

Severity

Warning

Message Text

Failed to initialize port %port% state: %state%

Message Parameters

| Name | Type |
|-------|--------|
| port | String |
| state | String |

LACP.MuxStateInv

Description

Received invalid mux state

Remedy

Check port and state validity. show port <portId>; show lacp member-port <port>; {detail}

Severity

Warning

Message Text

Mux state invalid. State:%state% Port:%port%

Message Parameters

| Name | Type |
|-------|--------|
| port | String |
| state | uInt32 |

LACP.WaitTimerAlrdyEnbl

Description

Mux state and port is valid. However, wait timer is already enabled

Remedy

Use a valid port and a MUX state and check if the wait timer on the port has already been enabled before proceeding to enable the timer on that port. show lacp member-port <port>; {detail} jerry lacp enable member-port <port>;

Severity

Warning

Message Text

Wait Timer Already Enabled for port %port% LACP mux state %state%

Message Parameters

| Name | Type |
|-------|--------|
| port | String |
| state | String |

LACP.WaitTimerExp

Description

Mux state and port are valid but wait timer value expired.

Remedy

Use a valid port with the appropriate MUX state. Try to restart the timer or initialize timer parameters. Check if the port on the switch is enabled. `show port <port>`; `show lacp member-port <port>`; {detail}

Severity

Warning

Message Text

Wait timer expired for port:%port% LACP mux state %state%

Message Parameters

| Name | Type |
|-------|--------|
| port | String |
| state | String |

LACP.AttachPort

Description

Attaching a LACP port whose state is FALSE.

Remedy

Check port state. Attach an LACP port when the state is TRUE. `show port <port>`; `show lacp show lacp member-port <port>`; {detail}

Severity

Warning

Message Text

Attaching port %port% with state %state%

Message Parameters

| Name | Type |
|-------|--------|
| port | String |
| state | uInt32 |

LACP.PortLogicInvMuxState

Description

Warning message to specify the logic state of the port

Remedy

Check port state logic. show lacp member-port <port> {detail}

Severity

Warning

Message Text

Port %port% logic %logic% invalid with mux state %state%

Message Parameters

| Name | Type |
|-------|--------|
| port | String |
| logic | String |
| state | String |

LACP.ChurnTimerStateInv

Description

Switch out of sync and churn state is already true. Churn Timer should not have been existing.

Remedy

Check to see if the port being used is valid. Check the port state and the corresponding timer associated with it. show lacp show process lacp show lacp member-port <port> {detail}

Severity

Warning

Message Text

Invalid Churn detection timer state. State TRUE Port %port% type %type%

Message Parameters

| Name | Type |
|------|--------|
| port | String |
| type | String |

LACP.ChurnTimerExp

Description

Churn detection timer expired, but churn state is true

Remedy

Check port state and the type to be valid with the corresponding timer parameters enabled. Check port statistics. show port <port>; show lacp member-port <port>; {detail}

Severity

Warning

Message Text

Churn detection Timer expired. Port %port% type %type%

Message Parameters

| Name | Type |
|------|--------|
| port | String |
| type | String |

LACP.ChurnEventUnk

Description

Unknown event in churn detection

Remedy

Check port state show port <port>; show lacp member-port <port>; {detail}

Severity

Warning

Message Text

Unknown event in Churn detection Port: %port% Event: %type%

Message Parameters

| Name | Type |
|------|--------|
| port | String |
| type | uInt32 |

LACP.LifNotExist

Description

Logical port instance, Lif not found.

Remedy

Check for the validity of the port instance queried. Use a valid port. show port <port>; show lacp member-port <port>; {detail} jerry enable lacp member-prot <port>;

Severity

Warning

Message Text

Logical port instance (lif) does not exist. Lif instance: %lif%

Message Parameters

| Name | Type |
|------|--------|
| lif | uInt32 |

LACP.PifNotExist

Description

Port, Pif not found.

Remedy

Check for the validity of the port instance. Use a valid port otherwise. show port <port>; show lacp member-port <port>; {detail} jerry enable lacp member-prot <port>;

Severity

Warning

Message Text

Port instance (pif) does not exist. Pif instance: %pif%

Message Parameters

| Name | Type |
|------|--------|
| pif | uInt32 |

LACP.LAGNotFndForLif

Description

LAG port not found for link, lif

Remedy

Check the port instance and check if the corresponding LAG exists. Use a valid instance to search for the corresponding LAG. show lacp show lacp member-port <port>; {detail} show lacp lag <group-id>; {detail} jerry lacp enable lag <group-id>;

Severity

Warning

Message Text

LAG does not exist. Logical port, Lif instance: %lif%

Message Parameters

| Name | Type |
|------|--------|
| lif | String |

LACP.AddPortDupGrpId

Description

Trying to add a port with duplicate LAG group ID

Remedy

Check group ID. Use a valid unique group ID. show lacp show lacp lag <group-id> {detail} jerry lacp enable lag <new_id>

Severity

Warning

Message Text

Add port with duplicate LAG group ID %grpID%

Message Parameters

| Name | Type |
|-------|--------|
| grpID | String |

LACP.RemLAGEntFail

Description

LAG entry returned a NULL value. The entry corresponding to the group ID does not exist, hence could not be removed.

Remedy

Check if the LAG entry exists for the corresponding groupID. Check if the group ID is correct. show lacp show lacp lag <group-id> {detail} jerry lacp disable <group-id>

Severity

Warning

Message Text

Failed to remove LAG entry as it does not exist. GroupID: %grpID%

Message Parameters

| Name | Type |
|-------|--------|
| grpID | String |

LACP.NoFreeLAGInstcAvail

Description

Could not get any free LAG instance. Unable to create a new LAG instance.

Remedy

Can not create a LAG instance until the one or more of the previous LAG entries are removed. show lacp show lacp counters show lacp lag <group-id> {detail}

Severity

Warning

Message Text

No free LAG instances available. %max_num%

Message Parameters

| Name | Type |
|---------|--------|
| max_num | uInt32 |

LACP.AddPortDupPortNum

Description

Tried to add port to the aggregator that has already been added. Did not add port.

Remedy

Check the port number, if it already exists use a unique port number. show lacp show lacp member-port <port> {detail}

Severity

Warning

Message Text

Tried adding a port with duplicate port number %port%. Add was skipped.

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.PortNotExistInLAG

Description

LACP port entry with the given port number does not exist in the LAG (returned NULL value).

Remedy

Check if the port is valid. Also check for the LAG group ID validity. show port <port-id>; show lacp member-port <port> {detail} show lacp lag <group-id> {detail}

Severity

Warning

Message Text

Port does not exist. Port number %port% LAG group ID%grpId%

Message Parameters

| Name | Type |
|-------|--------|
| port | String |
| grpId | String |

LACP.CurWhileTimerExp

Description

Current while timer fired prematurely

Remedy

Check if the timer has been set properly while creation of the port. The time stamp is erroneous. Reset the timers. show lacp show lacp counters show lacp member-port <port>; {detail}

Severity

Notice

Message Text

The current while timer expired prematurely for port %port% Expired after %sec% seconds %usec% microseconds. Timeout: %timer% seconds

Message Parameters

| Name | Type |
|-------|--------|
| port | String |
| sec | uInt32 |
| usec | uInt32 |
| timer | uInt32 |

LACP.RxPDUUnkType

Description

An unknown LACP PDU sub type has been received while calling the checkpointing routine. Possible PDU data corruption

Remedy

Check the message ID parameter, if valid. Also, look in to the check point BPDU. show lacp counters show lacp member-port <port>; {detail}

Severity

Warning

Message Text

Received unknown PDU subtype: %type%. Port: %port%

Message Parameters

| Name | Type |
|------|--------|
| type | uInt32 |
| port | String |

LACP.RecvUnkCkptMsg

Description

Unknown Checkpoint message received.

Remedy

Check the message ID parameter. Use a valid ID. show lacp counters

Severity

Warning

Message Text

Received unknown checkpoint message with message ID %msgId%

Message Parameters

| Name | Type |
|-------|--------|
| msgId | uInt32 |

LACP.SendTrapFailLAGNotExist

Description

Trap could not be sent as the LAG did not exist for the LACP port. LAG returned a NULL value.

Remedy

Check if the port is part of the aggregator. Check the LAG parameter for the LACP port, if exists. show lacp show lacp member-port <port>; {detail} show lacp lag <group-id>; {detail}

Severity

Warning

Message Text

Sending SNMP trap failed as LAG does not exist for port %port%

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.RecvLcnsUpdt

Description

Received an update to the existing license.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Receive license update message:: %license%

Message Parameters

| Name | Type |
|---------|--------|
| license | String |

LACP.SkipAckUsage

Description

The Unack count has reached a maximum. Hence skipping the usage of ack.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Skipping the usage of ack. Unack count %count%

Message Parameters

| Name | Type |
|-------|--------|
| count | uInt32 |

LACP.AddPortToAggr

Description

An LACP port is added to an aggregator

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Add port %port% to aggregator

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.RemPortFromAggr

Description

An LACP port is removed from an aggregator

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Remove port %port% from aggregator

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LACP.BindExpktFiltFail

Description

Unable to bind netTx filter as bind function returned negative value.

Remedy

No remedy is available.

Severity

Error

Message Text

Failed to bind the Expkt filter %filterId% for port %slotPort%.

Message Parameters

| Name | Type |
|----------|--------|
| filterId | uInt32 |
| slotPort | String |

LACP.UnBindExpktFiltFail

Description

Unable to unbind netTx filter as unbind function returned negative value.

Remedy

No remedy is available.

Severity

Error

Message Text

Failed to unbind the Expkt filter %filterId% for port %slotPort%.

Message Parameters

| Name | Type |
|----------|--------|
| filterId | uInt32 |
| slotPort | String |

LACP.MinActvLinkAchv

Description

The minimum number of links in Selected state required for LAG to come up has been reached.

Remedy

No action required - Informational message only

Severity

Notice

Message Text

LAG %port% with %totalMembers% member ports has reached the minimum of %threshold% links in Selected state.

Message Parameters

| Name | Type |
|--------------|--------|
| port | String |
| threshold | uInt8 |
| totalMembers | uInt8 |

LACP.MinActvLinkNotMntn

Description

The number of links in Selected state has fallen below the minimum required for the LAG to remain up.

Remedy

Check to make sure links are active via show port sharing command. Verify that all links are properly configured with LACP and communicating correctly using show lacp commands.

Severity

Warning

Message Text

The number of links in Selected state for LAG %port% with %totalMembers% member ports has fallen below the minimum %threshold% links in Selected state required for the LAG to remain up.

Message Parameters

| Name | Type |
|--------------|--------|
| port | String |
| threshold | ulnt8 |
| totalMembers | ulnt8 |

LACP.CreateEZFabricTimerFail

Description

The LACP timer object returned NULL during EZ Fabric delay timer creation. Could not allocate memory.

Remedy

No remedy is available.

Severity

Error

Message Text

Failed to create EZ Fabric delay timer for LAG for port %port%.

Message Parameters

| Name | Type |
|------|--------|
| port | ulnt32 |

LACP.CreatFallbkTimerFail

Description

The LACP timer object returned NULL during fallback timer creation. Could not allocate memory. action: - configure sharing <port>; lacp fallback enable

Remedy

Check the memory statistics and check for valid LAG Group Id. Otherwise reboot the switch. action: - show memory - show memory process lacp - show lacp lag <group-id>; detail

Severity

Error

Message Text

Failed to create fallback timer for LAG with Group Id %grpId%.

Message Parameters

| Name | Type |
|-------|--------|
| grpId | String |

LACP.SlctFallbkPortDone

Description

When LACP fallback is enabled and fallback timeout expires, one of the active LACP members will be selected as fallback port and added to the aggregator. action: - configure sharing <port>; lacp fallback enable

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Port %slotPort% has been selected as fallback port.

Message Parameters

| Name | Type |
|----------|----------|
| slotPort | SlotPort |

LAGHC.TCPTrckNtfyRecv

Description

Received a TCP Tracking notification from Nettools.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

TCP track notification received. MemberPort:%port% TrackId:%trackId% IP:%tcpPort%
%status%

Message Parameters

| Name | Type |
|---------|----------|
| trackId | uInt32 |
| port | SlotPort |
| IP | IP |
| tcpPort | uInt32 |
| status | String |

LAGHC.MbrPortRem

Description

A member port was removed from the LAG. This occurs when member port is disabled, or if TCP Tracking fails for a member port.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Port %port% was removed from Aggregator Group %groupId%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| groupId | String |

LAGHC.MbrPortAdd

Description

A member port was added back to the LAG. This occurs when tracking is disabled or deleted from a member port, or when tracking is successful.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Port %port% has been added to Aggregator Group %groupId%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| groupId | String |

LAGHC.MbrPortCreate

Description

A new member port has been created and added to a LAG.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Created a member port. Port %port% LAG group %groupId%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| groupId | String |

LAGHC.MbrPortDelete

Description

A member port has been completely removed from the LAG.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Port %port% has been deleted from LAG Group %groupId%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| groupId | String |

LAGHC.ACApply

Description

We applied an ACL rule to a port. ACL Rules are created at config time and applied to a port when the port is removed from the Aggregator when TCP tracking condition fails. This allows the switch to divert packets to the CPU even though the port is not an active LAG member. Normally, ports removed from the LAG drop all ingress packets.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

ACL %ruleName% applied to port %port%

Message Parameters

| Name | Type |
|----------|----------|
| port | SlotPort |
| ruleName | String |

LAGHC.ACLeApply

Description

We unapplied an ACL rule to a port. A port is added back to the LAG when the Tracking condition is restored or if Tracking is manually disabled. In this case, the ACL is no longer needed to divert packets to the CPU since the port is an active member of the LAG.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

ACL %ruleName% unapplied from port %port%

Message Parameters

| Name | Type |
|----------|----------|
| port | SlotPort |
| ruleName | String |

LAGHC.ACCLCreated

Description

Application automatically created an ACL rule at config time.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

ACL %ruleName% created

Message Parameters

| Name | Type |
|----------|--------|
| ruleName | String |

LAGHC.ACCLDeleted

Description

Application deleted an ACL when tracking is unconfigured for the member port.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

ACL %ruleName% deleted

Message Parameters

| Name | Type |
|----------|--------|
| ruleName | String |

LAGHC.ConfigTrace

Description

Used when tracing messages as they are received from the Configuration Manager

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

LAGHC.DuplicateGroupId

Description

Trying to add a node with an existing group-id already in use.

Remedy

Check the given group ID. Try adding the node with unique group-id which is not already used.

Severity

Error

Message Text

Trying to add port with duplicate group-id %groupid%

Message Parameters

| Name | Type |
|---------|--------|
| groupid | String |

LAGHC.GroupIdDoesNotExist

Description

Could not find a particular group-id that was being searched for.

Remedy

Check for the given group ID. Check if the group ID exists. Try using a group-id that exists.

Severity

Error

Message Text

Group-id %groupid% does not exist

Message Parameters

| Name | Type |
|---------|--------|
| groupid | String |

LAGHC.PortDoesNotExist

Description

Could not find a particular port that was being searched for.

Remedy

Verify port exists and is being used.

Severity

Error

Message Text

Port %port% does not exist

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

LAGHC.MaxLagInstancesReached

Description

The limit to the maximum number of LAGs to be configured is exceeded. The message is shown while trying to get the next free instance.

Remedy

Can not add new LAG instances unless the existing instances are removed.

Severity

Error

Message Text

Maximum LAG instances reached. Only %max% instances allowed.

Message Parameters

| Name | Type |
|------|------|
| max | ulnt |

LAGHC.LagInstanceOutOfRange

Description

The LAG instance specified is not within the valid range of instances.

Remedy

Check for the LAG instance value. Specify a LAG instance between 0 and MAX.

Severity

Error

Message Text

LAG instance %inst% specified is out of range. Valid range is between 0 and %max%

Message Parameters

| Name | Type |
|------|------|
| inst | ulnt |
| max | ulnt |

LAGHC.OutOfMemory

Description

Unsuccessful attempt to allocate memory.

Remedy

Make sure the switch has sufficient memory to handle this event. If it does, then the fault lies with allocating memory for a particular parameter. Reboot switch to see if the problem is solved.

Severity

Critical

Message Text

Out of Memory. %size% bytes.

Message Parameters

| Name | Type |
|------|------|
| size | ulnt |

LAGHC.TCPTrckNtfylgn

Description

Ignored an incoming TCP tracking notification from Nettools regarding a change of state. Node state disabled or node does not exist

Remedy

Check if the node exists. If it exists and this message is logged, check if the node is in disabled state.

Severity

Info

Message Text

TCP track notification ignored. MemberPort:%port% TrackId:%trackId% %action%
%state%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| trackId | uInt32 |
| action | String |
| state | String |

LAGHC.TmrCreateFailed

Description

Unable to create a system timer. The timer ID returned a NULL value.

Remedy

Check is timer has not expired and then check if the timer ID is valid, else reboot switch.

Severity

Critical

Message Text

Unable to create unack timer. LAG group ID:%grpID%

Message Parameters

| Name | Type |
|-------|--------|
| grpID | String |

LAGHC.PortNotFound

Description

Unable to find the port or PIF object corresponding to a particular port instance

Remedy

Check if the port exists and is being used i.e active and enabled.

Severity

Error

Message Text

Port not found for port instance %portInst%

Message Parameters

| Name | Type |
|----------|--------|
| portInst | uInt32 |

LAGHC.TCPTrkAddErr

Description

Can not add a tracking entry on a port on which TCP tracking is already enabled. API call to Nettools to add a tracking entry has failed.

Remedy

Check TCP tracking state on port. If tracking state is already enabled, do not attempt to re-enable it.

Severity

Error

Message Text

Adding TCP tracking functionality for port %port% failed because the tracking state is already enabled.

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

LAGHC.ChkPtTlvSendErr

Description

Failed to send checkpoint message to backup MSM

Remedy

Make sure the backup MSM is up and running. Reboot the backup MSM if not.

Severity

Error

Message Text

Failed to send checkpoint message type %type% size %size%

Message Parameters

| Name | Type |
|------|--------|
| type | uInt32 |
| size | uInt32 |

LAGHC.ChkPtTlvDecodeErr

Description

Failed to decode received checkpoint message

Remedy

Check TLV parameters for possible data corruption. Check if the message received from the MSM is appropriate.

Severity

Error

Message Text

Failed to decode checkpoint message for %msg% object

Message Parameters

| Name | Type |
|------|--------|
| msg | String |

LAGHC.ChkPtUnkEv

Description

Received a checkpoint event for an unknown type. Simply ignore.

Remedy

Check if the same versions are being used on both MSM

Severity

Warning

Message Text

Unknown checkpoint event %msgId% received. Ignoring.

Message Parameters

| Name | Type |
|-------|--------|
| msgId | ulnt32 |

LAGHC.ChkPtUnsupType

Description

Received a checkpoint msg for an object where a particular field of that object is unsupported. Simply ignore.

Remedy

Check for versions running on the MSM. Make sure the versions are the same.

Severity

Warning

Message Text

Unknown checkpointed type %type% for object %obj%. Ignoring.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |
| type | uInt32 |

LAGHC.ChkPtTlvSizeMismatch

Description

The object TLV length did not match the object length.

Remedy

Check for the MSM versions. Make sure they are identical. Check the parameters which make up the message that is being sent.

Severity

Warning

Message Text

This %obj% object type %type% TLV size %tlvLen% does not match object length %objLen%

Message Parameters

| Name | Type |
|--------|--------|
| obj | String |
| type | uInt32 |
| tlvLen | uInt32 |
| objLen | uInt32 |

LAGHC.InsPortFail

Description

The port could not be inserted as a HCLAG port as the port number already exists.

Remedy

Check port number. If it is valid, check if it is unique. Use a unique port number that is not being currently used.

Severity

Warning

Message Text

Failed to insert port %port%.

Message Parameters

| Name | Type |
|------|--------|
| port | String |

LAGHC.AddTrackIdFail

Description

API call to Nettools to add a tracking ID has failed. Track ID returned a negative value.

Remedy

Check parameters and re-add tracking ID, otherwise reboot switch.

Severity

Warning

Message Text

Failed to add Tracking ID %trackId% Not a valid parameter.

Message Parameters

| Name | Type |
|---------|--------|
| trackId | uInt32 |

LAGHC.RemTCPTrackFail

Description

Could not remove the TCP tracking ID. The health check library in the Nettools directory returned a negative value.

Remedy

Check TCP track ID to be valid and being used. Otherwise reboot switch

Severity

Warning

Message Text

Failed to remove TCP tracking ID %trackId% for IPAddr:%IPAddr% tcpPort:%port%

Message Parameters

| Name | Type |
|---------|--------------|
| trackId | uInt32 |
| IPAddr | IPAddrFamily |
| port | uInt32 |

LAGHC.DsbITCPTrackFail

Description

The node state had tracking state already disabled.

Remedy

Check the node state if it is previously disabled. If yes, then do not attempt to disable tracking on a node that has already tracking functionality disabled.

Severity

Warning

Message Text

Disabling the TCP tracking %trackId% for port %portId% IPaddress %IPAddr% failed as it was already disabled.

Message Parameters

| Name | Type |
|---------|--------------|
| trackId | uInt32 |
| portId | uInt32 |
| IPAddr | IPAddrFamily |

LAGHC.DsbITCPTrackMsgFail

Description

The tracking of the TCP port could not be disabled. The API call to nettools was sent a message to disable.

Remedy

Check TCP track ID and socket connections to be valid. If not, reboot the concerned switches.

Severity

Warning

Message Text

Message sent to disable TCP tracking on a port failed. Tracking ID: %trackID%

Message Parameters

| Name | Type |
|---------|--------|
| trackID | ulnt32 |

LAGHC.EnbITCPTrackFail

Description

The node state was already enabled

Remedy

Check node state and tracking ID. Do not attempt to enable tracking on a switch that has already been enabled with the tracking functionality.

Severity

Info

Message Text

Enabling TCP tracking %trackId% failed. IP %IPAddr% Port: %PortId%

Message Parameters

| Name | Type |
|---------|--------------|
| trackId | ulnt32 |
| IPAddr | IPAddrFamily |
| PortId | ulnt32 |

LAGHC.UnackTimerExp

Description

The LAG Unack timer expired. The timer entry could not be freed

Remedy

Check LAG. Check if all the nodes are up and running.

Severity

Warning

Message Text

Unack Timer Expired. GroupId %msg% context:%ctxt% instance: %inst% index:%index%

Message Parameters

| Name | Type |
|-------|--------|
| msg | String |
| ctxt | uInt32 |
| inst | uInt32 |
| index | uInt32 |

LAGHC.LAGNotExist

Description

No LAG existed for the link instance(lif). Unable to add/del ports to aggregator.

Remedy

Check for the concerned link ID. If valid, then reboot switch. Else, use a valid link instance ID

Severity

Warning

Message Text

No LAG exists for Lif %lifId%.

Message Parameters

| Name | Type |
|-------|--------|
| lifId | String |

LAGHC.NoFreeUnackEntAvail

Description

Unable to retrieve any more free unack timer entries. Reached limit.

Remedy

Wait till one or more unack timer entry expires or when the timer entries are removed.

Severity

Warning

Message Text

No free unack timer entries available for group %grpId% [count %count%]Maximum Limit:%maxLimit%

Message Parameters

| Name | Type |
|----------|--------|
| grpId | String |
| count | uInt32 |
| maxLimit | uInt32 |

LAGHC.SetAggrFail

Description

Message was not delivered to the aggregator preventing add/delete functions

Remedy

Check for valid LAG instance group ID and membership. If it is valid, try to see if the message is logged once the switch is rebooted.

Severity

Warning

Message Text

Setting the aggregator failed. Group %grpId% not sent, returned with %code%, to aggregator instead of %needed%.

Message Parameters

| Name | Type |
|--------|--------|
| grpId | String |
| code | uInt32 |
| needed | uInt32 |

LAGHC.AddPortFail

Description

Port was not added to the aggregator as no port instance was part of LAG

Remedy

Check for the correct port instance group ID. Else use a group Id that is valid.

Severity

Warning

Message Text

Adding a port failed. portInst:%portInst% slot:%portIdslot% port:%portId% association with group:%grpId%

Message Parameters

| Name | Type |
|------------|--------|
| portInst | uInt32 |
| portIdslot | uInt32 |
| portId | uInt32 |
| grpId | String |

LAGHC.LifNotExist

Description

Unable to locate the link instance corresponding to a port from VLAN library

Remedy

Check port instance. If it is valid, check the group Id. Else, contact the concerned personnel with the exact set of sequences that led to the logging of this message.

Severity

Warning

Message Text

Logical port instance, Lif does not exist %lifId%

Message Parameters

| Name | Type |
|-------|--------|
| lifId | uInt32 |

LAGHC.PifNotExist

Description

Unable to locate the port instance from VLAN library

Remedy

Check if the port is up and enabled. If valid, use valid pif instance while changing state of the pif. Check the state of the port instance.

Severity

Warning

Message Text

Port instance %port% does not exist.

Message Parameters

| Name | Type |
|------|--------|
| port | uInt32 |

licMgr.DsblFeatLcns

Description

A license product has been disabled on the device.

Remedy

No remedy is available.

Severity

Warning

Message Text

Disabled the %product% license product for the %generic% feature(s).

Message Parameters

| Name | Type |
|---------|--------|
| product | String |
| generic | String |

licMgr.RvkFeatLcns

Description

A license key has been revoked from the device. The same license key cannot be installed on the device again.

Remedy

A new license entitlement has to be created for this device.

Severity

Notice

Message Text

License for product %product% with EID %eid% has been revoked.

Message Parameters

| Name | Type |
|---------|--------|
| product | String |
| eid | String |

licMgr.UninstLcnsClnupFail

Description

This event occurs when a license uninstallation fails and we failed to re-enable the license.

Remedy

A reboot might re-enable the license.

Severity

Error

Message Text

Failed to cleanup after license uninstallation failure for product %product%.

Message Parameters

| Name | Type |
|---------|--------|
| product | String |

licMgr.InstLcnsClnupFail

Description

This event occurs when a license installation command fails. Specifically, an invalid license key has been installed to persistent memory and we failed to remove it.

Remedy

The command "debug licmgr uninstall" could be used to remove the license key.

Severity

Error

Message Text

Failed to cleanup after license installation failure for product %product%.

Message Parameters

| Name | Type |
|---------|--------|
| product | String |

licMgr.ClrCPD

Description

The Sentinel RMS Custom Persistent Data has been removed from the disk. This means that all licenses installed prior to this have been removed. It further means that revocation records have also been removed. Due to this, previously revoked licenses can be installed again. This event will be followed by a reboot in order for the system to function properly.

Remedy

No action required - Informational message only.

Severity

Critical

Message Text

The RMS Custom Persistent Data has been cleared.

Ildp.AddFdbFilter

Description

This message will indicate that a FDB hardware filter is added for the specified vlan and vlan-tag.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Adding a VLAN filter for vlan %vlan%, tag %tag% returned %rc%.

Message Parameters

| Name | Type |
|------|----------|
| vlan | VLAN |
| tag | VLAN-tag |
| rc | ulnt |

Ildp.DelFdbFilter

Description

This message will indicate that a FDB hardware filter is deleted for the specified vlan and vlan-tag.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support

Severity

Debug-Verbose

Message Text

Deleting a VLAN filter for vlan %vlan%, tag %tag% returned %rc%.

Message Parameters

| Name | Type |
|------|----------|
| vlan | VLAN |
| tag | VLAN-tag |
| rc | sInt |

lldp.FailedPktSocket

Description

No description is available.

Remedy

No remedy is available.

Severity

Warning

Message Text

Failed to allocate global LLDP packet socket, error: %errmsg%.

Message Parameters

| Name | Type |
|--------|--------|
| errmsg | String |

lldp.PktRecvError

Description

This message will return the error message received by the recvExpkt() function.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Summary

Message Text

The rcvExpkt() function returned error; %error%

Message Parameters

| Name | Type |
|-------|--------|
| error | String |

lldp.PktRcv

Description

This message is logged every time a LLDP packet is received on a port.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Received a %size% bytes LLDP packet on port %port%, vlan-tag %tag%.

Message Parameters

| Name | Type |
|------|-----------------|
| port | ingressSlotPort |
| tag | VLAN-tag |
| size | ulnt32 |

Ildp.PktRecvData

Description

This message is logged every time a LLDP packet is received on a port.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Data

Message Text

Received a %size% bytes LLDP packet on port %port%, vlan-tag %tag%.

Message Parameters

| Name | Type |
|--------|-----------------|
| port | ingressSlotPort |
| tag | VLAN-tag |
| buffer | Buf-ptr |
| size | Buf-len |

Ildp.LocalTLVChange

Description

This message gets logged if data for an Enabled TLV changes. Port 65535:65535 means it's a global data change.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Local TLV change for port %port%; %TLV%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |
| TLV | String |

lldp.AddTLVFailed

Description

Failed to add a TLV when constructing an outgoing TLV. This could happen when there is not enough room to fit all requested TLVs. Errors greater than 0 mean not enough space, all others are smaller than 0.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Adding TLV to transmit LLDPDU failed[%error%] on port %port% for %TLV%

Message Parameters

| Name | Type |
|-------|----------|
| port | SlotPort |
| TLV | String |
| error | uint |

lldp.LLDPDUExceeded

Description

When constructing a LLDPDU a maximum of 1500 bytes of data can be included. If the switch tried to construct a LLDPDU which would end up being larger than 1500 bytes this message will be logged.

Remedy

Disable all TLV which are not mandatory in your environment, see user manual for details.

Severity

Warning

Message Text

Constructed LLDPDU for port %port% does not contain all requested information.

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

lldp.AddedTLV

Description

Added specific TLV for port

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Data

Message Text

Added TLV \"%TLV%\" to LLDPDU for port %port%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |
| TLV | String |

lldp.PktTransmit

Description

This message is logged every time a LLDP packet is transmitted on a port.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Transmitted a %size% bytes LLDP packet on port %port%

Message Parameters

| Name | Type |
|------|-----------------|
| port | ingressSlotPort |
| size | uInt32 |

lldp.PktTransmitData

Description

This message is logged every time a LLDP packet is transmitted on a port.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Data

Message Text

Transmitted a %size% bytes LLDP packet on port %port%

Message Parameters

| Name | Type |
|--------|-----------------|
| port | ingressSlotPort |
| buffer | Buf-ptr |
| size | Buf-len |

lldp.PktTransmitFail

Description

This message is logged every time a LLDP packet could not be transmitted out of a port.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Summary

Message Text

Failed transmitting a %size% bytes LLDP packet out of port %port%, errno %error%

Message Parameters

| Name | Type |
|-------|-----------------|
| port | ingressSlotPort |
| size | uInt32 |
| error | sInt32 |

Ildp.TxStateChange

Description

This message logs the state changes for the LLDP Transmit state machine.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Summary

Message Text

Receive state change for port %port%; %oldState% -> %newState%

Message Parameters

| Name | Type |
|----------|-----------------|
| port | ingressSlotPort |
| oldState | String |
| newState | String |

Ildp.TxSMEEvent

Description

This message logs the events received by the LLDP Transmit state machine.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Summary

Message Text

Received event \"%event%\" for port %port% in state \"%state%\"

Message Parameters

| Name | Type |
|-------|-----------------|
| port | ingressSlotPort |
| event | String |
| state | String |

lldp.RxStateChange

Description

This message logs the state changes for the LLDP Receive state machine.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Summary

Message Text

Receive state change for port %port%; %oldState% -> %newState%

Message Parameters

| Name | Type |
|----------|-----------------|
| port | ingressSlotPort |
| oldState | String |
| newState | String |

lldp.RxSMEvent

Description

This message logs the events received by the LLDP Receive state machine.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Summary

Message Text

Received event \"%event%\" for port %port% in state \"%state%\"

Message Parameters

| Name | Type |
|-------|-----------------|
| port | ingressSlotPort |
| event | String |
| state | String |

lldp.TxStateVar

Description

This message logs the state variable for the LLDP Transmit state machine.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Port %port% Tx State variables: txTimer %timer%, portEnabled %pe%, chgLocal %scl%, TTR %txTTR%, delay %txDelay%, async %async%

Message Parameters

| Name | Type |
|-------|-----------------|
| port | ingressSlotPort |
| timer | xInt32 |
| pe | uInt8 |
| scl | uInt8 |
| txTTR | uInt16 |

| Name | Type |
|---------|--------|
| txDelay | uInt16 |
| async | sInt |

Ildp.RxStateVar

Description

This message logs the state variable for the LLDP Receive state machine.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Port %port% Rx State variables: rxTimer %timer%, portEnabled %pe%, rxInfoAge %infoAge%, rcvFrame %frame%

Message Parameters

| Name | Type |
|---------|-----------------|
| port | ingressSlotPort |
| timer | xInt32 |
| pe | uInt8 |
| infoAge | uInt8 |
| frame | uInt16 |

Ildp.RxPktInvalid

Description

When a LLDPDU was received and could not be validated this message gets logged.

Remedy

By either taking a trace or enabling the PktRecvData event (for the specific port) try to determine which device is sending the invalid packet.

Severity

Info

Message Text

LLDPDU received on port %port% was not valid

Message Parameters

| Name | Type |
|------|-----------------|
| port | ingressSlotPort |

Ildp.RxInvTLV

Description

This message is logged when an invalid TLV is received.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support. Note that the offset is only correct for the first invalid TLV in the frame.

Severity

Debug-Data

Message Text

Received an invalid TLV(%tlvType%, %tlvLength%) on port %port%, offset %offset%, length %len%

Message Parameters

| Name | Type |
|-----------|-----------------|
| port | ingressSlotPort |
| tlvType | uInt16 |
| tlvLength | uInt16 |
| offset | uInt16 |
| buffer | Buf-ptr |
| len | Buf-len |

lldp.MaxNbrsReached

Description

This message is logged when more than 4 neighbors are detected on a port.

Remedy

Currently the switch can only hold 4 neighbors per port, if this limit is reached, no new neighbors are accepted.

Severity

Notice

Message Text

The maximum number of neighbors supported on port %port% was exceeded.

Message Parameters

| Name | Type |
|------|-----------------|
| port | ingressSlotPort |

lldp.NoPktTransmit

Description

This message is logged every time a LLDP packet was not transmitted due to NetLogin restriction.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support. This message gets logged if NetLogin is enabled on the port, and no clients are authenticated.

Severity

Debug-Data

Message Text

Packet on port %port% not transmitted due to NetLogin blockage.

Message Parameters

| Name | Type |
|------|-----------------|
| port | ingressSlotPort |

lldp.NoPktReceive

Description

This message is logged every time a LLDP packet was not processed in receive path due to NetLogin restriction.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support. This message gets logged if NetLogin is enabled on the port, and no clients are authenticated.

Severity

Debug-Data

Message Text

Packet on port %port% not transmitted due to NetLogin blockage.

Message Parameters

| Name | Type |
|------|-----------------|
| port | ingressSlotPort |

lldp.SNMPPoETimeOut

Description

This message is logged when a request for PoE information to the PoE Library was not replied.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Received no response from PoE Library for %port%.

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

lldp.TLVPoETimeOut

Description

This message is logged when a request for PoE information to the PoE Library was not replied.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Received no response from PoE Library for %port%.

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

lldp.PortPhyConfig

Description

This message is logged when port MAC/PHY information is received for processing.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

%port% MAC/PHY dump: t=%ptype%, m=%media%, f=%flow%, d=%duplex%, s=%speed%, a=%autoneg%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| ptype | uInt32 |
| media | uInt32 |
| flow | uInt32 |
| duplex | uInt32 |
| speed | uInt32 |
| autoneg | uInt32 |

lldp.UPMEvent

Description

This message is logged when LLDP sends an event to UPM.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Send event %event% to UPM for port %port%, mac %mac%, IP %ip%, type %type%

Message Parameters

| Name | Type |
|-------|----------|
| event | String |
| port | SlotPort |
| mac | MAC |
| ip | IP |
| type | xInt32 |

lldp.ReachNXTDtect

Description

This message is logged when a ReachNXT device is detected on a port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Info

Message Text

ReachNXT device detect for port %port%, mac %mac%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |
| mac | MAC |

lldp.ReachNXTRem

Description

This message is logged when a ReachNXT device is removed from a port.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Info

Message Text

ReachNXT device remove for port %port%, mac %mac%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |
| mac | MAC |

lldp.SendHalMsgFail

Description

A condition has been detected that may interest a developer analyzing some system behavior at a more verbose level than provided by the debug summary information.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

%format%

lldp.IdmgrEvent

Description

This message is logged when LLDP sends an event to Identity Manager.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Send event %event% to IdMgr for port %port%, mac %mac%, device %device%

Message Parameters

| Name | Type |
|--------|----------|
| event | String |
| port | SlotPort |
| mac | MAC |
| device | xInt32 |

Ildp.Dot1brEvent

Description

This message is logged when LLDP sends an event to Dot1br.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

Send event %event% to Dot1br for port %port%, mac %mac%

Message Parameters

| Name | Type |
|-------|----------|
| event | String |
| port | SlotPort |
| mac | MAC |

Ildp.RemMgmtAddrVLANNotExist

Description

The VLAN configured in LLDP management-address configuration got deleted. So removing LLDP management-address configuration.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Unconfigured Management Address because the VLAN was Deleted

Ildp.RemMgmtAddrPrimNotExist

Description

No primary IP addresses exists on the configured VLAN of LLDP management-address configuration. So removing LLDP management-address configuration.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Unconfigured Management Address because the Primary IP was Removed

Ildp.RemMgmtAddrSecNotExist

Description

The configured secondary IP address does not exists on the configured VLAN of LLDP management-address configuration. So removing LLDP management-address configuration.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Unconfigured Management Address because the Secondary IP was Removed

Ildp.AllocMemFail

Description

Memory for the displayed object could not be allocated which may be due to the system running low on memory. This will result in incorrect operation of the Ildp feature.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory.

Severity

Error

Message Text

Memory allocation failed when trying to allocate a %obj% structure of size %size%.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |
| size | uInt32 |

lldp.DCBX.CfgMisMatchDtect

Description

A configuration mismatch has been detected by DCBX for the given TLV on the given port. When the DCB configuration does not match between peer devices, the DCB feature may not be functioning as expected.

Remedy

View relevant "show lldp dcbx" output for more details on the mismatch. If appropriate, modify relevant DCB parameters to rectify the mismatch.

Severity

Warning

Message Text

Configuration mismatch detected by DCBX (%dcbxVersion%) for the %tlvName% TLV on port %slotPort%.

Message Parameters

| Name | Type |
|-------------|----------|
| dcbxVersion | String |
| tlvName | String |
| slotPort | SlotPort |

lldp.DCBX.CfgMisMatchRslv

Description

A previously reported configuration mismatch has been resolved. The configuration now matches, and the DCB feature should be operating properly.

Remedy

No action required -- Notification message only.

Severity

Notice

Message Text

Configuration mismatch resolved by DCBX (%dcbxVersion%) for the %tlvName% TLV on port %slotPort%.

Message Parameters

lldp.FA.TmoutPortDev

Description

The Fabric Attach element on the specified port has timed out due to inactivity. This happens because no valid FA Element TLVs were received on the port during the 4-minute timeout interval.

Remedy

No action required - Notification message only.

Severity

Info

Message Text

The Fabric Attach element on port %port% has timed out due to inactivity.

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

lldp.FA.CfgNSIAldySet

Description

An attempt was made to configure a Network Service Identifier (NSI) on a VLAN where an NSI value is already set.

Remedy

Remove the existing NSI before setting a new value.

Severity

Error

Message Text

Unable to set NSI %newNsi%, on VLAN %vlan%, NSI %oldNsi% is already set.

Message Parameters

| Name | Type |
|--------|----------|
| newNsi | uInt32 |
| oldNsi | uInt32 |
| vlan | VLAN-tag |

lldp.FA.CreatMgmtVLAN

Description

The Fabric Attach (FA) management VLAN specified was created in the specified VR, and all ports with an active FA element have been added to the management VLAN. This occurs on an FA Proxy if a management VLAN is provided by the FA Server or on an FA Server when the management VLAN is configured. In either case, the management VLAN ID is communicated to all connected FA elements.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Created management VLAN %vlan% in VR %vr%.

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |
| vr | VR |

Ildp.FA.EnterSrvrMode

Description

Fabric Attach transitioned from an FA Proxy to an FA Server. This will occur either because a Local Tunnel End Point (LTEP) was created, indicating a connection to VxLAN fabric OR because BGP Auto-peering has been configured.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Entering Fabric Attach Server mode.

Ildp.FA.EnterProxyMode

Description

Fabric Attach transitioned from an FA Client to an FA Proxy. This occurs when a FA Client discovers a FA Server.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Entering Fabric Attach Proxy mode.

Ildp.FA.ElemTypeChg

Description

The Fabric Attach element type received on the specified port, has changed. This may be due to the discovery of a new FA element or because FA authentication has been

enabled or disabled on an already discovered element (for example "Proxy (No Auth)" to/from "Proxy").

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Element type changed from %oldElement% to %newElement% on port %port%

Message Parameters

| Name | Type |
|------------|----------|
| newElement | VLAN-tag |
| port | SlotPort |
| oldElement | uInt8 |

Ildp.FA.AddPortToVLANFail

Description

An attempt was made to add a list of ports to a VLAN, but the operation did not succeed.

Remedy

The CLI command "show vlan fabric attach assignments" will display VLAN and NSI values known to Fabric Attach for each port. Output from the "show vlan <vlan>" command will include a list of ports that have been added to that VLAN. From these, it is possible to determine which port(s) did not get added, though unless the VLAN manager logs a message, there is no way to tell why the failure occurred.

Severity

Warning

Message Text

Failed to add %numPorts% ports to VLAN %vlanTag%.

Message Parameters

| Name | Type |
|----------|----------|
| vlanTag | VLAN-tag |
| numPorts | sInt32 |

Ildp.FA.DelPortFmVLANFail

Description

An attempt was made to remove a list of ports from a VLAN, but the operation did not succeed.

Remedy

The CLI command "show vlan fabric attach assignments" will display VLAN and NSI values known to Fabric Attach for each port . Output from the "show vlan <vlan>" command will include a list of ports that have been added to that VLAN. From these, it is possible to determine which port(s) did not get removed, though unless the VLAN manager logs a message, there is no way to tell why the failure occurred.

Severity

Warning

Message Text

Failed to remove %numPorts% ports from VLAN %vlanTag%

Message Parameters

| Name | Type |
|----------|----------|
| vlanTag | VLAN-tag |
| numPorts | ulnt |

Ildp.FA.DelAssgnNotInuse

Description

The specified dynamic assignment of the Network Service Identifier (NSI) to the VLAN has timed out because the FA Client on that port has not requested it during the timeout period. If the port is a server port, then the assignment is removed when no client has requested it on any port during the timeout period.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Deleted assignment of NSI %nsi% to VLAN %vlanTag% on %portType% port %port% due to inactivity.

Message Parameters

| Name | Type |
|----------|----------|
| vlanTag | VLAN-tag |
| nsi | uInt32 |
| portType | String |
| port | SlotPort |

lldp.FA.EnterClntMode

Description

Fabric Attach transitioned to an FA Client. Fabric Attach will operate as a Client unless it detects a FA Server or is configured to become an FA server.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Entering Fabric Attach Client mode.

lldp.FA.AssgnNSIVLANRejct

Description

Either another NSI has already been assigned to this VLAN or the specified NSI has already been assigned to another VLAN. This indicates a misconfiguration that must be corrected before the system can function as desired.

Remedy

Verify that the VLAN/NSI assignment reflected in this message is correct. If so, display the current VLAN/NSI assignments (show fabric attach assignments) and look for an assignment of the specified VLAN to a different NSI, or the specified NSI to a different VLAN. Note the port number of that conflicting assignment and correct the configuration of the device on that port. If no port number is listed for the conflicting entry then the configuration was entered by Policy, RADIUS, VLAN CLI or OTM CLI. If no conflict is found, then another device connected to the FA Server has requested a conflicting assignment. Repeat this process on the server to identify the conflicting device.

Severity

Warning

Message Text

Fabric Attach assignment of NSI %nsi% to VLAN %vlanTag% has been rejected.

Message Parameters

| Name | Type |
|---------|----------|
| nsi | uInt32 |
| vlanTag | VLAN-tag |

lldp.FA.PeerModeCflct

Description

MLAG peers should be in the same fabric attach mode. This may indicate a transient condition, which can occur during configuration or boot of one or both of the MLAG peers. If the condition persists after both peers have been operational for more than the LLDP transmit interval (default 30 seconds), then one of the peers is likely misconfigured.

Remedy

All Fabric Attach (FA) devices start in client mode and communicate with other FA devices using LLDP. Transition to a proxy occurs when the client receives communication from a FA server. A FA server must be configured, either by creating a Local Tunnel End Point (LTEP) or enabling auto-peering; this configuration should be the same in both peers. The "show fabric attach elements" command will display a list of known FA devices, verify that the expected devices are seen by each peer.

Severity

Error

Message Text

Fabric attach %mode1% mode conflicts with fabric attach %mode2% mode on MLAG peer %peerName%.

Message Parameters

| Name | Type |
|----------|--------|
| mode1 | String |
| mode2 | String |
| peerName | String |

lldp.VSM.CIntInitFail

Description

Initialization of LLDP with VSM module has failed. In such a case MLAG functionality with respect to dot1br extended ports will not function properly.

Remedy

This is a rare condition which may be related to software, and may require a reboot to correct the problem.

Severity

Error

Message Text

VSM client initialization failed, Error = %err%

Message Parameters

| Name | Type |
|------|------|
| err | sInt |

lldp.VSM.CreatISC

Description

This is a debug message indicating that an ISC is being created.

Remedy

No action required -- Information message only.

Severity

Debug-Summary

Message Text

Create ISC for index %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

lldp.VSM.DelISC

Description

This is a debug message indicating that an ISC is being deleted.

Remedy

No action required -- Information message only.

Severity

Debug-Summary

Message Text

Deleting ISC for index %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

lldp.VSM.AllocBufFail

Description

Allocation of checkpoint buffer has failed for the specified ISC (Inter Switch Connection connecting to an MLAG peer). In such a case MLAG functionality with respect to dot1br extended ports will not function properly.

Remedy

This is an internal condition related to software. Check abnormal memory utilization of any process using "show memory". You may need to scale down the configuration related to it.

Severity

Error

Message Text

Unable to allocate IPML buffer for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

Ildp.VSM.AllocAppDataFail

Description

Allocation of application specific data buffer has failed for the specified ISC (Inter Switch Connection connecting to an MLAG peer). In such a case MLAG functionality with respect to dot1br extended ports will not function properly.

Remedy

This is an internal condition related to software. Check abnormal memory utilization of any process using "show memory". You may need to scale down the configuration related to it.

Severity

Error

Message Text

Unable to allocate ISC-specific global information for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

Ildp.VSM.CreatCkptTxTimer

Description

This is a debug message indicating that a timer which is used for transmitting checkpoint messages is created. This message will appear when the first ISC is being created.

Remedy

No action required -- Information message only.

Severity

Debug-Summary

Message Text

Checkpoint Tx timer created

lldp.VSM.DelCkptTxTimer

Description

This is a debug message indicating that the timer used for transmitting checkpoint messages is deleted. This message will appear when the last ISC is being deleted.

Remedy

No action required -- Information message only.

Severity

Debug-Summary

Message Text

Checkpoint Tx timer deleted

lldp.VSM.NtfyMLAGStateChg

Description

This is a debug message indicating that parameters relating to an MLAG have changed.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

MLAG state change notification for index %mlag%, ISC %isc%, remote port state %state%

Message Parameters

| Name | Type |
|-------|--------|
| mlag | uInt16 |
| isc | uInt16 |
| state | sInt |

lldp.VSM.GetLocMLAGPortInstcFail

Description

This message indicates that an attempt to get the port instance value for an MLAG from VSM has failed.

Remedy

This is a rare condition which may be related to software, and may require a reboot to correct the problem.

Severity

Error

Message Text

Unable to get local port instance for MLAG %mlag%, Error = %err%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| err | sInt |

lldp.VSM.MLAGPortInstcInv

Description

This message indicates that the port instance value for the specified MLAG is invalid.

Remedy

This is a rare condition which may be related to software, and may require a reboot to correct the problem.

Severity

Error

Message Text

Invalid port instance for MLAG %mlag%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |

lldp.VSM.GetLocMLAGPortStateFail

Description

This message indicates that an attempt to get the local MLAG port state from VSM has failed.

Remedy

This is a rare condition which may be related to software, and may require a reboot to correct the problem.

Severity

Error

Message Text

Unable to get local port state for MLAG %mlag%, Error = %err%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| err | sInt |

Ildp.VSM.IgnCkptMsgUnkOwner

Description

This message indicates that the received checkpoint message is being ignored since the owner field in the packet header is not valid.

Remedy

Ensure the EXOS versions on the M-LAG peers are compatible. One of the M-LAG may require an upgrade to a more recent version of EXOS.

Severity

Debug-Data

Message Text

Ignore checkpoint message, invalid owner role = %role%

Message Parameters

| Name | Type |
|------|-------|
| role | ulnt8 |

Ildp.VSM.IgnCkptTLV

Description

This is a debug message which indicates that a checkpoint message of unknown type is not being processed.

Remedy

No action required -- Information message only.

Severity

Debug-Verbose

Message Text

Ignore Checkpoint TLV, invalid type %type% on ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| type | uInt16 |

lldp.VSM.IgnPktUnkPortType

Description

This is a debug message which indicates that a LLDP packet of unknown portType is not being processed.

Remedy

No action required -- Information message only.

Severity

Debug-Verbose

Message Text

Ignore LLDP packet, invalid portType %type% on ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| type | uInt16 |

lldp.VSM.AllocCkptMsgFail

Description

This message indicates that an attempt to allocate a buffer to hold the checkpoint message has failed.

Remedy

This is an internal condition related to software. Check abnormal memory utilization of any process using "show memory". You may need to scale down the configuration related to it.

Severity

Error

Message Text

Failed to allocate checkpoint message buffer for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

Ildp.VSM.MLAGStrtCkpt

Description

This is a debug message which indicates that bulk checkpoint has started for the specified MLAG.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Start Checkpoint for MLAG %mlag%, ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| isc | uInt16 |

Ildp.VSM.StrtCkpt

Description

This is a debug message which indicates that bulk checkpoint has started for the specified MLAG.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Start Checkpoint for %port%, ISC %isc%

Message Parameters

| Name | Type |
|------|-----------------|
| port | ingressSlotPort |
| isc | uInt16 |

lldp.VSM.TxChkptMsg

Description

This is a debug message which indicates a checkpoint message has been transmitted to an MLAG peer.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Tx checkpoint message %len% bytes on ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| len | uInt16 |

lldp.VSM.RxCkptMsg

Description

This is a debug message which indicates a checkpoint message has been received from an MLAG peer.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Rx checkpoint message %len% bytes on ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| len | uInt16 |

lldp.VSM.RxLLDPPkt

Description

This is a debug message which indicates a LLDP packet has been received from an MLAG peer.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Rx LLDP packet %len% bytes for ISC %isc% INPORT %port%

Message Parameters

| Name | Type |
|------|-----------------|
| isc | uInt16 |
| len | uInt16 |
| port | ingressSlotPort |

lldp.VSM.TxLLDPPkt

Description

This is a debug message which indicates a LLDP packet has been transmitted to an MLAG peer.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Tx LLDP packet %len% bytes for ISC %isc% INPORT %port%

Message Parameters

| Name | Type |
|------|-----------------|
| isc | uInt16 |
| len | uInt16 |
| port | ingressSlotPort |

lldp.VSM.IgnCkptMsgUnkVer

Description

This message indicates that the received checkpoint message is being ignored since the version is not compatible with the running version.

Remedy

Ensure the EXOS versions on the M-LAG peers are compatible. One of the M-LAG may require an upgrade to a more recent version of EXOS.

Severity

Debug-Data

Message Text

Ignore checkpoint message, unknown version %rxVer%, supported version %ver%

Message Parameters

| Name | Type |
|-------|--------|
| rxVer | uInt16 |
| ver | uInt16 |

lldp.VSM.TxNSIPkt

Description

This is a debug message which indicates a NSI packet has been transmitted to an MLAG peer over the given ISC for the given MLAG index.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Tx NSI packet %len% bytes for ISC %isc% MLAG %mlag%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| len | uInt16 |
| mlag | uInt16 |

lldp.VSM.RxNSIPkt

Description

This is a debug message which indicates a NSI packet has been received from an MLAG peer over the given ISC for the given MLAG index.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Rx NSI packet %len% bytes for ISC %isc% MLAG %mlag%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| len | uInt16 |
| mlag | uInt16 |

lldp.VSM.TxGetNSI

Description

This is a debug message which indicates a get NSI request has been transmitted to an MLAG peer.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Tx Get NSI for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

Ildp.VSM.RxGetNSI

Description

This is a debug message which indicates a get NSI request has been received from an MLAG peer.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Rx Get NSI for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

Ildp.VSM.TxFAInfo

Description

This is a debug message which indicates that FA info has been transmitted to an MLAG peer.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Tx FA Info for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

lldp.VSM.RxFAInfo

Description

This is a debug message which indicates that FA info has been received from an MLAG peer.

Remedy

No action required -- Information message only.

Severity

Debug-Data

Message Text

Rx FA Info for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

log.ClientBufOvrfl

Description

This message gets logged when a client registered with the server, and has lost messages due to buffer overrun.

Remedy

No remedy is available.

Severity

Warning

Message Text

%client% dropped %num% messages before registration was finished.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| num | ulnt |

log.unregReq

Description

This message indicates a client has requested to unregister a component.

Remedy

This is an informational debug message.

Severity

Debug-Summary

Message Text

Received component unregistration request from \"%name%\"[%chassis%.%slot%.%pid%]
for \"%comp%\"

Message Parameters

| Name | Type |
|---------|--------|
| comp | String |
| name | String |
| chassis | ulnt |

| Name | Type |
|------|------|
| slot | ulnt |
| pid | ulnt |

log.regReq

Description

This message indicates a client has requested to register a component.

Remedy

This is an informational debug message.

Severity

Debug-Summary

Message Text

Received component registration request from \"%name%\"[%chassis%.%slot%.%pid%] for \"%comp%\" v%format%.%content%

Message Parameters

| Name | Type |
|---------|--------|
| comp | String |
| name | String |
| chassis | ulnt |
| slot | ulnt |
| pid | ulnt |
| format | ulnt |
| content | ulnt |

log.regFinAck

Description

This message indicates the server has acknowledged a component registration.

Remedy

This is an informational debug message.

Severity

Debug-Summary

Message Text

Transmitted component regFinAck[%oldIndex%:%newIndex%] for \"%comp%\" to client \"%name%\", peer %peer%

Message Parameters

| Name | Type |
|----------|--------|
| comp | String |
| name | String |
| peer | uInt |
| oldIndex | sInt |
| newIndex | sInt |

log.NVRAM_Reset

Description

When the NVRAM memory header or it's records are found incorrect the NVRAM Log header will be reseted.

Remedy

This will happen when the NVRAM was not used before, or due to an NVRAM layout change.

Severity

Info

Message Text

The NVRAM target log message storage header has been reset.

log.NVRAM_Update

Description

The log facility was unable to update the NVRAM LOG header to the NVRAM.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with outputs of "show tech" and "run diags".

Severity

Error

Message Text

Unable to update the NVRAM target log message storage header [return error: %errMsg%].

Message Parameters

| Name | Type |
|--------|--------|
| errMsg | String |

log.NVRAM_Validate

Description

The log facility failed to validate the newly created NVRAM Log header. The following header info are checked: signature, size, start offset and end offset.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with outputs of "show tech" and "run diags".

Severity

Error

Message Text

Updated NVRAM Log header failed validation [%signature%, %size%, %startOffset%, %endOffset%].

Message Parameters

| Name | Type |
|-------------|--------|
| signature | xInt32 |
| size | ulnt |
| startOffset | ulnt |
| endOffset | ulnt |

log.NVRAM_Init

Description

The NVRAM target was successfully initialized.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

The NVRAM target was successfully initialized.

log.serverStarted

Description

This message gets displayed when the emsServer starts.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

The Event Management System logging server has started.

log.clientNew

Description

This message indicates a client has connected to the server.

Remedy

This is an informational message.

Severity

Debug-Summary

Message Text

A new client application has connected to the server with peer ID %peer%

Message Parameters

| Name | Type |
|------|------|
| peer | uInt |

log.clientID

Description

This message indicates a client has connected to the server.

Remedy

This is an informational message.

Severity

Debug-Summary

Message Text

Received CLIENT_ID from client with peer ID %peer%: %name% [%chassis%.%slot%.%pid%]

Message Parameters

| Name | Type |
|---------|--------|
| peer | ulnt |
| name | String |
| chassis | ulnt |
| slot | ulnt |
| pid | ulnt |

log.clientDead

Description

This message indicates a client was disconnected from the log server

Remedy

This is an informational message.

Severity

Debug-Summary

Message Text

Client %name% [%chassis%.%slot%.%pid%] with peer ID %peer% has died

Message Parameters

| Name | Type |
|---------|--------|
| peer | ulnt |
| name | String |
| chassis | ulnt |
| slot | ulnt |
| pid | ulnt |

log.noBuffer

Description

The log server is unable to allocate an ipml packet for sending an internal message.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Error

Message Text

Unable to allocate a buffer for sending a %packetType% packet.

Message Parameters

| Name | Type |
|------------|--------|
| packetType | String |

log.dupClient

Description

The specified client is trying to register itself twice. The following parameters are shown in message: process name, incoming client peer ID, existing client peer ID, chassis ID, slot ID and process ID.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Warning

Message Text

Duplicate client registration detected for client %name%
[%peerOne%.%peerTwo%.%chassis%.%slot%.%pid%]

Message Parameters

| Name | Type |
|---------|--------|
| name | String |
| peerOne | ulnt |

| Name | Type |
|---------|------|
| peerTwo | ulnt |
| chassis | ulnt |
| slot | ulnt |
| pid | ulnt |

log.maxDupComp

Description

A given filter item can only be subscribed to a maximum number of component. If more components with the same name but with different versions exists the mentioned filters might not be functioning correctly.

Remedy

This should normally not happen as filters are being removed when this limitation is reached. Check with the "show log component" command to see if the limitation is hit. One reason for this to happen is that not all applications in the system are upgraded and therefore more versions could exist. Try restarting the log server.

Severity

Error

Message Text

More than %num% versions of the \"%comp%\" component exist, causing filter \"%filter%\" not to be initialized correctly.

Message Parameters

| Name | Type |
|--------|--------|
| num | ulnt |
| comp | String |
| filter | String |

log.syslogSocket

Description

The log server was unable to allocate a system socket for communication with syslog servers.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Error

Message Text

Unable to allocate system socket for syslog server communication [%errMsg%].

Message Parameters

| Name | Type |
|--------|--------|
| errMsg | String |

log.syslogBind

Description

The log server was unable to bind UDP or TCP port to the syslog client.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Error

Message Text

Unable to bind syslog client socket to address %sockaddr% port %port% [%error%]

Message Parameters

| Name | Type |
|----------|----------|
| sockaddr | SockAddr |
| port | L4port |
| error | String |

log.syslogVRID

Description

The log server was unable to assign the correct VR ID for the syslog client.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Error

Message Text

Unable to set VR ID %vrid% for syslog client socket [%error%]

Message Parameters

| Name | Type |
|-------|--------|
| vrid | VRID |
| error | String |

log.dumpClient

Description

This message will tell the user which clients have registered for a specific component library in memory.

Remedy

These messages get generated when component information is requested from the shell, and a filter is setup to include them.

Severity

Debug-Data

Message Text

Component \"%component%\" v%formatVer%.%contentVer% has registered client
 \"%clientName%\" peerID %clientPeer%

Message Parameters

| Name | Type |
|------------|--------|
| component | String |
| formatVer | ulnt |
| contentVer | ulnt |
| clientName | String |
| clientPeer | ulnt |

log.compClients

Description

This indicates that too many identical components are registered, but garbage collection failed. The reason for this is that these duplicate components are actually being used by applications.

Remedy

Figure out which applications are still using an older version of the component and upgrade those applications. This can be done by enabling the "log.dumpClient" message (don't forget to "enable log debug-mode"), and do a "show log components". The log will now contain a list of debug messages telling you which client is using which component.

Severity

Error

Message Text

More than %maxclients% versions of \"%component%\" are registered. Reduction failed; too many registered clients [%clients%]

Message Parameters

| Name | Type |
|------------|--------|
| maxclients | ulnt |
| component | String |
| clients | ulnt |

log.compLog

Description

When trying to reduce the number of identical components from the system this version could not be removed as log messages were still in the memory-buffer target.

Remedy

This could cause problems for filtering, and you can either stop/start the log server, or the specific application using the component (after you did a "clear log"). See compClients for information on how to obtain the component owner.

Severity

Error

Message Text

Component \"%component%\" v%formatVer%.%contentVer% could not be removed, as it has pending log messages.

Message Parameters

| Name | Type |
|------------|--------|
| component | String |
| formatVer | ulnt |
| contentVer | ulnt |

log.compRemoved

Description

This message indicates this version of the component has been removed from the system due to garbage collection.

Remedy

Nothing, this is normal behavior.

Severity

Info

Message Text

Component \"%component%\" v%formatVer%.%contentVer% has been removed from the system.

Message Parameters

| Name | Type |
|------------|--------|
| component | String |
| formatVer | ulnt |
| contentVer | ulnt |

log.compRegFailed

Description

This indicates that too many identical components are registered, but garbage collection failed. The reason for this is that these components still have messages in the memory-target.

Remedy

See "log.compLog" for more information.

Severity

Error

Message Text

More than %maxclients% versions of \"%component%\" are registered. Reduction failed; memory-target

Message Parameters

| Name | Type |
|------------|--------|
| maxclients | ulnt |
| component | String |

log.tftpSend

Description

This is a debug message than can be used to debug tftp log uploads. This should only be enabled when requested by the Extreme Networks support organization.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

emsTftpSend(%ip%, %port%, %size%, %replyOpcode%) called.

Message Parameters

| Name | Type |
|-------------|------|
| ip | IPN |
| port | ulnt |
| size | ulnt |
| replyOpcode | ulnt |

log.tftpOut

Description

This is a debug message than can be used to debug tftp log uploads. This should only be enabled when requested by the Extreme Networks support organization.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Outgoing tftp packet to %ip%:%port% size %size% bytes

Message Parameters

| Name | Type |
|------------|---------|
| ip | IPN |
| port | ulnt |
| size | ulnt |
| outpacketp | Buf-ptr |
| packetlen | Buf-len |

log.tftpIn

Description

This is a debug message than can be used to debug tftp log uploads. This should only be enabled when requested by the Extreme Networks support organization.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Incoming tftp packet from %ip%:%port% size %size% bytes

Message Parameters

| Name | Type |
|-----------|---------|
| ip | IPN |
| port | ulnt |
| size | ulnt |
| inpacketp | Buf-ptr |
| packetlen | Buf-len |

log.tftpTimeout

Description

This is a debug message than can be used to debug tftp log uploads. This should only be enabled when requested by the Extreme Networks support organization.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Timeout when waiting for %ip%:%port%

Message Parameters

| Name | Type |
|------|------|
| ip | IPN |
| port | ulnt |

log.tftpError

Description

This is a debug message than can be used to debug tftp log uploads. This should only be enabled when requested by the Extreme Networks support organization.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Received error on %ip%:%port% error %error%, \"%errorMsg%\"

Message Parameters

| Name | Type |
|----------|--------|
| ip | IPN |
| port | ulnt |
| error | ulnt |
| errorMsg | String |

log.uplLogStart

Description

This message gets logged as a result of the "upload log command".

Remedy

This is an informational message.

Severity

Info

Message Text

Start uploading log to %ip%, remote file name \"%file%\"

Message Parameters

| Name | Type |
|------|--------|
| ip | IPN |
| file | String |

log.uplLogFinished

Description

This message gets logged as a result of the "upload log command".

Remedy

This is an informational message.

Severity

Info

Message Text

Finished uploading log to %ip%, remote file name \"%file%\"

Message Parameters

| Name | Type |
|------|--------|
| ip | IPN |
| file | String |

log.uplLogError

Description

This message gets logged due to an error as a result of the "upload log command".

Remedy

If the information reported by this message is not clear enough, try to enable the tftp* debug messages.

Severity

Error

Message Text

Error uploading log to %ip%, remote file name \"%file%\": %error%

Message Parameters

| Name | Type |
|-------|--------|
| ip | IPN |
| file | String |
| error | String |

log.initFilter

Description

During initialization, the log server initializes the DefaultFilter to its default configuration which includes a rule to allow all components to log message at their respective FactoryThreshold: Log Filter Name: DefaultFilter I/ Severity E Component SubComponent Condition CEWNISVD - ----- I All ***** The log server causes this event if there is not sufficient memory to allocate for the filter and the rule, or if some other internal inconsistency occurs which prevents the log server from successfully completing the default configuration of the DefaultFilter. The log server will continue to operate despite this condition, although its functionality will be very limited. In particular, there may be no DefaultFilter at all, and it may not even be possible for this event message to be logged.

Remedy

There is no specific work-around if this condition does occur - it is most likely the result of some internal inconsistency or the overallocation of memory either by the log server or some other process. The output from the "show log configuration filter" and the "show memory" commands should be obtained to help in trouble-shooting this problem.

Severity

Error

Message Text

The log server was unable to initialize the default filter configuration

log.initTarget

Description

During initialization, the log server minimally initializes the memory-buffer, nvram, and console log targets to their default configurations. * (pacman debug) Slot-2 Stack.3 # show log configuration target Log Target : memory-buffer Enabled : yes Filter Name : DefaultFilter Match regex : Any Severity : Debug-Data (through Critical) Format : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition> Slot: Buffer size : 1000 messages Log Target : nvram Enabled : yes Filter Name : DefaultFilter Match regex : Any Severity : Warning (through Critical) Format : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition> Slot: Log Target : console Enabled : yes Filter Name : DefaultFilter Match regex : Any Severity : Info (through Critical) Format : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition> Slot: The log server causes this event if there is not sufficient memory to allocate for these targets, or if some other internal inconsistency occurs which prevents the log server from successfully

completing setting their default configuration. The log server will continue to operate despite this condition, although its functionality will be very limited. In particular, there may be no log targets at all, and it may not even be possible for this event message to be logged.

Remedy

There is no specific work-around if this condition does occur - it is most likely the result of some internal inconsistency or the overallocation of memory either by the log server or some other process. The output from the "show log configuration target" and the "show memory" commands should be obtained to help in trouble-shooting this problem.

Severity

Error

Message Text

The log server was unable to initialize the default target configuration

log.sendClrCounters

Description

Debug message indicating we have requested to clear the event counters for the specified component.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Send clear counters request to %app% for %comp%.%event% severity %sev%.

Message Parameters

| Name | Type |
|------|--------|
| app | String |
| comp | String |

| Name | Type |
|-------|--------|
| event | String |
| sev | xInt |

log.recvCounter

Description

This log message will tell you how many times the specified event has occurred for the mentioned application.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Received count value of %count% from %app% for %comp%.%event%.

Message Parameters

| Name | Type |
|-------|--------|
| app | String |
| comp | String |
| event | String |
| count | uInt |

log.NVRAM_Failed

Description

During NVRAM target initialization, log messages are first read from NVRAM, then written into memory buffer.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with outputs of "show tech" and "run diags".

Severity

Error

Message Text

The NVRAM target failed initialization.

log.NVRAM_Corrupted

Description

The current NVRAM content is corrupted, NVRAM needs to be reinitialized.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with outputs of "show tech" and "run diags".

Severity

Error

Message Text

Current NVRAM content is corrupted.

log.AlertMbufTrgtPrcntFull

Description

The percent full alert for the memory-buffer has been configured and the percent full threshold for the alert has been met. When the memory-buffer becomes full, it starts wrapping. The oldest messages will be replaced by the new ones.

Remedy

When the memory-buffer becomes full, it starts wrapping. The oldest messages will be replaced by the new ones. To avoid possible message loss, please use "configure log target memory-buffer number-of-messages" command to increase the buffer size.

Severity

Notice

Message Text

The memory-buffer log target is %percent%% full with %numOfMsg% of a possible %bufSize% messages currently logged.

Message Parameters

| Name | Type |
|----------|------|
| percent | ulnt |
| numOfMsg | ulnt |
| bufSize | ulnt |

log.Shutdown

Description

This event occurs when the EMS server receives a shutdown request from EPM.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

The Event Management System logging server is shutting down.

log.SyslogSSLFail

Description

Fail to establish SSL connection to syslog server. The reason for SSL failure is described in one of the following messages: "Can't allocate system resources to execute command.", "Certificate not found. Use 'Download ssl certificate' command to download a certificate.", "Private Key not found. Use 'Download ssl privkey' command to download a private key.", "CA Certificate not found. Use 'Download ssl certificate trusted-ca' command to download a CA certificate.", "Can't setup socket.", "Can't init SSL library.", "Can't create SSL CTX.", "Can't set file status flags.", "Invalid parameter.", "Can't load CA certificate.", "Can't load certificate.", "Can't load private key.", "Can't create SSL.", "Can't create BIO.", "Can't dispatch connect process.", "Dispatch timeout.", "Can't connect to syslog server.", "Can't connect to syslog server with SSL.", "Invalid connect state.", "Can't get syslog server certificate.", "Syslog server certificate purpose check failed.", "Server authentication purpose not found in extendedKeyUsage field in

syslog server certificate.", "digitalSignature bit not set in keyUsage field in syslog server certificate.", "Can't start OCSP revocation check.", "OCSP revocation check failed."

Remedy

Resolve specific cause for the connection failure.

Severity

Error

Message Text

Syslog SSL connection(%dstIP%:%tlsPort%) failed: %errString%

Message Parameters

| Name | Type |
|-----------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |
| errString | String |

log.SyslogSSLCnctFail

Description

Fail to establish SSL connection to syslog server.

Remedy

Resolve specific cause for the connection failure.

Severity

Error

Message Text

Syslog SSL connection(%dstIP%:%tlsPort%) failed: %cmErrStr% %fncName% returned \"%errStr%\".

Message Parameters

| Name | Type |
|----------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |
| cmErrStr | String |
| fncName | String |
| errStr | String |

log.SyslogSSLOCSPFail

Description

OCSP check failed

Remedy

Resolve specific cause for the ocsf failure.

Severity

Error

Message Text

Syslog SSL connection(%dstIP%:%tlsPort%) failed: %cmErrStr% at depth %depth%.
%fncName% returned \"%errStr%\".

Message Parameters

| Name | Type |
|----------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |
| cmErrStr | String |
| fncName | String |
| errStr | String |
| depth | sInt |

log.SyslogSSLCnctEstb

Description

SSL connection to syslog server is successfully established.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Syslog SSL connection(%dstIP%:%tlsPort%) established.

Message Parameters

| Name | Type |
|---------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |

log.SyslogSSLRecnctStrt

Description

Automatic periodic SSL reconnection to syslog server has started.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Starting syslog SSL reconnection(%dstIP%:%tlsPort%) timer with an initial period of %timerPeriod% seconds.

Message Parameters

| Name | Type |
|-------------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |
| timerPeriod | uInt |

log.SyslogSSLCnctLost

Description

SSL connection to syslog server is lost.

Remedy

Wait for network connection to resume or fix any problem that has brought down network connection between switch and syslog server.

Severity

Error

Message Text

Syslog SSL connection(%dstIP%:%tlsPort%) is lost.

Message Parameters

| Name | Type |
|---------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |

log.SyslogSSLMsgQueFull

Description

Internal message queue for syslog SSL connection has exceeded its predefined limit. New messages will be dropped.

Remedy

Check if SSL connection is successfully established. If not, resolve problems that cause the connection failure.

Severity

Warning

Message Text

Message Queue for syslog SSL connection(%dstIP%:%tlsPort%) is full, dropping new messages.

Message Parameters

| Name | Type |
|---------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |

log.SyslogSSLAddDsptchFail

Description

Could not add the given socket to dispatcher.

Remedy

Try to replicate this issue and report it to Extreme Networks technical support center.

Severity

Error

Message Text

Failed to add socket %socket% for syslog SSL connection(%dstIP%:%tlsPort%) to dispatcher.

Message Parameters

| Name | Type |
|---------|---------|
| socket | sInt |
| dstIP | IPAddrN |
| tlsPort | uInt16 |

log.SyslogSSLStrtTimerFail

Description

Failed to start timer for syslog SSL reconnection.

Remedy

Check the switch memory statistics. Otherwise reboot switch.

Severity

Error

Message Text

Failed to start timer for syslog SSL connection(%dstIP%:%tlsPort%).

Message Parameters

| Name | Type |
|---------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |

log.SyslogSSLWritFail

Description

SSL_write failed.

Remedy

No action required - dispatch will call SSL_write again.

Severity

Warning

Message Text

SSL Write to syslog server (%dstIP%:%tlsPort%) failed.

Message Parameters

| Name | Type |
|---------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |

log.EnbIFIPSMoDeFail

Description

Unable to properly configure crypto lib with FIPS mode enabled.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Error

Message Text

Failed to enable FIPS mode: %errString%

Message Parameters

| Name | Type |
|-----------|--------|
| errString | String |

log.EnbIFIPSMoDeOK

Description

FIPS mode is enabled in EMS process.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Self-Test passed. FIPS mode enabled.

log.NVRAMFull

Description

NVRAM is full, old messages will be deleted to create space for new messages.

Remedy

User can download event logs stored in NVRAM via TFTP using "upload log" command, then delete the logs using "clear log" command.

Severity

Warning

Message Text

NVRAM is full, old messages are overwritten.

log.CfgGlob

Description

Global log configuration is changed by issuing one of the following commands:
"configure log message privilege [admin | user]" "[enable | disable]" log debug-mode"

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Global log configuration changed.

log.CreatTrgt

Description

Log target is created.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Log target %targetName% is created.

Message Parameters

| Name | Type |
|------------|--------|
| targetName | String |

log.CfgTrgt

Description

Log target configuration has been changed.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Log target %targetName% configuration changed.

Message Parameters

| Name | Type |
|------------|--------|
| targetName | String |

log.CreatFilt

Description

Log filter is created.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Log filter %filterName% is created.

Message Parameters

| Name | Type |
|------------|--------|
| filterName | String |

log.CfgFilt

Description

Log filter configuration has been changed.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Log filter %filterName% configuration changed.

Message Parameters

| Name | Type |
|------------|--------|
| filterName | String |

log.SyslogSSLCnctTerm

Description

SSL connection to syslog server is terminated by disabling all targets that share the same connection.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Syslog SSL connection(%dstIP%:%tlsPort%) terminated.

Message Parameters

| Name | Type |
|---------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |

log.RslvHostNameFail

Description

Hostname to IP address lookup failed.

Remedy

Check switch DNS configuration. "configure dns-client add" is used to specify DNS server; "configure dns-client default-domain" is used to specify a default domain when hostname is used without a domain; "ping" command can be used to test DNS functionality.

Severity

Error

Message Text

Can't resolve hostname %hostname% for TFTP log upload.

Message Parameters

| Name | Type |
|----------|--------|
| hostname | String |

log.SyslogSSLParmInv

Description

Fail to establish SSL connection to syslog server due to invalid parmaters passed to connection routines.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Error

Message Text

Syslog SSL connection failed due to invalid internal parameters.

log.CrtfctVrfyFail

Description

SSL certificate verification failed.

Remedy

Resolve specific cause for the certificate verification error.

Severity

Error

Message Text

Syslog SSL certificate verification error: %err% (%errString%)\nCertificate at depth: %depth%\nIssuer: %issuer%\nSubject: %subject%

Message Parameters

| Name | Type |
|-----------|--------|
| err | sInt |
| errString | String |
| depth | sInt |
| issuer | String |
| subject | String |

log.SyslogSSLFailNoReason

Description

Fail to establish SSL connection to syslog server with unknown reason. SSL library did not return a valid error code. One possible scenario is that server closes socket after receiving hello message from client.

Remedy

In certain rare cases, SSL connect could fail with no error returned. Contact technical support with "show tech" output for further assistance.

Severity

Error

Message Text

Syslog SSL connection(%dstIP%:%tlsPort%) failed: %cmErrStr% Unexpected behavior, reason unknown.

Message Parameters

| Name | Type |
|----------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |
| cmErrStr | String |

log.ClrLogMsg

Description

Log messages in memory-buffer or nvram are cleared.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

User %user%: Cleared the log messages in %logTargetName%.

Message Parameters

| Name | Type |
|---------------|-------------|
| user | AccountName |
| logTargetName | String |

log.SyslogSSLOCSPStrtFail

Description

unable to start OCSP check

Remedy

Resolve specific cause for the ocsf failure.

Severity

Error

Message Text

Syslog SSL connection(%dstIP%:%tlsPort%) failed: %cmErrStr% %fncName% returned \"%errStr%\".

Message Parameters

| Name | Type |
|----------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |
| cmErrStr | String |
| fncName | String |
| errStr | String |

log.DelSyslogTrgtVRDel

Description

Syslog target is being deleted because its VR was deleted.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Deleted the syslog target (%dstIP% %portType% %tlsPort% VR %vrName% %local%) because VR %vrName% was deleted.

Message Parameters

| Name | Type |
|----------|---------|
| dstIP | IPAddrN |
| tlsPort | uInt16 |
| portType | String |
| local | String |
| vrName | VR |

log.tftpBlkOptNotSuprt

Description

The blocksize option is not supported by the tftp server. Standard fixed blocksize is used.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

The blocksize option is not supported by the tftp server on %ip%. Blocksize %blkSiz% is used.

Message Parameters

| Name | Type |
|--------|------|
| ip | IPN |
| blkSiz | ulnt |

log.EnbLOCSP

Description

Online Certificate Status Protocol (OCSP) for real-time certificate revocation status checking is enabled.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

OCSP is enabled.

log.DsblOCSP

Description

Online Certificate Status Protocol (OCSP) for real-time certificate revocation status checking is disabled. This is not a recommended configuration.

Remedy

It is recommended to have OCSP enabled for security.

Severity

Warning

Message Text

OCSP is disabled. This switch has no way of knowing if a syslog server's certificate has been revoked.

MACsec Messages

- [MACsec.PortDebugEvent](#) on page 3064
- [MACsec.DebugVerbose](#) on page 3065
- [MACsec.AllocMemFail](#) on page 3065
- [MACsec.RecvUnkMsgType](#) on page 3066
- [MACsec.VLANOperFail](#) on page 3067
- [MACsec.PortFail](#) on page 3067
- [MACsec.BlkPort](#) on page 3068
- [MACsec.UnblkPort](#) on page 3069
- [MACsec.RxEvent](#) on page 3070
- [MACsec.PortMACsecUnSuprt](#) on page 3070

MACsec.PortDebugEvent

Description

A condition has been detected that may interest a developer inspecting the data underlying system behavior.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Generic MACsec debug condition on port %slotPort%: %msg%.

Message Parameters

| Name | Type |
|----------|----------|
| slotPort | SlotPort |
| msg | Printf |

MACsec.DebugVerbose

Description

A condition has been detected that may interest a developer inspecting the data underlying system behavior.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Generic MACsec debug data: %msg%.

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

MACsec.AllocMemFail

Description

An attempt to allocate the specified memory size failed. Memory is used for sending registration messages to the VLAN manager.

Remedy

An unexpected internal error. Contact technical support with output of "show tech".

Severity

Error

Message Text

Memory allocation (%size%, %description%) failure

Message Parameters

| Name | Type |
|-------------|--------|
| size | uInt |
| description | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.RecvUnkMsgType

Description

MACsec received an unknown or unrecognized internal message from the HAL. Messages of unknown type are ignored.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with output of "show tech".

Severity

Warning

Message Text

Received unknown (%msgName%) message with type (%msgType%) from peer (%peerId%)

Message Parameters

| Name | Type |
|---------|--------|
| msgName | String |
| msgType | xInt32 |
| peerId | xInt32 |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.VLANOperFail

Description

PDU's are slow path forwarding due to an error while registering or deregistering MACsec with VLAN or while controlling the blocking state of MACsec. Possible actions include register, deregister, set and bulk-set to the VLAN manager.

Remedy

This may occur if registration with the VLAN protocol failed during initialization; check Protocol ID is valid and check system boot log messages via the command "show log" for any system wide failure. Restarting the process will correct the problem if necessary.

Severity

Error

Message Text

Protocol ID : %protoId% : Failed to %actionStr% Virtual Port Interface state for port %slotPort%

Message Parameters

| Name | Type |
|-----------|----------|
| protold | ulnt |
| actionStr | String |
| slotPort | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.PortFail

Description

Underlying system behavior relating to ports that was expected to work does not.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with output of "show tech".

Severity

Warning

Message Text

On port %slotPort% failed: (%description%)

Message Parameters

| Name | Type |
|-------------|----------|
| slotPort | SlotPort |
| description | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.BlkPort

Description

MACsec control port is down/blocking awaiting authentication. All traffic but MACsec PDUs will be blocked. MACsec is enabled but is waiting on valid key exchange (authentication) with remote port before allowing any other traffic.

Remedy

No action required - Notification message only. If the key exchange does not occur as expected there may be a misconfiguration on the local or remote port.

Severity

Notice

Message Text

Blocking traffic on port %port%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.UnblkPort

Description

MACsec control port is up/unblocked. If another protocol is registered on this port, the port state of that protocol will be used, else MACsec sets the port to the default forwarding state. MACsec will unblock all traffic on the port, however other registered protocols may affect the forwarding state. If no other protocol is registered, MACsec sets the port to the default forwarding state.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Unblocking traffic on port %port%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.RxEvent

Description

Track received events including port events, VLAN events and PDU's received from from peer.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Received %event% event for port %slotport% with EventType [%eventType%]

Message Parameters

| Name | Type |
|-----------|----------|
| event | String |
| slotport | SlotPort |
| eventType | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.PortMACsecUnSuprt

Description

This condition occurs when MAC Security (MACsec) is enabled on a port that does not support encryption. This may occur when an encryption-capable VIM is replaced with a non-encryption VIM

Remedy

If MACsec is desired then install a VIM that is capable of encryption, otherwise disable MACsec on the port.

Severity

Error

Message Text

MACsec is enabled on port %slotport% but port hardware does not support encryption

Message Parameters

| Name | Type |
|----------|----------|
| slotport | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.DupMAC

Description

This message indicates abnormal MKA operation as reported by the MAC Security Key Agreement Entity (KaY). MKA cannot continue because local and remote ports have identical MAC addresses.

Remedy

Each system should have a unique MAC address programmed at the factory. Execute "show system" command and verify "system MAC" matches the MAC address printed on the system's label. Verify that the remote device does not have the same MAC address. Also, all of a system's ports use the same system MAC address. Verify that two ports on the same system are not interconnected.

Severity

Error

Message Text

Misconfiguration detected, cannot elect MKA Key Server on port %slotPort%, local port and peer have same MAC (%mac%).

Message Parameters

| Name | Type |
|----------|----------|
| slotPort | SlotPort |
| mac | MAC |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.DupSCI

Description

A duplicate secure channel identifier is reported by the MAC Security Key Agreement Entity (KaY). The most likely scenario is that the remote peer was initialized and chose a new MI. MKA protocol will recover and accept the new MI. If message persists there may be an attacker trying to spoof remote peer's SCI (Secure Channel Identifier).

Remedy

This condition should be monitored and countermeasures should be made if spoofing is suspected. If the condition persists for more than a minute, verify that the remote system is stable (e.g. not in a reboot loop) and the remote port is stable (i.e. the remote port is not being periodically reinitialized). If the remote is stable, then verify no unauthorized devices are attached to the LAN.

Severity

Notice

Message Text

On port %slotPort%, a duplicate Secure Channel Identifier (SCI) was detected, this may be an active attacker or the peer changed member identifier(MI).

Message Parameters

| Name | Type |
|----------|----------|
| slotPort | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.PortOperUnSuprt

Description

This system does not support the non-default cipher suite that the adjacent device has distributed. The cipher suite selected by the key server must be supported on both the local and peer devices for correct operation.

Remedy

Investigation should be done to understand and correct the discrepancy with the peer. All MACsec-capable Extreme Networks systems support at a minimum, the default MACsec cipher suite(0x0080C20001000001). A possible solution is to raise the local peer's MKA actorPriority (configure macsec mka actor-priority <actor_priority> ports <port_list>) so that it is elected key server and can therefore choose a cipher suite that is supported by this system. If the remote system is not an Extreme Networks product, check that products user manual to determine if the mutually compatible MACsec cipher suite is supported.

Severity

Warning

Message Text

KaY: Rx MKPDU DIST-SAK: On port %slotPort%, the non-default Cipher Suite (%cipherSuite%) distributed by the peer MKA Key Server is not supported.

Message Parameters

| Name | Type |
|-------------|----------|
| slotPort | SlotPort |
| cipherSuite | xInt64 |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.PortSAKDistUnExpct

Description

The Key Server must not generate new SAKs faster than once every MKA Life Time (IEEE802.1X-2010 Clause 9.8). A new SAK was requested faster than this rate, so the request was ignored.

Remedy

This condition is most likely caused by a peer sending sequential MKPDUs with a lowest acceptable packet number (LPN) that exceeds the Key Server's PendingPNExhaustion threshold (0xC0000000 packets). The problem should resolve itself. If this event is logged more than a few times per minute, contact technical support with output from "show tech".

Severity

Notice

Message Text

On port %slotPort%, MKA Life Time (%lifetime% seconds) has not elapsed since previous SAK was distributed (%secs% seconds).

Message Parameters

| Name | Type |
|----------|----------|
| slotPort | SlotPort |
| lifetime | ulnt32 |
| secs | ulnt32 |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.PortStateChg

Description

Link state of common port used by MKA/MACsec has changed. MKA participation is halted when link goes down, resumed when link comes up.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Common Port link changed to %linkState% on port %slotPort%.

Message Parameters

| Name | Type |
|-----------|----------|
| linkState | String |
| slotPort | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.PortCnctChg

Description

Indicates connectivity provided by the controlled port. One of: 'PENDING' - Prevent connectivity by disabling the controlled port. 'UNAUTHENTICATED' - Provide unsecured connectivity, enabling the controlled port. 'AUTHENTICATED' - Provide unsecured connectivity but with authentication, enabling the controlled port. 'SECURE' - Provide secured connectivity, using Secure Association Keys(SAKs) provided by the MAC Security Key Agreement Entity(KaY) and enabling the controlled port when those keys are installed and in use.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Controlled Port connectivity changed to %connect% on port %slotPort%.

Message Parameters

| Name | Type |
|----------|----------|
| connect | String |
| slotPort | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.PortCKNMisMatch

Description

This message can be seen if local and remote pre-shared keys(PSKs) do not match.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

On port %slotPort% in a received MKPDU, the Secure Connectivity Association Key Name(CKN) is not included in local Secure Connectivity Association(CA). A possible CKN mismatch.

Message Parameters

| Name | Type |
|----------|----------|
| slotPort | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.PortCAKMisMatch

Description

This message can be seen if local and remote pre-shared keys(PSKs) do not match.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

On port %slotPort% in a received PDU, the computed Integrity Check Value(ICV) is not equal to the received ICV. A possible CAK mismatch.

Message Parameters

| Name | Type |
|----------|----------|
| slotPort | SlotPort |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

MACsec.MKA.PortProtoEvent

Description

This is a normal operation MKA message.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Applicable Platforms

- Summit family switches

- I386 virtual machine switch simulator

MACsec.PDU.ParseRxMKPDUFail

Description

Received MKPDU was discarded because it contained an unexpected or incorrect parameter. The MKA protocol tolerates occasional loss of MKPDUs by not terminating a connection until MKA_LIFE_TIME (6 seconds) has elapsed between valid MKPDUs.

Remedy

This condition is most often caused by a network peer re-initializing their MKA process, but can also be caused a peer sending a faulty MKPDU. If the condition persists and connectivity cannot be established or is lost, contact technical support with the following information: show macsec ports all show macsec ports <affected-port> detail show configuration macsec configure log filter DefaultFilter add events MACsec.PDU severity debug-data

Severity

Notice

MPLS.Critical

Description

A serious problem has been detected which is compromising the operation of the system. The system can not function as expected unless it is remedied. The problem may be related to hardware failure or software data corruption.

Remedy

The exact remedy is dependant on the particular situation; but the problem may not be resolved without intervention of some sort.

Severity

Critical

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependant on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.Warning

Description

An abnormal condition has been detected which, although it is not interfering with the normal operation of the system, may signal that the system or the network in general may not be functioning as expected. The condition may have been caused by an unusual or unexpect circumstance related to some external stimulus.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by by rejecting the request or performing some default action.

Severity

Warning

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.Notice

Description

A normal but significant condition has been detected, which signals that the system is functioning as expected. The condition is somewhat uncommon, but it is not necessarily unusual or unexpected.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Notice

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.Info

Description

A normal but potentially interesting condition has been detected, which signals that the system is functioning as expected and simply provides potentially detailed information or confirmation in that regard. The circumstance is common and not unusual or unexpected in any way.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Info

Message Text

| function | String |

MPLS.MemExhausted

Description

The system tried to allocate memory but failed in doing so. This condition is mainly due to system starvation or an extremely low memory condition.

Remedy

A possible remedy is to use "show memory" and "show log" commands to monitor the memory statuses of different processes. Depending on the results of these commands, the system configuration may need to be changed or memory may need to be freed by ending processes which are currently not needed.

Severity

Critical

MPLS.QcteAllocDispatchObj

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

There is no remedy because there is no problem to be resolved.

MPLS.ProtoStateTransBlk

Description

When MPLS initialized, an incompatibility prevented MPLS from becoming operational. For example, an incompatible I/O card could be inserted or the wrong stacking protocol is in-use. While the MPLS Administrative state will become Enabled, the MPLS Operational state will remain Disabled.

Remedy

Use the "show mpls" command to determine the incompatibility. Once the problem with incompatibility is addressed, issue "disable mpls", then "enable mpls" for MPLS to become operational.

Severity

Error

Message Text

When MPLS initialized, an incompatibility prevented MPLS from becoming operational. The "\show mpls\" command can be used for additional information.

MPLS.ChgStaticIngrLSPState

Description

This event occurs when a statically configured ingress MPLS LSP changes state. The valid states for a static MPLS LSP are "Up" and "Down". This event also contains relevant information about the LSP at the time of the state change, such as the MPLS label.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

LSP \"%lspName%\" to %destIpAddr% changed state from %prevState% to %curState%.
EgressLabel=%egressLabel%, NextHopIf=%nexthopIf%, NextHopAddr=%nexthopAddr%

Message Parameters

| Name | Type |
|-------------|--------|
| lspName | String |
| destIpAddr | IP |
| prevState | String |
| curState | String |
| egressLabel | xInt32 |
| nexthopIf | String |
| nexthopAddr | IP |

MPLS.ChgStaticTrnstLSPState

Description

This event occurs when a statically configured transit MPLS LSP changes state. The valid states for a static MPLS LSP are "Up" and "Down". This event also contains relevant information about the LSP at the time of the state change, such as the MPLS labels.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

LSP \"%lspName%\" to %destIpAddr% changed state from %prevState% to %curState%.
IngressLabel=%ingressLabel%, IngressIf=%ingressIf%, EgressLabel=%egressLabel%,
NextHopIf=%nexthopIf%, NextHopAddr=%nexthopAddr%

Message Parameters

| Name | Type |
|--------------|--------|
| lspName | String |
| destIpAddr | IP |
| prevState | String |
| curState | String |
| ingressLabel | xInt32 |
| ingressIf | String |
| egressLabel | xInt32 |
| nexthopIf | String |
| nexthopAddr | IP |

MPLS.ChgStaticEgrLSPState

Description

This event occurs when a statically configured egress MPLS LSP changes state. The valid states for a static MPLS LSP are "Up" and "Down". This event also contains relevant information about the LSP at the time of the state change, such as the MPLS label.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

LSP \"%lspName%\" to %destIpAddr% changed state from %prevState% to %curState%.
IngressLabel=%ingressLabel%, IngressIf=%ingressIf%

Message Parameters

| Name | Type |
|--------------|--------|
| lspName | String |
| destIpAddr | IP |
| prevState | String |
| curState | String |
| ingressLabel | xInt32 |
| ingressIf | String |

MPLS.ChgIfState

Description

This event occurs when an MPLS interface changes state. The valid states for an MPLS interface are "Up" and "Down".

Remedy

No action required - Informational message only.

Severity

Info

Message Text

MPLS interface \"%ifName%\" with IP address %ifAddr% changed state from %prevState% to %curState%.

Message Parameters

| Name | Type |
|-----------|--------|
| ifName | String |
| ifAddr | IP |
| prevState | String |
| curState | String |

MPLS.ChgProtoState

Description

This event occurs when the MPLS protocol changes state. The valid states for the MPLS protocol are "Enabled", "Enabling", "Disabled", and "Disabling".

Remedy

No action required - Informational message only.

Severity

Info

Message Text

MPLS protocol changed state from %prevState% to %curState%.

Message Parameters

| Name | Type |
|-----------|--------|
| prevState | String |
| curState | String |

MPLS.CfgLblMgrFail

Description

When MPLS label ranges are changed, the label space manager must be uninitialized and then initialized (specified by the action parameter) with the new ranges. If a problem occurs during either of these actions, the label database can become corrupted. The rc, or return code, will provide technical support with more detail on the specific cause of the failure.

Remedy

Reboot the system or restart the MPLS process. If the problem persists, contact technical support with the following information: the actual event message and the output from the following commands: "show mpls label usage", "debug mpls show tech label-space"

Severity

Error

Message Text

Configuration of label manager failed while trying to %action% label spaces (rc=%rc%).

Message Parameters

| Name | Type |
|--------|--------|
| action | String |
| rc | sInt32 |

| sub_code | sInt |
| str | String |

MPLS.CSPF.RtrAddrUpdtExceed

Description

The number of router addresses contained within the OSPF LSA sent to CSPF exceeded the internal limitation. Only the first addresses up to and including the limiting number were passed to CSPF, all others were discarded.

Remedy

Configure the network such that all routers within the OSPF area have fewer than the maximum number of allowed addresses configured on them as announced in their OSPF LSAs.

Severity

Error

Message Text

The number of router addresses (%numRtrAddrs%) contained within the Router Address Update LSA from %rtrId% exceeds the maximum (%maxNumRtrAddrs%)

Message Parameters

| Name | Type |
|----------------|--------|
| numRtrAdrrs | uInt32 |
| maxNumRtrAdrrs | uInt32 |
| rtrId | IP |

MPLS.CSPF.AdjRtrUpdtExceed

Description

The number of adjacent routers contained within the OSPF LSA sent to CSPF exceeded the internal limitation. Only the first routers up to and including the limiting number were passed to CSPF, all others were discarded.

Remedy

Configure the network such that all routers within the OSPF area have fewer than the maximum number of allowed neighbors configured on them as announced in their OSPF LSAs.

Severity

Error

Message Text

The number of adjacent routers (%numAdjRtr%) contained within the Network Update LSA from %rtrId% exceeds the maximum (%maxNumAdjRtr%)

Message Parameters

| Name | Type |
|--------------|--------|
| numAdjRtr | uInt32 |
| maxNumAdjRtr | uInt32 |
| rtrId | IP |

MPLS.CSPF.OSPFLibDebug

Description

Debugging event to check on the messages being received from the OSPF client library (and thus from OSPF) destined for CSPF.

Remedy

n/a

Severity

Debug-Data

Message Text

Received a code %opcode% message from the OSPF client library (%length% bytes)

Message Parameters

| Name | Type |
|--------|--------|
| opcode | uInt32 |
| length | uInt32 |

MPLS.CSPF.LinkUpdtLinkTypeUnk

Description

A received Link Update LSA from the router indicated has a link type that we could not process. Defaulting the type to multipoint.

Remedy

Correct the LSA link-type advertisement from the offending router.

Severity

Error

Message Text

The received link type (%linkType%) from %rtrId% is illegal, defaulting to Multipoint type

Message Parameters

| Name | Type |
|----------|--------|
| linkType | uInt32 |
| rtrId | IP |

MPLS.CSPF.LinkUpdtAddrExceed

Description

The number of local or remote addresses contained within the OSPF LSA sent to CSPF exceeded the internal limitation. Only the first local or remote addresses up to and including the limiting number were passed to CSPF, all others were discarded.

Remedy

Configure the network such that the offending router has fewer local or remote addresses than the stated maximum.

Severity

Error

Message Text

The number of %addrType% addresses (%numAddr%) contained within the Link Update LSA from %rtrId% exceeds the maximum (%maxNumAddr%)

Message Parameters

MPLS.DPM.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependant on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

%format%

Message Parameters

MPLS.DPM.Warning

Description

An abnormal condition has been detected which, although it is not interfering with the normal operation of the system, may signal that the system or the network in general may not be functioning as expected. The condition may have been caused by an unusual or unexpect circumstance related to some external stimulus.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by rejecting the request or performing some default action.

MPLS.L2VPN.updateNamedLsp

Description

Debug tracing for named LSPs being updated by the LSP manager.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Processing update for LSP named %1spName%: %message%

Message Parameters

| Name | Type |
|---------|--------|
| lspName | String |
| message | Printf |

MPLS.L2VPN.updateBestLsp

Description

Debug trace for best-LSP-to-dest updates from LSP manager.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

Dest %destAddr%: %message%

Message Parameters

| Name | Type |
|----------|-----------|
| destAddr | IPAddress |
| message | Printf |

MPLS.L2VPN.deleteNamedLsp

Description

Debug trace for named LSPs being deleted from LSP manager.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

LSP named %lspName%: %message%

Message Parameters

| Name | Type |
|---------|--------|
| lspName | String |
| message | Printf |

MPLS.L2VPN.deleteBestLsp

Description

Debug trace for deleting the best-LSP-to-dest, as notified by LSP manager.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.updateVcLsp

Description

Debug trace for updating the VC LSP, as notified by data plane manager.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

VPLS named %vplsName%, VC ID %vcId%: %message%

Message Parameters

| Name | Type |
|----------|--------|
| vplsName | String |
| vcId | uInt32 |
| message | Printf |

MPLS.L2VPN.peerNotFound

Description

A peer lookup has failed. The address specified may be bad, or the peer has been deleted prior to the lookup being performed.

Remedy

No remedy is available.

Severity

Notice

Message Text

Unable to find peer with address %peerAddr% on VPLS %vplsName%

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| peerAddr | IPAddress |

MPLS.L2VPN.IspNotUsable

Description

The LSP has not yet been established or is configured as not usable by VPLS.

Remedy

No remedy is available.

Severity

Notice

Message Text

LSP %lspName% not useable by VPLS: %reason%

Message Parameters

| Name | Type |
|---------|--------|
| lspName | String |
| reason | String |

MPLS.L2VPN.IspNotFound

Description

While configuring a named LSP to an L2VPN peer, the named LSP information could not be found. This may occur if the named LSP has been deleted.

Remedy

If the named LSP still exists, there may have been a timing issue and re-trying the command again may succeed.

Severity

Error

Message Text

LSP %lspName% not found.

Message Parameters

| Name | Type |
|---------|--------|
| lspName | String |

MPLS.L2VPN.noTunnelLsps

Description

No LSPs have been manually added for this peer, and no LSPs have been fed to VPLS by the LSP manager.

Remedy

No remedy is available.

Severity

Notice

Message Text

There are no tunnel LSPs for the peer at %peerAddr%

Message Parameters

| Name | Type |
|----------|-----------|
| peerAddr | IPaddress |

MPLS.L2VPN.vcLspNotReady

Description

The data plane manager has not notified VPLS about a VC label for this pseudo wire.

Remedy

No remedy is available.

Severity

Notice

Message Text

The VC LSP for the peer at %peerAddr% on VPLS %vplsName% is not ready.

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| peerAddr | IPAddress |

MPLS.L2VPN.pseudoWireUpdate

Description

Debug tracing for pseudo-wire updates.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

VPLS %vplsName%, Peer %peerAddr%: %message%

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| peerAddr | IPAddress |
| message | Printf |

MPLS.L2VPN.pseudoWireRemove

Description

Debug tracing for removing the pseudo-wire from hardware.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

VPLS %vplsName%, Peer %peerAddr%: %message%

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| peerAddr | IPAddress |
| message | Printf |

MPLS.L2VPN.unsupportedAddrFam

Description

AF_INET(0x2) is the only address family currently supported.

Remedy

No remedy is available.

Severity

Notice

Message Text

Address family (%addrFamily%) not supported.

Message Parameters

| Name | Type |
|------------|--------|
| addrFamily | xInt32 |

MPLS.L2VPN.triggerFuncEnter

Description

The function named was called. This function is triggered by other MPLS components.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

%funcName% entered.

Message Parameters

| Name | Type |
|----------|--------|
| funcName | String |

MPLS.L2VPN.subCompDisabled

Description

A component required by VPLS is not enabled.

Remedy

No remedy is available.

Severity

Notice

Message Text

An MPLS subcomponent required for VPLS is not enabled.

MPLS.L2VPN.noUsableTunnelLsp

Description

No usable LSPs have been fed to VPLS by the LSP manager.

Remedy

No remedy is available.

Severity

Info

Message Text

No usable LSP for %peerAddr%: %message%

Message Parameters

| Name | Type |
|----------|-----------|
| peerAddr | IPAddress |
| message | String |

MPLS.L2VPN.servicesDisabled

Description

Notification about the state of VPLS services for the specified VPLS instance.

Remedy

No remedy is available.

Severity

Info

Message Text

VPLS services are disabled for VPLS %vplsName%, PW not established

Message Parameters

| Name | Type |
|----------|--------|
| vplsName | String |

MPLS.L2VPN.sendVcFecInfo

Description

Debug tracing for sending the VC FEC info to DPM

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

VC ID %vcId%: %message%

Message Parameters

| Name | Type |
|---------|--------|
| vcId | uInt32 |
| message | Printf |

MPLS.L2VPN.dumpPeerState

Description

Dump of a peer's state bitmap, used to determine display messages regarding a peer's state.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Peer: %peerAddr%, state bitmap: %peerStateBitmap%

Message Parameters

| Name | Type |
|-----------------|-----------|
| peerAddr | IPAddress |
| peerStateBitmap | xInt32 |

MPLS.L2VPN.IdpAdjCallback

Description

Debug tracing for the LDP adjacency callback.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

VPLS %vplsName%, peer %adjAddr%: %message%

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| adjAddr | IPAddress |
| message | Printf |

MPLS.L2VPN.IdpAdjMsg

Description

debug tracing for targeted LDP adjacency events

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

VPLS %vplsName%, peer %peerAddr%: %message%

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| peerAddr | IPAddress |
| message | Printf |

MPLS.L2VPN.floodAdd

Description

debug tracing

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Adding NHLFE %nhlfeInstance% to VPLS %vplsName%: %msg%

Message Parameters

| Name | Type |
|---------------|--------|
| vplsName | String |
| nhlfeInstance | xInt32 |
| msg | Printf |

MPLS.L2VPN.floodDelete

Description

debug tracing

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Deleting NHLFE %nhlfeInstance% from VPLS %vplsName%: %msg%

Message Parameters

| Name | Type |
|---------------|--------|
| vplsName | String |
| nhlfeInstance | xInt32 |
| msg | Printf |

MPLS.L2VPN.setPwUptime

Description

This indicates that the PW is going UP for the first time since being down. The time is recorded for display purposes.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Peer: %peerAddr% - PW moving to UP state, setting time

Message Parameters

| Name | Type |
|----------|-----------|
| peerAddr | IPAddress |

MPLS.L2VPN.clearPwUptime

Description

This indicates that the PW is going UP for the first time since being down. The time is recorded for display purposes.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Peer: %peerAddr% - PW leaving UP state, time being cleared

Message Parameters

| Name | Type |
|----------|-----------|
| peerAddr | IPAddress |

MPLS.L2VPN.mtuMismatch

Description

A peer on this VPLS instance has an MTU size that does not match the locally configured VPLS MTU. They must match for the two switches to exchange VC LSP labels.

Remedy

Check configuration of local and remote switches. For the local switch, the VPLS MTU size can be seen in the output of 'show vpls detail'. This parameter is set on a per-VPLS basis.

Severity

Notice

Message Text

VPLS ID %vcId%, Peer %peerAddr%: local MTU size (%localMtu%) does not match the remote MTU size (%remoteMtu%)

Message Parameters

| Name | Type |
|-----------|-----------|
| vcId | uInt32 |
| peerAddr | IPaddress |
| localMtu | uInt16 |
| remoteMtu | uInt16 |

MPLS.L2VPN.noStorage

Description

The specified parameter was unexpectedly NULL and cannot be used for further processing. This may indicate corruption in L2VPN data and result in degradation of L2VPN services.

Remedy

There is no workaround for this problem.

Severity

Error

Message Text

No storage for parameter %varName% provided to routine.

Message Parameters

| Name | Type |
|---------|--------|
| varName | String |

MPLS.L2VPN.vcLspDump

Description

Debug trace for updating the VC LSP, as notified by data plane manager.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

VPLS %vplsName%, peer %peerAddr% VC info: ILM %ilmInstance% / %rxLabel%, NHLFE
%nhlfeInstance% / %txLabel%

Message Parameters

| Name | Type |
|---------------|-----------|
| vplsName | String |
| peerAddr | IPAddress |
| ilmInstance | uInt32 |
| rxLabel | xInt32 |
| nhlfeInstance | uInt32 |
| txLabel | xInt32 |

MPLS.L2VPN.fecSendFail

Description

Internal communication error, possibly recoverable (see message).

Remedy

No remedy is available.

Severity

Error

Message Text

Failed to send FEC to NBASE: %message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.fecSendQueued

Description

Internally handled communication error, automatically recoverable.

Remedy

No remedy is available.

Severity

Info

Message Text

Handling of VC FEC waiting for a free buffer, request is queued.

MPLS.L2VPN.rsmReady

Description

Debug tracing for the RSM ready notification.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.VplsRedundancyDebug

Description

VPLS-ESRP Module debug logs.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.L2VPN.VplsRedundancyVerbose

Description

VPLS ESRP generic verbose debug logs.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.L2VPN.receiveMacAddr

Description

Debug to dump info received from peer for MAC Address Withdrawal message.

Remedy

Analyze data for debugging.

Severity

Debug-Summary

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.sendMacAddr

Description

Debug information for sending MAC Address Withdrawal message.

Remedy

Analyze data for debugging.

Severity

Debug-Data

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.pseudoWireActivityCheck

Description

Debug tracing for pseudo-wire updates.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

VPLS %vplsName%, Peer %peerAddr%: %message%

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| peerAddr | IPAddress |
| message | Printf |

MPLS.L2VPN.EAPS_Debug

Description

No description is available.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.healthCheckVCCVFailure

Description

This log indicates that VCCV health check has detected or cleared a failure on a pseudo-wire.

Remedy

Fix the problem that caused the pseudo-wire to go down (if detected).

Severity

Notice

Message Text

VPLS %vplsName%, Peer %peerAddr%: Pseudo-Wire Failure %action% by VCCV

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| peerAddr | IPAddress |
| action | String |

MPLS.L2VPN.adjustSvcIf

Description

Debug message

Remedy

None. This is for debugging only.

Severity

Debug-Summary

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.VplsTransportLspDebug

Description

Debug message for looking at Transport LSP changes.

Remedy

None, this is a debug only log.

Severity

Debug-Data

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.VplsUpdateFec

Description

Debug log for tracking sending fec updates based on local vc status changes.

Remedy

None, as this is for general debugging only.

Severity

Info

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.IdpStatusList

Description

Debug log for printing info related to Peer Status Pending List.

Remedy

None, as this is for general debugging only.

Severity

Debug-Summary

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.IdpStatusListVerbose

Description

Verbose log for printing info related to Peer Status Pending List.

Remedy

None, as this is for general debugging only.

Severity

Debug-Verbose

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.STPDebugSummary

Description

Generic debug message related to STP-triggered flushes from STP redundancy.

Remedy

None. This is a debug message only.

Severity

Debug-Summary

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

MPLS.L2VPN.SpclFlushDebugSummary

Description

Generic debug message related to triggered flushes from VPLS redundancy.

Remedy

None. This is a debug message only.

Severity

Debug-Summary

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

MPLS.L2VPN.VplsMibDebug

Description

A generic message to debug SNMP related functionality for VPLS mibs.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Data

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.CreatVCFECFail

Description

An attempt to create a VC FEC object failed. As a result, either a PW will not be established to the specified peer, or the status of an existing PW will not be sent to the peer.

Remedy

There is no workaround for this problem.

Severity

Error

Message Text

An attempt to create a VC FEC object for peer %peer% failed (%reason%): %msg%.

Message Parameters

| Name | Type |
|--------|-----------|
| peer | IPAddress |
| reason | sInt |
| msg | String |

MPLS.L2VPN.SendVCFECFail

Description

An attempt to send a VC FEC object failed. As a result, either a PW will not be established to the specified peer, or the status of an existing PW will not be sent to the peer.

Remedy

There is no workaround for this problem.

Severity

Error

Message Text

An attempt to send a VC FEC object for peer %peer% failed.

Message Parameters

| Name | Type |
|------|-----------|
| peer | IPAddress |

MPLS.L2VPN.RemL2VPNVLANTreeFail

Description

An attempt to remove an L2VPN instance from a tree ordered by VLAN instance failed. The instance may have already been removed, in which case there should be no impact; however, there could have been data corruption, in which case this L2VPN or other L2VPNs may not function properly.

Remedy

There is no workaround for this error.

Severity

Error

Message Text

Removal of L2VPN instance with id %id% from the VLAN tree failed (%reason%).

Message Parameters

| Name | Type |
|--------|--------|
| id | uInt32 |
| reason | sInt |

MPLS.L2VPN.ChgPeerSrcAddrFail

Description

While changing the source address of all L2VPN peers, usually due to the MPLS LSR-ID changing, the list of peers was found to be corrupted. The functionality of some or all peers may be affected.

Remedy

There is no workaround.

Severity

Error

Message Text

While changing peer source addresses, an error occurred (%reason%): %msg%.

Message Parameters

| Name | Type |
|--------|--------|
| reason | sInt |
| msg | String |

MPLS.L2VPN.ERPS_Debug

Description

No description is available.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

MPLS.L2VPN.ParmMismatchRcvryNotCfg

Description

This condition occurs when the peer releases our label due to an interface parameter mismatch during pseudo-wire signaling and the user has configured automatic recovery from this situation as none.

Remedy

If the pseudo-wire is up, there is no action required. If the pseudo-wire is not up and still in the signaling state with no VC labels, administratively disable and re-enable the pseudo-wire.

Severity

Info

Message Text

Automatic interface parameter mismatch recovery is not configured for %vplsName% peer %peerAddr% vcid %vcId% and the peer has released our VC label.

Message Parameters

| Name | Type |
|----------|-----------|
| vplsName | String |
| peerAddr | IPAddress |
| vcId | uInt32 |

MPLS.L2VPN.VPLSStatusInfo

Description

Generic debug message for VPLS status changes.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

L2VPN: %vplsName%; Status: %status%; Msg: %message%

Message Parameters

| Name | Type |
|----------|--------|
| vplsName | String |
| status | sInt32 |
| message | Printf |

MPLS.L2VPN.ChgPWState

Description

This event occurs when an Ethernet pseudo-wire of an L2VPN changes state. The valid states for an Ethernet PW are "Up", "Down", "Signaling", and "Ready". If available, the new PW state may include detailed information regarding the reason for being in that particular state. This event also contains relevant information about the PW at the time of the state change, such as the MPLS PW labels.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Pseudo-wire to peer %peerIpaddr% in L2VPN %l2vpnType% \"%l2vpnName%\"
 changed state from %prevState% to %curState%. PWId=%pwId%, PWIndex=%pwIndex%,
 RxLabel=%rxLabel%, TxLabel=%txLabel%

Message Parameters

| Name | Type |
|------------|-----------|
| l2vpnName | String |
| l2vpnType | String |
| peerIpaddr | IPAddress |
| prevState | String |
| curState | String |
| pwId | uInt32 |
| pwIndex | uInt32 |

| Name | Type |
|---------|--------|
| rxLabel | xInt32 |
| txLabel | xInt32 |

| sub_code | sInt |
| str | String |

MPLS.LDP.RxHelloMsg

Description

LDP received a Hello Message.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP received a Hello Message. Local LDPID: %localLsrId%:%localLabelSpaceId%, Peer LDPID: %peerLsrId%:%peerLabelSpaceId%, Ent Idx: %entityIndex%, I/F Idx: %ifIndex%, Transport Addr: %transportAddress%, Source Addr: %sourceAddress%.

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| peerLsrId | dstIP |
| peerLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| ifIndex | sInt32 |
| transportAddress | IP |
| sourceAddress | IP |

MPLS.LDP.TxHelloMsg

Description

LDP sent a Hello Message.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP sent a Hello Message. Local LDPID: %localLsrId%:%localLabelSpaceId%, Ent Idx: %entityIndex%, I/F Idx: %ifIndex%, Transport Addr: %transportAddress%, Source Addr: %sourceAddress%.

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| ifIndex | sInt32 |
| transportAddress | IP |
| sourceAddress | IP |

MPLS.LDP.RxInitializationMsg

Description

LDP received a Initialization Message.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP received an Initialization Message. Local LDPID: %localLsrId%:%localLabelSpaceId%, Peer LDPID: %peerLsrId%:%peerLabelSpaceId%, Ent Idx: %entityIndex%, Role: %role%, I/F Idx: %ifIndex%, Sess Addr: %sessAddress%.

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| peerLsrId | dstIP |
| peerLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| role | String |
| ifIndex | sInt32 |
| sessAddress | IP |

MPLS.LDP.TxInitializationMsg

Description

LDP sent an Initialization Message.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP sent an Initialization Message. Local LDPID: %localLsrId%:%localLabelSpaceId%, Peer LDPID: %peerLsrId%:%peerLabelSpaceId%, Ent Idx: %entityIndex%, Role: %role%, I/F Idx: %ifIndex%, Sess Addr: %sessAddress%.

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| peerLsrId | dstIP |
| peerLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| role | String |

| Name | Type |
|-------------|--------|
| ifIndex | sInt32 |
| sessAddress | IP |

MPLS.LDP.RxKeepAliveMsg

Description

LDP received a KeepAlive Message.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP received a KeepAlive Message. Local LDPID: %localLsrId%:%localLabelSpaceId%, Peer LDPID: %peerLsrId%:%peerLabelSpaceId%, Ent Idx: %entityIndex%, Role: %role%, I/F Idx: %ifIndex%, Sess Addr: %sessAddress%.

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| peerLsrId | dstIP |
| peerLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| role | String |
| ifIndex | sInt32 |
| sessAddress | IP |

MPLS.LDP.TxKeepAliveMsg

Description

LDP sent a KeepAlive Message.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP sent a KeepAlive Message. Local LDPID: %localLsrId%:%localLabelSpaceId%, Peer LDPID: %peerLsrId%:%peerLabelSpaceId%, Ent Idx: %entityIndex%, Role: %role%, I/F Idx: %ifIndex%, Sess Addr: %sessAddress%.

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| peerLsrId | dstIP |
| peerLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| role | String |
| ifIndex | sInt32 |
| sessAddress | IP |

MPLS.LDP.SessnUp

Description

An LDP Session came Up.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP session came Up. Local LDPID: %localLsrId%:%localLabelSpaceId%, Peer LDPID: %peerLsrId%:%peerLabelSpaceId%, Ent Idx: %entityIndex%, Role: %role%, I/F Idx: %ifIndex%, Sess Addr: %sessAddress%.

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| peerLsrId | dstIP |
| peerLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| role | String |
| ifIndex | sInt32 |
| sessAddress | IP |

MPLS.LDP.SessnDown

Description

An LDP session went Down. See the MPLS.LDP.ProtocolError log for more information regarding why the session went Down.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP session went Down. Local LDPID: %localLsrId%:%localLabelSpaceId%, Peer LDPID: %peerLsrId%:%peerLabelSpaceId%, Ent Idx: %entityIndex%, Role: %role%, I/F Idx: %ifIndex%, Sess Addr: %sessAddress%.

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| peerLsrId | dstIP |
| peerLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| role | String |
| ifIndex | sInt32 |
| sessAddress | IP |

MPLS.LDP.ProtocolError

Description

This message can provide details on other LDP events and messages by displaying status codes associated with those events.

Remedy

This log is for informational purposes only.

Severity

Info

Message Text

LDP protocol error. Local LDPID: %localLsrId%:%localLabelSpaceId%, Peer LDPID: %peerLsrId%:%peerLabelSpaceId%, Ent Idx: %entityIndex%, Role: %role%, I/F Idx: %ifIndex%, Sess Addr: %sessAddress%, Status: %statusCodeStr% (%statusCode%).

Message Parameters

| Name | Type |
|-------------------|--------|
| localLsrId | srcIP |
| localLabelSpaceId | uInt16 |
| peerLsrId | dstIP |
| peerLabelSpaceId | uInt16 |
| entityIndex | uInt32 |
| role | String |

| Name | Type |
|---------------|--------|
| ifIndex | sInt32 |
| sessAddress | IP |
| statusCode | xInt32 |
| statusCodeStr | String |

MPLS.LDP.LogSessnMsgFail

Description

Due to the reason specified, a log message for an LDP session was not generated. LDP functionality should not be impacted.

Remedy

There is no workaround for this issue.

Severity

Warning

Message Text

A log for a %direction% session message was not generated: %reason%. Local LDPID: %ldpid%, Peer LDPID: %peerldpid%, Entity Index: %entidx%.

Message Parameters

| Name | Type |
|-----------|--------|
| direction | String |
| ldpid | String |
| peerldpid | String |
| entidx | uInt32 |
| reason | String |

MPLS.LDP.ChgProtoState

Description

This event occurs when the LDP protocol changes state. The valid states for the LDP protocol are "Enabled", "Enabling", "Disabled", and "Disabling".

Remedy

No action required - Informational message only.

Severity

Info

Message Text

LDP protocol changed state from %prevState% to %curState%.

Message Parameters

| Name | Type |
|-----------|--------|
| prevState | String |
| curState | String |

MPLS.Ping.Info

Description

A normal but potentially interesting condition has been detected, which signals that the system is functioning as expected and simply provides potentially detailed information or confirmation in that regard. The circumstance is common and not unusual or unexpected in any way.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Info

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.Ping.DebugSummary

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.Ping.DebugVerbose

Description

A condition has been detected that may interest a developer analyzing some system behavior at a more verbose level than provided by the debug summary information.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.Ping.DebugData

Description

A condition has been detected that may interest a developer inspecting the data underlying system behavior

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Data

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.Ping.Entry

Description

function entry

Remedy

none

Severity

Debug-Verbose

Message Text

Message Text

%function%

Message Parameters

| Name | Type |
|----------|--------|
| function | String |

MPLS.Ping.pingPacketReceived

Description

An incoming MPLS echo packet from the mentioned socket was received.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Summary

Message Text

MPLS packet from %sip%:%spo% on socket %sock%-%vrid% type %type% code %code%

Message Parameters

| Name | Type |
|------|-----------|
| sip | srcIP |
| spo | srcL4port |
| sock | sInt |
| vrid | uInt |

| Name | Type |
|------|------|
| type | ulnt |
| code | ulnt |

MPLS.Ping.pingOpenSocketError

Description

Unable to open MPLS socket. This may prevent either an echo request or an echo reply from either being sent or received.

Remedy

There is no workaround; however, this problem is usually transient and should not persist.

Severity

Error

Message Text

Unable to open an MPLS socket %sock% to %ip%:%port% error %err%

Message Parameters

| Name | Type |
|------|----------|
| sock | sInt |
| ip | SockAddr |
| port | ulnt |
| err | sInt |

MPLS.Ping.pingBindError

Description

Can't bind MPLS socket to local address or port. This may prevent either an echo request or an echo reply from either being sent or received.

Remedy

There is no workaround; however, this problem is usually transient and should not persist.

Severity

Error

Message Text

Unable to bind MPLS socket %sock% to %ip%:%port% error %err%

Message Parameters

| Name | Type |
|------|----------|
| sock | sInt |
| ip | SockAddr |
| port | uInt |
| err | sInt |

MPLS.Ping.pingReceiveError

Description

An error was encountered while processing a received ping packet.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Debug-Verbose

Message Text

Error parsing received ping packet.

MPLS.Ping.pingParseError

Description

An error was encountered while parsing a received MPLS ping packet.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Debug-Verbose

Message Text

Error in MPLS OAM packet.

MPLS.Ping.pingReply

Description

A valid echo reply was received for an outstanding ping request. Enable the pingReply message to see details on the source of the echo reply.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Summary

Message Text

Echo reply; %size% bytes from %from%: mpls_seq=%seq% ttl=%ttl% [%secNow%.%usecNow% - %secSend%.%usecSend%]

Message Parameters

| Name | Type |
|----------|-------|
| size | ulnt |
| from | srcIP |
| seq | ulnt |
| ttl | ulnt |
| secNow | ulnt |
| usecNow | ulnt |
| secSend | ulnt |
| usecSend | ulnt |

MPLS.Ping.dispatch

Description

Could not add the specified socket to the dispatcher. This may prevent either an echo request or an echo reply from being received.

Remedy

There is no workaround; however, this problem is usually transient and should not persist.

Severity

Error

Message Text

Failed to add socket %socket%-%type% with Vrid %vrid% to dispatcher.

Message Parameters

| Name | Type |
|--------|------|
| vrid | sInt |
| socket | sInt |
| type | uInt |

MPLS.Ping.pingPacketNotEgress

Description

An incoming MPLS ping reply packet was received, but the sender was not the egress.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Summary

Message Text

MPLS ping reply packet received, but sender was not egress.

MPLS.Ping.pingUnknownPingId

Description

A ping reply message was received for an unknown ping ID. This may happen normally when a ping is stopped before the reply is received.

Remedy

If the reply is not for a ping which was recently terminated, try to narrow down the sender and prevent the invalid reply from being sent.

Severity

Debug-Verbose

Message Text

Unable to located ping ID %id% in ping reply.

Message Parameters

| Name | Type |
|------|------|
| id | uInt |

MPLS.Ping.pingRx

Description

Dumps the pkt when received.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Received ping packet: addr %pdu% of len %len%

Message Parameters

| Name | Type |
|------|---------|
| pdu | Buf-ptr |
| len | Buf-len |

MPLS.Ping.pingTxIP

Description

Dumps the pkt when transmitted.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Transmit ping packet, IP Header: addr %pdu% of len %len%

Message Parameters

| Name | Type |
|------|---------|
| pdu | Buf-ptr |
| len | Buf-len |

MPLS.Ping.pingTxOAM

Description

Dumps the pkt when transmitted.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Transmit ping packet, OAM Data: addr %pdu% of len %len%

Message Parameters

| Name | Type |
|------|---------|
| pdu | Buf-ptr |
| len | Buf-len |

MPLS.Ping.pingTxEcho

Description

Dumps the pkt when transmitted.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

Transmit ping echo reply: addr %pdu% of len %len%

Message Parameters

| Name | Type |
|------|---------|
| pdu | Buf-ptr |
| len | Buf-len |

MPLS.Ping.SetIPSockOptFail

Description

The specified IP socket option was not set correctly on the socket used to send an echo reply. This may result in the echo reply not being sent, delivered, or processed correctly.

Remedy

There is no workaround; however, this problem is usually transient and should not persist.

Severity

Warning

Message Text

Failed to set IP sockopt (%opt%) on echo reply socket %sck%.

Message Parameters

| Name | Type |
|------|--------|
| opt | String |
| sck | sInt |

MPLS.Ping.SetMPLSSockOptFail

Description

The specified MPLS socket option was not set correctly on the socket used to send an echo request. This may result in the echo request not being sent, delivered, or processed correctly.

Remedy

There is no workaround; however, this problem is usually transient and should not persist.

Severity

Warning

Message Text

Failed to set MPLS sockopt (%opt%) on echo request socket %sck%.

Message Parameters

| Name | Type |
|------|--------|
| opt | String |
| sck | sInt |

MPLS.Ping.ParmNull

Description

The specified function received a parameter that was unexpectedly NULL and will not be able to continue processing the request.

Remedy

There is no workaround for this condition; however, this problem may be transient.

Severity

Error

Message Text

An unexpected NULL parameter was received by %func%.

Message Parameters

| Name | Type |
|------|--------|
| func | String |

MPLS.Ping.SendEchoReplyFail

Description

An attempt to send an echo reply on the specified socket failed.

Remedy

This problem typically occurs due to network connectivity issues. Once the network issues are corrected, this problem should no longer occur.

Severity

Error

Message Text

Failed to send an echo reply on socket %sck% (errno=%err%).

Message Parameters

| Name | Type |
|------|------|
| sck | sInt |
| err | sInt |

MPLS.Ping.RxMPLSOAMPktSmall

Description

An MPLS OAM packet was received that was too small to contain a ping header. This could happen due to packet corruption or mis-classification. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet.

Severity

Warning

Message Text

An MPLS OAM packet was received that was too small to contain a ping header.

MPLS.Ping.RxMPLSOAMPktTLVSmall

Description

An MPLS OAM packet was received that was too small to contain all the parsed TLV headers. This could happen due to packet corruption or mis-classification. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet.

Severity

Warning

Message Text

An MPLS OAM packet was received that was too small to contain all the parsed TLV headers.

MPLS.Ping.RxMPLSOAMPktFECSmall

Description

An MPLS OAM packet was received that was too small to contain a ping FEC TLV. This could happen due to packet corruption or mis-classification. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet.

Severity

Warning

Message Text

An MPLS OAM packet was received that was too small to contain a ping FEC TLV.

MPLS.Ping.RxMPLSOAMPktFECTypeUnk

Description

An MPLS OAM packet was received with an unknown FEC Type. This could happen due to packet corruption, mis-classification, or interoperability issues. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet. If the packet is a valid MPLS OAM packet, the problem could be due to another node sending an unsupported FEC type.

Severity

Warning

Message Text

An MPLS OAM packet was received with an unknown FEC Type (%type%).

Message Parameters

| Name | Type |
|------|--------|
| type | uInt16 |

MPLS.Ping.RxMPLSOAMPktTLVTypeUnk

Description

An MPLS OAM packet was received with an unknown TLV Type. This could happen due to packet corruption, mis-classification, or interoperability issues. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet. If the packet is a valid MPLS OAM packet, the problem could be due to another node sending an unsupported TLV type.

Severity

Warning

Message Text

An MPLS OAM packet was received with an unknown TLV Type (%type%).

Message Parameters

| Name | Type |
|------|--------|
| type | uInt16 |

MPLS.Ping.RxMPLSOAMPktProtUnk

Description

An MPLS OAM packet was received for an unknown protocol. This could happen due to packet corruption, mis-classification, or interoperability issues. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet. If the packet is a valid MPLS OAM packet, the problem could be due to another node using an unsupported protocol.

Severity

Warning

Message Text

An MPLS OAM packet was received for an unknown protocol (%prot%).

Message Parameters

| Name | Type |
|------|--------|
| prot | uInt16 |

MPLS.Ping.RxMPLSOAMPktIPVerUnk

Description

An MPLS OAM packet was received for an unknown IP version. This could happen due to packet corruption, mis-classification, or interoperability issues. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet. If the packet is a valid MPLS OAM packet, the problem could be due to another node using an unsupported IP version.

Severity

Warning

Message Text

An MPLS OAM packet was received for an unknown IP version (%ver%).

Message Parameters

| Name | Type |
|------|-------|
| ver | uInt8 |

MPLS.Ping.RxMPLSOAMPktIPProtUnk

Description

An MPLS OAM packet was received with an unknown IP protocol version. This could happen due to packet corruption, mis-classification, or interoperability issues. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet. If the packet is a valid MPLS OAM packet, the problem could be due to another node using an unsupported IP protocol.

Severity

Warning

Message Text

An MPLS OAM packet was received with an unknown IP protocol version (%prot%).

Message Parameters

| Name | Type |
|------|-------|
| prot | uInt8 |

MPLS.Ping.FndLSPForFECFail

Description

While attempting to send an echo request, the LSP originally selected is no longer available and the echo request will not be sent.

Remedy

This is a transient condition and the OAM request should be tried again when that LSP or another LSP becomes available.

Severity

Warning

Message Text

Unable to find an LSP for FEC %dest%/%mask%.

Message Parameters

| Name | Type |
|------|-----------|
| dest | dstIP |
| mask | IPmasklen |

MPLS.Ping.RxMPLSOAMPktLabExcd

Description

An MPLS OAM packet was received with more than the maximum number of labels allowed. This packet will be dropped and an echo reply will not be sent.

Remedy

Determine how an MPLS OAM packet was received with a number of labels greater than the maximum supported and take corrective action to ensure a smaller number of labels are used in the encapsulation path(s).

Severity

Warning

Message Text

An MPLS OAM packet was received with more than %maxNumLab% labels.

Message Parameters

| Name | Type |
|-----------|------|
| maxNumLab | ulnt |

MPLS.Ping.FndLSPByNameFail

Description

While attempting to append downstream mappings to an echo request, the named LSP information is no longer available. As a result, the downstream mappings will not be added.

Remedy

This is a transient condition and the OAM request should be tried again when that LSP or another LSP becomes available.

Severity

Warning

Message Text

Unable to find an LSP named %lspName% (%reason%).

Message Parameters

| Name | Type |
|---------|--------|
| lspName | String |
| reason | sInt |

MPLS.Ping.AppndDownstrmMapLenInv

Description

The downstream mapping for an MPLS OAM packet was not appended due to an invalid length specified for the mapping TLV.

Remedy

This is a transient condition and the request should be tried again.

Severity

Warning

Message Text

The downstream mapping for an MPLS OAM packet was not appended due to an invalid length (%len%).

Message Parameters

| Name | Type |
|------|--------|
| len | uInt32 |

MPLS.Ping.RxMPLSOAMPktIPv4Small

Description

An MPLS OAM packet was received that was too small to contain a ping IPv4 prefix FEC TLV. This could happen due to packet corruption or mis-classification. When this log is generated, the received packet is dropped.

Remedy

If the problem persists, narrow down which packet causes the log to be generated and then determine if the packet is corrupted or being mis-classified as an MPLS OAM packet.

Severity

Warning

Message Text

An MPLS OAM packet was received that was too small to contain a ping IPv4 prefix FEC TLV.

MPLS.RSVPTTE.ChgIngrLSPState

Description

This event occurs when an ingress MPLS RSVP-TE LSP changes state. The valid states for an MPLS RSVP-TE LSP are "Up" and "Down". This event also contains relevant information about the LSP at the time of the state change, such as the MPLS label.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

LSP \"%lspName%\" using Path \"%lspPath%\" changed state from %prevState% to %curState%. Source=%srcIpAddr%, Destination=%destIpAddr%, TunnelId=%tunnelId%, LSPId=%lspId%, Active=%isActive%, ReceivedLabel=%rcvdLabel%, NextHopIf=%nexthopIf%, NextHopAddr=%nexthopAddr%

Message Parameters

| Name | Type |
|-------------|--------|
| lspName | String |
| lspPath | String |
| srcIpAddr | IP |
| destIpAddr | IP |
| tunnelId | uInt32 |
| lspId | uInt32 |

MPLS.SCK.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependant on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

MPLS.SCK.Warning

Description

An abnormal condition has been detected which, although it is not interfering with the normal operation of the system, may signal that the system or the network in general may not be functioning as expected. The condition may have been caused by an unusual or unexpect circumstance related to some external stimulus.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by rejecting the request or performing some default action.

Severity

Warning

Message Text

| function | String |

MPLS.TPM.AddEntFail

Description

Due to the specified reason, the pseudo-wire indentified by the given index could not be added to an internal table.

Remedy

Disabling and enabling the L2VPN or CES container for the pseudo-wire may fix the problem. To enable/disable an L2VPN, use the "enable/disable l2vpn" command. To enable/disable a CES, use the "enable/disable ces" command. If the problem continues, disabling and enabling MPLS will cause this internal table to be reset. To enable/disable MPLS, use the "enable/disable mpls" command.

Severity

| pwIndex | uInt32 |
| table | String |
| reason | Printf |

MPLS.TPM.CBDatIgn

Description

While performing work on an internal pseudo-wire table entry, some unexpected data was found associated with the control block. Since the data was not expected, and not required, it was ignored.

Remedy

No action may be required; however, if the pseudo-wire specified by the pwIndex is not functioning properly, disabling and enabling the L2VPN or CES container for the pseudo-wire may fix the problem. To enable/disable an L2VPN, use the "enable/disable l2vpn" command. To enable/disable a CES, use the "enable/disable ces" command. If the problem continues, disabling and enabling MPLS will cause this internal table to be reset. To enable/disable MPLS, use the "enable/disable mpls" command.

Severity

%action%

Message Parameters

| Name | Type |
|---------|--------|
| pwIndex | uInt32 |
| action | Printf |

MPLS.TPM.CBDataNotFnd

Description

While performing work on an internal pseudo-wire table entry, the control block data used to manage the entry could not be found.

Remedy

Since the control block data was missing, the action being performed on the pseudo-wire likely did not complete. Disabling and enabling the L2VPN or CES container for the pseudo-wire may restore normal operation. To enable/disable an L2VPN, use the "enable/disable l2vpn" command. To enable/disable a CES, use the "enable/disable ces" command. If the problem continues, disabling and enabling MPLS will cause this internal table to be reset. To enable/disable MPLS, use the "enable/disable mpls" command.

Severity

Error

Message Parameters

| Name | Type |
|---------|--------|
| pwIndex | uInt32 |
| action | Printf |

MPLS.TPM.CBParamNotFnd

Description

While performing work on an internal pseudo-wire table entry, a control block parameter used to manage the entry was not received.

Remedy

Since the control block parameter was missing, the action being performed on the pseudo-wire likely did not complete. Disabling and enabling the L2VPN or CES container for the pseudo-wire may restore normal operation. To enable/disable an L2VPN, use the "enable/disable l2vpn" command. To enable/disable a CES, use the "enable/disable ces" command. If the problem continues, disabling and enabling MPLS will cause this internal table to be reset. To enable/disable MPLS, use the "enable/disable mpls" command.

Severity

| pwIndex | uInt32 |
| action | Printf |

MPLS.TPM.CBDataNull

Description

While performing work on an internal pseudo-wire table entry, the control block data used to manage the entry was found to be NULL.

Remedy

Since the control block data was NULL, the affected pseudo-wire cannot be determined from the information available when the log was generated. If the affected pseudo-wire can be determined by some other method, disabling and enabling the L2VPN or CES container for the pseudo-wire may restore normal operation. To enable/disable an L2VPN, use the "enable/disable l2vpn" command. To enable/disable a CES, use the "enable/disable ces" command. If the problem continues, disabling and enabling MPLS will cause this internal table to be reset. To enable/disable MPLS, use the "enable/disable mpls" command.

Severity

Error

Message Text

Control block data for a pseudo-wire was unexpectedly NULL in function %function%

Message Parameters

| Name | Type |
|----------|--------|
| function | String |

MPLS.TPM.StateChgInv

Description

A pseudo-wire received an event that is not valid or handled for the current state of the pseudo-wire FSM. The requested event was rejected and the pseudo-wire did not take any action because of the event.

Remedy

Since no action was taken, the affected pseudo-wire may still be functioning properly; however, if the pseudo-wire is not functioning properly, disabling and enabling the L2VPN or CES container for the pseudo-wire may restore normal operation. To enable/disable an L2VPN, use the "enable/disable l2vpn" command. To enable/disable a CES, use the "enable/disable ces" command. If the problem continues, disabling and enabling MPLS will cause this internal table to be reset. To enable/disable MPLS, use the "enable/disable mpls" command.

Severity

Error

Message Text

A pseudo-wire with index %pwIndex% incorrectly received \"%event%\" event while in FSM state \"%state%\"

Message Parameters

| Name | Type |
|---------|--------|
| pwIndex | uint32 |
| state | String |
| event | String |

MPLS.TPM.AddWorkQueFail

Description

A pseudo-wire received an event request that had to be added to a work queue for deferred processing. The item could not be added to the work queue and as a result, the request will not be processed.

Remedy

Disabling and enabling the L2VPN or CES container for the pseudo-wire may restore normal operation. To enable/disable an L2VPN, use the "enable/disable l2vpn" command. To enable/disable a CES, use the "enable/disable ces" command. If the problem continues, disabling and enabling MPLS will cause this internal table to be reset. To enable/disable MPLS, use the "enable/disable mpls" command.

Severity

Warning

Message Text

A work item (%work%) triggered by event \"%event%\" for the pseudo-wire with index %pwIndex% in FSM state \"%state%\" could not be added to the work queue

Message Parameters

| Name | Type |
|---------|--------|
| pwIndex | uint32 |
| state | String |
| event | String |
| work | xInt32 |

MPLS.TPM.EventInv

Description

A pseudo-wire received an event that is not valid. The requested event was rejected and the pseudo-wire did not take any action because of the event.

Remedy

Since no action was taken, the affected pseudo-wire may still be functioning properly; however, if the pseudo-wire is not functioning properly, disabling and enabling the L2VPN or CES container for the pseudo-wire may restore normal operation. To enable/disable an L2VPN, use the "enable/disable l2vpn" command. To enable/disable a CES, use the "enable/disable ces" command. If the problem continues, disabling and enabling MPLS will cause this internal table to be reset. To enable/disable MPLS, use the "enable/disable mpls" command.

MRP.StrmRsvFail

Description

This event occurs when the stream reservation fails on a port due to any of the below reasons: 1. Insufficient bandwidth 2. Insufficient Bridge resources 3. Insufficient bandwidth for traffic class. 4. StreamID in use by another Talker 5. Stream destination_address already in use 6. Stream preempted by higher rank 7. Reported latency has changed 8. Egress port is not AVB capable 9. Use a different destination_address (i.e., MAC DA hash table full) 10. Out of MSRP resources 11. Out of MMRP resources 12. Cannot store destination_address (i.e., Bridge is out of MAC DA resources) 13. Requested priority is not an SR Class priority 14. MaxFrameSize is too large for media 15. msrpMaxFanInPorts limit has been reached 16. Changes in FirstValue for a registered StreamID. 17. VLAN is blocked on this egress port (Registration Forbidden) 18. VLAN tagging is disabled on this egress port (untagged set) 19. SR class priority mismatch

This event occurs when a VLAN was failed to be created dynamically.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Failed to create VLAN dynamically with VLANId %vlanId%.

Message Parameters

| Name | Type |
|--------|----------|
| vlanId | VLAN-tag |

MRP.DelPortVLANOK

Description

This event occurs when port was successfully deleted from a VLAN.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Deleted port %port% from VLAN with VLANId: %vlanId%.

Message Parameters

| Name | Type |
|--------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |

MRP.DelPortVLANFail

Description

This event occurs when port was failed to delete from a VLAN.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Failed to delete port %port% from VLAN with VLANId: %vlanId%.

Message Parameters

| Name | Type |
|--------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |

MRP.RxMVRPMsg

Description

This event occurs when a MVRP message is received on a port.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Received MVRP message on port %port% with the following parameters: VLANid - %vlanId%, Message - %message%, Attribute Event- %attributeEvent%, Attribute type- %attrType%.

Message Parameters

| Name | Type |
|----------------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |
| message | uInt8 |
| attributeEvent | String |
| attrType | String |

MRP.TxMVRPMsg

Description

This event occurs when a MVRP message is transmitted from a port.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Transmitted MVRP message on port %port% with the following parameters: VLANid - %vlanId%, Attribute Event - %attrEvent%, Attribute type- %attrType%.

Message Parameters

| Name | Type |
|-----------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |
| attrEvent | String |
| attrType | String |

MRP.AddStrmRsv

Description

This event occurs when the stream reservation is added.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

MSRP stream reservation added with StreamId- %streamID%, Destination MAC- %desMAC% Class- %trafficClass% Bandwidth- %bandwidth% on port %port%.

Message Parameters

| Name | Type |
|--------------|----------|
| port | SlotPort |
| streamID | String |
| bandwidth | uInt32 |
| trafficClass | uInt8 |
| desMAC | MAC |

MRP.RemStrmRsv

Description

This event occurs when a MSP stream reservation is removed.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

MSRP stream reservation removed with StreamId- %streamID%, Destination MAC- %dstMAC%, Class- %trafficClass%, Bandwidth- %bandwidth% on port %port%.

Message Parameters

| Name | Type |
|--------------|----------|
| port | SlotPort |
| streamID | String |
| bandwidth | uInt32 |
| trafficClass | uInt8 |
| dstMAC | MAC |

MRP.RxMSRPDmnMsg

Description

This event occurs when a MSRP domain message is received on a port.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Received MSRP Domain message on port %port% with VLAN- %vlanId%, Attribute Event- %attributeEvent%, SR Class Id- %classId%, SR Class Priority- %classPriority%.

Message Parameters

| Name | Type |
|----------------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |
| attributeEvent | String |
| classId | ulnt8 |
| classPriority | ulnt8 |

MRP.TxMSRPDmnMsg

Description

This event occurs when a MSRP domain message is transmitted on a port.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Transmitted MSRP Domain message on port %port% with VLAN- %vlanId%, Attribute Event- %attributeEvent%, SR Class Id- %classId%, SR Class Priority- %classPriority%.

Message Parameters

| Name | Type |
|----------------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |
| attributeEvent | String |
| classId | uInt8 |
| classPriority | uInt8 |

MRP.TxMSRPTalkMsg

Description

This event occurs when a MSRP Talker message is transmitted on a port.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Transmitted MSRP Talker message on port %port% with StreamId - %streamId%, Destination MAC: %dstMAC%, VLAN- %vlanId%, Attribute Event- %attributeEvent%, Declaration Type-%declarationType%.

Message Parameters

| Name | Type |
|----------------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |
| attributeEvent | String |
| streamId | String |

| Name | Type |
|-----------------|--------|
| dstMAC | MAC |
| declarationType | String |

MRP.RxMSRPTalkMsg

Description

This event occurs when a MSRP Talker message is received on a port.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Received MSRP Talker message on port %port% with StreamId - %streamId%,
Destination MAC: %dstMAC%, VLAN- %vlanId%, Attribute Event- %attributeEvent%,
Declaration Type-%declarationType%.

Message Parameters

| Name | Type |
|-----------------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |
| attributeEvent | String |
| streamId | String |
| dstMAC | MAC |
| declarationType | String |

MRP.TxMSRPLstnMsg

Description

This event occurs when a MSRP Listener message is transmitted on a port.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Transmitted MSRP Listener message on port %port% with StreamId - %streamId%, Destination MAC: %dstMAC%, VLAN- %vlanId%, Attribute Event- %attributeEvent%, Declaration Type-%declarationType%.

Message Parameters

| Name | Type |
|-----------------|----------|
| port | SlotPort |
| vlanId | VLAN-tag |
| attributeEvent | String |
| streamId | String |
| dstMAC | MAC |
| declarationType | String |

MRP.RxMSRPLstnMsg

Description

This event occurs when a MSRP listener message is received on a port.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Received MSRP Listener message on port %port% with StreamId - %streamId%, Attribute Event- %attributeEvent%, Declaration Type-%declarationType%.

Message Parameters

| Name | Type |
|-----------------|----------|
| port | SlotPort |
| attributeEvent | String |
| streamId | String |
| declarationType | String |

msdp.Init

Description

When user creates a Virtual Router, MSDP will initialize it's own database for that particular VR.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Initializing MSDP node for virtual router %vrname%

Message Parameters

| Name | Type |
|--------|--------|
| vrname | String |

msdp.DeInit

Description

When user deletes a Virtual Router, MSDP will remove it's own database for that particular VR.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Removing MSDP node for virtual router %vrname%

Message Parameters

| Name | Type |
|--------|--------|
| vrname | String |

msdp.NodeNotFnd

Description

MSDP doesn't know about this VR. The associated MSDP database in not yet initialized

Remedy

No remedy is available.

Severity

Warning

Message Text

MSDP node not found for virtual router %vrId% !!!

Message Parameters

| Name | Type |

msdp.extif.RxSyncRspFromBGP

Description

No description is available.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Recd sync route response from BGP about dest %dest% in VR %vrname%

Message Parameters

| Name | Type |
|--------|--------|
| dest | IP |
| vrname | String |

msdp.extif.SendGrpNotifToPIM

Description

No description is available.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Notifying PIM about sources for group %grp% source count %num% in VR %vrname%

Message Parameters

| Name | Type |
|--------|--------|
| grp | IP |
| num | sInt32 |
| vrname | String |

msdp.extif.RxMsgFromPIM

Description

This message gets logged when MSDP receives a message from PIM.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Rx message from PIM - %msgtype% type:%type%; mode:%mode%; flags:%flags%; rp:%rp%; num:%num%

Message Parameters

| Name | Type |
|---------|--------|
| msgtype | String |
| type | ulnt |
| mode | ulnt |
| flags | ulnt |
| rp | String |
| num | ulnt |

msdp.extif.RxEntriesSGfromPIM

Description

This message logs the individual (S, G) entry from PIM to MSDP

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

(S, G) entry in PIM to MSDP message - index:%i%; S:%S%; G:%G%

Message Parameters

| Name | Type |
|------|--------|
| i | ulnt |
| S | String |
| G | String |

msdp.extif.RxDupRegMsgFromPIM

Description

This message gets logged when MSDP receives a duplicate message from PIM.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Rx duplicate register message from PIM - group: %grp% source: %src% already registered

Message Parameters

| Name | Type |
|------|--------|
| grp | String |
| src | String |

msdp.extif.RxDupUnRegMsgFromPIM

Description

This message gets logged when MSDP receives a duplicate message from PIM.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Rx duplicate unregister message from PIM - group: %grp% source: %src% doesn't exist

Message Parameters

| Name | Type |
|------|--------|
| grp | String |
| src | String |

msdp.extif.RxDupSAFromPIM

Description

This message gets logged when MSDP receives a duplicate SA Add/Delete message from PIM.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Rx duplicate local SA %oper% message from PIM - group: %grp% source: %src%

Message Parameters

| Name | Type |
|------|--------|
| oper | String |
| grp | String |
| src | String |

msdp.msgs.DebugSummary

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

msdp.msgs.DebugVerbose

Description

A condition has been detected that may interest a developer analyzing some system behavior at a more verbose level than provided by the debug summary information.

Remedy

There is no remedy because there is no problem to be resolved.

| vrname | String |

msdp.msgs.SAReqNotSent

Description

This event is about transmission of a SA request msg

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

SA request msg not sent for group %grp% to peer %peer% in VR %vrname% as peer is not up

Message Parameters

| Name | Type |
|--------|--------|
| grp | IP |
| peer | IP |
| vrname | String |

msdp.msgs.RxFrmMeshGrp

Description

This event is about reception of a SA msg from a peer that is also a member of the same Mesh Group

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

SA msg rxd from peer %peer% a member of mesh group %grp% so bypass RPF check

Message Parameters

| Name | Type |
|------|--------|
| peer | IP |
| grp | String |

msdp.msgs.NumPeerSACacheExcd

Description

This event is about reception of a SA msg from a peer that causes the number of cache entries from that peer to exceed the preconfigured limit.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

Num of SA cache entries from peer %peer% exceeds the preconfigured limit of %num%.
Discard

Message Parameters

| Name | Type |
|------|--------|
| peer | IP |
| num | sInt32 |

msdp.msgs.NumRejSACacheExcd

Description

This event is about reception of a SA msg from a peer that causes the number of cache entries to exceed the preconfigured limit.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

Num of rejected SA cache entries exceeds the preconfigured limit of %num%. Discard

Message Parameters

| Name | Type |
|------|--------|
| num | sInt32 |

msdp.msgs.TXSAEncap

Description

This event is about transmission of a MSDP msg to its peer

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Sending MSDP SA msg with encapsulated data length %len% to peer %peer% in VR
%vrname%

Message Parameters

| Name | Type |
|--------|--------|
| len | sInt32 |
| peer | IP |
| vrname | String |

msdp.msgs.EncapFree

Description

This event is about transmission of a MSDP msg to its peer

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

Freeing MSDP SA encapsulated data of length %len%

Message Parameters

| Name | Type |
|------|--------|
| len | sInt32 |

msdp.msgs.DupEncapDataRx

Description

This event is about reception of a duplicate MSDP SA msg with encapsulated data field

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Recvd MSDP SA %src% %grp% %rp% with encap data from %peer% for which encap data is already present

Message Parameters

| Name | Type |
|------|------|
| src | IP |
| grp | IP |
| rp | IP |
| peer | IP |

NetDBMgr.ParmNull

Description

An internal function was called with a NULL pointer. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on the switch configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% is NULL

Message Parameters

| Name | Type |
|------|--------|
| arg | String |

NetDBMgr.ParmInv

Description

An internal function was called with an invalid value. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on the switch configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% has an invalid value %val%

Message Parameters

| Name | Type |
|------|--------|
| arg | String |
| val | uInt32 |

NetDBMgr.AllocMemFail

Description

Memory for the displayed object could not be allocated which may be due to the system running low on memory. This will result in incorrect network database operations.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory. Once sufficient system memory is reclaimed, it is recommended that netDbMgr process be restarted for internal state to be fully rebuilt.

Severity

Error

Message Text

Memory allocation failed when trying to allocate a %obj% structure of size %size%.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |
| size | uInt32 |

NetDBMgr.AllocPipeFail

Description

A thread failed to open a pipe to talk to other threads in netDbMgr. This may be either due to the system running low on memory or a large number of file descriptors being opened by the process due to software bug. Pipe allocation failures imply no or partial control information exchange between threads that results in incorrect operation of netDbMgr. Users may see incorrect operation of applications that talk to a remote database

Remedy

Check free memory available on the system using the "show memory" command. If there is sufficient memory try restarting netDbMgr else reducing configuration may help reclaiming memory. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Failed to create pipe with error: %errormsg%(%err%)

Message Parameters

| Name | Type |
|----------|--------|
| errormsg | String |
| err | sInt32 |

NetDBMgr.SetPipeFail

Description

netDbMgr failed to set a configuration option on the pipe file descriptor used inter-thread communication. Failure to set correct options will result remote database operations failing and in incorrect working of application that rely on netDb infrastructure

Remedy

Try restarting netDbMgr using the "restart process netDbMgr" command. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Failed to set Pipe %option% with error: %errormsg%(%err%)

Message Parameters

| Name | Type |
|----------|--------|
| option | String |
| errormsg | String |
| err | sInt32 |

NetDBMgr.InitSvrFail

Description

Failed to start the netDbMgr server. This condition results in applications not being able to communicate with netDbMgr and hence will not have access to remote databases. This is not expected and is indicative of a serious problem.

Remedy

Try restarting netDbMgr using the "restart process netDbMgr" command. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Network Database server failed to start

NetDBMgr.InitApplFail

Description

Failed to initialize application that uses netDbMgr. This condition results in netDbMgr being unable to populate its structures on details of the connecting application. Some applications may not being able to communicate with netDbMgr and hence will not have access to remote databases. This is not expected and is indicative of a serious problem.

Remedy

Check free memory available on the system using the "show memory" command. If there is sufficient memory try restarting netDbMgr else reducing configuration may help reclaiming memory. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Failed to initialize application: %appl%

Message Parameters

| Name | Type |
|------|--------|
| appl | String |

NetDBMgr.InitSrvrDone

Description

This message is an informational message used for debugging problems related to netDbMgr Server and does not indicate a problem.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

netDbMgr server initialized successfully

NetDBMgr.OpenDrvrFail

Description

netDbMgr failed to open a database driver library of the indicated type. Driver open failures result in netDbMgr failing to connect to remote databases of the specified type. This is not expected and is indicative of a serious problem.

Remedy

Check free memory available on the system using the "show memory" command. If there is sufficient memory try restarting netDbMgr else reducing configuration may help reclaiming memory. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Network Database Driver: %name% open failed with error: %error%)

Message Parameters

| Name | Type |
|-------|--------|
| name | String |
| error | String |

NetDBMgr.LkupDrvrFail

Description

netDbMgr failed to lookup a driver function. Database drivers are dynamically loaded depending on applications that use a specific type of database. Lookup failures indicate netDbMgr and the database driver library may have mismatched versions. This is not expected and is indicative of a serious problem.

Remedy

Try restarting netDbMgr using "restart process netDbMgr" command. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Network Database Driver: %name% lookup for function %function% failed with error: %error%)

Message Parameters

| Name | Type |
|----------|--------|
| name | String |
| function | String |
| error | String |

NetDBMgr.InitDrvrFail

Description

netDbMgr failed to initialize a database driver. Driver initialization failures result in netDbMgr failing to connect to remote databases of the specified type. This is not expected and is indicative of a serious problem.

Remedy

Try restarting netDbMgr using "restart process netDbMgr" command. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Network Database Driver: %name% initialization failed with error: %error%)

Message Parameters

| Name | Type |
|-------|--------|
| name | String |
| error | String |

NetDBMgr.SchedTimerFail

Description

netDbMgr failed to schedule a timer. Failure to schedule timers will result in incorrect operation of periodic or time-bound events in netDbMgr's operation. This is not expected and is indicative of a serious problem.

Remedy

Check free memory available on the system using the "show memory" command. If there is sufficient memory try restarting netDbMgr. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

netDbMgr failed to schedule an internal timer: %name% initialization failed with error: %error%)

Message Parameters

| Name | Type |
|-------|--------|
| name | String |
| error | String |

NetDBMgr.CreatThreadFail

Description

netDbMgr process failed to create an internal thread. Thread allocation failures are indicative of a serious resource depletion problem in the underlying Linux Kernel.

Remedy

Check free memory available on the system using the "show memory" command. If there is sufficient memory try restarting netDbMgr. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Failed to create thread name:%name% with error: %errormsg% (%err%)

Message Parameters

| Name | Type |
|----------|--------|
| name | String |
| errormsg | String |
| err | sInt32 |

NetDBMgr.AllocEventBaseFail

Description

netDbMgr process failed to allocate an event base. Event base allocation failures is indicative of the system being low on memory.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory. Once sufficient system memory is reclaimed, it is recommended that netDbMgr process be restarted for internal state to be fully rebuilt.

Severity

Error

Message Text

Failed to allocate a event base: %name%

Message Parameters

| Name | Type |
|------|--------|
| name | String |

NetDBMgr.AllocEventStrucFail

Description

netDbMgr process failed to allocate an event structure. Event allocation failures indicates the system may be running low on memory.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory. Once sufficient system memory is reclaimed, it is recommended that netDbMgr process be restarted for internal state to be fully rebuilt.

Severity

Error

Message Text

Failed to allocate an event structure: %name%

Message Parameters

| Name | Type |
|------|--------|
| name | String |

NetDBMgr.AssgnEventStrucFail

Description

netDbMgr process failed to assign an event structure. Event assignment failures will result in missed events and incorrect operation of netDbMgr

Remedy

Check free memory available on the system using the "show memory" command. If there is sufficient memory try restarting netDbMgr. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

Failed to assign an event; %name%

Message Parameters

| Name | Type |
|------|--------|
| name | String |

NetDBMgr.ParseMsgFail

Description

netDbMgr was not able to successfully parse an internal message. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on the switch configuration.

Severity

Critical

Message Text

Failed to parse message %format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

NetDBMgr.ConnDBSrvrFail

Description

netDbMgr was not able to successfully connect to a database server. This can happen due to one or more of these conditions - DNS resolution failure, route lookup failure,

a network connectivity issue, remote host being down, the remote database not accepting connections, authentication failure etc.

Remedy

Check if the remote database server is configured correctly and is accepting connections. Check the output of the show database command to see if the server address or hostname and the L4 port has been configured correctly. Use ping or traceroute from the switch to troubleshoot network connectivity and DNS lookup issues.

Severity

Critical

Message Text

Failed to connect. Database: %db% Server: %host% Port: %port% Error: %err%

Message Parameters

| Name | Type |
|------|------------|
| db | String |
| host | String |
| port | dstL4portN |
| err | String |

NetDBMgr.AutoEdgeMsgTrace

Description

This message is for debugging problems related to Automated Edge application messages in netDbMgr. This does not indicate a problem.

Remedy

No action required - Informational message intended to help debug problems that may involve the Automated Edge application

NetTools.PrvlgNotRoot

Description

NetTools must be started with root privileges.

Remedy

Start NetTools with root privileges.

Severity

Error

Message Text

NetTools was not started with root privileges

NetTools.AllocRawSockFail

Description

Can't allocate a system resource for receiving a raw protocol.

Remedy

When the protocol type is IPPROTO_ICMP this is probably related to the ping or traceroute functions. Gather as much information on replication as possible and get in touch with the Extrmene Networks technical support center.

Severity

Error

Message Text

Can't allocate RAW socket for protocol %prot% error %error%

Message Parameters

| Name | Type |
|-------|--------|
| prot | String |
| error | sInt |

NetTools.AddSockToDsptchFail

Description

Could not add the given socket to the dispatcher.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Error

Message Text

Failed to add socket %socket%->type% with VriD %vrid% to dispatcher.

Message Parameters

| Name | Type |
|--------|------|
| vrid | sInt |
| socket | sInt |
| type | uInt |

NetTools.DsptchClbkCtrlBlkNull

Description

Callback function was called without any work to do.

Remedy

This should not happen, but if it does report it to Extreme Networks technical support center. This should not influence the operation of the switch.

Severity

Info

Message Text

ntDtCallback() received a NULL socketEntry_t controll block.

NetTools.ICMPPktRxFmSock

Description

An incoming ICMP packet from the above socket was received.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Verbose

Message Text

ICMP packet from %sip% to %dip% on socket %sock%-%vrid% type %type% code %code%

Message Parameters

| Name | Type |
|-------|--------|
| srcIP | srcIPN |
| dstIP | dstIPN |
| sock | sInt |
| vrid | uInt |
| type | uInt |
| code | uInt |

NetTools.ICMPFragSizeSmall

Description

An ICMP packet with fragment data was received, but the fragment is too small to identify if it was ours.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Summary

Message Text

ICMP fragment is too small to hold original IP packet plus ICMP header
 [%vrid%: %iplen%: %ipHdrLen%: %ipFragHdrLen%]

Message Parameters

| Name | Type |
|--------------|------|
| vrid | uInt |
| iplen | uInt |
| ipHdrLen | uInt |
| ipFragHdrLen | uInt |

NetTools.ICMPFragInvalid

Description

An ICMP packet with fragment data was received but the fragment is not an ICMP Echo Request packet.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Summary

Message Text

ICMP fragment does not contain an ICMP echo request packet [%vrid%:%prot%:%type%]

Message Parameters

| Name | Type |
|------|------|
| vrid | ulnt |
| prot | ulnt |
| type | ulnt |

NetTools.ICMPFragPktRxFmSock

Description

An incoming ICMP fragment packet from the above socket was received.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Verbose

Message Text

ICMP fragment packet from %sip% to %dip% on socket %sock%-%vrid% type %type%
code %code% id %id% seq %seq%

Message Parameters

| Name | Type |
|------|-------|
| sip | srcIP |
| dip | dstIP |
| sock | ulnt |
| vrid | ulnt |
| type | ulnt |
| code | ulnt |
| id | ulnt |
| seq | ulnt |

NetTools.AllocUDPSockFail

Description

Can't allocate a system resource for receiving and sending UDP datagrams.

Remedy

For some reason it's not possible to allocate a socket. Please restart the netTools application. If this does not solve it get in touch with Extreme Networks techsupport.

Severity

Error

Message Text

Can't allocate UDP socket for source port %port% error %error%

Message Parameters

| Name | Type |
|-------|------|
| port | ulnt |
| error | slnt |

NetTools.BindUDPSockFail

Description

Can't bind UDP socket to local address or port.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Error

Message Text

Unable to bind UDP socket %sock% to %ip%:%port% error %err%

Message Parameters

| Name | Type |
|------|----------|
| sock | sInt |
| ip | SockAddr |
| port | uInt |
| err | sInt |

NetTools.ICMPPktRxSizeSmall

Description

The packet size returned from recvfrom() is not enough to hold entire IP packet.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Summary

Message Text

ICMP packet received from recvfrom() is not large enough to hold IP and ICMP data [%socket%-%vrid%].

Message Parameters

| Name | Type |
|--------|------|
| socket | sInt |
| vrid | uInt |

NetTools.RxPingReply

Description

A valid echo reply was received for an outstanding ping request. Enable the icmpIn message to see details on the source of the echo reply.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Verbose

Message Text

Echo reply; %size% bytes from %from%: icmp_seq=%seq% ttl=%ttl% [%secNow%.%usecNow% - %secSend%.%usecSend%]

Message Parameters

| Name | Type |
|----------|--------|
| size | uInt |
| from | srcIPN |
| seq | uInt |
| ttl | uInt |
| secNow | uInt |
| usecNow | uInt |
| secSend | uInt |
| usecSend | uInt |

NetTools.ConnectUDPSockFail

Description

Can't connect UDP socket to/from address and port specified.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Error

Message Text

Unable to connect UDP socket %sock% to %dip%:%dport% from %sip%:%sport% error %err%

Message Parameters

| Name | Type |
|-------|-------------|
| sock | sInt |
| dip | dstSockAddr |
| dport | dstL4port |
| sip | srcSockAddr |
| sport | srcL4port |
| err | uInt |

NetTools.AllocTCPSockFail

Description

Can't allocate a system resource for receiving and sending TCP datagrams.

Remedy

For some reason it's not possible to allocate a socket. Please restart the netTools application. If this does not solve it get in touch with Extreme Networks techsupport.

Severity

Error

Message Text

Can't allocate TCP socket for source port %port% error %error%

Message Parameters

| Name | Type |
|-------|------|
| port | uInt |
| error | sInt |

NetTools.BindTCPSockFail

Description

Can't bind TCP socket to local address or port.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Error

Message Text

Unable to bind TCP socket %sock% to %ip%:%port% error %err%

Message Parameters

| Name | Type |
|------|----------|
| sock | sInt |
| ip | SockAddr |
| port | uInt |
| err | sInt |

NetTools.ListenTCPSockFail

Description

Can't listen on TCP socket for specific IP address and TCP port.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Error

Message Text

Unable to listen for TCP socket %sock% on %ip%:%port% error %err%

Message Parameters

| Name | Type |
|------|----------|
| sock | sInt |
| ip | SockAddr |
| port | uInt |
| err | sInt |

NetTools.AcceptTCPSockFail

Description

Can't accept an new connection on TCP socket for specific IP address and TCP port.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Error

Message Text

Unable to accept TCP connection for socket %sock% on %ip%:%port% error %err%

Message Parameters

| Name | Type |
|------|----------|
| sock | sInt |
| ip | SockAddr |
| port | uInt |
| err | sInt |

NetTools.ConnectTCPSockFail

Description

Can't connect a TCP socket for specific IP destination address and TCP port.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Error

Message Text

Unable to setup a TCP connection for socket %sock% on %ip%:%port% error %err%

Message Parameters

| Name | Type |
|------|----------|
| sock | sInt |
| ip | SockAddr |
| port | uInt |
| err | sInt |

NetTools.InitVLANLibFail

Description

Failed initializing the VLAN Library

Remedy

Restart the netTools application, if it continues to fail get in touch with Extreme Networks techsupport.

Severity

Error

Message Text

VLAN Library initialization failed.

NetTools.BindICMPSockFail

Description

Can't bind ICMP socket to local address.

Remedy

Try to replicate this issue and report it to the Extreme Networks technical support center.

Severity

Error

Message Text

Unable to bind ICMP socket %sock% to %ip% error %err%

Message Parameters

| Name | Type |
|------|----------|
| sock | sInt |
| ip | SockAddr |
| err | sInt |

NetTools.RxUDPPingReply

Description

An incoming UDP echo packet from the mentioned socket was received.

Remedy

This is for debug purposes and should only be enabled on request of Extreme Networks technical support.

Severity

Debug-Verbose

Message Text

UDP packet from %sip%:%spo% on socket %sock%-%vrid% type %type% code %code%

Message Parameters

| Name | Type |

| sip | srcIPN |
| spo | srcL4port |
| sock | sInt |
| vrid | uInt |
| type | uInt |
| code | uInt |

NetTools.BindEchoSockFail

Description

Failed to bind the UDP Echo server port for the specified virtual router.

Remedy

This could happen if the specified port is already used by the switch for another service.

Severity

Error

Message Text

Failed to bind UDP Echo server to UDP port %port% for virtual router number %vrid%

Message Parameters

| Name | Type |
|------|--------|
| port | L4port |
| vrid | uInt16 |

NetTools.AllocPFSockFail

Description

Cannot allocate a system resource for receiving and sending PF_PACKET datagrams.

Remedy

For some reason it's not possible to allocate a socket. Please restart the netTools application. If this does not solve it get in touch with Extreme Networks techsupport.

Severity

Error

Message Text

Cannot allocate PF_PACKET socket for protocol %prot% error %error%

Message Parameters

| Name | Type |
|-------|--------|
| prot | uInt16 |
| error | sInt |

NetTools.ProcTrackingEvent

Description

This message can be used for debugging the netTools ping tracking module.

Remedy

Restart the netTools application, if it continues to fail get in touch with Extreme Networks techsupport.

Severity

Debug-Verbose

Message Text

Received event %event% for target %ip%, VR id %vrid%, freq %freq%, misses %cfgMis% (%curMis%), successes %cfgSucc%(%curSucc%)

Message Parameters

NetTools.IpV6HopLmtMisMatch

Description

A deprecated command was used that allowed configuration of the IPv6 hop-limit only for Router Advertisements. According to RFC 4861, the IPv6 hop-limit configuration of the local VLAN interface must be the same as the advertised hop-limit in outgoing Router Advertisements. A mismatch may lead to unexpected network problems like dropped packets. The Router Advertisement hop-limit will revert to interface hop-limit value when either the interface hop-limit is configured or the system reboots.

Remedy

Use "configure ipv6 hop-limit" command to specify a hop-limit for the local VLAN interface as well as for outgoing router advertisements. It is flexible enough to allow specifying a value of zero for router advertisements and a non-zero value for the local interface.

Severity

Warning

Message Text

IPv6 hop-limit mismatch on %vlan%: Interface hop-limit is %vhl% and zero-in-ra is %unspec%, while Router Advertisement hop-limit is %rahl%

Message Parameters

| Name | Type |
|--------|--------|
| vlan | String |
| vhl | uInt8 |
| unspec | uInt |
| rahl | uInt8 |

NetTools.SetSockVRFFail

- [NetTools.NAT.CfgNFTFail](#) on page 3502

NetTools.NAT.ParmNull

Description

An internal function was called with a NULL pointer. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on the switch configuration by collecting the outputs of "show tech-support", "show ip nat", "show ip nat vlan" and "show ip nat rule" commands. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% is NULL

Message Parameters

| Name | Type |
|------|--------|
| arg | String |

NetTools.NAT.ParmInv

Description

Provide technical support information on the switch configuration by collecting the outputs of "show tech-support", "show ip nat", "show ip nat vlan" and "show ip nat rule" commands. Also, check the scalability limit and compare this with the current configuration.

Remedy

Provide technical support information on the switch configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% has an invalid value %val%

Message Parameters

| Name | Type |
|------|--------|
| arg | String |
| val | uInt32 |

NetTools.NAT.AllocMemFail

Description

Memory for the displayed object could not be allocated which may be due to the system running low on memory. This will result in incorrect network address translation operations.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory. Once sufficient system memory is

reclaimed, it is recommended that netTools process be restarted for internal state to be fully rebuilt.

Severity

Error

Message Text

Memory allocation failed when trying to allocate a %obj% structure of size %size%.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |
| size | uint32 |

NetTools.NAT.SchedTimerFail

Description

NAT failed to schedule a timer. Failure to schedule timers will result in incorrect operation of periodic or time-bound events in NAT's operation. This is not expected and is indicative of a serious problem.

Remedy

Check free memory available on the system using the "show memory" command. If there is sufficient memory try restarting netTools. If the issue persists, on systems with backup nodes try failing over to the backup. Standalone systems may require a reboot to correct the problem.

Severity

Error

Message Text

NAT failed to schedule an internal timer: %name% initialization failed with error: %error%)

Message Parameters

| Name | Type |

| otherRouter | IPv6 |
| prefix | IPv6 |
| fieldName | String |
| otherVal | uint |
| localVal | uint |

NetTools.RouterAdv.VLANNotExist

Description

A Router Advertisement was received from another IPv6 router, but the configuration information for the vlan cannot be found.

Remedy

No remedy is available.

Severity

Warning

Message Text

Cannot process Router Advertisement from %otherRouter%: no such VLAN

Message Parameters

| Name | Type |
|-------------|------|
| otherRouter | IPv6 |

NetTools.RouterAdv.AddrNotLinkLoc

Description

RFC2461 states that Router Advertisements must be sent from an IPv6 Link Local address. The router which sent the Router Advertisement has been misconfigured.

Remedy

No remedy is available.

Severity

Warning

Message Text

Cannot process Router Advertisement received from %otherRouter% on vlan %vlanName%, because it is not a link local address.

Message Parameters

| Name | Type |
|-------------|------|
| otherRouter | IPv6 |
| vlanName | VLAN |

NetTools.RouterAdv.AdvertInvPktShort

Description

A Router Advertisement packet was received which is smaller than the minimum size for a Router Advertisement. The router which sent the packet is misconfigured.

Remedy

No remedy is available.

Severity

Warning

Message Text

received bad Router Advertisement on vlan %vlanName% from %sourceAddress% : packet is too small (%packetLen% bytes)

Message Parameters

| Name | Type |
|---------------|------|
| vlanName | VLAN |
| sourceAddress | IPv6 |
| packetLen | uInt |

NetTools.RouterAdv.AdvertHopLmtInv

Description

RFC2461 states that Router Advertisements must contain a hop limit of 255, but a packet was received which did not. This means either that the other router is misconfigured and is sending the packet with an invalid hop count, or there is a network problem causing link local ICMP6 packets to be inappropriately routed.

Remedy

No remedy is available.

Severity

Warning

Message Text

received bad Router Advertisement on vlan %vlanName% from %sourceAddress% : hop limit (%hopLimit%) is not 255

Message Parameters

| Name | Type |
|---------------|------|
| vlanName | VLAN |
| sourceAddress | IPv6 |
| hopLimit | uInt |

NetTools.RouterAdv.AdvertInvOptLenZero

Description

Option headers for ICMP6 Router Advertisements have a length specified in multiples of 8 bytes. A length of zero is nonsensical, and the router which sent this packet has been misconfigured.

Remedy

No remedy is available.

Severity

Warning

Message Text

Received bad Router Advertisement on VLAN %vlanName% from %sourceAddress% :
Option length for code %optCode% is zero

Message Parameters

| Name | Type |
|---------------|------|
| vlanName | VLAN |
| sourceAddress | IPv6 |
| optCode | ulnt |

NetTools.RouterAdv.AdvertInvICMPCodNotZero

Description

RFC2461 states that Router Advertisements must contain an ICMP Code of zero. A packet was received which does not. This may indicate misconfiguration of the other router.

Remedy

No remedy is available.

Severity

Warning

Message Text

received bad Router Advertisement on vlan %vlanName% from %sourceAddress% : ICMP
Code %icmpCode% is not zero

Message Parameters

| Name | Type |
|---------------|------|
| vlanName | VLAN |
| sourceAddress | IPv6 |
| icmpCode | uint |

NetTools.RouterAdv.AdvertInvParseFail

Description

A Router Advertisement was received which cannot be parsed. The router which sent it may be misconfigured.

Remedy

No remedy is available.

Severity

Warning

Message Text

received bad Router Advertisement on vlan %vlanName% from %sourceAddress% :
Cannot parse the packet

Message Parameters

| Name | Type |
|---------------|------|
| vlanName | VLAN |
| sourceAddress | IPv6 |

NetTools.RouterAdv.AdvertPrefixInv

Description

Indicates a misconfiguration in another router on a locally attached subnet.

Remedy

No remedy is available.

Severity

Warning

Message Text

Received Router Advertisement on vlan %vlanName% from %otherRouter% containing prefix %prefix% which is invalid (%reasonInvalid%)

Message Parameters

| Name | Type |
|---------------|--------|
| vlanName | VLAN |
| otherRouter | IPv6 |
| prefix | IPv6 |
| reasonInvalid | String |

NetTools.RouterAdv.ICMP6IfNotFnd

Description

An ICMP6 packet was received, but could not be associated with any vlan.

Remedy

No remedy is available.

Severity

Warning

Message Text

Cannot process packet from %sourceAddr%: no interface

|--------|--------|
| logMsg | Printf |

NetTools.RouterAdv.DNSSLSfxTxFail

Description

There was a problem in adding the DNS suffix to the Router Advertisement packet for transmission over the specified interface. This will cause the suffix to not be present in the Router Advertisement message that is transmitted. This can happen if the configuration is invalid.

Remedy

Check the configuration and correct any inconsistencies found. Configuration can be verified by issuing a 'show router-discovery <vlan-name>'. Configuration can be corrected by the 'configure <vlan-name> router-discovery [add|delete] dnssl <dns_suffix>' command.

Severity

Error

Message Text

Error transmitting DNSSL suffix %suffix% as part of DNSSL option of Router Advertisement over vlan %vlan%

Message Parameters

| Name | Type |
|--------|--------|
| suffix | String |
| vlan | VLAN |

NetTools.RouterAdv.AdvertRDNSSOptLenInv

Description

This indicates a misconfiguration between routers on a locally attached subnet.

Remedy

Check the configuration on appropriate routers and make any configuration updates as needed. Locally, configuration can be verified by issuing a 'show router-discovery <vlan-name>'. Configuration can be corrected by the 'configure <vlan-name> router-discovery [add|delete] rdns <ipaddress>' command.

Severity

Warning

Message Text

Received Router Advertisement on vlan %vlanName% from %otherRouter% with a RDNSS Option Length of %optLen% which is less than the minimum required length of %minLen%

Message Parameters

| Name | Type |
|-------------|------|
| vlanName | VLAN |
| otherRouter | IPv6 |

| Name | Type |
|--------|------|
| optLen | ulnt |
| minLen | ulnt |

NetTools.RouterAdv.RxAdvertRDNSSOpt

Description

A Router Advertisement message with a RDNSS Option was received from a router on the same subnet.

Remedy

No action required. Informational message only.

Severity

Info

Message Text

Received Router Advertisement on vlan %vlanName% from %otherRouter% with a RDNSS Address %addr% and lifetime %rxLfTm%

Message Parameters

| Name | Type |
|-------------|------|
| vlanName | VLAN |
| otherRouter | IPv6 |
| addr | IPv6 |
| rxLfTm | ulnt |

NetTools.RouterAdv.LkupRDNSSAddrFail

Description

The RDNSS address seems to be configured on the other router but not on the local router. This is possible as a transient when configurations are being updated on multiple routes or as a persistent because of a misconfiguration in one of the routers

Remedy

Check the configuration on appropriate routers and make any configuration updates as needed. Locally, configuration can be verified by issuing a 'show router-discovery <vlan-name>'. Configuration can be corrected by the 'configure <vlan-name> router-discovery [add|delete] rdns <ipaddress>' command.

Severity

Warning

Message Text

RDNSS Address Lookup failed for received Router Advertisement on vlan %vlanName% from %otherRouter% with a RDNSS Address %addr%

Message Parameters

| Name | Type |
|-------------|------|
| vlanName | VLAN |
| otherRouter | IPv6 |
| addr | IPv6 |

NetTools.RouterAdv.AdvertRDNSSOptLftimeInv

Description

The RDNSS Lifetime value between two routers seem to not match. This is possible as a transient when configurations are being updated on multiple routes or as a persistent condition because of a misconfiguration in one of the routers

Remedy

Check the configuration on appropriate routers and make any configuration updates as needed. Locally, configuration can be verified by issuing a 'show router-discovery <vlan-name>'. Configuration can be corrected by one of the 'configure <vlan-name> router-discovery [add|delete] rdns <ipaddress> {<rdns_lifetime>}' or 'configure <vlan-name> router-discovery rdns-lifetime <rdns_lifetime>' command.

Severity

Warning

Message Text

Received Router Advertisement on vlan %vlanName% from %otherRouter% with a RDNSS Address %addr% and lifetime %rxLfTm% which differs from locally configured lifetime of %cfgLfTm%

Message Parameters

| Name | Type |
|-------------|------|
| vlanName | VLAN |
| otherRouter | IPv6 |
| addr | IPv6 |
| rxLfTm | ulnt |
| cfgLfTm | ulnt |

NetTools.RouterAdv.AdvertDNSSLOptLenInv

| new | String |

nl.SetNetLoginVlanFail

Description

NetLogin framework failed to set the NetLogin VLAN.

Remedy

NetLogin VLAN could not be set by VLAN Manager. Verify that the criteria for a NetLogin VLAN are met (no ports configured, ipforwarding disabled).

Severity

Error

Message Text

Failed to configure the NetLogin VLAN to %vlan%, reason %ret%

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |
| ret | uint |

nl.ClientStateChange

Description

This is a debug message used that can be used to debug client authentication. It will show the state changes for all clients moving from unauthenticated to authenticated and the other way around.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Summary

Message Text

Client [%mac%, %port%] state change from %old% to %new%.

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |
| mac | MAC |
| old | String |
| new | String |

nl.NetLoginVlanAddFail

Description

NetLogin needs to add all port enabled for NetLogin to the NetLogin VLAN. For some reason this failed for the mentioned VLAN on the specific port.

Remedy

This should only happen if the NetLogin VLAN has not been configured correctly. i.e. IP-Forwarding disabled, a valid TAG is assigned, and no ports are added. The result for now is always zero, this might change in the future.

Severity

Error

Message Text

Failed to add the NetLogin VLAN, %vlan%, to port %port%, reason %reason%

Message Parameters

| Name | Type |
|--------|----------|
| vlan | VLAN |
| port | SlotPort |
| reason | sInt |

nl.ClientMoveResult

Description

This is a debug message used that can be used to debug client authentication. It will show the framework internal return codes as a result to a VLAN move request.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Summary

| mac | srcMAC |

nl.ClientMoveFail

Description

The framework failed to authenticate the client, as it cant move to the requested VLAN.

Remedy

This could happen when there are authenticated clients existing on the current port (untagged), and we can only be in one port untagged at a given time. This could also happen when a port already exists tagged/untagged and your client tried to authenticate untagged/tagged. To allow the client to authenticated to the current vlan, change the NetLogin related CLI setting.

Severity

Notice

Message Text

Failed authentication for client %mac% on port %port%, VLAN %vlan%; Cant move to VLAN %dstvlan%

Message Parameters

| Name | Type |
|---------|----------|
| mac | MAC |
| port | SlotPort |
| vlan | VLAN |
| dstvlan | VLAN |

nl.InvalidVlanVSA

Description

User was authenticated and requested to move to a new VLAN. This did not happen due to one of the following reasons: 1) VLAN does not exist on the switch 2) VLAN is disabled 3) VLAN has a tag OR 4) VSA has an invalid delimiter.

Remedy

Check radius configuration, or create VLAN on the switch.

Severity

Warning

Message Text

VLAN %vlan% specified in Radius VSA does not exist, is disabled, has an internal tag value or an invalid VLAN delimiter is present

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |

nl.InvalidVlanTagVSA

Description

User was authenticated and requested to move to a new vlan. This did not happen as the destination VLAN does not exists on the switch (identified by the vlan Tag).

Remedy

Check radius configuration, or create vlan with specified tag on the switch.

Severity

Warning

Message Text

VLAN Tag %vlan% specified in Radius VSA does not exist on the switch or cannot be created. Please verify RADIUS configuration

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |

nl.ClientLinkDown

Description

This message gets logged when the physical link the client was authenticated on went down.

Remedy

This is an informational message.

Severity

Info

Message Text

Network Login user %user% cleared due to link down event, Mac %mac% port %port% VLAN(s) \"%vlan%\"

| user | String |
| mac | MAC |
| port | SlotPort |
| vlan | VLAN |

nl.ChkPntStart

Description

This message gets logged when check-pointing to backup Needling framework has started.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Summary

Message Text

Initial Check Pointing started for NetLogin Framework

nl.ChkPntFinished

Description

This message gets logged when initial check-pointing to backup NetLogin framework is finished.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Summary

Message Text

Initial Check Pointing finished for NetLogin Framework

nl.ChkPntTxClient

Description

This message gets logged when client information is send to the backup instance.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Data

Message Text

Client %mac% on port %port% checkpointed, state = %state%

Message Parameters

| Name | Type |
|-------|----------|
| mac | MAC |
| port | SlotPort |
| state | uInt32 |

nl.ChkPntRxClient

Description

This message gets logged when client information is received by the backup instance.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Data

Message Text

Client %mac% on port %port%, checkpointed, state = %state%

Message Parameters

| Name | Type |
|-------|----------|
| mac | MAC |
| port | SlotPort |
| state | uInt |

nl.ChkPntTxVPif

Description

This message gets logged when nIVPif information is send to the backup instance.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Data

Message Text

VPif for port %port%, VLAN %vlan% checkpointed; type=%type%,
orgUntaggedVlanOnPort=%orgVlan%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| vlan | VLAN |
| type | uInt32 |
| orgVlan | uInt32 |

nl.ChkPntRxVPif

Description

This message gets logged when nIVPif information is received by the backup instance.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Data

Message Text

VPif for port %port%, VLAN %vlan% checkpointed; type=%type%, orgVLAN=%orgVlan%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| vlan | VLAN |
| type | uInt32 |
| orgVlan | uInt32 |

nl.ChkPntTxReqVPif

Description

This message gets logged when a request for nIVPif information is send to the backup instance.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Data

Message Text

Checkpoint VPif request for port %port%, VLAN %vlan%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |
| vlan | VLAN |

nl.ChkPntRxReqVPif

Description

This message gets logged when a request for nlVPif information is received by the backup instance

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Data

Message Text

Checkpoint VPif request for port %port%, VLAN %vlan%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |
| vlan | VLAN |

nl.ChkPntRxData

Description

This message gets logged when checkpoint data is received for one of the protocols.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Data

Message Text

%bytes% bytes checkpoint data received for protocol %protocol%

Message Parameters

| Name | Type |
|----------|--------|
| bytes | uint32 |
| protocol | String |

nl.ChkPntRxInitData

Description

This message gets logged when initial checkpoint data is received for one of the protocols.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Data

Message Text

%bytes% bytes checkpoint data received for protocol %protocol%

Message Parameters

| Name | Type |
|----------|--------|
| bytes | uint32 |
| protocol | String |

nl.InitDataAddFail

Description

This message gets logged when initial checkpoint data could not be added to update.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Summary

Message Text

Failed adding checkpoint data to initial request for protocol %protocol%

Message Parameters

| Name | Type |
|----------|--------|
| protocol | String |

nl.CreateVlanReq

Description

This message gets logged when the FrameWork requested the creation of a VLAN.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Summary

Message Text

FrameWork requested to create VLAN %vlan%

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |

nl.CreateVlanRes

Description

This message gets logged when the FrameWork receives a response to a VLAN creation request.

Remedy

This is a debug message and should only be turned on by request of Extreme Networks.

Severity

Debug-Summary

Message Text

Response to VLAN %vlan% create request; %msg%

Message Parameters

| Name | Type |
|------|--------|
| vlan | VLAN |
| msg | String |

nl.AddUpLinkFailed

Description

When a dynamic VLAN is created, and for some reason NetLogin can not add the up-link ports this error message gets logged.

Remedy

When this happens, check to see if the configured port exists in the system, if it does make verify if any protocol conflicts could exists. If this all is fine get in touch with Extreme Networks Technical support to further trouble shoot this issue.

Severity

Error

Message Text

Failed to add up-link port %port% to VLAN %vlan%

Message Parameters

| Name | Type |
|------|----------|
| vlan | VLAN |
| port | SlotPort |

nl.AddedUpLinkPort

Description

When a dynamic VLAN is created, this message gets logged when the up-link ports are successfully added.

Remedy

Information message that uplink port was added, used for debuggin only.

Severity

Debug-Summary

Message Text

Successfully added up-link port %port% to VLAN %vlan%

Message Parameters

| Name | Type |
|------|----------|
| vlan | VLAN |
| port | SlotPort |

nl.ClientAdd

Description

This gets called whenever a client gets added via the nlAddClient() API.

Remedy

This is an debug message, and should only be used by request from engineering.

Severity

Debug-Data

Message Text

nlAddClient() request for %mac%, port %portInst% for protocol %protocol%

Message Parameters

| Name | Type |
|----------|----------|
| portInst | SlotPort |
| mac | MAC |
| protocol | uInt32 |

nl.ClientReAuth

Description

This message gets logged when dot1x reauthentication fails

Remedy

This is an informational message.

Severity

Info

Message Text

Network Login user %user% unauthenticated as reauthentication failed, Mac %mac% port %port% VLAN(s) \"%vlan%\"

Message Parameters

| Name | Type |
|------|--------|
| user | String |
| mac | MAC |

| Name | Type |
|------|----------|
| port | SlotPort |
| vlan | VLAN |

nl.UPMEvent

Description

This message is logged when NetLogin sends an event to UPM.

Remedy

This message is for debug purposes only, and should only be enabled on request of Extreme Networks Technical Support.

Severity

Debug-Verbose

Message Text

UPM event %event% send for port %port%, VLAN(s) \"%vlan%\", mac %mac%, IP %ip%, clients %clients%, user \"%user%\", xmlVSA \"%xmlVSA%\"

Message Parameters

| Name | Type |
|---------|----------|
| event | String |
| port | SlotPort |
| vlan | VLAN |
| mac | MAC |
| ip | IP |
| clients | ulnt |
| user | String |
| xmlVSA | String |

nl.ClientRefreshFailLogout

Description

This message gets logged when ever a user is logged out because the session failed to be refreshed more times than the allowed maximum.

Remedy

This is an informational message.

Severity

Info

Message Text

Network Login user %user% logged out due to session refresh failure , Mac %mac% port %port% VLAN(s) \"%vlan%\"

Message Parameters

| Name | Type |
|------|----------|
| user | String |
| mac | MAC |
| port | SlotPort |
| vlan | VLAN |

nl.VlanMoveSuccess

Description

This message gets logged when client move is complete

Remedy

This message is for debug purposes only

Severity

Info

Message Text

Network Login user move complete, Mac %mac% port %portInstance% VLAN %vlanInstance%

Message Parameters

| Name | Type |
|--------------|--------|
| mac | MAC |
| portInstance | xInt32 |
| vlanInstance | uInt |

nl.RemoveClientFromQueue

Description

This message gets logged when client move is complete

Remedy

This message is for debug purposes only

Severity

Info

Message Text

remove processed client from queue, Mac %mac% port %portInstance%

Message Parameters

| Name | Type |
|--------------|--------|
| mac | MAC |
| portInstance | xInt32 |

nl.ProcessNextReqOnPif

Description

This message gets logged when client move is complete

Remedy

This message is for debug purposes only

Severity

Info

Message Text

processed next client from queue, Mac %mac% port %portInstance% vlan
%vlanInstance%

Message Parameters

| Name | Type |
|--------------|--------|
| mac | MAC |
| portInstance | xInt32 |
| vlanInstance | uInt |

nl.AAATimeout

Description

This message gets logged when AAA cannot reach radius server and is trying for the next configured server

Remedy

This is an debug message, and should only be used by request from engineering.

Severity

Debug-Data

Message Text

Got AAA_TIMEOUT_HAVE_2ND_SERVER from AAA for %mac% on %port%.

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |
| mac | MAC |

nl.ClientAuthRespDrop

Description

This message gets logged when client receives an AAA response for a authentication request but the client is already authenticated using a different authType and this auth is dropped because of Service Unavail/Failure/guest Vlan.

Remedy

Check if the port is already authenticated in a Vlan using a different authentication method. This is for debug purposes and no action needs to be taken.

Severity

Debug-Summary

Message Text

Network Login user Mac %mac% port %port% already Authenticated using %authString%. Dropping this authentication response for %authMethod% related to %authError%.

Message Parameters

| Name | Type |
|------------|----------|
| mac | MAC |
| port | SlotPort |
| authString | String |
| authMethod | String |
| authError | String |

nl.VSMCIntInitFail

Description

Initialization of Netlogin with VSM module has failed. In such a case MLAG functionality with respect to Netlogin will not function properly

Remedy

Stackables or standalone systems may require a reboot to correct the problem. If the issue persists, please escalate to technical support team with below logs 1) debug epm show process netLogin ipml 2) debug epm show process vsm ipml.

Severity

Error

Message Text

VSM client initialization failed

nl.VSMCIntInitOK

Description

Netlogin is initiated with VSM library and ready for MLAG checkpointing functionality

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

netlogin initialization with vsm library is success

nl.NodesAuthMLAGPeer

Description

This peer acts as authenticator for the MLAG setup. And other peer acts as non-authenticator.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

This node is the authenticator for the MLAG peer

nl.ISCUp

Description

This is a debug message indicating that the state of an ISC has changed to UP.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

State changed to UP for ISC %iscIdx%

Message Parameters

| Name | Type |
|--------|--------|
| iscIdx | uInt16 |

nl.ISCDown

Description

This is a debug message indicating that the state of an ISC has changed to DOWN.

Remedy

This is a debug message indicating that the state of an ISC has changed to DOWN.

Severity

Debug-Summary

Message Text

ISC %iscIdx% is DOWN, re-initialize application-specific data

Message Parameters

| Name | Type |
|--------|--------|
| iscIdx | uInt16 |

nl.CreatISC

Description

This is a debug message indicating that an ISC is being created.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Create ISC for index %iscIdx%

Message Parameters

| Name | Type |
|--------|--------|
| iscIdx | uInt16 |

nl.UpdtISC

Description

This is a debug message indicating that an update of ISC-related parameters is being attempted. The parameters that can be modified are ISC state, ISC port instance and IP address.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Update ISC for ISC %iscIdx%

Message Parameters

| Name | Type |
|--------|--------|
| iscIdx | uInt16 |

nl.DelISC

Description

This is a debug message indicating that an ISC is being deleted.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Deleting ISC for index %iscIdx%

Message Parameters

| Name | Type |
|--------|--------|
| iscIdx | uInt16 |

nl.CreatMLAG

Description

This is a debug message which indicates that an MLAG has been created.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Created MLAG for index %mLagId%

Message Parameters

| Name | Type |
|--------|--------|
| mLagId | uInt16 |

nl.DeIMLAG

Description

This is a debug message indicating that the specified MLAG is deleted.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Deleted Mlag for index %mLagId%

Message Parameters

| Name | Type |
|--------|--------|
| mLagId | uInt16 |

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

NM.NodeStateFail

Description

The primary node has detected that the state of another node has changed to being failed. The reason for the failure may be one of the following: "OverHeat" Fan failure, component failure, or an external heat condition has caused the temperature of the module to exceed its operating limit. "Process Failure" The node can not continue to function due the abnormal termination of an an essential software module due to corruption or inconsistency. "Hw Failure" An essential hardware component on the module has failed. "Slot unsecured" The module present in the slot is not safely locked in the chassis. "Dual Master" More than one node is claiming to be the master (primary). This may be caused by a communication failure between the nodes. "Backup lost" The master (primary) node has lost communication with the backup node and so it has forced the backup node into failed state. "No Master" A standby node has lost communication with the master (primary) node and no backup node is available or taken over the role of master node. "License Mismatch" The license installed on the node is not as capable as the license that is installed on the master (primary) node. "Not In Sync" The master (primary) node has failed or otherwise the backup node has lost communication with it before the backup had synchronized with the primary, and consequently the backup can not become primary. "Incompatible XOS" The version of EXOS running on the failed node is not compatible with the version running on the master (primary) node. "Card Mismatch" The module type present in the slot does not match the configured type for that slot. "Device Timeout" The module present in the slot is not responding to informational queries within the expected time period. "Node Not Yet UP" The node has not yet assumed the role of a standby node when the master (primary) is ready to proceed with module initialization.

Remedy

Possible resolutions to the problem depend on the exact reason for the failure; and the approach should be to alleviate the cause as described.

Severity

Critical

Message Text

%SlotName% has failed for the reason of \"%ReasonStr%\".

Message Parameters

| Name | Type |
|-----------|--------|
| SlotName | String |
| ReasonStr | String |

NM.StrtProc

Description

The EXOS Node Manager application process (nodemgr) has completed initialization and begun normal processing.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Notice

Message Text

The Node Manager (NM) has started processing.

NM.EffctLcnsMismatch

Description

The effective license of a master capable node does not match the effective license of the primary node. If a failover occurs while in this state, some features may be disabled which may result in service interruption. If the stack is rebooted or if this slot is rebooted before resolving the license mismatch, the slot will not come into service. It will be in a failed state.

Remedy

Use the command, "show license slot all", to see the licenses installed on each slot. All licenses for all master capable nodes must match. Use the command, "enable license <license_key>", to install new licenses on a slot. The "enable license <license_key>" command must be executed on the switch terminal that is being upgraded - i.e. a license cannot be installed from the primary node for a different node.

Severity

Critical

Message Text

Effective license of %SlotName% does not match the effective license of the master %MasterSlotName%.

Message Parameters

| Name | Type |
|----------------|--------|
| SlotName | String |
| MasterSlotName | String |

NM.FeatLcnsMismatch

Description

One or more feature pack licenses of a master capable node do not match the feature pack licenses of the primary node. If a failover occurs while in this state, some features may be disabled which may result in service interruption. If the stack is rebooted or if this slot is rebooted before resolving the license mismatch, the slot will not come into service. It will be in a failed state.

Remedy

Use the command, "show license slot all", to see the licenses installed on each slot. All licenses for all master capable nodes must match. Use the command, "enable license <license_key>", to install new licenses on a slot. The "enable license <license_key>" command must be executed on the switch terminal that is being upgraded - i.e. a license cannot be installed from the primary node for a different node.

NodeAlias.DebugSummary

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

NodeAlias.ParmNull

Description

An internal function was called with a NULL pointer. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs attention.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with the following information: configuration, and the "show log" output.

Severity

Error

Message Text

Arg %arg% is NULL

Message Parameters

| Name | Type |
|------|--------|
| arg | String |

NodeAlias.ParmInv

Description

An internal function was called with an invalid value. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs attention.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with the following information: configuration, and the "show log" output.

Severity

Error

Message Text

Argument %arg% has an invalid value %val%

Message Parameters

| Name | Type |
|------|--------|
| arg | String |
| val | uInt32 |

NodeAlias.AllocMemFail

Description

Memory for the displayed object could not be allocated which may be due to the system running low on memory. This will result in incorrect operation of the NodeAlias feature.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory.

Severity

Error

Message Text

Memory allocation failed when trying to allocate a %obj% structure of size %size%.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |
| size | uInt32 |

NodeAlias.AllocInstFail

Description

Instance for the displayed object could not be allocated.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory.

Severity

Error

Message Text

Instance allocation failed when trying to allocate an instance for %obj% structure.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |

NodeAlias.PktRx

Description

Nodealias module has received a packet for snooping.

NTP.StrtSrvcFail

Description

The NTP process tried to start the NTP service process, but failed when calling the system API fork(). The only expected reason for this to happen is when we run out of memory.

Remedy

This is an unexpected internal condition. Please try to restart the NTP process "restart process ntp" to see if the problem disappears. If the problem persists, please contact technical support and supply the output of the "show tech" command.

Severity

Error

Message Text

Failed to start the NTP service, reason being; %sterror%(%error%)

Message Parameters

| Name | Type |
|----------|--------|
| error | ulnt |
| strerror | String |

NTP.SrvcFail

Description

When the NTP service stops unexpectedly, the NTP process can take two actions, namely "Terminate" or "Restart". If action is "Restart" the service will be restarted. If this has happened five times in one hour the NTP service will not be restarted, indicated by action "Terminated"

Remedy

If the action taken is "Terminated", try to restart the NTP process. In addition when this happens see if a core file was generated for the NTPD process, "ls /usr/local/tmp". If so please contact technical support with the following information: "show tech" and "upload debug".

Severity

Warning

Message Text

The NTP service stopped unexpectedly, and will be %action%.

Message Parameters

| Name | Type |
|--------|--------|
| action | String |

NTP.LoadCfgKeyLong

Description

Load configuration of the key failed, since its key length exceeds maximum limit (20).

Remedy

Configure the key with key length between 5 to 20 characters.

Severity

Error

Message Text

Load configuration of key %keyIndex% failed. Key length exceeds maximum limit.

Message Parameters

| Name | Type |
|----------|--------|
| keyIndex | uInt32 |

NTP.LoadCfgSvrKeyNotFnd

Description

Load configuration of the server failed, since its key index is not found.

Remedy

Configure the server with valid key index.

Severity

Error

Message Text

Load configuration of server %server% failed. Server's key index %keyIndex% is not found.

Message Parameters

| Name | Type |
|----------|--------|
| server | String |
| keyIndex | uInt32 |

NTP.LoadCfgBcastKeyNotFnd

Description

Load configuration of the broadcast server failed, since its key index is not found.

Remedy

Configure the broadcast server with valid key index.

Severity

Error

Message Text

Load configuration of broadcast server in the VLAN %vlanName% failed. Broadcast server's key index %keyIndex% is not found.

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | String |
| keyIndex | uInt32 |

NTP.LoadCfgKeyUnsuprt

Description

Load configuration of the key failed, since its authentication type is not supported in FIPS mode.

Remedy

Configure the key with FIPS mode supported authentication type (SHA-256).

Severity

Error

Message Text

Load configuration of key %keyIndex% failed. MD5 authentication type is not supported in FIPS mode.

Message Parameters

| Name | Type |

NTP.Peer Messages

[NTP.Peer.DtectServRch](#) on page 3599

[NTP.Peer.DtectServUnrch](#) on page 3600

[NTP.Peer.SelSysPeer](#) on page 3600

NTP.Peer.DtectServRch

Description

The NTP client sends an NTP request packet per poll interval (Default:64 seconds) to the NTP server(server, peer, or local reference clock) and waits for an NTP response packet. If there is no response for last 8 trials (one trial per pool interval), the NTP server is recognized as unreachable. When the NTP server is in the unreachable status and an NTP client receives an NTP response packet from the NTP server, the NTP server is considered as reachable from the NTP client system.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

The NTP %type% %server% is reachable from the local system.

Message Parameters

| Name | Type |
|--------|--------|
| type | String |
| server | String |

NTP.Peer.DtectServUnrch

Description

The NTP server(server, peer, or local reference clock) becomes unreachable from the local system after 8 continuous failures to receive NTP response packets from the server. The NTP client sends an NTP request packet per poll interval (Default:64 seconds) to the NTP server(server, peer, or local reference clock) and waits for an NTP response packet. If there is no response for 8 consecutive trials, the NTP server is recognized as unreachable. When a target NTP server becomes unreachable, it is removed from the system peer or candidate list. In case of a local reference clock, reachability of the local reference clock is dependent on the external system peer election. When the system elects a system peer from the external clock sources, the local reference clock becomes unreachable later because the local system stopped polling the local reference clock and adjusts to the external clock source.

Remedy

Check network reachability using ping or traceroute from the local system to the target NTP server.

Severity

Info

Message Text

The NTP %type% %server% is unreachable from the local system.

Message Parameters

| Name | Type |
|--------|--------|
| type | String |
| server | String |

NTP.Peer.SelSysPeer

Description

NTP server(server, peer, or local reference clock) was selected as the system peer among candidates to adjust the local system clock by the selection algorithm. The selection algorithm scans all associations and casts off the false-tickers, which have demonstrated incorrect time, leaving the true-chimers as a result. In a series of rounds, the algorithm also discards the association statistically furthest from the center until a specified minimum number of survivors remain. One of the survivors is selected as system peer based on the statistical information with a weighted average basis. After

a system peer is chosen, the local system can synchronize the clock itself from the system peer. While the clock is synchronized, a change of reliability, network path load, or system load can trigger another round of system peer election and then choose a new system peer.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

The NTP %type% %server% is selected as system peer.

Message Parameters

| Name | Type |
|--------|--------|
| type | String |
| server | String |

NTP.Sys Messages

- [NTP.Sys.SetKernClockFreq](#) on page 3602
- [NTP.Sys.InitKernClockFreq](#) on page 3603

- [NTP.Sys.DtectClockSpike](#) on page 3604
- [NTP.Sys.DtectClockStep](#) on page 3604
- [NTP.Sys.NtfyClockSync](#) on page 3605

NTP.Sys.SetKernClockFreq

Description

When NTP is started and the frequency file does exist, the NTP frequency is initialized from the file with this log message and enters normal mode immediately. After that, the current frequency offset is written to the file at hourly intervals

Remedy

No action required - Informational message only.

Severity

Info

Message Text

System kernel clock frequency is set at %val% ppm

Message Parameters

| Name | Type |
|------|--------|
| val | String |

NTP.Sys.InitKernClockFreq

Description

NTP logs this message when NTP starts without the frequency file, which contains the latest estimate of clock frequency error. After NTP starts, NTP enters a special mode designed to quickly adapt to the particular system clock oscillator time and frequency error. This adaptation takes approximately 15 minutes, after which the time and frequency are set to nominal values and NTP enters normal mode, where the time and frequency are continuously tracked relative to the server. After one hour the frequency file is created and the current frequency offset is written to it.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

System kernel frequency value is not set.

NTP.Sys.ActvSysPeerNotExist

Description

NTP has no active system peer to receive clock information from the statically configured servers, peers, or local clocks. This event can be triggered by losing the path to a server or a server service stop. After this event, the accuracy of clock might drift.

Remedy

Check reachability from switch to destination using ping. In case of ping failures, use traceroute to see if the network segments are dropping packets. If the network segments are OK, check for a possible service outage in the server.

Severity

Notice

Message Text

No active NTP system peer exists to adjust the system clock.

NTP.Sys.DtectClockSpike

Description

A clock spike can occur due to packet collisions and network congestion. The NTP clock filter algorithm selects the most appropriate sample state and rejects noise spike. The clock offset and round-trip delay samples are computed from the four most recent timestamps based on the assumption that the network path is idle. If an offset sample exceeds the step threshold value, it is ignored and a timer is started. If a later sample is below the step threshold value, the counter is reset and the operation continues normally.

Remedy

Because a spike is caused by network congestion over a path to a system peer, check network utilization and round-trip time over the network segments leading to the server using traceroute or ping, and also check system CPU status, which can cause the possible delay of NTP packet processing via the top command.

Severity

Info

Message Text

Clock spike %val% seconds was detected while clock was synchronized with system peer.

Message Parameters

| Name | Type |
|------|--------|
| val | String |

NTP.Sys.DtectClockStep

Description

Since the system time is outside the step threshold (default: 128 ms), the clock is stepped. The clock step event is dependent on whether the frequency is set from frequency file or initialized without information from frequency file. When the frequency is set from file, the clock step happens immediately, without waiting for the stepout interval (default: 15 minutes). However, when kernel frequency information is not available, the clock step happens after stepout interval (default: 15 minutes). After step adjustment, the clock discipline algorithm of NTP starts over again, requiring another round of at least four messages as before. If the system time is below the step

threshold, NTP gradually slews the clock to the nominal time. Clock step event occurs as the result of restarting the NTP process, manual time changes, or system failures.

Remedy

Check whether the NTP process was restarted before the clock step event. If this event happens continuously without restarting NTP process events, please contact technical support with the following information: "show tech".

Severity

Info

Message Text

Clock step %val% seconds was detected and the system clock is updated.

Message Parameters

| Name | Type |
|------|--------|
| val | String |

NTP.Sys.NtfyClockSync

Description

System time is synchronized with the NTP system peer that feeds best time information. The time information is based on UTC (Coordinated Universal Time). The Difference and frequency difference between local time and UTC time was provided by the system peer, and the system clock has been reduced to below normal tolerances.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

System clock is synchronized with NTP system peer.

ospf.AreaCfgNotFnd

Description

Used when access ospf area which does not have area configuration structure. %area%: the area ID.

Remedy

No remedy required.

Severity

Warning

Message Text

Area %area% configuration does not found.

Message Parameters

| Name | Type |
|------|------|
| area | IPN |

ospf.BldExtLSAFail

Description

Used when ospf fails to build ASE Link. %ase%: the pointer of ospf external hdr structure. %without%: It could be string "without" or "".

Remedy

If ospf is doing graceful restart/lsa origination is triggered within LS Min interval, ospf doesn't generate the LSA immediately. No remedy required. LSA will be originated later. This may also occur when memory allocation fails for LSA origination, If that happens, system reboot may be required.

Severity

Debug-Verbose

Message Text

Building an external LSA %ase% %without% using Appendix E failed.

Message Parameters

| Name | Type |
|---------|--------|
| ase | Ptr |
| without | String |

ospf.ExtLSALmtState

Description

Used to report the state of the number of external LSAs relative to the limit of the database. %state%: either "above", or "down" %limit%: the configured limit of type-5 LSAs. %action%: either "entering" or "exiting".

Remedy

None. This is an informational message

Severity

Warning

Message Text

The number of external LSAs goes %state% the limit %limit%, %action% overflow state.

Message Parameters

| Name | Type |
|--------|--------|
| state | String |
| limit | ulnt |
| action | String |

ospf.AllocMemFail

Description

Used when memory allocation is failed. %size%: the size of the memory allocated. %object%:Object

Remedy

The system might be running with low memory. Reduce the load on the system. Reboot may be required

Severity

Error

Message Text

malloc(%size%) failed %object%.

Message Parameters

| Name | Type |
|--------|--------|
| size | uint32 |
| object | String |

ospf.SummListAddrDup

Description

There are multiple summary list matches the address when ospf tries to leak the route to other ospf areas. %addr%: the route's IP address. %mask%: the route's IP mask. %type%: the type of the route.

Remedy

No remedy is required.

Severity

Error

Message Text

Multiple Matches in Summary List for Addr %addr%, Mask %mask%, Type %type%.

Message Parameters

| Name | Type |
|------|-----------|
| addr | IP |
| mask | IPmaskval |
| type | uint |

ospf.RtIfNull

Description

Used to report error when no interface associate the interface route. %route_ip%: the route IP address. %gw%: the route's gateway IP address.

Remedy

None. This is for debugging

Severity

Error

Message Text

ospf Validate Kernel Rt: No intf for intf rt %route_ip% gw %gw%.

Message Parameters

| Name | Type |
|----------|------|
| route_ip | IP |
| gw | IP |

ospf.RtUpdtAddDel

Description

Used when kernel table route updates, ospf needs to process both "add" and "delete" action. %action%: If it is set "add", ospf needs to process "add" besides "delete". Otherwise, ospf needs to process "delete" besides "add".

Remedy

None. This is for debugging

Severity

Error

Message Text

Update Kernel Rt: A Route to %action% also present.

Message Parameters

| Name | Type |
|--------|--------|
| action | String |

ospf.AllocInitMemFail

Description

Used when ospf reports memory mallocation failure in initialization.

Remedy

System may be under low memory condition. Reduce the scaling limits. Restarting process/reboot may be required

Severity

Critical

Message Text

Initializing allocation %what% memory failed.

Message Parameters

| Name | Type |
|------|--------|
| what | String |

ospf.InitSockFail

Description

Used when ospf fails to initialiize input socket.

Remedy

OSPF will fail to start in this condition. Restarting process/Rebooting system may be required

Severity

Critical

Message Text

Initializing socket failed

ospf.TmpDownTimerExp

Description

Used when ospf interface (point-to-point interface with no configured neighbor) temp down timer expires. %circ%: the pointer of ospf interface structure.

Remedy

None. This is for informational purpose

Severity

Debug-Data

Message Text

Temp Down Timer expiration (circuit=%circ%).

Message Parameters

| Name | Type |
|------|------|
| circ | Ptr |

ospf.AllocPathEntFail

Description

Used when ospf fails to alloc a path_entry structure for SPF from currently active pent block.

Remedy

Unable to allocate memory for path entry during spf mputation. Reduce the scaling number in the system and disable & enable ospf for the recovery

Severity

Error

Message Text

Allocating a path entry (PE) failed.

ospf.DelAreaFail

Description

Used when ospf fails to delete one area. %reason%: failure reason.

Remedy

Either virtual link/address range/circuit is still associated with this area. Remove all before deleting the area.

Severity

Error

Message Text

Deleting an OSPF area failed at %reason%.

Message Parameters

| Name | Type |
|--------|--------|
| reason | String |

ospf.InitIPCFail

Description

Used when ospf fails to initial IPML client to DS server.

Remedy

Inter process communication initialization failed. Restart the process/Reboot the system for the recovery

Severity

Warning

Message Text

Initializing Inter-Process Communications failed

ospf.RtMgrRegFail

Description

Used when ospf fails to register to rtmgr process. %src%: the pointer of OSPF DS server structure.

Remedy

None. Ospf will retry the registration procedure.

Severity

Warning

Message Text

Registering with the Route Manager fails on dsService %src%.

Message Parameters

| Name | Type |
|------|------|
| src | Ptr |

Description

This event occurs when inter-VR export fails to register with Route Manager.

Remedy

This is an internal error. Contact technical support with "show tech" output.

Severity

Error

Message Text

Failed to register inter-VR export with Route Manager. Source VR %vrname%, route type %rttype%..

Message Parameters

| Name | Type |
|--------|--------|
| vrname | String |
| rttype | String |

NEW! ospf.RfrshInterVRPlcyFail

Description

A policy used for inter-VR export was refreshed. The refreshed policy will not be applied to the export.

Remedy

Disable inter-VR export and enable again with the same policy.

Severity

Notice

Message Text

Policy refresh is not supported for inter-VR export. Source VR %vrname%, route type %rttype%, policy name %policy%.

Message Parameters

| Name | Type |
|--------|--------|
| vrname | String |
| rttype | String |
| policy | String |

NEW! ospf.TrvrsStrtInterVRRtFail

Description

This event occurs when OSPF is trying to traverse the route table to add or delete routes for inter-VR export and the traversal fails to start.

Remedy

This is an internal error. Contact technical support with "show tech" output.

Severity

Error

Message Text

Route table traversal start failed for inter-VR export. Source VR %vrname%, route type %rttype%, traversal type %travtype%, error code %retcode%.

Message Parameters

| Name | Type |
|----------|--------|
| vrname | String |
| rttype | String |
| travtype | String |
| retcode | sInt |

NEW! ospf.UnregInterVRExprtFail

Description

This event occurs when inter-VR export fails to unregister with Route Manager.

Remedy

This is an internal error. Contact technical support with "show tech" output.

Severity

Error

Message Text

Failed to unregister inter-VR export with Route Manager. Source VR %vrname%, route type %rttype%.

Message Parameters

| Name | Type |
|--------|--------|
| vrname | String |
| rttype | String |

ospf.event.ProcExtRtRedist

Description

Used when ospf adds or deletes redistribution route. %addelete%: It could be "Adding" or "Deleting". %ip%: IP address of the route. %mask%: IP mask of the route.

Remedy

None. This is an informational message

Severity

Debug-Verbose

Message Text

%addelete% an external Route %ip%/%mask% for redistribution.

Message Parameters

| Name | Type |
|----------|------------|
| ip | IPN |
| mask | IPmaskvalN |
| addelete | String |

ospf.event.ExtRtGet

Description

Used when ospf get one route from routing table for redistribution. %ip%: the IP address of the route. %mask%: the IP mask of the route.

Remedy

None. This is an informational message

Severity

Debug-Data

Message Text

An external Route %ip%/%mask% has been gotten from Route Manager.

Message Parameters

| Name | Type |
|------|------------|
| ip | IPN |
| mask | IPmaskvalN |

ospf.event.RxPktNonIP

Description

Used when ospf receives non-IP packets. %level%: the level of the packet. %type%: the type of the packet. %len%: the length of the packet.

Remedy

Something could be wrong in the system. Either process restart/system reboot may be required if any functional problem observed in ospf

Severity

Debug-Data

Message Text

Receiving non-IP packet with CMSG level=%level%, type=%type%, len=%len%.

Message Parameters

| Name | Type |
|-------|------|
| level | ulnt |
| type | ulnt |
| len | ulnt |

ospf.event.ProcSockFail

Description

Used when ospf fails to initialize or manipulate input socket.

%reason%: failure action. %err%, %err_s%: Error function reason err_s/err

----- setsockopt() setting socket
 option IP_ADD_MEMBERSHIP EBADF setting socket option IP_DROP_MEMBERSHIP
 ENOTSOCK setting socket option SO_DONTROUTE ENOPROTOOPT setting socket
 option SO_BINDTODEVICE EFAULT setting socket option SO_DONTROUTE setting
 socket option IP_MULTICAST_LOOP setting socket option IP_PKTINFO sendto()
 multicasting sending to EBADF unitcasting sneding to ENOTSOCK EFAULT EMSGSIZE
 EAGAIN EWOULDBLOCK ENOBUFS EINTR ENOMEM EINVAL EPIPE socket() Initializing
 socket EPROTONOSUPPORT ENFILE EACCES ENOBUFS ENOMEM EINVAL

Remedy

If ospf has any operational issue, process restart/system reboot may be required

Severity

Debug-Summary

Message Text

Processing socket fails since %reason% with error %err%(%err_s%).

Message Parameters

| Name | Type |
|--------|--------|
| reason | String |
| err | ulnt |
| err_s | String |

ospf.event.IPVerInv

Description

Used when ospf received bad IP version packet. %ver%: the IP version of the received packet.

Remedy

None. Something could be wrong in the system. If any operational issues observed, system reboot may be required.

Severity

Warning

Message Text

IP Version %ver% is invalid.

Message Parameters

| Name | Type |
|------|------|
| ver | ulnt |

ospf.event.PktLenInv

Description

Used when ospf receives too short packet. %len1%: the length of the IP header. %len2%: the length of the buffer.

Remedy

None. This is an informational message

Severity

Warning

Message Text

Packet is too short (ipHdr=%len1%, buf=%len2%)

Message Parameters

| Name | Type |
|------|------|
| len1 | ulnt |
| len2 | ulnt |

ospf.event.ProtoInv

Description

Used when ospf receives packet whose protocol is not 89. %proto%: the protocol number of the received packet.

Remedy

If any operational issues are observed in ospf, system reboot may be required.

Severity

Warning

Message Text

Protocol %proto% is invalid

Message Parameters

| Name | Type |
|-------|------|
| proto | ulnt |

ospf.event.EnbIVLANFail

Description

Used when the vlan fails to be enabled on ospf. %err%: the error number.

Remedy

If memory allocation fails OR any address conflict exists this error message appears. If address conflict find, correct it. Otherwise process restart/system reboot may be required.

Severity

Warning

Message Text

Enabling VLAN %vlan% fails with err %err%.

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |
| err | ulnt |

ospf.event.VLANIPAddrNotFnd

Description

Used when ospf tries to remove one vlan's IP address which does not exist. %vlan%: the vlan name. %ip%: the IP address which causes error. %mask%: the IP mask which causes error.

Remedy

None. This is to debug error condition

Severity

Warning

Message Text

Vlan %vlan% has NOT IP %ip%/%mask%.

Message Parameters

| Name | Type |
|------|-----------|
| vlan | VLAN |
| ip | IP |
| mask | IPmaskval |

ospf.event.VLANNotFnd

Description

Used when the vlan is NOT in ospf interface list. %vlan%: the vlan name.

Remedy

None. This vlan is already deleted/This vlan is no longer I3 vlan. This is an informational message

Severity

Debug-Verbose

Message Text

Vlan %vlan% is not found in the OSPF interface list.

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |

ospf.event.EntRstr

Description

Used when ospf enters into graceful restart mode %mode%: Planned/Unplanned graceful restart mode

Remedy

None. This is an informational message

Severity

Info

Message Text

OSPF enters %mode% restarting mode.

Message Parameters

| Name | Type |
|------|--------|
| mode | String |

ospf.event.ExitRstr

Description

Used when ospf exits graceful restart mode %mode% : Planned/Unplanned mode %reason%: Reason to exit graceful restart

Remedy

None. This is an informational message

Severity

Info

Message Text

OSPF exits %mode% restarting mode due to %reason%.

Message Parameters

| Name | Type |
|--------|--------|
| mode | String |
| reason | String |

ospf.event.EntRstrHelp

Description

Used when ospf interface enters into restart helper mode %interface%: vlan name

Remedy

None. This an informational message

Severity

Info

Message Text

OSPF interface %interface% enters restart helper mode.

Message Parameters

| Name | Type |
|-----------|--------|
| interface | String |

ospf.event.ExitRstrHelp

Description

Used when ospf interface exits restart helper mode %interface% : vlan name %reason%:
reason to exit graceful restart

Remedy

None. This is an informational message

Severity

Info

Message Text

OSPF interface %interface% exits restart helper mode due to %reason%.

Message Parameters

| Name | Type |
|-----------|--------|
| interface | String |
| reason | String |

ospf.event.NotEntRstr

Description

Used when ospf fails to enter into restarting mode %mode% : planned/unplanned
%reason%: reason for the failure

Remedy

None. Ospf normal restart will happen.

Severity

Info

Message Text

OSPF failies to enter %mode% restarting mode due to %reason%.

Message Parameters

| Name | Type |
|--------|--------|
| mode | String |
| reason | String |

ospf.event.NotEntRstrHelp

Description

Used when ospf interface fails to enter into restarting helper mode %interface%: vlan
name %reason% : reason for the failure

Remedy

If reason indicates that helper is not configured, then configure the helper on the vlan. Otherwise no remedy required.

Severity

Info

Message Text

OSPF interface %interface% fails to enter restarting helper mode due to %reason%.

Message Parameters

| Name | Type |
|-----------|--------|
| interface | String |
| reason | String |

ospf.event.RemGraceInt

Description

Used when ospf queries remaining grace time out from route manager. %time%: time in seconds

Remedy

None. This is an informational message

Severity

Info

Message Text

The remaining time for grace restart is %time%.

Message Parameters

| Name | Type |
|------|------|
| time | ulnt |

ospf.event.ExitRstrPurgeType5ASE

Description

Used when ospf sends LSA Purges of External Route (Type 5) after Graceful Restart is complete. %lsaid%: the LSA ID of the LSA.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

OSPF GR Purge sent LSA [%lsaid%].

Message Parameters

| Name | Type |
|-------|------|
| lsaid | IPN |

ospf.event.ExitRstrPurgeType7ASE

Description

Used when ospf sends LSA Purges of External Route (Type 7) after Graceful Restart is complete. %area%: the IP address of Area. %lsaid%: the LSA ID of the LSA.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

OSPF GR Purge sent %area% LSA [%lsaid%].

Message Parameters

| Name | Type |
|-------|------|
| area | IPN |
| lsaid | IPN |

ospf.event.ExitRstrPurgeType34Summ

Description

Used when ospf sends LSA Purges of Summary LSAs (Type 3 and Type 4) after Graceful Restart is complete. %type%: Lsa Type ` (Type 3 or 4). %area%: the IP address of Area. %lsaid%: the LSA ID of the LSA.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

OSPF GR Purge sent %type% %area% LSA [%lsaid%].

Message Parameters

| Name | Type |
|-------|--------|
| type | String |
| area | IPN |
| lsaid | IPN |

ospf.event.ExitRstrRouteUpdateReq

Description

Used when ospf sends requests to rtmgr to send external routes configured for leak after Graceful Restart is complete. %proto%: The protocol for which the request is sent to rtmgr.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

OSPF GR Proto Routes Update sent to rtmgr %proto%.

Message Parameters

| Name | Type |
|-------|------|
| proto | ulnt |

ospf.event.ExitRstrRouteUpdateComp

Description

Used when ospf receives all the extgernal routes from rtMgr.

Remedy

This is for debugging

Severity

Debug-Summary

Message Text

OSPF GR Proto Routes Update From rtmgr Complete.

ospf.hello Messages

[ospf.hello.TxPkt](#) on page 3639

[ospf.hello.VLANTxDataDump](#) on page 3643

[ospf.hello.TxPkt](#)

Description

Used when ospf vlan sends ospf hello message. %vlan%: the name of vlan which sends hello message %dst%: the destination IP address which shall be in IP header. %len%: the packet length. %intf%: the ospf interface structure pointer %pktnum%: the number of packets which have been transmitted.

Remedy

None. This is an informational message

Severity

Debug-Summary

Message Text

%vlan% is transmitting a Hello pkt to %dst% (length %len%, interface %intf%, pkt num %pktnum%).

Message Parameters

| Name | Type |
|--------|------|
| vlan | VLAN |
| dst | IPN |
| len | uInt |
| intf | Ptr |
| pktnum | uInt |

ospf.hello.PktRx

Description

Used when ospf correctly receives the hello message. %vlan%: the ospf vlan which receives the correct hello message. %src%: the source IP address of the hello message.

Remedy

None. This is an informational message

Severity

Info

Message Text

%vlan% received a Hello pkt from %src%

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |
| src | IPN |

ospf.hello.PktInv

Description

Used when ospf does not correctly receive the hello message. %vlan%: the ospf vlan which received the hello message. %src%: the source IP address of the received hello packet. %reason%: the failure reason. The possible arguments are "checksum", "authentication(simple password)", "authentication(no MD5 keyID)", "authentication(MD5)", "incorrect ospf version", "incorrect sender", "No Virtual Link for sender", "DOWN Virtual Link", "source area is not the same area of the interface",

"mismatch authentication type", "self-originated packet", "Hello interval mismatch", "Router dead interval mismatch", "Area type mismatch", "Netmask mismatch", "Not a configured neighbor", "Different/Extra neighbor on Point-to-Point link", "Interface is temp down state", "Different neighbor on Virtual link".

Remedy

If any configuration issue is observed, that needs to be corrected.

Severity

Warning

Message Text

%vlan% receives Hello pkt from %src% failed %reason%.

Message Parameters

| Name | Type |
|--------|--------|
| vlan | VLAN |
| src | IPN |
| reason | String |

ospf.hello.VLANDebugSummary

Description

A debug condition has occurred on the given VLAN.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Vlan (%bridgeInst%) - %msg%

Message Parameters

| Name | Type |
|------------|--------|
| bridgeInst | VLAN |
| msg | Printf |

ospf.hello.VLANWarning

Description

A warning condition has occurred on the given VLAN.

Remedy

None. This is for debugging

Severity

Warning

Message Text

Vlan (%bridgeInst%) - %msg%

Message Parameters

| Name | Type |
|------------|--------|
| bridgeInst | VLAN |
| msg | Printf |

ospf.hello.VLANRxMbufDump

Description

Internal mbuf (memory buffer) dump during input processing. Note: a VLAN can be used for match criteria.

Remedy

None. This is for debugging

Severity

Debug-Data

Message Text

to vlan %vlan%, len %len%, msg: %mbufPtr%

Message Parameters

| Name | Type |
|---------|---------|
| vlan | String |
| mbufPtr | Buf-ptr |
| len | Buf-len |

ospf.hello.VLANTxDataDump

Description

Packet dump during output processing.

Remedy

None. This is for debugging

Severity

Debug-Data

Message Text

From %vlan%: len %len%, msg: %bufPtr%

Message Parameters

| Name | Type |
|--------|---------|
| vlan | String |
| bufPtr | Buf-ptr |
| len | Buf-len |

ospf.lsa.TxPkt

Description

Used when ospf sends LS Update packet or LS Ack packet. %vlan%: the vlan name which sends the packet. %pktttype%: the packet type. It is LS Update or LS Ack packet. %dst%: the destination IP address of the packet. %len%: the length of the packet. %intf%: the pointer of ospf vlan structure which sends the packet. %pktnum%: the number of packets which have been transmitted.

Remedy

None. This is an informational message

Severity

Debug-Summary

Message Text

%vlan% sends %pktttype% to %dst% (length %len%, interface %intf%, pkt num %pktnum%).

Message Parameters

| Name | Type |
|----------|--------|
| vlan | VLAN |
| pktttype | String |
| dst | IPN |
| len | ulnt |
| intf | Ptr |
| pktnum | ulnt |

ospf.lsa.PktRx

Description

Used when ospf correctly receives LS Update or LS Ack packet. %vlan%: the ospf vlan which receives the packet. %pktttype%: the packet type, it is LS Update or LS Ack packet. %src%: the source IP address of the packet.

Remedy

None. This is an informational message

Severity

Info

Message Text

%vlan% receives type %pkttype% pkt from %src%.

Message Parameters

| Name | Type |
|---------|------|
| vlan | VLAN |
| pkttype | ulnt |
| src | IPN |

ospf.lsa.PktInv

Description

Used when ospf does not correctly receive LS Update or LS Ack packet. %vlan%: the ospf vlan which received the message. %pkttype%: the packet type. It is LS Update or LS Ack packet. %src%: the source IP address of the received packet. %reason%: the failure reason.

Remedy

Configuration mismatch may cause the problem. Please check the configuration at both end of ospf adjacency

Severity

Warning

Message Text

OSPF Lsa receives type %pkttype% pkt from %src% failed %reason%.

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| pkttype | ulnt |
| src | IPN |
| reason | String |

ospf.lsa.ExclExtFlood

Description

Used when ospf filters external routes to one area. %lsid%: the IP address of the external route. %mask%: the IP mask of the external route. %area%: the area ID the external route shall be filtered to.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Excluding external LSA %lsid% mask %mask% flooding to area %area%.

Message Parameters

| Name | Type |
|------|------|
| lsid | IPN |
| mask | IPN |
| area | IPN |

ospf.lsa.AddExtRt

Description

Used when ospf processes external route. %inase%: the pointer of external route structure. %ip%: the IP address of the external route. %mask%: the IP mask of the external route. %nhs%: the IP address of the next hop of the external route. %nh%: It is set to 1 when using next hop to calculate forwarding address of LSA.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Adding an external route (inase=%inase%[%ip%/%mask%, nh=%nhs%, useNextHop=%nh%]).

Message Parameters

| Name | Type |
|-------|------------|
| inase | Ptr |
| ip | IPN |
| mask | IPmaskvalN |
| nhs | IPN |
| nh | ulnt |

ospf.lsa.AddToDB

Description

Used when ospf add one LSA to the database. %id%: Link State ID of the LSA. %rtid%: the advertise router ID of the LSA. %area%: the area ID the LSA should added to. %type%: LSA type.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Adding LSA to database with id %id% rtid %rtid% area %area% type %type%.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |
| area | IPN |
| type | ulnt |

ospf.lsa.AddExtToDB

Description

Used when ospf add Type-5 or Type-7 external route to database. %mask%: the IP mask of the route. %cost%: the cost of the route. %type%: the type of the cost, it is Type-1 or Type-2. %fwd%: the forwarding address. %tag%: tag.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Adding external LSA with mask %mask% cost %cost% type %type% fwd %fwd% tag %tag% to database.

Message Parameters

| Name | Type |
|------|------------|
| mask | IPmaskvalN |
| cost | ulnt |
| type | ulnt |
| fwd | IPN |
| tag | ulnt |

ospf.lsa.Type5ExtDBCntAcc

Description

Used when ospf reports the number of type-5 external LSA while adding LSAs to the database. %count%: the number of type-5 LSA in the system.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Type 5 external LSA database count accumulated to %count%.

Message Parameters

| Name | Type |
|-------|------|
| count | ulnt |

ospf.lsa.RfrshType2IfNull

Description

Used when ospf reports no interface associated with the network-LSA while trying to regenerate the self-originated LSA. %id%: the Link State ID of the network-LSA. %rtid%: the advertise router ID of the network-LSA. %age%: the age of the network-LSA. %seq%: the sequence number of the network-LSA.

Remedy

None. Interface is already deleted. This is for developer debugging.

Severity

Critical

Message Text

Refreshing network-LSA id %id% advRtr %rtid% age %age% seq %seq% failed on NULL interface.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |
| age | ulnt |
| seq | ulnt |

ospf.lsa.RfrshType34SummHdrNull

Description

Used when ospf try to regenerate self-originated summary-net or summary-asb LSA, but could not find summary header structure to the LSA. %type%: the summary LSA type, it could be 3 or 4. %id%: the Link Data ID of the LSA. %rtid%: the advertise router ID of the LSA. %area%: the associated area ID. %seq%: the sequence number of the LSA.

Remedy

None. This is for developer debugging.

Severity

Warning

Message Text

Refreshing Type-%type% LSA id %id% rtid %rtid% area %area% lsa_seq %seq% failed on NULL summary header structure.

Message Parameters

| Name | Type |
|------|-----------|
| type | IPmaskval |
| id | IPN |
| rtid | IPN |
| area | IPN |
| seq | ulInt32 |

ospf.lsa.RfrshType5ExtHdrNull

Description

Used when ospf tries to regenerate self-originated type-5 LSA, but could not find the external route header structure. %id%: the Link State ID of the type-5 LSA. %rtid%: the advertise router ID of the type-5 LSA. %age%: the age of the LSA. %seq%: the sequence number of the LSA.

Remedy

None. This is for developer debugging

Severity

Warning

Message Text

Refreshing external Lsa id %id% advRtr %rtid% age %age% seq %seq% failed on NULL external header structure.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |
| age | ulnt |
| seq | ulnt |

ospf.lsa.DelFmDB

Description

Used when ospf deletes one LSA from the database. %id%: the Link State of the LSA. %rtid%: the advertise router ID of the LSA. %area%: the area ID of the LSA. %type%: the LSA type.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Deleting one LSA with id %id% rtid %rtid% area %area% type %type%.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |

| Name | Type |
|------|------|
| area | IPN |
| type | ulnt |

ospf.lsa.Type5ExtDBCntRmn

Description

Used when ospf reports the left number of type-5 LSA while deleting LSAs from the database. %count%: the number of type-5 LSA in the system.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Deleting one type-5 LSA with remaining %count% type-5 LSAs.

Message Parameters

| Name | Type |
|-------|------|
| count | ulnt |

ospf.lsa.Updt

Description

Used when ospf update a LSA in the database. %lsai%: the pointer of LSAI structure in the database. %lsa%: the pointer of new LSA.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

ospf Update Lsai (lsai=%lsai%, lsa=%lsa%).

Message Parameters

| Name | Type |
|------|------|
| lsai | Ptr |
| lsa | Ptr |

ospf.lsa.ProcUpdt

Description

Used when ospf updating a LSA in database by the new LSA info. %id%: the Link State ID of the new LSA. %rtid%: the advertise router ID of the new LSA. %area%: the area ID of the new LSA. %type%: the new LSA type.

Remedy

None. This is an informational message

Severity

Debug-Summary

Message Text

Modifying LSA with id %id% rtid %rtid% area %area% type %type%.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |
| area | IPN |
| type | ulnt |

ospf.lsa.UpdtExtVal

Description

Used when ospf updates type-5 or type-7 LSA. %style%: It could be "old" and "new". %mask%: the IP mask of the route. %cost%: the cost of the route. %type%: the cost type, it could be type-1 or type-2 cost. %fwd%: the forwarding address. %tag%: the tag.

Remedy

None. This is for debugging

Severity

Debug-Data

Message Text

Modifying %style% LSA mask %mask% cost %cost% type %type% fwd %fwd% tag %tag%.

Message Parameters

| Name | Type |
|-------|--------|
| style | String |
| mask | IPN |
| cost | ulnt |
| type | ulnt |
| fwd | IPN |
| tag | ulnt |

ospf.lsa.AgeOut

Description

Used when ospf updates LSA, updating the holding timer of LSA. %lsai%: the pointer of LSA structure. %lsid%: the Link State ID of the LSA. %rtid%: the advertise router ID of the LSA, %lsa_age%: the age of the LSA. %seq%: the sequence number of the LSA.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Deleting the hold time of Lsai %lsai% lsid %lsid% rtid %rtid% lsa_age %lsa_age% seq %seq%.

Message Parameters

| Name | Type |
|---------|------|
| lsai | Ptr |
| lsid | IPN |
| rtid | IPN |
| lsa_age | ulnt |
| seq | ulnt |

ospf.lsa.ProcStrt

Description

Used when ospf processes received LSA. %id%: the Link State ID of the LSA. %rtid%: the advertise router ID of the LSA. %area%: the area ID of the LSA. %type%: the LSA type. %seq%: the sequence number of the LSA. %age%: the age of the LSA. %len%: the length of the LSA.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Processing one received LSA id %id% rtid %rtid% area %area% type %type% seq %seq% age %age% len %len%.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |
| area | IPN |
| type | ulnt |
| seq | ulnt |
| age | ulnt |
| len | ulnt |

ospf.lsa.DropLenInv

Description

Used when ospf received bad LSA. %lsid%: the Link State ID of the bad LSA. %type%: the type of the bad LSA. %nbr%: the neighbor IP address which sends the bad LSA.

Remedy

None. This is for debugging.

Severity

Warning

Message Text

Processing received LSA with lsid %lsid% type %type% from nbr %nbr% failed on bad len %len%.

Message Parameters

| Name | Type |
|------|------|
| lsid | IPN |
| type | ulnt |
| nbr | IPN |
| len | ulnt |

ospf.lsa.DropNotOpqCpbl

Description

Used when ospf processes the received opaque LSA but it does not have opaque ability. %area%: the area ID of the opaque LSA. %type%: the type of the LSA, it could be Type-9(local opaque), type-10(area opaque), type-11(global opaque). %lsid%: the link State ID of the LSA. %rtid%: the advertise router ID of the LSA. %nbr%: neighbor info.

Remedy

Please have the same opaque configuration at both end of ospf adjacency

Severity

Debug-Data

Message Text

Dropping the opaque LSA with area %area% type %type% lsid %lsid% routerid %rtid% %nbr% since we do not have opaque capability.

Message Parameters

| Name | Type |
|------|--------|
| area | IPN |
| type | ulnt |
| lsid | IPN |
| rtid | IPN |
| nbr | String |

ospf.lsa.DropNbrNotOpqCpbl

Description

Used when ospf processes the received opaque LSA but the neighbor does not have opaque ability. %area%: the area ID of the opaque LSA. %type%: the type of the LSA, it could be Type-9(local opaque), type-10(area opaque), type-11(global opaque). %lsid%: the link State ID of the LSA. %rtid%: the advertise router ID of the LSA. %nbr%: neighbor info.

Remedy

None. This is for debugging

Severity

Debug-Data

Message Text

Dropping the opaque LSA with area %area% type %type% lsid %lsid% routerid %rtid% %nbr% since neighbor does not have opaque capability.

Message Parameters

| Name | Type |
|------|--------|
| area | IPN |
| type | ulnt |
| lsid | IPN |
| rtid | IPN |
| nbr | String |

ospf.lsa.Fnd

Description

When ospf processes the received LSA, it found one version of the LSA in the database. %lsai%: the pointer of the LSA in the database. %age%: the age of the LSA in the database. %lsid%: the Link State ID of the LSA in the database. %rtid%: the advertise router ID of the LSA in the database. %seq%: the sequence number of the LSA in the database.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Processing LSA lsai %lsai% age %age% lsid %lsid% rtrld %rtid% seq %seq% which is found in database.

Message Parameters

| Name | Type |
|------|--------|
| lsai | Ptr |
| age | ulnt |
| lsid | IPN |
| rtid | IPN |
| seq | xInt32 |

ospf.lsa.RtrNotSame

Description

When ospf processes the received LSA, it finds one version of it in the database. %type%: the LSA type. %id1%: the Link State ID of the received LSA. %id2%: the Link State ID of the LSA in database. %rtid1%: the advertise router ID of the received LSA. %rtid2%: the advertise router ID of the LSA in database. %age1%: the age of the received LSA. %age2%: the age of the LSA in database. %seq1%: the sequence number of the received LSA. %seq2%: the sequence number of the LSA in database.

Remedy

None. This is for debugging

Severity

Warning

Message Text

Processing one LSA by comparing it with founded database version Lsa/Lsai (type %type%) id %id1%/ %id2% rtid %rtid1%/ %rtid2% age %age1%/ %age2% seq %seq1%/ %seq2%.

Message Parameters

| Name | Type |
|-------|------|
| type | ulnt |
| id1 | IP |
| id2 | IP |
| rtid1 | IP |
| rtid2 | IP |
| age1 | ulnt |

| Name | Type |
|------|--------|
| age2 | ulnt |
| seq1 | xInt32 |
| seq2 | xInt32 |

ospf.lsa.DropDupType9IfcDiff

Description

When ospf receives received local opaque LSA, it finds one version of the LSA in database which is from different interface. %circ1%: the interface IP address which received the local opaque LSA. %circ2%: the interface IP address which received the LSA is in database. %id1%: the Link State ID of the received LSA. %id2%: the Link State ID of the LSA in database. %rtid1%: the advertise router ID of the received LSA. %rtid2%: the advertise router ID of the LSA in database. %age1%: the age of the received LSA. %age2%: the age of the LSA in database. %seq1%: the sequence number of the received LSA. %seq2%: the sequence number of the LSA in database.

Remedy

None. This is for debugging

Severity

Warning

Message Text

Processing one duplicate link-local opaque LSA from a different interface. LSA circ %circ1%/%circ2% id %id1%/%id2% rtid %rtid1%/%rtid2% age %age1%/%age2% seq %seq1%/%seq2%.

Message Parameters

| Name | Type |
|-------|------|
| circ1 | IP |
| circ2 | IP |
| id1 | IP |
| id2 | IP |
| rtid1 | IP |
| rtid2 | IP |
| age1 | ulnt |

| Name | Type |
|------|--------|
| age2 | ulnt |
| seq1 | xInt32 |
| seq2 | xInt32 |

ospf.lsa.DelPendLSReq

Description

Used when ospf deletes the LSA from link list request list of the neighbor while processing received LSA. %lsid%: the Link State ID of the LSA. %rtid%: the advertise router ID of the LSA. %age%: the age of the LSA. %nbr%: the neighbor's IP address which sends the LSA. %state%: the state of the neighbor.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Deleting pending Link State Request with lsid %lsid% rtid %rtid% age %age% nbr %nbr% state %state%.

Message Parameters

| Name | Type |
|-------|------|
| lsid | IPN |
| rtid | IPN |
| age | ulnt |
| nbr | IPN |
| state | ulnt |

ospf.lsa.DropNotMinArrivTime

Description

Used when ospf processes one received LSA, it find one version of the LSA in its database, the LSA in database is received within the minimum arrival time. %lsai%: the pointer of the LSA in database.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Drop one LSA with lsai %lsai% which is received within the minimum arrival time.

Message Parameters

| Name | Type |
|------|------|
| lsai | Ptr |

ospf.lsa.ProcFunc

Description

When ospf processes one received LSA, it could "added", "purging" or "updated" the LSA. %action%: It could be "added", "purging" or "updated". %lsai%: the pointer of the LSA structure. %type%: the LSA type. %rtid%: the advertise router ID of the LSA. %lsid%: the Link State ID of the LSA. %age%: the age of the LSA. %seq%: the sequence number of the LSA.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

%action% one LSA with lsai %lsai% type %type% rtid %rtid% lsid %lsid% age %age% seq %seq%.

Message Parameters

| Name | Type |
|--------|--------|
| action | String |
| lsai | Ptr |
| type | ulnt |
| rtid | IPN |
| lsid | IPN |
| age | ulnt |
| seq | xInt32 |

ospf.lsa.DelLSRtxListEnt

Description

When ospf deletes one LSA from the retransmit list of the neighbor which receive it.
%lsai%: the pointer of LSA. %nbr%: the IP address of the neighbor.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Deleting one LSA %lsai% from retransmit list deleting of nbr %nbr%.

Message Parameters

| Name | Type |
|------|------|
| lsai | Ptr |
| nbr | IP |

ospf.lsa.DropOld

Description

When ospf receives an older LSA comparing to the version of the database, it ignores the LSA.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Receiving old version of LSA, ignoring.

ospf.lsa.TxLSAckNbrNotUpdt

Description

When ospf processes one received external type-5 LSA, it sends LS ACK instead of asking the neighbor to update its new version. %lsid%: the Link State ID of the LSA. %mask%: the network mask of the LSA. %area%: the area ID the received interface belongs to.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Sending LS Ack instead of updating nbr for old external LSA lsd %lsid% mask %mask% area %area%.

Message Parameters

| Name | Type |
|------|------|
| lsid | IPN |
| mask | IPN |
| area | IPN |

ospf.lsa.CmpAge

Description

When ospf compares the received LSA with the LSA in the database. %seq%: the sequence number of the received LSA. %age%: the age of the received LSA. %csum%: the checksum of the received LSA. %seq2%: the sequence number of the LSA in database. %age2%: the age of the LSA in database. %csum2%: the checksum of the LSA in database.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Comparing age of LSA(seq %seq% age %age% csum %csum%) with database version(seq %seq2% age %age2% csum %csum2%).

Message Parameters

| Name | Type |
|-------|--------|
| seq | xInt32 |
| age | uInt |
| csum | xInt32 |
| seq2 | xInt32 |
| age2 | uInt |
| csum2 | xInt32 |

ospf.lsa.BldType1

Description

Used when ospf builds its router-LSA in one specific area. %a%: the pointer of the area structure. %as%: the area ID of the area. %mod%: It may need to do snmp trap if it is set to 1.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Building router-LSA on area a=%a%(%as%, mod=%mod%).

Message Parameters

| Name | Type |
|------|------|
| a | Ptr |
| as | IPN |
| mod | ulnt |

ospf.lsa.BldType2Strt

Description

Used when ospf starts to build its own network-LSA. %if_ip%: the interface IP address. %if_mask%: the interface IP mask. %state%: the state of the interface. %trig%: the interface's trigger flag, it could be "need do dr elect", etc.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Starting to building network-LSA with %if_ip%/%if_mask% state %state% dr_trig %trig%.

Message Parameters

| Name | Type |
|---------|-----------|
| if_ip | IPN |
| if_mask | IPmaskval |
| state | String |
| trig | ulnt |

ospf.lsa.BldType2Fnd

Description

When ospf builds its own network-LSA, it finds one copy in its database. %lsai%: the pointer of the LSA in database. %flag%: the flag of the LSA in database. %age%: the age of the LSA in database. %seq%: the sequence number of the LSA in database.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Found own network-LSA lsai %lsai% flags %flag% age %age% seq %seq% while building.

Message Parameters

| Name | Type |
|------|------|
| lsai | Ptr |
| flag | ulnt |
| age | ulnt |
| seq | ulnt |

ospf.lsa.DelType2NotDR

Description

Used when ospf purging its own network-LSA when the interface is no-longer DR.
%lsai%: the pointer of the LSA structure.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Deleting own network-LSA %lsai% when the interface is no longer DR.

Message Parameters

| Name | Type |
|------|------|
| lsai | Ptr |

ospf.lsa.BldType2NotDone

Description

Used when ospf does not build its network-LSA in this interface. %ip%: the IP address of the interface. %mask%: the IP mask of the interface.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Building own network-LSA %ip%/%mask% is not done.

Message Parameters

| Name | Type |
|------|------|
| ip | IPN |
| mask | IPN |

ospf.lsa.BldType2Pstpn

Description

Used when ospf decides to build its network-LSA later since it is within minimum arrival time period.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Building own network-LSA after the minumum arrival timer expiration.

ospf.lsa.PurgeType2MaxSeqNum

Description

Used when ospf builds its network-LSA, the sequence number of the local LSA reaches the maximum limit. %lsai%: the pointer of the LSA. %seq%: the sequece number of the LSA>

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

ospf Build My Net links: Purge and return lsai %lsai%, reached max seqNum %seq%.

Message Parameters

| Name | Type |
|------|--------|
| lsai | Ptr |
| seq | xInt32 |

ospf.lsa.BldType2Func

Description

Used when ospf adds or updates its own network-LSA. %action%: It could be "added" or "updated" %lsai%: the pointer of the LSA structure.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

%action% network-LSA %lsai%.

Message Parameters

| Name | Type |
|--------|--------|
| action | String |
| lsai | Ptr |

ospf.lsa.BldType2Done

Description

Used when ospf ends to build its own network-LSA. %if_ip%: the interface IP address. %if_mask%: the interface IP mask. %state%: the state of the interface. %trig%: the interface's trigger flag, it could be "need do dr elect", etc.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Completely building own network-LSA %ip%/%mask% state %state% dr_trig %trig%.

Message Parameters

| Name | Type |
|-------|-----------|
| ip | IPN |
| mask | IPmaskval |
| state | String |
| trig | ulnt |

ospf.lsa.BldType34

Description

Used when ospf builds summary-LSA. %sh%: the pointer of the summary header structure. %mod%: when it is set to 1, it may need to do snmp trap.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Building own type-3 or type-4 LSA with (sh=%sh%, mod=%mod%).

Message Parameters

| Name | Type |
|------|------|
| sh | Ptr |
| mod | ulnt |

ospf.lsa.BldDfltType3

Description

Used when ospf builds default summary-LSA. %a%: the pointer of the area. %as%: the area ID of the area. %mod%: when it is set to 1, it may need to do snmp trap.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Building one default summary-LSA with (a=%a%[%as%, mod=%mod%)

Message Parameters

| Name | Type |
|------|------|
| a | Ptr |
| as | IPN |
| mod | ulnt |

ospf.lsa.BldDfltType7

Description

Used when ospf builds default type-7 LSA. %a%: the pointer of the area. %as%: the area ID of the area. %mod%: when it is set to 1, it may need to do snmp trap.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Building default type-7 LSA (a=%a%[%as%], mod=%mod%).

Message Parameters

| Name | Type |
|------|------|
| a | Ptr |
| as | IPN |
| mod | ulnt |

ospf.lsa.BldType5

Description

Used when ospf builds AS-external link. %ase%: the pointer of the as-external header structure. %mod%: when it is set to 1, it may need to do snmp trap. %lsid%: the new Link State ID.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Building own type-5 LSA (ase=%ase%, mod=%mod%, newLsid=%lsid%).

Message Parameters

| Name | Type |
|------|------|
| ase | Ptr |
| mod | ulnt |
| lsid | Ptr |

ospf.lsa.CalcType7FwdAddr

Description

Used when ospf compute forwarding address for type-7 LSA. %area%: the pointer of the area. %id%: the area ID. %ase%: the pointer of the external header structure. %lsid%: the Link State ID of the LSA. %ptr%: the pointer of the build in return address.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Computing Type7 Fwd Address (area=%area%[%id%], ase=%ase%[%lsid%], ra=%ra%).

Message Parameters

| Name | Type |
|------|------|
| area | Ptr |
| id | IPN |
| ase | Ptr |
| lsid | IPN |
| ra | Ptr |

ospf.lsa.CalcType7FwdAddrDone

Description

Used when ospf computes the forwarding address for type-7 LSA. %result%: the computed forwarding address.

Remedy

None. This is for debugging,

Severity

Debug-Verbose

Message Text

Computing Type7 forwarding address with the result %result%.

Message Parameters

| Name | Type |
|--------|------|
| result | IPN |

ospf.lsa.BldType7

Description

Used when ospf builds type-7 LSA. %ase%: the pointer of the external header structure. %lsid%: the Link State ID of the LSA. %area%: the pointer of the area. %id%: the area ID. %mod%: when it is set to 1, it may need to do snmp trap. %ra%: the pointer of the build in return address.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Building type-7 LSA (ase=%ase%[%lsid%], area=%area%[%id%], mod=%mod%), ra=%ra%.

Message Parameters

| Name | Type |
|------|------|
| ase | Ptr |
| lsid | IPN |
| area | Ptr |
| id | IPN |
| mod | ulnt |
| ra | Ptr |

ospf.lsa.RxLSAck

Description

Used when ospf receives LS Ack. %id%: the Link State ID of the LS Ack. %rtid%: the advertise router ID of the LS Ack. %nbr%: the router ID of the neighbor.

Remedy

None. This is an informational message

Severity

Debug-Summary

Message Text

Receiving LSA Ack lsaid %id% lsartid %rtid% nbr %nbr%.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |
| nbr | IPN |

ospf.lsa.TxDrctLSAck

Description

Used when ospf sends direct LS Ack. %id%: the Link State ID of the LS Ack. %rtid%: the advertise router ID of the LS Ack. %nbr%: the router ID of the neighbor.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Sending direct ACK lsaid %id% lsartid %rtid% nbr %nbr%.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |
| nbr | IPN |

ospf.lsa.EnqDlayLSAck

Description

Used when queues the delayed LS Ack. %id%: the Link State ID of the LS Ack. %rtid%: the advertise router ID of the LS Ack. %nbr%: the router ID of the neighbor.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Queuing Delayed Ack lsaid %id% lsartid %rtid% nbr %nbr%.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |
| nbr | IPN |

ospf.lsa.TxDlayLSAck

Description

Used when ospf sends delayed LS Ack on one interface. %ip%: the interface IP address.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Sending Delayed Ack on interface %ip%.

Message Parameters

| Name | Type |
|------|------|
| ip | IPN |

ospf.lsa.LSUpdtPktInv

Description

Used when ospf receives bad LS Update packet. %type%: the packet type. %ip%: the interface IP address.

Remedy

None. This is for debugging

Severity

Warning

Message Text

Receiving Bad pkt (type %type%) from interface %ip%.

Message Parameters

| Name | Type |
|------|------|
| type | ulnt |
| ip | IPN |

ospf.lsa.RtxListNbr

Description

Used when ospf retransmit LSA to one neighbor. %rtid%: the router ID of the neighbor.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Retransmitting one LSA to neighbor %rtid%.

Message Parameters

| Name | Type |
|------|------|
| rtid | IPN |

ospf.lsa.AddRtxList

Description

Used when ospf add retransmit LSA to retransmitting queue. %id%: the Link State ID of the LSA. %rtid%: the advertise router ID of the LSA.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

Adding LSA with id %id% rtr %rtid% to retransmitting queue.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| rtid | IPN |

ospf.lsa.CalcFwdAddr

Description

Used when ospf compute forwarding address for one area. %area%: the area ID. %fwd%: the cached forwarding address of the area. %flags%: the flag of the area.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Computing forwarding address on (area=%area%) with cached forwarding address% fwd% and flag %flags%.

Message Parameters

| Name | Type |
|-------|------|
| area | IPN |
| fwd | IPN |
| flags | ulnt |

ospf.lsa.CalcFwdAddrDone

Description

Used when ospf finishes computing forwarding address for one area. %changed%: the forwarding address is changed or not, it is "with" or "without". %fwd%: the cached forwarding address of the area. %flags%: the flag of the area.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Computing forwarding address %change% change, cached forwarding address %fwd% and flagg %flags%.

Message Parameters

| Name | Type |
|--------|------|
| change | ulnt |
| fwd | IPN |
| flags | ulnt |

ospf.lsa.RbldType7

Description

Used when ospf rebuilds type-7 LSA. %circ%: the pointer of interface structure.
%ip_int%: the IP address of the interface. %area%: the NSSA area.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Rebuilding type-7 LSA with circuit=%circ%[%ip_int%], area=%area%.

Message Parameters

| Name | Type |
|--------|------|
| circ | Ptr |
| ip_int | IPN |
| area | IPN |

ospf.lsa.IncrSeqNum

Description

Used when ospf receives its own originated LSA. It shall sends LSA with sequence number increased by one. %lsai%: the pointer of the LSA in database. %type%: the LSA type. %rtid%: the advertise router ID of the LSA %lsid%: the link State ID of the LSA %age%: the age of the LSA. %oldseq%: the old sequence number of the LSA. %newseq%: the new sequence number of the LSA.

Remedy

None. This is for debugging

Severity

Warning

Message Text

Sending its LSA with lsai %lsai% type %type% rtid %rtid% lsid %lsid% age %age% oldseq %oldseq% newseq %newseq% by incrementing sequence number by 1.

Message Parameters

| Name | Type |
|--------|--------|
| lsai | Ptr |
| type | ulnt |
| rtid | IPN |
| lsid | IPN |
| age | ulnt |
| oldseq | xInt32 |
| newseq | xInt32 |

ospf.lsa.DfltType7AlrdyExist

Description

Used when ospf tries to build type-7 default LSA which an exported default exists.

Remedy

None. This is for debugging.

Severity

Warning

Message Text

Building a Type-7 Default LSA.

ospf.lsa.StrtBatchTx

Description

Used when ospf begins to do LSA batch. %time%: the seconds after the ospf timer thread is created.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

OSPF LSA Batch Interval Starting at %time%.

Message Parameters

| Name | Type |
|------|------|
| time | ulnt |

ospf.lsa.Warning

Description

A warning condition has occurred. The message contains details.

Remedy

None

Severity

Warning

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

ospf.lsa.DebugSummary

Description

A summary debug condition has occurred. The message contains details.

Remedy

None

Severity

Debug-Summary

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

ospf.lsa.DebugVerbose

Description

A verbose debug condition has occurred. The message contains details.

Remedy

None

Severity

Debug-Verbose

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

ospf.lsa.DelExtRt

Description

Used when ospf processes external route. %inase%: the pointer of external route structure. %ip%: the IP address of the external route. %mask%: the IP mask of the external route. %nhs%: the IP address of the next hop of the external route. %nh%: It is set to 1 when using next hop to calculate forwarding address of LSA.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Deleting an external route (inase=%inase%[%ip%/%mask%, nh=%nhs%, useNextHop=%nh%]).

Message Parameters

| Name | Type |
|-------|------------|
| inase | Ptr |
| ip | IPN |
| mask | IPmaskvalN |
| nhs | IP |
| nh | ulnt |

ospf.lsa.CksumInv

Description

Used when ospf received bad LSA. %lsid%: the Link State ID of the bad LSA. %type%: the type of the bad LSA. %nbr%: the neighbor IP address which sends the bad LSA. %thing%: it could be "len %d" or "checksum".

Remedy

None. This is for debugging.

Severity

Warning

Message Text

Processing received LSA with lsid %lsid% type %type% from nbr %nbr% failed on bad checksum

Message Parameters

| Name | Type |
|------|------|
| lsid | IPN |
| type | ulnt |
| nbr | IPN |

ospf.lsa.NotAgeOut

Description

Used when ospf updates LSA, updating the holding timer of LSA. %lsai%: the pointer of LSA structure. %lsid%: the Link State ID of the LSA. %rtid%: the advertise router ID of the LSA, %lsa_age%: the age of the LSA. %seq%: the sequence number of the LSA.

Remedy

None. This is for debugging

Severity

Debug-Verbose

Message Text

Holding off deleting the hold time of LSAi %lsai% lsid %lsid% rtid %rtid% lsa_age %lsa_age% seq %seq%.

Message Parameters

| Name | Type |
|---------|------|
| lsai | Ptr |
| lsid | IPN |
| rtid | IPN |
| lsa_age | ulnt |
| seq | ulnt |

ospf.lsa.RxMbufDump

Description

Internal mbuf (memory buffer) dump during input processing.

Remedy

None. This is for debugging

Severity

Debug-Data

Message Text

To vlan %vlan%, len %len%, msg %mbufPtr%.

Message Parameters

| Name | Type |
|---------|---------|
| vlan | String |
| mbufPtr | Buf-ptr |
| len | Buf-len |

ospf.lsa.TxDataDump

Description

Packet dump during output processing.

Remedy

None. This is for debugging

Severity

Debug-Data

Message Text

From vlan %vlan%, len %len%, msg %bufPtr%.

Message Parameters

| Name | Type |
|--------|---------|
| vlan | String |
| bufPtr | Buf-ptr |
| len | Buf-len |

ospf.lsa.BldType9Grace

Description

Used ospf when builds grace lsa for graceful restart %interface%: vlan name %reason% : reason for the graceful restart

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

OSPF builds Grace-LSA for interface %interface% with reason - %reason%.

Message Parameters

| Name | Type |
|-----------|--------|
| interface | String |
| reason | String |

ospf.lsa.DropRtrLSAMaxLinkExcd

Description

Used when OSPF drops router LSA which contains links more than the supported limits in an area. %lsid%: Link state ID of the router LSA. %nbr%: neighbor ip address. %numlink%: number of links in router LSA %suplimit%: max supported interface in an area

Remedy

Please configure OSPF area to have number of interfaces within the specified limit

Severity

Warning

Message Text

Dropped router LSA (lsid %lsid%) from neighbor %nbr% which has %numlink% links (more than the supported limit %suplimit%)

Message Parameters

| Name | Type |
|----------|--------|
| lsid | IPN |
| nbr | IPN |
| numlink | uInt16 |
| suplimit | uInt16 |

ospf.lsa.DropRtrLSAIDMismatch

Description

Occurs when OSPF drops Router LSA because Link State ID and Advertising Router are not the same.

Remedy

A router in the network is sending incorrect LSAs. Please locate and correct the router.

Severity

Warning

Message Text

Dropped Router LSA from neighbor %nbr% because Link State ID %lsid% and Advertising Router %artr% are not the same.

Message Parameters

| Name | Type |
|------|------|
| nbr | IPN |
| lsid | IPN |
| artr | IPN |

ospf.neighbor.TxPkt

Description

Used when ospf sends DD packet or LS Req packet. %vlan%: the vlan name which sends the packet. %pkttype%: the packet type. It is DD or LS Req. %dst%: the destination IP address of the packet. %len%: the length of the packet. %intf%: the pointer of ospf vlan structure which sends the packet. %pktnum%: the number of packets which have been transmitted.

Remedy

None. This is an informational message.

Severity

Debug-Summary

Message Text

%vlan% sends %pkttype% pkt to %dst% (length %len%, interface %intf%, pkt num %pktnum%).

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| pkttype | String |
| dst | IPN |
| len | ulnt |
| intf | Ptr |
| pktnum | ulnt |

ospf.neighbor.PktRx

Description

Used when ospf correctly receives DD or LS Req packet. %vlan%: the ospf vlan which receives the packet. %pkttype%: the packet type, it is DD or LS Req packet. %src%: the source IP address of the packet.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

OSPF Nbr %vlan% receivies type %pkttype% pkt from %src%.

Message Parameters

| Name | Type |
|---------|------|
| vlan | VLAN |
| pkttype | ulnt |
| src | IPN |

ospf.neighbor.PktInv

Description

Used when ospf does not correctly receive DD or LS Req packet. %vlan%: the ospf vlan which received the message. %pkttype%: the packet type. It is DD or LS Req packet. %src%: the source IP address of the received packet. %reason%: the failure reason.

Remedy

If failure happens due to configuration issue, that needs to be corrected.

Severity

Warning

Message Text

OSPF Nbr %vlan% receives type %pkttype% pkt from %src% failed %reason%.

Message Parameters

| Name | Type |
|---------|--------|
| vlan | VLAN |
| pkttype | ulnt |
| src | IPN |
| reason | String |

ospf.neighbor.ElectDR

Description

Used when DR and BDR is elected on a broadcast interface. %vlanname%: the vlan name which connected to a broadcast network. %dr%: elected IP address of DR. %bdr%: elected IP address of BDR.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Electing DR on interface %vlanname%, DR is %dr%, BDR is %bdr%.

Message Parameters

| Name | Type |
|----------|------|
| vlanname | VLAN |
| dr | IPN |
| bdr | IPN |

ospf.neighbor.TxDD

Description

Used when ospf sends DD packet. %rtid%: the router ID of the neighbor. %seq%: the sequence number of the DD packet. %flagI%: the Initial flag. It is set to "I" if the packet is initial packet. %flagM%: the More flag. It is set to "M" if the packet has more packets following. %flagMS%: the Master/Slave flag. It is set to "MS" if the local ospf switch thinks that it is the Master.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Sending DD to %rtid% with seq %seq% flags %flagI%%flagM%%flagMS%.

Message Parameters

| Name | Type |
|--------|--------|
| rtid | IPN |
| seq | xInt32 |
| flagI | String |
| flagM | String |
| flagMS | String |

ospf.neighbor.SkipExtLSA

Description

Used when ospf skip filtered external LSA when sending DD packet. %id%: the skipped LSA's ID. %mask%: the skipped external LSA's network mask. %nbr%: the neighbor's IP address %area%: the area ID.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Skipping external Lsa lsd %id% mask %mask% in database exchange for nbr %nbr% area %area%.

Message Parameters

| Name | Type |
|------|------------|
| id | IPN |
| mask | IPmaskvalN |
| nbr | IPN |
| area | IPN |

ospf.neighbor.ProcInvLSREvent

Description

Used when handling bad LS Req event.

Remedy

None. Unwanted event occurred in protocol operation.

Severity

Debug-Summary

Message Text

Processing Link State Request invalid event.

ospf.neighbor.ChgState

Description

Used when ospf neighbor changes its state. %rtid%: neighbor router ID. %ip%: neighbor IP address. %state%: the state which the neighbor changes to. %reason%: the reason why the state transition is happening. The possible state is "DOWN", "ATTEMPT", "2WAY", "INIT", "EX_START", "EXCHANGE", "LOADING" and "FULL".

Remedy

None. This is an informational message.

Severity

Notice

Message Text

Changing the state of neighbor rtid %rtid% ipa %ip% to state = %state% %reason%.

Message Parameters

| Name | Type |
|--------|--------|
| rtid | IPN |
| ip | IPN |
| state | String |
| reason | String |

ospf.neighbor.ProcDD

Description

Used when ospf process DD packet. %nbr%: the neighbor router ID which sends the DD packet. %seq%: the sequence number of the DD packet. %flagI%: the Initial flag. It is set to "I" when the DD packet is the first one. %flagM%: the More flag. It is set to "M" when more packets will follow the received DD packet. %flagMS%: the "Master/Slave" flag. It is set to "MS" if the neighbor thinks it is the Master.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Processing DD Packet from neighbor %nbr% with seq %seq% flags %flagI%%flagM%
%flagMS%.

Message Parameters

| Name | Type |
|--------|--------|
| nbr | IPN |
| seq | xInt32 |
| flagI | String |
| flagM | String |
| flagMS | String |

ospf.neighbor.MstrSlave

Description

Used when ospf determine the neighbor is Master or Slave. %MS%: It is set to "Master" when the neighbor is Master.

Remedy

None. This is for debugging

Severity

Debug-Summary

Message Text

The neighbor with IP %ip% and rtid %rtid% is %MastSlv%

Message Parameters

| Name | Type |
|---------|--------|
| ip | IPN |
| rtid | IPN |
| MastSlv | String |

ospf.neighbor.ProcDDFail

Description

Used to report error DD packet when the neighbor is in Exchange state. %reason%: Failure reason, it could be "Neighbor DD's Initial flag is set", "mismatch Master/Slave", "sequence mismatch", "option mismatch" etc. %rtid%: Neighbor's router ID.

Remedy

None. Unwanted event occurred in protocol operation.

Severity

Warning

Message Text

Processing DD from neighbor %rtid% fails on %reason%.

Message Parameters

| Name | Type |
|--------|--------|
| rtid | IPN |
| reason | String |

ospf.neighbor.VLANWarning

Description

A warning condition has occurred on the given VLAN.

Remedy

None. This is for debugging.

Severity

Warning

Message Text

Vlan (%bridgeInst%) - %msg%

Message Parameters

| Name | Type |
|------------|--------|
| bridgeInst | VLAN |
| msg | Printf |

ospf.neighbor.VLANDebugSummary

Description

A summary debug condition has occurred on the given VLAN.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Vlan (instance %bridgeInst%) - %msg%

Message Parameters

| Name | Type |
|------------|--------|
| bridgeInst | VLAN |
| msg | Printf |

ospf.neighbor.VLANDebugVerbose

Description

A verbose debug condition has occurred on the given VLAN.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Vlan (%bridgeInst%) - %msg%

Message Parameters

| Name | Type |
|------------|--------|
| bridgeInst | VLAN |
| msg | Printf |

ospf.neighbor.VLANRxMbufDump

Description

Internal mbuf (memory buffer) dump during input processing.

Remedy

None. This is for debugging.

Severity

Debug-Data

Message Text

To vlan %vlan%, len %len%, msg %mbufPtr%.

Message Parameters

| Name | Type |
|---------|---------|
| vlan | String |
| mbufPtr | Buf-ptr |
| len | Buf-len |

ospf.neighbor.VLANTxDataDump

Description

Packet dump during output processing.

Remedy

None. This is for debugging.

Severity

Debug-Data

Message Text

From vlan %vlan%, len %len%, msg %bufPtr%.

Message Parameters

| Name | Type |
|--------|---------|
| vlan | String |
| bufPtr | Buf-ptr |
| len | Buf-len |

ospf.neighbor.DDMTUMismatch

Description

Received DD packet has MTU mismatch. The adjacency will not go to full state. %nbr%: the neighbor router ID which sends the DD packet. %local_mtu%: MTU for the interface on local router. %remote_mtu%: MTU of the interface on remote router.

Remedy

Please configure same interface MTU in both the end of ospf adjacency

Severity

Warning

Message Text

MTU mismatch for DD Packet from neighbor %nbr% local MTU %local_mtu% recvd MTU %remote_mtu%.

Message Parameters

| Name | Type |
|------------|------|
| nbr | IPN |
| local_mtu | ulnt |
| remote_mtu | ulnt |

ospf.spf.TmpPathEntAdd

Description

Used when tent to SPF TENT is added. %pent%: the pointer of tent entry which is added. %hop%: the number of next hops which can reach the destination. %ip%: the IP address of the destination. %mask%: the IP mask of the destination. %cost%: the Type 1 cost of the destination. %cost2%: the Type 2 cost of the destination. %type%: the pent type. %lsai%: the associated pointer of LSAI. %hash%: the hash number of the pent.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Temporary Path Entry %pent% numHops %hop% %ip%/%mask% cost %cost% cost2 %cost% type %type% lsai %lsai% hashbucket %hash% added.

Message Parameters

| Name | Type |
|------|------------|
| pent | Ptr |
| hop | ulnt |
| ip | IPN |
| mask | IPmaskvalN |

| Name | Type |
|-------|------|
| cost | ulnt |
| cost2 | ulnt |
| type | ulnt |
| lsai | Ptr |
| hash | ulnt |

ospf.spf.AddIntASBR

Description

Used when ospf add internal AS boundary router to NSSA area. %vid%: the router ID of the internal AS boundary router. %type%: the associated LSA type. %artr%: the advertise router ID of the associated LSA. %lsid%: the Link State ID of the associated LSA. %area%: the area ID of the NSSA.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Adding Internal ASBR Vid %vid% Type %type% Artr %artr% Lsid %lsid% in Area %area%.

Message Parameters

| Name | Type |
|------|------|
| vid | IPN |
| type | ulnt |
| artr | IPN |
| lsid | IPN |
| area | IPN |

ospf.spf.IntASBRDupFnd

Description

Used when ospf finds duplicate internal AS boundary router in NSSA area. %vid%: the router ID of the internal AS boundary router. %type%: the type of the associated LSA. %artr%: the advertise router ID of the associated LSA. %lsid%: the link State ID of the associated LSA. %area%: the area ID of the NSSA.

Remedy

None. This is for debugging.

Severity

Critical

Message Text

Duplicate Vertex Vid %vid% Type %type% Artr %artr% Lsid %lsid% in Area %area% is found.

Message Parameters

| Name | Type |
|------|------|
| vid | IP |
| type | uInt |
| artr | IP |
| lsid | IP |
| area | IP |

ospf.spf.DelAddTmpPathEnt

Description

Used when ospf replaces router type of tent entry.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Deleting and Adding Temporary Path Entry.

ospf.spf.ReplTmpPathEnt

Description

Used when ospf replaces tent entry with new one. %pent%: the pointer of pent structure. %hop%: the number of next hops of the new pent. %cost%: the Type-1 cost of the new pent. %cost2%:the Type-2 cost of the new pent. %type%: the type of the pent.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Replacing temporary path entry %pent% with numHops %hop% cost %cost% cost2 %cost2% type %type%.

Message Parameters

| Name | Type |
|-------|------|
| pent | Ptr |
| hop | ulnt |
| cost | ulnt |
| cost2 | ulnt |
| type | ulnt |

ospf.spf.TmpPathEntUpdt

Description

Used when ospf successfully replace the tent entry by new one. %pent%: the pointer of the pent. %hop%: the number of next hops of the new pent. %ip%: the IP address of the pent. %mask%: the IP mask of the pent. %cost%: the Type-1 cost of the pent. %cost2%: the Type-2 cost of the pent. %type%: the type of the pent. %lsai%: the pointer of associated LSA.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Temporary path entry %pent% numHops %hop% %ip%/%mask% cost %cost% cost2 %cost2% type %type% lsai %lsai% is updated.

Message Parameters

| Name | Type |
|-------|------------|
| pent | Ptr |
| hop | ulnt |
| ip | IPN |
| mask | IPmaskvalN |
| cost | ulnt |
| cost2 | ulnt |
| type | ulnt |
| lsai | Ptr |

ospf.spf.lgnTmpPathEntLowCost

Description

Used when ospf tries to add a tent entry to SPF TENT, but find a same tent (same IP) with lower cost. Stop adding the new pent. %id%: IP address of the pent. Type %id% ----- Point-to-Point Neighboring router's Router ID Transit Networks IP address of the Designated Router Stub Network IP network/subnet number Virtual Link Neighboring router's Router ID %data%: IP mask of the pent. Value depends on the link's Type field. For connections to stub networks, it specifies the network's IP address. For the other link types it specified the router interface's IP address. %cost%: the cost of the found same pent.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Found temporary path entry %id%/%data% with lower cost %cost%. Ignoring.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| data | IPN |
| cost | ulnt |

ospf.spf.MergeTmpPathEntEqCost

Description

Used when ospf tries to add a tent entry to SPF TENT, find a same tent with same cost as the new pent. Merge the pent to the found tent. %id%: the IP address of the pent. %data%: the IP mask of the pent. %cost%: the cost of the pent.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Found tent %id%/%data% with equal cost %cost%. Merging.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| data | IPN |
| cost | ulnt |

ospf.spf.IgnTmpPathEntEqICost

Description

Used when ospf tries to add tent entry to SPF TENT, find a equal cost pent (with same IP) for multicast OSPF and could not do the replacement. Ignore the new pent. %id%: the IP address of the pent. %data%: the IP mask of the pent. %cost%: the cost of the pent.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Found tent %id%/ %data% equal cost %cost%. Ignoring.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| data | IPN |
| cost | ulnt |

ospf.spf.ReplHighCostTmpPathEnt

Description

Used when ospf tries to add new pent to SPF TENT, find a higher cost pent (with same IP), replace it with the new pent. %id%: the IP address of the pent. %data%: the IP mask of the pent. %cost%: the cost of the found pent.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Found tent %id%/%data% higher cost %cost%. Replacing.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| data | IPN |
| cost | ulnt |

ospf.spf.AddTmpPathEnt

Description

Used when ospf tries to add a new pent to SPF TENT, no found in TENT, just add the new one. %id%: the IP address of the pent. %data%: the IP mask of the pent. %cost%: the cost of the pent.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Adding tent %id%/%data% cost=%cost%.

Message Parameters

| Name | Type |
|------|------|
| id | IPN |
| data | IPN |
| cost | ulnt |

ospf.spf.AddType3LSATmpPathEnt

Description

Used when ospf tries to summary-net LSA as a pent to SPF TENT. %lsa%: the pointer of the summary LSA. %id%: the IP address of the pent. %data%: the IP mask of the pent. %cost%: the cost of the pent.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Trying to add summary LSA %lsa% %id%/%data% cost %cost% to tent.

Message Parameters

| Name | Type |
|------|------|

ospf.spf.IntraAreaCalcStrt

Description

Used when ospf starts intra-area SPF on one area. %area%: the area ID of the SPF running.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Start Intra area SPF on Area %area%.

Message Parameters

| Name | Type |
|------|------|
| area | IPN |

ospf.spf.IntraAreaCalcDone

Description

Used when ospf ends intra-area SPF on one area. %area%: the area ID of the SPF.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

End Intra Area SPF on Area %area%.

Message Parameters

| Name | Type |
|------|------|
| area | IPN |

ospf.spf.InterAreaCalcStrt

Description

Used when ospf start inter-area or transit area SPF on one area. %area%: the area ID which runs the SPF. %uflag%: If it is set to 0, it is intra-area SPF. Otherwise, it is transit area SPF.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Start Inter Area SPF on Area %area% uflag %uflag%.

Message Parameters

| Name | Type |
|-------|------|
| area | IPN |
| uflag | uInt |

ospf.spf.ExtndABRInterAreaCalc

Description

Used when ospf extends one area border router in running SPF. %rtid%: the router ID of the extended ABR.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Extending ABR %rtid% while run inter SPF.

Message Parameters

| Name | Type |
|------|------|
| rtid | IPN |

ospf.spf.InterAreaCalcDone

Description

Used when ospf ends inter-area or transit area SPF on one area. %area%: the area ID which runs the SPF. %uflag%: If it is set to 0, it is intra-area SPF. Otherwise, it is transit area SPF.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

End ospf Inter area SPF on %area% uflag %uflag%.

Message Parameters

| Name | Type |
|-------|------|
| area | IPN |
| uflag | uInt |

ospf.spf.ExtCalcStrt

Description

Used when ospf starts running external SPF. %flag%: It is set to 1 when running the external SPF at the beginning.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Start Extern Spf with flag %flag%.

Message Parameters

| Name | Type |
|------|------|
| flag | uInt |

ospf.spf.ExtndASBRExtCalc

Description

Used when ospf extends one AS boundary router when running external SPF. %rtid%: the router ID of the AS boundary router. %is_first%: It is set to 1 when ospf runs the external SPF at the beginning.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Extending ASBR %rtid% is_first = %is_first%.

Message Parameters

| Name | Type |
|----------|------|
| rtid | IPN |
| is_first | uInt |

ospf.spf.ExtndIntASBRExtCalc

Description

Used when ospf extends one internal AS boundary router of NSSA area when running external SPF. %rtid%: the router ID of the AS boundary router. %area%: the area ID of the NSSA area. %is_first%: It is set to 1 when ospf runs the external SPF at the beginning.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Extending Internal ASBR %rtid% Area %area% is_first = %is_first%.

Message Parameters

| Name | Type |
|----------|------|
| rtid | IPN |
| area | IPN |
| is_first | ulnt |

ospf.spf.ExtCalcDone

Description

Used when ospf ends external SPF. %is_first%: It is set to 1 when ospf runs the external SPF at the beginning.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

End Extern SPF with flag %flag%.

Message Parameters

| Name | Type |
|------|------|
| flag | ulnt |

ospf.spf.ProcInterAreaRt

Description

Used when ospf adds inter-area routes to kernel routing table or leak inter-area routes to other areas as summary routes. %action%: the possible string should be "add", "leaking" and "unable add". %pent%: the pointer of the pent. %pent_ip%: the IP address of the route. %pent_mask%: the IP mask of the route. %hop%: the number of next hops to the destination. %cost%: the Type 1 cost to the destination. %cost2%: the Type 2 cost to the destination. %type%: the pent type. %lsai%: the associated pointer of LSA structure. %tentbucket%: the hash key in PATH.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

```
%action% route pent %pent% %pent_ip%/%pent_mask% numhops %hop% cost %cost%
cost2 %cost2% type %type% lsai %lsai% tentbucket %tentbucket%.
```

Message Parameters

| Name | Type |
|------------|------------|
| action | String |
| pent | Ptr |
| pent_ip | IPN |
| pent_mask | IPmaskvalN |
| hop | ulnt |
| cost | ulnt |
| cost2 | ulnt |
| type | ulnt |
| lsai | Ptr |
| tentbucket | ulnt |

ospf.spf.TrnstAreaRtTblUpdtStrt

Description

Used when ospf starts updating the routing table from the transit area.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Start transit area routing table update.

ospf.spf.TrnstAreaLeakSummRt

Description

Used when ospf leaks inter-area routes to other areas as summary routes. %pent%: the pointer of the pent. %pent_ip%: the IP address of the route. %pent_mask%: the IP mask of the route. %hop%: the number of next hops to the destination. %cost%: the Type 1 cost to the destination. %cost2%: the Type 2 cost to the destination. %type%: the pent type. %lsai%: the associated pointer of LSA structure. %tentbucket%: the hash key in PATH.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Pent %pent% %pent_ip%/%pent_mask% numhops %hopcount% cost %cost% cost2 %cost2% type %type% lsai %lsai% tentbucket %tentbucket% is leaked to other areas as a summary route.

Message Parameters

| Name | Type |
|------------|-------------|
| pent | Ptr |
| pent_ip | IPN |
| pent_mask | IPmaskvalIN |
| hopcount | ulnt |
| cost | ulnt |
| cost2 | ulnt |
| type | ulnt |
| lsai | Ptr |
| tentbucket | ulnt |

ospf.spf.GetMinCostTmpPathEnt

Description

Used when ospf selects the pent with minimum cost from SPF TENT. %pent%: the pointer of the pent which has minimum cost in SPF TENT.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Get minimum cost tent %pent%

Message Parameters

| Name | Type |
|------|------|
| pent | Ptr |

ospf.spf.ExtndTmpPathEnt

Description

Used when ospf extending one tent entry in SPF. %pent%: the pointer of pent entry.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

Extending temporary path entry %pent%.

Message Parameters

| Name | Type |
|------|------|
| pent | Ptr |

ospf.spf.Warning

Description

A warning condition has occurred. The message contains details.

Remedy

None.

Severity

Warning

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

ospf.spf.DebugSummary

Description

A summary debug condition has occurred. The message contains details.

Remedy

None.

Severity

Debug-Summary

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

ospf.spf.DebugVerbose

Description

A verbose debug condition has occurred. The message contains details.

Remedy

None.

Severity

Debug-Verbose

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

ospf.spf.TrnstAreaRtTblUpdtDone

Description

Used when ospf ends updating the routing table from the transit area.

Remedy

None. This is for debugging.

Severity

Debug-Summary

Message Text

End transit area routing table update.

ospf.spf.TrnstAreaRtTblUpdt

Description

Used when ospf modifies inter-area routes from transit area updating to kernel routing table. %pent%: the pointer of the pent. %pent_ip%: the IP address of the route. %pent_mask%: the IP mask of the route. %hop%: the number of next hops to the destination. %cost%: the Type 1 cost to the destination. %cost2%: the Type 2 cost to the destination. %type%: the pent type. %lsai%: the associated pointer of LSA structure. %tentbucket%: the hash key in PATH.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Pent %pent% %pent_ip%/%pent_mask% numhops %hopcount% cost %cost% cost2
%cost2% type %type% lsai %lsai% tentbucket %tentbucket% updated

Message Parameters

| Name | Type |
|-----------|------------|
| pent | Ptr |
| pent_ip | IPN |
| pent_mask | IPmaskvalN |
| hopcount | ulnt |
| cost | ulnt |
| cost2 | ulnt |

| Name | Type |
|------------|------|
| type | ulnt |
| lsai | Ptr |
| tentbucket | ulnt |

ospf.spf.TrnstAreaRtTblUpdtFail

Description

Used when ospf fails to modify inter-area routes from transit area updating to kernel routing table. %pent%: the pointer of the pent. %pent_ip%: the IP address of the route. %pent_mask%: the IP mask of the route. %hop%: the number of next hops to the destination. %cost%: the Type 1 cost to the destination. %cost2%: the Type 2 cost to the destination. %type%: the pent type. %lsai%: the associated pointer of LSA structure. %tentbucket%: the hash key in PATH.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Pent %pent% %pent_ip%/%pent_mask% numhops %hopcount% cost %cost% cost2 %cost2% type %type% lsai %lsai% tentbucket %tentbucket% failed to update.

Message Parameters

| Name | Type |
|------------|------------|
| pent | Ptr |
| pent_ip | IPN |
| pent_mask | IPmaskvalN |
| hopcount | ulnt |
| cost | ulnt |
| cost2 | ulnt |
| type | ulnt |
| lsai | Ptr |
| tentbucket | ulnt |

ospf.spf.AddRt

Description

Used when ospf is adding one route to kernel routing table. %ip%: the IP address of the destination. %mask%: the IP mask of the destination. %gw%: the next hope address of the route to the destination. %cost%: the cost to the destination. %area%: the associated area of the destination route. %proto%: the route type, it could be intra-area, inter-area, extern-1 or extern-2.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Adding dst %ip%/%mask% gw %gw% cost %cost% area %area% %proto%.

Message Parameters

| Name | Type |
|-------|-----------|
| ip | IP |
| mask | IPmaskval |
| gw | IPN |
| cost | uInt |
| area | IPN |
| proto | String |

ospf.spf.NetInheritLsp

Description

Inherits the parent node's LSP information during SPF computation. Network node in SPF tree always inherit LSP information from its parent node, which will be of Router node.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Network node inherit LSP %num% type %type% XC NHLFEs for %net%/%mask% from %node%

Message Parameters

| Name | Type |
|------|------|
| num | uInt |
| type | xInt |
| net | IPN |
| mask | uInt |
| node | IP |

ospf.spf.RtrFindLsp

Description

Finding LSP information for a Router/Summary ASBR node in SPF tree.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

%type% PENT find LSP to Router ID %rtr1% instead of %rtr2%

Message Parameters

| Name | Type |
|------|--------|
| type | String |
| rtr1 | IPN |
| rtr2 | IPN |

ospf.spf.RtrLspFound

Description

LSP information to a Router/Summary ASBR node in SPF tree is found.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Found LSP to %type% PENT to Router ID %rtr%

Message Parameters

| Name | Type |
|------|--------|
| type | String |
| rtr | IPN |

ospf.spf.RtrLspNotFound

Description

LSP information to a Router/Summary ASBR node in SPF tree doesn't exist. This router node will use/inherit the LSP information of it's parent node in the SPF tree

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

LSP to %type% PENT to Router ID %rtr% is not found

Message Parameters

| Name | Type |
|------|--------|
| type | String |
| rtr | IPN |

ospf.spf.RtrInheritLsp

Description

LSP information to reach a router is not found in the LSP database. So, Inheirts the parent node's LSP information during SPF computation.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Router node inherit LSP %num% type %type% XC NHLFEs for %net%/%mask% from %node%

Message Parameters

| Name | Type |
|------|------|
| num | uInt |
| type | xInt |
| net | IP |
| mask | uInt |
| node | IP |

ospf.spf.InvPathType

Description

Invalid Path Entry type encountered while adding LSP information for a Path.

Remedy

None. This is for debugging.

Severity

Error

Message Text

Unexpected type %type% for %net%:%mask% in ospfAddLspInfo

Message Parameters

| Name | Type |
|------|------|
| type | ulnt |
| net | IP |
| mask | ulnt |

ospf.spf.LspPathsMerged

Description

Two or more LSP paths exist for a particular destination. These LSP paths are merged and can be used as equal cost multi path (ECMP) for that destination

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Updated path entry for %net%/%mask% with %num% new indirects LSPs

Message Parameters

| Name | Type |
|------|------|
| net | IPN |
| mask | ulnt |
| num | ulnt |

ospf.spf.DelRt

Description

Used when ospf is deleting one route from kernel routing table. %ip%: the IP address of the destination. %mask%: the IP mask of the destination. %gw%: the next hope address of the route to the destination. %cost%: the cost to the destination. %area%: the associated area of the destination route. %proto%: the route type, it could be intra-area, inter-area, extern-1 or extern-2.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Deleting route %ip%/%mask% gw %gw% cost %cost% area %area% %proto%.

Message Parameters

| Name | Type |
|-------|------------|
| ip | IPN |
| mask | IPmaskvalN |
| gw | IP |
| cost | ulnt |
| area | IP |
| proto | String |

ospf.spf.DelRtErr

Description

Used when deletion fails while deleting one route from kernel route table. %ip%: the IP address of the destination. %mask%: the IP mask of the destination. %gw%: the next hope address of the route to the destination. %cost%: the cost to the destination. %area%: the associated area of the destination route. %proto%: the route type, it could be intra-area, inter-area, extern-1 or extern-2.

Remedy

Disable/enable ospf for correcting route table.

Severity

Debug-Verbose

Message Text

Delete failed for dst %ip%/%mask% gw %gw% cost %cost% area %area% %proto%.

Message Parameters

| Name | Type |
|-------|------------|
| ip | IPN |
| mask | IPmaskvalN |
| gw | IPN |
| cost | uInt |
| area | IP |
| proto | String |

ospf.spf.AddRtErr

Description

Used when addition fails while adding one route to kernel route table. %ip%: the IP address of the destination. %mask%: the IP mask of the destination. %gw%: the next hope address of the route to the destination. %cost%: the cost to the destination. %area%: the associated area of the destination route. %proto%: the route type, it could be intra-area, inter-area, extern-1 or extern-2.

Remedy

Disable/enable ospf for correcting routing table.

Severity

Debug-Verbose

Message Text

Add failed dst %ip%/%mask% gw %gw% cost %cost% area %area% %proto%.

Message Parameters

| Name | Type |
|-------|------------|
| ip | IPN |
| mask | IPmaskvalN |
| gw | IPN |
| cost | ulnt |
| area | IP |
| proto | String |

ospf.spf.IgnAddRt

Description

Used when ospf ignores adding one route to kernel routing table. %ip%: the IP address of the destination. %mask%: the IP mask of the destination. %gw%: the next hope address of the route to the destination. %cost%: the cost to the destination. %area%: the associated area of the destination route. %proto%: the route type, it could be intra-area, inter-area, extern-1 or extern-2.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Ignore adding dst %ip%/%mask% gw %gw% cost %cost% area %area% %proto%.

Message Parameters

| Name | Type |
|-------|------------|
| ip | IPN |
| mask | IPmaskvalN |
| gw | IPN |
| cost | ulnt |
| area | IPN |
| proto | String |

ospf.spf.IgnDelRt

Description

Used when ospf ignores deleting one route from kernel routing table. %ip%: the IP address of the destination. %mask%: the IP mask of the destination. %gw%: the next hop address of the route to the destination. %cost%: the cost to the destination. %area%: the associated area of the destination route. %proto%: the route type, it could be intra-area, inter-area, extern-1 or extern-2.

Remedy

None. This is for debugging.

Severity

Debug-Verbose

Message Text

Ignore deleting dst %ip%/%mask% gw %gw% cost %cost% area %area% %proto%.

Message Parameters

| Name | Type |
|-------|------------|
| ip | IPN |
| mask | IPmaskvalN |
| gw | IPN |
| cost | ulnt |
| area | IPN |
| proto | String |

OSPFv3.SendToProtoThreadFail

Description

This event occurs whenever inter-thread message send failed. vrid: VR ID object: Object to be sent

Remedy

This is a rare internal condition needing technical assistance. It should be fixed by reset running OSPFv3 settings with CLI commands "disable ospfv3/enable ospfv3", if not, try restart the OSPFv3 process with CLI command "restart process ospfv3", or reboot the system. If the event still occurs after reboot, contact technical support with the following information: "show tech" command output."

Severity

Error

Message Text

VR %vrId%: Failed to send %object% to protocol thread.

Message Parameters

| Name | Type |
|--------|--------|
| vrId | VRID |
| object | String |

OSPFv3.AllocMemFail

Description

This event occurs whenever memory allocation for the specific object type failed. vrId: VR ID object: Object to be allocate

Remedy

This is internal error, try to free some memory, restart process or reboot switch might be required.

Severity

Error

Message Text

VR %vrId%: Failed to allocate memory for %object%.

Message Parameters

| Name | Type |
|--------|--------|
| vrId | VRID |
| object | String |

OSPFv3.EnblProtoRtrIdFail

Description

This event occurs whenever enable OSPFv3 protocol failed because there is neither an IPv4 interface address nor a configured router ID. vrid: VR ID

Remedy

Try to enable OSPFv3 after configure at lease one IPv4 interface address, or configure a router ID.

Severity

Error

Message Text

VR %vrid%: Failed to enable OSPFv3, there is neither an IPv4 interface address nor a configured router ID.

Message Parameters

| Name | Type |
|------|------|
| vrid | VRID |

OSPFv3.UpdtLcnsDone

Description

This event occurs whenever license information is updated. vrid: VRID level: License level

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

VR %vrid%: License updated to %level%.

Message Parameters

| Name | Type |
|-------|--------|
| vrId | VRID |
| level | String |

OSPFv3.SemWait

Description

This event occurs whenever wait for specific semaphore starts. vrId: VR ID name:
Semaphore name

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

VR %vrId%: Wait for %name% semaphore.

Message Parameters

| Name | Type |
|------|--------|
| vrId | VRID |
| name | String |

OSPFv3.SemWaitDone

Description

This event occurs whenever specific semaphore is obtained. vrId: VR ID name:
Semaphore name

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

VR %vrId%: Got %name% semaphore.

Message Parameters

| Name | Type |
|------|--------|
| vrId | VRID |
| name | String |

OSPFv3.EnterGrcflRstr

Description

This event occurs whenever graceful restart is entered. vrId: VR ID type: Graceful restart type, planned or unplanned

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

VR %vrId%: Enter %type% graceful restart.

Message Parameters

| Name | Type |
|------|--------|
| vrId | VRID |
| type | String |

OSPFv3.ExitGrcflRstrt

Description

This event occurs whenever graceful restart is exited. vrlId: VR ID type: Graceful restart type, planned or unplanned

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

VR %vrlId%: Exit %type% graceful restart.

Message Parameters

| Name | Type |
|-------|--------|
| vrlId | VRID |
| type | String |

OSPFv3.RfrshPlcyFail

Description

This event occurs whenever specific policy is no longer used because policy refresh failed. vrlId: VR ID type: policy type name: policy name

Remedy

Please check policy syntax to make sure it is valid.

Severity

Error

Message Text

VR %vrlId%: Refresh failed, stop using %type% policy %name%.

Message Parameters

| Name | Type |
|-------|--------|
| vrlId | VRID |
| type | String |
| name | String |

OSPFv3.RfrshPlcyDone

Description

This event occurs whenever specific policy is refreshed. vrlId: VR ID type: policy type name: policy name

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

VR %vrlId%: Refresh %type% policy %name%.

Message Parameters

| Name | Type |
|-------|--------|
| vrlId | VRID |
| type | String |
| name | String |

OSPFv3.BindPlcy

Description

This event occurs whenever specific policy is bind. vrlId: VR ID type: policy type name: policy name

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

VR %vrId%: Bind %type% policy %name%.

Message Parameters

| Name | Type |
|------|--------|
| vrId | VRID |
| type | String |
| name | String |

OSPFv3.MovelfToAreaFmArea

Description

This event occurs whenever an existing OSPFv3 interface is moved from one area to another area with CLI command: `configure ospf vlan <vlan-name> area <area-id>`. Since with this configuration change the interface is deleted from the old area and added to the new area, the associated adjacencies will be lost in the old area. vrId: VR ID vlan: VLAN name area_new: the new area ID area_old: the old area ID

Remedy

No action required - Informational message only.

Severity

Info

Message Text

VR %vrId%: Interface %vlan% was moved to area %area_new% from area %area_old% which caused the associated adjacencies to be lost.

Message Parameters

| Name | Type |

| vrId | VRID |
| vlan | VLAN |

| Name | Type |
|----------|------|
| area_new | IPN |
| area_old | IPN |

OSPFv3.MaxIfRtxIntvExcd

Description

The current OSPFv3 implementation supports a maximum retransmit interval of 1800. A saved configuration with a higher value was loaded. The value applied will be 1800 to stay within limits.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

VR %vrId%: Maximum retransmit interval of 1800 exceeded on interface %vlan%. Setting value to 1800.

Message Parameters

| Name | Type |
|------|------|
| vrId | VRID |
| vlan | VLAN |

OSPFv3.MaxVifRtxIntvExcd

Description

The current OSPFv3 implementation supports a maximum retransmit interval of 1800. A saved configuration with a higher value was loaded. The value applied will be 1800 to stay within limits.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

VR %vrId%: Maximum retransmit interval of 1800 exceeded on virtual interface with neighbor %nbr%, area %area%. Setting value to 1800.

Message Parameters

| Name | Type |
|------|------|
| vrId | VRID |
| nbr | IPN |
| area | IPN |

OSPFv3.MaxIfTrnstDlayExcd

Description

The current OSPFv3 implementation supports a maximum transit delay of 1800. A saved configuration with a higher value was loaded. The value applied will be 1800 to stay within limits.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

VR %vrId%: Maximum transit delay of 1800 exceeded on interface %vlan%. Setting value to 1800.

Message Parameters

| Name | Type |
|------|------|
| vrId | VRID |
| vlan | VLAN |

OSPFv3.MaxVifTrnstDlayExcd

Description

The current OSPFv3 implementation supports a maximum transit delay of 1800. A saved configuration with a higher value was loaded. The value applied will be 1800 to stay within limits.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Message Parameters

| Name | Type |
|------|------|
| vrId | VRID |
| nbr | IPN |
| area | IPN |

OSPFv3.RxPktAuthFail

Description

This event occurs when authentication fails for a packet received on an interface. Adjacency will go down on the interface. vrid: OSPFv3 instance interface: Interface index

Remedy

There was a mismatch in authentication type or key. Check authentication configuration on interface. If you wish to re-establish adjacency without authentication, then remove authentication configuration from both sides of the link, delete interface from OSPFv3 and add it back.

Severity

Warning

Message Text

%vrid%: Authentication failed for packet received on interface = %interface%.

OSPFv3.NbrMgr.InitRsrcFail

Description

OSPF NM creation failed due to lack of memory. OSPF NM failed to start.

Remedy

Retry OSPF NM initialization. Investigate the shortage of memory on this system. Make more memory available on this system.

Severity

Error

Message Text

%p1% initialization failed because of lack of memory.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.NbrMgr.InitLibRsrcFail

Description

OSPF NM creation failed because a required software library failed to initialize. This may be due to lack of memory. OSPF NM failed to start.

Remedy

Retry OSPF NM initialization. Investigate whether there was a shortage of memory on this system and, if so, make more memory available. If this does not resolve the problem, contact support with diagnostics.

Severity

Error

Message Text

%p1% initialization failed due to lack of system resource.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.NbrMgr.CreatIfRsrcFail

Description

OSPF NM interface creation failed due to lack of memory. OSPF NM interface creation failed. OSPF routing was not activated on this interface. The local routing table may not be accurate, and there may be routing problems.

Remedy

Try deactivating and reactivating the OSPF interface. Investigate the shortage of memory on this system. Make more memory available on this system.

Severity

Error

Message Text

%p1% %p2% %p3% creation failed due to lack of system resource.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.CreatNbrRsrcFail

Description

OSPF NM neighbor creation failed due to lack of memory. OSPF NM neighbor creation failed. The local OSPF router cannot exchange routing information with this neighbor. The local routing table may not be accurate, and there may be routing problems.

Remedy

If the neighbor is configured through the MIB, try deactivating and reactivating the MIB. If the neighbor is discovered, the protocol will automatically try to create the neighbor again. If this does not resolve the problem, investigate the shortage of memory on this system. Make more memory available on this system.

Severity

Error

Message Text

%p1% %p2% %p3% %p4% creation failed due to lack of system resource.

Message Parameters

OSPFv3.NbrMgr.FreeHelloOld

Description

Hello packet freed because PM has sent an updated version.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% %p3% Hello packet freed due to later one sent by PM.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.TxNoHelloPollIntvNotRch

Description

Hello packet not sent to NBMA neighbor because poll interval not reached.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% %p3% %p4% Poll interval not reached for NBMA nbr, so no Hello sent. Time since last Hello was sent to this neighbor (ms) = %p5%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

| Name | Type |
|------|--------|
| p4 | String |
| p5 | sInt32 |

OSPFv3.NbrMgr.XferTxPktToPMFail

Description

Buffer transfer failed on incoming OSPF packet for PM.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% Failed to transfer OSPF packet to NM-to-PM incoming packet pool. Physical interface index = %p2% Multicast group = %p3% Packet type = %p4% Source address = %p5%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | xInt32 |
| p3 | uInt8 |
| p4 | sInt32 |
| p5 | VarFmtByteArray |

OSPFv3.NbrMgr.PktBufNotRtrnNbrCBFree

Description

Packet buffer not returned to PM because the related neighbor CB has been freed.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% Packet buffer not returned to PM as related nbr CB has been freed. Packet type =
%p2% Source address = %p3% Handle of the now-freed neighbor control block = %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | sInt32 |
| p3 | VarFmtByteArray |
| p4 | uInt32 |

OSPFv3.NbrMgr.TxHello

Description

NM has sent a Hello packet.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% NM has sent a Hello packet. Sending interface index = %p2%. Router ID of target neighbor (null string if sent per interface) = %p3%. Destination IP address = %p4%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |
| p4 | String |

OSPFv3.NbrMgr.RxHello

Description

NM has received a Hello packet.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% NM has received a Hello packet. Receiving interface index = %p2%. Router ID of sending neighbor = %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.IgnSockErr

Description

NM received a socket error. Possible transient problems, such as - loss of contact with a neighbor - a delay in updating the Link State database.

Remedy

Check the network connection is correctly configured and working.

Severity

Debug-Verbose

Message Text

%p1% NM ignored a reported socket error with code %p2%. Diagnostic information for support: Application socket handle = %p3% Stub socket handle = %p4%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | sInt32 |
| p3 | uInt32 |
| p4 | uInt32 |

OSPFv3.NbrMgr.JoinStatusChg

Description

OSPF NM join status changed.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% join status changed. NMI join is %p2% SCK join is %p3% BFD join is %p4%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |
| p4 | String |

OSPFv3.NbrMgr.EntityStatusChg

Description

OSPF NM Entity status has changed.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% was %p2% and is now %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.DropPktFmOldIPSockStub

Description

NM dropped a packet which appeared to come from an old instance of the IP sockets stub. Possible transient problems, such as - loss of contact with a neighbor - a delay in updating the Link State database.

Remedy

If many of these logs are seen, contact support with details of the problem.

Severity

Warning

Message Text

%p1% NM dropped packet from old IP sockets instance. Diagnostic information for support: Receiver handle = %p2% Sender's main PID = %p3%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |
| p3 | uInt32 |

OSPFv3.NbrMgr.DropPktNoMatchIf

Description

An OSPFv3 packet with a link local or multicast destination address was received. It was attempted to match it to an interface (rather than a virtual interface or sham link). No interface could be found with a matching interface index and instance ID. The packet was dropped.

Remedy

If the problem persists and this log is unexpected check configuration. In particular check that the instance ID is correct on the specified interface.

Severity

Info

Message Text

%p1%%p3% dropped a link local or multicast packet on interface with instance ID %p4% as no i/f was configured with that i/f index and instance. This log may be expected if multiple OSPF instances have been configured on this i/f. Diagnostic information for support: Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | HexPktByteArray |
| p3 | String |
| p4 | uInt8 |

OSPFv3.NbrMgr.PMCommFail

Description

OSPF NM communications with PM failed. OSPF NM cannot communicate with PM. NM handles this condition by deactivating. OSPF failed to initialize or OSPF failed. This condition is self-clearing. NM recovers when NM is able to communicate with PM again.

Remedy

Wait a few seconds and see whether OSPF recovers. Note that this condition can occur in normal operation if NM is activated before PM or deactivated after PM. If OSPF does not recover from the failure, then gather diagnostics and contact support.

Severity

Info

Message Text

%p1% communications with PM failed.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.NbrMgr.IgnPktIncrctProto

Description

Received packet's protocol field was incorrect. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate. reach some recipients.

Remedy

Contact support with details of the problem.

Severity

Warning

Message Text

%p1% Received packet's protocol field %p2% was incorrect. Diagnostic information for support: Expected protocol ID = %p3% Packet data = %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | xInt8 |
| p3 | xInt8 |
| p4 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktIncrctVer

Description

Received packet's OSPF version number was incorrect. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Investigate the configuration of the sending device. If no problem is apparent, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Received packet's OSPF version number %p2% was incorrect. Diagnostic information for support: Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | xInt8 |
| p3 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktIncrctSrcIP

Description

Received packet's source IP address does not match address of receiving interface. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Investigate the configuration of the sending device or the network. If no problem is apparent, contact support with details of the problem.

Severity

Warning

Message Text

| p2 | VarFmtByteArray |
| p3 | uInt16 |
| p4 | sInt32 |

OSPFv3.NbrMgr.SockStubCommFail

Description

OSPF NM communications with the sockets stub failed. OSPF NM cannot communicate with the sockets stub. NM handles this condition by deactivating. OSPF failed to initialize or OSPF failed. This condition is self-clearing. NM recovers when when NM is able to communicate with the sockets stub again.

Remedy

Wait a few seconds and see whether OSPF recovers. Investigate why NM cannot communicate with the sockets stub. Check that the sockets stub is present and active. If OSPF does not recover from the failure, then gather diagnostics and contact support.

Severity

Error

Message Text

%p1% communications with the sockets stub failed.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.NbrMgr.DtectNMSwErr

Description

OSPF NM detected a software error in NM logic. Undefined. This condition is unexpected.

Remedy

Gather diagnostics and contact support.

Severity

Error

Message Text

%p1% detected a software error in NM logic. Diagnostic information for support: FSM action = %p2% FSM input = %p3% FSM state = %p4%

Message Parameters

| Name | Type |

| p1 | String |
| p2 | uInt8 |
| p3 | String |
| p4 | String |

OSPFv3.NbrMgr.IgnPktInvSrcIP

Description

Source address of an incoming packet was invalid. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Investigate the configuration of the sending device (particularly that of its interfaces) or the network. If no problem is apparent, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Source address of an incoming packet was zero. Source address = %p2% Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | VarFmtByteArray |
| p3 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktCalcAuthRsrcFail

Description

Resource failure meant that authentication fields could not be calculated. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Give more memory to OSPF.

Severity

Warning

Message Text

%p1% Authentication fields could not be calculated. Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktUnexpAuthType

Description

Packet received with unexpected authentication type. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Investigate the configuration of the sending device. If no problem is apparent, contact support with details of the problem.

Severity

Info

Message Text

%p1% Packet received with unexpected authentication type %p2%. Expected authentication type = %p3%. Packet data = %p4%

| p1 | String |
| p2 | HexByteArray |
| p3 | HexByteArray |
| p4 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktIncrctCksum

Description

A packet has been received with an incorrect OSPF checksum. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Contact support for advice.

Severity

Warning

Message Text

%p1% Packet received with incorrect OSPF checksum %p2%. Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | xInt16 |
| p3 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktIncrctSeq

Description

Counterfeit packet received - cryptographic sequence number incorrect. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Investigate the configuration of the sending device. If no problem is apparent, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Counterfeit packet received. Received cryptographic sequence number = %p2%.
Previous cryptographic sequence number = %p3%. Packet data = %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | uInt32 |
| p3 | uInt32 |
| p4 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktIncrctDigest

Description

Packet received with incorrect MD5 or HMAC-SHA message digest. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Investigate the configuration of the sending device. If no problem is apparent, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Packet received with incorrect MD5 or HMAC-SHA message digest %p2% MD5 or HMAC-SHA message digest should be %p3% Packet data = %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | HexByteArray |
| p3 | HexByteArray |
| p4 | HexPktByteArray |

OSPFv3.NbrMgr.IgnHelloSmall

Description

Hello packet received was too small. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router.

Remedy

Investigate the behavior of the sending device. If no problem is apparent, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Hello packet received was too small. Minimum packet length = %p2% Received packet length = %p3% Packet data = %p4%

Message Parameters

| p1 | String |
| p2 | xInt8 |
| p3 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktSmall

Description

Packet received was too small. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Investigate the behavior of the sending device. If no problem is apparent, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Packet received was too small. Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | HexPktByteArray |

OSPFv3.NbrMgr.SetSockOptIPMcastFail

Description

The IP_MULTICAST_LOOP socket option could not be set. Socket processing may not be as efficient as OSPF will receive copies of the multicast packets it sent. However, OSPF continues to function normally as the extra packets will simply be silently discarded.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% The IP_MULTICAST_LOOP socket option could not be set.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.NbrMgr.CloseSockFail

Description

A socket close attempt failed. There may be no immediate effect, but it is possible that some resources have not been freed, which may result in a failure to open a socket at some later time.

Remedy

Examine other diagnostics (including those of the IP stack) for a reason for the failure. If this does not resolve the problem, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Failed to close socket. Error code = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | sInt32 |

OSPFv3.NbrMgr.DropHelloDiffHelloIntv

Description

Invalid Hello packet received - mismatched hello intervals Packet dropped. This leads to adjacency with originating router not being formed.

Remedy

Check configuration of routers. If this does not solve problem, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Hello packet with mismatched hello interval received from router %p2%. My Hello Interval = %p3% Neighboring Hello Interval = %p4%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |
| p3 | sInt32 |
| p4 | sInt16 |

OSPFv3.NbrMgr.DropHelloDiffDeadIntv

Description

Invalid Hello packet received - mismatched dead intervals Packet dropped. This leads to adjacency with originating router not being formed.

Remedy

Check configuration of routers. If this does not solve problem, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Hello packet with mismatched dead interval received from router %p2%. My Dead Interval = %p3% Neighboring Dead Interval = %p4%

|------|--------------|
| p1 | String |
| p2 | DecByteArray |
| p3 | sInt32 |
| p4 | sInt32 |

OSPFv3.NbrMgr.DropHelloDiffNetMsk

Description

Invalid Hello packet received - mismatched network masks Packet dropped. This leads to adjacency with originating router not being formed.

Remedy

Check configuration of routers. If this does not solve problem, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Hello packet with mismatched network mask received from router %p2%. My Network Mask = %p3% Neighboring Network Mask = %p4%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |
| p3 | DecByteArray |
| p4 | DecByteArray |

OSPFv3.NbrMgr.DropHelloDiffAreaType

Description

Invalid Hello packet received - Disagreement on area type. Packet dropped. This leads to adjacency with originating router not being formed.

Remedy

Check configuration of routers. If this does not solve problem, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Hello packet received from router %p2% which disagrees on area type. My area type is Standard(%p3%) Stub(%p4%) NSSA (%p5%) Neighboring Routers Area Type is Standard(%p6%) Stub(%p7%) NSSA (%p8%)

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |
| p3 | sInt16 |
| p4 | sInt16 |
| p5 | sInt16 |
| p6 | sInt16 |
| p7 | sInt16 |
| p8 | sInt16 |

OSPFv3.NbrMgr.IgnPktIncrctAuthLen

Description

Packet received with incorrect MD5 or HMAC-SHA authentication data length. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Investigate the configuration of the sending device. If no problem is apparent, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Packet received with invalid MD5 or HMAC-SHA authentication data length.
Diagnostic information for support: MD5 or HMAC-SHA authentication data length
should be %p2% Packet authentication data length = %p3%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | ulnt8 |
| p3 | ulnt8 |

OSPFv3.NbrMgr.AuthPktFailInvKey

Description

Failure to get an authentication key. Packet cannot be authenticated. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Define an authentication key, or investigate why the defined authentication key has is invalid. If this does not resolve the problem, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Packet cannot be authenticated. Diagnostic information for support: Packet data
= %p2% Error code (from A0AUTH_GET_KEY) = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | HexPktByteArray |
| p3 | ulnt8 |

OSPFv3.NbrMgr.DropPktRsvdRtrId

Description

Received packet with router ID 0.0.0.0. Packet dropped.

Remedy

Check configuration, particularly ensuring that there are no other routers with router ID 0.0.0.0. If this does not solve problem, contact support with details of the problem.

Severity

Warning

Message Text

%p1% Received packet with reserved router ID %p2% Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | DecByteArray |
| p3 | HexPktByteArray |

OSPFv3.NbrMgr.DtectIntInconsist

Description

The OSPF NM has detected an internal inconsistency. The Neighbor Manager instance terminates.

Remedy

This represents an internal logic error. Contact OSPF customer support with details of the problem.

Severity

Error

Message Text

%p1% has detected an internal inconsistency. Inconsistency code = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | xInt32 |

OSPFv3.NbrMgr.AllocNewNbrSigFail

Description

Failed to allocate a buffer for a QONM_RCVD_HELLO_FRM_NEW_NBR signal. NM relies on the OSPF underlying protocols to retry

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% Failed to allocate buffer for a New Neighbor signal. Neighbor's Router ID = %p3%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.ActvFail

Description

OSPF has failed to activate. OSPF needs to be restarted.

Remedy

Check diagnostics to try to determine the cause of the failure. In particular, check if there is sufficient memory available. If this does not resolve the problem, contact support with details of the problem.

Severity

Error

Message Text

%p1% Failed to activate. Router ID = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |

OSPFv3.NbrMgr.IgnPktUnexpRtrId

Description

OSPF has received a packet on a virtual or P2P link whose router ID does not match that configured. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Check the configuration of the network. There should be only one router at the other end of a P2P or virtual interface.

Severity

Warning

Message Text

%p1% %p2% %p3% %p4% Unexpected router id (%p5%) received from neighbor.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |
| p4 | String |
| p5 | String |

OSPFv3.NbrMgr.IgnPktVIfNoNbr

Description

OSPF has received a packet and matched it to a virtual interface but no neighbor CB was found. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

This log is expected while a virtual interface is being set up, because the virtual interface and the neighbor cannot be configured at exactly the same time. If this log occurs at at any other time, check PM configuration. If that does not solve it, contact support with details of the problem.

Severity

Debug-Summary

Message Text

%p1% dropped a packet received on virtual interface %p2% as no neighbor was configured.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.NbrMgr.IgnPktUnsuprtHdrLen

Description

OSPF has received a packet whose IP header is not 20 bytes long. This could be because there are options specified in the IP header, these are not supported by OSPF. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

Reconfigure the sending router with respect to building the IP header, e.g. IP header options.

Severity

Info

Message Text

%p1% Packet's IP header is not 20 bytes long. IP header length: %p2% Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | uInt8 |
| p3 | HexPktByteArray |

OSPFv3.NbrMgr.IgnPktUnkVlIf

Description

Packet received on unknown virtual interface. This is probably a transient problem when network interfaces are deactivated while a virtual interface is active. This packet was ignored. OSPF may show problems establishing or maintaining an adjacency with a neighboring router, or the Link State database may become inaccurate.

Remedy

No action is required unless the problem persists, in which case check the configuration of routers, especially for network interfaces being deactivated.

Severity

Warning

Message Text

%p1% dropped a packet with %p4% received on an unknown virtual interface. Packet type = %p2% Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | xInt8 |
| p3 | HexPktByteArray |
| p4 | String |

OSPFv3.NbrMgr.IgnPktSuprsIf

Description

OSPF packet received on suppressed interface was ignored. This packet was ignored. OSPF is unable to form any adjacencies using this interface.

Remedy

To start accepting packets on this interface, deactivate any other interfaces to this network.

Severity

Debug-Summary

Message Text

%p1% OSPF packet received on suppressed interface was ignored. Receiving interface = %p2% IP addr of receiving interface = %p3% Instance ID = %p4% Packet type = %p5% Packet data = %p6%

Message Parameters

|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |
| p4 | String |
| p5 | String |

OSPFv3.NbrMgr.IgnUnexpSigFmPM

Description

OSPF NM has received an unexpected signal from OSPF PM. The signal was ignored.

Remedy

This error may be logged during normal operation if OSPF NM has recently been deactivated.

Severity

Debug-Summary

Message Text

%p1% Ignored NMI signal %p2% because NMI join is in state %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | xInt32 |
| p3 | String |

OSPFv3.NbrMgr.RepEntityMIBToBkupFail

Description

Replication of the top-level NM entity MIB to the backup has not occurred because the primary is yet to be replicated. This will only happen in race conditions where the backup entity is ready for replication before the primary has received the initial MIB configuration. Catch-up replication is not possible for top-level entity MIBs.

Remedy

No action needs to be taken.

Severity

Debug-Summary

Message Text

%p1% Could not replicate entity MIB to backup - primary not yet replicated.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.NbrMgr.BFDStubCommFail

Description

OSPF NM communications with the BFD stub failed. OSPF NM cannot communicate with the BFD stub. NM handles this condition by deactivating. OSPF failed to initialize. This condition is self-clearing. NM recovers when when NM is able to communicate with the BFD stub again.

Remedy

Wait a few seconds and see whether OSPF recovers. Investigate why NM cannot communicate with the BFD stub. Check that the BFD stub is present and active. If a BFD stub is not expected, confirm that a join to one is not configured in the OSPF NM Entity MIB. If OSPF does not recover from the failure, then gather diagnostics and contact support.

Severity

Error

Message Text

%p1% communications with the BFD stub failed.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.NbrMgr.RecvBFDIndctSessUp

Description

A SESSION UP indication was received from the BFD stub.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% A SESSION UP indication was received from the BFD stub. Local Interface index = %p2% Neighbor IP Address = %p3%

Message Parameters

| Name | Type |

OSPFv3.NbrMgr.DropPktIfSLinkNotMatch

Description

A packet was received on a unicast socket. No network interface could be found to match the packet's destination address. No sham link could be found to match the area ID, source address and destination address of the packet. The packet has been dropped.

Remedy

If this log is unexpected then check configuration. Check that the interface or sham link was configured for this NM entity.

Severity

Info

Message Text

%p1% dropped a packet from %p3% to %p2% in area %p4%. No i/f matched the subnet of the destination address and no sham link matched both addresses and area. Diagnostic information for support: Packet data = %p5%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | String |
| p4 | DecByteArray |
| p5 | HexPktByteArray |

OSPFv3.NbrMgr.DropPktVifSLinkNotMatch

Description

A packet was received with a global unicast destination address. No network interface has been configured on this NM to match the interface index this packet was received on, so there was no matching virtual interface. No sham link matched the area ID, destination address, source address and instance ID of the packet. The packet has been dropped.

Remedy

If this log is unexpected then check configuration. Check that the interface or sham link was configured for this NM entity.

Severity

Info

Message Text

%p1% dropped a packet from %p4% to %p3% in area %p5% with instance ID %p6%. No OSPF i/f matched the receiving i/f index %p2% and therefore no virtual i/f matched. No sham link matched both addresses, area and instance. This may be expected if multiple OSPF instances are configured with this interface. Diagnostic information for support: Packet data = %p7%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | uInt32 |
| p3 | String |
| p4 | String |
| p5 | DecByteArray |
| p6 | uInt8 |
| p7 | HexPktByteArray |

OSPFv3.NbrMgr.SetSockOptTClassFail

Description

The IPV6_TCLASS socket option could not be set. Socket processing will continue but transmitted IPv6 packets will have Traffic Class 0, which may make it difficult for Network Administrators to manage traffic flow in the IPv6 network.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% The IPV6_TCLASS socket option could not be set.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.NbrMgr.SuprsIfCfgErrTrap

Description

OSPF suppressed an interface config error MIB trap.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% %p2%: suppressed trap: if config error: %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.SuprsVIfCfgErrTrap

Description

OSPF suppressed a virtual interface config error MIB trap.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% %p2%: suppressed trap: virt if config error: %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.SuprsIfAuthFailTrap

Description

OSPF suppressed an interface authentication failure MIB trap.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% %p2%: suppressed trap: if auth failure: %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.SuprsVlIfAuthFailTrap

Description

OSPF suppressed a virtual interface authentication failure MIB trap.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% %p2%: suppressed trap: virt if auth failure: %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.NbrMgr.TxMsg

Description

NM has sent an OSPF message.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

%p1% Sent OSPF message type %p2% to %p4% on interface %p3%. OSPF message = %p5%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | uInt8 |
| p3 | String |
| p4 | String |
| p5 | HexPktByteArray |

OSPFv3.NbrMgr.RxMsg

Description

NM has received an OSPF message.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

%p1% Received OSPF message type %p2% from %p3%. OSPF message = %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | uint8 |
| p3 | String |
| p4 | HexPktByteArray |

OSPFv3.NbrMgr.PostNMICtrlBufIfDead

Description

Buffer post for NMI control buffer pool for a QONM_ACTIVE_INTERFACE_DEAD signal.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

%p1% %p2% %p3% Buffer post made for NMI control buffer pool: active i/f dead

Message Parameters

OSPFv3.ProtoMgr.InitRsrcFail

Description

Resource failure during creation of the OSPF Protocol Manager FTI. Creation fails

Remedy

Gather diagnostics and investigate cause of failure.

Severity

Error

Message Text

%p1% Initialization failed because of lack of system resources.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.ProtoMgr.InitOK

Description

The OSPF Protocol Manager has initialized successfully. Creation successful.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% Protocol Manager has initialized successfully. Entity index = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |
| p2 | String |

OSPFv3.ProtoMgr.Dstry

Description

The OSPF Protocol Manager has been destroyed. FTI destroyed.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% Protocol Manager has been destroyed. Entity index = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |
| p2 | String |

OSPFv3.ProtoMgr.InitHAFLibFail

Description

The OSPF Protocol Manager has failed to initialize the HAF library. Protocol Manager initialization will fail.

Remedy

Gather diagnostics and investigate cause of failure.

Severity

Debug-Summary

Message Text

%p1% Failed to initialize the HAF library.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.ProtoMgr.InitMIBLibFail

Description

The OSPF Protocol Manager has failed to initialize the MIB product support library. Protocol Manager initialization will fail.

Remedy

Gather diagnostics and investigate cause of failure.

Severity

Debug-Summary

Message Text

The OSPF Protocol Manager has failed to initialize the MIB product support library.

OSPFv3.ProtoMgr.InitMIBTblFail

Description

The OSPF Protocol Manager has failed to initialize one of its MIB tables. Protocol Manager initialization will fail.

Remedy

Gather diagnostics and investigate cause of failure.

Severity

Debug-Summary

Message Text

The OSPF Protocol Manager has failed to initialize one of its MIB tables.

OSPFv3.ProtoMgr.DtectIntCflct

Description

OSPF has detected an internal inconsistency. The primary OSPF instance will abend.

Remedy

Contact support personnel.

Severity

Error

Message Text

%p1% has encountered a problem and must terminate. Please contact support
Diagnostic information for support: Inconsistency code = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | xInt8 |

OSPFv3.ProtoMgr.JoinIntCompRsrcFail

Description

An attempt to join internal components together has failed due to resource shortages. OSPF may not be able to send or receive signals.

Remedy

Free some system resources and try again. If the problem persists then please contact support.

Severity

Error

Message Text

%p1% Internal component initialization has failed because of resource shortage.
Diagnostic information for support: System Manager handle = %p2% Master application
index = %p3%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |
| p3 | xInt32 |

OSPFv3.ProtoMgr.AllocAreaCBFail

Description

It was not possible to preallocate new memory for an area CB. A MIB request for an inactive interface to join a different area has failed.

Remedy

Free some system resources and try again.

Severity

Error

Message Text

A MIB request for an inactive interface to join a new area has failed due to a lack of memory. Size of memory requested %p1% Old area ID %p2% Requested area ID %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | sInt |
| p2 | DecByteArray |
| p3 | DecByteArray |

OSPFv3.ProtoMgr.SlaveJoinMstrFailOvr

Description

A join to an instance of PM is failing over. PM is slave on this join. There will be a pause in OSPF processing until the join is reconnected to a backup instance of the master on this join.

Remedy

Investigate why the original instance failed over. If the problem persists then please contact support.

Severity

Warning

Message Text

%p1% A fault tolerance procedure has been initiated. Diagnostic information for support:
Master index = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |

OSPFv3.ProtoMgr.SlaveJoinMstrFail

Description

A join to an instance of PM has failed. PM is slave on this join. There will be a pause in OSPF processing until the join is restarted to a new instance of the master on this join. Adjacencies or traffic engineering route calculation updates may be lost as a result.

Remedy

Investigate why the original instance failed. If the problem persists then please contact support.

Severity

Warning

Message Text

%p1% A component has failed. Diagnostic information for support: Master index = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |

OSPFv3.ProtoMgr.SlaveJoinDeactvOK

Description

A join to PM has been deactivated normally. PM is slave on this join. No more data can flow to this instance of PM.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% A component has been disconnected. Diagnostic information for support: Master index = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |

OSPFv3.ProtoMgr.MstrJoinSlaveFailOvr

Description

A master join is failing over. There will be a pause in send/receive processing until the join is reconnected to a backup instance of the join partner.

Remedy

Investigate why the original join partner failed over.

Severity

Warning

Message Text

A master join is failing over. Join interface type = %p1% Join interface ID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | xInt32 |

OSPFv3.ProtoMgr.MstrJoinSlaveFail

Description

A master join has failed. There will be a pause in send/receive processing until the join is restarted to a new slave instance.

Remedy

Investigate why the original join partner failed.

Severity

Warning

Message Text

A master join has failed. Join interface type = %p1% Join interface ID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | xInt32 |

OSPFv3.ProtoMgr.MstrJoinSlaveUnavail

Description

There is no slave entity available for the given master join. This can occur during normal operation depending on the order in which components are started. No data will flow over the given interface until the join partner becomes available.

Remedy

If the problem persists then investigate why there is no join partner available.

Severity

Info

Message Text

There is no slave entity available for the given master join. Join interface type = %p1%
Join interface ID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | xInt32 |

OSPFv3.ProtoMgr.MstrJoinSlaveCflct

Description

There is no suitable slave entity available for the given master join. No data will flow over the given interface.

Remedy

Fix system configuration so that the join master requests a suitable slave entity.

Severity

Error

Message Text

There is no suitable slave entity available for the given master join. Join interface type = %p1% Join interface ID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | xInt32 |

OSPFv3.ProtoMgr.MstrJoinDeactvOK

Description

A master join has been deactivated normally. No more data can flow over the given interface.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

A master join has been deactivated normally. Join interface type = %p1% Join interface ID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | xInt32 |

OSPFv3.ProtoMgr.ExitHelpNbrBFDDown

Description

The BFD session to a restarting neighbor has gone down while we are in helper mode for this neighbor. OSPF has exited helper mode for the neighbor.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% exited helper mode with %p2% because of BFD session failure.

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.AllocAggrMIBFail

Description

There was a failure to allocate the necessary memory to create an aggregate MIB row. The area aggregate will not be activated.

Remedy

Make more memory available to the system.

Severity

Error

Message Text

Failure to allocate memory for aggregate MIB row. The area aggregate will not be activated. Area ID = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |

OSPFv3.ProtoMgr.CfgHostNoArea

Description

An attempt was made to configure a host for a non-existent area. The host will not be activated.

Remedy

Either create the area and try again, or configure the correct area.

Severity

Error

Message Text

The host will not be activated because the defined area does not exist. Defined area ID = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |

OSPFv3.ProtoMgr.CfgAreaAggrNoArea

Description

An attempt was made to configure an area aggregate for a non-existent area. The area aggregate will not be activated.

Remedy

Either create the area and try again, or configure the correct area.

Severity

Error

Message Text

The area aggregate will not be activated because the area does not exist. Area ID = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |

OSPFv3.ProtoMgr.IfSLRGExcdMaxMIBRprt

Description

An interface is configured with too many SRLGs to be able to report them all in the MIB signal. All the SRLGs cannot be reported over the MIB, but they will continue to be used in Traffic Engineering calculations. The MIB signal will contain as many SRLGs as possible.

Remedy

Either increase the number of SRLGs the MIB can report, or reduce the number of SRLGs an interface can hold.

Severity

Info

Message Text

All the SRLGs for %p3% could not be reported by the MIB. Number of SRLGs on this interface %p1% Maximum number that can be reported %p2% Interfaces IP address %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | sInt32 |
| p2 | sInt32 |
| p3 | String |
| p4 | VarFmtByteArray |

OSPFv3.ProtoMgr.MstrJoinRegOK

Description

A master join has been successfully registered.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

A master join has been successfully registered. Join interface type = %p1% Join interface ID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | xInt32 |

OSPFv3.ProtoMgr.MstrJoinUnregOK

Description

A master join has been unregistered.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

A master join has been unregistered. Join interface type = %p1% Join interface ID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | xInt32 |

OSPFv3.ProtoMgr.MstrJoinRegFail

Description

PM failed to register a master join. There will be a pause in send/receive processing until the join is restarted to a new slave instance.

Remedy

Investigate why the original join registration failed.

Severity

Warning

Message Text

PM has failed to register a master join. Join interface type = %p1% Join interface ID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | xInt32 |

OSPFv3.ProtoMgr.ParsePreStrtRtrLSAFail

Description

The pre-start router LSA received from a neighbor as we attempt to restart hitlessly could not be parsed. Hitless restart will not perform as expected. It is likely that hitless restart will extend until the grace period expires.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Pre-start router LSA could not be parsed.

OSPFv3.ProtoMgr.RecvGrcLSAFmUnkNbr

Description

Could not identify the neighbor that originated a received grace LSA. This router will not act as helper for a neighbor undergoing hitless restart, and so that neighbor's hitless restart will exit prematurely.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Could not identify neighbor that originated grace LSA. Advertising Router = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |

OSPFv3.ProtoMgr.HelpNotEnter

Description

Decided not to enter helper mode for a neighbor attempting hitless restart. The neighbor will not succeed in a hitless restart, and data will be forwarded round the restarting router until it reestablishes all adjacencies.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p7% %p9% will not help neighbor %p8% attempt hitless restart Diagnostic information for support: Not adjacent %p1% Invalid restart reason %p2% Invalid grace period %p3%

Database change since restart %p4% Expired grace period %p5% User-defined policy reason %p6%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | sInt |
| p2 | sInt |
| p3 | sInt |
| p4 | sInt |
| p5 | sInt |
| p6 | sInt |
| p7 | String |
| p8 | DecByteArray |
| p9 | String |

OSPFv3.ProtoMgr.ParseGrcLSAFail

Description

Failed to parse a grace LSA. If the LSA is self originated, the grace period requested from neighbors prior to restart may not be discovered, and the default used instead. Otherwise, we may not act as a helper neighbor for another restarting router.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Failed to parse an LSA. The fields below supply more information on this problem. Advertising router %p1% Incorrect length %p2% Incorrect value %p3% Mandatory TLV not present %p4% Repeated type %p5%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | sInt |
| p3 | sInt |
| p4 | sInt |
| p5 | sInt |

OSPFv3.ProtoMgr.RecvGrcLSAUnkTLV

Description

Received a grace LSA containing an unknown TLV.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Received a grace LSA with an unknown TLV. TLV type %p1% TLV length %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt16 |
| p2 | xInt16 |

OSPFv3.ProtoMgr.ReestbAdjacAfterRstrtOK

Description

All adjacencies we had prior to hitless restart have been reestablished. OSPF has exited from hitless restart.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF has exited hitless restart as all adjacencies are reestablished. Our router ID = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |

OSPFv3.ProtoMgr.ExitRstrtGrcTimerExp

Description

The hitless restart grace period has expired. OSPF has exited from hitless restart.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF has exited hitless restart because grace period has expired. Our router ID = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |

OSPFv3.ProtoMgr.ExitHelpRstrtLSAFlood

Description

An LSA is being flooded which is not a simple refresh while we are in helper mode for a restarting neighbor. OSPF has exited helper mode for a neighbor.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF has exited helper mode because of attempted flood of non-refresh LSA to neighbor. Our router ID = %p1% Neighbor's router ID = %p2% LSA Header = %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |
| p3 | HexByteArray |

OSPFv3.ProtoMgr.ExitHelpGrcTimerExp

Description

The grace period for a restarting neighbor has expired. OSPF has exited helper mode for a neighbor.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF has exited helper mode for a neighbor whose grace period has expired. Our router ID = %p1% Neighbor's router ID = %p2%

Message Parameters

|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.ExitHelpGrcLSAFlush

Description

The grace LSA for a restarting neighbor has been flushed from our database. OSPF has exited helper mode for a neighbor.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF has exited helper mode as the nbr's grace LSA has been flushed. Our router ID = %p1% Neighbor's router ID = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.DefRepCBFail

Description

Defining a replication control block has failed, probably due to a resource shortage. The Protocol Manager entity cannot be created.

Remedy

Investigate the cause of the failure.

Severity

Error

Message Text

%p2% failed to define replication control block type %p1%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |
| p2 | String |

OSPFv3.ProtoMgr.RecvUnexpRepOperHAFLib

Description

An unexpected replication operation has been received from the HAF library. The Protocol Manager instance will terminate.

Remedy

This represents an internal logic error. Contact OSPF customer support with details of the problem.

Severity

Error

Message Text

An unexpected replication operation has been received from the HAF library. This is a critical failure and the Protocol Manager will be destroyed. Replication operation request = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |

OSPFv3.ProtoMgr.RecvUnexpRtrnHAFLib

Description

An unexpected return code has been received from the HAF library. The Protocol Manager instance will terminate.

Remedy

This represents an internal logic error. Contact OSPF customer support with details of the problem.

Severity

Error

Message Text

An unexpected return code has been received from the HAF library. This is a critical failure and the Protocol Manager will be destroyed. Return code = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |

OSPFv3.ProtoMgr.AllocRepHndlFail

Description

A replication handle could not be created for a control block. The Control Block will be destroyed. If this operation was triggered by a MIB command then the MIB signal will be returned with a failure code. This may cause some configuration information to have to be resent. Alternatively if this operation was caused by an OSPF protocol exchange then the packet that triggered it will be dropped.

Remedy

Investigate the source of the failure. It is probably due to a resource shortage.

Severity

Warning

Message Text

%p2% failed to allocate a replication handle for control block type %p1%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |
| p2 | String |

OSPFv3.ProtoMgr.AllocRepCBFail

Description

Failed to allocate a replicated control block. The replication operation will be failed and the MIB command that attempted to create it will be returned with a failure code. This may cause some configuration information to have to be resent.

Remedy

Investigate the source of the failure. It is probably due to a resource shortage on the backup protocol manager.

Severity

Warning

Message Text

%p3% failed to allocate control block type %p1% identifier %p2%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |
| p2 | xInt32 |
| p3 | String |

OSPFv3.ProtoMgr.CreatAreaAggrNotMIBCfg

Description

An attempt was made to configure an area aggregate for an area that has not been MIB configured. An area must be MIB configured before an area aggregate can be

configured. Implicitly created areas (such as those created by activating an interface in the area) are not suitable to hold area aggregates, they have to be explicitly configured first. The area aggregate will not be created.

Remedy

Send in a request to configure the area via the MIB, and then repeat the command to create the area aggregate.

Severity

Error

Message Text

The area aggregate will not be created because the associated area has not been MIB configured. Areas must be explicitly MIB configured (rather than implicitly created by an interface activation) before area aggregates can be assigned to them. The solution is to configure the area by sending in a MIB request, which will replicate this area to the backup. Then resend the area aggregate MIB request. Area ID = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |

OSPFv3.ProtoMgr.ActvNonP2PIfNoIPAddr

Description

Attempted to activate an interface which requires an IP address but for which one has not been defined. The MIB activation request is failed.

Remedy

Correct the configuration and reissue the activation request.

Severity

Error

Message Text

Non point-to-point interfaces must have an IP-address If index = %p1% Interface type = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | sInt32 |
| p2 | sInt32 |

OSPFv3.ProtoMgr.ActvProtoOK

Description

OSPF successfully activated. All necessary pre-configuration has been done. The OSPF protocol should now be running over any enabled interfaces.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% activated successfully Router ID %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.ActvProtoFail

Description

OSPF entity has failed to activate. OSPF will need to be restarted.

Remedy

Check diagnostics to try to determine the cause of the failure. If problem persists contact support.

Severity

Error

Message Text

%p1% has failed to activate. Router ID %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.DeactivProtoOK

Description

OSPF deactivated. OSPF has been deactivated - no further protocol operations will occur until it is reactivated.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% deactivated Router ID %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.AllocRtrLSAFail

Description

Memory shortage The new or changed router LSA will not be advertised. Routes may temporarily not be available to the network.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to build a router LSA. Size of requested memory = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |

OSPFv3.ProtoMgr.AllocNetLSAFail

Description

Memory shortage The new or changed network LSA will not be advertised. Routes may temporarily not be available to the network.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to build a network LSA. Size of requested memory = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |

OSPFv3.ProtoMgr.DtectDBMemCrupt

Description

Memory corruption. Memory within the box has been corrupted.

Remedy

Reboot the system and contact support. Turn memory verification on if possible to catch the first occurrence of memory being overwritten.

Severity

Error

Message Text

Memory corruption discovered when checksumming LSAs in the database.

OSPFv3.ProtoMgr.SyncFSMRecvInvln

Description

The synchronizer FSM has received a bad input. Updates sent to QCLS users (LFA, CSPF) and RTM components may fail.

Remedy

Contact support, passing details of this problem log.

Severity

Error

Message Text

An error has occurred with the synchronizer FSM. Action: %p1% Input: %p2% Old state: %p3%

Message Parameters

| Name | Type |
|------|-------|
| p1 | sInt8 |
| p2 | sInt8 |
| p3 | sInt8 |

OSPFv3.ProtoMgr.DBFSMRecvInvIn

Description

The database FSM has received a bad input. LSAs may not be updated and stored correctly in the database, resulting in routes not being calculated.

Remedy

Contact support, passing details of this problem log.

Severity

Error

Message Text

An error has occurred with the database FSM. Action: %p1% Input: %p2% Old state: %p3%

Message Parameters

| Name | Type |
|------|-------|
| p1 | sInt8 |
| p2 | sInt8 |
| p3 | sInt8 |

OSPFv3.ProtoMgr.AllocSummLSAFail

Description

Memory shortage The new or changed summary LSA will not be advertised. Routes may temporarily not be available to the network.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to build a summary LSA.

OSPFv3.ProtoMgr.AllocReschedBufFail

Description

Memory shortage, causing failure to allocate a necessary buffer at start-up. OSPF will not start.

Remedy

Make more memory available to the system.

Severity

Error

Message Text

Failed to allocate memory at start-up for NBB_RESCHEDULE buffer.

OSPFv3.ProtoMgr.AllocAdverExtLSAFail

Description

Memory shortage The new or changed external LSA will not be advertised. Routes may temporarily not be available to other routers in the network.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to build an external LSA. LSA type = %p1% Size of requested memory = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt8 |
| p2 | uInt32 |

OSPFv3.ProtoMgr.AllocProcExtLSAFail

Description

Memory shortage meaning that new route(s) from RTM are not processed. The external routes will not be stored or advertised. Routing information will not be accurate.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to process an external LSA. Size of requested memory = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |

OSPFv3.ProtoMgr.DropPktFmOldCSPF

Description

PM has dropped a packet which appeared to come from an old instance of a QCLS user (CSPF or LFA).

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF dropped packet from old instance of CSPF or LFA. Receiver handle = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |

OSPFv3.ProtoMgr.DropPktFmOldRTM

Description

PM has dropped a packet which appeared to come from an old instance of RTM.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF dropped packet from old instance of RTM. Receiver handle = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |

OSPFv3.ProtoMgr.AllocUpdtLSAFail

Description

Memory shortage Failed to reoriginate a new LSA to replace an LSA with wrapping sequence number. We will attempt to update the LSA again in 5 seconds time.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to update LSA with wrapping sequence number. LS ID of the LSA is %p1% Advertising router %p2% LS Type %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |
| p3 | uInt8 |

OSPFv3.ProtoMgr.AllocGrcLSAFail

Description

Memory shortage A grace LSA cannot be advertised. This may lead to the attempted planned or unplanned hitless restart failing.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to build a grace LSA. Size of requested memory = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |

OSPFv3.ProtoMgr.WrapLSIDInstcCnt

Description

An LS ID instance counter has wrapped.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1%: An LS ID instance counter has wrapped. LS ID instance counter pointer = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | Ptr |

OSPFv3.ProtoMgr.AllocRtInstlFail

Description

Failed to allocate memory to process a new summary or external LSA. The LSA will not be stored in the routing table, so that routing calculations may be not up to date.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to obtain memory to install route in routing table. LSA type = %p1%

Message Parameters

| Name | Type |
|------|-------|
| p1 | xInt8 |

OSPFv3.ProtoMgr.AllocNSSADfltLSAFail

Description

Memory shortage The new or changed NSSA default LSA will not be advertised. Routes may temporarily not be available to the network.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to build an NSSA default LSA. Size of requested memory = %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |

OSPFv3.ProtoMgr.AllocLSAInstIDBFail

Description

Memory shortage Failed to install an LSA into the database. The database will be out of date, and routes may temporarily not be available to the network.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory to install an LSA into the database. LS ID of the LSA is %p1%
Advertising router %p2% LS Type %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |
| p3 | uInt8 |

OSPFv3.ProtoMgr.CreatBufPoolFail

Description

Memory shortage The system will not activate successfully.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to create buffer pools at start-up.

OSPFv3.ProtoMgr.CreatDistListFail

Description

Memory shortage - Failed to initialize a Distribution List successfully. The system will not activate successfully.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to create Distribution List at start-up.

OSPFv3.ProtoMgr.AllocRtCalcFail

Description

Memory shortage Failed to allocate memory required for the routing calculation. This routing calculation may not report all routes.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory during routing calculation.

OSPFv3.ProtoMgr.CreatExtRtFail

Description

Memory shortage Failed to create an external route entry. This destination will not be included in routing calculations, or passed to other routers.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to create external route entry. Destination Network = %p1% Network Mask = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.BldNSSADfltFail

Description

Memory shortage Failed to build an NSSA default entry. Databases in the network may become inaccurate.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

NSSA default will not get flooded.

OSPFv3.ProtoMgr.InitCSPFJoinOK

Description

Join to QCLS user has initialized successfully. Join successful.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

The join to a QCLS user has initialized successfully. Receiver handle = %p1% LSDBM type = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |
| p2 | String |

OSPFv3.ProtoMgr.TermCSPFJoinOK

Description

Join to QCLS user has terminated. Join terminated.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

The join to a QCLS user has terminated. Receiver handle = %p1% LSDBM type = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |
| p2 | String |

OSPFv3.ProtoMgr.AllocStrtUpMemFail

Description

Memory shortage, causing failure to allocate a necessary portion of memory at start-up. OSPF will not start.

Remedy

Make more memory available to the system.

Severity

Error

Message Text

Failed to allocate memory at start-up.

OSPFv3.ProtoMgr.AllocRadixTreeNodeFail

Description

Memory shortage, failed to allocate radix tree node. This route will not be added to the radix tree. Some external routes may be marked as unreachable if they have a forwarding address corresponding to this network.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to allocate memory for radix tree node. Destination Network = %p1% Prefix length = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | ulnt8 |

OSPFv3.ProtoMgr.AddNbrLSARtxListFail

Description

Memory shortage Failed to install an LSA into the neighbor's retransmit list. The databases between us and the neighbor may become out of step, but the protocol will recover.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to add LSA to neighbor's retransmit list. LS ID of the LSA is %p1% Advertising router %p2% LS Type %p3% Neighbor's router id %p4%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |
| p3 | uInt8 |
| p4 | DecByteArray |

OSPFv3.ProtoMgr.FloodMaxAgeLSAFail

Description

Memory shortage Failed to flood a maxage LSA. The databases between this box and its neighbors may become temporarily out of step, but the protocol will recover.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

Failed to add LSA to neighbor's retransmit list. LS ID of the LSA is %p1% Advertising router %p2% LS Type %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |
| p3 | uInt8 |

OSPFv3.ProtoMgr.DtectNullIPAddrLinkTLV

Description

Null IP Address found in Link TLV. IP Address will not be included in Link_update signal.

Remedy

Trace source of LSA.

Severity

Info

Message Text

Null IP Address found in link TLV in Traffic Engineering LSA. Neighbor ID : %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |

OSPFv3.ProtoMgr.AllocDebugRtTblFail

Description

A resource shortage has meant that memory has not been allocated for the debug routing table. It will not be possible to perform the debug routing table check of the incremental routing calculation.

Remedy

Make more memory available to OSPF.

Severity

Warning

Message Text

Memory for the debug routing table could not be allocated. Memory type %p1%

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |

OSPFv3.ProtoMgr.AllNbrUp

Description

All expected neighbors are now up. Synchronization of the external CSPF TE database(s), LFA database(s) and RTM Routing Table(s) will now begin.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

All expected OSPF neighbors are now up. Synchronization of the external CSPF TE database(s), LFA database(s) and RTM Routing Table(s) will now begin. Current number of neighbors in state: DOWN %p1% ATTEMPT %p2% INIT %p3% TWO_WAY %p4% EXCHANGE_START %p5% EXCHANGE %p6% LOADING %p7% FULL %p8%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt16 |
| p2 | uInt16 |
| p3 | uInt16 |
| p4 | uInt16 |
| p5 | uInt16 |
| p6 | uInt16 |
| p7 | uInt16 |
| p8 | uInt16 |

OSPFv3.ProtoMgr.NbrAdjacDown

Description

An adjacency with a neighbor has gone down. Resources associated with database exchange for this neighbor will be freed.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p3% An adjacency with a neighbor has gone down. Resources associated with database exchange for this neighbor will be freed. Neighbor router ID %p1% Neighbor IP address %p2% Interface category %p4% Interface neighbor %p5%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | DecByteArray |
| p2 | VarFmtByteArray |
| p3 | String |
| p4 | String |
| p5 | String |

OSPFv3.ProtoMgr.GetLSIDInstcNumFail

Description

Could not originate a new LSA because all LS ID instance numbers are in use. The new LSA will not be advertised.

Remedy

Investigate why the router is trying to originate so many LSAs.

Severity

Warning

Message Text

%p1%: Failed to obtain LS ID instance number to build an LSA. LSA type = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | xInt8 |

OSPFv3.ProtoMgr.AddSPFEntOK

Description

SPF entry added to tree.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1%: Added SPF entry to tree LSA header = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | HexByteArray |

OSPFv3.ProtoMgr.DestNotAddSPFNotBiDirect

Description

Destination not added to SPF tree because link is not bi-directional.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1%: Destination not added to SPF tree because link is not bi-directional. LSA header = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | HexByteArray |

OSPFv3.ProtoMgr.RemDestFmSPF

Description

Destination removed from SPF tree because node is not reachable.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1%: Destination removed from SPF tree because node is not reachable. LSA header = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | HexByteArray |

OSPFv3.ProtoMgr.AddRtToRtTbl

Description

Route added to OSPFv3 routing table.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1%: Route added to OSPFv3 routing table. Route entry = %p2% Destination type = %p3%
Route entry flags = %p4% %p5% Destination router ID = %p6% Prefix length = %p7% Prefix =
%p8% Is local route? = %p9%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | Ptr |
| p3 | xInt8 |
| p4 | xInt8 |
| p5 | xInt8 |
| p6 | HexByteArray |
| p7 | xInt8 |
| p8 | VarFmtByteArray |
| p9 | sInt |

OSPFv3.ProtoMgr.SendRtToRtMgr

Description

Send route to routing table manager.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1%: Send route to routing table manager. Route entry = %p2% Destination type = %p3%
Route entry flags = %p4% %p5% Destination router ID = %p6% Prefix length = %p7% Prefix =
%p8% Is local route? = %p9%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | Ptr |
| p3 | xInt8 |
| p4 | xInt8 |
| p5 | xInt8 |
| p6 | HexByteArray |
| p7 | xInt8 |
| p8 | VarFmtByteArray |
| p9 | sInt |

OSPFv3.ProtoMgr.RtEntStatus

Description

Route entry status.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1%: Route entry status. Route entry = %p2% Route entry flags = %p3% %p4%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | Ptr |
| p3 | xInt8 |
| p4 | xInt8 |

OSPFv3.ProtoMgr.DropPktFmTermNbr

Description

A packet has been dropped because it was received from a neighbor with which contact has already been terminated.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% packet dropped because contact with the neighbor has already been lost.
Neighbor router ID = %p2% Area ID = %p3% Packet data = %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | DecByteArray |
| p3 | DecByteArray |
| p4 | HexPktByteArray |

OSPFv3.ProtoMgr.DtectSwErr

Description

Internal logic error within a OSPF FSM. OSPF abends.

Remedy

Contact support with details of the problem.

Severity

Error

Message Text

%p1% detected a software error. Diagnostic information for support: %p2% FSM id = %p3%
FSM action = %p4% FSM input = %p5% FSM state = %p6%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | xInt32 |
| p4 | uInt8 |
| p5 | String |
| p6 | String |

OSPFv3.ProtoMgr.DropHelloRxUnexplf

Description

A Hello packet has been dropped because the same Hello packet had previously been received through a different local interface or the neighbor is configured to use a different interface.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% Hello packet dropped because it was received through an unexpected local interface. Neighbor %p3%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.ProtoMgr.DropHelloFmLocRtrId

Description

Received Hello packet with our router ID. Packet dropped.

Remedy

Check configuration, particularly ensuring that there are no other routers with our ID. If this does not solve problem, contact support with details of the problem.

Severity

Warning

Message Text

%p1% %p2% Hello packet dropped because source router ID matches local router ID.
Source IP address = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | VarFmtByteArray |

OSPFv3.ProtoMgr.DropPktNoMatchNbr

Description

Received packet to the destination AllDRouters, yet we are not designated or backup designated router on this interface. Packet dropped.

Remedy

Contact support with details of the problem.

Severity

Warning

Message Text

%p1% %p2% OSPF packet dropped because it was not matched to an active neighbor. Received packet on designated router multicast address. Diagnostic information for support: Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | HexPktByteArray |

OSPFv3.ProtoMgr.ActvVifFailDeactv

Description

A virtual interface has not been activated because tidy-up processing from a previous instance of the virtual interface has not yet completed.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% Virtual interface not activated because previous deactivation in progress. Neighbor router ID = %p2% Area ID = %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |
| p3 | DecByteArray |

OSPFv3.ProtoMgr.DropIntMsgIfNotActv

Description

An internal message has been dropped because it could not be correlated with an active interface.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% An internal message has been dropped because no related active interface was found.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.ProtoMgr.DropPktNoMatchLink

Description

OSPF Packet was dropped because it was received over a virtual or sham link but we do not have a matching link.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% OSPF packet dropped because it was received on non-existent or inactive virtual or sham link. Diagnostic information for support: Source router ID = %p2% Source IP address = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | VarFmtByteArray |

OSPFv3.ProtoMgr.DropNonHelloNoMatchNbr

Description

Non-HELLO packet could not be matched to an active neighbor. Packet dropped.

Remedy

Contact support with details of the problem.

Severity

Warning

Message Text

%p1% %p2% OSPF packet dropped because it was not matched to an active neighbor.
Diagnostic information for support: Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | HexPktByteArray |

OSPFv3.ProtoMgr.DropPktNoRsrc

Description

An action for a neighbor has failed because of resource shortage. Packet dropped.

Remedy

Give the system more memory to work with. If the problem persists then please contact support.

Severity

Warning

Message Text

%p1% %p2% %p3% %p4% Action for neighbor failed because of resource shortage.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |
| p4 | String |

OSPFv3.ProtoMgr.DropDDInvlfMTU

Description

DB DESCRIPTION packet received with invalid interface MTU. Packet dropped.

Remedy

Contact support for advice.

Severity

Info

Message Text

DB DESCRIPTION packet received with invalid interface MTU %p1% and will be dropped. To ignore MTU mismatches, set the MtuIgnore MIB option to true. Expected MTU = %p2% Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt16 |
| p2 | uInt16 |
| p3 | HexPktByteArray |

OSPFv3.ProtoMgr.DropDDInvMstrBit

Description

DB DESCRIPTION packet received with invalid master / slave bit. Packet dropped.

Remedy

Contact support for advice.

Severity

Info

Message Text

DB DESCRIPTION packet received with invalid master / slave bit. Flags = %p1%.
Exchange status = %p2%. Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | xInt8 |
| p2 | xInt8 |
| p3 | HexPktByteArray |

OSPFv3.ProtoMgr.DropDDInvInitBit

Description

DB DESCRIPTION packet received with invalid init bit. Packet dropped.

Remedy

This is an unexpected condition. Restart the process. If that does not help contact technical support with the output of "show tech".

Severity

Warning

Message Text

DB DESCRIPTION packet received with invalid init bit. Packet data = %p1%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | HexPktByteArray |

OSPFv3.ProtoMgr.DropDDInvOptByte

Description

DB DESCRIPTION packet received with invalid options byte. Packet dropped.

Remedy

Contact support for advice.

Severity

Warning

Message Text

DB DESCRIPTION packet received with invalid options byte %p1%. Expected value for options byte = %p2%. Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | xInt8 |
| p2 | xInt8 |
| p3 | HexPktByteArray |

OSPFv3.ProtoMgr.DropLSAInvType

Description

LSA received during database exchange with invalid type. Packet dropped.

Remedy

Contact support for advice.

Severity

Warning

Message Text

LSA received during database exchange with invalid type. LS type = %p1%. Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt8 |
| p2 | HexPktByteArray |

OSPFv3.ProtoMgr.DropLSReqInvState

Description

LS REQUEST packet received in invalid state. This is most likely because an interface has restarted without the neighbor noticing, or because the packet is multicast. Packet dropped.

Remedy

Contact support for advice.

Severity

Debug-Summary

Message Text

LS REQUEST packet received in invalid state. Neighbor state = %p1% Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt8 |
| p2 | HexPktByteArray |

OSPFv3.ProtoMgr.DropLSUpdtFmtErr

Description

Error in the packet formatting of a received LS UPDATE signal. Packet dropped.

Remedy

Contact support for advice.

Severity

Warning

Message Text

Error in the packet formatting of a received LS UPDATE signal. Length = %p1% Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt32 |
| p2 | HexPktByteArray |

OSPFv3.ProtoMgr.DropLSUpdtInvState

Description

LS UPDATE packet received in invalid state. This is most likely because an interface has restarted without the neighbor noticing, or because the packet is multicast. Packet dropped.

Remedy

Contact support for advice.

Severity

Debug-Summary

Message Text

LS UPDATE packet received in invalid state. Neighbor state = %p1% Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt8 |
| p2 | HexPktByteArray |

OSPFv3.ProtoMgr.DropLSUpdtInvType

Description

LS UPDATE received with invalid LS type. Packet dropped.

Remedy

Contact support for advice.

Severity

Warning

Message Text

LS UPDATE received with invalid LS type. LS type = %p1% LS type bits = %p2%

Message Parameters

| Name | Type |
|------|-------|
| p1 | uInt8 |
| p2 | xInt8 |

OSPFv3.ProtoMgr.AllocRtxCBFail

Description

Retransmit CB could not be allocated. LSA cannot be flooded.

Remedy

Give the system more memory to work with.

Severity

Warning

Message Text

Retransmit CB could not be allocated. LSA header = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | HexByteArray |

OSPFv3.ProtoMgr.IgnAckFmDiffRtxInstc

Description

Acked instance is not the same as instance on the retransmission list. This is most likely to be when large-scale network topology changes are taking place and, for example, a max-aged version of an LSA is flooded before an acknowledgement to a previous version has been received. Ack ignored.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Acked instance is not the same as instance on the retransmission list. Acked LSA instance = %p1% LSA instance on list = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | HexByteArray |
| p2 | HexByteArray |

OSPFv3.ProtoMgr.AddLSReqListRsrcFail

Description

LSA could not be added to Link State Request list due to resource failure. Database description packet will be dropped.

Remedy

Give the system more memory to work with.

Severity

Warning

Message Text

LSA could not be added to Link State Request list. Database description packet data = %p1%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | HexPktByteArray |

OSPFv3.ProtoMgr.AllocTxCBFail

Description

Transmit CB could not be allocated. LSA cannot be flooded.

Remedy

Give the system more memory to work with.

Severity

Warning

Message Text

Transmit CB could not be allocated. LSA header = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | HexByteArray |

OSPFv3.ProtoMgr.AckLSARsrcFail

Description

LSA could not be acked due to a resource failure. Neighbor will retransmit LSA to us.

Remedy

Give the system more memory to work with.

Severity

Warning

Message Text

LSA could not be acked. LSA header = %p1%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | HexByteArray |

OSPFv3.ProtoMgr.DropLSAckInvState

Description

LS ACK packet received in invalid state. This is most likely because an interface has restarted without the neighbor noticing, or because the packet is multicast. Packet dropped.

Remedy

Contact support for advice.

Severity

Debug-Summary

Message Text

LS ACK packet received in invalid state. Neighbor state = %p1% Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt8 |
| p2 | HexPktByteArray |

OSPFv3.ProtoMgr.DropLSReqEmptyPkt

Description

Empty LS REQUEST packet received. Packet dropped.

Remedy

Contact support for advice.

Severity

Warning

Message Text

Empty LS REQUEST packet received. Packet data = %p1%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | HexPktByteArray |

OSPFv3.ProtoMgr.ProcLargeLSARsrcFail

Description

A resource shortage meant that a large LSA could not be processed. The LSA is ignored and routing may be impaired.

Remedy

Make more memory available to OSPF.

Severity

Error

Message Text

A large LSA could not be processed because of a memory shortage. LSA size = %p1%.
Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt16 |
| p2 | HexPktByteArray |

OSPFv3.ProtoMgr.AllocIfCBFail

Description

Could not allocate memory for an interface CB. OSPF will not function fully.

Remedy

Give the system more memory to work with.

Severity

Error

Message Text

Could not allocate memory for an interface CB.

OSPFv3.ProtoMgr.I3IfQueryFail

Description

The I3 stub failed to inform NM of the local network interfaces. The OSPF stack terminates.

Remedy

Check the network connections are correctly configured and working.

Severity

Error

Message Text

I3 interface query failed, return code %p1%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |

OSPFv3.ProtoMgr.IfNameChg

Description

The interface name of an interface has been changed. Interface has different name.

Remedy

Check interface configuration is as expected.

Severity

Info

Message Text

The interface name of an interface (%p1%) has been changed. Old interface name = %p2%
New interface name = %p3%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.ProtoMgr.I3AddrQueryFail

Description

The I3 stub failed to inform NM of the local network addresses. The OSPF stack terminates.

Remedy

Check the network connections are correctly configured and working.

Severity

Error

Message Text

I3 addresses query failed, return code %p1%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | xInt32 |

OSPFv3.ProtoMgr.DropPktFmOldI3Stub

Description

NM dropped a packet which appeared to come from an old instance of the I3 interface information stub.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

PM dropped packet from old I3 stub instance. Receiver handle = %p1% Sender's main PID = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |
| p2 | uInt32 |

OSPFv3.ProtoMgr.AllocIGPShortcutCBFail

Description

Could not allocate memory for an IGP shortcut interface CB. The IGP shortcut will not be used by OSPF.

Remedy

Give the system more memory to work with.

Severity

Warning

Message Text

%p1%%p2% Could not allocate memory for the IGP shortcut interface.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.DropLSAInvCksum

Description

LSA received with invalid fletcher checksum. Packet dropped.

Remedy

Contact support for advice.

Severity

Warning

Message Text

LSA received with invalid fletcher checksum. LS type = %p1% Source router = %p2%
Received checksum = %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | uint8 |
| p2 | DecByteArray |
| p3 | xInt16 |

OSPFv3.ProtoMgr.DropLSAInv

Description

Received LSA is invalid. The LSA is ignored. The neighbor may resend the LSA repeatedly.

Remedy

If the problem persists then check the diagnostics on the neighboring router for indications of why it is sending an invalid LSA.

Severity

Warning

Message Text

%p1% %p2% %p3% %p4% A received LSA is being dropped because it is invalid. Diagnostic information for support: LSA header = %p5%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | String |
| p3 | String |
| p4 | String |
| p5 | HexByteArray |

OSPFv3.ProtoMgr.CreatIfCBSameIndxFail

Description

A newly created interface used the same interface index as an existing IGP shortcut interface. None. OSPF will attempt to resolve the problem.

Remedy

If the condition recurs then contact support with details of the problem.

Severity

Info

Message Text

%p1%%p2% <%p3%> An interface CB cannot be created because of a clash with an existing IGP shortcut interface.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.ProtoMgr.UpdtNextHopInfo

Description

Next hop information for a route or SPF entry has just been updated.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Updated next hop information: Route/SPF pointer = %p1% Route/SPF dest ID = %p2%
Next hop info ptr = %p3% Flags = %p4% Size = %p5% Hops pointer = %p6% Num ECMP paths
= %p7%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | Ptr |
| p2 | HexByteArray |
| p3 | Ptr |
| p4 | uInt8 |
| p5 | uInt32 |
| p6 | Ptr |
| p7 | uInt16 |

OSPFv3.ProtoMgr.SaveIfOpaqueObjRsrcFail

Description

Resource failure preventing storage of an interface's opaque object. All interface information will be refreshed.

Remedy

Increase the amount of memory available to the system. If the problem persists then please contact support with details of the problem.

Severity

Error

Message Text

%p1% %p2% Resource failure during storage of interface's opaque object, length %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | uInt32 |

OSPFv3.ProtoMgr.AllocCfgIfFail

Description

Could not allocate memory required to configure an interface. Interface cannot be configured.

Remedy

Give OSPF more memory.

Severity

Error

Message Text

Could not allocate memory required to configure an interface.

OSPFv3.ProtoMgr.CreatUnnumIfNoIndx

Description

Cannot create unnumbered interface with no interface index. Interface MIB row cannot be created.

Remedy

Retry, specifying either an IP address or a non-zero interface index.

Severity

Error

Message Text

Cannot create unnumbered interface with no if index.

OSPFv3.ProtoMgr.CreatNumIfNonZeroIndx

Description

Cannot create a numbered network or multi-area interface with a non-zero address_less_if index. Interface MIB row cannot be created.

Remedy

Retry, specifying either an unnumbered interface or a zero address_less_if index.

Severity

Error

Message Text

Cannot create numbered interface with non-zero address_less_if. address_less_if field = %p1% IP address = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | sInt32 |
| p2 | VarFmtByteArray |

OSPFv3.ProtoMgr.OrigSameLSA

Description

An LSA has been originated which does not differ to the last LSA originated. No effects.

Remedy

No action is necessary.

Severity

Debug-Summary

Message Text

LSA originated which does not differ from previous origination. LS type = %p1%

Message Parameters

| Name | Type |
|------|-------|
| p1 | uInt8 |

OSPFv3.ProtoMgr.ResizRtxHashTbl

Description

The retransmit list hash table has been resized.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

The retransmit list hash table has been resized. The previous size of the hash table was %p1% entries. The new size of the hash table is %p2% entries.

Message Parameters

| Name | Type |
|------|--------|
| p1 | uInt32 |
| p2 | uInt32 |

OSPFv3.ProtoMgr.ResizRtxHashTblRsrcFail

Description

Could not allocate memory to resize the retransmit list hash table. The hash table will not have been resized.

Remedy

Allocate more memory to the system.

Severity

Debug-Summary

Message Text

Could not resize retransmit list hash table.

OSPFv3.ProtoMgr.DropLSAckSmall

Description

LS ACK packet received which is too small. That is, it does not contain at least one LSA header. Packet dropped.

Remedy

Check diagnostics on the sending neighbor router for reasons why the invalid packet was sent.

Severity

Warning

Message Text

LS ACK packet received which is too small. Minimum packet length = %p1% Received packet length = %p2% Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt32 |
| p2 | uInt32 |
| p3 | HexPktByteArray |

OSPFv3.ProtoMgr.DropDDSmall

Description

DATABASE DESCRIPTION packet received which is too small. That is, it does not contain at least one LSA header. Packet dropped.

Remedy

Check diagnostics on the sending neighbor router for reasons why the invalid packet was sent.

Severity

Warning

Message Text

DATABASE DESCRIPTION packet received which is too small. Minimum packet length = %p1% Received packet length = %p2% Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt32 |
| p2 | uInt32 |
| p3 | HexPktByteArray |

OSPFv3.ProtoMgr.CfgIfCBFail

Description

An Interface cannot be used by OSPF. The interface is unusable for OSPF.

Remedy

Give the system more memory to work with and check the configuration is consistent. If the problem persists then please contact support.

Severity

Error

Message Text

%p1% %p2% %p3% Interface CB cannot be configured. Give system more memory, and check configuration is consistent.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.ProtoMgr.DropLSUpdtSmall

Description

LS UPDATE packet received which is too small. That is, it does not contain at least one LSA header. Packet dropped.

Remedy

Check diagnostics on the sending neighbor router for reasons why the invalid packet was sent.

Severity

Warning

Message Text

LS UPDATE packet received which is too small. Minimum packet length = %p1%
Received packet length = %p2% Packet data = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt32 |
| p2 | uInt32 |
| p3 | HexPktByteArray |

OSPFv3.ProtoMgr.AllocRtCtrlFail

Description

Could not allocate memory for storing information on a Routing Controller advertised by the local node. OSPF will not function fully.

Remedy

Increase the memory available to OSPF.

Severity

Warning

Message Text

%p1% Could not allocate memory for a Routing Controller with Id %p2%.

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.AllocRtCtrlCB

Description

A Routing Controller CB has been allocated.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

%p1% A Routing Controller CB has been allocated for Id %p2%.

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.DropHelloFmSelf

Description

Received Hello packet that we have sent. Hello Packet dropped.

Remedy

Contact support with details of the problem.

Severity

Warning

Message Text

%p1% %p2% Received Hello packet dropped because it originated from local router.
Diagnostic information for support: Source IP address = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | VarFmtByteArray |

OSPFv3.ProtoMgr.FloodLSARsrcFail

Description

Could not flood LSA due to resource failure. LSA is not acked and will be retransmitted by neighbor.

Remedy

Allocate more resources to OSPF.

Severity

Warning

Message Text

Could not flood LSA due to resource failure. Packet data = %p1%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | HexPktByteArray |

OSPFv3.ProtoMgr.DropUnexplntSig

Description

Internal signal received when not expected. The internal signal is ignored.

Remedy

If the problem persists or appears to be related to other problems then please contact support with details.

Severity

Warning

Message Text

%p1% Unexpected internal signal dropped. Diagnostic information for support: Sender
PID = %p2% IPS type = %p3%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |
| p3 | xInt32 |

OSPFv3.ProtoMgr.AddI3StubJoinFail

Description

Could not add join to the I3 stub. OSPF will not activate.

Remedy

Contact support for advice.

Severity

Error

Message Text

Could not add join to the I3 stub.

OSPFv3.ProtoMgr.NMIJoinUp

Description

An NMI join has come up.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% An NMI join has come up. NM entity index = %p2% NM PID = %p3% Receiver handle = %p4%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |
| p3 | uInt32 |
| p4 | uInt32 |

OSPFv3.ProtoMgr.NMIJoinDown

Description

An NMI join has gone down.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% An NMI join has gone down. NM entity index = %p2% NM PID = %p3% Receiver handle = %p4%

|------|--------|
| p1 | String |
| p2 | uInt32 |
| p3 | uInt32 |
| p4 | uInt32 |

OSPFv3.ProtoMgr.DropDDIncrctState

Description

DATABASE DESCRIPTION packet received in incorrect neighbor state. This is most likely because an interface has restarted without the neighbor noticing, or because the packet is multicast. Packet is thrown away.

Remedy

Contact support for advice.

Severity

Debug-Summary

Message Text

DB DESCRIPTION packet received in incorrect state %p1%. Packet data = %p2%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uInt8 |
| p2 | HexPktByteArray |

OSPFv3.ProtoMgr.RecvDDAfterTimerExp

Description

DB DESCRIPTION packet received after dd timer pop. Adjacency is restarted.

Remedy

This is an unexpected condition. Restart the process. If that does not help contact technical support with the output of "show tech".

Severity

Error

Message Text

DB DESCRIPTION packet received after dd timer pop. Packet data = %p1%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | HexPktByteArray |

OSPFv3.ProtoMgr.AllocIfSwchDescFail

Description

Failed to allocate memory for an Interface Switching Descriptor. TE information for this interface will be out of date until a refresh is received.

Remedy

OSPF will recover automatically when resource becomes available.

Severity

Error

Message Text

%p2%: Failed to allocate memory for an Interface Switching Descriptor. Switching capability %p1% Interfaces IP address %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | uint8 |
| p2 | String |
| p3 | VarFmtByteArray |

OSPFv3.ProtoMgr.AllocSRLGArrayFail

Description

Failed to allocate memory for an SRLG array. TE information for this interface will be out of date until a refresh is received.

Remedy

OSPF will recover automatically when resource becomes available.

Severity

Error

Message Text

%p2%: Failed to allocate memory for an SRLG array. Size of memory requested %p1%
Interfaces IP address %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | sInt32 |
| p2 | String |

| p1 | uInt8 |
| p2 | uInt16 |
| p3 | uInt16 |

OSPFv3.ProtoMgr.UserExitRsrcFail

Description

User exit qopm_user_update_if_params encountered a resource shortage. The interface opaque parameters for this interface may be out of date. OSPF will refresh its interface information from the I3 stub.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

qopm_user_update_if_params reported a resource shortage on an interface (%p1%).
Interface IP address %p2% Opaque data %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | VarFmtByteArray |
| p3 | HexByteArray |

OSPFv3.ProtoMgr.LSAReqTmout

Description

A neighbor has failed to respond to our request for LSAs within the configured timeout period (ospfPmIfRetransInterval). OSPF will resend the request for the LSAs and reduce the number of LSAs that are requested in subsequent packets. This event is logged as re-requests should be avoided where possible as they can considerably increase the time taken for adjacency formation.

Remedy

Check for network issues that might be preventing the remote router from responding in a timely fashion.

Severity

Debug-Summary

Message Text

%p1% %p2% %p3% %p4% LSA request has timed out and will be retried. Num LSAs requested %p5% Num LSAs that must be re-requested %p6%

OSPFv3.ProtoMgr.FloodGrcflRstrtRsrcFail

Description

Resource failure prevented flooding of an LSA during graceful restart. This may cause the current planned or unplanned graceful restart to fail.

Remedy

Increase the amount of memory available to the system. If the problem persists then please contact support with details of the problem.

Severity

Warning

Message Text

%p1% %p2% LSA not flooded during graceful restart because of resource failure
Diagnostic information for support: LSA header = %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | String |
| p3 | HexByteArray |

OSPFv3.ProtoMgr.DropPktNMIDeactvTxIf

Description

An packet has been dropped because the sending interface is deactivating over the NMI.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% packet dropped because interface is deactivating over the NMI. signal type = %p3%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | xInt32 |

OSPFv3.ProtoMgr.IfIntErr

Description

Interface has failed because of an internal error. Interface becomes inactive.

Remedy

Check for other logs that indicate the cause of the error, for example logs of resource failures. If the problem persists then please contact support.

Severity

Error

Message Text

%p1% %p2% Interface failed because of an internal error.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.NbrCommFailIntErr

Description

Communication with a neighbor has failed because of an internal error. An adjacency cannot be set up with the neighbor.

Remedy

Check for other logs that indicate the cause of the error, for example logs of resource failures. If the problem persists then please contact support.

Severity

Error

Message Text

%p1% %p2% %p3% %p4% Communication with neighbor has failed because of an internal error.

| p1 | String |
| p2 | String |
| p3 | String |
| p4 | String |

OSPFv3.ProtoMgr.ActRsrcFail

Description

An action has failed because of resource shortage. The operation of OSPF may be affected. For example, adjacencies may not be set up with neighbors.

Remedy

Check for other logs that indicate the action that has failed. Allocate more resources to the OSPF system. If the problem persists then please contact support.

Severity

Error

Message Text

%p1% An action has failed because of resource shortage.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.ProtoMgr.DropHelloRxVifChg

Description

A Hello packet has been dropped because the virtual interface on which it was received is in the process of being switched to a different NM instance.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% %p3% Hello packet dropped because virtual interface is in a transient state.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.ProtoMgr.DropHelloRxIfDeactiv

Description

A Hello packet has been dropped because the interface on which it was received is either deactivating or inactive.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% Hello packet dropped because the receiving interface is not active.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.ActvIfFail

Description

An interface could not be activated because part of the system is not ready. This state should be self-clearing.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% Interface cannot be activated at present.

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | VarFmtByteArray |

OSPFv3.ProtoMgr.CfgIPv6AddrRsrcFail

Description

Resource failure preventing configuration of an IPv6 address. OSPF will not function fully.

Remedy

Increase the amount of memory available to the system. If the problem persists then please contact support with details of the problem.

Severity

Warning

Message Text

%p1% %p2% Resource failure during configuration of an IPv6 address. Address = %p3%
Scope ID = %p4% Prefix length = %p5%

Message Parameters

| Name | Type |

| p1 | String |
| p2 | String |
| p3 | HexColByteArray |
| p4 | sInt32 |
| p5 | uInt8 |

OSPFv3.ProtoMgr.DropHelloVldtChkFail

Description

A Hello packet has been dropped because it failed validation checks. Either the Hello is labeled as being from the local router, or no suitable interface could not be found. This can happen in race conditions, and is not considered an error.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% Hello packet failed validation checks, and was dropped. Router ID in Hello packet = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.IgnIGPShortcutFuncDsbl

Description

IGP shortcut interface information from the I3 stub has been ignored because the IGP shortcut function is currently disabled.

Remedy

None required.

Severity

Info

Message Text

%p1% has ignored the IGP shortcut %p2% - IGP shortcut function is disabled. IGP shortcut interface next hop address = %p3%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | VarFmtByteArray |

OSPFv3.ProtoMgr.IgnLSAMinArrvIntv

Description

A received LSA is being ignored because it was previously received within the last ospfPmEntMinLsArrival/ ospfv3PmEntMinLsArrival milliseconds.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% has ignored an LSA because it was previously received within the last minimum LSA arrival interval milliseconds. Milliseconds since last received = %p2% Minimum LSA arrival interval = %p3% Neighbor = %p4% LS ID of the LSA = %p5% Advertising router = %p6% LS Type = %p7%

| p4 | String |
| p5 | DecByteArray |
| p6 | DecByteArray |
| p7 | uInt8 |

OSPFv3.ProtoMgr.RxLSAOld

Description

An LSA has been received that is less recent than the database copy.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% has received an LSA that is less recent than the copy in its database. Received LSA header = %p2% Database LSA header = %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | HexByteArray |
| p3 | HexByteArray |

OSPFv3.ProtoMgr.TxDlayGTMinOrigIntv

Description

PM has been activated with the transmit timer delay of an interface configured to be greater than the minimum LSA origination interval. Multiple copies of the same LSA may get bundled into the same OSPF packet, causing the second and subsequent copies to be dropped by the receiving neighbor.

Remedy

Change the configuration so that the transmit timer delay is not greater than the minimum LSA origination interval.

Severity

Info

Message Text

%p1% %p2% The transmit timer delay %p3% is greater than the minimum LSA origination interval %p4%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | sInt32 |
| p4 | sInt32 |

OSPFv3.ProtoMgr.RfrshIntvLTMinOrig

Description

PM has been activated with the LSA refresh interval of an interface configured to be smaller than the minimum LSA origination interval. All LSA refreshes on the interface will be delayed.

Remedy

Change the configuration so that the LSA refresh interval is not smaller than the minimum LSA origination interval.

Severity

Info

Message Text

%p1% %p2% The LSA refresh interval %p3% has been configured to be smaller than the minimum LSA origination interval %p4%.

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | sInt32 |
| p4 | sInt32 |

OSPFv3.ProtoMgr.DropHelloMultiAreaVif

Description

A hello packet that matches both a multi-area interface and a virtual interface was received. The hello packet is dropped.

Remedy

Change interface configuration so that hello packets for the two interfaces can be distinguished.

Severity

Warning

Message Text

%p1% %p2% %p3% A hello packet matched both a multi-area interface and a virtual interface.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.ProtoMgr.AddRemLSAGlobAgeList

Description

LSA added to or removed from global age list.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

%p1%: LSA added to or removed from global age list. LSA CB pointer = %p2% Age array index for LSA = %p3% Current age index = %p4% Delayed LSAs present = %p5% Self originated present = %p6% LSA CB flags = %p7% %p8% LSA header = %p9% Added? = %p10%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | Ptr |
| p3 | uInt16 |
| p4 | uInt16 |
| p5 | uInt16 |

| p7 | xInt8 |
| p8 | xInt8 |
| p9 | HexByteArray |
| p10 | sInt |

OSPFv3.ProtoMgr.SelfOrigLSAAgeOutIntErr

Description

An LSA is marked as being a self-originated LSA, but is being aged out. This should never happen - self-originated LSAs should always be regenerated before this happens. OSPF will terminate.

Remedy

This represents an internal logic error. Contact OSPF customer support with details of the problem.

Severity

Error

Message Text

%p1%: An internal logic error has caused a self-originated LSA to age out. LSA CB pointer = %p2% Delayed LSAs present = %p3% Self originated present = %p4% LSA CB flags = %p5% %p6% LSA header = %p7%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | Ptr |
| p3 | uInt16 |
| p4 | sInt |
| p5 | xInt8 |
| p6 | xInt8 |
| p7 | HexByteArray |

OSPFv3.ProtoMgr.RtrLSALinkCostZero

Description

The OSPF route calculation has encountered a router LSA advertising a link with a metric of 0. This is not a valid value, as it can lead to loops in the SPF calculation. To prevent loops in the routing calculation, OSPF will treat the link as having a metric of 1.

Remedy

Check the interface configuration on the router advertising the LSA.

Severity

Warning

Message Text

%p1% %p2% is advertising a non-stub link in a router LSA with a metric of 0.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.AddRemLSARtEntLSAList

Description

LSA added to or removed from a route entry's LSA list.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

%p1% LSA added to or removed from a route entry's LSA list. Added? = %p2% Route entry CB pointer = %p3% Destination ID = %p4% Associated area = %p5% Address mask (OSPFv2 only) = %p6% Prefix (OSPFv3 only) = %p7% LSA CB pointer = %p8% LSA LS ID = %p9% LSA advertising router = %p10% LSA sequence number = %p11% LSA checksum = %p12%

OSPFv3.ProtoMgr.RejctLSALinkSetFmtErr

Description

An LSA is being rejected because of a formatting error in a link set contained within it. An exception log will be made after this current log; the purpose of this log is to trace out the erroneous link set for ease of investigation. See subsequent exception log (281).

Remedy

See subsequent exception log (281).

Severity

Debug-Data

Message Text

%p1% LSA has a formatting error in a link set that it contains. Link set contents: %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | HexByteArray |

OSPFv3.ProtoMgr.SlctPrefAddr

Description

An address has been selected as the preferred address for an area. This address is used as follows. If used as the source IP address for any packets sent through virtual interfaces that transit the area then the address will be included as the first address in the Intra-Area-Prefix-LSA(s) for the area.

Remedy

None required.

Severity

Debug-Verbose

Message Text

%p1% %p2% preferred address is %p3%.

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | VarFmtByteArray |

OSPFv3.ProtoMgr.PrefAddrUnavailArea

Description

No address is available to use as the preferred address for an area. Virtual interfaces that transit the area will not activate. Locally originated NSSA LSAs will not automatically include a routable forwarding address.

Remedy

Configure a global scope unicast IPv6 address on an OSPFv3 loopback interface associated with the area.

Severity

Error

Message Text

%p1% %p2% Configure a global scope unicast IPv6 address on a loopback interface in this area.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.PrefAddrNotRqr

Description

No preferred address is required for this area because there are no active transiting virtual interfaces.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% no preferred address is required.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.NSSAXlateStateChg

Description

The NSSA translator state for an area has changed. The OSPF protocol will operate according to the new translator state.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% now has NSSA translator state %p2% in area %p3% (was %p4%)

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |
| p4 | String |

OSPFv3.ProtoMgr.PDIRfrshTimerStrt

Description

The PDI refresh timer has been started.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% PDI refresh timer has started for a PDI join. Master index = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |

OSPFv3.ProtoMgr.PDIRfrshTimerExp

Description

The PDI refresh timer has popped.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% PDI refresh timer popped for a PDI join. Master index = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |

OSPFv3.ProtoMgr.AllocPDISrvrUpdtFail

Description

Memory shortage meaning that a new server advertised across across a PDI join has not been processed. The server will not be advertised across the network and as a result PCCs will not discover and use the PCE.

Remedy

Make more memory available to the system.

Severity

Warning

Message Text

%p1% failed to allocate memory when processing a PDI server update. The server will not be advertised. Server IP address = %p2% Scope = %p3% Area = %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | VarFmtByteArray |
| p3 | uInt8 |
| p4 | DecByteArray |

OSPFv3.ProtoMgr.SuprsNSSAXlateChgTrap

Description

OSPF suppressed an NSSA translator state change MIB trap.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% %p2%: suppressed trap: NSSA translator state now %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |
| p3 | String |

OSPFv3.ProtoMgr.Type7LSANotXlate

Description

A type-7 LSA cannot be translated.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% A type-7 LSA cannot be translated. LSA header = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | HexByteArray |

OSPFv3.ProtoMgr.ChkFwdAddrRch

Description

The reachability of the forwarding address for a Type-5, AS-External LSA, or type-7, NSSA, LSA has been determined.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% Is the forwarding address %p2% (route CB %p3%) reachable? %p4%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | VarFmtByteArray |
| p3 | Ptr |
| p4 | sInt |

OSPFv3.ProtoMgr.ChkLSAOrigRch

Description

The reachability of the originator of an LSA has been determined.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% Is the LSA originator %p2% (route CB %p3%) reachable? %p4% via path type %p5% (intra-area reachable? %p6%)

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | DecByteArray |
| p3 | Ptr |
| p4 | sInt |
| p5 | uInt8 |
| p6 | sInt |

OSPFv3.ProtoMgr.IgnInvASEOrNSSALSA

Description

OSPF has received an invalid AS-External or NSSA LSA. OSPF will not create a route for or (in the case of an NSSA LSA) translate the invalid LSA.

Remedy

Check the configuration of the advertising router.

Severity

Warning

Message Text

%p1% Ignoring an invalid AS-External or NSSA LSA Diagnostic information for support:
Advertising %p2% Forwarding address %p3% Destination prefix %p4% network mask /
prefix length %p5%

Message Parameters

| Name | Type |
|------|-----------------|
| p1 | String |
| p2 | String |
| p3 | VarFmtByteArray |
| p4 | VarFmtByteArray |
| p5 | HexByteArray |

OSPFv3.ProtoMgr.FlushLSAGrcflRstrtClnup

Description

LSA being flushed as part of graceful restart garbage collection.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

%p1% LSA being flushed as part of graceful restart garbage collection. LSA CB pointer = %p2% LSA entry type = %p3% LSA flags = %p4% %p5% LSA header = %p6%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | Ptr |
| p3 | uInt8 |
| p4 | xInt8 |
| p5 | xInt8 |
| p6 | HexByteArray |

OSPFv3.ProtoMgr.InterAreaRtStatusChg

Description

This router's role in inter-area routing has changed. Either the Area Border Router status has changed, or the presence of an active backbone connection has changed. The origination / flushing of summary LSAs and the calculation of inter-area routes will change accordingly.

Remedy

None required.

Severity

Info

Message Text

Inter-area routing status has changed. Area Border Router = %p1% Active Backbone Connection = %p2%

Message Parameters

| Name | Type |
|------|------|
| p1 | sInt |
| p2 | sInt |

OSPFv3.ProtoMgr.DeactivAllIfNoIPAddr

Description

No IP addresses are currently configured to OSPF. OSPF deactivates all interfaces as at least one IP address must be available for OSPF packets to be sent on unnumbered interfaces.

Remedy

Configure an IP address for use by OSPF, for example an IP address on a loopback interface.

Severity

Error

Message Text

%p1% Deactivated all interfaces because no IP addresses are configured and at least one IP address is required.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |

OSPFv3.ProtoMgr.FreeLSACB

Description

Memory to store an LSA has been freed.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

%p1% Destroyed LSA CB for %p7% LSA LS Type = %p8% LSA LS ID = %p3% LSA advertising router = %p4% LSA sequence number = %p5% LSA checksum = %p6% LSA CB pointer = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | Ptr |
| p3 | DecByteArray |
| p4 | DecByteArray |
| p5 | HexByteArray |
| p6 | HexByteArray |
| p7 | String |
| p8 | uInt8 |

OSPFv3.ProtoMgr.ExitHelpNbrMIBDeactiv

Description

We are in helper mode for a neighbor that is undergoing a hitless restart and the neighbor has been deactivated through the MIB. OSPF has exited helper mode for a neighbor.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF has exited helper mode because the neighbor has been deactivated in the MIB. Our router ID = %p1% Neighbor's router ID = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.EnterHelpNbrRstrt

Description

We have received a Grace LSA from a neighbor that is undergoing a hitless restart. OSPF has entered helper mode for a neighbor.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OSPF has entered helper mode for a restarting neighbor. Our router ID = %p1%
Neighbor's router ID = %p2% Interface = %p3%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |
| p3 | String |

OSPFv3.ProtoMgr.RecvRtMgrUnexpRtType

Description

OSPF received an RTM route with an unexpected OSPF route type. The route is treated as a type-2 external route.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% An RTM route contains an unexpected OSPF route type. OSPF route type = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | xInt8 |

OSPFv3.ProtoMgr.FloodNonRfrshLSAHelp

Description

An LSA is being flooded which is not a simple refresh while we are in helper mode for a restarting neighbor which has strict LSA checking disabled. Nothing.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Attempted flood of non-refresh LSA to neighbor would have caused exit of helper mode but strict LSA checking is disabled. Our router ID = %p1% Neighbor's router ID = %p2%

Message Parameters

| Name | Type |
|------|--------------|
| p1 | DecByteArray |
| p2 | DecByteArray |

OSPFv3.ProtoMgr.RegNMINoRstrtIndctBuf

Description

PM failed to allocate the buffer for a restart indication IPS required for a slave join to a neighbor manager. This is likely to be because the router is out of memory. The join to the neighbor manager has failed.

Remedy

Free up memory and attempt to configure the join again.

Severity

Warning

Message Text

%p1% The NMI register attempt has failed because PM could not get a buffer for the restart indication for the join. Master index = %p2%

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | uInt32 |

OSPFv3.ProtoMgr.AllocCfgCBfail

Description

Failed to allocate a configuration control block. The Control Block will not be created. If this operation was triggered by a MIB command then the MIB signal will be returned with a failure code. This may cause some configuration information to have to be resent.

Remedy

Investigate the source of the failure. It is probably due to a resource shortage.

Severity

Error

Message Text

%p1% failed to allocate control block type %p2% identifier %p3%.

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | xInt32 |
| p3 | HexByteArray |

OSPFv3.ProtoMgr.MinOrigIntvLTMinArrv

Description

PM has been activated with a minimum LSA origination interval smaller than its minimum LSA arrival interval. Nothing.

Remedy

Check that the configuration of the minimum LSA origination interval and minimum LSA arrival interval is consistent across the local router and its neighbors.

Severity

Info

Message Text

%p1% The minimum LSA origination interval %p2% ms is smaller than minimum LSA arrival interval %p3% ms.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | sInt32 |
| p3 | sInt32 |

OSPFv3.ProtoMgr.RfrshIntvLTMinOrigIntv

Description

PM has been activated with a minimum LSA origination interval greater than its LSA refresh interval. All LSA refreshes will be delayed.

Remedy

Change the configuration so that the LSA refresh interval is not smaller than the minimum LSA origination interval.

Severity

Info

Message Text

%p1% The entity LSA refresh interval %p2% has been configured to be smaller the minimum LSA origination interval %p3%.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | sInt32 |
| p3 | sInt32 |

OSPFv3.ProtoMgr.DtectIfIndxCflct

Description

There are network interfaces, IGP shortcuts, multi-area interfaces, virtual links or sham links with conflicting interface index values. Virtual interfaces and sham links with conflicting interface values remain inactive. Network interfaces and multi-area interfaces with inconsistent configuration remain inactive.

Remedy

Check other problem determination logs to identify all the conflicting interfaces. Ensure that interface index values are assigned avoiding conflicts.

Severity

Warning

Message Text

%p1% There is an interface index conflict for interface%p2%. Interface category: %p3%
Interface: %p4%

| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.RstrtOSPFInstcldChg

Description

The OSPF Instance ID has been changed while the PM entity is active. The PM entity will immediately deactivate and then reactivate; all current adjacencies will be lost.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% The Instance ID has been changed from %p2% to %p3%, OSPF will restart.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | sInt32 |
| p3 | sInt32 |

OSPFv3.ProtoMgr.IfOperUpWaitLinkLocAddr

Description

An OSPFv3 interface is waiting to receive a link-local address before it can go operationally up. The interface will not go operationally until it receives a link local address. It will not start sending hellos or form adjacencies until it receives the link local address. This will normally be a transient state, however if it persists it indicates that the physical interface has not been configured with a link local address.

Remedy

If the interface fails to come up check that a link local address has been configured on the physical interface.

Severity

Info

Message Text

%p1% Interface%p2% is waiting for a link local address before it goes operationally up.

Message Parameters

| Name | Type |
|------|--------|
| p1 | String |
| p2 | String |

OSPFv3.ProtoMgr.NSSAXlateRoleChg

Description

The NSSA translator role for an area has been changed. The local node will update its NSSA translator state for the area according to the newly configured role.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

%p1% now has NSSA translator role %p2% in area %p3%

Message Parameters

| p2 | String |
| p3 | DecByteArray |
| p4 | String |
| p5 | uInt8 |
| p6 | sInt32 |
| p7 | sInt |
| p8 | sInt |

OSPFv3.ProtoMgr.NewBestDRCnddt

Description

DR election; new best candidate for DR.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

%p1% %p2% DR election; neighbor %p3% is the best candidate for DR in pass %p4%.

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | String |
| p3 | DecByteArray |
| p4 | sInt |

OSPFv3.ProtoMgr.NewBestBDRCnddt

Description

DR election; new best candidate for BDR.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

%p1% %p2% DR election; neighbor %p3% is the best candidate for BDR in pass %p4%.

Message Parameters

| Name | Type |
|------|--------------|
| p1 | String |
| p2 | String |
| p3 | DecByteArray |
| p4 | sInt |

OSPFv3.ProtoMgr.DRElectDone

Description

DR election; DR and BDR have been determined. Note that, for OSPFv2, the DR and BDR are identified by their IPv4 addresses, for OSPFv3, by their 32-bit Router ID.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%p1% %p2% DR election; DR is %p3% BDR is %p4%.

Message Parameters

OTM.DebugSummary

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

OTM.DebugVerbose

Description

A condition has been detected that may interest a developer analyzing some system behavior at a more verbose level than provided by the debug summary information.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

OTM.DebugData

Description

A condition has been detected that may interest a developer inspecting the data underlying system behavior

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

OTM.ParmNull

Description

An internal function was called with a NULL pointer. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on overlay network configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Arg %arg% is NULL

Message Parameters

| Name | Type |
|------|--------|
| arg | String |

OTM.ParmInv

Description

An internal function was called with an invalid value. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on overlay network configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% has an invalid value %val%

Message Parameters

| Name | Type |
|------|---------|
| arg | String |
| val | ulInt32 |

OTM.AllocMemFail

Description

Memory for the displayed object could not be allocated which may be due to the system running low on memory. This will result in incorrect operation of the Overlay feature.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory.

Severity

Error

Message Text

Memory allocation failed when trying to allocate a %obj% structure of size %size%.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |
| size | uInt32 |

OTM.AllocInstFail

Description

Instance for the displayed object could not be allocated.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory.

Severity

Error

Message Text

Instance allocation failed when trying to allocate an instance for %obj% structure.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |

OTM.InitSrvrFail

Description

Failed to start the OTM server. This is not expected and is indicative of a serious problem.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

OTM Server failed to start

OTM.InitSrvrDone

Description

This message is used for debugging problems related to OTM Server.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

OTM server initialized successfully

OTM.LocIfMatchRmtEndpt

Description

This message indicates that the local interface configured by user matches an already existing remote endpoint. However, the local interface has been accepted but the remote endpoint has been removed.

Remedy

User might want to double check if the configured local interface is correct. Otherwise, the remote endpoint has been wrongly configured.

Severity

Warning

Message Text

Local interface IP %addr% on VR %vr% VLAN %vlan% matches an existing remote-endpoint, deleting remote-endpoint

Message Parameters

| Name | Type |
|------|---------|
| addr | IPAddrN |
| vr | String |
| vlan | String |

OTM.RmtEndptMatchLoclf

Description

This message indicates that the remote endpoint received from the client matches an already existing local interface. So, the remote endpoint has not been accepted.

Remedy

User might want to check if the configured local interface is correct. Otherwise, the remote endpoint has been wrongly configured.

Severity

Warning

Message Text

Dropping remote-endpoint IP %addr% on VR %vr% from %client% as it matches a local interface

Message Parameters

| Name | Type |
|--------|---------|
| addr | IPAddrN |
| vr | String |
| client | String |

OTM.KernTrace

Description

Messages that may interest a developer inspecting the events between OTM and kernel.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

OTM.AsstRepRoleChange

Description

Assisted Replication (AR) role has changed. Valid roles are rnve, leaf, and replicator. This message is set to Notice level while the OTM default setting is Warning so user configuration of the EMS filter is required. This is to ensure overly verbose output isnt displayed by default in systems with large numbers of virtual-networks.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Assisted Replication role change, virtual-network: %vnet% configured role: %configured% new role: %new%

Message Parameters

| Name | Type |
|------------|--------|
| vnet | String |
| configured | String |
| new | String |

OTM.CreatVNetFailMaxExcd

Description

This message indicates that a virtual network is not created for the given VLAN and VNI because the number of virtual networks in the system has already reached the maximum limit.

Remedy

User might want to limit the number VLAN-NSI mappings, thereby limiting the requests for virtual networks beyond the system limit.

Severity

Warning

Message Text

Virtual network not created for %vlan% VNI %vni%, since system limit of %max% reached

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |
| vni | uInt32 |
| max | uInt32 |

OTM.CreatVNetFailAlrdyExist

Description

This message indicates that a virtual network is not created for the given VLAN and VNI because a virtual network already exists either for the given VLAN or for the given VNI. Note this message is logged when either the VLAN or the VNI mismatches with that of the already existing virtual network.

Remedy

User might want to check for the conflicting VLAN-NSI mappings and take corrective action.

Severity

Warning

Message Text

Virtual network not created for %vlan% VNI %vni%, since %vnet% already exists for %vnetVlan% VNI %vnetVni%

Message Parameters

| Name | Type |
|----------|--------|
| vlan | String |
| vni | uInt32 |
| vnet | String |
| vnetVlan | String |
| vnetVni | uInt32 |

pim.AnycastRP.RxRegMsg

Description

This event occurs when PIM register message is received from anycast RP peer.

Remedy

No action required - Informational message only

Severity

Debug-Summary

Message Text

Register message received from anycast RP peer %ipa1%, destined to %ipa2% for (Source %ipa4%, Group %ipa3%).

Message Parameters

| Name | Type |
|------|---------|
| ipa1 | IPAddrN |
| ipa2 | IPAddrN |
| ipa3 | IPAddrN |
| ipa4 | IPAddrN |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.AncastRP.FwdRegNoSrcIP

Description

PIM is not able to forward the register messages to anycast RP set peers due to non-availability of Source IP address. Register messages between the Anycast RP set peers are encapsulated with the configured unicast source and destination header.

Remedy

Create loopback interface with routable unicast address configured on it. Enable PIM on the interface and then add unicast address in anycast RP set peer policy file. Refresh the policy file for the new entry to take effect. Verify that "show pim anycast-rp" command displays the newly configured local address

Severity

Warning

Message Text

Register message cannot be forwarded to %anycastrp% anycastRP set peers since Source IP is not configured.

Message Parameters

| Name | Type |
|-----------|---------|
| anycastrp | IPAddrN |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.AncastRP.FwdRegMsg

Description

Register message received from the Designated Router (DR) will be forwarded to all the peers listed in anycast RP set with the encapsulated PIM register header.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Register message is forwarded from %srcIp% to peer %dstIp% in anycastRP address %rp%.

Message Parameters

| Name | Type |
|-------|---------|
| srcIp | IPAddrN |
| dstIp | IPAddrN |
| rp | IPAddrN |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.AnycastRP.TxNullRegMsg

Description

The NULL register message received from Designated Router(DR) will be forwarded to all the peers listed in anycast RP set with the encapsulated PIM register header.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Transmitting NULL Register message for cache (Source %ips%, Group %ipg%) to peer %odip% in anycastRP address %rp% from source address %osip%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipg | IPAddrN |
| rp | IPAddrN |
| osip | IPAddrN |
| odip | IPAddrN |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.AnycastRP.TxRegStopMsg

Description

If there are no local receivers for a group, the nearest Anycast RP node sends a unicast Register stop message for (S,G) to anycast peer node that originally sent the register message for this group.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Transmitting Register Stop message for cache (Source %ips%, Group %ipg%) to peer %odip% in anycastRP address %rp% using source address %osip%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipg | IPAddrN |
| rp | IPAddrN |

| Name | Type |
|------|---------|
| osip | IPAddrN |
| odip | IPAddrN |

[pim.cache.BldMcFDB](#)

Description

Starting to add multicast FDB entry to ASIC.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding cache FDB, %ip1%/%ip2%, %cpu%, %upif%

Message Parameters

| Name | Type |
|------|---------|
| ip1 | IPAddrN |
| ip2 | IPAddrN |
| cpu | String |
| upif | String |

pim.cache.AddMcFDBDone

Description

PIM sent the multicast fdb to be added to ASIC successfully. The FDB would be used for fast path forwarding.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Add cache, %ip0%/%ip1%, FDB succeeded.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.AddMcFDBFail

Description

Pim failed to send the multicast fdb to be added to ASIC. This may be because the message queue to mcmgr is full. Another attempt would be made when the next cache miss is received from mcmgr.

Remedy

Informational message only, for debug purpose.

Severity

Notice

Message Text

Add cache, %ip0%/ip1%, FDB failed.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.DelShadFDB

Description

On shared tree multicast FDB is created for each source learnt. This message is displayed when such entries are cleared. Typically this happens while switching from shared tree to 'source specific tree'.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Delete multicast FDB entry, %ip0%/ip1%, learnt on shared tree.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.RfrshNonUpifFDB

Description

The stream coming from non upcoming interface is discarded by adding a drop entry on in the FDB. This is done to stop unwanted traffic from coming to CPU. In this case it is found that such an entry already exists corresponding to the cache miss received. %ip2% is the source address in cache. It will be shown as 0.0.0.0 for (*,g) and (*,*,rp) entries.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Refresh multicast FDB, %ip0%/ %ip1%, for stream coming from non-upcoming interface, %vname%. Cache source, %ip2%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |
| ip2 | IPAddrN |

pim.cache.AddNonUpifFDB

Description

The stream coming from non upcoming interface is discarded by adding a drop entry on in the FDB. This is done to stop unwanted traffic from coming to CPU.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Add multicast FDB, %ip0%/ip1%, for stream coming from non upcoming interface, %vname%. Cache source, %ip2%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |
| ip2 | IPAddrN |

pim.cache.AddShadFDB

Description

On shared tree multicast FDB is created for each source learnt. The message is displayed when a new source is learnt and is added to FDB.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Add multicast FDB entry, %ip0%/ip1%, learnt on shared tree.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.DelMcFDB

Description

The message is displayed when multicast FSB is added for a cache for fast path forwarding.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Delete multicast FDB corresponding to cache, %ip0%/ip1%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.AddMiscMcFDB

Description

In some situation a cache entry could not be created. This may happen because of no route or no RP information. In such cases multicast FDB entry is added to switch the traffic on ingress vlan. This entry is added mainly to save the CPU from processing, however, in some cases these entry is useful to legitimately switch the traffic. Traffic hitting on Non-DR is one such application, as (*,g) could not be created on Non-DR.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Add multicast FDB entry for stream, %ip0%/ip1%, arriving on vlan %vlan0%, as cache could not be created.

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vlan0 | VLAN |

pim.cache.TmoutAsrtCache

Description

Assert timer expired on the cache. This timer is started after the downstream router listens the assert message on ingress vlan. On expiry join is sent to upstream to trigger another assert process.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Assert timer expired on cache, %ip0%/ip1% (%ip2%).

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.TmoutAsrtCacheDone

Description

Assert timer expired on the cache. This timer is started after the downstream router listens the assert message on ingress vlan. On expiry join is scheduled to upstream neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Assert timer expired on cache, %ip0%/ %ip1%. Scheduling join upstream neighbor %ip2%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.ProcAsrtWinEgr

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Process assert win on cache, %ip0%/ %ip1%, for egress vlan, %nm%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| nm | VLAN |

pim.cache.ProcAsrtWinPrn

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Process assert win on cache, %ip0%/%ip1%, for non-egress vlan, %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| nm | VLAN |

pim.cache.ProcEgrPkt

Description

Message is shown when a multicast data packet is received on egress of corresponding cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Check if assert is required for cache, %ip0%/ %ip1% on vlan %nm%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| nm | VLAN |

pim.cache.ProcIngrJoin

Description

Received join on ingress vlan for cache. Any pending join would be cancelled, as there was another vlan who sent the join message.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Snooped join message on ingress vlan, %nm%, of cache,%ip0%/ %ip1%. Join sent from %ip2%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.ProcEgrJoin

Description

Received join on egress vlan for cache. The vlan would be added as egress on the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Received join message on downstream vlan, %nm%, for cache, %ip0%/ip1%.
Join sent from %ip2%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.ProcIngrPrun

Description

Received prune on ingress vlan for cache. An overriding join could be scheduled if the switch has positive cache entry state.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Snooped prune message on ingress vlan, %nm%, of cache,%ip0%/ip1%. Prune sent from %ip2%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.ProcEgrPrunFwd

Description

Received a prune message on a downstream vlan of cache. The vlan was in forwarding state. The action would be to out the egress in prune pending state as dictated by the RFC.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Received prune message on egress vlan, %nm%,in forwarding state for cache, %ip0%/ip1%. Prune received from %ip2%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.ProcEgrPrun

Description

Received a prune message on a downstream vlan of cache. The vlan was in prune pending state. The action would be reset the prune pending time for the holdtime in the message.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Received prune message on egress vlan, %nm%,in prune pend state for cache, %ip0%/ %ip1%. Prune received from %ip2%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.ProcEgrPrunHld

Description

Received a prune message on a downstream vlan of cache. The vlan was in prune hold state before. The action would be to restart the prune hold timer.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Received prune message on egress vlan, %nm%, in prune hold state for cache, %ip0%/ip1%. Prune received from %ip2%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.ProcEgrGraft

Description

Received a graft message on a downstream vlan of cache. The action would be to put the vlan in egress state.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Received prune message on egress vlan, %nm%, for cache, %ip0%/ip1%. Graft received from %ip2%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.cache.ProcSparseJoin

Description

Received join on the sparse interface, thus the interface is added to the egress list of the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Applying sparse join on egress vlan, %nm%, for cache %ips%/%ipd%. Join received from %ip1%

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |
| ip1 | IPAddrN |

pim.cache.RxIngrSGPrune

Description

Snooped prune message on the ingress vlan. An overriding joining would be scheduled if required.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (s,g) prune on ingress, %nm%, for cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxEgrSGPrune

Description

Received (s,g) prune on the egress vlan. The prune is being applied to the existing cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (s,g) prune on egress vlan, %nm%, for cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.CreatEgrSGRptPruneOnRP

Description

Received (s,g)rpt prune on egress vlan. New cache created as no cache was found.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (s,g)rpt prune on egress vlan, %nm%. New cache created %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RfrshEgrSGRptPruneOnRP

Description

SG rpt prune received for a group whose RP is on this switch. The corresponding cache already exists. The cache's pruned list would be refreshed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (s,g)rpt prune on egress vlan, %nm%, on existing cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxIngrSGRptPrune

Description

PIM-SM: Received (s,g)rpt prune on ingress vlan, %nm%, on existing cache %ips%/ %ipd%. An appropriate overing join could be sent if there is a (s,g) state on the switch. The message is displayed if the elected RP for the group is not on this switch.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (s,g)rpt prune on ingress vlan, %nm%, on existing cache %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxEgrSGRptPruneOver

Description

The SG rpt prune is not applied on the egress as there already is local IGMP membership on the vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Dropping (s,g)rpt prune on egress vlan,%nm%, matched cache %ips%/%ipd%, because of IGMP state on egress.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.CreatEgrSGRptPrune

Description

SG rpt prune received, for which a new (s,g)rpt entry is created.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (s,g)rpt prune on egress vlan, %nm%. Creating new cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RfrshEgrSGRptPrune

Description

SG rpt prune received, on the cache. The corresponding vlan would be removed from egress of the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (s,g)rpt prune on egress vlan, %nm%. Refreshing pruned list on cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxIngrZGPrune

Description

Recived (*,g) prune on the ingress of the cache. Overriding join could be scheduled, if the cache any egress interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (*,g) prune on ingress vlan, %nm%, on cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.CreatEgrZGPruneState

Description

(*g) prune received on the vlan. However no cache was found corresponding to the prune message, thus a new (*g) cache entry is created and the vlan is put in the pruned list.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (*g) prune on egress vlan, %nm%. New cache, %ips%/ipd%, was created as result of the prune message.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RefrshEgrZGPrune

Description

(*g) prune is received on the egress of the cache. The vlan would be scheduled to be pruned from the egress list.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (*,g) prune on egress vlan, %nm%, of cache, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxZZRpPrune

Description

Received the (**,rp) prune message on vlan. The interface would be removed from the corresponding cache's egress list.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (**,rp) prune on egress vlan, %nm%, of cache, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.InheritZgState

Description

(*g) join is received on the vlan, which would be propagated to all the (s,g)/(s,g)rpt cache entries if any..

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Propagating (*g) join, on vlan %nm%, on to the (s,g)/(s,g)rpt entries for group %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ipd | IPAddrN |

pim.cache.InheritZSRpState

Description

Propagating the (*,rp) join received on the vlan to all the cache entries. This pulls all the traffic, from RP to the PMBR router.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Propagating (*,rp) join on vlan, %nm%, for rp, %rp%, to all the cache.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| rp | IPAddrN |

pim.cache.SndRegStopMsg

Description

Register stop for (s,g) is being sent via unicast to RP.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending regiester stop for cache, %ips%/%ipd%, to dst IP, %ip2%

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| ip2 | IPAddrN |

pim.cache.DelEgrVlan

Description

Deleting the egress interface with flag.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting egress vlan, %nm%, on cache %ips%/%ipd%, with flag %flg% , holdtime %tm%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |
| flg | String |
| tm | sInt |

pim.cache.RegMsgVerFail

Description

The register message is dropped as the version set in the packet is wrong.

Remedy

The source switch is not configured for pim version 2 or it is sending erroneous message. Check other switch's configuration.

Severity

Warning

Message Text

Register message from %ips%, to %ipd%, has wrong version, %num%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| num | sInt |

pim.cache.RxNullRegMsg

Description

Received the periodic NULL register message.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received NULL register message from %ips%, to %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ReadRegMsg

Description

The register message received has the above source and group address set in the packet.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received register message for source/group, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxRegMsgUnk

Description

No RP was found for the group address embedded in the register packet. The packet would be dropped.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

No RP was found for the register message, %ips%/%ipd%. Packet is being dropped.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxRegMsgNoRP

Description

The elected RP corresponding to the group in the message is not configured on this switch. Sometimes this may happen because of inconsistent RP information on first hop and other switch on the network. In such case the switch responds by sending register stop. Later if the correct RP is learnt the register message is accepted.

Remedy

In case of static RP configuration please check the RP on first hop and this switch. If the RP is being learnt through BSR mechanism no action is required.

Severity

Info

Message Text

RP found for the register message, %ips%/%ipd%, is not configured on this switch.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxRegMsgInv

Description

The register message is unicasted to RP. This message show up when the message is destined to other interface on the switch. The register packet is silently dropped.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

The RP address, %rp% for group %ipd%, in the switch doesn't match with IP destination address, %ipd2%.

Message Parameters

| Name | Type |
|------|---------|
| rp | IPAddrN |
| ipd | IPAddrN |
| ipd2 | IPAddrN |

pim.cache.RxBdrRegMsg

Description

Received the register message from the PMBR source. The PMBR router acts as a first hop to RP for the stream originating in the Dense mode domain. The register message for such stream originating from PMBR router as border bit set.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received register message the 'Border' bit set from %ips%, to %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ProcRegMsg

Description

Processing the register message originating from the PIM-SM mode. i.e., the border bit in the register message is not set.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Processing register message from %ips%, to %ipd%, for RP %rp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.RefrshNullRegSgState

Description

Processing the null register message on the cache. This basically updates the timer on the cache, and register stop is triggered, so the the normal register message sending is not resumed from the first hop.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Applying NULL register message on cache, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.FndRegMsgCache

Description

The cache corresponding to the register message found with the flow already established. The switch would respond with a register stop message as normal traffic flow is already established.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Found the cache, %ips%/%ipd%, for the register message, with SPT bit set.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RxRegStopMsg

Description

Received the register stop message for the cache. This would restart the register suupress timer, such that the register message would be suppressed for 'Register suppression time'.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received register stop message. Matching cache found %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.TxNullRegMsg

Description

Going to send periodic null register message for the cache, from the first hop router. The message would be sent to the RP.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Sending NULL register message for cache, %ips%/%ipd% to rp %rp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.RegMsgCksumFail

Description

The register message failed the checksum test. The packet would be dropped.

Remedy

The checksum failure could happen because first hop and RP may be calculating the register checksum differently. The cisco calculates the checksum for register message differently than as recommended by RFC. The default for the extreme is cisco way, which could be changed to RFC method through cli, configure register-checksum-to-exclude-data. If the message is encountered even if the source switch is extreme's switch, please make sure that, the configurations on source and RP are identical.

Severity

Error

Message Text

Register message from %ips%, to %ipd% failed the checksum test.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.CreatRegMsgState

Description

Created (s,g) entry for register message. There was no (*,g) entry corresponding to the group. The (s,g) entry is created in order to facilitate instant join to the source, for the new downstream members. If the (s,g) is not created, the new members may have to wait for upto 1 minutes to receive any packet. Creating (s,g) entry is way to remember all the source streaming to group, towards which instant (s,g) join could be sent on receiving (*,g)/IGMP join from downstream routers/hosts.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

No state for the register message received. Creating (s,g) enrtry, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ChgRpIngrParmOnSg

Description

Route to rp has changed. The changed information is being updated on non (s,g) cache entries.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Change in RP upstream interface and neighbor info on (s,g)/(s,g)rp cache, %ips%/%ipd%/%iprp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| iprp | IPAddrN |

pim.cache.GetRpRoute

Description

While creating multicast cache the route lookup for RP was done. The resultant gateway found is displayed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Route to rp %ip0% found with gateway, %ip1%\n

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.AddMcCache

Description

Building dense mode cache.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Adding cache, %ips%/%ipd%, with ingress, %nm%, to database.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| nm | VLAN |

pim.cache.LkupSrcRouteFail

Description

No cache can be created if the route lookup fails. This may be a legitimate condition too.

Remedy

Please check if there is any route present for the source in the routing table. If the route is expected to be there please check the unicast protocol being run, to debug the problem. Adding static route will also solve the problem.

Severity

Info

Message Text

PIM-DM: Cache could not be created as route to the source, %ips% could not be found.\n

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |

pim.cache.CmplIngrVlanFail

Description

Cache is created only if the stream is received on upstream interface. The upstream interface is the gateway interface towards the source network of the stream.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

PIM-DM: cache could not be created for source, %ips%, as stream arrived on non upcoming interface, %if1%. Expected interface, %if2%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| if1 | VLAN |
| if2 | VLAN |

pim.cache.CreatNegCache

Description

Cache entry built for (s,g), however, no downstream egress was added to the cache. Thus, prune would be sent towards the source. One reason for no egress be added could be because the switch is a leaf router on the dense cloud. A leaf router is that router, which has no IGMP member on any of the vlan, and no PIM neighbor on any of the vlan except the ingress vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Created negative cache entry, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.CreatPosCache

Description

Created positive cache entry, i.e., the cache has at least one egress interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-DM: Created positive cache entry, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ProcEgrTimeExp

Description

Timer expired on the egress vlan. The vlan would be removed from the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Egress timer on egress, %nm%, for cache, %ips%/%ipd%/%iprp%, expired. Cache type, %tp%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |
| iprp | IPAddrN |
| tp | String |

pim.cache.ChgPruneState

Description

Prune state timer expired on the vlan. The vlan is going to prune state 2. A reienforcing prune would be sent to downstream.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Prune timer expired on vlan, %nm%, for cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.SetPruneState

Description

Prune state timer expired on the vlan for the second time. The vlan will be pruned instantaneously.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Pruning vlan, %nm%, on cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ClrPruneState

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Prune timer expired on vlan %nm%, on cache %ips%/%ipd%. The vlan would be added to egress.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ExpPruneTimeUnk

Description

On prune timer expiry the egress is put in different states as described in RFC. In this case the state of the egress could not be recognized. This is an error condition and there is no suggested remedy for this.

Remedy

Contact tech support.

Severity

Error

Message Text

Egress, %nm%, on cache %ips%/%ipd%, is in unknown state, when the prune timer expired.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.TmoutJoinTime

Description

Timer on ingress vlan was running to wait for random time before sending any join upstream. Such timer is started mainly for sending overriding joins. Joins are not sent immediately in the hope of overriding join from other switch on the network. If no join is snooped this timer expires, and join is sent upstream.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Timer on the ingress, %nm%, of cache, %ips%/%ipd% expired. Sending join upstream.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.SetEgrTime

Description

Egress timer is being set on the given egress for the given cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Setting egress timer on vlan, %nm%, for cache, %ips%/%ipd%, with timeout period %num%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |
| num | sInt |

pim.cache.DelEgrVlanFail

Description

The vlan being deleted from the cache is not a member of egress list .

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Delete egress vlan, %nm%, from cache, %ips%/%ipd%/rp%, failed as the vlan has no join state on the cache.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.DelEgrVlanDup

Description

The interface being deleted from egress list of the cache is already in pruned list.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Vlan, %nm%, is already in pruned state on cache, %ips%/ %ipd%/ %rp%. Delete operation is not required.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.DelNonSgMcFDB

Description

For no (s,g) entries, to del an egress to the cache all the associated entries' are removed from the FDB, such that the next stream would program all the egress excluding the new one.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting egress, %nm%, on Non (s,g) cache, %ips%/ %ipd%/ %rp%. Removing multicast FDB.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.DelEgrVlanDone

Description

Displaying the cache state after egress delete.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleted egress of cache, %ips%/ %ipd%/ %rp%. As a result egress list is %st%. Number of local member on cache is %num1%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

| Name | Type |
|------|---------|
| rp | IPAddrN |
| st | String |
| num1 | sInt |

pim.cache.DelCacheNoEgr

Description

The (*,g) cache entry is deleted as soon as the egress list is empty.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting the (*,g) cache entry, %ips%/%ipd%/rp%, as there is no egress.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.ClrEgrVlanDone

Description

The cache entry has no egress interface now. The cache would be deleted eventually when the entry timer expires. The entry timer expires based on the actual stream flow.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

The egress list of cache, %ips%/%ipd%/%rp%, is empty.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.StrtCacheTime

Description

Entry timer on (*,g) is run only if there is no local membership for the group address. Here the last IGMP member is deleted, but there are other downstream members, so start the entry timer on the (*,g) cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

No local member on (*,g) cache, %ips%/%ipd%/%rp%. Starting cache entry timer.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.SwitchSrcTree

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Switching to SPT tree on %name0% for source, %ips% and group, %ipd%.

Message Parameters

| Name | Type |
|-------|---------|
| name0 | String |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ChgIngrSgNbr

Description

Upstream gateway changed for (s,g) entry, however the incoming interface is the same.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Upstream nbr changed from %ip2% to %ip3%, on cache %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ip2 | IPAddrN |
| ip3 | IPAddrN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ChgIngrVlan

Description

Dense mode cache upstream interface is changed as route to the source changed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Change in upstream interface on cache, %ips%/ %ipd%, from %num0% to %num1%

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| num0 | VLAN |
| num1 | VLAN |

pim.cache.ChgIngrDensNbr

Description

Upstream gateway changed for (s,g) entry, however the incoming interface is the same.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Upstream nbr changed from %ip2% to %ip3%, on cache %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ip2 | IPAddrN |
| ip3 | IPAddrN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ExtCacheTime

Description

Only for those systems where ASIC doesn't support age bit the cache is not deleted even after expiry time. Only the FDB is deleted and if the stream is still active the next packet would restart the entry timer and will reinstate the FDB entry.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Extending lifetime for cache, %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.GetCache

Description

Find or delete cache for the given source/group/rp.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Find or create cache entry, %ips%/%ipd%/%rp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.CreatCache

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Create a new multicast cache entry, %ips%/%ipd%/%rp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.ImpprtEgrData

Description

New cache entry is being created which would inherit egress list from the (*,g) or (*,rp) or (s,g)rpt entries.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Inheriting egress list from cache, %ips%/%ipd%/%rp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.FndRpFail

Description

No RP could be found for the group so cache create operation failed.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Create PIM cache failed as no RP could be found for group, %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.cache.GetRpRouteFail

Description

No route to the RP so, cache could not be created.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Create PIM cache failed as no route lookup for RP, %ip0%, returned NULL.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.cache.InsIngrVlan

Description

Displaying the ingress vlan for the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

The ingress vlan for the cache being created is %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

pim.cache.AddIGMPVlan

Description

Learnt a new IGMP member on the vlan, which would be added to the egress list of all the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding IGMP membership for, grp %ip0% on vlan %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| nm | VLAN |

pim.cache.DelIGMPVlan

Description

Leaving IGMP member on the vlan. This would result into deleting egress vlan's IGMP flag from all the relevant cache entries.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting IGMP membership for grp, %ip0% vlan %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| nm | VLAN |

pim.cache.TmoutGarbTime

Description

On expiry of this timer all the statistics on the shared tree is cleared. PIM's internal unused route database is cleared too.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Expired internal garbage collection timer.

pim.cache.ChgRpMapFail

Description

Route to new RP does not exist.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

RP failover could not be completed as there is no route to new RP, %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.cache.TmoutEgrTime

Description

The egress timer being run for the cache has expired. Subsequent action would be taken for the egress, whoes timer were to expire.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Egress timer expired for cache, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ClrRpMap

Description

Existing RP for the group is removed from the database with no backup RP. So the cache would be deleted.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

The elected RP for the cache, %ips%/ipd%, is NULL. Cache would be deleted.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ProcPruneMsg

Description

Existing RP for the group is removed from the database with no backup RP. So the cache would be deleted.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Received prune message of type, %tp%, on vlan %vl%, for cache, %ips%/rp%.

Message Parameters

| Name | Type |
|------|---------|
| tp | String |
| vl | VLAN |
| ips | IPAddrN |
| rp | IPAddrN |

pim.cache.AddEgrVlan

Description

Adding or refreshing the egress interface with the flag.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding egress vlan, %nm%, of %tp% type, on cache %ips%/ipd%, with flag %flg%, holdtime %tm%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| tp | String |
| ips | IPAddrN |
| ipd | IPAddrN |

| Name | Type |
|------|--------|
| flg | String |
| tm | sInt |

pim.cache.StrtCacheTimer

Description

Refresh entry timer on cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Starting entry timer on cache %ips%/%ipd% for time %tm%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| tm | sInt |

pim.cache.StopCacheTimer

Description

Refresh entry timer on cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Stopping entry timer on cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ProcDensRtChg

Description

Route change being applied to above cache in dense mode.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM DM cache src route change (%str0%) for %ips%/%ipd%,.

Message Parameters

| Name | Type |
|------|---------|
| str0 | String |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.ReplDensRt

Description

More specific route being added to route.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Replacing to more specific route for %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.RecvInfRoute

Description

Switching to inferior route to destination.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received inferior route to destination %ips%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |

pim.cache.SendMcmMsgFail

Description

Error while sending message to mcmgr.

Remedy

Check whether mcmgr process is dead or switch is in heavy load, contact tech support.

Severity

Error

Message Text

Message (%n1%) could not be sent to mcm in %n2% attempt %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| n1 | sInt |
| n2 | sInt |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.DelIGMPV3Vlan

Description

Leaving IGMPv3 member on the vlan. This would result into deleting egress vlan's IGMP flag from all the relevant cache entries.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting IGMPv3 membership for grp/src, %ip0%/%ip1% vlan %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| nm | VLAN |

pim.cache.AddIGMPV3Vlan

Description

Learnt a new IGMPv3 member on the vlan, which would be added to the egress list of all the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding IGMPv3 membership for, grp/src %ip0%/%ip1% on vlan %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| nm | VLAN |

pim.cache.DelSubShadFDB

Description

On shared tree multicast FDB is created for each source learnt. This message is displayed when such entries are cleared. Typically this happens while switching from shared tree to 'source specific tree'.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Delete all multicast FDB entry, %ip0%/ %ip1%, learnt on shared tree.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.AddSgOnRPtree

Description

This log is written when receiving data for an existing (S,G) entry, but on the Upif toward RP. We program hardware's inVlan to be Upif toward RP, instead of the usual Upif toward Src.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Add multicast FDB entry, (S,G) [%ip0%, %ip1%], on RP tree with inVlan using Upif toward RP

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.RegPduNoSpecialFlag

Description

This log is written when receiving Register PDU for an existing (S,G) entry, but whose SPECIAL flag was not already set. We must set it so that we can send JOINS back toward Src to handle scenarios where Last-Hop-Router is in between First-Hop-Router and RP.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Receiving Register Pdu for existing (S,G) [%ip0%, %ip1%], whose special flag was not set

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.cache.SkipRpDel

Description

RP is being deleted. So skip this RP while processing.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Skipping RP %ip0% as it is being Deleted.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.cache.NoNeighbor

Description

Cache is created only if the stream is received from a valid neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

PIM-DM: Cache could not be created for traffic from, %ips%, on circuit,%if1%. No such neighbor exist.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| if1 | VLAN |

pim.cache.DelRegOif

Description

The register OIF is being deleted from the cache as RP is not available .

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting Register OIF from cache, %ips%/%ipd%/%rp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.cache.RxIngrZZRpPrune

Description

Recived (**,rp) prune on the ingress of the cache. Overriding join could be scheduled, if the cache any egress interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM-SM: Received (**,rp) prune on ingress vlan, %nm%, for cache %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.cache.DropCacheMissMsg

Description

The source and group could have been denied by the register filter if the cache is dropped due to register policy.

Remedy

Multicast data traffic from this source denied by the register filter, if it is not a valid source then find the origin of this packet then stop the stream.

Severity

Warning

Message Text

Cache miss message received from %ipa1%, destined to %ipa2% is dropped due to %dropReason%.

Message Parameters

| Name | Type |
|------------|---------|
| ipa1 | IPAddrN |
| ipa2 | IPAddrN |
| dropReason | String |

[pim.debug.PrnEgrFDBData](#)

Description

Debug message to be able to dump the egress on a cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Egress: %num0%

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.debug.AddEgrVlan

Description

Debug message to dump the egress information for the cache, being sent to the MCM manager.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding egress interface, %num0% (remote addr: %ip0%), to FDB.

Message Parameters

| Name | Type |
|------|---------|
| num0 | sInt |
| ip0 | IPAddrN |

pim.debug.DumpEgrVlanCnt

Description

Debug message showing the number of egress being added to cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding cache, %ips%/%ipd%, with egress count %num0%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| num0 | sInt |

pim.debug.DelCacheEntry

Description

Shows that the delete cache message is being sent to MCM process.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending delete cache message to MCM for cache, %ip0%/%ip1%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.debug.ProcCacheMissMsgFail

Description

The interface id in the cache miss message from MCM is invalid or PIM has not learnt about such an interface.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Could not process cache miss message as the interface, %num0%, could not be found.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.debug.ProcMcPktFail

Description

Multicast data packet in control range is not routed, so there won't be any multicast cache entry for the same.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Cache miss is being dropped, as destination, %name0%, is in control range.

Message Parameters

| Name | Type |
|-------|---------|
| name0 | IPAddrN |

pim.debug.LkupVlanModeFail

Description

Invalid configuration on the vlan.

Remedy

Contact tech support.

Severity

Notice

Message Text

Cache miss on the vlan, %name0%, is dropped as it has no pim sparse or dense configured.

Message Parameters

| Name | Type |
|-------|------|
| name0 | VLAN |

pim.debug.ProcCacheMissMsg

Description

The cache message for given s,g,iif being processed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received cache miss for source, %ip0%, group, %ip1%, invlan %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| nm | VLAN |

pim.debug.SetFirstHopFlag

Description

The cache miss has been detected to be for a stream originating from host connected to one of the vlans. Such streams are treated differently in PIM-SM as explained in the RFC.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

First hop flag is set for stream, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.CreatCacheEnt

Description

PIM-SM: Going to create a new cache entry for given S/G.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Going to create cache entry for stream, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.CreatShadEntFail

Description

PIM learns the source addresses when the last hop is in shared tree. Each new source is added in internal database. The message shows that source could not be added in database. This could happen mainly because of memory alloc failure.

Remedy

Check memory stats for the interface for PIM. If nothing wrong is found, contact tech support.

Severity

Error

Message Text

Could not create a shadow entry on RPT tree for source, %ips%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |

pim.debug.SwitchSPTModeTry

Description

Since the (*,g) entry has local membership try to switch to SPT tree.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Switch to SPT tree, if possible for source, %ips%, group, %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.AddSPTFDB

Description

After switching to SPT tree, if the ingress of (*,g) and (s,g) is the same the (s,g) is added to the FDB.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Add new (s,g) FDB, %ips%/%ipd%, as the ingress of (s,g) and (*,g) is the same.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.AddRPTFDB

Description

Either switch to SPT tree failed or (*,g) and (s,g) has different ingress. In such condition FDB for the shadow entry is added to forward packet coming on the shared tree. The FDB entry is removed when the switch gets a packet on SPT tree.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Add FDB for shadow entry, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.CheckPktCnt

Description

On shared tree the data packet rate is measured. When the configured threshold exceeds the last hop switches to SPT tree. The message shows that the rate would be checked for the given multicast stream.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

On shared tree, check for traffic rate for source, %ips%, group %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.ProcTimeExp

Description

Going to process PIM timer for n seconds.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Processing PIM timer for %num0% seconds.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.debug.SndEpmMsg

Description

Sending hello to EPM from the given thread.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending update to epm from %name% thread.

Message Parameters

| Name | Type |
|------|--------|
| name | String |

[pim.debug.TermAllTaskDone](#)

Description

Debug message to show that all the thread has finished its job.

Remedy

This message should never appear. Please contact tech support on seeing this.

Severity

Error

Message Text

All PIM task terminated.

[pim.debug.InitRawSockFail](#)

Description

Error found for raw socket creation.

Remedy

Contact tech support.

Severity

Error

Message Text

Error in creating and initializing raw socket for PIM.

pim.debug.InitEMSFail

Description

PIM could not register one of the components with EMS. Process cannot be started unless this succeeds.

Remedy

This is an error condition, please contact tech support.

Severity

Error

Message Text

Failed to register %name% component with EMS.

Message Parameters

| Name | Type |
|------|--------|
| name | String |

pim.debug.InitDSFail

Description

PIM is unable to initialize an internal service which is required for correct protocol operation. This error is not expected and is indicative of a serious problem.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Critical

Message Text

Unable to initialize an internal service.

[pim.debug.StrtPimMsg](#)

Description

Pim has started to listen for PIM messages.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM has started listening for PIM messaged with status, %num0%.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

[pim.debug.StrtMcmMsg](#)

Description

PIM has started listening for messages from MCM.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Pim has started to listen for MCM message with status, %num0%.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.debug.InitDsptchOK

Description

PIM registered to dispatcher and EPM.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Dispatched initialization done.

pim.debug.AllocMemFail

Description

Memory allocation failed.

Remedy

Check the available memory on the system. The remedy would be taken internally, however, if the memory exhaustion is unexpected, please contact tech support.

Severity

Warning

Message Text

Failed to allocate memory at %st%, %num%.

Message Parameters

| Name | Type |
|------|--------|
| st | String |
| num | sInt |

pim.debug.CreatPimVlanFail

Description

For each vlan on which pim is configured, PIM creates an internal database to keep track of state and stats on the vlan. The message shows the failure while attempting to create the internal db.

Remedy

Check memory status and contact tech support.

Severity

Error

Message Text

New PIM interface corresponding to vlan, %nm%, could not be created.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

pim.debug.DelPimVlanFail

Description

The vlan may not be configured for PIM, so it could not be found while deleting.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM vlan corresponding to vlan, %nm%, could not be found.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

pim.debug.TermPimDone

Description

Epm is shutting down PIM.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

PIM shutdown initiated through EPM.

pim.debug.UnregPimCompFail

Description

The interface unregisters itself to receive packets with destination address 224.0.0.13, when PIM is disabled. The message shows that the unregsiter process failed.

Remedy

Contact tech support.

Severity

Error

Message Text

Unable to unregister for 224.0.0.13 address on socket for vlan, %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

pim.debug.RegPimCompFail

Description

The interface registers itself to receive PIM packets when PIM is enabled. The message shows that the register process failed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Unable to register for 224.0.0.13 address on socket for vlan, %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

pim.debug.GetVlanIndxOK

Description

Getting kernel if index for vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Got kernel if index for vlan %name0% as %num0%.

Message Parameters

| Name | Type |
|-------|------|
| name0 | VLAN |
| num0 | sInt |

pim.debug.DumpVlanData

Description

Show the vlan information learnt by PIM..

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Vlan Name %name0%, ip %ip0%, masklen %num0%, id %num1%.

Message Parameters

| Name | Type |
|-------|---------|
| name0 | VLAN |
| ip0 | IPAddrN |
| num0 | sInt |
| num1 | sInt |

pim.debug.AddNbrFail

Description

The neighbor address in the hello packet was not in the same subnet as interface, so was rejected.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Adding nbr %ip0%, on pim interface, %nm%, failed.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| nm | VLAN |

pim.debug.FreeRouteData

Description

The route to a destination is cached in PIM such that the next lookup could be done locally. When this cached route is not being used, its freed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Delete cached route in PIM to destination, %ip0%, as it is no longer used.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.debug.ProcRegStopMsgFail

Description

Register stop message is applied only for the matchin cache entries. The message just shows that the cache with different source is being skipped.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

The register stop for %ip0%, could not be applied to cache with source, %ips%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ips | IPAddrN |

pim.debug.GetRpGrpEnt

Description

Trying to get group db in the RP database.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Get the group entry for, %ipd%, in the RP-Group mapping database.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.debug.GetRpGrpEntFail

Description

This message means there have been internal error while creating group to RP mapping.

Remedy

Unexpected error happened. Please contact tech support.

Severity

Error

Message Text

Could not get group entry for, %ipd%, unexpectedly.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.debug.RegDstRoute

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%name0% route to destination, %ip0%.

Message Parameters

| Name | Type |
|-------|---------|
| name0 | String |
| ip0 | IPAddrN |

pim.debug.LkupDstRouteFail

Description

Reverse path lookup failed as route to source could not be found while creating PIM cache entry.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Reverse path lookup failed for source address, %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.debug.FndLocRoute

Description

Route to destination was found in pim route database. The route is stored locally after getting the result from route manager. For the subsequent lookup for the same destination route manager need not be consulted. The cached route is learnt.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Cached route found for destination %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

[pim.debug.GetRoute](#)

Description

The route for the given destination could not be found, so route manager is going to be asked for the route to the destination.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

New route lookup for %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.debug.LkupRouteNull

Description

Route manager don't have any route to the given destination.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

No route could be found in routing table for destination, %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.debug.AddMcCacheFail

Description

A new cache could not be created. This could happen because of memory alloc failure.

Remedy

If the problem persists contact tech support.

Severity

Warning

Message Text

Could not add cache, %ips%/%ipd%/%iprp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| iprp | IPAddrN |

[pim.debug.GetEgrCacheFail](#)

Description

Internal error, probably due to memory exhaustion.

Remedy

Contact tech support.

Severity

Error

Message Text

Could not find/allocate egress entry for, %nm%, on cache, %ips%/%ipd% .

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

[pim.debug.CalcPktCntFail](#)

Description

Error occurred while trying to update the packet rate for the stream on RPT tree.

Remedy

Contact tech support..

Severity

Error

Message Text

Failed to calculate data rate from stream, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.ChgSPTModeRtrn

Description

SPT threshold is not reached for the stream, so the stream stays on the RPT tree.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Switching to SPT tree failed because of insufficient rate %dl% of the stream, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| dl | sInt |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.TxTrigCRPMsg

Description

If the CRP interface is deleted, or is going down, it sends a poisoned CRP advertisement to BSR, for faster RP convergence.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending poison reversed CRP message for CRP, %ip0%, as the interface is going down.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.debug.ChgRouteSgCache

Description

Route change being applied to the given cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%name0% route change is being applied to S,G cache, %ips%/ %ipd%/ %rp%

Message Parameters

| Name | Type |
|-------|---------|
| name0 | String |
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.debug.ChgRouteSgCacheRtrn

Description

The add route notification got from the route manager cannot be applied to the cache. There can be situation when the same message could be applicable for other cache but fail for remaining.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Add route could not be incorporated in the cache, as the new route is less specific than the route being used by cache.

pim.debug.AddRouteSgCache

Description

The add route message from route manager is being applied to replace the existing route on the given cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

New route to %ipa%, would replace the existing route being used by cache, %ips%/%ipd%. New upcoming interface, %nm%, new gateway, %ipg%.

Message Parameters

| Name | Type |
|------|---------|
| ipa | IPAddrN |
| ips | IPAddrN |
| ipd | IPAddrN |
| nm | VLAN |
| ipg | IPAddrN |

pim.debug.ChgIngVlanSgCache

Description

The route to source changed to change the ingress interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Ingress interface for cache, %ips%/%ipd%, changed from %nm0% to %nm1%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| nm0 | VLAN |
| nm1 | VLAN |

pim.debug.RecvRoute

Description

When a route for registered prefix changes or become available route manager notifies the client. The message shows up for such a notification.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received route information for destination %ip0%/bitsmask%, with ingress vlan %nm%, gateway %gw%

Message Parameters

| Name | Type |
|----------|---------|
| ip0 | IPAddrN |
| nm | VLAN |
| bitsmask | sInt |
| gw | IPAddrN |

pim.debug.UpdtRouteData

Description

On receiving the notification for a new route the old route was replaced. So the old cached route is being deleted.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting route to detination, %ip0%, as its not being used in PIM.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

[pim.debug.DelRouteData](#)

Description

Deleting cached route for the given destination.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting cached route to destination, %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

[pim.debug.RfrshRouteData](#)

Description

The un-referred routes are deleted in PIM, peridically.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Periodic refresh for the cached route database under progress.

pim.debug.DelPimCache

Description

Delete PIM cache entry.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Delete PIM cache, %ips%/%ipd%/%rp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.debug.TmoutCacheEnt

Description

Entry timer for the given cache expired. This happens because the stream may have stopped coming on to the switch.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Entry timer expired to %num0%, for cache, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| num0 | sInt |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.RecvPktCnt

Description

For the stream on shared tree packet rate is monitored, to check if the rate is still below the threshold. If the threshold is exceeded the stream is switched to SPT tree mode.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received the rate %d1% for stream, %ips%/%ipd%, on shared tree.

Message Parameters

| Name | Type |
|------|---------|
| d1 | sInt |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.RecvPktCntRtrn

Description

The packet count is sent by mcmgr as directed by PIM. The message shows up if the entry type sent by MCM is unsupported.

Remedy

Unexpected message received from MCM. Not necessarily an error condition. The user may want to inform tech support.

Severity

Warning

Message Text

Received packet count for unsupported entry type, %num0% for s/g %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| num0 | sInt |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.AddRouteMsg

Description

Route manager sent a new route.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received route reachable message for destination, %ips%, masklen, %num0%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| num0 | sInt |

pim.debug.RecvRouteMsg

Description

Received message from route manager of the given type.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Message type %nm% received from route manager.

Message Parameters

| Name | Type |
|------|--------|
| nm | String |

pim.debug.DelRouteMsg

Description

Route manager sent a del route message.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received route not reachable message for destination, %ips%, masklen, %num%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| num | sInt |

pim.debug.InitRtMgrDone

Description

Shows the result of registering with route manager. The %num1% is the internal id to be used to receive the messages from the route manager, %num2% is the id on which route lookup message would be sent.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Registered with route manager with return value, %num0%, rtMgrDataPeerId %num1%, NotifPeerId, %num2%..

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |
| num1 | sInt |
| num2 | sInt |

pim.debug.InitCacheFail

Description

Internal error while creating socket to register with MCM.

Remedy

Contact tech support.

Severity

Error

Message Text

CacheService init failed.

[pim.debug.GetRegIndx](#)

Description

Shows the ID used to tell the kernel to send unicast register message.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

The kernel index to be used for sending register message is %num0%.

Message Parameters

| Name | Type |
|------|------|
| num0 | slnt |

[pim.debug.RegMCMDone](#)

Description

The peer id to be used to get the messaged from MCM and route manager.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Registered PIM with MCM and cache manager. The peer IDs are, %num0% %num1%.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |
| num1 | sInt |

pim.debug.ClrEgrIGMPJoin

Description

While inheriting the egress from (s,g)rpt, clearing the IGMP join flag on egress if the vlan doesn't have the IGMP membership for the group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Clearing IGMP join on vlan, %nm% on cache, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| nm | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.ChgRoutZgCache

Description

Route change being applied to the given cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%name0% route change is being applied to *,G cache, %ips%/%ipd%/%rp%

Message Parameters

| Name | Type |
|-------|---------|
| name0 | String |
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.debug.AddRouteZgCache

Description

The add route message from route manager is being applied to replace the existing route on the given cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

New route to %ipa%, would replace the existing route being used by (*,g) cache, %ipr%/ %ipd%. New upcoming interface, %nm%, new gateway, %ipg%.

Message Parameters

| Name | Type |
|------|---------|
| ipa | IPAddrN |
| ipr | IPAddrN |
| ipd | IPAddrN |
| nm | VLAN |
| ipg | IPAddrN |

pim.debug.DelRouteZgCache

Description

Deleting the route existing route being used for RP reachability.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Route to RP is being deleted for (*,g) cache, %ips%/ %ipd%/ %rp%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.debug.DelZgCacheNull

Description

The delete route message resulted in the cache delete. The reason could be because there was no alternate route present in the routing table or the ingress pointed by new route is down or has PIM disabled.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Removing (*,g) cache, %ips%/%ipd%/%rp%, because the new route is %nm1% or because of %nm2%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |
| nm1 | String |
| nm2 | String |

pim.debug.ChgIngVlanZgCache

Description

The route to source changed to change the ingress interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Ingress interface for cache, %ips%/%ipd%/%rp%, changed from %nm0% to %nm1%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |
| nm0 | VLAN |
| nm1 | VLAN |

pim.debug.ChgRouteRef

Description

The add or delete route change callback was received, but there was no change in ingress vlan or gateway information. However the route reference is changed to this new one so that the future update could be referred to this new cached route.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Replacing route reference for cache, %ips%/%ipd%/%rp%, however, no ingress or gateway change.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.debug.UpdtRPDenseCache

Description

Elected RP change is being applied to the given cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Applying RP change from, %ip2% to %ip3% on dense mode cache entry, %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ip2 | IPAddrN |
| ip3 | IPAddrN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.UpdtRPSparseCache

Description

Elected RP change is being applied to the given cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Updating the sparse mode cache, %ips%/ %ipd%/ %rp%, for RP change.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |

pim.debug.LkupPimVlanFail

Description

Pim message received on unexpected interface on which PIM is not enabled.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Pim interfce could not be found for id %num0%.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.debug.RxRegMsg

Description

Received register message from first hop router.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received register message.

pim.debug.RxJoinPktUnk

Description

Join-prune is excepted only if the sender is accepted as neighbor before.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Join-prune packet received from %ip0% is dropped as its not in the neighbor list of pim interface %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| nm | VLAN |

pim.debug.RxBSRPkt

Description

Received bootstrap message from the given neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received bootstarp packet from %ip0% on vlan %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| nm | VLAN |

pim.debug.RxPktUnk

Description

Packet type in the pim is unsupported..

Remedy

Informational message only, for debug purpose.

Severity

Notice

Message Text

PIM packet with unknown type, %num0%, received.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.debug.SetSockParm

Description

Socket set operation failed. This may happen because of an internal error.

Remedy

Contact tech support.

Severity

Error

Message Text

Error while setting socket option, %nm%, before transmitting pim packet.

Message Parameters

| Name | Type |
|------|--------|
| nm | String |

[pim.debug.TxPktFail](#)

Description

The send system call failed with the return code.

Remedy

Contact tech support.

Severity

Error

Message Text

Packet transmit unsuccessful. Returned error code, %num%, error message, %msg%.

Message Parameters

| Name | Type |
|------|--------|
| num | sInt |
| msg | String |

[pim.debug.InitSockParm](#)

Description

PIM failed to set an option on a socket used for internal communication. Failure to set correct socket options may result in incorrect operation of PIM protocol.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Critical

Message Text

Error while setting socket option, %nm%.

Message Parameters

| Name | Type |
|------|--------|
| nm | String |

pim.debug.CreatTCPSockFail

Description

PIM failed to create a socket used for internal communication. Socket creation failures may result in incorrect operation of PIM protocol.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Critical

Message Text

Failed to create PIM raw socket.

pim.debug.RxPktInv

Description

Receive operation on the PIM socket failed with error code.

Remedy

If the message shows up persistently, contact tech support.

Severity

Notice

Message Text

Packet receive failed with error code %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | sInt |

[pim.debug.RxPktSizInv](#)

Description

Received packet size is less than that IP header packet size.

Remedy

If the message shows up persistently, contact tech support.

Severity

Notice

Message Text

Packet received has size, %num%, less than size of IP header.

Message Parameters

| Name | Type |
|------|------|
| num | sInt |

pim.debug.TermMsgTask

Description

This is an unexpected event. Message receive task should not fail.

Remedy

Contact tech support.

Severity

Error

Message Text

PIM message received task is being terminated.

pim.debug.RecvRouteMsgOK

Description

Message received from route manager about a route update.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received message from route manager peer, %num0% of size %num2%.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |
| num2 | sInt |

pim.debug.RecvMsgUnk

Description

Received message from unexpected peer.

Remedy

If the message shows up persistently, contact tech support.

Severity

Notice

Message Text

Receive message from unexpected peer, %num0%.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.debug.RecvCacheMissMsg

Description

Received MCM message of 'cache-miss' type. This means kernel received a multicast stream which had no matching cache entry.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received cache miss message from MCM.

pim.debug.RecvWrongIfMsg

Description

Received a cache miss for a stream coming from unexpected interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received wrong ingress message from MCM.

pim.debug.RecvIGMPAddMsg

Description

Received notification for new membership add on a vlan for the given group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Received igmp membership add message from MCM for source %ip0%, group %ip1% on vlan %if1%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| if1 | String |

pim.debug.RecvCacheRateMsg

Description

Received cache rate update from MCM. This message used in updating PIM timer etc.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received stream rate update message from MCM for cache, %ips%/%ipd%, with rate, %num0%

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| num0 | sInt |

pim.debug.RecvMcmMsgUnk

Description

The message should not come up unless, the pim and mcmgr processes are not compatible.

Remedy

Contact tech support.

Severity

Notice

Message Text

Received message from MCM of unknown type, %num0%.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.debug.LkupRouteSucc

Description

Route lookup for the address has succeeded in the local PIM database.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Cached route found for destination, %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.debug.SndMcmMsg

Description

For give src/grp pair a message is being sent to MCM.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending message to Mcm for cache %ip0%/%ip1%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.debug.AllocCacheMemFail

Description

Memory out of condition has resulted into failure in cache creation.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Pim cache creation failed for lack of memory.

pim.debug.GetVlanIndxFail

Description

Getting kernel if index for vlan has failed.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Kernel i/f index for vlan %name0% could not be found.

Message Parameters

| Name | Type |
|-------|------|
| name0 | VLAN |

[pim.debug.CreatIpmcCache](#)

Description

Cache miss is received for s,g not already in kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Creating new cache for src/grp.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

[pim.debug.CreatIpmcCacheFail](#)

Description

Cache could not be created for S,G.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Failed to create new cache for src/grp, %ips%/%ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.TrySharedTreeFwd

Description

Cache could not be created for s,g.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Trying to forward packet on shared tree, %ips%/%ipd% .

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.ChkRegMsg

Description

Message indicates that a register message is to be sent to RP

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Register to RP, %rp%, is required for %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| rp | IPAddrN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.LkupHwCacheDtect

Description

Message indicates that on first hop the cache is already programmed in h/w.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Hardware cache already programmed for %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.RxPktOnSG

Description

Indicates that packet is received on (s,g) tree. It will result into (s,g)rpt prune towards RP.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received first packet on S,G tree for %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.ChkSgRptPrune

Description

Checking if the (*,g) entry has different ingress than (s,g) entry The message indicates that it is, and thus a (s,g)rpt prune could be generated towards RP.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

(* ,g) entry with different ingress, %num%, exists for %ips%/ %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| num | sInt |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.debug.SetSockVlan

Description

Socket set operation failed. This may happen if vlan mgr and pim db is out of sync. If it happens regularly pl contact tech support.

Remedy

Contact tech support.

Severity

Debug-Summary

Message Text

Error while setting socket option, %nm%, before transmitting pim packet to vlan %name0%.

Message Parameters

| Name | Type |
|-------|--------|
| nm | String |
| name0 | VLAN |

pim.debug.RcvVlanMsg

Description

Strictly debug message received from vlan module.

Remedy

None.

Severity

Debug-Data

Message Text

Received vlan message, %nm%, for vlan %name0%

Message Parameters

| Name | Type |
|-------|--------|
| nm | String |
| name0 | VLAN |

pim.debug.DelSgCacheNull

Description

The delete route message resulted in the cache delete. The reason could be because there was no alternate route present in the routing table or the ingress pointed by new route is down or has PIM disabled.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Removing (s,g) cache, %ips%/%ipd%/%rp%, because the new route is %nm1% or because of %nm2%.

Message Parameters

| Name | Type |
|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| rp | IPAddrN |
| nm1 | String |
| nm2 | String |

pim.debug.PimVlanUnk

Description

If this message is printed somewhere we are trying to do PIM operation on non PIM interface. This should be reported to Extreme TAC. However, this message doesn't affect any regular PIM operation.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Trying to find IGMP membership on an intf that does not have PIM enabled anymore.
Called from %nm1%(), line#%num2%

Message Parameters

| Name | Type |
|------|--------|
| num | sInt |
| nm1 | String |
| num2 | sInt |

pim.debug.InvalidRouteRefCount

Description

The reference count to the route is already 0. No need to decrement reference count anymore. PIM's route cache entry will be freed up.

Remedy

Informational message only. Used for debug purposes.

Severity

Debug-Summary

Message Text

While attempting to free route to destination %dest%, reference count to this route was already %ref%.

Message Parameters

| Name | Type |
|------|---------|
| ref | sInt |
| dest | IPAddrN |

pim.debug.RecvRouteError

Description

When a route for registered prefix changes or become available route manager notifies the client. This message is called when there is some internal error while processing this route.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

pim.debug.Log

Description

This is used strictly for developers debugging. The idea is for developer to have a way to quickly add debug messages while debugging their code. Ideally, all of these messages should be removed or converted to more meaningful messages before releasing the product.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

%log%

Message Parameters

| Name | Type |
|------|--------|
| log | Printf |

pim.debug.PostUrtCallback

Description

This message is called after calling pimUrtCallback(). In pimUrtCallback() the entire multicast cache is traversed. This may result in an old route's cache entry or new route's cache entry not to get updated correctly due to MSDP registering for the same route too. We use this message for debugging purposes to make sure we are handling the above situation correctly.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

pim.debug.PktRxedOnDisVlan

Description

Pim message received on unexpected interface on which PIM is not enabled.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

PIM control packet received on vlan %vlan% on which PIM protocol is disabled. Drop

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |

pim.debug.RPchgFHRdelSG

Description

RP has changed, and we are not RP anymore. If we were First-Hop-Router for this (S, G), then we should remove this entry, and re-create it with the next cache miss.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Summary

Message Text

RP has changed, and we are not RP anymore, and we were FHR. Del cache entry for (S,G) [%src%, %grp%]

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.debug.BypassIGMP

Description

This message is called when PIM does not create an IGMP entry when it receives an IGMPAdd message.

Remedy

We may have to clear IGMP snooping for the Vlan, Group which was printed in this message. This would enable PIM to get in sync with IGMP.

Severity

Warning

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

pim.debug.RecvIGMPDelMsgAll

Description

This message is called when PIM receives an IGMP Delete message from MCMGR. This will delete all IGMP entries.

Remedy

This message is informational. There is no problem, so nothing to resolve.

Severity

Debug-Summary

Message Text

Received message from MCM to delete all IGMP membership entries

pim.debug.RecvIGMPDelMsg

Description

This message is called when PIM receives an IGMP Delete message for a specific Group on a Vlan from MCMGR.

Remedy

This message is informational. There is no problem, so nothing to resolve.

Severity

Debug-Summary

Message Text

Received IGMP membership DEL message from MCM for Group %ip0%, on vlan %if1%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| if1 | String |

pim.debug.SndMcmQFull

Description

For give src/grp pair a message is being sent to MCM.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Message to Mcm for cache %ip0%/ip1% is not sent immediately because there are other entries already in the queue.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.debug.RecvIGMPMemAbnormal

Description

Received notification for new membership add on a vlan for the given group. Memory state is not normal.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Received igmp ADD message from MCM for source %ip0%, group %ip1% on vlan %if1%.
Mem state not normal.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| if1 | String |

pim.debug.queryMbrVlan

Description

PIM is querying MCM for IGMP membership on vlan. This is debug message.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

PIM is querying MCM for IGMP membership groups on vlan %index%

Message Parameters

| Name | Type |
|-------|------|
| index | ulnt |

pim.debug.IgmpRtifNull

Description

This message is called when PIM does not create an IGMP entry when it receives an IGMP Add message. The entry was not created because the Rtif was Null.

Remedy

We may have to clear IGMP snooping for the Vlan, Group which was printed in this message. This would enable PIM to get in sync with IGMP.

Severity

Warning

Message Text

| msg | Printf |

pim.debug.IgmpDelGroupAll

Description

This message is called when PIM receives a delete message from MCM with group address set to 0. All the group entries on this vlan will get deleted.

Remedy

We may have to clear IGMP snooping for the Vlan, Group which was printed in this message. This would enable PIM to get in sync with IGMP.

Severity

Debug-Summary

Message Text

Received DEL message from MCM on vlan %vlan%, group %gaddr%. Deleting all groups on this interface.

Message Parameters

| Name | Type |
|-------|---------|
| vlan | String |
| gaddr | IPAddrN |

pim.debug.DelRpGrpEnt

Description

Delete group db in the RP database.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Delete the group entry for, %ipd%, in the RP-Group mapping database.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.debug.CreateRpGrpEnt

Description

Create a group db in the RP database.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Created the group entry for, %ipd%, in the RP-Group mapping database.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.debug.CnvSgrptDelIngrFromEgr

Description

While converting a SGRPT cache entry into an SG entry, need to remove the Up-interface (Ingress-vlan) from the Egress Vlan list.

Remedy

This is debug information. No remedial action needed.

Severity

Debug-Summary

Message Text

Removing Up-interface vlan %vlan% from Egress list for (S, G, RP) [%src%, %grp%, %rp%]

Message Parameters

| Name | Type |
|------|---------|
| vlan | String |
| src | IPAddrN |
| grp | IPAddrN |
| rp | IPAddrN |

pim.debug.CnvSgrptDelIngrFromPrn

Description

While converting a SGRPT cache entry into an SG entry, need to remove the Up-interface (Ingress-vlan) from the Pruned Vlan list.

Remedy

This is debug information. No remedial action needed.

Severity

Debug-Summary

Message Text

Removing Up-interface vlan %vlan% from Pruned list for (S, G, RP) [%src%, %grp%, %rp%]

Message Parameters

| Name | Type |
|------|---------|
| vlan | String |
| src | IPAddrN |
| grp | IPAddrN |
| rp | IPAddrN |

pim.debug.RtReachable

Description

These EMS debug messages are logged when a route to a source which was unreachable earlier, becomes reachable.

Remedy

These messages are informational only during generic debugging. They do not indicate an error condition.

Severity

Debug-Summary

Message Text

%log%

Message Parameters

| Name | Type |
|------|--------|
| log | Printf |

pim.debug.NoPimIntf

Description

This is used to display a warning message to indicate that source address is reachable through a L3 Interface upon which PIM is not enabled.

Remedy

This is debug information. No remedial action needed.

Severity

Debug-Summary

Message Text

Pim cache (%source%, %group%) source is reachable through Rtlf (%rtIfIndex%), but PIM is not enabled on this RTIF

Message Parameters

| Name | Type |
|-----------|---------|
| source | IPAddrN |
| group | IPAddrN |
| rtIfIndex | xInt |

pim.debug.SsmAck

Description

This is used for debugging SSM-RANGE-ACK message that PIM needs to receive from MCMGR.

Remedy

This is used for debugging purposes only.

Severity

Debug-Summary

Message Text

%log%

Message Parameters

| Name | Type |

[pim.hello.CreatNbr](#)

Description

Adding new pim neighbor failed. %vlan0% : The pim enabled vlan on which neighbor is being created. %ip0% : IP address of neighbor %ip1% : The ipaddress of the vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

```
%vlan0% Adding neighbor %ip0% in pim circuit %ip1% failed.\n
```

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.hello.ChgNbrIndx

Description

Indicates that the neighbor's generation id has changed. Normally this happens because the pim neighbor went down and came back up.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

```
%vlan0% genid %xnum0% changed to %xnum1% for nbr %ip0%\n
```

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| xnum0 | xInt |
| xnum1 | xInt |
| ip0 | IPAddrN |

pim.hello.ProcHelloMsgFail

Description

Unsupported option type found in the hello message from the pim neighbor.

Remedy

Normally such events are taken care of in the protocol. If adjacency is not established with the neighbor, please contact tech support.

Severity

Notice

Message Text

On %vlan0% could not process the option in hello message sent from %ip%. Unknown option type %num0%\n

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| num0 | sInt |
| ip | IPAddrN |

pim.hello.RecvHelloPkt

Description

Received hello packet from the neighbor.

Remedy

Normal behavior.

Severity

Debug-Verbose

Message Text

Receiving Hello on %vlana% cid %numa% from %ipa%

Message Parameters

| Name | Type |
|-------|---------|
| vlana | VLAN |
| numa | sInt |
| ipa | IPAddrN |

pim.hello.RecvPimPkt

Description

Received a pim packet.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received pim %typeStr% packet of length %len% on %ip0% from %ipa% to %dipa%.

Message Parameters

| Name | Type |
|---------|---------|
| typeStr | String |
| len | sInt |
| ip0 | IPAddrN |
| ipa | IPAddrN |
| dipa | IPAddrN |

pim.hello.ProcPktFail

Description

Pim packet is dropped as pim is disabled on vlan or globally.

Remedy

Ok to have this message, unless pim is expected to be up on the vlan. Try issuing command to diable and then enable pim on the vlan.

Severity

Warning

Message Text

Failed to process pim packet on vlan %vlan0% as pim interface is down or pim is disabled.

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |

pim.hello.TxHelloPkt

Description

Transmitting hello packet. %vlan0% : Hello sent out on this vlan. %num0% : packet length. %ip0% : Source address of the packet. %ip1% : Destination address of the packet.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

%vlan0% Xmitting Hello pkt of len %num0% from src %ip0% to %ip1%\n

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |
| num0 | sInt |

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.hello.RxHelloCksumFail

Description

The packet received on vlan which looks like to be pim hello message has failed the checksum test. Packet may be corrupted, so is being dropped.

Remedy

If the message persists there could be problem in the other switch, which is generating junk packets, or there could be problem on the line.

Severity

Warning

Message Text

%vlan0% cksum failure for hello message.

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |

pim.hello.RxHelloVerFail

Description

Version field in the received packet is set incorrectly. Expected value is 2.

Remedy

Check the pim configuration on the neighbor.

Severity

Warning

Message Text

%vlan0% version, %num0%, on the received pim packet from %ip0% is incorrect.

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| num0 | sInt |
| ip0 | IPAddrN |

pim.hello.RxHelloOnPassive

Description

Receiving hello message on a passive interface.

Remedy

Check the pim enabled host on the vlan, and disable pim on that.

Severity

Info

Message Text

Pim Hello message on %vlan0%, from %ip0% is dropped as Vlan is in passive mode.

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.hello.RemDupScndAddr

Description

The same secondary IP address has been configured on the PIM circuit which is advertised in the PIM hello messages from the PIM neighbor. That same secondary address was previously advertised by another neighbor and only the most recently received mapping will be maintained.

Remedy

Remove the duplicate secondary address from the any one of the VLAN. Use "show vlan <vlan_name>" to see the configured ipaddress on the VLAN and use "unconfig vlan <vlan_name> ipaddress <ip_address>" to remove the duplicate address from the VLAN.

Severity

Warning

Message Text

Removing the duplicate secondary address %addr1% from %nbr2% which was received from %nbr1% in circuit %vlan0%.

Message Parameters

| Name | Type |
|-------|---------|
| addr1 | IPAddrN |
| nbr1 | IPAddrN |
| vlan0 | VLAN |
| nbr2 | IPAddrN |

|------|---------|
| ips | IPAddrN |
| ipd | IPAddrN |
| num | sInt |
| ptr1 | Ptr |

pim.mcdbg.AddCacheGrpTry

Description

Debug message to track the cache insertion process.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Found cache group location while inserting cache. Finding location for the source. Curr pointer, %ptr0%. Cache, (%ips%/%ipd%/)

Message Parameters

| Name | Type |
|------|---------|
| ptr0 | Ptr |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.mcdbg.AddCacheMaskTry

Description

Debug message to track the cache insertion process..

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sorting mask while insterting cache. Current mask, %ip0%. Mask %ip1%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.mcdbg.AddCacheGrp

Description

Debug message to track the cache insertion process..

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Inserting cache for group, %ipd%, %nm% group address %ip0%

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |
| nm | String |
| ip0 | IPAddrN |

pim.mcdbg.DelCacheEnt

Description

Debug message to track the cache deletion process.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting cache, %ips%/%ipd%/%msk%, from the cache database.

Message Parameters

| Name | Type |

pim.msdp.AllocMSDPMsgFail

Description

PIM MSDP function takes msdpPimMsg pointer as one of its parameters. It makes a check if this parameter is null, in which case it allocates memory and starts filling in (S, G) requests in the allocated memory. This condition occurs when the malloc function returned null while trying to allocate the memory indicating that the process has gone out of memory.

Remedy

A possible remedy will be to use "show memory" and "show log" commands to monitor the memory statuses of different processes. Depending on the results of these commands, you can either change the system configuration or free up the system memory by ending processes which are currently not needed.

Severity

Critical

Message Text

Out of Memory. Cannot malloc MSDP message

pim.msg.TxAsrtMsg

Description

Shows origination of assert message for group %grp% on egress num0/vlan0.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

%vlan0% Sending Pim assert. : %ip0%/ %grp%, egress id %num0%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| grp | IPAddrN |
| num0 | sInt |

pim.msg.ProcAsrtwinState

Description

Assert win case on a vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% pimAssertWeWin: %ip0%/grp%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPaddrN |
| grp | IPaddrN |

pim.msg.ProcAsrtloseState

Description

Assert lose case on vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% pimAssertWeLose: %ip0%/grp%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| grp | IPAddrN |

pim.msg.ProcAsrtGrpDnst

Description

Processing downstream assert state machine on vlan for given cache entry.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% pimAsrtDnst: best matching: %ip0%/ip1%(ip2%)

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |

pim.msg.CmpAsrtData

Description

Compare the asser metric received with the metric on the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% pimAsrtDnst: metric in: %name0%-%num0%(%num1%) ours: %name1%-%num2% (%num3%)

Message Parameters

| Name | Type |
|-------|--------|
| vlan0 | VLAN |
| name0 | String |
| num0 | sInt |
| num1 | sInt |
| name1 | String |
| num2 | sInt |
| num3 | sInt |

pim.msg.ProcAsrtGrpUpst

Description

Processing assert state machine on incoming interface for the cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% Learning assert information on incoming interface: %ip0%/%ip1%(%ip2%) source ip %ips%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |
| ips | IPAddrN |

pim.msg.ProcSparseJpPkt

Description

Processing sparse join of the given type.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% Processing join/prune for %ips%/%ipd%, Type : %typ%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |
| typ | String |

pim.msg.SchedUpstJoin

Description

Scheduling a join to be sent upstream for the cache as a result of learning an assert winner on ingress vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% pimAsrtUpst: schedule join send to asrt winner for %ips%/%ipd%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.msg.ProcAsrtMsg

Description

Message shows that an assert message is received on interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% pimProcAssert: %ip0%/%ip1% of %name0% tree

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

| Name | Type |
|-------|---------|
| ip1 | IPAddrN |
| name0 | String |

pim.msg.BldJpPkt

Description

Building join prune packet to be sent on vlan for neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% processing grp %ip0% src %ip1% via %ip2%(%num0%) rp %ip3% via %ip4%(%num1%)

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |
| num0 | sInt |
| ip3 | IPAddrN |
| ip4 | IPAddrN |
| num1 | sInt |

pim.msg.AddSrcRptPrune

Description

Putting SGRPT prune in the join packet to neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% adding source, %ip0%, SGRPT prune list.

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.msg.SendGraftUp

Description

Sending graft upstream for cache.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% pimSendGraft: src %ip0%, grp %ip1%, una %ip2%, oif %ip3%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |

| Name | Type |
|------|---------|
| ip2 | IPAddrN |
| ip3 | IPAddrN |

pim.msg.AddSrcPrune

Description

Putting SG prune in the join/prune packet to neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% adding %ip0% to prune list

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.msg.AddSrcJoin

Description

Putting SG join in the join/prune packet to neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% adding %ip0% to join list

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.msg.AddSrcRptPruneDiffIng

Description

Putting SGRPT prune in the join packet to neighbor because the neighbor is on different ingress than SG's ingress.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% adding %ip0% to SGRPT prune list

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.msg.AddRptPrune

Description

Putting SGRPT prune in the join packet to neighbor due to (s,g)rpt state.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% adding %ips% R to prune list for group %ipd%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.msg.AddZgJoin

Description

Adding (s,g) join to join/prune packet for the given group towards given RP.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% adding %ip0% WR to join list for rp %ipr%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ipr | IPAddrN |

pim.msg.AddZgPrune

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% adding %ip0% WR to prune list for rp %ipr%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ipr | IPAddrN |

pim.msg.AddZgJoinVldEgress

Description

Adding (s,g) join to join/prune packet for the given group towards given R P because of positive egress state.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% adding %ip0% WR to join list towards RP %ipr%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ipr | IPAddrN |

pim.msg.CreatNbrJp

Description

Going to construct join prune packet to be sent to neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% constructing Join/Prune pkt from src %ip0% to %ip1%\n

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.msg.WritNbrJpMsg

Description

Done creating join prune packet for given group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

```
%vlan0% done with group %ip0% joins %num0% prunes %num1%\n
```

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPaddrN |
| num0 | sInt |
| num1 | sInt |

pim.msg.EndNbrJpMsg

Description

Done creating join prune packet for all group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

```
%vlan0% done with all group joins %num0% prunes %num1%\n
```

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |
| num0 | sInt |
| num1 | sInt |

pim.msg.RxDenseJpMsg

Description

Going to process join prune packet on dense circuit.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% ProcJoinPrune on dense interface: joins %num0% prunes %num1%

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |
| num0 | sInt |
| num1 | sInt |

pim.msg.ProcDenseJoinMsg

Description

Going to process join part of the J/P packet received on dense circuit.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% ProcJoin on dense interface, packet received on src %ip0%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.msg.ProcDensePruneMsg

Description

Going to process prune part of the J/P packet received on dense circuit.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% ProcPrune on dense interface, packet received on src %ip0%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.msg.RxGraftPkt

Description

Received graft message on interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% ProcGraft: joins %num0% prunes %num1%

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |
| num0 | sInt |
| num1 | sInt |

pim.msg.ProcGraftPkt

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% Processing join portion in graft message for src %ip0%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.msg.RxGraftAckPkt

Description

Received ack for graft message from vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% ProcGraftAck: joins %num0% prunes %num1%

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |
| num0 | sInt |
| num1 | sInt |

pim.msg.ProcGraftAckPkt

Description

Processing the graft ack for given source.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% ProcGraftAck: src %ip0%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |

pim.msg.RxSparseJpPkt

Description

Received the sparse join prune packet with give number of join and prunes inside it.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% ProcJoinPrune: number of joins %num0% prunes %num1%

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |
| num0 | sInt |
| num1 | sInt |

pim.msg.ProcJpPkt

Description

Going to process join/prune for a single group out of the big join/prune packet.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% ProcJPG: handling %ip0%/%num0%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| num0 | sInt |

pim.msg.ProcRegStopMsg

Description

Processing the register stop message on vlan for the given group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% pimProcRegStop: grp: %ip0%/num0% src:%ip1%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| num0 | sInt |
| ip1 | IPAddrN |

pim.msg.TxMsg

Description

Transmitting message of given type on vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% Xmitting %name0%(num0%) pkt of len %num1% from src %ip0% to %ip1%\n

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| name0 | String |
| num0 | sInt |
| num1 | sInt |
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.msg.RxMsgCksumFail

Description

Checksum failed on pim message received on the given vlan.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

%vlan0% chksum failure for pim message of length %num0%

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |
| num0 | sInt |

pim.msg.RxMsgVerFail

Description

The version field in the pim packet should be 2. Other version type is not supported.

Remedy

Check the configuration on the neighboring switch. If they keep sending such packets, this wswitch may not be able to interoperate.

Severity

Warning

Message Text

%vlan0% version unsupported for pim message. Invalid version given %num0%, message type %num1%

Message Parameters

| Name | Type |
|-------|------|
| vlan0 | VLAN |
| num0 | sInt |
| num1 | sInt |

pim.msg.TxJoinUp

Description

Sending join/prune to neighbor.

Remedy

Informational message only.

Severity

Debug-Data

Message Text

Sending %str0% for src/grp %ips%/%ipd% to neighbor %ipa%.

Message Parameters

| Name | Type |
|------|---------|
| str0 | String |
| ips | IPAddrN |

| Name | Type |
|------|---------|
| ipd | IPAddrN |
| ipa | IPAddrN |

pim.msg.ProcJoinPruneMsg

Description

Processing join/prune to neighbor.

Remedy

Informational message only.

Severity

Debug-Data

Message Text

Processing Join/Prune packet from %ipa%.

Message Parameters

| Name | Type |
|------|---------|
| ipa | IPAddrN |

pim.msg.TxPartJoinPrunePkt

Description

Sending join prune packet of above length. Rest of join prune would be sent in subsequent packets.

Remedy

Informational message only.

Severity

Debug-Data

Message Text

Transmitting partial join/prune packet of len %ln%.

Message Parameters

| Name | Type |
|------|------|
| ln | sInt |

pim.msg.TxPktFail

Description

Error while sending the packet to kernel.

Remedy

Informational message only.

Severity

Notice

Message Text

%tp% packet send to %ip0% (size %sz%) fail with error %str0% (%ln%).

Message Parameters

| Name | Type |
|------|---------|
| tp | String |
| ip0 | IPAddrN |
| sz | sInt |
| str0 | String |
| ln | sInt |

pim.msg.AddNameItemFail

Description

Error while adding name space to cli.

Remedy

contact tech support.

Severity

Error

Message Text

Could not add the new vlan, %tp%, to cli name-space..

Message Parameters

| Name | Type |
|------|------|
| tp | VLAN |

[pim.msg.RxPktFail](#)

Description

Error while receiving the packet to kernel.

Remedy

Internal error.

Severity

Error

Message Text

Error while receiving pim control packet on raw socket.

[pim.msg.RxPimPkt](#)

Description

Received a pim packet.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Received pim %typeStr% packet of length %len% on %ip0% from %ipa% to %dipa%.

Message Parameters

| Name | Type |
|---------|---------|
| typeStr | String |
| len | sInt |
| ip0 | IPAddrN |
| ipa | IPAddrN |
| dipa | IPAddrN |

pim.msg.RxMsgDrop

Description

Received a pim packet.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Packet received on %v10% from %ip0% rejected for access violation.

Message Parameters

| Name | Type |
|------|---------|
| v10 | VLAN |
| ip0 | IPAddrN |

pim.msg.DropTxGenRegMsg

Description

This source and group could have been denied in the register policy file if generated register message dropped due to register policy.

Remedy

Check the register policy for First Hop Router(FHR) configuration in "show pim ipv4" or "show pim ipv6" command. If it is valid source and group then edit the policy file to permit this source and refresh it.

Severity

Warning

Message Text

Transmission of generated Register message from %ipa1%, destined to %ipa2% is dropped due to %dropReason%.

Message Parameters

| Name | Type |
|------------|---------|
| ipa1 | IPAddrN |
| ipa2 | IPAddrN |
| dropReason | String |

pim.msg.RfrshSSMTimer

Description

Processing sparse join and refreshing cache timer for SG cache as it is on SSM vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% Refreshing SSM cache timer for %ips%/%ipd%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ips | IPAddrN |
| ipd | IPAddrN |

pim.msg.TxPktError

Description

This message will be written when we were unable to transmit a PIM packet because the PIM circuit was not passed as a parameter. This is a software error.

Remedy

This is a software error, and Extreme's TAC personnel should be notified.

Severity

Notice

Message Text

%msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | Printf |

pim.msg.FHRSrcRptPruneDiffUpif

Description

If (*, G) entry exists, put SGRPT prune in the join packet to neighbor because the neighbor is on different ingress than SG's ingress. This message is logged on First-Hop-Router.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%vlan0% add %ip0% to SGRPT prune list for Group %ip1% if (*,G) entry exists

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.msg.SkipSendingGraftUp

Description

Do not send graft upstream because PIM neighbor is gone.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Graft not sent because PIM upstream nbr (una: %ip2%) is gone. Vlan:%vlan0%, Src:%ip0%, Grp:%ip1%, Oif:%ip3%

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |

| Name | Type |
|------|---------|
| ip2 | IPAddrN |
| ip3 | IPAddrN |

pim.msg.RxRegDrop

Description

This source and group could have been denied in the register policy file if the received register message dropped due to register policy. Switch could have the insufficient licenses if the received register message dropped due to insufficient license.

Remedy

Check the register policy for Rendezvous point(RP) configuration in "show pim ipv4" or "show pim ipv6" command. If it is valid source and group then edit the policy file to permit this source and refresh it. Check the currently installed system license and upgrade if necessary.

Severity

Warning

Message Text

Register message received from %ipa1%, destined to %ipa2% for Group %ipa3% and Src %ipa4% is dropped due to %dropReason%.

Message Parameters

| Name | Type |
|------------|---------|
| ipa1 | IPAddrN |
| ipa2 | IPAddrN |
| ipa3 | IPAddrN |
| ipa4 | IPAddrN |
| dropReason | String |

pim.msg.SkipTxJoinPrune

Description

This event occurs when join/prune message is not sent to upstream neighbor because the PIM neighborhood is not established.

Remedy

No action required - Informational message only

Severity

Debug-Data

Message Text

Join/Prune message for source %ip0%, group %ip1% is not sent over VLAN %vlan0% for OIF %ip3% because PIM upstream neighbor (address: %ip2%) is not available.

Message Parameters

| Name | Type |
|-------|---------|
| vlan0 | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |
| ip3 | IPAddrN |

pim.mtrace Messages

[pim.mtrace.RecvReq](#) on page 4225

[pim.mtrace.SendRspns](#) on page 4226

pim.mtrace.RecvReq

Description

This log message is displayed when PIM receives mtrace query/request message from multicast manager to retrieve information.

Remedy

Informational message only, for debug purpose

Severity

Debug-Data

Message Text

Received mtrace %type% with source address %srcAddr% group address %grpAddr% destination address %destAddr% queryId %queryId% from Multicast manager for VR %vrId%

Message Parameters

| Name | Type |
|----------|--------|
| type | String |
| srcAddr | IP |
| grpAddr | IP |
| destAddr | IP |
| queryId | uInt32 |
| vrId | uInt32 |

pim.mtrace.SendRspns

Description

This log message is displayed when PIM sends response to multicast manager for the mtrace trace request.

Remedy

Informational message only, for debug purpose

Severity

Debug-Data

Message Text

Sending Response to multicast manager for %srcAddr% %grpAddr% %queryId% with previous hop address %prevHopAddr% incoming interface address %iifAddr% srcMask %srcMask% forwarding code %fwdCode% on VR %vrId%

Message Parameters

| Name | Type |
|-------------|--------|
| srcAddr | IP |
| grpAddr | IP |
| queryId | uInt32 |
| prevHopAddr | IP |
| iifAddr | IP |
| srcMask | uInt8 |
| fwdCode | uInt8 |
| vrId | uInt32 |

pim.nbr Messages

[pim.nbr.AddNbrNode](#) on page 4227

[pim.nbr.DelNbrNode](#) on page 4227

pim.nbr.AddNbrNode

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

New neighbor node, with ip-address %ip0%, is being created on vlan, %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| nm | VLAN |

pim.nbr.DelNbrNode

Description

Debug message informing what is being programmed into the kernel.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Neighbor node corresponding to ip-address, %ip0%, is being deleted from vlan, %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| nm | VLAN |

pim.overlay Messages

- [pim.overlay.IgnNbrJoinPrune](#) on page 4234

pim.overlay.RecvCreatCache

Description

Received call back message from overlay tunnel manager to create cache on First-Hop-Router and Last-Hop-Router for the multicast overlay tunnels.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.overlay.CreatCacheOK

Description

Successfully created overlay multicast tunnel cache on First-Hop-Router and Last-Hop-Router.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.overlay.CreatCacheFail

Description

Failed to create overlay multicast tunnel cache on First-Hop-Router and Last-Hop-Router for the given reason.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.overlay.RecvDelCache

Description

Received call back message from overlay tunnel manager to delete cache on First-Hop-Router and Last-Hop-Router for the multicast overlay tunnels.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches

- I386 virtual machine switch simulator

pim.overlay.DelCacheOK

Description

Successfully deleted overlay multicast tunnel cache on First-Hop-Router and Last-Hop-Router.

Remedy

No action required - Informational message only.

Severity

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.overlay.DelCacheFail

Description

Failed to delete overlay multicast tunnel cache on First-Hop-Router and Last-Hop-Router for the given reason.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.overlay.RecvCacheMiss

Description

The cache message for (S,G) received for overlay cache from the specified ingress VLAN.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.overlay.IgnNbrJoinPrune

Description

Indicates that periodic join is not being sent on 'vlan' for the specified overlay multicast cache. This is due to the fact that the peer's cache entry has better metric to the source so peer is forwarding traffic to the tenant vlan egress. This log will appear when this cache is excluded in the periodical Join-Prune message to upstream neighbor.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Skipping periodic join for S %src%, G %grp% on VLAN %vlan%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | VLAN |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

pim.rpm.ModBsrState

Description

If no BSR message is received for BSR timeout period, the BSR state machine is executed and the BSR changes state. The message is displayed for such state transition.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Modifying state, %name0% for current BSR, %ip0%(%num0%), on expiry of the timer.

Message Parameters

| Name | Type |
|-------|---------|
| name0 | String |
| ip0 | IPAddrN |
| num0 | sInt |

pim.rpm.ChgCbsrParm

Description

The candidate BSR is being changed. Either the bsr address or the priority is different. %ip1% is new bsr address, %num2% is the new priority and %st% is the current state.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Candidate BSR is being changed. Old config, %ip0%/num%, %ip1%/num2%. Bsr state is %st%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| num | sInt |
| ip1 | IPAddrN |
| num2 | sInt |
| st | String |

pim.rpm.ChgCbsrParmDone

Description

Displays the changed BSR info, where %ip0% is new bsr address, %num0% is the new priority and %name0% is the new BSR state.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Candidate BSR changed to, %ip0%(%num0%), state %name0%\n

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| num0 | sInt |
| name0 | String |

pim.rpm.ProcBSRMsg

Description

Processing the CBSR message. Displays the current BSR state on the switch and the BSR information in the message being processed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Candidate BSR message received. Current BSR %ip0%(%num0%) state %name0%. Given BSR %ip1%(%num1%)

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| num0 | sInt |
| name0 | String |
| ip1 | IPAddrN |
| num1 | sInt |

pim.rpm.ChgBSRParm

Description

The BSR packet received caused change in the elected BSR info.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

New BSR, %ip0%(%num0%), is elected over the existing one. Current BSR state %name0%.

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| num0 | sInt |
| name0 | String |

pim.rpm.ProcCRPMsgFail

Description

The policy configuration is such that the CRP is not to be accepted from the given source, the CRP advertisement received will not be processed.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

CRP message from %ip0% is rejected as its not in trusted CRP list.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.UpdtCRPData

Description

Updating the CRP information locally, instead of unicasting outside to the BSR.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Loopback CRP information, as the elected BSR is on the same switch. CRP address, %ip0%, packet length, %num0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| num0 | sInt |

pim.rpm.ClrCRPData

Description

When the CRP is unconfigured, or the interface is going down, it unicasts a CRP advertisement with 0 holdtime, so that the next BSR advertisement will not contain this CRP. This is to speed up the BSR convergence time, otherwise the CRP entry on the BSR will have to timeout, before the BSR would know that the CRP is no longer up.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Loopback poisoned CRP information on local elected BSR. CRP address, %ip0%, packet length, %num0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| num0 | sInt |

pim.rpm.BldBSRMsg

Description

Constructing BSR packet segment for the given group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Building BSR advertisement packet for CRPs corresponding to group %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.rpm.BldBSRMsgNull

Description

The given CRP is not added in the BSR advertisement as the CRP has been poison reversed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Skipping CRP, %ip0%, while constructing BSR packet.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.SkipRpBSRMsg

Description

If the CRP advertisement doesn't contain the group, the group would fall to the next CRP as elected RP, so the advertisement will not include the group-rp combination.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Skipping CRP, %ip0%, for group, %ipd%, while constructing BSR packet as the last advertisement from the CRP didn't include this group.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ipd | IPAddrN |

pim.rpm.AddRpBSRMsg

Description

The CRP-group combination is being added in BSR advertisement.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding crp, %ip0%, for group, %ipd%, while constructing BSR packet.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ipd | IPAddrN |

pim.rpm.BldBsrMsgDone

Description

The BSR packet has been constructed and is ready to be transmitted to the neighbors.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Built the BSR packet. The last group added is %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.rpm.ProcGrpBsrMsg

Description

The BSR packet is being processed for the group mask.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Processing segment of BSR packet received, for group %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.rpm.ChgCRPPrio

Description

While processing the CRP advertisement the priority for CRP was found to have changed than the previous advertisement. So, this change would be saved.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

CRP priority changed for, %crp%, from %num0% to %num1%.

Message Parameters

| Name | Type |
|------|---------|
| crp | IPAddrN |
| num0 | sInt |
| num1 | sInt |

pim.rpm.ReadGrpBsrMsg

Description

The BSR packet received has CRP information for the given group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Read group, %ip0%, in the BSR packet being processed.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.ReadCrpBsrMsg

Description

The packet contains the given crp for the group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Read CRP, %ip0%, for group, %ipd%, while processing BSR packet.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ipd | IPAddrN |

pim.rpm.DelGrpCrpData

Description

The BSR didn't advertise the given CRP in this group, so remove it from the list of CRPs for the group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Delete %ip0% as one of the CRPs for the group, %ipd%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ipd | IPAddrN |

pim.rpm.RxBsrPkt

Description

Received the BSR packet on the given vlan.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received BSR packet from %ip0% of length %num0%, on vlan %nm%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| num0 | sInt |
| nm | VLAN |

pim.rpm.LkupBSRRtNull

Description

Expected interface to receive the BSR packet is different than the interface it was received on, or there is no route to the BSR from this switch. The BSR packet will not be processed.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Bsr packet received from %ip0%, failed the RPF test.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.GetBSRTagData

Description

The fragmented BSR packet is not supported, the tag shows whether any such packet was received.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Fragment tag on the BSR packet received, %num0%.

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

pim.rpm.TmoutCrpTime

Description

CRP advertisement would be sent to BSR as CRP advertisement timer has expired.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

CRP advertisement timer expired.

pim.rpm.TxOldBSRPkt

Description

On detecting new neighbor, the last BSR received on the switch is forwarded to that, facilitating faster RP convergence.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Transmitting the cached BSR advertisement to the new neighbor, %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.TxNewBSRPkt

Description

On detecting new neighbor, BSR message would be sent to that as this switch has the current elected BSR interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Transmitting BSR advertisement to the new neighbor, %ip0%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.TxOldBSRPktToSw

Description

As new or changed generation ID is seen in the hello message, its assumed that a new switch has come up or the old switch has restarted. In such situation BSR advertisement is sent.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Transmitting BSR advertisement on detecting a new switch on vlan %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

pim.rpm.TxNewBSRPktToSw

Description

As new or changed generation ID is seen in the hello message, its assumed that a new switch has come up or the old switch has restarted. In such situation BSR advertisement is sent.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Transmitting BSR advertisement to the new switch detected in vlan, %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

pim.rpm.GetRpEnt

Description

Trying the get a RP entry object to link it to the group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Find or create rp entry for, %ip0%\n

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPaddrN |

pim.rpm.DelRpEnt

Description

Deleting RP entry.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Deleting RP entry, %ip0%, with origin (%name0%).

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| name0 | String |

pim.rpm.AgeRPData

Description

If the CRP gies away, the BSR needs to know. This is done through poisoned CRP message and through aging. If the BSR didn't get the poisoned message, it will eventually age out the CRP entry learnt earlier.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

RP learnt through CRP is being aged.

pim.rpm.GetPolParmFail

Description

Policy attached on vlan is not returning any result for unknown reasons This will affect the RP propagaion in PIM or .

Remedy

Check if polmgr process is running OK, otherwise this is an internal error. Please contact tech support.

Severity

Error

Message Text

Policy evaluation failed with policy attached on vlan %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

pim.rpm.RegPolMgrFail

Description

Could not register with policy manager, or the connection to pol mgr failed.

Remedy

Check if polmgr process is running OK, otherwise this is an internal error. Please contact tech support.

Severity

Error

Message Text

Policy manager registration failed with code %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | sInt |

pim.rpm.RecvUnkPolMsg

Description

Could not handle policy manager refresh message status.

Remedy

Check if polmgr process is running OK, otherwise this could be ignored.

Severity

Notice

Message Text

Cannot handle policy manager refresh msg type %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | slnt |

pim.rpm.AddGrNoRpBSRMsg

Description

The CRP-group combination is being added in BSR advertisement.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding group: %ipd% with zero RP Count, while constructing BSR packet.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |

pim.rpm.CreateRpEnt

Description

Create an RP entry object to link it to the group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Find or create rp entry for, %ip0%\n

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.ReadTmpCrpBsrMsg

Description

The packet contains the given crp for the group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Read CRP, %ip0%, for group, %ipd%, and add it to the temp group list while processing BSR packet.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ipd | IPAddrN |

pim.rpm.RemGrpRpCntZero

Description

Received a BSR fragment with RP count zero for this group. So delete the group entry.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Remove group %ip0% as RP count is zero

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.RemGrpHoldTimerExpiry

Description

Received no BSR advertisements for this group for the interval BSR timeout. So the group entry is being deleted.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Group %ip0% is being removed as it is aged out

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.BsrMsgSent

Description

BSR advertisements are sent out.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Sent BSR advertisements.

pim.rpm.tmpGrpToRpMapToWork

Description

Received the complete RP information for this group from multiple BSR fragments.
Copy the temp RP mapping to the working group RP mapping.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Copy Group to RP mapping for %ip0% from temp list to the working list

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.GetBestRpSkipRpDel

Description

The RP is being aged out and hence need to be skipped from the list of feasible RPs for the specified group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

CRP %ip0% is skipped during computation of the best RP for group %ipd% as RP is being deleted.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ipd | IPAddrN |

pim.rpm.GetBestRpSkipLinkDel

Description

This specific Group to RP mapping is being aged out and hence need to be skipped from the list of feasible RPs for the specified group.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

CRP %ip0% is skipped during computation of the best RP for group %ipd% as the Grp to RP Mapping is being deleted for this specific RP-Grp.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ipd | IPAddrN |

pim.rpm.GetRpSetSkipGroup

Description

The specified group mask combination is skipped as RP count is zero.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Skip group %ipd% mask %mask% as RP count is zero.

Message Parameters

| Name | Type |
|------|---------|
| ipd | IPAddrN |
| mask | sInt |

pim.rpm.ErrRpCntNeg

Description

RP Count for this group is already zero and is being decremented again which will result in a wrong value.

Remedy

This error check is more of a consistency check and should not ideally happen. If you see this message, try disabling pim and re-enabling it to resolve the problem.

Severity

Critical

Message Text

Function %function%: RP Count for Group %group% is ZERO and is being deremented.

Message Parameters

| Name | Type |
|----------|---------|
| function | String |
| group | IPAddrN |

pim.rpm.BldBSRMsgRPCntExceed

Description

Currently the max supported limit for number of RPs for a single group EXOS is 145 for IPV4 and 64 for IPV6. Hence if any group has RP count greater than allowed limit, it will not be included in the BSR message being advertised.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Group %ipd% wth RP count %rpcount% exceeds the max supported limit of %maxlimit% and will be skipped in the BSR message being advertised.

Message Parameters

| Name | Type |
|----------|---------|
| ipd | IPAddrN |
| rpcount | sInt |
| maxlimit | sInt |

pim.rpm.LkupBSRRouteFail

Description

Route to BSR is not available, so cannot send CRP Advertisement.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Cannot send CRP Adv because route to BSR %ip0% not available

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.rpm.DropCrpAdvAtBorder

Description

CRP Advertisements cannot be sent across an interface configured to be a Border vlan. If the UPIF toward a BSR is such a Border interface, then the CRP advertisement must be dropped here.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Cannot send CRP Adv because UPIF toward BSR %ip0% is configured to be a Border interface

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.StateRfrsh.AddTLV

Description

State Refresh TLV is included in the hello message generated on the interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Including State Refresh option in Hello for vlan %vname%, Origination Interval %num%

Message Parameters

| Name | Type |
|-------|------|
| vname | VLAN |
| num | ulnt |

pim.StateRfrsh.RxTLV

Description

Hello message received from neighbor included state refresh TLV information.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

State Refresh option included in hello by neighbor %ip0%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.StateRfrsh.RxMsgDump

Description

Received State refresh information.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Received State Refresh Info Src %ip0% Grp %ip1%, Originator Addr %ip2%, TTL %ttl%,
Metric %met%, Preference %pref%, Mask Len %mask%, Origination Interval %orint%, Flags
%flags%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |
| ttl | ulnt |

| Name | Type |
|-------|--------|
| met | ulnt |
| pref | ulnt |
| mask | ulnt |
| orint | ulnt32 |
| flags | xInt8 |

pim.StateRfrsh.DropMsgIfPssv

Description

State refresh message received on passive interface is not processed, dropped.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

State Refresh message received on passive interface %vname%, Dropped

Message Parameters

| Name | Type |
|-------|------|
| vname | VLAN |

pim.StateRfrsh.DropMsgLocMcastGrp

Description

State refresh message included a local multicast group, dropped.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

State Refresh received for local multicast group %ip0%, dropped

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.StateRfrsh.DropMsgIfInv

Description

State refresh message is received on non-dense circuit, dropped.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

State Refresh received on non-dense circuit %vname%, dropped

Message Parameters

| Name | Type |
|-------|------|
| vname | VLAN |

pim.StateRfrsh.DropMsgIfDsbl

Description

State refresh message is received on an interface on which state refresh is disabled.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

State Refresh received on state refresh disabled vlan %vname%, dropped

Message Parameters

| Name | Type |
|-------|------|
| vname | VLAN |

pim.StateRfrsh.RxMsgDwnstrmIf

Description

State refresh message is received on a downstream interface for an existing S, G cache entry.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

State Refresh message received on downstream interface %vname% for Src %ip0% Grp %ip1%

Message Parameters

| Name | Type |
|-------|---------|
| vname | VLAN |
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.StateRfrsh.RxMsgIfAssrtLoser

Description

State Refresh message is received on a downstream interface on which the local switch is an assert loser. OIF timer associated with the interface is reset.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Resetting timer for OIF %vname% to %num% secs.

Message Parameters

| Name | Type |
|-------|------|
| vname | VLAN |
| num | ulnt |

pim.StateRfrsh.DropMsgIfNotUpstrm

Description

State Refresh messages will be subjected to RPF checks similar to data packets. This message indicates that the state refresh message is received on non-upstream interface and hence dropped.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

State Refresh received on non-upstream vlan %vname%, dropped

Message Parameters

| Name | Type |
|-------|------|
| vname | VLAN |

pim.StateRfrsh.DropMsgWrongNbr

Description

State Refresh messages will be subjected to RPF checks similar to data packets. This message indicates that the state refresh message is received from wrong RPF neighbor and hence dropped.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

State Refresh received from wrong neighbor %ip0%, dropped

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.StateRfrsh.RxMsgUpstrmPruneIndSet

Description

State Refresh received with prune indicator bit set. The local S, G cache's upstream is in forwarding state and hence starting a Join Override timer to send a Join upstream.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

Upstream prune indicator set for Src %ip0% Grp %ip1%, Join override timer started

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.StateRfrsh.RxMsgUpstrmPruneIndClr

Description

State Refresh received with prune indicator bit cleared and the local S, G cache's upstream is in forwarding state. Delete Graft retransmission list entries if any.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

Upstream prune indicator bit not set for Src %ip0% Grp %ip1%, delete Graft retransmission list

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.StateRfrsh.RxMsgSendPruneUpstrm

Description

State Refresh received with prune indicator bit cleared and local S, G cache's upstream is in prune state. Send a prune upstream.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

Upstream prune indicator bit not set for Src %ip0% Grp %ip1%, sending Prune upstream

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.StateRfrsh.DropMsgRtNotExist

Description

State Refresh message included S, G information for which route does not exist. Message is dropped.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

State Refresh for Src %ip0% Grp %ip1% dropped, Route does not exist

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.StateRfrsh.RxMsgSPTIgn

Description

S, G cache entries will be created even when state refresh messages are received. In such a case SPT bit should not be set. This message indicates such a scenario.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

SPT bit not set for Src %ip0% Grp %ip1%.

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.StateRfrsh.DropMsgTTLZero

Description

State Refresh messages with 0 TTL are not supposed to be forwarded. This message indicates reception of such a message which is dropped.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

State Refresh with invalid TTL %ttl% for Src %ip0% Grp %ip1%, dropped.

Message Parameters

| Name | Type |
|------|---------|
| ttl | ulnt |
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.StateRfrsh.FwdMsgIfNotCap

Description

This message indicates that a State Refresh message is being forwarded on an interface which is not state refresh capable.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Forwarding State Refresh for Src %ip0%, Grp %ip1% on vlan %vname%, which is not state refresh capable

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.FwdMsg

Description

This message indicates that a state refresh message corresponding to the S, G is being forwarded on the interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Forwarding State Refresh for Src %ip0%, Grp %ip1% on vlan %vname%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.SkipDsblIf

Description

This message indicates that State Refresh message is not sent on state refresh disabled interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh for Src %ip0%, Grp %ip1% not forwarded on state refresh disabled vlan %vname%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.SkipBorderIf

Description

This message indicates that State Refresh message is not sent on border interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh for Src %ip0%, Grp %ip1% not forwarded on border vlan %vname%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.SkipPssvelf

Description

This message indicates that state refresh message is not sent on passive interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh for Src %ip0%, Grp %ip1% not forwarded on passive interface %vname%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.SkipAssrtLoserIf

Description

State Refresh message is not forwarded over the interface on which the local switch is an Assert loser.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh for Src %ip0%, Grp %ip1% not forwarded on assert loser interface %vname%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.NbrSyncTimerExp

Description

S, G cache entries will be sent to new neighbors to sync S, G state. A separate sync timer which is used for this purpose expired.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Neighbor Sync timer expired for circuit %ip0%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.StateRfrsh.NbrSyncDone

Description

Syncing of S, G cache to neighbor completed.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Completed S, G cache sync for Neighbor %ip0%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.StateRfrsh.IgnNbrIfNonDense

Description

State Refresh messages will not be forwarded on Sparse circuits. A new neighbor is detected on a sparse circuit which will be ignored and no S, G cache sync will happen to the neighbor.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

Ignore neighbor on non-dense vlan %vname%

Message Parameters

| Name | Type |
|-------|------|
| vname | VLAN |

pim.StateRfrsh.TxMsgIfNotCap

Description

This message indicates that a State Refresh message is being forwarded on an interface which is not state refresh capable.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending state refresh for Src %ip0%, Grp %ip1% on vlan %vname%, which is not state refresh capable

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.SkipCacheInact

Description

Cache sync to neighbor can happen only if state refresh messages are being received periodically for the S, G. Otherwise the S, G cache will be ignored during neighbor sync. This message indicates that state refresh state is inactive for the S, G and hence ignored during neighbor sync.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Refresh state not active for Src %ip0% Grp %ip1%

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |

pim.StateRfrsh.NbrSyncMoreCacheRmn

Description

S, G cache sync to neighbor is throttled to avoid overwhelming the neighbor with state refresh messages. Every second 500 S, G cache will be handled. If there are more entries, then the timer is restarted and the remaining entries handled in the next expiry. This message appears during one such cycle.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

%num% S,G done. More S,G to be Synced to Neighbor %ip0%, Restarting Timer

Message Parameters

| Name | Type |
|------|---------|
| num | uInt |
| ip0 | IPAddrN |

pim.StateRfrsh.OrigTimerExp

Description

This message indicates Origination timer expiry which will result in state refresh messages being generated for S, G cache for which local switch is the first hop router.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh origination timer expired

pim.StateRfrsh.OrigTimerExpNoCache

Description

This message indicates that when origination timer expired there are no cache entries to be handled. The window will be reset to initial value and the timer restarted.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

No S,G Cache entries present, Resetting window

pim.StateRfrsh.TxNbrIfNotCap

Description

This message indicates that a State Refresh message is being forwarded to a neighbor on an interface which is not state refresh capable.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Transmitting State Refresh for Src %ip0%, Grp %ip1% on vlan %vname%, which is not state refresh capable

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.TxMsg

Description

This message indicates that a state refresh message corresponding to the S, G is being transmitted on the interface.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Transmitting State Refresh for Src %ip0%, Grp %ip1% on vlan %vname%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.TxMsgToNbr

Description

This message indicates that a state refresh message is being sent to neighbor for the S, G on the interface during neighbor sync.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Sending State Refresh for Src %ip0%, Grp %ip1% to neighbor %ip2% on vlan %vname%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |
| vname | VLAN |

pim.StateRfrsh.MaxCacheEntRateRch

Description

A maximum of 500 cache entries are processed per second during origination and neighbor sync timer expiry. This log message indicates that the maximum has reached for the current window.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Max Cache entries %num% sent, Window %win%

Message Parameters

| Name | Type |
|------|------|
| num | ulnt |
| win | ulnt |

pim.StateRfrsh.TxMsgDump

Description

Transmitted State refresh information.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Transmitted State Refresh Info Src %ip0% Grp %ip1%, Originator Addr %ip2%, TTL %ttl%, Metric %met%, Preference %pref%, Mask Len %mask%, Origination Interval %orint%, Flags %flags%

Message Parameters

| Name | Type |
|-------|---------|
| ip0 | IPAddrN |
| ip1 | IPAddrN |
| ip2 | IPAddrN |
| ttl | uInt |
| met | uInt |
| pref | uInt |
| mask | uInt |
| orint | uInt32 |
| flags | xInt8 |

pim.StateRfrsh.DropMsgIfBorder

Description

State refresh message received on border interface is not processed, dropped.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

State Refresh message received on border interface %vname%, Dropped

Message Parameters

| Name | Type |
|-------|------|
| vname | VLAN |

pim.StateRfrsh.SkipCacheTTLZero

Description

The S,G entry is skipped during neighbor sync since the TTL is zero. State Refresh messages with zero TTL value are not forwarded and hence will not be updated to new neighbors during neighbor sync.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Skipping cache with invalid TTL %ttl% for Src %ip0% Grp %ip1%

Message Parameters

| Name | Type |
|------|---------|
| ttl | ulnt |
| ip0 | IPaddrN |
| ip1 | IPaddrN |

pim.StateRfrsh.DropMsgInvSrc

Description

State Refresh message received with invalid source is dropped

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh message with invalid source %ip0%, dropped

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPaddrN |

pim.StateRfrsh.DropMsgInvGrp

Description

State Refresh message received with invalid group is dropped

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh message with invalid group %ip0%. dropped

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.StateRfrsh.DropMsgInvAddr

Description

State Refresh message received with invalid originator address is dropped

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh message with originator address %ip0%, dropped

Message Parameters

| Name | Type |
|------|---------|
| ip0 | IPAddrN |

pim.StateRfrsh.DropMsgInvTTL

Description

State Refresh message received with Zero TTL is dropped

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh with invalid TTL %ttl% dropped.

Message Parameters

| Name | Type |
|------|------|
| ttl | ulnt |

pim.StateRfrsh.DropMsgInvIntvl

Description

State refresh message received with zero origination interval is dropped

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

State Refresh message with Origination Interval %interval% dropped

Message Parameters

| Name | Type |
|----------|------|
| interval | uInt |

pim.vsm.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependant on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

pim.vsm.AllocNewCkptNode

Description

Indicates that memory is being allocated for storing checkpoint information received from MLAG peer relating to the specified source and group.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Allocate checkpoint node for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.UnkIPNetAddr

Description

This event occurs when an MLAG node receives a checkpoint message from the peer with ingress VLAN IP address information that does not match any of the MLAG VLANs configured on the local node.

Remedy

Ensure that MLAG VLANs are configured with correct IP addresses and mask length on MLAG peer nodes. If the IP addresses do not match for MLAG VLANs then PIM may not function as expected. Contact technical support with output from following commands: 1. show pim 2. show vlan 3. show pim cache detail

Severity

Info

Message Text

Unknown IP address %ip%/%mlen% in checkpoint message for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| ip | IPAddrN |
| mlen | ulnt |

pim.vsm.CirctNotFnd

Description

This event occurs when a PIM circuit corresponding to the given VLAN is not found during processing of checkpoint messages.

Remedy

Ensure that PIM is enabled on all VLANs consistently on MLAG peer nodes.

Severity

Info

Message Text

PIM circuit not found for VLAN %vlan%, S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | String |

pim.vsm.CreatCacheFail

Description

This event occurs when an attempt to create a cache for the specified source and group fails. This may happen if route to source is not available or if RP is not available (in case of PIM-SM) which is normal. Once route to source or RP is available the cache entry gets created.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Create cache failed for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.ProcAddCacheCkptMsg

Description

Indicates that an Add Cache checkpoint message is being processed for the specified source and group.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Process Add Cache checkpoint message for S %src%, G %grp% from peer

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.AddCacheEgr

Description

This event occurs when an egress interface is being added to a multicast cache entry during checkpoint message processing.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Adding Egress Interface %vlan% to S %src%, G %grp% cache entry

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | VLAN |

pim.vsm.DelCacheEgr

Description

This event occurs when an egress interface is being deleted from a multicast cache entry during checkpoint message processing.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Deleting Egress Interface %vlan% from S %src%, G %grp% cache entry

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | VLAN |

pim.vsm.UpdtCkptDBEnt

Description

Indicates that existing checkpoint database information pertaining to the specified source and group is being updated.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Update checkpoint database information for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.AddCkptDBEnt

Description

Indicates that a new checkpoint database entry is being created for the specified source and group.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Add checkpoint database entry for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.ProcDelCacheCkptMsg

Description

This event occurs when a Delete Cache checkpoint message is received from MLAG peer for the specified source and group.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Process Delete Cache checkpoint message for S %src%, G %grp% from peer

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.CkptEntNotFnd

Description

Indicates that checkpoint database entry corresponding to the specified source and group is not found. This may happen due to lost checkpoint messages between MLAG peers.

Remedy

Checkpoint messages may be lost due to considerable CPU bound traffic. Check if this is the case and rectify the same if it is due to configuration issues.

Severity

Info

Message Text

Checkpoint database entry for %src%, G %grp% not found

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.DelCkptDBEnt

Description

Indicates that checkpoint database entry corresponding to the specified source and group is being deleted.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Delete checkpoint database entry for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.ProcAddOIFCkptMsg

Description

Indicates that an Add OIF checkpoint message is being processed for the specified source and group.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Process Add OIF checkpoint message for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.ProcDelOIFCkptMsg

Description

Indicates that a Delete OIF checkpoint message is being processed for the specified source and group.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Process Delete OIF checkpoint message for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.ProcIngVLANQuery

Description

Indicates that an Ingress VLAN Request/Response checkpoint message is being processed for the specified source and group.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Processing %cmd% for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| cmd | String |

pim.vsm.ResetRtxTimer

Description

Indicates that re-transmit timer, started to ensure ingress VLAN query commands are delivered to the MLAG peer without fail, is being reset since a response is received.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Resetting Ingress VLAN Query Re-transmit timer for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.UpdIngVLAN

Description

This event occurs when local switch receives an ingress VLAN query command from the peer. 'asrt' indicates whether MLAG egresses can move to assert-winner/assert-loser state. When 'asrt' is FALSE all MLAG egresses of the multicast cache identified by 'src' and 'grp' will be moved to forwarding state and ISC port corresponding to the specified ISC 'isc' will be deleted from the MLAG egresses of the multicast cache.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Ingress VLAN update for S %src%, G %grp%, canAssert %asrt%, ISC %isc%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| asrt | uInt |
| isc | uInt16 |

pim.vsm.AddISCPort

Description

Indicates that ISC port corresponding to ISC 'isc' is being added to the egress VLAN 'vlan' corresponding to the multicast cache identified by the specified source 'src' and group 'grp'.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Adding ISC %isc% to VLAN %vlan% for multicast cache S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | VLAN |
| isc | uInt16 |

pim.vsm.DelISCPort

Description

Indicates that ISC port corresponding to ISC 'isc' is being deleted from the egress VLAN 'vlan' corresponding to the multicast cache identified by the specified source 'src' and group 'grp'.

Remedy

No action required - Informational message onl

Severity

Debug-Verbose

Message Text

Deleting ISC %isc% from VLAN %vlan% for multicast cache S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | VLAN |
| isc | uInt16 |

pim.vsm.CkptFlagErr

Description

Indicates that WC and RPT bit combination in the received checkpoint message is erroneous. As per PIM RFC if WC bit is set then RPT bit must be set. If this is not the case then the above message is logged.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with output from following commands: 1. show pim cache detail 2. show pim

Severity

Error

Message Text

Erroneous bit combination in checkpoint message flags %flags%

Message Parameters

| Name | Type |
|-------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| flags | uInt32 |

pim.vsm.VrfyCkptDB

Description

When a checkpoint message is received from the peer, cache creation could have failed due to either route or RP not being available. When either a route or RP has become available, local switch tries to create multicast cache entries from the information in the checkpoint database. The event indicates that such a process has

started. The reason code 'rc' indicates whether the verification is happening due to RP or route becoming available.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Checkpoint database verification started, Reason %rc%

Message Parameters

| Name | Type |
|------|------|
| rc | ulnt |

pim.vsm.CreatCacheRtAvail

Description

Indicates that a multicast cache is being created due to a route becoming available.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Creating multicast cache for S %src%, G %grp%, Reason \"Route Reachable\"

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.CreatCacheRPAvail

Description

Indicates that a multicast cache is being created due to RP becoming available/reachable.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Creating multicast cache for S %src%, G %grp%, Reason \"RP Reachable/Available\"

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.CreatISC

Description

Indicates that an ISC specified by index 'isc' is being created.

Remedy

No action required - Informational message only

Severity

Debug-Verbose

Message Text

Create ISC for index %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

pim.vsm.DelISC

Description

Indicates that ISC specified by index 'isc' is being deleted.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Deleting ISC for index %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

pim.vsm.DelCkptTxTimer

Description

This is a debug message indicating that the timer used for transmitting checkpoint messages is deleted. This event will occur when the last ISC is being deleted.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Checkpoint Tx timer deleted

pim.vsm.UpdtISC

Description

This event indicates that an update of ISC-related parameters is being attempted. The parameters that can be modified are ISC state, ISC port instance and IP address.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Update ISC for ISC %isc%, change mask %mask%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |
| mask | xInt32 |

pim.vsm.StateChgNtfy

Description

This event indicates that the state of an ISC has changed.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

State change notification for ISC %isc%, state = %state%

Message Parameters

| Name | Type |
|-------|--------|
| isc | uInt16 |
| state | sInt |

pim.vsm.ISCUp

Description

This event indicates that the state of an ISC has changed to UP.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

State changed to UP for ISC %isc%

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

pim.vsm.ISCDown

Description

This event indicates that the state of an ISC has changed to DOWN.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

ISC %isc% is DOWN, re-initialize application-specific data

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

pim.vsm.CreatMLAG

Description

This event indicates that an MLAG has been created.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Created MLAG for index %mlag%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |

pim.vsm.DeIMLAG

Description

This event indicates that the specified MLAG is deleted.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Deleted Mlag for index %mlag%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |

pim.vsm.MLAGStateChgNtfy

Description

This event indicates that parameters relating to an MLAG have changed.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

MLAG state change notification for index %mlag%, ISC %isc%, remote port state %state%

Message Parameters

| Name | Type |
|-------|--------|
| mlag | uInt16 |
| isc | uInt16 |
| state | sInt |

pim.vsm.RmtMLAGPortDown

Description

This event indicates that the port state corresponding to the specified MLAG has changed to DOWN on the remote switch.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Remote MLAG port down for MLAG %mlag%, VLAN %vlan%

Message Parameters

| Name | Type |
|------|--------|
| mlag | uInt16 |
| vlan | String |

pim.vsm.CreatCkptTxTimer

Description

This event indicates that a timer which is used for transmitting checkpoint messages is created. This event will occur when the first ISC is being created.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Checkpoint Tx timer created

pim.vsm.AddMLAGPortToVLAN

Description

Indicates that the specified MLAG port is being added to the VLAN 'vlan'

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Adding MLAG port %slot%:%port% to VLAN %vlan%

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |
| slot | ulnt |
| port | ulnt |

pim.vsm.VLANMLAGPortCnt

Description

Specifies the number of MLAG ports included in the given VLAN.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Number of MLAG ports %count% in VLAN %vlan%

Message Parameters

| Name | Type |
|-------|------|
| vlan | VLAN |
| count | ulnt |

pim.vsm.DeIMLAGPortFmVLAN

Description

Indicates that the specified MLAG port is being deleted from the VLAN 'vlan'

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Deleting MLAG port %slot%:%port% from VLAN %vlan%

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |
| slot | ulnt |
| port | ulnt |

pim.vsm.IgnCkptMsgUnkOwner

Description

Indicates that the received checkpoint message is being ignored since it has unknown owner object.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Ignoring checkpoint message, unknown owner %owner%

Message Parameters

| Name | Type |
|-------|------|
| owner | ulnt |

pim.vsm.RxInfoDump

Description

A debug log to dump information from the checkpoint message.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Received checkpoint message, type %type%, reLen %len%, totalLen %tlen%

Message Parameters

| Name | Type |
|------|--------|
| type | String |
| len | ulnt |
| tlen | ulnt |

pim.vsm.MsgTypeInv

Description

Indicates that a checkpoint message with invalid type is being ignored.

Remedy

No action required - Informational message only.

Severity

Error

Message Text

Ignoring checkpoint message with invalid type %type%

Message Parameters

| Name | Type |
|------|------|
| type | ulnt |

pim.vsm.AddTLVHdrToCkptBuf

Description

Event indicating that a TLV header is being added to checkpoint buffer.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Adding TLV header to checkpoint buffer, type %type%, Len %len%, writeOffset %offset%

Message Parameters

| Name | Type |
|--------|------|
| type | ulnt |
| len | ulnt |
| offset | ulnt |

pim.vsm.AddSGInfoToCkptBuf

Description

Indicates that source-group information is being added to checkpoint buffer.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Adding SG information to checkpoint buffer, S %src%, G %grp%, Ingress IP %ing%, Mask Len %mlen%, Flags %flags%, Num Egresses %egrs%, writeOffset %offset%

Message Parameters

| Name | Type |
|--------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| ing | IP |
| mlen | ulnt |
| flags | ulnt |
| egrs | ulnt |
| offset | ulnt |

pim.vsm.AddEgrInfoToCkptBuf

Description

Indicates that MLAG egress information is being added to checkpoint buffer.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Adding Egress Information to checkpoint buffer, IP %ip%, Mask Len %mlen%, WriteOffset %offset%

Message Parameters

| Name | Type |
|--------|---------|
| ip | IPAddrN |
| mlen | ulnt |
| offset | ulnt |

pim.vsm.CkptAddCache

Description

Indicates that an ADD CACHE command is being checkpointed for the specified source and group to MLAG peer.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Checkpointing ADD CACHE command to MLAG peer for S %src%. G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.ISCNotUp

Description

Indicates that the specified ISC is being ignored while checkpointing SG cache information. There may be many ISCs and some of the ISCs may be down. Checkpoint messages will not be transmitted over such ISCs.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Ignoring checkpoint for ISC %isc%, ISC not UP

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

pim.vsm.ISCDlayTimerActv

Description

ISC delay timer is started to defer handling ISC UP events in PIM. This is to ensure that a link flap will not result in various actions being performed by the PIM module unnecessarily. This event indicates that a checkpoint message is not being sent on the specified ISC since active timer is still running.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

ISC delay timer active for ISC %isc%, ignoring checkpoint message

Message Parameters

| Name | Type |
|------|--------|
| isc | uInt16 |

pim.vsm.CkptDelCache

Description

Indicates that an DELETE CACHE command is being checkpointed for the specified source and group to MLAG peer.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Checkpointing Delete Cache command to MLAG peer for S %src%. G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.CkptEgrInfo

Description

Indicates that egress VLAN information, which is added/deleted to/from the egress list of a multicast cache identified by 'src' and 'grp', is beign checkpointed to MLAG peer.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Checkpointing %cmd% command for S %src%, G %grp%, Egress %vlan%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | VLAN |
| cmd | String |

pim.vsm.RtxIngVLANQuery

Description

Indicates that an ingress VLAN query request is being retransmitted to MLAG peer due to query timer expiry.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Retransmitting ingress VLAN query request for S %src%, G %grp% on ISC %isc%, Num Retries %retries%

Message Parameters

| Name | Type |
|---------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| isc | uInt16 |
| retries | uInt |

pim.vsm.RtxTimerExpNoRspns

Description

Indicates that ingress VLAN query request command has been retransmitted to MLAG peer for maximum number of times without any response. This means that the local

switch will not have the peer's ingress VLAN information which may result in PIM not performing as expected over MLAG egresses.

Remedy

Check whether the peer switch is UP and running. If there is lot of CPU bound traffic on the peer switch, rectify the same if that is due to some configuration issue. Checkpoint messages may be dropped by the peer switch due to heavy CPU bound traffic. If this is not the case contact technical support with the output of the following commands: 1. show pim 2. show pim cache detail 3. sh mlag ports

Severity

Warning

Message Text

Ingress VLAN query timer expired for S %src%, G %grp% for ISC %isc%, max retries %retries% over, no response received

Message Parameters

| Name | Type |
|---------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| isc | uInt16 |
| retries | uInt |

pim.vsm.CkptIngVLANInfo

Description

Indicates that Ingress VLAN information is being checkpointed to MLAG peer.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Checkpointing %cmd% command to MLAG peer for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| cmd | String |

pim.vsm.StrtRtxTimer

Description

Indicates that Retransmit timer is being restarted for the specified multicast cache identified by 'src' and 'grp', for the psecified ISC.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Restarting retransmit timer for S %src%, G %grp%, ISC %isc%, Num Retries %retries%

Message Parameters

| Name | Type |
|---------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| isc | uInt16 |
| retries | uInt |

pim.vsm.ClrCacheEgr

Description

During DR change an MLAG peer switch becoming a DR should clear the checkpoint database corresponding to the VLAN on which it has become the DR. This event indicates that the local switch is the DR on the specified VLAN and hence it is clearing off the information pertaining to the specified VLAN from the database entry corresponding to the given source and group.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Clearing egress VLAN %vlan% from egress list of S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | VLAN |

pim.vsm.DelCkptNode

Description

Indicates that a checkpoint node identified by the given source and group is being deleted.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Deleting checkpoint node for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.IgnNbrJP

Description

Indicates that periodic join is not being sent on 'vlan' for the specified multicast cache. This is due to the fact that the cache entry has egresses which are checkpointed by the peer and there are no local joins on any of the egress VLANs. Periodic joins will be sent by the peer, who is the DR on the VLAN.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Skipping periodic join for S %src%, G %grp% on VLAN %vlan%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| vlan | VLAN |

pim.vsm.EgrMLAGStateChg

Description

Indicates that the specified VLAN does not include any MLAG ports. MLAG egresses are treated specially by PIM during asserts and since the specified VLAN has become a non- MLAG VLAN the special treatment no more applies to the VLAN.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

VLAN %vlan% changed from MLAG to non-MLAG VLAN

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |

pim.vsm.StrtBulkCkpt

Description

Indicates that bulk checkpoint has started.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Starting Bulk Checkpoint

pim.vsm.HndIDRChg

Description

Indicates that DR status for the specified VLAN has changed. In the case of PIM MLAG checkpoint database must be updated appropriately and egress information cleared in case such information was checkpointed by the peer.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

Handle DR Change for VLAN %vlan%

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |

pim.vsm.CacheNotFnd

Description

Indicates that cache entry corresponding to the specified source and group is not found.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Cache not found for S %src%, G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.AddRfrshInfoToCkptBuf

Description

Event indicating that a SG Refresh message is being added to checkpoint buffer.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Adding Refresh Information to checkpoint buffer, S %src%, G %grp%, writeOffset %offset%

Message Parameters

| Name | Type |
|--------|---------|
| src | IPAddrN |
| grp | IPAddrN |
| offset | ulnt |

pim.vsm.CkptRfrshInfo

Description

Indicates that a REFRESH command is being checkpointed for the specified source and group to MLAG peer.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Checkpointing SG refresh command to MLAG peer for S %src%. G %grp%

Message Parameters

| Name | Type |
|------|---------|
| src | IPAddrN |
| grp | IPAddrN |

pim.vsm.ProcSGRfrsh

Description

Indicates that a REFRESH command is being processed for the specified source and group.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

Processing SG refresh command from MLAG peer for S %src%. G %grp%

Message Parameters

| Name | Type |

| com | String |

pm.config.IpMaskHole

Description

No description is available.

Remedy

No remedy is available.

Severity

Error

Message Text

IP mask %mask% is not a valid mask.

Message Parameters

| Name | Type |
|------|--------|
| mask | String |

pm.config.refreshed

Description

No description is available.

Remedy

add file

Severity

Warning

Message Text

Policy %polName% has been refreshed

Message Parameters

| Name | Type |
|---------|--------|
| polName | String |

pm.config.readTimeOut

Description

For large policies (more than 1000 lines), policy manager times out for 1 second every 1000 lines so that policy manager can do other tasks assigned to it.

Remedy

No remedy is available.

Severity

Warning

Message Text

Read Time out for policy %polName% at line %LineNumber%

Message Parameters

| Name | Type |
|------------|--------|
| polName | String |
| LineNumber | sInt32 |

pm.config.refreshClientP

Description

No description is available.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Refreshed policy %polName% successfully sent to client %Client%

Message Parameters

| Name | Type |
|---------|--------|
| polName | String |
| Client | String |

pm.config.refreshClientF

Description

This can happen when the client no longer exists.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Policy manager was not able to send refreshed policy %polName% to client %Client%

Message Parameters

| Name | Type |
|---------|--------|
| polName | String |
| Client | String |

pm.config.attrInvalidApp

Description

The attribute is unknown or is not valid for this application.

Remedy

Ensure that the attribute is correct. Use cli command "check policy attribute", to check for valid attributes

Severity

Error

Message Text

Line %lineNumber% :Attribute %attr% is not valid \"%Application%\" attribute.

Message Parameters

| Name | Type |
|-------------|--------|
| lineNumber | sInt |
| attr | String |
| Application | String |

pm.config.hardRefCli

Description

A hard refresh can be forced using the hidden hard refresh command.

Remedy

None.

Severity

Warning

Message Text

%polName% to be refresh using hard refresh.

Message Parameters

| Name | Type |
|---------|--------|
| polName | String |

pm.config.hardRefForced

Description

Forcing a hard refresh since the system cannot figure out the changes to do a smart refresh.

Remedy

None.

Severity

Warning

Message Text

Unable to find changes for %polName% . Cannot do smart refresh, forcing hard refresh.

Message Parameters

| Name | Type |
|---------|--------|
| polName | String |

pm.config.InvalidAclAttribute

Description

The attribute is not valid for Acl manager. It is valid attribute but it applies to another client for example routing. It will be ignored by acl manager and treated as if it does not exist.

Remedy

No remedy is available.

Severity

Warning

Message Text

Policy %polName%, line %lineNumber% the attribute %attribute% is not valid for installing ACL's. It will be ignored by ACL manager.

Message Parameters

| Name | Type |
|------------|--------|
| polName | String |
| lineNumber | sInt32 |
| attribute | String |

POE.Critical

Description

A serious problem has been detected which is compromising the operation of the system. The system can not function as expected unless it is remedied. The problem may be related to hardware failure or software data corruption.

Remedy

The exact remedy is dependant on the particular situation; but the problem may not be resolved without intervention of some sort.

Severity

Critical

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

POE.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependant on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

POE.Warning

Description

An abnormal condition has been detected which, although it is not interfering with the normal operation of the system, may signal that the system or the network in

general may not be functioning as expected. The condition may have been caused by an unusual or unexpect circumstance related to some external stimulus.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by by rejecting the request or performing some default action.

Severity

Warning

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|

POE.power_exceeded

Description

The power consumption used by Power-over-Ethernet devices is exceeding the system-wide threshold.

Remedy

Increase the amount of power available for the slot, or reduce the amount of power being used by the Power-over-Ethernet devices.

Severity

Warning

Message Text

Power usage exceeding threshold for slot %slotnum%

Message Parameters

| Name | Type |
|---------|------|
| slotnum | ulnt |

POE.power_cleared

Description

The power usage condition previously reported has been cleared. Power consumption is now below the usage threshold.

Remedy

No action required.

Severity

Notice

Message Text

Power usage threshold condition cleared, slot %slotnum%

Message Parameters

| Name | Type |
|---------|------|
| slotnum | ulnt |

POE.power_denied

Description

The specified port was denied power due to insufficient power configured for the slot.

Remedy

Increase the budgeted power for the slot.

Severity

Warning

Message Text

Port %slotPort% was denied power

Message Parameters

| Name | Type |
|----------|--------|
| slotPort | String |

POE.port_fault

Description

The specified port has encountered a condition which has resulted in it entering a fault state.

Remedy

If the fault is due to an insufficient power limit, increase the operator limit for the port.

Severity

Error

Message Text

Port %slotPort% has encountered a fault condition

Message Parameters

| Name | Type |
|----------|--------|
| slotPort | String |

POE.port_state

Description

The specified port has entered the specified state.

Remedy

No action required.

Severity

Info

Message Text

Port %slotPort% has entered the %state% state

Message Parameters

| Name | Type |
|----------|--------|
| slotPort | String |
| state | String |

POE.port_delivering

Description

The specified port is delivering power.

Remedy

No action required.

Severity

Notice

Message Text

Port %slotPort% is delivering power

Message Parameters

| Name | Type |
|----------|--------|
| slotPort | String |

POE.cardbringup

Description

The specified inline-power module encountered an error when initializing.

Remedy

Run diagnostics on the slot.

Severity

Error

Message Text

Error initializing inline-power module in slot %slot%

Message Parameters

| Name | Type |
|------|------|
| slot | uint |

Policy.RxPkt

Description

This event occurs when policy receives a packet.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Incoming packet from port %slotport% with a length of %len% bytes

Message Parameters

| Name | Type |
|----------|-----------------|
| slotport | ingressSlotPort |
| ptr | Buf-ptr |
| len | Buf-len |

Policy.TxPkt

Description

This event occurs when policy transmits a packet.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Outgoing packet to port %slotport% with a length of %len% bytes

Message Parameters

| Name | Type |
|----------|----------------|
| slotport | egressSlotPort |
| ptr | Buf-ptr |
| len | Buf-len |

Policy.SessAuth

Description

This event occurs when an agents session is authenticated to a new profile.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%Agent% session for %RuleDescription% authenticated to Profile %pid% (%ProfileName%).

Message Parameters

| Name | Type |
|-----------------|--------|
| Agent | String |
| RuleDescription | String |
| pid | uInt16 |
| ProfileName | String |

Policy.ProcSess

Description

This event occurs when an agents authentication session is in process.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%Agent% authentication for %RuleDescription% In Process.

Message Parameters

| Name | Type |
|-----------------|--------|
| Agent | String |
| RuleDescription | String |

Policy.TermSess

Description

This event occurs when an agents authentication session is terminated.

Remedy

No action required - Informational message only.

Severity

Debug-Summary

Message Text

%Agent% session for %RuleDescription% terminated (%TerminateString%).

Message Parameters

| Name | Type |
|-----------------|--------|
| Agent | String |
| RuleDescription | String |
| TerminateString | String |

Policy.SessLmtExcd

Description

This event occurs when a rule could not be applied due to resource limitations.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Policy %pid%(%ProfileName%) assignment by rule %RuleDescription% failed (exceeded %FailureReason% limits).

Message Parameters

| Name | Type |
|-----------------|--------|
| pid | uint16 |
| ProfileName | String |
| RuleDescription | String |
| FailureReason | String |

Policy.AllocMemFail

Description

This event occurs when a policy client memory allocation fails.

Remedy

This is a rare internal condition needing technical assistance. Restart the policy client process using the CLI command "restart process policy". If the event still occurs, contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr vr-mgmt" CLI command.

Severity

Critical

Message Text

Failed allocating memory for policy client (%object%).

Message Parameters

| Name | Type |
|--------|--------|
| object | String |

Policy.InitParmInv

Description

This event occurs when policy cannot initialize with the default parameters provided at startup.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr-vr-mgmt" CLI command.

Severity

Error

Message Text

Policy initialization parameters are out of range
(%numRules%,%numMuxRules%,%numProfiles%).

Message Parameters

| Name | Type |
|-------------|--------|
| numRules | uInt32 |
| numMuxRules | uInt32 |
| numProfiles | uInt32 |

Policy.RuleRangeExcd

Description

This event occurs when a policy lookup of a mux index for a specific port produces an invalid index.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr-vr-mgmt" CLI command.

Severity

Warning

Message Text

Policy Mux index %Index% out of range for %systemPort%.

Message Parameters

| Name | Type |
|------------|--------|
| Index | uint16 |
| systemPort | uint16 |

Policy.AddRuleListFail

Description

This event occurs when a policy mux rule could not be added to the list.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr-mgmt" CLI command.

Severity

Warning

Message Text

muxRuleChain error (%idx% %list% %head% %tail% %ordered%)

Message Parameters

| Name | Type |
|---------|--------|
| idx | uint |
| list | uint |
| head | uint32 |
| tail | uint16 |
| ordered | String |

Policy.AddAntiSpoofListFail

Description

This event occurs when a policy anti-spoof rule could not be added to the list.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress>; vr-vr-mgmt" CLI command.

Severity

Warning

Message Text

Policy antiSpoofIpChain error (%idx% %head% %next% %previous%)

Message Parameters

| Name | Type |
|----------|------|
| idx | ulnt |
| head | ulnt |
| next | ulnt |
| previous | ulnt |

Policy.DelRuleListFail

Description

This event occurs when a policy mux rule could not be removed from the list.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress>; vr-vr-mgmt" CLI command.

Severity

Warning

Message Text

Policy Mux Rule UnChain error (%idx% %list% %head% %tail%)

Message Parameters

| Name | Type |
|------|--------|
| idx | ulnt |
| list | ulnt |
| head | ulnt32 |
| tail | ulnt16 |

Policy.DelAntiSpoofListFail

Description

This event occurs when a policy anti-spoof rule could not be removed from the list.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr-mgmt" CLI command.

Severity

Warning

Message Text

Policy antiSpoofIpUnChain error (%idx% %head% %idxV4Addr% %headV4Addr%)

Message Parameters

| Name | Type |
|------------|--------|
| idx | ulnt |
| head | ulnt |
| idxV4Addr | ulnt32 |
| headV4Addr | ulnt32 |

Policy.InitClntFail

Description

This event occurs when a policy client fails to initialize.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr-vr-mgmt" CLI command.

Severity

Warning

Message Text

Policy client initialilzation failed.

Policy.SetNameLenExcd

Description

This event occurs when a policy profile name set by the client is too long to store.

Remedy

Use a shorter profile name.

Severity

Notice

Message Text

Policy profile name %profileName% length %length% is too long for defined data type.

Message Parameters

| Name | Type |
|-------------|--------|
| profileName | String |
| length | uInt32 |

Policy.RxVerInv

Description

This event occurs when the policy library detected a message version error from a peer. The version encoded in the message received from the peer was the incorrect size and could not be decoded, this message is discarded.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr vr-mgmt" CLI command.

Severity

Warning

Message Text

Invalid message %version% size %size% received from peerId: %peerId%

Message Parameters

| Name | Type |
|---------|--------|
| version | uint16 |
| size | uint32 |
| peerId | uint |

Policy.AllocPktFail

Description

This event will occur if the client fails to allocate the memory required for a packet transmit.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr vr-mgmt" CLI command.

Severity

Warning

Message Text

Policy client failed to allocate packet of size %size%.

Message Parameters

| Name | Type |
|------|--------|
| size | uInt32 |

Policy.RegApplFail

Description

This event will occur when policy failed to register with an application required for full operation.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr vr-mgmt" CLI command.

Severity

Warning

Message Text

Policy failed to register with required application %registerApp%.

Message Parameters

| Name | Type |
|-------------|--------|
| registerApp | String |

Policy.TxPeerFail

Description

This event will occur when policy failed to send message to peer.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr vr-mgmt" CLI command.

Severity

Warning

Message Text

Policy send to %peerId% failed with result %policyResult%.

Message Parameters

| Name | Type |
|--------------|------|
| peerId | uint |
| policyResult | uint |

Policy.RxVerWrong

Description

This event occurs when policy received a newer message version from a peer than what is locally supported.

Remedy

No action required - Informational message only. This event should only happen temporarily while the system is adding new devices to stack or chassis.

Severity

Debug-Summary

Message Text

Recieved newer message version %rxVersion% from peerId %peerId%, local version %localVersion%.

Message Parameters

| Name | Type |
|--------------|--------|
| rxVersion | uint16 |
| peerId | uint |
| localVersion | uint16 |

Policy.SendACLReqFail

Description

This event occurs when a request to manipulate a hardware rule or related resource fails. action: - add rule - delete rule - configure rule - unconfigure rule - reserve - unreserve

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr vr-mgmt" CLI command.

Severity

Error

Message Text

Request to %action% %name% failed with return value %retVal%.

Message Parameters

| Name | Type |
|--------|--------|
| action | String |
| name | String |
| retVal | sInt |

Policy.CfgHwEntFail

Description

This event occurs when an operation to manipulate a hardware rule fails. action: - addition - deletion - configuration - unconfiguration

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress> vr vr-mgmt" CLI command.

Severity

Error

Message Text

Hardware %action% of rule failed for %ruleName% with return value %retVal%.

Message Parameters

| Name | Type |
|----------|--------|
| action | String |
| ruleName | String |
| retVal | sInt |

Policy.CfgHwRsrcFail

Description

This event occurs when an operation to manipulate a rule resource fails. action: - reserve: Designate hardware resources for use by policy - unreserve: Cancel previous reservation

Remedy

This is a rare internal condition needing technical assistance. Contact technical support after gathering relevant information using "show tech-support" CLI command and uploading the debug data out of the switch using "upload debug <ipaddress>; vr-vr-mgmt" CLI command.

Severity

Error

Message Text

Failed to %action% hardware rules of type %ruleType%.

Message Parameters

| Name | Type |
|----------|--------|
| action | String |
| ruleType | String |

Policy.CfgHwRsrcExcd

Description

This event occurs when a slot is added to a running Policy configuration which exceeds the hardware capabilities of the new slot.

Remedy

Reduce the number of Policy rules configured to allow ports on the device to operate with Policy.

Severity

Warning

Message Text

Policy hardware resources for slot %slotNum% are insufficient to operate with the current running configuration. Reduce Policy rule usage to allow this slot to become Policy capable.

Message Parameters

| Name | Type |
|---------|------|
| slotNum | Slot |

Policy.CfgHwRsrcAvail

Description

This event occurs when the Policy configuration changes such that a slot who's hardware was previously not capable of running Policy is now within allowable range.

Remedy

Reboot the slot to gain full Policy functionality on the slot.

Severity

Notice

Message Text

Policy's configuration now allows for slot %slotNum% to participate in Policy operation. Reboot slot %slotNum% to gain Policy functionality for that slot.

Message Parameters

| Name | Type |
|---------|------|
| slotNum | Slot |

Policy.AddUserPortVLANFail

Description

This event occurs when an attempt to add a port to a VLAN fails.

Remedy

This is an unexpected event, that however could occur in some cases due to a misconfiguration. For example if the port is configured to a specific Virtual-Router (VR) and the VLAN exists (or is being created) on a different VR.

Severity

Error

Message Text

User %mac% could not be added on port %port% to VLAN %vlan%

Message Parameters

| Name | Type |
|------|--------|
| mac | MAC |
| port | uInt32 |
| vlan | uInt16 |

Policy.CreatSessUserDfltVR

Description

This event occurs when an authenticated session receives a Virtual-Router name that is not configured on the device.

Remedy

This condition can happen if the session's Virtual Router name is mistakenly not configured, or is simply not desired to be used.

Severity

Notice

Message Text

Cannot create session for user %mac% with unconfigured Virtual-Router %vr%, VR-Default will be used.

Message Parameters

| Name | Type |
|------|--------|
| mac | MAC |
| vr | String |

Policy.LogRuleHit

Description

This event informs the user that a rule has been used. Only sent if a rule is configured to syslog when hit.

Remedy

No action required - Informational message only. This event should only happen when the specified rule is configured to syslog when hit.

Severity

Info

Message Text

```
{ %TrafficDesc% %Actions% } %Results%
```

Message Parameters

| Name | Type |
|-------------|--------|
| TrafficDesc | String |
| Actions | String |
| Results | String |

Policy.SetNameInvChr

Description

This event informs the user that certain characters are not recommended in policy profile names

Remedy

No action required - Notification message only. However, for the policy RADIUS filter-id attribute to be handled properly, these characters should be omitted from the policy name.

Severity

Notice

Message Text

For compatibility with RADIUS, the policy profile name %PolicyName% should not contain characters in the set '%ProblematicCharacters%'

Message Parameters

| Name | Type |
|-----------------------|--------|
| PolicyName | String |
| ProblematicCharacters | String |

Policy.UncfgObsltPcdnc

Description

This event occurs when loading a configuration saved with an EXOS image that supported different profile precedence rules than the current image.

Remedy

No action required - Notification message only. However, if you had non-default profile precedence configuration you will need to re-configure them.

Severity

Notice

Message Text

This configuration was saved with a version of EXOS supporting different profile precedence rules. Default values will be configured.

PTPv2.Critical

Description

A serious problem has been detected which is compromising the operation of the system. The system can not function as expected unless it is remedied. The problem may be related to hardware failure or software data corruption.

Remedy

The exact remedy is dependant on the particular situation; but the problem may not be resolved without intervention of some sort.

Severity

Critical

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

PTPv2.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependant on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

PTPv2.Warning

Description

An abnormal condition has been detected which, although it is not interfering with the normal operation of the system, may signal that the system or the network in general may not be functioning as expected. The condition may have been caused by an unusual or unexpect circumstance related to some external stimulus.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by rejecting the request or performing some default action.

Severity

Warning

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

PTPv2.Info

Description

A normal but potentially interesting condition has been detected, which signals that the system is functioning as expected and simply provides potentially detailed information or confirmation in that regard. The circumstance is common and not unusual or unexpected in any way.

Remedy

No action required - Informational message only.

Severity

- Summit family switches
- I386 virtual machine switch simulator

PTPv2.AllocMemFail

Description

The system tried to allocate memory but failed in doing so. This condition is mainly due to system starvation or an extremely low memory condition.

Remedy

A possible remedy is to use "show memory" and "show log" commands to monitor the memory status of different processes. Depending on the results of these commands, the system configuration may need to be changed or memory may need to be freed by ending processes which are currently not needed.

Severity

Error

Message Text

Failed to obtain %size% bytes of memory for %message%

| client | String |

PWMIB.RecvMsgFail

Description

Inter Process Communication Commands Reception Fault

Remedy

No Action required - Informational message only.

Severity

Debug-Verbose

Message Text

Receiving Message : %msg% from client: %client% is failed.

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| client | String |

PWMIB.SendMsgFail

Description

Inter Process Communication Commands Send Fault

Remedy

No Action required - Informational message only.

Severity

Debug-Verbose

Message Text

Sending Message: %msg% to the client: %client% is failed.

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| client | String |

PWMIB.InitFail

Description

PWMIB Mgr Initialization Failed

Remedy

The remedy is to reboot the system.

Severity

Error

Message Text

Failed to initialize PWMIB Mgr. Reson:%reason%

Message Parameters

| Name | Type |
|--------|--------|
| reason | String |

PWMIB.AllocMemFail

Description

Memory Allocation Failure

Remedy

Check the scalability limit and compare with the current configurations. Reducing the system configuration may help to reclaim memory. "show memory" command provides all process's current memory usage.

Severity

Error

Message Text

Unable to allocate memory of Size: %size%

Message Parameters

rip.event.rxAyncRespLate

Description

received a positive reponse to a policy bind request, but too late: the request context has been already deleted, therefore ignoring the late response. The system might be under stress and slow.

Remedy

repeat policy bind request.operation might be possible if processing load reduced.if problem persist, please report.

Severity

Error

Message Text

rx late response to a policy: %policyName% bind request

Message Parameters

| Name | Type |
|------------|--------|
| policyName | String |

rip.event.pmRereg

Description

second registration with Policy mgr server.system works as expected, but there was a restart of Policy Mgr or RIP.

Remedy

system ok, no action needed.

Severity

Notice

Message Text

PM Client successfully re-registered

rip.event.getAttrErr

Description

the policy mgr client could not provide policy attributes: error in the policy file or internal system error.

Remedy

review and correct the policy file. If problem persists, report it. operation might be possible without using the failed policy.

Severity

Error

Message Text

Get attribute for policy %policyName% on vlan: %vlanName% failed.

Message Parameters

| Name | Type |
|------------|--------|
| policyName | String |
| vlanName | String |

rip.event.pmEvalErr

Description

evaluation of specified policy failed in the routine "caller".

Remedy

Probably an error in the policy file. Review and correct policy file.

Severity

Error

Message Text

%caller%: pmEvaluate failed for policy: %policyName%, err: %errCode%

Message Parameters

| Name | Type |
|------------|--------|
| caller | String |
| policyName | String |
| errCode | ulnt |

rip.event.policyFilter

Description

applied policy filtered a route.

Remedy

this was a required action. If not, please unbind the policy.

Severity

Info

Message Text

%caller%: policy: %policyName% does not permit %direction% route: %addr% on interface: %interfaceName%

Message Parameters

| Name | Type |
|---------------|--------|
| caller | String |
| policyName | String |
| direction | String |
| addr | IP |
| interfaceName | String |

rip.event.pmHandleErr

Description

RIP policy mgr call back routine received a policy bind confirmation for an unknown handle.

Remedy

internal system error, report problem.

Severity

Warning

Message Text

%caller% received policy mgr handle: 0x%pmHandle%, which is not available in rip cli context

Message Parameters

| Name | Type |
|----------|--------|
| caller | String |
| pmHandle | xInt32 |

rip.event.ifShutDown

Description

the interface does not accept any route updates and all routes learned through this interface have been deleted from the RIP routing table.

Remedy

add more memory, increase the interface shut down priority.

Severity

Warning

Message Text

interface: %vlanName% shut down. low on memory, zone: %memUsageZone%, interface shut down priority: %intShutDownPrio%

Message Parameters

| Name | Type |
|-----------------|--------|
| vlanName | String |
| memUsageZone | uInt |
| intShutDownPrio | uInt |

rip.event.redistDeny

Description

Request to redistribute the indicated protocol (e.g. BGP) has been denied, because the system is running low on memory.

Remedy

add more memory or reconfigure the system to reduce memory consumption.

Severity

Warning

Message Text

redistribution of protocol: %protoName% not permitted. low on memory, zone:
%memUsageZone%

Message Parameters

| Name | Type |
|--------------|--------|
| protoName | String |
| memUsageZone | ulnt |

rip.event.ifUp

Description

the interface accepts new route updates and installes all routes learned through this interface in the RIP routing table.

Remedy

This is an expected event. increase/decrease the interface shut down priority are feasible actions.

Severity

Warning

Message Text

interface: %vlanName% up again. recovering from low on memory, current zone:
%memUsageZone%, interface shut down priority: %intShutDownPrio%

Message Parameters

| Name | Type |
|-----------------|--------|
| vlanName | String |
| memUsageZone | ulnt |
| intShutDownPrio | ulnt |

rip.event.addVlanDeny

Description

Request to enable the indicated vlan as active RIP interface has been denied, because the system is running low on memory.

Remedy

add more memory or reconfigure the system to reduce memory consumption.

Severity

Warning

Message Text

adding vlan: %vlanName% not permitted. low on memory, zone: %memUsageZone%

Message Parameters

| Name | Type |
|--------------|--------|
| vlanName | String |
| memUsageZone | ulnt |

rip.event.redistShutDown

Description

Redistribution of the indicated protocol (e.g. BGP) has been shut down (and the related routes removed from the RIP routing table), because the system is running low on memory.

Remedy

add more memory or reconfigure the system to reduce memory consumption.

Severity

Warning

Message Text

redistribution of protocol: %protoName% shut down. low on memory, zone:
%memUsageZone%, protocol priority: %protocolPriority%

Message Parameters

| Name | Type |
|------------------|--------|
| protoName | String |
| memUsageZone | uint |
| protocolPriority | uint |

rip.event.redistUp

Description

Redistribution of the indicated protocol (e.g. BGP) has been activated, because the system has more memory available.

Remedy

expected event.

Severity

Info

Message Text

redistribution of protocol: %protoName% up, more memory available: %memUsageZone%,
protocol priority: %protocolPriority%

Message Parameters

| Name | Type |
|------------------|--------|
| protoName | String |
| memUsageZone | uint |
| protocolPriority | uint |

rip.event.shutDown

Description

RIP disabled because lack of memory. Manual intervention required.

Remedy

add more memory or reconfigure the system to reduce memory consumption, then enable RIP.

Severity

Error

Message Text

RIP has been shut down (disabled), because the system is dangerously low on memory, zone RED.

Description

A system call failed

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

ripGetSocket: setsockopt(SO_RCVBUF) %err%

Message Parameters

| Name | Type |
|------|------|
| err | ulnt |

rip.sys.sockBindErr

Description

A system call failed

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

ripGetSocket: bind error %err%

Message Parameters

| Name | Type |
|------|------|
| err | ulnt |

rip.sys.sockMcLoopErr

Description

A system call failed

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

ripGetSocket: setsockopt(IP_MULTICAST_LOOP) error %err%

Message Parameters

| Name | Type |
|------|------|
| err | ulnt |

rip.sys.sockOpVrldErr

Description

A system call failed

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

ripGetSocket: SO_BINDTODEVICE error: %err% vrlId: %vrId%

Message Parameters

| Name | Type |
|-------|------|
| err | ulnt |
| vrlId | ulnt |

rip.sys.sockOpFIONBIOErr

Description

A system call failed

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

ripGetSocket: ioctl(FIONBIO) error %err%

Message Parameters

| Name | Type |
|------|------|
| err | ulnt |

rip.sys.sendErr

Description

system call sendmsg returned error

Remedy

disable and enable rip. If problem persists reboot system

Severity

Notice

Message Text

system call sendmsg failed: vlan:%vlan% src: %src% dst: %dst% err: %err% socket: %sock%

Message Parameters

| Name | Type |
|------|--------|
| vlan | String |
| src | IP |
| dst | IP |
| err | String |
| sock | sInt |

rip.sys.recvErr

Description

system call recvmsg returned error

Remedy

disable and enable rip. If problem persists reboot system

Severity

Error

Message Text

system call recvmsg failed: err: %err% socket: %sock%

Message Parameters

| Name | Type |
|------|------|
| err | sInt |
| sock | sInt |

rip.sys.exTimerInitErr

Description

during start up RIP could not initialize timer

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

Unable to initialize rip Timer

rip.sys.joinMCGroupErr

Description

An internal error has prevented RIP from initializing its communications sockets. This will cause RIP to not receive RIPv2 messages

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

%caller%: Unable to join rip multicast %addr% group on %vlanName% ifIdx: %ifIndex%
err: %err%

Message Parameters

| Name | Type |
|----------|--------|
| addr | IP |
| vlanName | String |
| ifIndex | ulnt |
| err | ulnt |
| caller | String |

rip.sys.leaveMCGroupErr

Description

A system call failed

Remedy

disable and enable rip. If problem persists reboot system

Severity

Error

Message Text

%caller%: Unable to leave rip multicast %addr% group on %vlanName% ifIdx: %ifIndex%
err: %err%

Message Parameters

| Name | Type |
|----------|--------|
| addr | IP |
| vlanName | String |
| ifIndex | ulnt |
| err | ulnt |
| caller | String |

rip.sys.recvErrSenderLen

Description

system call recvmsg returned invalid length of ipaddress of the sender

Remedy

report problem, if problem persistent reboot system

Severity

Error

Message Text

ripProcess: Invalid length for sender sockaddr %len%

Message Parameters

| Name | Type |
|------|------|
| len | ulnt |

rip.sys.sockCreateErr

Description

A system call failed

Remedy

disable and enable rip. If problem persists reboot system

Severity

Error

Message Text

Error %err% while creating socket

Message Parameters

| Name | Type |
|------|------|
| err | ulnt |

rip.sys.sockMclfErr

Description

system call to set socket multicast option returned error

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

setsockopt IPPROTO_IP, IP_MULTICAST_IF error %err% interface %vlanName%

Message Parameters

| Name | Type |
|----------|--------|
| err | uint |
| vlanName | String |

rip.sys.threadUp

Description

No description is available.

Remedy

No remedy is available.

Severity

Info

Message Text

RIP thread: %name% came up, threadId: %threadId%, processId: %processId%

Message Parameters

| Name | Type |
|-----------|--------|
| name | String |
| threadId | xInt32 |
| processid | xInt32 |

rip.sys.selectErr

Description

system call "select" returned an error, calling select again (receive loop)

Remedy

if problem persist, report problem and rebeoot

Severity

Warning

Message Text

select return error %err%

Message Parameters

| Name | Type |
|------|------|
| err | ulnt |

rip.sys.lockInitErr

Description

system call "pthread_rwlock_init" returned error

Remedy

disable and enable rip. If problem persists reboot system

Severity

Critical

Message Text

Error Initing lock: %lock% err:%err%

Message Parameters

| Name | Type |
|------|--------|
| lock | String |
| err | ulnt |

rip.sys.rtMgrRegErr

Description

cannot register with RTMGR

Remedy

report problem, reboot

Severity

Critical

Message Text

rtMgrRegister returned error: %err%

Message Parameters

| Name | Type |
|------|------|
| err | slnt |

rip.sys.rtMgrRegNotifErr

Description

cannot register with RTMGR

Remedy

report problem, reboot

Severity

Critical

Message Text

rtMgrRegisterNotif returned error: %err%

Message Parameters

| Name | Type |
|------|------|
| err | sInt |

[rip.sys.threadCreateErr](#)

Description

system call pthread_create returned error

Remedy

report problem, reboot

Severity

Critical

Message Text

could not create %threadName% thread, error: %err%

Message Parameters

| Name | Type |
|------------|--------|
| threadName | String |
| err | sInt |

[rip.sys.sigactionErr](#)

Description

No description is available.

Remedy

report problem, if problem persistent reboot system

Severity

Critical

Message Text

system call sigaction failed: err: %err%

Message Parameters

| Name | Type |
|------|------|
| err | sInt |

rip.sys.noMemory

Description

memory manager call could not allocate requested memory

Remedy

This indicates that the switch is running low on memory resources. Reducing the size or complexity of the switch configuration may alleviate this issue. The rip process will need to be restarted. If the problem persists capture "show tech" output and contact customer support.

Severity

Critical

Message Text

%caller% could not allocate %size% bytes of memory

Message Parameters

| Name | Type |
|--------|--------|
| caller | String |
| size | ulnt |

rip.sys.freeMemErr

Description

memory manager call could not free requested memory. Process may experience memory corruption or memory leak

Remedy

If rip restarts or process memory consumption keeps increasing, report problem

Severity

Critical

Message Text

routine %caller%, line %line%, could not free memmory address %ptr%

Message Parameters

| Name | Type |
|--------|--------|
| caller | String |
| line | ulnt |
| err | ulnt |
| ptr | Ptr |

rip.sys.partialSend

Description

Non-blocking socket could not send out the entire packet

Remedy

Handle scenario by sending out the remaining packet

Severity

Notice

Message Text

Sent %sent% bytes out of a total of %size% for socket=%sock% dst=%dst%

Message Parameters

| Name | Type |
|------|------|
| sent | sInt |
| size | sInt |
| sock | sInt |
| dst | IP |

rip.sys.sockOpReuseAddrErr

Description

A system call failed. RIP may not be able to transmit or receive messages

Remedy

disable rip, wait a few minutes and enable rip again. If problem persists reboot system

Severity

Critical

Message Text

ripGetSocket: SO_REUSEADDR error: %err%

Message Parameters

| Name | Type |
|------|------|
| err | ulnt |

rip.sys.LockStateChg

Description

Lock was released or acquired by a thread

Remedy

None. Debug purpose only

Severity

Debug-Verbose

Message Text

Lock %act%: Caller %ptr%, Thread %thd%

Message Parameters

| Name | Type |
|------|--------|
| act | String |
| ptr | Ptr |
| thd | String |

rip.sys.LockBusy

Description

Thread is trying to acquire a lock

Remedy

None. Debug purpose only

Severity

Debug-Verbose

Message Text

Lock Busy: Caller %ptr%, Current: %newthread%, PCaller: %pc% Prev: %oldthread%, duration: %dur%

Message Parameters

| Name | Type |
|-----------|--------|
| ptr | Ptr |
| newthread | String |
| pc | Ptr |
| oldthread | String |
| dur | uInt64 |

rip.sys.LockEvent

Description

Thread couldnot acquire a lock. It will retry

Remedy

None. Debug purpose only

Severity

Debug-Verbose

Message Text

Lock %act% Event: Caller %ptr%, Current: %newthread%, PCaller: %pc%, Prev: %oldthread%,
retCode: %retCode%

Message Parameters

| Name | Type |
|-----------|--------|
| act | String |
| ptr | Ptr |
| newthread | String |
| pc | Ptr |
| oldthread | String |
| retCode | sInt |

[ripng.debug.CreatSockFail](#)

Description

Internal error in RIPng udp socket initialization.

Remedy

Contact tech support.

Severity

Error

Message Text

Error in creating ripngSocket init. Code %num0%

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

ripng.debug.SetSockFail

Description

Internal error in RIPng udp socket initialization.

Remedy

Contact tech support.

Severity

Error

Message Text

Set sock option fail. Code %num0%

Message Parameters

| Name | Type |
|------|------|
| num0 | sInt |

ripng.debug.BindSockFail

Description

Internal error in RIPng udp socket initialization.

Remedy

Contact tech support.

Severity

Error

Message Text

Socket bind fail.

ripng.debug.SetIOFail

Description

Internal error in RIPng udp socket initialization.

Remedy

Contact tech support.

Severity

Error

Message Text

Socket set FIONBIO fail.

ripng.debug.RegRtMgrFail

Description

Internal error in RIPng registering with route manager initialization.

Remedy

Contact tech support.

Severity

Error

Message Text

Failed to register with router manager..

ripng.debug.MemAllocFail

Description

Internal error in RIPng. If it is temporary memory outage it should recover, otherwise, there is not enough memory in the system.

Remedy

Disable and enable ripng. If problem persists, reconfigure the system to reduce memory consumption or reboot system

Severity

Critical

Message Text

Failed to alloc memory for %num0% size.

Message Parameters

| Name | Type |
|------|--------|
| num0 | uInt32 |

ripng.debug.ProcRtNotif

Description

Debug message.

Remedy

Debug message.

Severity

Debug-Verbose

Message Text

Processing notification for route %rte%/%len% of origin %or% from %rte2%.

Message Parameters

| Name | Type |
|------|------|
| rte | IPv6 |
| len | sInt |
| or | sInt |
| rte2 | IPv6 |

ripng.debug.RtNotifNoRout

Description

Debug message.

Remedy

Debug message.

Severity

Debug-Verbose

Message Text

Route not found while processing notification for route %rte%/%len%.

Message Parameters

| Name | Type |
|------|------|
| rte | IPv6 |
| len | sInt |

ripng.debug.RtNotifUpdt

Description

Debug message.

Remedy

Debug message.

Severity

Debug-Data

Message Text

Updating route in ripng db after route notification from rtMgr. %rte%/%len%, origin %or%

Message Parameters

| Name | Type |
|------|------|
| rte | IPv6 |
| len | sInt |
| or | sInt |

ripng.debug.RtNotifUpdtFail

Description

Debug message.

Remedy

Debug message.

Severity

Notice

Message Text

Updating route in ripng db after route notification from rtMgr. %rte%/%len%, origin %or%

Message Parameters

| Name | Type |
|------|------|
| rte | IPv6 |
| len | sInt |
| or | sInt |

ripng.debug.RtNotifPathLkupFail

Description

Debug message.

Remedy

Debug message.

Severity

Notice

Message Text

Route path could not be found while processing update, %rte%/%len%, from %rte2%

Message Parameters

| Name | Type |
|------|------|
| rte | IPv6 |
| len | sInt |
| rte2 | IPv6 |

ripng.debug.RtNotifCmpMetric

Description

Debug message.

Remedy

Debug message.

Severity

Debug-Data

Message Text

Route path and route metric comparison for, %rte%/%len%, %le1%, %le2%

Message Parameters

| Name | Type |
|------|------|
| rte | IPv6 |
| len | sInt |
| le1 | sInt |
| le2 | sInt |

ripng.debug.BestRtFlagFail

Description

Debug message.

Remedy

Debug message.

Severity

Debug-Data

Message Text

Route path for %rte%/%len%, from %rte2% could not be marked best as %st1%

Message Parameters

| Name | Type |
|------|--------|
| rte | IPv6 |
| len | sInt |
| rte2 | IPv6 |
| st1 | String |

ripng.debug.RpFindDump

Description

Debug message.

Remedy

Debug message.

Severity

Debug-Data

Message Text

Route path for %rte%/%len%, from/gw %rte2%/rte3%.

Message Parameters

| Name | Type |
|------|------|
| rte | IPv6 |
| len | sInt |
| rte2 | IPv6 |
| rte3 | IPv6 |

ripng.external.CreatIpVlan

Description

Adding cache into db.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Creating IpV6 vlan, %str% on vrid %num% with index %num2% IPv6 addr, %addr6% with state %st%.

Message Parameters

| Name | Type |
|-------|------|
| str | VLAN |
| num | sInt |
| num2 | sInt |
| addr6 | IPv6 |
| st | sInt |

ripng.external.CreatIpVlanFail

Description

Adding cache into db.

Remedy

Informational message only, for debug purpose.

Severity

Error

Message Text

IPv6 vlan creation failed as there is no vlan configured by name, %s1% and index %v2%.

Message Parameters

| Name | Type |
|------|------|
| s1 | VLAN |
| v2 | sInt |

ripng.external.DelIPv6Addr

Description

Adding cache into db.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

IPv6 address %addr6% being deleted from vlan, %s1%.

Message Parameters

| Name | Type |
|-------|------|
| addr6 | IPv6 |
| s1 | VLAN |

ripng.external.ChgSecIPv6AddrStat

Description

Adding cache into db.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

IPv6 address %addr6% state changed to, %st%.

Message Parameters

| Name | Type |
|-------|--------|
| vl | VLAN |
| addr6 | IPv6 |
| st | uInt32 |

ripng.external.ChgVlanStat

Description

Changingg state of vlan in internal database.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Change vlan state for vlan, %nm% , %st%.

Message Parameters

| Name | Type |
|------|--------|
| nm | VLAN |
| st | uInt32 |

ripng.external.ChgIpFwdState

Description

Changingg global IPv6 forwarding state .

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Change IPv6 forwarding state for VR, %st%.

Message Parameters

| Name | Type |
|------|--------|
| st | uInt32 |

ripng.external.DellpVlan

Description

Deleting vlan from db.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Deleting IpV6 vlan, %str% with kernel index %num% and vlan index %num2% .

Message Parameters

| Name | Type |
|------|------|
| str | VLAN |
| num | sInt |
| num2 | sInt |

ripng.external.CreatVr

Description

Creating VR in RIPNg db.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Creating VR %vr% with if %num%.

Message Parameters

| Name | Type |
|------|--------|
| vr | String |
| num | sInt |

ripng.external.CreatVrFail

Description

Creating VR in RIPNg db.

Remedy

Informational message only, for debug purpose.

Severity

Critical

Message Text

Internal error for setsock option for VR %vr% with if %num%.

Message Parameters

| Name | Type |
|------|--------|
| vr | String |
| num | sInt |

ripng.external.ChgIpFwdStateVlan

Description

Changing vlan's IPv6 forwarding state .

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Change IPv6 forwarding state for vlan, %st%.

Message Parameters

| Name | Type |
|------|------|
| st | VLAN |

ripng.external.ChgVlanName

Description

Changing vlan's name .

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Change vlan name from , %st% to %st1%.

Message Parameters

| Name | Type |
|------|------|
| st | VLAN |
| st1 | VLAN |

ripng.external.ChgVlanNameFail

Description

Changing vlan's name .

Remedy

Informational message only, for debug purpose.

Severity

Error

Message Text

Error while changing vlan name from, %st% to %st1%.

Message Parameters

| Name | Type |
|------|------|
| st | VLAN |
| st1 | VLAN |

ripng.message.ProcInMsgFail

Description

Failed to process input message as no IPv6 address is active on the VLAN.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

ignoring received packet from invalid source interface. %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

ripng.message.IgnInMsgFail

Description

Failed to process input message as no IPv6 address is active on the VLAN.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

ignoring received packet because we lack a unicast address for response on interface %nm%.

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

ripng.message.LkupAddrFail

Description

Failed to process input message no link local address found on local interface.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

cannot respond out interface %nm% - no link-local found

Message Parameters

| Name | Type |
|------|------|
| nm | VLAN |

ripng.message.CmpRipPortFail

Description

Failed to process input message as message received from a port other than UDP port.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Ignoring received packet from invalid source port, %port%.

Message Parameters

| Name | Type |
|------|--------|
| port | uint32 |

[ripng.message.CmpRipSrcFail](#)

Description

Failed to process input message as message received from non link local address.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Ignoring received packet from invalid source address %ipa%

Message Parameters

| Name | Type |
|------|------|
| ipa | IPv6 |

[ripng.message.CmpRipHopLimitFail](#)

Description

Failed to process input message as message received has invalid hopcount.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Ignoring received packet with invalid hop limit, %ln%.

Message Parameters

| Name | Type |
|------|--------|
| ln | uint32 |

ripng.message.RxSrcRoutInv

Description

Failed to process route as route prefix was wrong .

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Received invalid address %ip1% from %ip2%.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |

ripng.message.RxSrcRoutTagInv

Description

Failed to process route as route tag was wrong .

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Received next hop with invalid tag, %num% from %ip2%.

Message Parameters

| Name | Type |
|------|--------|
| num | uInt32 |
| ip2 | IPv6 |

ripng.message.RxSrcRoutLenInv

Description

Failed to process route as route len was wrong .

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

Received next hop with invalid prefix length %num% from %ip2%.

Message Parameters

| Name | Type |
|------|--------|
| num | uInt32 |
| ip2 | IPv6 |

ripng.message.RxRoutNextHopInv

Description

Failed to process route as route next hop was wrong .

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Received received invalid next hop %ip1% from %ip2%.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |

ripng.message.RxRoutCostInv

Description

Failed to process route as route metric was wrong .

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Received received invalid metric %num% from %ip2%.

Message Parameters

| Name | Type |
|------|--------|
| num | uInt32 |
| ip2 | IPv6 |

ripng.message.RxMsgIgn

Description

Received RIP message not known to RIP .

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

ripng input start: received RIP packet on an interface not configured for RIP.

ripng.message.RxMsgDrp

Description

Received RIP message on an interface not known to RIP.

Remedy

Informational message only, for debug purpose.

Severity

Info

Message Text

ripng input start: received packet on non-up/-enabled if - %str1%.

Message Parameters

| Name | Type |
|------|--------|
| str1 | String |

ripng.message.RxMsgAddrInv

Description

Received RIP message from invalid source address .

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

ripng HandleResRte packet from %str1%.

Message Parameters

| Name | Type |
|------|--------|
| str1 | String |

ripng.message.RxMsgSizInv

Description

Received RIP message not known to RIP .

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Ripng read socker: packetsize not a multiple.

ripng.message.RxMsgVerInv

Description

Received RIP message not known to RIP .

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Ripng : Invalid RIPng version in the message %num%

Message Parameters

| Name | Type |
|------|--------|
| num | uInt32 |

ripng.message.RxMsgFldInv

Description

Received RIP message with invalid field.

Remedy

Informational message only, for debug purpose.

Severity

Warning

Message Text

Invalid RIPng field

ripng.message.RxMsgTyplnv

Description

Received RIP message with invalid command.

Remedy

Informational message only, for debug purpose.

Severity

Notice

Message Text

Ignoring received invalid command type, %num%.

Message Parameters

| Name | Type |
|------|--------|
| num | uInt32 |

ripng.message.TxMsgFail

Description

Received RIP message with invalid command.

Remedy

Informational message only, for debug purpose.

Severity

Notice

Message Text

RIPng message transmit failed on vlan %v1%. Error %num% , error string, %str0% .

Message Parameters

| Name | Type |
|------|--------|
| v11 | VLAN |
| num | sInt |
| str0 | String |

ripng.message.RxSrcRout

Description

Received route update from neighbor .

Remedy

Informational message only, for debug purpose.

Severity

Debug-Verbose

Message Text

Received route %ip1%/%mask_len% from %ip3% in vlan %vlanName% with metric %num%.

Message Parameters

| Name | Type |
|----------|------|
| ip1 | IPv6 |
| mask_len | sInt |
| ip3 | IPv6 |
| vlanName | VLAN |
| num | sInt |

ripng.message.RxRoutPolDrop

Description

Received route update from neighbor dropped due to policy configuration.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Summary

Message Text

Received route %ip1% from %ip2% with metric %num% dropped due to import policy on vlan %nm%.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |
| num | sInt |
| nm | VLAN |

ripng.message.RxPathAddFail

Description

Received route update from neighbor could not be added.

Remedy

Contact tech support.

Severity

Warning

Message Text

Received route %ip1% from %ip2% with metric %num% could not be added into RIPng db.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |
| num | sInt |

ripng.message.RxPathUpdtFail

Description

Received route update from neighbor could not be updated.

Remedy

Contact tech support.

Severity

Warning

Message Text

Received route %ip1% from %ip2% with metric %num% could not be updated into RIPng db.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |
| num | sInt |

ripng.message.RxRoutAddFail

Description

Received route update from neighbor could not be updated.

Remedy

Contact tech support.

Severity

Warning

Message Text

Received new route %ip1% from %ip2% with metric %num% could not be added into RIPng db.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |
| num | sInt |

ripng.message.SndRtMgrMsg

Description

Send route update to route manager.

Remedy

Debug message.

Severity

Debug-Verbose

Message Text

Sending route %ip1%/%num% to route manager.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| num | sInt |

ripng.message.SndRtMgrMsgFail

Description

Send route update to route manager fail.

Remedy

Contact tech support.

Severity

Warning

Message Text

Failed to send route update message for route, %ip1%/%num% to route manager.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| num | sInt |

ripng.message.SndRtMgrAbrt

Description

Send route update to route manager fail.

Remedy

Contact tech support.

Severity

Warning

Message Text

Aborted route update to rtMgr for route, %ip1%/%num%, as gateway %ip2% is not link local address.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| num | sInt |
| ip2 | IPv6 |

ripng.message.RtLkup

Description

Debug data

Remedy

Debug Data.

Severity

Description

Error occurred while trying to delete a route from RIPng database.

Remedy

Contact tech support.

Severity

Error

Message Text

Error in deleting route from internal database.

ripng.route.ClrRoutDbFail

Description

Error occurred while trying to delete a route from RIPng database.

Remedy

Contact tech support.

Severity

Error

Message Text

Error in flushing all route from internal database. Leftovers after flush %d1% %d2%.

Message Parameters

| Name | Type |
|------|------|
| d1 | sInt |
| d2 | sInt |

ripng.route.DelTUFail

Description

Error occurred while trying to delete a triggered updates from RIPng database.

Remedy

Contact tech support.

Severity

Error

Message Text

Internal error while deleting triggered updates. Internal loop found.

ripng.route.RoutAddFail

Description

Error occurred while trying to add route into route manager.

Remedy

Contact tech support.

Severity

Warning

Message Text

Could not add route %ip1%, from %ip2% with metric %num% to routing db.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |
| num | sInt |

ripng.route.RoutPathUpdt

Description

Error occurred while trying to add route into route manager.

Remedy

Contact tech support.

Severity

Debug-Verbose

Message Text

Updating route path for dest %ip1%, from %ip2% with metric %num% to RIPng db.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |
| num | sInt |

ripng.route.RoutPathAdd

Description

Error occurred while trying to add route into route manager.

Remedy

Contact tech support.

Severity

Debug-Verbose

Message Text

Adding route path for dest %ip1%, from %ip2%, origin %n1% with metric %num% to RIPng db.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| ip2 | IPv6 |
| n1 | sInt |
| num | sInt |

ripng.route.AddRoutStrt

Description

Adding to RIPng database.

Remedy

Debug data only.

Severity

Debug-Summary

Message Text

Adding new route %ip1%/%1len%to RIPng database.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |
| len | sInt |

ripng.route.RecvRoutMgrMsg

Description

Message from Route manager.

Remedy

Debug data only.

Severity

Debug-Verbose

Message Text

Received message from route manager of type %len%.

Message Parameters

| Name | Type |
|------|------|
| len | sInt |

ripng.route.RecvRoutMgrNotif

Description

Message from Route manager.

Remedy

Debug data only.

Severity

Debug-Verbose

Message Text

Received route add/del notification from route manager. Type %len%.

Message Parameters

| Name | Type |
|------|------|
| len | sInt |

ripng.route.ProcRtAddMsg

Description

Message from Route manager.

Remedy

Debug data only.

Severity

Debug-Verbose

Message Text

Going to process route add notification from route manager for route %ip1%.

Message Parameters

| Name | Type |
|------|------|
| ip1 | IPv6 |

ripng.route.RecvRtAddFail

Description

Message from Route manager.

Remedy

Debug data only.

Severity

Warning

Message Text

Process route add notification failed because of incorrect route family, %len%.

RMON.GetEPICSemFail

Description

The RMON failed to create/get EPIC Semaphore.

Remedy

NA

Severity

Error

Message Text

RMON fails to get EPIC semaphore.

RMON.GetEPICAuthFail

Description

The RMON failed to (EPIC) Authenticate.

Remedy

NA

Severity

Error

Message Text

RMON fails to get EPIC Authentication.

RMON.TxEPICReqFail

Description

The RMON fails to send the EPIC request.

Remedy

NA

Severity

Error

Message Text

RMON fails to send EPIC request.

RMON.AsynchHALReqFail

Description

The RMON fails to send msg request to the HAL for port statistics.

Remedy

NA

Severity

Warning

Message Text

RMON fails to send hal request with error %error%.

Message Parameters

| Name | Type |
|-------|------|
| error | xInt |

RMON.Alarm.AddEnt

Description

RMON alarm has been added.

Remedy

NA

Severity

Debug-Summary

Message Text

RMON adds alarm entry %index%.

Message Parameters

| Name | Type |
|-------|------|
| index | ulnt |

RMON.Alarm.DelEnt

Description

RMON alarm has been deleted.

Remedy

NA

Severity

Debug-Summary

Message Text

RMON deletes alarm entry %index%/

Message Parameters

| Name | Type |
|-------|------|
| index | uInt |

RMON.Alarm.EntStatusChg

Description

RMON alarm entry status has been changed.

Remedy

NA

Severity

Debug-Summary

Message Text

The status of alarm entry %index% is changed from %status1% to %status2% %reason%.

Message Parameters

| Name | Type |
|---------|--------|
| index | ulnt |
| status1 | String |
| status2 | String |
| reason | String |

RMON.Alarm.RiseEvent

Description

The RMON will send the rising alarm when the current value exceeds the configured (maximum) threshold value.

Remedy

The Administrator will take the corrective action based on the RMON Notification.

Severity

Debug-Summary

Message Text

Alarm %index% sends rising event %event% with value %value% and threshold %limit%.

Message Parameters

| Name | Type |
|-------|------|
| index | ulnt |
| event | ulnt |
| value | ulnt |
| limit | ulnt |

RMON.Alarm.FallEvent

Description

The RMON will send the falling alarm when the current value is below the configured (minimum)threshold value.

Remedy

The Administrator will take the corrective action based on the RMON Notification.

Severity

Debug-Summary

Message Text

Alarm %index% sends falling event %event% with value %value% and threshold %limit%.

Message Parameters

| Name | Type |
|-------|------|
| index | ulnt |
| event | ulnt |
| value | ulnt |
| limit | ulnt |

RMON.Alarm.SendTrap

Description

The RMON sends the Trap with the corresponding state information.

Remedy

No remedy is available.

Severity

Info

Message Text

Alarm %index% sends %type% trap with %state%.

Message Parameters

| Name | Type |
|-------|--------|
| index | uint |
| type | String |
| state | String |

RMON.Events.AddEnt

Description

RMON event entry has been created by the user.

Remedy

NA

Severity

Debug-Summary

Message Text

RMON adds a event entry %index%.

Message Parameters

| Name | Type |
|-------|------|
| index | uInt |

RMON.Events.DelEnt

Description

RMON event entry has been deleted by the user.

Remedy

NA

Severity

Debug-Summary

Message Text

RMON deletes event entry %index%.

Message Parameters

| Name | Type |
|-------|------|
| index | ulnt |

RMON.Events.StatusChg

Description

The status of the RMON event entry has been changed from valid(1) to undercreation(3) or viseversa.

Remedy

NA

Severity

Debug-Summary

Message Text

The status of event %index% is changed from %status1% to %status2%.

Message Parameters

| Name | Type |
|---------|--------|
| index | ulnt |
| status1 | String |
| status2 | String |

RMON.Events.MakeLog

Description

The RMON rising event alarm has been logged.

Remedy

NA

Severity

Debug-Summary

Message Text

RMON makes log %index%.%sample%.

Message Parameters

| Name | Type |
|--------|------|
| index | ulnt |
| sample | ulnt |

RMON.HAL Messages

RMON.History.DelEnt

Description

RMON history control entry has been deleted.

Remedy

NA

Severity

Info

Message Text

Deleting history control entry %index% with port %port%, buckets requested %req%, buckets granted %grant%, interval %interval% and owner %owner%

Message Parameters

| Name | Type |
|-------|----------|
| index | ulnt |
| port | SlotPort |
| req | ulnt |
| grant | ulnt |

| Name | Type |
|----------|--------|
| interval | ulnt |
| owner | String |

RMON.History.UnderCreatTimerExp

Description

The RMON history control entry "undercreation" timer has been expired. The entry will be deleted if the entry's timeout value is greater than 1 second.

Remedy

NA

Severity

Info

Message Text

The undercreation timer of history control entry %index% with port %port%, buckets requested %req%, buckets granted %grant%, interval %interval% and owner %owner% expires.

Message Parameters

| Name | Type |
|----------|----------|
| index | ulnt |
| port | SlotPort |
| req | ulnt |
| grant | ulnt |
| interval | ulnt |
| owner | String |

RMON.History.AddEtherEnt

Description

RMON Ethernet history entry has been updated to the backup MSM.

Remedy

NA

Severity

Debug-Summary

Message Text

RMON adds a ethernet history entry with index %index% and sample index %sample%.

Message Parameters

| Name | Type |
|--------|------|
| index | ulnt |
| sample | ulnt |

RMON.History.AddEnt

Description

RMON :: New row has been added to history control table.

Remedy

NA

Severity

Debug-Summary

Message Text

RMON adds a history control entry %index%.

Message Parameters

| Name | Type |
|-------|------|
| index | ulnt |

RMON.History.AddDfltEnt

Description

RMON Default history control entry has been created.

Remedy

NA

Severity

Debug-Summary

Message Text

RMON adds a default history entry %index%.

Message Parameters

| Name | Type |
|-------|------|
| index | uInt |

RMON.History.InitDone

Description

RtMgr.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependant on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

RtMgr.Warning

Description

An abnormal condition has been detected which, although it is not interfering with the normal operation of the system, may signal that the system or the network in general may not be functioning as expected. The condition may have been caused by an unusual or unexpect circumstance related to some external stimulus.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by by rejecting the request or performing some default action.

Severity

Warning

Message Text

| app | String |
| slot | Slot |

RtMgr.multiReg

Description

An application has attempted to register with Route Manager more than once.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by rejecting the request or performing some default action.

Severity

Debug-Summary

Message Text

Application %app% on slot %slot% trying to register more than once

Message Parameters

| Name | Type |
|------|--------|
| app | String |
| slot | Slot |

RtMgr.dsInitFailure

Description

Route Manager can not register with Directory Service Process

Remedy

Route Manager shall be restarted or whole switch needs to be rebooted.

Severity

Critical

Message Text

Can not register DS service

RtMgr.dsRegisterErr

Description

Route Manager can not register with DS for specified service.

Remedy

Route Manager shall be restarted or whole switch needs to be rebooted.

Severity

Critical

Message Text

Fail to register with DS service name=%name% ret=%ret%

Message Parameters

| Name | Type |
|------|--------|
| name | String |
| ret | ulnt |

RtMgr.cliMasterErr

Description

Route Manager can not register with CLI Master.

Remedy

Route Manager shall be restarted or whole switch needs to be rebooted.

Severity

Critical

Message Text

Fail to register with CLI master

RtMgr.ORErr

Description

No description is available.

Remedy

No remedy is available.

Severity

Critical

Message Text

Fail to register with Object Router subagent

RtMgr.icmplnitFailure

Description

Route Manager can not open raw ICMP socket.

Remedy

Route Manager shall be restarted or whole switch needs to be rebooted.

Severity

Critical

Message Text

Can not initialize raw ICMP socket

RtMgr.closeDataCon

Description

An application client has closed data connection with Route Manager

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by rejecting the request or performing some default action.

Severity

Debug-Summary

Message Text

Connection closed abnormally from app=%app% slot=%slot%

Message Parameters

| Name | Type |
|------|--------|
| app | String |
| slot | Slot |

RtMgr.rxDataPkt

Description

No description is available.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Recives a data packet(len=%len%) from app=%app% slot=%slot% msg=%msgTag%
peer=%peerId%

Message Parameters

| Name | Type |
|--------|--------|
| len | ulnt |
| app | String |
| slot | Slot |
| msgTag | ulnt |
| peerId | ulnt |

RtMgr.rxNotifPkt

Description

No description is available.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Recives a data packet(len=%len%) from app=%app% slot=%slot% msg=%msgTag%
peer=%peerId%

Message Parameters

| Name | Type |
|--------|--------|
| len | ulnt |
| app | String |
| slot | Slot |
| msgTag | ulnt |
| peerId | ulnt |

RtMgr.notifStart

Description

No description is available.

Remedy

No remedy is available.

Severity

Info

Message Text

Notification thread has started

RtMgr.shutdown

Description

Route Manager is shutting down while there are still application client registering.

Remedy

The exact remedy is dependant on the particular situation. Mostly this is rather informational.

Severity

Info

Message Text

rtmgr is shutting down and waiting for %num% clients to be dead

Message Parameters

| Name | Type |
|------|------|
| num | ulnt |

RtMgr.dead

Description

No description is available.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

I am really dead now !

RtMgr.nullGateway

Description

Routing Protocol tries to add a route with a gateway address, which is unreachable.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by rejecting the request or performing some default action.

Severity

Debug-Summary

Message Text

Can not find interface for gateway vr=%vr% addr=%addr%

Message Parameters

| Name | Type |
|------|------|
| vr | ulnt |
| addr | IP |

RtMgr.purgeRtStart

Description

Starting purge of routes for a specific client.

Remedy

[No action required - Debug message only. May be of interest to developers to trace and debug events in BGP.]

Severity

Debug-Verbose

Message Text

Start to purge routes from client id=%id% app=%app% chassis=%chassis% slot=%slot%:
purge=%purge% start=%stime% status=%resume%

Message Parameters

| Name | Type |
|---------|--------|
| id | xInt32 |
| app | String |
| chassis | ulnt |
| slot | Slot |
| purge | Ptr |
| stime | ulnt |
| resume | String |

RtMgr.purgeRtEnd

Description

Ending purge of routes for a specific client.

Remedy

[No action required - Debug message only. May be of interest to developers to trace and debug events in BGP.

Severity

Debug-Verbose

Message Text

```
purged %npurged% routes from client id=%id% app=%app% chassis=%chassis%
slot=%slot%: purge=%purge% time=%time% newrtes=%nnew% rtstats=%stats%
status=%status%
```

Message Parameters

| Name | Type |
|---------|--------|
| npurged | ulnt |
| id | xInt32 |
| app | String |
| chassis | Slot |
| slot | Slot |
| purge | Ptr |
| time | ulnt |
| nnew | ulnt |
| stats | String |
| status | String |

RtMgr.ospfEndRt

Description

No description is available.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

purged %total% OSPF routes from client app=%app% chassis=%chassis% slot=%slot%
time=%time%

Message Parameters

| b | String |
| d | sInt32 |
| c | String |

RtMgr.DelRtFail

Description

Delete route failed for dest/mask via the nh, possible err are route node or route info not found for the route to be deleted.

Remedy

This may not be an issue, as it may be hit when delete is tried for a route not found. Will need developer to take a look if that is not the case.

Severity

Debug-Data

Message Text

Delete Route Failed for %addr%/%mask% via %nh% in vr=%vr%

Message Parameters

| Name | Type |
|------|-----------|
| vr | VRID |
| addr | String |
| mask | IPmasklen |
| nh | String |
| err | String |

RtMgr.XlateRtLSPNotFnd

Description

During Route translation from the message sent by the protocols LSP lookup failed for the route with addr/mask and the LSP index is ifIndex. This is a very unlikely error that indicates that the protocols did not know about the proper LSP index. For route add case and route del case when MPLS is disabled this can be ignored as this lookup is not used by RTMgr.

Remedy

Collect more logs of the Prorotocol (and rtmgr like RtReq) that deleted the route. Will need a developer to take a look at these logs.

Severity

Debug-Data

Message Text

during Translate Route LSP Not Found for %addr%/%mask% ifIndex=%ifIndex% in vr=%vr%

Message Parameters

| Name | Type |
|---------|-----------|
| vr | VRID |
| addr | String |
| mask | IPmasklen |
| ifIndex | uInt |

RtMgr.DelRtNodeLkupFail

Description

When routes are deleted if there are no more routes for a particular prefix then the route node is also deleted. This message is used to display the error if a route node lookup fails. vr is the name of the vr in which this happened and addr/mask is the prefix of the route node.

Remedy

Not a real problem so there is nothing to be resolved.

Severity

Debug-Data

Message Text

during Delete of Route Node %addr%/%mask% Lookup failed resetting compression to start from radix root vr=%vr%

Message Parameters

| Name | Type |
|------|-----------|
| vr | String |
| addr | String |
| mask | IPmasklen |

RtMgr.DelRtNodeFail

Description

When routes are deleted if there are no more routes for a particular prefix then the route node is also deleted. This message is used to display the error if a route node fails. vr is the name of the vr in which this happened and addr/mask is the prefix of the route node.

Remedy

Collect more logs related to route add/delete. It may need developer intervention.

Severity

Notice

Message Text

Delete of Route Node %addr%/%mask% Failed vr=%vr%

Message Parameters

| Name | Type |
|------|-----------|
| vr | String |
| addr | String |
| mask | IPmasklen |

RtMgr.BFD Messages

[RtMgr.BFD.StaticRtStateUp](#) on page 4610

[RtMgr.BFD.StaticRtStateDown](#) on page 4611

RtMgr.BFD.StaticRtStateUp

Description

The operational state of the static route has changed to "UP", either because the BFD session to the gateway has transitioned to "UP", or because BFD protection for the route has been removed via configuration, and the interface to the gateway is "UP".

Remedy

This is a notification of a network change.

Severity

Notice

Message Text

The state of the static route to %dest_ip%/%dest_masklen% (gateway %gw_addr%, VR %vrname%) has changed to UP due to a BFD session state or protection status change.

Message Parameters

| Name | Type |
|--------------|--------|
| dest_ip | String |
| dest_masklen | ulnt |
| gw_addr | String |
| vrname | VR |

RtMgr.BFD.StaticRtStateDown

Description

The operational state of the static route has changed to "DOWN" because either the BFD session to the gateway has transitioned to "DOWN", or the route has been configured for BFD protection and the BFD session to the gateway is "DOWN".

Remedy

This is a notification of a network change.

Severity

Notice

Message Text

The state of the static route to %dest_ip%/%dest_masklen% (gateway %gw_addr%, VR %vrname%) has changed to DOWN due to a BFD session state or protection status change.

Message Parameters

| Name | Type |
|--------------|--------|
| dest_ip | String |
| dest_masklen | uInt |
| gw_addr | String |
| vrname | VR |

RtMgr.Client.RegCIntAllocMemFail

Description

Running Low on memory in the system

Remedy

We need to find out who is leaking memory in the system. Or did we configure beyond scale limits of the platform?

Severity

Error

Message Text

```
Failed to alloc %size% bytes
```

Message Parameters

| Name | Type |
|------|--------|
| size | xInt32 |

RtMgr.Client.LkupSvcNameFail

Description

Trying to resolve a service name to IPML information.

Remedy

Platform is goofed up now. What can I do? Reboot.

Severity

Error

Message Text

Failed to dsGetEntryByAttr(%service%)

Message Parameters

| Name | Type |
|---------|--------|
| service | String |

RtMgr.Client.CIntNotFnd

Description

All Registered clients are placed in a Hash Table in the RTMGR client Lib. Find hash is unable to locate the client id.

Remedy

Use jerry show RTM client to see if the client ever registered. If yes, then Hash Find is buggy.

Severity

Error

Message Text

Failed to find_rtMgrClient_hash(%id%)

Message Parameters

| Name | Type |
|------|--------|
| id | xInt32 |

RtMgr.Client.RegExpMasks

Description

A client is registering with RTMGR set of export masks for notifications

Remedy

This is a debug message

Severity

Debug-Data

Message Text

clientId=(%id%) is Registering new Export Masks DontCare=%dc%,masks=%m%

Message Parameters

| Name | Type |
|------|--------|
| id | xInt32 |
| dc | xInt32 |
| m | String |

RtMgr.Client.RegPeerByAddr

Description

A client is registering with RTMGR for notifications. But IPML layer is failing.

Remedy

I dont know how to debug and work around this Issue.

Severity

Error

Message Text

Call to ipmlRegisterPeerByAddr(%attr%) failed.

Message Parameters

| Name | Type |
|------|--------|
| attr | String |

RtMgr.Client.IPMLSendFail

Description

A client is sending some IPML MSg to RTM. But IPML layer is failing.

Remedy

I dont know how to debug and work around this Issue.

Severity

Error

Message Text

When sending *%cmd%*, call to ipmlSend(%peer%) from clientId=%id% failed.

Message Parameters

| Name | Type |
|------|--------|
| peer | xInt32 |
| id | xInt32 |
| cmd | String |

RtMgr.Client.RegNilPeerId

Description

RTMGR Clients need to register before setting export masks.

Remedy

Use jerry show RTM client to see if the client ever registered. If yes, then client library is buggy.

Severity

Error

Message Text

Client with ID=%id% has NULL Notify Peer ID.

Message Parameters

| Name | Type |
|------|--------|
| id | xInt32 |

RtMgr.Client.RegInvFam

Description

RTMGR can support two Address families - AF_INET and AF_INET6.

Remedy

Check code for RT_AFI_MAX constant. A client can send %af% less-than RT_AFI_MAX.

Severity

Error

Message Text

Client with ID=%id% is passing invalif AF(%af%).

Message Parameters

| Name | Type |
|------|--------|
| id | xInt32 |
| af | xInt32 |

RtMgr.Client.RegNotifyFail

Description

A client %id% is calling rtMgrRegisterNotif(). For some reason RTMG Notify IPML Service is down

Remedy

I don't know how to debug IPML

Severity

Error

Message Text

Client with ID=%id% failed to register with Notify Service in RTMGR.

Message Parameters

| Name | Type |
|------|--------|
| id | xInt32 |

RtMgr.Client.ipmlAllocFail

Description

A client %id% is calling rtMgrRegisterNotif(). For some reason RTMG Notify IPML Service is down

Remedy

I don't know how to debug IPML

Severity

Error

Message Text

Client with ID=%id% failed to Alloc IPML buffers size=%sz%, type=%type%.

Message Parameters

| lbl | xInt32 |
| func | String |

RtMgr.Client.ClientCleanup

Description

A rtMgr client has called rtMgrClientCleanup(). All clients registered will be removed.

Remedy

None

Severity

Debug-Data

Message Text

RtMgr Client %id% called rtMgrClientCleanup().

Message Parameters

| Name | Type |
|------|--------|
| id | xInt32 |

RtMgr.Client.DebugInfo

Description

A rtMgr client has called functions named %func% and its arguments are in %args% and its return code is %rc%.

Remedy

None

Severity

Debug-Data

Message Text

RtMgr Client Function %func%(%args%) return %rc%.

Message Parameters

| Name | Type |
|------|--------|
| func | String |
| args | String |
| rc | sInt32 |

RtMgr.Client.RtReplNumPathErr

Description

A client is passing Zero or Negative Numpaths when calling rtMgrReplaceRtEntry() function .

Remedy

Translate Client Id to a role (Look at rtMgrShare.h) and explore Caller's code.

Severity

Error

Message Text

Invalid NumPaths(%numpath%) called by Client %id%

Message Parameters

| Name | Type |
|---------|--------|
| numpath | xInt32 |
| id | xInt32 |

RtMgr.Client.RtReplMismatchErr

Description

A client is passing array of rtes. But there is mismatch in either key, metirc, origin or ttl.

Remedy

Translate Client Id to a role (Look at rtMgrShare.h) and explore Caller's code.

Severity

Error

Message Text

Mismatch in parameters: Client=%id% Info=%buf%

Message Parameters

| Name | Type |
|------|--------|
| id | xInt32 |
| buf | String |

RtMgr.Client.GetMsgErr

Description

Caller of this function is expecting a TLV which does not match with what is in the message.

Remedy

This a message packaging bug and needs to be resolved before it works.

Severity

Error

Message Text

Mismatch in TLV TYPE: Expecting %one%, Got %two%

Message Parameters

| Name | Type |
|------|--------|
| one | xInt32 |
| two | xInt32 |

RtMgr.Client.TlvGetObjErr

Description

Caller is trying to pull a TLV from an IPML message but fails.

Remedy

This may be that IPML layer has a bug or the sender never sent the TLV. Only code analysis can provide a confirmation.

Severity

Error

Message Text

TlvGetObjErr() failed: %msg%

Message Parameters

| Name | Type |
|------|--------|
| msg | String |

RtMgr.Client.ReplyToVlanTimeOut

Description

A client %id% has called ipmlRecv() and is timed out. The response delayed may not be picked up by the client. In order to solve the issue, some state machine was added to VLAN manager code so the client function call shall proceed in a meaningful order.

Remedy

Handled already

Severity

Warning

Message Text

Client VLAN with ID=%id% Timed out waiting for (%msg%).

Message Parameters

| Name | Type |
|------|--------|
| id | xInt32 |
| msg | String |

RtMgr.HAL.ProcHALMsg

Description

Route Manager is connected to HAL via IPC.

Remedy

None.

Severity

Debug-Data

Message Text

%a%

Message Parameters

| Name | Type |
|------|--------|
| a | String |

RtMgr.HAL.ProcSync

Description

Route Manager Received a Message from HAL via IPC.

Remedy

None.

Severity

Debug-Data

Message Text

%a% message Received from HAL for Card %b% (status=%c%)

Message Parameters

| Name | Type |
|------|--------|
| a | xInt32 |
| b | xInt32 |
| c | xInt32 |

RtMgr.HAL.AddIPFIB

Description

Route Manager sends an IP FIB Add message to HAL.

Remedy

None.

Severity

Debug-Data

Message Text

Send an IP FiB ADD %a% message to HAL for all slots

Message Parameters

| Name | Type |
|------|--------|
| a | String |

RtMgr.HAL.ReplIPFIB

Description

Route Manager sends an IP FIB Replace message to HAL.

Remedy

None.

Severity

Debug-Data

Message Text

Send an IP FiB REPLACE %a% message to HAL for all slots

Message Parameters

| Name | Type |
|------|--------|
| a | String |

RtMgr.HAL.DelIPFIB

Description

Route Manager sends an IP FIB Replace message to HAL.

Remedy

None.

Severity

Debug-Data

Message Text

Send an IP FiB DELETE %a% message to HAL for all slots

Message Parameters

| Name | Type |
|------|--------|
| a | String |

RtMgr.HAL.AgeIPFIB

Description

Route Manager sends an IP FIB Age message to HAL.

Remedy

None.

Severity

Debug-Data

Message Text

Send an IP FiB AGE %a% message to HAL for all slots

Message Parameters

| Name | Type |
|------|--------|
| a | String |

RtMgr.HAL.FlushIPFIB

Description

Route Manager sends an IP FIB Flush message to HAL.

Remedy

None.

Severity

Debug-Data

Message Text

Send an IP FIB FLUSH %a% message to HAL for all slots

Message Parameters

| Name | Type |
|------|--------|
| a | String |

RtMgr.HAL.SendSyncMsg

Description

Route Manager sends an IP FIB Sync message to HAL.

Remedy

None.

Severity

Debug-Data

Message Text

Send an IP FIB SYNC %a% message to HAL for slot %b% (status=%c%)

Message Parameters

| Name | Type |
|------|--------|
| a | xInt32 |
| b | xInt32 |
| c | xInt32 |

RtMgr.HAL.ProcSyncCard

Description

Sync of Routes to Card in Slot did not start or finish.

Remedy

May be someone pulled the card out.

Severity

Info

Message Text

%a% of Routes to slot %c%: %b%

Message Parameters

| Name | Type |
|------|--------|
| a | String |
| b | String |
| c | sInt32 |

RtMgr.HAL.AddNHLFE

Description

Added NHLFE

Remedy

None.

Severity

Debug-Data

Message Text

Added L3VPN NHLFE for Inst=%inst% label[0]=%label0% label[1]=%label1% nh=%nh%
IfInstance = %ifi%

Message Parameters

| Name | Type |
|--------|--------|
| inst | xInt32 |
| label0 | xInt32 |
| label1 | xInt32 |

| Name | Type |
|------|--------|
| nh | String |
| ifi | ulnt32 |

RtMgr.HAL.DeINHLFE

Description

Added NHLFE

Remedy

None.

Severity

Debug-Data

Message Text

Deleted L3VPN NHLFE for Inst=%inst% label[0]=%label0% label[1]=%label1% nh=%nh%
IfInstance = %ifi%

Message Parameters

RtMgr.Kern.DelILM

Description

RTM deleting ILM label for a L3VPN VRF.

Remedy

This is a debug message

Severity

Debug-Summary

Message Text

Delete ILM label=%lbl% VRF-ID=%id% VRF=%vrf%

Message Parameters

| Name | Type |
|------|--------|
| lbl | xInt32 |
| id | xInt32 |
| vrf | VRF |

RtMgr.Kern.AddNHLFE

Description

RTM adding NHLFE Instance for a L3VPN VRF.

Remedy

This is a debug message

Severity

Debug-Summary

Message Text

Add NHLFE Instance=%key% Inner-label=%lbl% Outer-label=%olbl% Outer-key=%okey%
VRF-ID=%id% VRF=%vrf%

Message Parameters

| Name | Type |
|------|--------|
| key | xInt32 |
| lbl | xInt32 |
| olbl | xInt32 |
| okey | xInt32 |
| id | xInt32 |
| vrf | VRF |

RtMgr.Kern.DeINHLFE

Description

RTM deleting NHLFE Instance for a L3VPN VRF.

Remedy

This is a debug message

Severity

Debug-Summary

Message Text

Delete NHLFE Instance=%key% Inner-label=%lbl% Outer-label=%olbl% Outer-key=%okey% VRF-ID=%id% VRF=%vrf%

Message Parameters

| Name | Type |
|------|--------|
| key | xInt32 |
| lbl | xInt32 |
| olbl | xInt32 |
| okey | xInt32 |
| id | xInt32 |
| vrf | VRF |

RtMgr.Kern.ChgNHLFE

Description

RTM Changing NHLFE Instance for a L3VPN VRF.

Remedy

This is a debug message

Severity

Debug-Summary

Message Text

Change NHLFE Instance=%key% Inner-label=%lbl% Outer-label=%olbl% Outer-key=%okey% VRF-ID=%id% VRF=%vrf%

Message Parameters

| Name | Type |
|------|--------|
| key | xInt32 |
| lbl | xInt32 |
| olbl | xInt32 |
| okey | xInt32 |

| Name | Type |
|------|--------|
| id | xInt32 |
| vrf | VRF |

RtMgr.Kern.ModNHLFEFail

Description

NHLFE Modify Failed.

Remedy

None

Severity

Debug-Data

Message Text

NHLFE Modify Failed: innerNHInst=%iInst% innerLabel=%innerLabel%
lspNhInst=%lInst% outerLabel=%outerLabel% VRF=%vrf%

Message Parameters

| Name | Type |
|------------|--------|
| iInst | xInt32 |
| innerLabel | xInt32 |
| lInst | xInt32 |
| outerLabel | xInt32 |
| vrf | VRF |

RtMgr.Kern.ModNHLFEOK

Description

NHLFE Modify Failed.

Remedy

None

Severity

Debug-Data

Message Text

NHLFE Modify Succeeded: innerNHInst=%iInst% innerLabel=%innerLabel%
lspNhInst=%lInst% outerLabel=%outerLabel% VRF=%vrf%

Message Parameters

| Name | Type |
|------------|--------|
| iInst | xInt32 |
| innerLabel | xInt32 |
| lInst | xInt32 |
| outerLabel | xInt32 |
| vrf | VRF |

RtMgr.Kern.BndFail

Description

Socket bind() syscall failed.

Remedy

This should not happen. Something wrong with kernel.

Severity

Error

Message Text

Socket bind failed - %err%

Message Parameters

| Name | Type |
|------|--------|
| err | String |

RtMgr.Kern.GetSockNameFail

Description

Socket getsockname() syscall failed.

Remedy

This should not happen. Something wrong with kernel.

Severity

Error

Message Text

Socket getsockname failed - %err%

Message Parameters

| Name | Type |
|------|--------|
| err | String |

RtMgr.Kern.InvAddrLen

Description

getsockname() syscall returns address and length in bytes of the address. If we have a mismatch in what we expect and what is returned, then this error is returned.

Remedy

This should not happen. Mismatch with kernel and Userspace data structures.

Severity

Error

Message Text

getsockname returns Address length %a% that does not match %b%

Message Parameters

| Name | Type |
|------|--------|
| a | sInt32 |
| b | sInt32 |

RtMgr.Kern.InvAddrFamily

Description

getsockname() syscall returns address and length in bytes of the address. If we have a mismatch in what we expect and what is returned, then this error is returned.

Remedy

This should not happen. Mismatch with kernel and Userspace data structures.

Severity

Error

Message Text

getsockname returns Address family %a% that is not AF_NETLINK.

Message Parameters

| Name | Type |
|------|--------|
| a | sInt32 |

RtMgr.Kern.SendFail

Description

We failed to send a netlink message to the kernel..

Remedy

Look at the error message to help you debug..

Severity

Error

Message Text

Sendmsg() socket system call failed - %err% ret=%ret%.

Message Parameters

| Name | Type |
|------|--------|
| ret | uInt32 |
| err | String |

RtMgr.Kern.MsgInv

Description

recvmsg() returned bytes and Netlink header and Netlink PDU bytes are confused.

Remedy

Need to debug kernel.

Severity

Info

Message Text

Received Invalid lengths - Rxd Bytes=%ret%, Netlink-hdr-len=%len% Netlink-pdu-byte-%pdu%.

Message Parameters

| Name | Type |
|------|--------|
| pdu | sInt32 |
| len | sInt32 |
| ret | sInt32 |

RtMgr.Kern.MsgLenMatchFail

Description

recvmsg() returned bytes and Netlink header and Netlink PDU bytes are confused.

Remedy

Need to debug kernel.

Severity

Info

Message Text

Received Netlink - Remaining %ret% bytes.

Message Parameters

| Name | Type |
|------|--------|
| ret | sInt32 |

RtMgr.Kern.InvRtAttr

Description

When parsing RTE attributes, we have some ATTR bytes left over.

Remedy

Need to debug kernel.

Severity

Info

Message Text

Invalid Route Attributes - Remaining %a% bytes in RTA(%b%).

Message Parameters

| Name | Type |
|------|--------|
| a | sInt32 |
| b | sInt32 |

RtMgr.Kern.ProcUpdtRt

Description

Update Kernel Route Tables.

Remedy

None.

Severity

Debug-Data

Message Text

Update Kernel - table=%vr% delcnt=%a% Blackhole=%b% BestRt=(%c%) DelRt=%d%.

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | sInt32 |
| b | sInt32 |
| c | String |
| d | String |

RtMgr.Kern.UpdtRtFailInvTbl

Description

Update Kernel Route Table failed due to invalid table.

Remedy

None.

Severity

Info

Message Text

Route to the mgmt table failed,Invalid Table when stacking not enabled table=%vr%.

Message Parameters

| Name | Type |
|------|------|
| vr | VR |

RtMgr.Kern.UpdtMPLSRt

Description

Update Kernel Route Tables.

Remedy

None.

Severity

Debug-Data

Message Text

Backup MSM/MM: Update Kernel MPLS RTE table - Table=%vr%.

Message Parameters

| Name | Type |
|------|------|
| vr | VR |

RtMgr.Kern.UpdtRtDelNonDrctRt

Description

Delete a Kernel Indirect Route.

Remedy

None.

Severity

Debug-Data

Message Text

Table=%vr% Delete IPv4 RTE=%a%

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | String |

RtMgr.Kern.UpdtRtDelIPv6Rt

Description

Delete a Kernel IPv6 Route.

Remedy

None.

Severity

Debug-Data

Message Text

Table=%vr% Delete IPv6 RTE=%a%

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | String |

RtMgr.Kern.UpdtRtOK

Description

Delete a Kernel IPv6 Route.

Remedy

None.

Severity

Debug-Data

Message Text

Table=%vr% %a% RTE=(%b%) OK

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | String |
| b | String |

RtMgr.Kern.AddRt

Description

Add Kernel Route.

Remedy

None.

Severity

Debug-Data

Message Text

Table=%vr% Add RTE=%a% (%b%)

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | String |
| b | String |

RtMgr.Kern.DelRt

Description

Add Kernel Route.

Remedy

None.

Severity

Debug-Data

Message Text

Table=%vr% Del RTE=%a% (%b%)

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | String |
| b | String |

RtMgr.Kern.ReplRt

Description

Add Kernel Route.

Remedy

None.

Severity

Debug-Data

Message Text

Table=%vr% Repl RTE (%a%) with (%b%) (%c%)

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | String |
| b | String |
| c | String |

RtMgr.Kern.MsgTrunc

Description

recvmsg() returned bytes and Netlink header and Netlink PDU bytes are confused.

Remedy

Need to debug kernel.

Severity

Info

Message Text

Received Netlink Error - Netlink-pdu-byte-%pdu% is less than sizeof netlink error message.

Message Parameters

| Name | Type |
|------|--------|
| pdu | sInt32 |

RtMgr.Kern.RecvTruncMsgFlag

Description

Possible that the message is too big or some other kernel issue

Remedy

Need to debug kernel.

Severity

Info

Message Text

Received Truncated Message Flag, Netlink message header has MSG_TRUNC set.

RtMgr.Kern.AddRtOK

Description

Add Kernel Route.

Remedy

None.

Severity

Debug-Data

Message Text

Table=%vr% Add RTE=%a% Successful.

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | String |

RtMgr.Kern.DelRtOK

Description

Del Kernel Route.

Remedy

None.

Severity

Debug-Data

Message Text

Table=%vr% Del RTE=%a% Succesful.

Message Parameters

| Name | Type |
|------|--------|
| vr | VR |
| a | String |

RtMgr.Kern.DeINHLFEFail

Description

NHLFE Modify Failed.

Remedy

None

Severity

Debug-Data

Message Text

NHLFE Del Failed: innerNHInst=%iInst% innerLabel=%innerLabel% lspNhInst=%lInst%
outerLabel=%outerLabel% VRF=%vrf%

Message Parameters

| Name | Type |
|------------|--------|
| iInst | xInt32 |
| innerLabel | xInt32 |
| lInst | xInt32 |
| outerLabel | xInt32 |
| vrf | VRF |

RtMgr.Kern.DeINHLFEOK

Description

NHLFE Modify Failed.

Remedy

None

Severity

Debug-Data

Message Text

NHLFE Del Succeeded: innerNHInst=%iInst% innerLabel=%innerLabel%
IspNhInst=%lInst% outerLabel=%outerLabel% VRF=%vrf%

Message Parameters

| Name | Type |
|------------|--------|
| iInst | xInt32 |
| innerLabel | xInt32 |
| lInst | xInt32 |
| outerLabel | xInt32 |
| vrf | VRF |

RtMgr.Kern.ChgKernEXFIBShimOK

Description

Modificaitaion of Kernel EXFIB shim succeeded. This shim is added for gateways that are in a VR different from that of the route. The shim has a key "key" via a "nharr" , interface index "ifIndex". The shim is added in the VRF=vrf.

Remedy

None

Severity

Debug-Data

Message Text

Change Kernel EXFIB shim Succeeded: key=%key% nhaddr=%nhaddr% ifIndex=%ifIndex%
VRF=%vrf%

Message Parameters

| Name | Type |
|---------|--------|
| key | xInt32 |
| nhaddr | String |
| ifIndex | sInt32 |
| vrf | VRF |

RtMgr.Kern.DelKernEXFIBShimOK

Description

Delete of Kernel EXFIB shim succeeded. The deleted shim has a key "key" via a "nharr", interface index "ifIndex". The shim is added in the VRF=vrf.

Remedy

None

Severity

Debug-Data

Message Text

Delete Kernel EXFIB shim Succeeded: key=%key% nhaddr=%nhaddr% ifIndex=%ifIndex% VRF=%vrf%

Message Parameters

| Name | Type |
|---------|--------|
| key | xInt32 |
| nhaddr | String |
| ifIndex | sInt32 |
| vrf | VRF |

RtMgr.Kern.MsgReqRecvNoRspns

Description

Possible failure of netlink request to kernel.

Remedy

Need to debug kernel.

Severity

Info

Message Text

Received no response to netlink request %cmd% to kernel err=%err%

Message Parameters

| Name | Type |
|------|--------|
| cmd | uInt16 |
| err | sInt32 |

RtMgr.Kern.MsgReqFail

Description

Netlink request to kernel failed.

Remedy

Need to debug kernel.

Severity

Debug-Summary

Message Text

Netlink request %cmd% to kernel failed, rcv bytes=%ret% err=%err%

Message Parameters

| Name | Type |
|------|--------|
| cmd | uInt16 |
| ret | sInt32 |
| err | sInt32 |

RtMgr.PingProtect Messages

[RtMgr.PingProtect.GwUp](#) on page 4683

[RtMgr.PingProtect.GwDown](#) on page 4684

[RtMgr.PingProtect.StaticRtStateUp](#) on page 4684

[RtMgr.PingProtect.StaticRtStateDown](#) on page 4685

[RtMgr.PingProtect.GwProtectFail](#) on page 4686

RtMgr.PingProtect.GwUp

Description

This event occurs when ICMP Ping Protection detects the given gateway IP address has replied to an ICMP Request. All static routes added with this gateway IP address with Ping Protection will be changed from down state to Up.

Remedy

No action required - Notification of a network change only.

Severity

Notice

Message Text

%vrName%: Gateway IP %gwIPaddr% is up

Message Parameters

| Name | Type |
|----------|--------|
| vrName | String |
| gwIPaddr | String |

RtMgr.PingProtect.GwDown

Description

This event occurs when ICMP Ping Protection detects the given gateway IP address failed to reply to any ICMP Requests of the configured number of misses allowed. All static routes added with this gateway IP address with Ping Protection will be changed from Up state to down.

Remedy

This is a notification of a network change. Check the status of the device with the given IP address.

Severity

Notice

Message Text

%vrName%: Gateway IP %gwIPAddr% is down

Message Parameters

| Name | Type |
|----------|--------|
| vrName | String |
| gwIPAddr | String |

RtMgr.PingProtect.StaticRtStateUp

Description

The operational state of the static route has changed to "Up", either because ICMP Ping Protection detected the gateway replied with an ICMP Echo Reply, or because Ping Protection for the IP address family has been disabled, thus assuming ping-protected gateways are up.

Remedy

No action required - Notification of a network change only.

Severity

Notice

Message Text

%vrName%: Static route to %subnet%/%masklen% gateway %gwIPAddr% has changed to Up state

Message Parameters

| Name | Type |
|----------|--------|
| vrName | String |
| subnet | String |
| masklen | ulnt |
| gwIPAddr | String |

RtMgr.PingProtect.StaticRtStateDown

Description

The operational state of the static route has changed from "Up" state to down because ICMP Ping Protection detected the given gateway IP address failed to reply to any ICMP Requests of the configured number of misses allowed.

Remedy

No action required - Notification of a network change only.

Severity

Notice

Message Text

%vrName%: Static route to %subnet%/%masklen% gateway %gwIPAddr% has changed to down state

Message Parameters

| Name | Type |
|----------|--------|
| vrName | String |
| subnet | String |
| masklen | ulnt |
| gwIPAddr | String |

RtMgr.PingProtect.GwProtectFail

Description

This event occurs when ICMP Ping Protection could not start on the given gateway IP address for the given reason. All static routes added with this gateway IP address with Ping Protection will be assumed to be in Up state.

Remedy

This is a notification of an internal error or limit reached. Check Release Notes to see if a supported limit has been exceeded. Use CLI command "show iproute {ipv4|ipv6} protection ping" to see current list of gateways with ICMP Ping Protection.

Severity

Warning

Message Text

%vrName%: Ping protection failed to start on gateway IP %gwIPAddr%. Reason: %reason%.
Gateway assumed to be up.

Message Parameters

| Name | Type |
|----------|--------|
| vrName | String |
| gwIPAddr | String |
| reason | String |

RtMgr.Server.ProcRegClntMsgOK

Description

An application client has registered with Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed Registered Client Message for %client% / %VRFCInt% for %NewRExist% with flag %flag% sucessfully.

Message Parameters

| Name | Type |
|---------|--------|
| client | String |
| VRFCInt | String |

| Name | Type |
|-----------|--------|
| NewRExist | String |
| flag | xInt |

RtMgr.Server.LkupClntFail

Description

A client lookup failed in Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Lookup for Client %client% Failed.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |

RtMgr.Server.CnctClntDown

Description

IPML connection to a client is broken.

Remedy

It is not be an issue, but may be of interest to a developer.

Severity

Debug-Summary

Message Text

Connection to Client %client% Down.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |

RtMgr.Server.RecvMsgSiz

Description

Received a client Message.

Remedy

Not an issue. So no remedy.

Severity

Debug-Summary

Message Text

Received Message of size=%size% from Client %client%.

Message Parameters

| Name | Type |
|--------|------|
| size | ulnt |
| client | ulnt |

RtMgr.Server.RecvMsgType

Description

Received a client Message.

Remedy

Not an issue. So no remedy.

Severity

Debug-Summary

Message Text

Received message of type %msg% from Client %client% with flags=%flags%.

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| client | String |
| flags | String |

RtMgr.Server.ProcUnregClntMsgFail

Description

A client process unregister failed in Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

UnRegister of Client %client% failed as it can be located.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |

RtMgr.Server.ProcUnregClntMsgOK

Description

An application client has unregistered with Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Unregistered client %client% / %VRFCInt%

Message Parameters

| Name | Type |
|---------|--------|
| client | String |
| VRFCInt | String |

RtMgr.Server.ProcSetPurgTimerMsgFail

Description

A client set purge timeout failed in Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Set purge timer value for Client %client% failed, as it can be located.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |

RtMgr.Server.ProcSetPurgTimerMsgOK

Description

An application client has set purge timeout with Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Set Purge Timer Value for client %client% to %tout%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| tout | ulnt |

RtMgr.Server.ProcGetPurgTimerMsgFail

Description

A client get purge timeout failed in Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing Get purge timeout Msg for Client %client% failed, as it can be located.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |

RtMgr.Server.ProcGetPurgTimerMsgOK

Description

An application client got purge timeout from Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing Get Purge Timeout Msg for client %client% succeeded with timer value=%tout% remaining time=%trem%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| tout | ulnt |
| trem | ulnt |

RtMgr.Server.ProcClrPurgTimerMsgFail

Description

A client cancel purge timeout failed in Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Clear purge timer value for Client %client% failed, as it cannot be located.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |

RtMgr.Server.ProcClrPurgimertMsgOK

Description

An application client cancelled purge timeout from Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Cleared Purge Timer value for client %client%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |

RtMgr.Server.RecvOSPFEndUpdtMsgOK

Description

An application client sent OSPF_END_UPDATE msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Message OSPF End Update for Client %client% af=%af% vrid=%vrid%
level=%level% aid=%aid%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| af | String |
| vrid | sInt32 |
| level | sInt32 |
| aid | uInt |

RtMgr.Server.PurgOSPFrtOK

Description

purging route due to receiving OSPF_END_UPDATE .

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Purged %total% OSPF routes from client=%client% time=%time%

Message Parameters

| Name | Type |
|--------|--------|
| total | uInt |
| client | String |
| time | uInt |

RtMgr.Server.RecvEndUpdtMsgOK

Description

An application client sent END_UPDATE msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Message End Update for Client %client% af=%af% vrid=%vrid% ttl=%ttl%
protocol=%prot%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| af | String |
| vrid | sInt32 |
| ttl | sInt32 |
| prot | String |

RtMgr.Server.PurgVRRtOK

Description

purging route due to receiving END_UPDATE .

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Purged %total% routes from client=%client% time=%time% for VR %vrid%

Message Parameters

| Name | Type |
|--------|--------|
| total | ulnt |
| client | String |
| time | ulnt |
| vrid | ulnt |

RtMgr.Server.ProcAddVRMsgOK

Description

An application client sent ADD VR msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed Message Add VR for Client %client% vrid=%vrid% successfully.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| vrid | sInt32 |

RtMgr.Server.ProcDelVRMsgOK

Description

An application client sent Del VR msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed Del VR message for Client %client% vrid=%vrid% successfully.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| vrid | sInt32 |

RtMgr.Server.ProcAddRtMsgOK

Description

An application client sent Add rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed Add Rt for %rt% from Client %client% successfully.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.RecvReplRtMsgOK

Description

An application client sent replace rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Replace Rt Message for %rt% from Client %client% successfully.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.RecvReplRtMsg

Description

Number of route replaces sent by application client to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Replace Rt request from Client %client% it has %cnt% routes in it.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| cnt | ulnt |

RtMgr.Server.ProcRegPfxMsgOK

Description

An application client sent reg prefix msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing Reister Prefix request for %pfx% from Client %client% succeeded

Message Parameters

| Name | Type |
|--------|--------|
| pfx | String |
| client | String |

RtMgr.Server.ProcUnregPfxMsgOK

Description

An application client sent unreg prefix msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing UnRegister Prefix request for %pfx% from Client %client% succeeded

Message Parameters

| Name | Type |
|--------|--------|
| pfx | String |
| client | String |

RtMgr.Server.ProcRegPfxMsgFail

Description

Processing of register prefix message failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing of Register prefix %pfx% for Client %client% failed, status=%status%

Message Parameters

| Name | Type |
|--------|--------|
| pfx | String |
| client | String |
| status | String |

RtMgr.Server.ProcUnregPfxMsgFail

Description

Processing of unregister prefix message failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing of Unregister prefix %pfx% for Client %client% failed, status=%status%

Message Parameters

| Name | Type |
|--------|--------|
| pfx | String |
| client | String |
| status | String |

RtMgr.Server.ProcRegPfxTrkMsgOK

Description

An application client sent reg prefix Track msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Register Prefix Track request for %pfx% from Client %client% succeeded

Message Parameters

| Name | Type |
|--------|--------|
| pfx | String |
| client | String |

RtMgr.Server.ProcUnregPfxTrkMsgOK

Description

An application client sent unreg prefix track msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of UnRegister Prefix Track request for %pfx% from Client %client% succeeded

Message Parameters

| Name | Type |
|--------|--------|
| pfx | String |
| client | String |

RtMgr.Server.ProcRegPfxTrkMsgFail

Description

Processing of register prefix track message failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing of Register prefix Track %pfx% for Client %client% failed, status=%status%

Message Parameters

| Name | Type |
|--------|--------|
| pfx | String |
| client | String |
| status | String |

RtMgr.Server.ProcUnregPfxTrkMsgFail

Description

Processing of unregister prefix track message failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing of Unregister prefix %pfx% for Client %client% failed, status=%status%

Message Parameters

| Name | Type |
|--------|--------|
| pfx | String |
| client | String |
| status | String |

RtMgr.Server.ProcUnregAllPfxMsgOK

Description

An application client sent unreg prefix track msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of UnRegister all Prefix request from Client %client% succeeded

Message Parameters

| Name | Type |
|--------|--------|
| client | String |

RtMgr.Server.ProcUpdtRtMsgOK

Description

An application client sent update rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Update Rt request for %rt% from Client %client% succeeded

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.ProcDelRtMsgOK

Description

An application client sent delete rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Delete Rt request for %rt% from Client %client% succeeded

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.ProcGetProtoPrioMsgOK

Description

An application client sent delete rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Get Protocol Priority request for %prio% from Client %client% succeeded.

Message Parameters

| Name | Type |
|--------|--------|
| prio | String |
| client | String |
| status | String |

RtMgr.Server.ProcLkupRtMsgOK

Description

An application client sent lookup rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Lookup Rt request for %rt% from Client %client% succeeded
result=%lkupRt% succeeded.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| lkupRt | String |

RtMgr.Server.ProcLkupRtMsgFail

Description

An application client sent lookup rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Lookup Rt request for %rt% from Client %client% failed.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.ProcLkupRPFRTMsgOK

Description

An application client sent rpf lookup rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Rpf lookup Rt request for %rt% from Client %client% succeeded
result=%lkupRt% succeeded.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| lkupRt | String |

RtMgr.Server.ProcLkupRPFRTMsgFail

Description

An application client sent rpf lookup rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Rpf lookup Rt request for %rt% from Client %client% failed.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.ProcGetRtMsgOK

Description

An application client sent get rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Get Rt request for %rt% and flags=%flag% from Client %client% succeeded result=%lkupRt%

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| flag | String |
| lkupRt | String |

RtMgr.Server.ProcGetRtMsgFail

Description

An application client sent lookup rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed get Rt request for %rt% from Client %client% failed.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.RecvGetBulkMsgRtOK

Description

An application client sent get bulk rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Message Get bulk Rt for %rt% from Client %client% with flags=%flags%

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| flags | String |

RtMgr.Server.ProcGetBulkRtMsgOK

Description

An application client sent bulk get rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Get Bulk Rt for Client %client% succeeded.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| rt | String |

RtMgr.Server.RecvLkupOSPFNhMsgOK

Description

An application client sent lookup ospf nexthop msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received lookup ospf nexthop request for %rt% from Client %client%

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.ProcLkupOSPFNhMsgOK

Description

An application client sent lookup ospf nexthop msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed lookup ospf nexthop result for Client %client% result=%rt% successfully

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| rt | String |

RtMgr.Server.RecvLPMLkupMsgOK

Description

An application client sent lpm lookup msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received LPM lookup request for key=%key% from Client %client%

Message Parameters

| Name | Type |
|--------|--------|
| key | String |
| client | String |

RtMgr.Server.ProcLPMLkupMsgOK

Description

Result for LPM lookup returned from Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Sending LPM lookup result %n% of %cnt% for Client %client% result=%rt% succeeded.

Message Parameters

| Name | Type |
|--------|--------|
| n | sInt32 |
| cnt | sInt32 |
| client | String |
| rt | String |

RtMgr.Server.RecvBulkDelRtMsgOK

Description

An application client sent Bulk delete msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Bulk delete request for rt=%rt% from Client %client% with flags=%flags%

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| flags | String |

RtMgr.Server.RecvRtTrvrsMsgOK

Description

An application client sent Route Traverse msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Route Traverse Msg for %rt% from Client %client% with flags=%flags%

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| flags | String |

RtMgr.Server.ProcRtTrvrsMsgOK

Description

An application client sent Route Traverse msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed Route Traverse Message Msg for Client %client% result=%rt%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| rt | String |

RtMgr.Server.RecvRtNtfyMsgOK

Description

An application client sent Route Notify msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Route Notify request for %rt% from Client %client% with flags=%flags%

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| flags | String |

RtMgr.Server.ProcRtNtfyMsgOK

Description

An application client sent Route Notify msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed Route Notify result for Client %client% result=%rt%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| rt | String |

RtMgr.Server.ProcRtNtfyNextHop

Description

An application client sent Route Notify msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processed Route Notify %nh%

Message Parameters

| Name | Type |
|------|--------|
| nh | String |

RtMgr.Server.RecvAddLSPMsgOK

Description

An application client sent Add LSP msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Add LSP request for lsp=%lsp% from Client %client%

Message Parameters

| Name | Type |
|--------|--------|
| lsp | String |
| client | String |

RtMgr.Server.RecvDelLSPMsgOK

Description

An application client sent Del LSP msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Del LSP request for lsp=%lsp% from Client %client%

Message Parameters

| Name | Type |
|--------|--------|
| lsp | String |
| client | String |

RtMgr.Server.RecvUpdtLSPMsgOK

Description

An application client sent Update LSP msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Update LSP request for lsp=%lsp% from Client %client%

Message Parameters

| Name | Type |
|--------|--------|
| lsp | String |
| client | String |

RtMgr.Server.RecvAddLSPFECMsgOK

Description

An application client sent Add LSP FEC msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Add LSP FEC request for fec=%fec% from Client %client%

Message Parameters

| Name | Type |
|--------|--------|
| fec | String |
| client | String |

RtMgr.Server.RecvDelLSPFECMsgOK

Description

An application client sent Del LSP FEC msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Del LSP FEC request for fec=%fec% from Client %client%

Message Parameters

| Name | Type |
|--------|--------|
| fec | String |
| client | String |

RtMgr.Server.RecvUpdtLSPFECMsgOK

Description

An application client sent Update LSP FEC msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Update LSP FEC request for fec=%fec% from Client %client%

Message Parameters

| Name | Type |
|--------|--------|
| fec | String |
| client | String |

RtMgr.Server.RecvUpdtLSPFECNexthop

Description

An application client sent Update LSP FEC msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Update LSP FEC request with %fec%

Message Parameters

| Name | Type |
|------|--------|
| fec | String |

RtMgr.Server.RecvUpdtLSPDPMMsgOK

Description

An application client sent Update LSP DPM msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Update LSP DPM Msg from Client %client% for nh DPM=%dpm%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| dpm | String |

RtMgr.Server.RecvFlushVRLSPMsgOK

Description

An application client sent FLush VR LSPs msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received FLush VR LSPs request from Client %client% for vr=%vr%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| vr | sInt32 |

RtMgr.Server.RecvMsgTypeInv

Description

Procesing of client message failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Received Message type %type% for Client %client% is an invalid type.

Message Parameters

| Name | Type |
|--------|--------|
| type | sInt32 |
| client | String |

RtMgr.Server.RecvExprtMsg

Description

Received a client Notification Message.

Remedy

Not an issue. So no remedy.

Severity

Debug-Summary

Message Text

Received route export related message %msg% from Client %client% with flags=%flags%.

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| client | String |
| flags | String |

RtMgr.Server.RecvRegExprtMsgOK

Description

An application client has notify registered with Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Register Export Message from client %client% / %VRFCInt% with regInfo=%reginfo%

Message Parameters

| Name | Type |
|---------|--------|
| client | String |
| VRFCInt | String |
| reginfo | String |

RtMgr.Server.RecvRegExprtMsgFail

Description

A client process unregister notif failed in Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Cannot Register client/Client %client% / %VRFCInt% because %fstr%.

Message Parameters

| Name | Type |
|---------|--------|
| client | String |
| VRFCInt | String |
| fstr | String |

RtMgr.Server.RecvUpdtExprtMsgOK

Description

An application client has sent reg export msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Update Export Message from client %client% / %VRFCInt% with regInfo=%reginfo%

Message Parameters

| Name | Type |
|---------|--------|
| client | String |
| VRFCInt | String |
| reginfo | String |

RtMgr.Server.RecvUpdtExpprtMsgFail

Description

A client process reg export failed in Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Cannot Register Export Bits for client %client% / %VRFCInt% because %fstr%.

Message Parameters

| Name | Type |
|---------|--------|
| client | String |
| VRFCInt | String |
| fstr | String |

RtMgr.Server.RecvUnRegExpprtMsgOK

Description

An application client has sent notify unregister to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Received Unregister Export Msg from client %client% / %VRFCInt%

Message Parameters

| Name | Type |
|---------|--------|
| client | String |
| VRFCInt | String |

RtMgr.Server.RecvExprtMsgFail

Description

A Notify receive failed in Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Receiving of Notify Message failed for %client% , possible that connection was lost as process went down.

Message Parameters

| Name | Type |
|--------|------|
| client | uInt |

RtMgr.Server.ProcRegClntMsgFail

Description

An application client registered with Route Manager failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Registered Client %client% / %VRFCInt% failed because of alloc.

Message Parameters

| Name | Type |
|---------|--------|
| client | String |
| VRFCInt | String |

RtMgr.Server.ProcAddVRMsgFail

Description

An application client sent ADD VR msg to Route Manager and it failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing of Add VR for Client %client% vrid=%vrid% failed as Route table create failed .

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| vrid | uInt32 |

RtMgr.Server.ProcDelVRMsgFail

Description

An application client sent ADD VR msg to Route Manager and it failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing of Del VR for Client %client% vrid=%vrid% failed as Route table Delete failed err status=%status%.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| vrid | sInt32 |
| status | String |

RtMgr.Server.ProcAddRtMsgFail

Description

An application client sent ADD VR msg to Route Manager and it failed.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing of Add Rt for %rt% from Client %client% failed as Lock table or Route insert failed err status=%status%.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| status | String |

RtMgr.Server.ProcReplRtMsgOK

Description

An application client sent replace rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Processing of Replace Rt request for %rt% from Client %client% succeeded

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

RtMgr.Server.ProcReplRtMsgFail

Description

An application client sent replace rt msg to Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Debug-Summary

Message Text

Processing of Replace Rt request for %rt% from Client %client% failed because either Lock table or replace route failed err status=%status%.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| status | String |

RtMgr.Server.ProcUnregAllPfxMsgFail

Description

An application client sent unreg prefix track msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Info

Message Text

Processing of UnRegister all Prefix request from Client %client% failed err status=%status%.

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| status | String |

RtMgr.Server.ProcUpdtRtMsgFail

Description

An application client sent update rt msg to Route Manager.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Info

Message Text

Processing of Update Rt request for %rt% from Client %client% failed, status=%status%

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| status | String |

RtMgr.Server.ProcDelRtMsgFail

Description

An application client sent delete rt msg to Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Debug-Summary

Message Text

Processing of Delete Rt request for %rt% from Client %client% failed, status=%status%

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |
| status | String |

RtMgr.Server.ProcGetProtoPrioMsgFail

Description

An application client sent delete rt msg to Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Info

Message Text

Processing of Get Protocol Priority request for %prio% from Client %client% failed,
status=%status%

Message Parameters

| Name | Type |
|--------|--------|
| prio | String |
| client | String |
| status | String |

RtMgr.Server.RtXlateFailInvLSP

Description

Translation of message from Protocols failed as LSP is invalid.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Debug-Summary

Message Text

Route Translation Failed , for rt=%rt% LSP %lsp%

Message Parameters

| Name | Type |
|------|--------|
| lsp | uInt32 |
| rt | String |

RtMgr.Server.RecvL3VPNLbl

Description

An application client sent delete rt msg to Route Manager.

Remedy

It may not be an issue, but may be of interest to a developer.

Severity

Debug-Summary

Message Text

Processing of L3VPN Label request for VRF %id% from Client %client% - cmd=%cmd%, new=%lnew% old=%lold%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| id | sInt32 |
| cmd | xInt32 |
| lnew | xInt32 |
| lold | xInt32 |

RtMgr.Server.SendLblMsg

Description

Sending VPN label message to a "client". "labelMsg" contains label message details like action, old label and new label.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Send Label Message to client %client% with labelMsg=%lmsg%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| lmsg | String |

RtMgr.Server.NotSendLbIMsg

Description

Not Sending VPN label message to a "client". "cause" contains reason like "Label Msg already sent".

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Not Sending Label Message to client %client% because %cause%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| cause | String |

RtMgr.Server.SendRecurRtErrMsg

Description

Sending Recursive Route Error message to a "client". "rt" contains route details like prefix, nexthop and metric. Recursive route are formed when protocols like BGP try to add routes via BGP nexthops that are in turn reachable by a BGP route.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Send Recursive Route Error Message to client %client% route=%rt%

Message Parameters

| Name | Type |
|--------|--------|
| client | String |
| rt | String |

RtMgr.Server.ProcUpdateStart

Description

Used when route manager processes UpdateStart event for an application client %msg\$: Information related to UpdateStart event processing. %client%: provides client name VR and VRF instance information

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

%msg% for application client %client%

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| client | String |

RtMgr.Server.ProcUpdateEnd

Description

Used when route manager processes UpdateEnd event for an application client
%msg\$: Information related to UpdateEnd event processing. %client%: provides client name VR and VRF instance information

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

%msg% for application client %client%

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| client | String |

RtMgr.Server.ProcPurgeTimer

Description

Used when route manager processes purge timer event for an application client
%msg\$: Information related to purge timer processing. %client%: provides client name VR and VRF instance information

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

%msg% for application client %client%

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| client | String |

RtMgr.Server.ProcMplsNexthop

Description

Used when route manager processes mpls-nexthop event for an application client
%msg\$: Information related to enable/disbale nexthop. %client%: provides client name
VR and VRF instance information

Remedy

Restart the client process OR reboot the system

Severity

Debug-Summary

Message Text

%msg% for application client %client%

Message Parameters

| Name | Type |
|--------|--------|
| msg | String |
| client | String |

RtMgr.Server.XCUpdateError

Description

A cross-connect update message was received, but there was an error in the message

Remedy

Send logs to Engineering.

Severity

Error

Message Text

Received bad XC update message in Route Manager. TLV Type: %tlvType%, TLV length: %tlvLength%

Message Parameters

| Name | Type |
|-----------|------|
| tlvType | sInt |
| tlvLength | sInt |

RtMgr.Server.MplsMibTrace

Description

MPLS L3 VPN MIB Tracing.

Remedy

There is no remedy because there is no problem to be resolved.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

RtMgr.Server.IpmlAllocFail

Description

Tried to allocate an IPML buffer, but ipmlAllocPacket returned NULL.

Remedy

Contact Engineering.

Severity

Error

Message Text

Failed to Alloc IPML buffer. Size=%sz%, type=%type%.

Message Parameters

| Name | Type |
|------|--------|
| type | sInt32 |
| sz | sInt32 |

RtMgr.Server.NtfyIpmlQFull

Description

Notify Ipml queue is full. Notifications to clients may be lost.

Remedy

This is an unexpected internal condition needing technical assistance. Contact technical support with the following information: "show tech" and "upload debug". While it is not a serious system issue, protocol restart may be required for proper operation.

Severity

Warning

Message Text

Notify IPML queue full. clnt=%clntid%, ntfy peer-id=%peerid%.

Message Parameters

| Name | Type |
|--------|--------|
| clntid | uInt32 |
| peerid | uInt32 |

RtMgr.Server.RecvReplRtMsgIgn

Description

Ignored a replace route message sent by application client to Route Manager since client is no longer registered.

Remedy

There is no remedy because there is no problem to be resolved

Severity

Debug-Summary

Message Text

Ignore received Replace Rt Message for %rt% from Client %client%.

Message Parameters

| Name | Type |
|--------|--------|
| rt | String |
| client | String |

- [sflow.debug.AddSmplObjFail](#) on page 4865

sflow.debug.AddCntSmplFail

Description

Debug message to be able to dump the egress on a cache.

Remedy

Informational message only, for debug purpose.

Severity

Notice

Message Text

Could not add the counter sample for port %s0%:%s1%, as receiver is not configured.

Message Parameters

| Name | Type |
|------|------|
| s0 | Slot |
| s1 | Port |

sflow.debug.RecvMsgInv

Description

Internal error.

Remedy

Contact tech support.

Severity

Warning

Message Text

Sample message with invalid slot id received. Garbage message number %num1%

Message Parameters

| Name | Type |
|------|------|
| num1 | uInt |

sflow.debug.RecvSmplMsg

Description

Received samples from module.

Remedy

Debug message only

Severity

Debug-Verbose

Message Text

Received sample message bundle of length %l1%.

Message Parameters

| Name | Type |
|------|------|
| l1 | ulnt |

sflow.debug.RecvSmplMsgInv

Description

Internal error. Should rectify itself.

Remedy

If persists please contact tech support.

Severity

Warning

Message Text

Message received for sample had %l1% length. Retrying.

Message Parameters

| Name | Type |
|------|------|
| l1 | ulnt |

sflow.debug.StrtThrtlProc

Description

This is the defined throttling behavior. System should stabilize soon to a sustainable sampling rate. If the message persists then its an error condition.

Remedy

If message persists, pl contact tech support.

Severity

Notice

Message Text

Max cpu sample limit exceeded. Sampling rate for slot %s1% throttled from %11% to %12%.

Message Parameters

| Name | Type |
|------|------|
| s1 | Slot |
| l1 | ulnt |
| l2 | ulnt |

sflow.debug.WritDevFail

Description

Internal error.

Remedy

Please contact tech support.

Severity

Warning

Message Text

Failed to write on to sflow device.

sflow.debug.AddSmplObjFail

Description

Internal error. Could not allocate an internal sampler object.

Remedy

Contact tech support.

Severity

Error

Message Text

Failed to add a sampler for port %s1%:%p1%

Message Parameters

| Name | Type |
|------|------|
| s1 | Slot |
| p1 | Port |

sflow.msg.BldMcFDB

Description

Starting to add multicast FDB entry to asic.

Remedy

Informational message only, for debug purpose.

Severity

Debug-Data

Message Text

Adding cache FDB, %ip1%/%ip2%, %cpu%.

Message Parameters

| Name | Type |
|------|--------|
| ip1 | srcIP |
| ip2 | dstIP |
| cpu | String |

sflow.msg.CreatSockFail

Description

Internal error.

Remedy

Contact tech support.

Severity

Error

Message Text

Failed to open socket for receiver %ip1%

Message Parameters

| Name | Type |
|------|------|
| ip1 | IP |

sflow.msg.OpnDevFail

Description

Failed to open sflow kernel device. This could be due to system running low on resources.

Remedy

Check the system configuration to see if the prescribed limits are not exceeded. Try with a scaled down configuration by ending processes which are not currently needed. If the problem persists, please try failover or rebooting.

Severity

Critical

Message Text

Failed to open sflow device.

sflow.msg.CreatThrdFail

Description

Creation of one of the pthreads in sflow Failed. Sflow process will terminate. This could be due to system running low on resources.

Remedy

Check the system configuration to see if the prescribed limits are not exceeded. Try with a scaled down configuration by ending processes which are not currently needed. If the problem persists, please try failover or rebooting.

Severity

Critical

Message Text

Could not create one or more threads. Exiting.

sflow.msg.BindVRFFail

Description

Internal error.

Remedy

This is a rare internal condition needing technical assistance. Please contact tech support.

Severity

Error

Message Text

Could not bind specified socket %sockid% to VRF %vrf% for receiver with ip %ip%.

Message Parameters

| Name | Type |
|--------|--------|
| sockid | sInt |
| vrf | String |
| ip | IP |

SNMP.Master.EventRecv

Description

This is a debug message to indicate the event received in the snmpMasterMain() while loop. Direction 0->M to S, 1->S to M, 2->local event.

Remedy

NA

Severity

Debug-Data

Message Text

snmpMasterMain: Received event type=%type% direction=%direction%

Message Parameters

| Name | Type |
|-----------|--------|
| type | xInt32 |
| direction | sInt32 |

SNMP.Master.InitDone

Description

Initialization of snmpMaster process is complete.

Remedy

NA

Severity

Info

Message Text

snmpMaster initialization complete

SNMP.Master.SubagentCnct

Description

Received IPML_NEW_PEER signal in snmpMaster signalling that snmpSubagent has connected to snmpMaster.

Remedy

NA

Severity

Debug-Summary

Message Text

snmpSubagent process (peerId=%peer%) connected to snmpMaster

Message Parameters

| Name | Type |
|------|--------|
| peer | ulnt32 |

SNMP.Master.SubagentTerm

Description

Received IPML_DEAD_PEER signal in snmpMaster, signalling that snmpSubagent process has died.

Remedy

snmpSubagent process will be restarted automatically.

Severity

Debug-Summary

Message Text

snmpSubagent process (peerId = %peer%) died

Message Parameters

| Name | Type |
|------|--------|
| peer | ulnt32 |

SNMP.Master.DropReqAccessDeny

Description

SNMP access from the specified source is denied by Policy Manager or access-list rule. Dropping this SNMP Request.

Remedy

Check the policy file or access-list associated with the application.

Severity

Warning

Message Text

SNMP access from source %address% is denied by rule %rule%. Dropping this Request.

Message Parameters

| Name | Type |
|---------|--------|
| address | String |
| rule | String |

SNMP.Master.SendTrapFail

Description

Failed to send trap to the configured trap receiver.

Remedy

Check the route to trap receiver from the switch. If problem persists, contact Extreme Networks support.

Severity

Error

Message Text

Unable to send trap to %destIPAddr%.

Message Parameters

| Name | Type |
|------------|--------|
| destIPAddr | String |

SNMP.Master.ShutdownRecv

Description

snmpMaster process received EPM_PROCESS_SHUTDOWN_IMMEDIATE signal.

Remedy

NA

Severity

Debug-Summary

Message Text

snmpMaster process received EPM_PROCESS_SHUTDOWN_IMMEDIATE signal

SNMP.Master.AuthFail

Description

Authentication failure through SNMP. The user might have entered wrong Community string in case of SNMP v1/v2c and in case of SNMPv3 the user might have entered wrong password or the SNMP request is from out of sync SNMPv3 Manager.

Remedy

1) For SNMP v1/v2c bad community string error retry with correct community name. 2) For SNMPv3 wrong message digest error retry with correct password. 3) For SNMPv3 not in life time error sync the SNMP Manager and the SNMP Agent.

Severity

Warning

Message Text

Login failed through SNMP%version% - %reason% (%srcAddr%)

Message Parameters

| Name | Type |
|---------|--------|
| version | String |
| reason | String |
| srcAddr | String |

SNMP.Master.ReadEngBootCntFail

Description

snmpEngineBoots stores the number of times the SNMP Engine has initialized (on switch reboot or SNMP restart the value will increment). The value should always be a positive number in the range of 1-2147483647. Due to some internal error snmpEngineBoots read got failed. The reason for failure can be identified from the error code. The errors are self-correcting. A wrong read will reset the value to 1. The reset

will not cause any issue in the system and system will continue to work in the expected way. The Error condition and corresponding error codes are as follows. -1: Parameter not valid -2: Object type not valid -3: Not used -4: Device could not be opened -5: Object was not found -6: Error occurred attempting to add an object -7: Object is read only -8: Device is not valid -9: Read error occurred -10: Seek error occurred -11: Device error occurred during the operation -12: Device contains no objects -13: Device is full -14: EOF was encountered -15: No EOI object found -16: An internal routine was passed a bad file descriptor

Remedy

It is indeed a failure. But this do not cause any change in the behavior of SNMP or the switch. Only change after this will be the reset of the boot counter. If the counter value is being closely monitored or used, then the user can change the value with the recent value using command "configure snmpv3 engine-boots <value>". In the case of write error, the previous value is even provided in the warning message. Call for RMA is required only when the failure is frequent. That is multiple failures due to read, seek or device error (Error types can be identified from the return value). This kind of multiple failure in the same switch can be called for an RMA, since it is not the expected behavior from our hardware.

Severity

Warning

Message Text

An internal read error (Error code %ecode%) occurred while reading snmpEngineBoots value from non-volatile memory.

Message Parameters

| Name | Type |
|-------|--------|
| ecode | sInt32 |

SNMP.Master.WritEngBootCntFail

Description

snmpEngineBoots stores the number of times the SNMP Engine has initialized (on switch reboot or SNMP restart the value will increment). The value should always be a positive number in the range of 1-2147483647. Due to some internal error snmpEngineBoots write got failed. The reason for failure can be identified from the error code. The system will continue to work in the expected way. The Error condition and corresponding error codes are as follows. -1: Parameter not valid -2: Object type not valid -3: Not used -4: Device could not be opened -5: Object was not found -6: Error

occurred attempting to add an object -7: Object is read only -8: Device is not valid
 -9: Read error occurred -10: Seek error occurred -11: Device error occurred during the
 operation -12: Device contains no objects -13: Device is full -14: EOF was encountered -15:
 No EOI object found -16: An internal routine was passed a bad file descriptor

Remedy

It is indeed a failure. But this do not cause any change in the behavior of SNMP or the switch. Only change after this will be the reset of the boot counter. If the counter value is being closely monitored or used, then the user can change the value with the recent value using command "configure snmpv3 engine-boots <value>". In the case of write error, the previous value is even provided in the warning message. Call for RMA is required only when the failure is frequent. That is multiple failures due to read, seek or device error (Error types can be identified from the return value). This kind of multiple failure in the same switch can be called for an RMA, since it is not the expected behavior from our hardware.

Severity

Warning

Message Text

An internal write error (Error code %ecode%) occurred while writing snmpEngineBoots(value %eBoots%) to non-volatile memory.

Message Parameters

| Name | Type |
|--------|--------|
| ecode | sInt32 |
| eBoots | sInt32 |

SNMP.Master.EngBootCntInv

Description

snmpEngineBoots stores the number of times the SNMP Engine has initialized (on switch reboot or SNMP restart the value will increment). The value should always be a positive number in the range of 1-2147483647. When the value for snmpEngineBoots is outside the permitted range, it gets reset to 1 internally to keep it in the permitted range. As per the standards, snmpEngineBoots value will increment up to 2147483647 and then will remain the same. So a user reset is required in this stage. This is not done internally since the value is still under the permitted range. This is the duty of the network administrator to check and reset.

Remedy

The command "show snmpv3 engine-info" shows the snmpEngineBoots value. This value can reset to any value in the range of 1-2147483647 manually using the command "configure snmpv3 engine-boots <value>". This is usually required when the snmpEngineBoots reaches value 2147483647.

Severity

Notice

Message Text

snmpEngineBoots value reset to 1 internally since it was outside the permitted range(value before reset %eBoots%).

Message Parameters

| Name | Type |
|--------|--------|
| eBoots | sInt32 |

SNMP.Master.EnbIFIPSMODEOK

Description

FIPS mode is enabled in SNMP process.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Self-Test passed. FIPS mode enabled.

SNMP.Master.EnbIFIPSMODEFail

Description

Unable to properly configure crypto lib with FIPS mode enabled.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with "show tech" output.

Severity

Error

Message Text

Failed to enable FIPS mode: %errString%

STM.Library.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependant on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

STM.Library.Warning

Description

An abnormal condition has been detected which, although it is not interfering with the normal operation of the system, may signal that the system or the network in general may not be functioning as expected. The condition may have been caused by an unusual or unexpect circumstance related to some external stimulus.

Remedy

The exact remedy is dependant on the particular situation; but the problem may have been resolved by rejecting the request or performing some default action.

Severity

Warning

Message Text

STP.LicenseError

Description

A generic error message concerning licensing issues. May appear due to an error in the licensing subsystem or due to insufficient licenses to do the requested action.

Remedy

Obtain the appropriate license

Severity

Warning

Message Text

%err%

Message Parameters

| Name | Type |
|------|--------|
| err | Printf |

STP.IgnRSTPProp

Description

RSTP refused to respond to a neighbor's Proposal for a RSTP state change because the hardware has not yet responded that it is in sync with the software port state. This is critical to avoid allowing the neighbor to prematurely transition and create a temporary cycle in the network.

Remedy

This is a transient error and does not pose a problem.

Severity

Notice

Message Text

Refusing to agree to RSTP proposal due to pending VPST hardware sync on STP domain %domain%

Message Parameters

| Name | Type |
|--------|--------|
| domain | String |

STP.NetLoginClntUnAuth

Description

STP has detected a topology change for which it needs to flush the FDB on a port for which Netlogin is enabled. Flushing the FDB necessarily causes any Netlogin clients that may be authenticated on that port to become unauthenticated.

Remedy

Try to reauthenticate netlogin clients.

Severity

Info

Message Text

Any Netlogin clients on port (%portId%) are unauthenticated because of a topology change.

Message Parameters

| Name | Type |
|--------|--------|
| portId | String |

STP.SendClntTopoChgMsg

Description

A topology change has occurred. A message indicating this is being sent to STP clients.

Remedy

None. This is an informational message only.

Severity

Debug-Summary

Message Text

Send topology change notification type %tcType% for STPD %stpdName%

Message Parameters

| Name | Type |
|----------|--------|
| stpdName | String |
| tcType | uInt32 |

STP.AllocCIntMsgFail

Description

STP could not allocate memory in order to notify a client about a topology change. By not sending this message, network convergence time may increase depending on the topology of the network and the nature of the topology change.

Remedy

Reduce the configuration to reclaim memory resources.

Severity

Warning

Message Text

Failed to allocate client message, out of resources

STP.SendCIntMsgFail

Description

A message could not be sent to an STP client due to an unexpected error. Depending on the nature of the network topology and the topology change that just occurred, network convergence may be delayed as a result of not being able to send this message.

Remedy

The error code may be useful to engineering in debugging client/server connectivity issues.

Severity

Warning

Message Text

Internal error %ipmlErr% while attempting to send client message

Message Parameters

| Name | Type |
|---------|------|
| ipmlErr | sInt |

STP.DsblPortLoopDtect

Description

STP has detected a Loop for which it needs to shutdown the port.

Remedy

Try to remove the loop on Edge Safeguard ports.

Severity

Warning

Message Text

Loop Detected on Edge Safeguard Port (%portId%) and port will be shutdown.

Message Parameters

| Name | Type |
|--------|--------|
| portId | String |

STP.DsblPortBrdgDtect

Description

STP has received a BPDU on restricted port for which it needs to shutdown port.

Remedy

Try to remove the external bridge connected to the port.

Severity

Warning

Message Text

BPDU Restrict Port (%portId%) has received a bpdud and will be shutdown.

Message Parameters

| Name | Type |
|--------|--------|
| portId | String |

STP.EnblPortTimerExp

Description

Port is re-enabled due to time out expiry.

Remedy

NA.

Severity

Warning

Message Text

Port (%portId%) is re-enabled as the disable time out has expired.

Message Parameters

| Name | Type |
|--------|--------|

| bufPtr | Buf-ptr |
| bufLen | Buf-len |

STP.OutBPDU.Trace

Description

Informational messages along a BPDU's path through STP.

Remedy

N/A

Severity

Debug-Verbose

Message Text

Port=%outport%: %msg%

Message Parameters

| Name | Type |
|---------|--------|
| outport | String |
| msg | Printf |

STP.OutBPDU.DropMaxAge

Description

Used when packets are dropped during STP output processing due to the MaxAge value being too large. This is normal for networks of large diameter or when a BPDU flood appears on a network.

Remedy

Check network size to make sure the maximum diameter is not exceeded and check to make sure no L2 devices are flooding/looping BPDUs.

STP.System Messages

- [STP.System.InitFail](#) on page 4927
- [STP.System.AllocMemFail](#) on page 4928
- [STP.System.InsNodeFail](#) on page 4928

STP.System.InitFail

Description

Initialization failed due to the insufficient memory to allocate the STP tables in the system. This condition is mainly due to system starvation or an extreme low memory condition.

Remedy

A possible remedy is to use the "show memory" and "show log" commands to monitor the memory status of different processes. Depending on the results of these commands, you can either change the system configuration or free up the system memory by ending processes which are currently not needed. If the problem persists, please try failover or rebooting the switch.

Severity

Critical

Message Text

Initialization failed, %reason%

Message Parameters

| Name | Type |
|--------|--------|
| reason | Printf |

STP.System.AllocMemFail

Description

An attempt to allocate the specified memory size failed.

Remedy

An unexpected internal error. Please contact Extreme Networks with configuration information.

Severity

Error

Message Text

Memory allocation (%size%) failure

Message Parameters

| Name | Type |
|------|--------|
| size | uInt32 |

STP.System.InsNodeFail

Description

Implementation-specific data structure routine failure.

Remedy

No corrective action can be taken by the user other than rebooting the switch.

Severity

Error

Message Text

Failed to insert new node into data structure.

[thttpd.RejctConnAccessDeny](#)

Description

HTTP connection request from the specified source IP-Address has been rejected by the configured access-list. This connection will not be permitted.

Remedy

Check the access-list associated with the application. Verify the rule order is correct. Use 'debug thttpd show access-profile' to view the order of access-list execution. Use 'show access-list dynamic rule <rule-name>', where rule-name is the name of the rule in the log message, to see the access-list that blocked the source IP.

Severity

Warning

Message Text

HTTP connection request from the source %address% has been denied by the access-list %rule%. Rejecting connection.

Message Parameters

| Name | Type |
|---------|--------|
| address | String |
| rule | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.StrtSvrOK

Description

Web server has started.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Web server has started on TCP port %port%.

Message Parameters

| Name | Type |
|------|--------|
| port | L4port |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.StrtSvrSSL0K

Description

Web server has started with SSL support.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Web server has started with SSL support. HTTPS is enabled.

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.StopSvr0K

Description

Web server has stopped.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Web server has stopped.

Applicable Platforms

thttpd.StopSrvrSSL0K

Description

Web server is no longer SSL-enabled.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Web server SSL support has stopped.

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.SSLnotRdy

Description

HTTP SSL support has been enabled, but either the Private Key or the Certificate have not been configured yet, or have been misconfigured.

Remedy

Properly configure the Private Key and the Certificate

Severity

Notice

Message Text

HTTP SSL support has been enabled, but Private Key or Certificate are not configured yet.

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.PrvtKeyInv

Description

The provided SSL Private Key is not valid

Remedy

Provide a valid SSL Private Key which meets the following: - key must have correct passphrase - key must be less than 4KB

Severity

Warning

Message Text

The provided SSL Private Key is not valid. Reason: %reason%.

Message Parameters

| Name | Type |
|--------|--------|
| reason | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.CrtfctPrvtKeyMismatch

Description

Provided SSL Private Key does not match the provided SSL Certificate.

Remedy

Provide the matching SSL Private Key and Certificate

Severity

Warning

Message Text

SSL Private Key does not match SSL Certificate. Reason: %reason%.

Message Parameters

| Name | Type |
|--------|--------|
| reason | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.CreatSSLCrtfct

Description

Creating SSL Certificate and Private Key from the provided key length, country code, organization name, and common name.

Remedy

No action required - Information message only.

Severity

Info

Message Text

Creating SSL certificate with key length: %len%, country code: %cc%, organization: %org%, CN: %cname%

Message Parameters

| Name | Type |
|-------|--------|
| len | sInt |
| cc | String |
| org | String |
| cname | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.IntExcpt

Description

HTTPD process ran into an exception. The exception is printed for debugging purposes

Remedy

No action required - Informational message only.

Debug-Summary

Message Text

Process has generated an exception: %exception%

Message Parameters

| Name | Type |
|-----------|--------|
| exception | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.CrtfctInv

Description

The provided SSL certificate is not valid.

Remedy

Provide a valid SSL certificate which meets the following: - certificate must be in PEM format - certificate must be less than 8KB

Severity

Warning

Message Text

The provided SSL certificate is not valid. Reason: %reason%

Message Parameters

| Name | Type |
|--------|--------|
| reason | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.CACrtfctInv

Description

The provided CA certificate is not valid.

Remedy

Provide a valid Trusted-ca/OCSP signature-ca certificate which meets the following: - certificate must be in PEM format - certificate must be less than 8KB - key usage must be available - key cert sign must be present in key usage - basic constraints must be available - notBefore and notAfter options must be valid

Severity

Warning

Message Text

The provided CA certificate is not valid. Reason: %reason%

Message Parameters

| Name | Type |
|--------|--------|
| reason | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.CrtfctVld

Description

The provided SSL certificate is valid. This is a general event which will be used during verification of SSL certificate in all the below cases: - Pasting of self-signed/CA-signed SSL certificate in the CLI "configure ssl certificate pregenerated" - Downloading of self-signed/CA-signed SSL certificate using CLI "download ssl <ip> cert <file>" - Generation of Self-signed SSL certificate

Remedy

No action required - Notification message only

Severity

Notice

Message Text

The provided SSL certificate (CN:%c_name%) is valid.

Message Parameters

| Name | Type |
|--------|--------|
| c_name | String |

Applicable Platforms

- Summit family switches

- I386 virtual machine switch simulator

thttpd.CACrtfctVld

Description

The provided CA certificate is valid. This is a general event which will be used during verification of CA certificates in the below case: - Downloading of trusted/ocsp-signature CA certificate using CLI "download ssl <ip> cert trusted-ca|ocsp-signature-ca <file>"

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

The provided CA certificate (CN:%c_name%) is valid.

Message Parameters

| Name | Type |
|--------|--------|
| c_name | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.PrvtKeyVld

Description

The provided SSL private key is valid. This is a general event and will be used at the time of: - Generation of self-signed certificate/private-key pair - Generation of CSR/private-key pair - Pasting of private-key using CLI "configure ssl privkey pregenerated" - Downloading of private-key using "download ssl..." command

Remedy

No action required - Information message only.

Severity

Info

Message Text

The provided SSL private key is valid.

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.CrtfctPrvtKeyMatch

Description

The SSL private key - certificate pair matches.

Remedy

No action required - Notification message only.

Severity

Info

Message Text

SSL private key and SSL certificate (CN:%c_name%) matches.

Message Parameters

| Name | Type |
|--------|--------|
| c_name | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

thttpd.UncfgAllCACrtfct

Description

All the Trusted/OCSP-signature CA certificate(s) have been unconfigured successfully.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

All the Trusted/OCSP-signature CA certificate(s) have been unconfigured successfully.

Applicable Platforms

- Summit family switches

UPM.Msg.UserAuthenticated

Description

This message is generated when a user is authenticated on a port.

Remedy

This is a informational message

Severity

Notice

Message Text

User %userName% authenticated on machine whose IP is %ipaddr%, mac is %macaddr%,
vlan %vlanName%, port %slotPort%, VSA is %vsa%

Message Parameters

| Name | Type |
|----------|----------|
| userName | String |
| ipaddr | IP |
| macaddr | srcMAC |
| vlanName | String |
| slotPort | SlotPort |
| vsa | String |

UPM.Msg.UserUnauthenticated

Description

This message is generated when a user is unauthenticated on a port

Remedy

This is a informational message.

Severity

Notice

Message Text

User %userName% logged off on machine whose IP is %ipaddr%, mac is %macaddr%, vlan %vlanName%, port %slotPort%, VSA is %vsa%

Message Parameters

| Name | Type |
|----------|----------|
| userName | String |
| ipaddr | IP |
| macaddr | srcMAC |
| vlanName | String |
| slotPort | SlotPort |
| vsa | String |

UPM.Msg.LLDPDevDetected

Description

A LLDP device-detect on the port

Remedy

This is a informational message.

Severity

Notice

Message Text

LLDP Device detected. Mac is %mac%, IP is %ipaddr%, on port %slotPort%, device type is %type%, max power is %power%

Message Parameters

| Name | Type |

UPM.Msg.upmNotCfgForEvent

Description

UPM Programming issue. Invalid Param

Remedy

Please get in touch with Extreme Networks Technical support report the message, and provide any additional information related to this failure. This information needs to be supplied to Engineering, if possible in combination with a core dump.

Severity

Warning

Message Text

Upm did not find Profile %profile% configured for the %eventName%

Message Parameters

| Name | Type |
|-----------|--------|
| profile | String |
| eventName | String |

UPM.Msg.msgRecvHandler

Description

UPM Programming issue. Invalid Param

Remedy

The message is for debug purposes only, and needs to be supplied to Engineering, if possible in combination with a core dump.

Severity

Debug-Summary

Message Text

Upm recvd a message %cmd%

Message Parameters

| Name | Type |
|------|--------|
| cmd | String |

UPM.Msg.upmMsgExshLaunch

Description

Message produced when UPM launches the profile

Remedy

Informational Message to the user know that a profile has been launched

Severity

Notice

Message Text

Launched profile %name% for the event %event%

Message Parameters

| Name | Type |
|-------|--------|
| event | String |
| name | String |

UPM.Msg.upmMsgExshLaunchStsOk

Description

Troubleshoot message UPM Programming

Remedy

The message is for debug purposes only. Status of profile execution is OK.

Severity

Debug-Summary

Message Text

Profile %name% execution return SUCCESS on event %event%

Message Parameters

| Name | Type |
|-------|--------|
| event | String |
| name | String |

UPM.Msg.upmMsgExshLaunchStsFail

Description

Troubleshoot message UPM Programming

Remedy

The message is produced when the status of profile execution is not OK. Please check the syntax of the profile contents

Severity

Error

Message Text

Profile execution returned FAIL on event %event%, profile %name%

Message Parameters

| Name | Type |
|-------|--------|
| event | String |
| name | String |

UPM.Msg.portNotCfgUpmEvent

Description

Troubleshoot message UPM Programming

Remedy

The message is produced when the port is not configured in UPM for a event. This is not a error condition.

Severity

Debug-Summary

Message Text

Port %port% is not configured for the event %event%

Message Parameters

| Name | Type |
|-------|----------|
| event | String |
| port | SlotPort |

UPM.Msg.eventQueuedUp

Description

Troubleshoot message UPM Programming

Remedy

The message is produced when the port is not configured in UPM for a event. This is not a error condition.

Severity

Info

Message Text

Event %event% on port %port% queued up for execution

Message Parameters

| Name | Type |
|-------|----------|
| event | String |
| port | SlotPort |

UPM.Msg.dmlpmlErr

Description

Troubleshoot message UPM Programming

Remedy

The message is produced when the UPM cannot write to the backup.

Severity

Critical

Message Text

writeBackup failed with %status%. Msg is %cmd%. Msg size %size%.

Message Parameters

| Name | Type |
|--------|--------|
| status | sInt |
| cmd | uInt32 |
| size | uInt32 |

UPM.Msg.unknownProfileDm

Description

Troubleshoot message UPM Programming

Remedy

The message is produced when the UPM on backup cannot find the profile.

Severity

Critical

Message Text

Unknown profile from chk pointing %profile%, msg %cmd%

Message Parameters

| Name | Type |
|---------|--------|
| profile | String |
| cmd | uInt32 |

UPM.Msg.exshLaunchStsFailLoop

Description

Troubleshoot message UPM Profile

Remedy

The message is produced when the UPM profile detects a loop condition in profile

Severity

Critical

Message Text

Possible Loop condition on UPM profile %profile%, event - %name%

Message Parameters

| Name | Type |
|---------|--------|
| profile | String |
| name | String |

UPM.Msg.eventDroppedAuthNotRun

Description

Troubleshoot message UPM Profile

Remedy

The message is produced when the UPM profile detects a loop condition in profile

Severity

Warning

Message Text

User-Unauthenticated event was dropped as User-Authenticated did not run earlier on the port %port%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

UPM.Msg.snmpTrapOnProfileExec

Description

Troubleshoot message UPM Profile execution SNMP

Remedy

Sent before UPM sends a SNMP trap

Severity

Debug-Data

Message Text

Sending a trap to signal a profile %profile% execution on event %event%, port %port% with execlId %id% and status %sts%

Message Parameters

| Name | Type |
|---------|----------|
| profile | String |
| event | String |
| port | SlotPort |
| id | sInt |
| sts | sInt |

UPM.Msg.profileMissCfg

Description

UPM did not find the profile with the given name. Possible misconfiguration from ems - Log

Remedy

Please check the name of profile in UPM configuration.

Severity

Error

Message Text

UPM Profile %profile_name% not found in the UPM configuration

Message Parameters

| Name | Type |
|--------------|--------|
| profile_name | String |

UPM.Msg.upmEventQInfo

Description

Messages are queued up. A message is logged after every 25 (multiple of 25)

Remedy

Expect the profile to run after some time

Severity

Info

Message Text

Current UPM Event Queue length is %len% messages(Logged after every 25 msgs)

Message Parameters

| Name | Type |
|------|------|
| len | sInt |

UPM.Msg.upmEventQFull

Description

Messages are queued up. The rate of event generation is too high for the system to launch the UPM profiles.

Remedy

Expect the profile to run after some time

Severity

Warning

Message Text

Maximum UPM Event Queue length supported is %len% messages. Dropping Messages from Client Applications.

Message Parameters

| Name | Type |
|------|------|
| len | sInt |

UPM.Msg.DscvrIdOnPort

Description

A new identity has been discovered on the port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Identity \"%identityName%\" with MAC is %mac%, IP is %ipaddr% discovered on port %slotPort%

Message Parameters

| Name | Type |
|--------------|----------|
| identityName | String |
| mac | srcMAC |
| ipaddr | IP |
| slotPort | SlotPort |

UPM.Msg.RemIdFrmPort

Description

An Identity got removed from the port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Identity \"%identityName%\" with MAC is %mac%, IP is %ipaddr% removed from port %slotPort%

Message Parameters

| Name | Type |
|--------------|----------|
| identityName | String |
| mac | srcMAC |
| ipaddr | IP |
| slotPort | SlotPort |

UPM.Msg.AssocIdToRole

Description

An Identity discovered is associated to role based on attributes of identity to role's match-criteria.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Identity \"%identityName%\" with MAC: %mac% IP: %ipaddr% on port %slotPort% and on vlan \"%vlanName%\" is associated to role \"%roleName%\"

Message Parameters

| Name | Type |
|--------------|----------|
| identityName | String |
| mac | srcMAC |
| ipaddr | IP |
| slotPort | SlotPort |
| roleName | String |
| vlanName | String |

UPM.Msg.DisassocIdFmRole

Description

An Identity is dissociated from role.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Identity \"%identityName%\" with MAC: %mac% on port %slotPort% and on vlan \"%vlanName%\" is dissociated from role \"%roleName%\"

Message Parameters

| Name | Type |
|--------------|----------|
| identityName | String |
| mac | srcMAC |
| ipaddr | IP |
| slotPort | SlotPort |

| Name | Type |
|----------|--------|
| roleName | String |
| vlanName | String |

UPM.Msg.ProfExecDlayForSave

Description

UPM profile execution is delayed due to system configuration save operation. The profile execution will start once the save operation completes.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Configuration save is in progress. UPM profile execution is delayed for profile \"%profileName%\".

Message Parameters

| Name | Type |
|-------------|--------|
| profileName | String |

uRPF Messages

[uRPF.DropIngrPkt](#) on page 5001

uRPF.DropIngrPkt

Description

A unicast RPF packet was dropped as a match was not found in the routing table. For packet details see the log message content.

Remedy

This is an information message, and was received due to user configuration.

Severity

Info

Message Text

Unicasr Reverse-Path dropped a packet from %sip% to %dip% received on vlan %vlan% port %port%

Message Parameters

VirtMgr.Error

Description

A problem has been detected which is interfering with the normal operation of the system. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource.

Remedy

The exact remedy is dependent on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

VirtMgr.Warning

Description

An abnormal condition has been detected which, although it is not interfering with the normal operation of the system, may signal that the system or the network in general may not be functioning as expected. The condition may have been caused by an unusual or unexpected circumstance related to some external stimulus.

Remedy

The exact remedy is dependent on the particular situation; but the problem may have been resolved by rejecting the request or performing some default action.

VirtMgr.ShellCmdFail

Description

A problem was encountered when running a shell command. The system is not functioning as expected. The problem may be related to the failure to allocate an internal system resource. The arguments for this event are: - shellCommand: Shows the shell command which failed to execute. - errorMessage: The reason for the command failure.

Remedy

The exact remedy is dependent on the particular situation; but the problem may be resolved by retrying the operation when the resource becomes available.

Severity

Error

Message Text

Failed to execute shell command %shellCommand%: %errorMessage%.

Message Parameters

| Name | Type |
|--------------|--------|
| shellCommand | String |
| errorMessage | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

VirtMgr.MntStrgFail

Description

This event occurs when there is a failure to mount the storage filesystem. The arguments for this event are: - deviceName: The filesystem to be attached from. - directory: The filesystem found on device is attached at this directory. - errorMessage: The reason for the mount failure. The problem may be due to one of the following: - Mounting a read only file system. - Source is already mounted. - Filesystem type not configured. - Source is not a block device. - Target is not valid directory. - Invalid privileges.

Remedy

Check if the disk is partitioned properly. In the shell use command "lsblk" and check if the device sda/sdb has two partitions sda1, sda2 (or sdb1,sdb2). If not the disk needs to be partitioned correctly. Check if the disk is formatted properly with ext4 filesystem type. Use "clear vm storage" CLI command to reformat and remount the directories. (Note: This will destroy any data currently on the device) If the disk is partitioned and formatted properly then restarting the switch will resolve the issue. If the issue still persists contact technical support with the above details.

Severity

Error

Message Text

Unable to mount the storage filesystem %deviceName%, %directory%: %errorMessage%

Message Parameters

| Name | Type |
|--------------|--------|
| deviceName | String |
| directory | String |
| errorMessage | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

VirtMgr.UnmntStrgFail

Description

This event occurs when there is a failure to unmount the storage filesystem. The arguments for this event are: - **directory**: The directory from which the filesystem is to be disassociated from its mount point. - **errorMessage**: The reason for the unmount failure. The problem may be due to one of the following: - Target could not be mounted because it is busy. - Target is not a mount point. - Invalid privileges.

Remedy

Check if the disk is partitioned properly. In the shell use command "lsblk" and check if the sda/sdb has two partitions sda1, sda2 (or sdb1, sdb2). If not the disk needs to be partitioned correctly. This event also occurs when the disk is busy so make sure all domains are shutdown (use command "virsh list --all" in shell) and the libvirt daemons are killed (Use command "ps | grep libvirtd" in shell) before unmounting the disk. The problem may be resolved by restarting the virtMgr process or by restarting the switch.

Severity

Warning

Message Text

Failure to unmount the %directory% filesystem. %errorMessage%

Message Parameters

| Name | Type |
|--------------|--------|
| directory | String |
| errorMessage | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

VirtMgr.SysCallFail

Description

This event occurs when there is a failure in making system calls like mkdir, chown, symlink. The arguments to this event are: - command: The command which failed to execute (e.g. mkdir, chown, symlink). - errorMsg: The reason for the failure of the command. The probable reasons for the failure are: - Invalid permissions of the parent directory - Pathname already exists - Insufficient kernel memory available. - Pathname points outside your accessible address space. - Pathname refers to a read-only filesystem

Remedy

Check if the disk is partitioned properly. In the shell use command "lsblk" and check if the sda/sdb has two partitions sda1, sda2 (or sdb1,sdb2). If not the disk needs to be partitioned correctly. Check if the disk is mounted and formatted (with ext4 filesystem) properly. Use "clear vm storage" CLI command to reformat and remount the directories. (Note: This will destroy any data currently on the device)

Severity

Error

Message Text

Error executing command %command%. %errorMsg%

Message Parameters

| Name | Type |
|----------|--------|
| command | String |
| errorMsg | String |

Applicable Platforms

- Summit family switches

VirtMgr.HndLibVirtErr

Description

This event occurs when the libvirt global error handling function is called and virErrorLevel indicates an error has been raised (i.e. VIR_ERR_ERROR) most likely due to an API call. The arguments for this event are: - errorMessage: Provides the reason for the failure. - errorCode: The virErrorNumber from the virterror module of libvirt API. - errorDomain: The virErrorDomain from the virterror module of libvirt API. For further details on the virterror module please check the link <https://libvirt.org>.

Remedy

The exact remedy is dependent on the particular situation. Check if the virtMgr process is running. If not then check if the libvirt daemon is running on shell (Use command "ps | grep libvirtd"). If the libvirt daemon is running then start the virtMgr process using CLI command "start process virtMgr". Fetch the debug logs and the CLI command which failed to execute (if any) and contact technical support. If the virtMgr process is not running and if the libvirt daemon is not running too, then restart the switch. Fetch the core dump and the debug logs and contact technical support. - To fetch debug logs configure the log filter as shown below before reproducing the issue. "configure log filter DefaultFilter add events VirtMgr severity debug-summary". - Reproduce the issue and fetch the logs using "show log" command. - To get the core dumps, restart the switch and fetch the latest core dump file (core.virtMgr.xxxx.s-1.gz) generated at "/usr/local/tmp" (internal memory) folder. - Use "tftp put <ip-address> core.virtMgr.xxxx.s-1.gz <remote-file>" to save the core dump to the desired location.

Severity

| errorMessage | String |
| errorCode | ulnt |
| errorDomain | ulnt |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

VirtMgr.HndLibVirtWarn

Description

This event occurs when the libvirt global error handling function is called and `virErrorLevel` indicates a warning has been raised (i.e. `VIR_ERR_WARNING`) most likely due to an API call. The arguments for this event are: - `errorMessage`: Provides the reason for the failure. - `errorCode`: The `virErrorNumber` from the `virerror` module of libvirt API. - `errorDomain`: The `virErrorDomain` from the `virerror` module of libvirt API. For further details on the `virerror` module please check the link <https://libvirt.org>.

Remedy

Check if the `virtMgr` process is running. If not then check if the libvirt daemon is running on shell (Use command `"ps | grep libvirtd"`). If the libvirt daemon is running then start the `virtMgr` process using CLI command `"start process virtMgr"`. Fetch the debug logs and the CLI command which failed to execute (if any) and contact technical support. If the `virtMgr` process is not running and if the libvirt daemon is not running too, then restart the switch. Fetch the core dump and the debug logs and contact technical support. - To fetch debug logs, configure the log filter as shown below before reproducing the issue. `"configure log filter DefaultFilter add events VirtMgr severity debug-summary"`. - Reproduce the issue and fetch the logs using `"show log"` command. - To get the core dumps, restart the switch and fetch the latest core dump file (`core.virtMgr.xxxx.s-1.gz`) generated at `"/usr/local/tmp"` (internal memory) folder. - Use `"tftp put <ip-address> core.virtMgr.xxxx.s-1.gz <remote-file>"` to save the core dump to the desired location.

Severity

Message Text

Vlan Mgr application started

vlan.CfgIPMTUExcdRcmdIPMTU

Description

The event is observed when the switch reboots with a configured value that exceeds the recommended value of IPMTU or when the user attempts to configure such a value. There are two parameters - configuredIpmtu is what the user is trying to configure, validIpmtu - is the ipmtu that will not exceed the jumbo frame size.

Remedy

Recommend changing the ip-mtu value to the one that is supported using "configure ip-mtu value .." command.

Severity

Warning

Message Text

The IP-MTU size %configuredIpmtu% for vlan %vlanName% may be too large for jumbo-frame-size %jumbosize%. IP packets larger than %validIpmtu% may be lost.

Message Parameters

| Name | Type |
|-----------------|--------|
| configuredIpmtu | uInt32 |
| vlanName | String |
| jumbosize | uInt32 |
| validIpmtu | uInt32 |

vlan.CfgVLANAddPortOK

Description

The addition of a port to a VLAN was successfully configured.

Remedy

No remedy is available.

Severity

Info

Message Text

Port %port% added to VLAN %vlan% %taggedness%.

Message Parameters

| Name | Type |

| vlan | VLAN |
| taggedness | String |

vlan.CfgVLANDelPortOK

Description

The deletion of a port from a VLAN was successfully configured.

Remedy

No remedy is available.

Severity

Info

Message Text

Port %port% deleted from VLAN %vlan%.

Message Parameters

| Name | Type |
|------|--------|
| port | String |
| vlan | VLAN |

vlan.LAGMinActvLinkAchv

Description

The minimum number of active links required for LAG to come up has been reached.

Remedy

No action required - Informational message only

Severity

Notice

Message Text

LAG %port% with %totalMembers% member ports has reached the minimum %threshold% active links.

Message Parameters

| Name | Type |
|--------------|--------|
| port | String |
| threshold | uInt8 |
| totalMembers | uInt8 |

vlan.LAGMinActvLinkNotMntn

Description

The number of active links has fallen below the minimum required for the LAG to remain up.

Remedy

Check to make sure links are active via show port sharing command

Severity

Warning

Message Text

The number of active links for LAG %port% with %totalMembers% member ports has fallen below the minimum %threshold% active links required for the LAG to remain up.

Message Parameters

| Name | Type |
|--------------|--------|
| port | String |
| threshold | uInt8 |
| totalMembers | uInt8 |

vlan.AddIPAddrFail

Description

The specified IP address from the specified application cannot be installed on the specified VLAN because of the specified error.

Remedy

Correct the error indicated by Error_Msg. Error_Msg is the same message that would be displayed on the command line. The most likely error is that the requested IP address conflicts with an existing address: either remove the existing address, or change the requested address (e.g., change the DHCP server to assign a different address). The next most likely error is that the switch's capacity for IP addresses (either the number of IP addresses on the specified VLAN or tunnel, or the number of VLANs and tunnels with IP addresses) has been reached: either remove an address from the specified VLAN or tunnel, or remove all addresses from some other VLAN or tunnel. Last is an invalid requested IP address (e.g., loopback address, broadcast address, multicast address, and invalid mask or prefix length): change the source of the requested address to specify a valid unicast IP address.

Severity

Error

Message Text

Failed to add IP addr %IP_Addr%/%Mask_or_Prefix_Len% from %Appl_Name% to VLAN %VLAN_Name%, %Error_Msg%

Message Parameters

vlan.dad.GetGrpMskFail

Description

In order for VLAN Manager to receive messages that indicate a duplicate IP (including IPv6) address has been discovered for a VLAN, registration for Generic Netlink group messages related to the DAD must be successful. In order to achieve this registration, the DAD family's groups must first be converted into a group mask using the Generic Netlink's control channel. This event indicates that the appropriate group mask could not be determined and registration for Generic Netlink group messages will not be

performed. As a result of this failure, VLAN Manager will not be made aware of duplicate IP addresses. This failure indicates an internal software error.

Remedy

When this happens DAD will not be able to function. This is an unexpected internal condition needing technical assistance. Contact technical support with the following information: Output of 'show tech', 'show ip dad', 'show ipv6 dad'

Severity

Error

Message Text

Failed to get group mask for Generic Netlink family. error: %errmsg%

vlan.mac.clientVlanRequest

Description

An add or delete has been request for 1 to N VLANs. Only the last VLAN in the request is displayed.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

Application request: %req% %mac% for VLAN instance %vlanInstance%

Message Parameters

| Name | Type |
|--------------|--------|
| req | String |
| mac | MAC |
| vlanInstance | xInt32 |

vlan.mac.noGlobalEntry

Description

Switch has no entry for the specified MAC existing, though one was expected to exist.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

Global MAC entry for %mac% does not exist

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |

vlan.mac.noAvailEntry

Description

No global entries are available to insert this MAC address. No entry for this MAC address already exists.

Remedy

No remedy is available.

Severity

Warning

Message Text

No global entries exist for %mac%, nor are any open entries available.

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |

vlan.mac.sysErr

Description

Underlying system behaviour that was expected to work does not. Includes port lookups, VLAN lookups, memory allocation, etc.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

vlan.mac.dynMem

Description

Some issue with dynamic memory. Fairly complex for vMAC support, can cover a lot.

Remedy

No remedy is available.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

vlan.mac.entryInv

Description

A MAC entry is somehow invalid. Details should go in the message.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

vlan.mac.refCntInv

Description

Bad news, ref count bug.

Remedy

No remedy is available.

Severity

Debug-Summary

Message Text

%func% Invalid ref count for %mac% (index of %index%) is %refCnt%!! (%proc%)

Message Parameters

| Name | Type |
|--------|--------|
| func | String |
| refCnt | sInt |
| mac | MAC |
| index | sInt |
| proc | String |

vlan.mac.refCntInc

Description

Bumping the reference count.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

%func% (%type%) Ref count for %mac% (index %index%) incremented to %refCnt%.
vpif_bit_map:%vpifBitmap% (%proc%)

Message Parameters

| Name | Type |
|------------|--------|
| func | String |
| type | String |
| index | sInt |
| refCnt | sInt |
| mac | MAC |
| vpifBitmap | sInt |
| proc | String |

vlan.mac.refCntDec

Description

Removing a reference.

Remedy

No remedy is available.

Severity

Debug-Data

Message Text

%func% (%type%) Ref count for %mac% (index %index%) deremented to %refCnt%.
vpif_bit_map:%vpifBitmap%(%proc%)

Message Parameters

vlan.Mirror.RmtIPRtAvail

Description

This event occurs when an IP route is available to reach the specified remote IP. If ping-check is configured "on", ping-check is started.

Remedy

No action required - Notification of a network change only.

Severity

Notice

Message Text

%mirName%: Route is available to remote IP %IPaddr%, %vrName%, priority %prio%

Message Parameters

| Name | Type |
|---------|--------|
| vrName | VR |
| IPaddr | IPv4N |
| prio | uInt8 |
| mirName | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

vlan.Mirror.RmtIPRtUnavail

Description

This event occurs when no IP route is available to reach the specified remote IP. Ping-check will not run.

Remedy

This is a notification of a network change. No action is required, but if a route to the remote IP is expected to be present, show the state of routing protocols in use, or issue "show iproute" to examine the route table.

Severity

Notice

Message Text

%mirName%: Route is unavailable to remote IP %IPaddr%, %vrName%, priority %prio%

Message Parameters

| Name | Type |
|---------|--------|
| vrName | VR |
| IPaddr | IPv4N |
| prio | uInt8 |
| mirName | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

vlan.Mirror.RmtIPUp

Description

The operational state of the mirror-to-remote IP has changed to "Up", because ping-check detected the remote IP replied with an ICMP Echo Reply.

Remedy

No action required - Notification of a network change only.

Severity

Notice

Message Text

%mirName%: Ping check is successful to remote IP %IPAddr%, %vrName%, priority %prio%

Message Parameters

| Name | Type |
|---------|--------|
| vrName | VR |
| IPAddr | IPv4N |
| prio | uInt8 |
| mirName | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

vlan.Mirror.RmtIPDown

Description

The operational state of the mirror-to-remote-IP is "Ping timed out" because ping-check detected the given remote IP address failed to reply to 3 consecutive ICMP Requests.

Remedy

No action required - Notification of a network change only. Check the connectivity along the path to the remote IP.

Severity

Notice

Message Text

%mirName%: Ping check timed out to remote IP %IPAddr%, %vrName%, priority %prio%

Message Parameters

| Name | Type |
|---------|--------|
| vrName | VR |
| IPAddr | IPv4N |
| prio | uInt8 |
| mirName | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

vlan.Mirror.RmtIPPingChkFail

Description

This event occurs when ICMP Ping Protection could not start to the given remote IP address for the given reason. The mirror-to-remote IP operational status is "Up".

Remedy

This is a notification of an internal error or limit reached in the nettools software component, and should be rare. Collect the following information: show mirror debug
vlan show mirror debug nettools show ping

Severity

Warning

Message Text

`%mirName%: Ping check failed to start to remote IP %IPAddr%, %vrName%, priority %prio%. Reason: %reason%. Remote IP assumed to be up.`

Message Parameters

| Name | Type |
|---------|--------|
| vrName | VR |
| IPAddr | IPv4N |
| reason | String |
| prio | ulnt8 |
| mirName | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

vlan.Mirror.RmtIPRtMgrRegFail

Description

This event occurs when Route Manager could not register route tracking to the given remote IP address for the given reason code. The mirror-to-remote IP operational status is "No route".

Remedy

This is a notification of an internal error in the route manager software component, and should be rare. Collect the following information: `show iproute summary`
`show virtual-router` Then for each user-created VR, collect: `show iproute summary <user_vr_name>`

Severity

Warning

Message Text

`%mirName%: Route Manager failed to register route tracking to remote IP %IPAddr%, %vrName%, priority %prio% (rc=%rc%)`

Message Parameters

| Name | Type |
|---------|--------|
| vrName | VR |
| IPAddr | IPv4N |
| rc | uInt8 |
| prio | uInt8 |
| mirName | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

vlan.Mirror.RmtIPRtMgrUnregFail

Description

This event occurs when Route Manager could not unregister route tracking to the given remote IP address for the given reason code.

Remedy

This is a notification of an internal error in the route manager software component, and should be rare. Collect the following information: show iproute summary show virtual-router Then for each user-created VR, collect: show iproute summary <user_vr_name>

Severity

Warning

Message Text

```
%mirName%: Route Manager failed to unregister route tracking to remote IP %IPAddr%,
%vrName%, priority %prio% (rc=%rc%)
```

Message Parameters

| Name | Type |
|--------|-------|
| vrName | VR |
| IPAddr | IPv4N |
| rc | uInt8 |

| Name | Type |
|---------|--------|
| prio | ulnt8 |
| mirName | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

vlan.Mirror.DebugSummary

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

No action required - Informational message only.

Severity

vlan.Mirror.SlctRmtIPOK

Description

The mirror-to-remote IP instance has selected an active remote IP for mirroring. This remote IP is the highest priority in "Up" status.

Remedy

No action required - Notification of a network change only.

Severity

Notice

Message Text

%mirName%: Started mirroring to selected remote IP %IPAddr%, %vrName%, priority %prio%

Message Parameters

| Name | Type |
|---------|--------|
| vrName | VR |
| IPAddr | IPv4N |
| prio | uInt8 |
| mirName | String |

Applicable Platforms

- Summit family switches

- I386 virtual machine switch simulator

vlan.Mirror.SlctRmtIPFail

Description

The mirror-to-remote IP instance has failed to find any remote IP in "Up" status. Mirroring for this instance will not take place. Up to 4 redundant remote IP addresses can be configured per mirror instance.

Remedy

Up to 4 redundant remote IP addresses can be configured per mirror instance. This message indicates none of those remote IP's are in "Up" status. See "show mirroring" status for further information on why each remote IP is Down. This may indicate a network change has occurred.

Severity

Notice

Message Text

%mirName%: Not mirroring to remote IP. None of the configured remote IP addresses are in Up status.

Message Parameters

| Name | Type |
|---------|--------|
| mirName | String |

Applicable Platforms

- Summit family switches
- I386 virtual machine switch simulator

vlan.Mirror.SlctRmtGwChg

Description

The mirror-to-remote IP instance has updated the gateway to reach the selected remote IP for mirroring. This remote IP was already in use, only the gateway has changed.

Remedy

No action required - Notification of a gateway change only.

Severity

Info

Message Text

%mirName%: Updated gateway to %gwAddr% for selected remote IP %IPAddr%, %vrName%,
priority %prio%

Message Parameters

| Name | Type |
|---------|--------|
| vrName | VR |
| IPAddr | IPv4N |
| prio | uInt8 |
| mirName | String |
| gwAddr | IPv4N |

|------|--------|
| str | String |
| name | String |
| peer | ulnt |
| msg | ulnt |

vlan.msgs.RstrctTrnscvr

Description

A port has been enabled, and it is attached to an unsupported and unlicensed high speed transceiver. The transceiver is restricted to 25 percent of capacity.

Remedy

Use a supported transceiver instead. Otherwise, contact technical support to purchase and install a '3rd Party Optics' feature license. Issue the CLI command 'show port x transceiver information detail' to see the transceiver type, vendor, part number, etc.

Severity

Warning

Message Text

The transceiver attached to port %slo_po% is unsupported and unlicensed. The port is restricted to %restrict_val%.

Message Parameters

| Name | Type |
|--------------|----------|
| slo_po | SlotPort |
| restrict_val | String |

vlan.msgs.FldRateOutActLogEvent

Description

This event occurs because the log action is configured for Port Flood Rate and the ingress traffic rate has exceeded the rate limit. The log action is one of the configurable out actions to be taken when the rate limit is exceeded with the "configure ports [<port_list>|<port_group>] rate-limit flood...out-actions" command

Remedy

The out-of-profile status may be cleared using the "clear ports rate-limit flood out-of-profile" command. A review of the Port Flood Rate-Limit configuration may be warranted.

Severity

Info

Message Text

Ingress traffic on port %portString% exceeded a Flood Control Limit resulting in change of out-of-profile status to true.

Message Parameters

| Name | Type |
|------------|----------|
| portString | SlotPort |

vlan.msgs.FldRateOutActDsblPort

Description

This event occurs because the disable-port action is configured for Port Flood Rate and the ingress traffic rate has exceeded the rate limit. The disable-port is one of the configurable out actions to be taken when the rate limit is exceeded with the "configure ports [<port_list>|<port_group>] rate-limit flood...out-actions" command

Remedy

The out-of-profile status may be cleared using the "clear ports rate-limit flood out-of-profile" command. A review of the Port Flood Rate-Limit configuration may be warranted.

Severity

Info

Message Text

Port %portString% disabled by Flood Control Rate Limit because the traffic exceeded the configured rate.

Message Parameters

| Name | Type |
|------------|----------|
| portString | SlotPort |

vlan.msgs.PortLinkFlapActLogEvent

Description

This message is displayed if a user has enabled link-flap detection on a port and has set the action to log a message on exceeding the configured threshold value for link flaps. The operational status indicates whether the port has been disabled for excessive link flapping or not.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Port %slotPort% link-flap detection operational status is %lfOperStatus%. Link has flapped more than %linkFlapCount% times in %interval% seconds.

Message Parameters

| Name | Type |
|---------------|----------|
| slotPort | SlotPort |
| lfOperStatus | String |
| linkFlapCount | uInt32 |
| interval | uInt32 |

vlan.msgs.PortLinkFlapActDsblPort

Description

This message is displayed if a user has enabled link-flap detection on a port and has set the action to disable the port on exceeding the configured threshold value for link flaps. The severity is set to debug-summary to avoid duplicate messages from being printed, if the link-flap detection log action is also enabled for this port.

Remedy

No action required - Notification message only.

Severity

Debug-Summary

Message Text

Port %slotPort% is disabled for excessive link flapping. Link has flapped more than %linkFlapCount% times in %interval% seconds.

Message Parameters

| Name | Type |
|---------------|----------|
| slotPort | SlotPort |
| linkFlapCount | uInt32 |
| interval | uInt32 |

VMT.InitDone

Description

Virtual machine tracking framework was initialized.

Remedy

No action required - Information message only.

Severity

Info

Message Text

Virtual machine tracking framework has been initialized.

VMT.AllocMemFail

Description

Memory for the displayed object could not be allocated which may be due to the system running low on memory. This will result in incorrect operation of the VMT feature.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory.

Severity

Critical

Message Text

Memory allocation failed when trying to allocate a %obj% structure of size %size%.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |
| size | uInt32 |

VMT.FDBEventDump

Description

FDB event description. Events are:
0 FDB_CLIENT_CALLBACK_MAC_TRACKING_ADD_EVENT
1 FDB_CLIENT_CALLBACK_MAC_TRACKING_DEL_EVENT
2 FDB_CLIENT_CALLBACK_MAC_TRACKING_MOVE_EVENT

Remedy

No action required - Information message only.

Severity

Debug-Data

Message Text

Event %event%: vlanInstance %vlanInstance%, portInstance %portInstance%, tag %vlanTag%, mac %mac%.

Message Parameters

| Name | Type |
|--------------|----------|
| event | sInt |
| vlanInstance | uInt |
| portInstance | xInt32 |
| vlanTag | VLAN-tag |
| mac | MAC |

VMT.DtectMAC

Description

Virtual machine MAC was detected and reported to virtual machine tracking framework.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Virtual machine MAC %mac% detected on port %port% on VLAN instance %vlanIfInstance%.

Message Parameters

| Name | Type |
|----------------|----------|
| mac | MAC |
| port | SlotPort |
| vlanIfInstance | uInt32 |

VMT.DeIMAC

Description

Virtual machine MAC was deleted and was reported to the virtual machine tracking framework. VLAN instance of -1 means that the virtual machine mac was deleted on all VLANs on which it has been detected.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Virtual machine MAC %mac% deleted on port %port% on VLAN instance %vlanIfInstance%.

Message Parameters

| Name | Type |
|----------------|----------|
| mac | MAC |
| port | SlotPort |
| vlanIfInstance | uInt32 |

VMT.MoveMAC

Description

Virtual machine MAC moved between ports and was reported to the virtual machine tracking framework.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Virtual machine MAC %mac% moved from port %srcPort% to port %dstPort%.

Message Parameters

| Name | Type |
|---------|----------|
| mac | MAC |
| srcPort | SlotPort |
| dstPort | SlotPort |

VMT.AuthMAC

Description

This message logs information about virtual machine MAC authentication and virtual port profile execution.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Virtual machine MAC %mac% port %port% user %user% is authenticated and virtual port profile %profile% is applied.

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| port | SlotPort |

| Name | Type |
|---------|--------|
| user | String |
| profile | String |

VMT.UnAuthMAC

Description

This message logs information about virtual machine MAC unauthentication.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Virtual machine MAC %mac% port %port% user %user% is unauthenticated and virtual port profile %profile% is unapplied.

Message Parameters

| Name | Type |
|---------|----------|
| mac | MAC |
| port | SlotPort |
| user | String |
| profile | String |

VMT.StrtInitCkpt

Description

Check-pointing to the backup instance has started.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Initial check pointing started for virtual machine tracking.

VMT.DoneInitCkpt

Description

Check-pointing to the backup instance has finished.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Initial check pointing finished for virtual machine tracking.

VMT.SendCkpt

Description

Virtual machine MAC information sent to backup node.

Remedy

No action required - Information message only.

Severity

Debug-Data

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

VMT.RecvCkpt

Description

Virtual machine MAC information received by backup node.

Remedy

No action required - Information message only.

Severity

Debug-Data

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

VMT.AuthMACRadius

Description

Radius authentication initiated for virtual machine MAC.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Radius authentication initiated for Virtual Machine MAC %mac%.

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |

VMT.AuthMACMap

Description

VMMAP file based authentication initiated for virtual machine MAC.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

VMMAP file based authentication initiated for virtual machine MAC %mac%.

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |

VMT.AuthMACLoc

Description

Local authentication initiated for virtual machine MAC.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Local authentication initiated for virtual machine MAC %mac%.

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |

VMT.AuthMACAAA

Description

An authentication request to the AAA manager.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

AAA request has been initiated for virtual machine MAC %mac% user %user%.

Message Parameters

| Name | Type |
|------|--------|
| mac | MAC |
| user | String |

VMT.AuthMACAAARspns

Description

AAA request result. A result of one equals authentication successful other value authentication failure.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

AAA request for virtual machine MAC %mac%, port %port%, user %user%, AAA result %result%, authError %error%.

Message Parameters

| Name | Type |
|--------|----------|
| mac | MAC |
| port | SlotPort |
| user | String |
| result | ulnt8 |
| error | String |

VMT.AuthMACFail

Description

Virtual machine MAC fail authentication.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Authentication failed for virtual machine MAC %mac%, port %port%, by %auth% authentication.

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| port | SlotPort |
| auth | String |

VMT.RecvACLClbk

Description

Call back received from ACL manager.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

vmtAclCallback() returned for %rcString% %rc% for command %cmd%, client %client%.

Message Parameters

| Name | Type |
|----------|--------|
| cmd | xInt |
| rc | sInt |
| rcString | String |
| client | Ptr |

VMT.BindPlcy

Description

PolicyName binded with ACL module for the specified direction.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Policy name %policyName% is binded in %dir% direction.

Message Parameters

| Name | Type |
|------------|--------|
| policyName | String |
| dir | String |

VMT.UnBindPlcy

Description

PolicyName unbinded with ACL module for the specified direction.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Policy name %policyName% is unbinded in %dir% direction.

Message Parameters

| Name | Type |
|------------|--------|
| policyName | String |
| dir | String |

VMT.ApplyPlcy

Description

PolicyName applied for virtual machine MAC.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Policy name %policyName% is applied for client MAC %mac% in %dir% direction.

Message Parameters

| Name | Type |
|------------|--------|
| policyName | String |
| mac | MAC |
| dir | String |

VMT.UnApplyPlcy

Description

PolicyName is unapplied for virtual machine MAC.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Policy name %policyName% is unapplied for client MAC %mac% in %dir% direction.

Message Parameters

| Name | Type |
|------------|--------|
| policyName | String |
| mac | MAC |
| dir | String |

VMT.RegFDBMACTrack

Description

This message gets logged when virtual machine tracking registers for FDB MAC tracking events on a set of ports.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Virtual machine tracking registered for FDB MAC tracking events.

VMT.DeRegFDBMACTrack

Description

This message gets logged when virtual machine tracking deregisters for FDB MAC tracking events on a set of ports.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Virtual machine tracking deregistered for FDB MAC tracking events.

VMT.ParmNull

Description

An internal function was called with a null pointer. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide information to technical support team on VMT configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Function %func% was called with a null pointer %arg%.

Message Parameters

| Name | Type |
|------|--------|
| func | String |
| arg | String |

VMT.FndMACMapFail

Description

The client is not found in the VMMAP file downloaded to switch during VMMAP file based authentication.

Remedy

Provide information to technical support team on VMT configuration and check whether the VMMAP file was downloaded successfully and the VMMAP file has this MAC entry.

Severity

Error

Message Text

VM client MAC %mac% not found in VMMAP file.

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |

VMT.FndMACLocDBFail

Description

The client is not found local VM database during local authentication.

Remedy

Provide information to technical support team on VMT configuration and check whether the local VM database entries are created for this MAC entry.

Severity

Error

Message Text

VM client MAC %mac% not found in local VM database.

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |

VMT.OpenFileFail

Description

Unable to open the specific file.

Remedy

Check whether the file is present.

Severity

Error

Message Text

Unable to open file %filename%.

Message Parameters

| Name | Type |
|----------|--------|
| filename | String |

VMT.ReadFileFail

Description

Unable to read the specific file contents.

Remedy

Check whether the file format is as per specification.

Severity

Warning

Message Text

Unable to read the file %filename% contents %line%.

Message Parameters

| Name | Type |
|----------|--------|
| filename | String |
| line | String |

VMT.AddMACMapDBFail

Description

Addition of the specified VM client MAC to the VMMAP file database failed. Return Values 6- Entry already present, 3- Memory Allocation Failure.

Remedy

Provide information to technical support team on VMT configuration.

Severity

Warning

Message Text

Adding VM client MAC %mac% to VMMAP file database failed due to %ret%.

Message Parameters

| Name | Type |
|------|--------|
| mac | MAC |
| ret | ulnt32 |

VMT.AddNameVPPDBFail

Description

Addition of the specified VPP name to the VPP database failed. Return Values 8- Entry already present, 3- Memory Allocation Failure.

Remedy

Provide information to technical support team on VMT configuration.

Severity

Warning

Message Text

Adding VPP Name %name% to VPP database failed due to %ret%.

Message Parameters

| Name | Type |
|------|--------|
| name | String |
| ret | ulnt32 |

VMT.DelNameVPPDBFail

Description

VPP Name was not present in VPP database and could not be deleted.

Remedy

Provide information to technical support team on VMT configuration.

Severity

Warning

Message Text

VPP name %name% delete failed.

Message Parameters

| Name | Type |
|------|--------|
| name | String |

VMT.ParseFileFail

Description

Error while parsing the file.

Remedy

Check whether the file format is as per specification.

Severity

Error

Message Text

File parsing failed %string%.

Message Parameters

| Name | Type |
|--------|--------|
| string | Printf |

VMT.ParmInv

Description

An internal function was called with an invalid value. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide information to technical support team on VMT configuration.

Severity

Warning

Message Text

Function %func% Arg %arg% has an invalid value %val%.

Message Parameters

| Name | Type |
|------|--------|
| func | String |
| arg | String |
| val | uInt32 |

VMT.FileNameLenLong

Description

File name length is longer than the maximum file name size that can be downloaded to the switch.

Remedy

Use a filename that is less than or equal to 32 characters.

Severity

Warning

Message Text

File name %filename% length %length% is more than 32 characters.

Message Parameters

| Name | Type |
|----------|--------|
| filename | String |
| length | uInt32 |

VMT.PlcyNameLenLong

Description

The policy name in the file is too long.

Remedy

Use a policy name in the file that is less than or equal to 28 characters.

Severity

Warning

Message Text

Policy name %plcyName% in the file %fileName% has length %len%, which exceeds the 28-character limit.

Message Parameters

| Name | Type |
|----------|--------|
| plcyName | String |
| len | uInt32 |
| fileName | String |

VMT.VMNameLenLong

Description

The specified VM name in the file is too long.

Remedy

Use a VM name in the file that is less than or equal to 32 characters.

Severity

Warning

Message Text

The VM name %vmName% in the file %fileName% has length %len%, which exceeds the 32-character limit.

Message Parameters

| Name | Type |
|----------|--------|
| vmName | String |
| len | uInt32 |
| fileName | String |

VMT.ClientMaxExcd

Description

Virtual machine MAC exceeds the 2k limit for the maximum number of clients.

Remedy

Provide information to the technical support team on the VMT configuration.

Severity

Warning

Message Text

Virtual machine MAC %mac% detected on port %port% exceeds the maximum-number-of-clients limit.

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| port | SlotPort |

VMT.VMMaxExcd

Description

Virtual machine MAC exceeds the 16k limit for the maximum number of VMs.

Remedy

Provide information to the technical support team on the VMT configuration.

Severity

Warning

Message Text

Adding VM client MAC %mac% addition to the VM database failed as it exceeds the limit for the number of VMs supported.

Message Parameters

| Name | Type |
|------|------|
| mac | MAC |

VMT.VPPMaxExcd

Description

The VPP database supports up to 2K entries and it is full. The VPP database cannot accept additional VPP names.

Remedy

Provide information to the technical support team on the VMT configuration.

Severity

Warning

Message Text

VPP Name %name% addition to the VPP database failed because the database already contains the maximum number of names.

Message Parameters

| Name | Type |
|------|--------|
| name | String |

VMT.DtectDupMAC

Description

A duplicate virtual machine MAC was received on the specified port. The duplicate MAC addresses are on different VLANs.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Duplicate virtual machine MAC %mac% detected on port %port%.

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| port | SlotPort |

VMT.FTPSyncTrace

Description

This message is used for debugging problems related to FTP Sync. This is normal and does not indicate a problem.

Remedy

No action required - Informational message intended to help debug problems related to FTP sync.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

VMT.VPPNameLenLong

Description

The specified VPP name in the file is too long.

Remedy

Use a VPP name in the file that is less than or equal to 32 characters.

Severity

Warning

Message Text

The VPP name %vppName% in the file %fileName% has length %len%, which exceeds the 32-character limit.

Message Parameters

| Name | Type |
|----------|--------|
| vppName | String |
| len | ulnt |
| fileName | String |

VMT.AuthDtectMACFail

Description

Virtual machine MAC was detected and it's authentication is failed because either NMS/VMMAP/LOCAL auth methods does not have authentication information about this MAC.

Remedy

If this Virtual machine MAC needs to be authenticated then the database should be populated for either of NMS/VMMAP/LOCAL, if not the MAC can be left in unauthenticated state and no VPP will be applied. Create NMS mapping for this detected Virtual machine MAC refer to concepts guide section "Configuring NMS Server Authentication". Create VMMAP mapping for this detected Virtual machine MAC and sync VMMAP repository refer to concepts guide section "Configuring VMMAP File Authentication". Create Local Mapping for this detected Virtual machine MAC refer to concepts guide section "Configuring Local Database Authentication". Do nothing.

Severity

Warning

Message Text

Authentication of virtual machine MAC %mac% detected on port %port% is failed.

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| port | SlotPort |

VMT.DeIMACNotAuth

Description

Virtual machine MAC is detected and its authentication is failed is informed via "AuthDtectMACFail" message and now that virtual machine MAC is getting deleted from switch.

Remedy

If the database was populated for either NMS/VMMAP/LOCAL for this virtual machine MAC with respect to "AuthDtectMACFail" message then database needs to be unpopulated for this message. Remove NMS mapping for this deleted Virtual machine MAC. Remove VMMAP mapping for this deleted Virtual machine MAC and sync VMMAP repository. Remove Local Mapping for this deleted Virtual machine MAC. Do nothing.

Severity

Warning

Message Text

Virtual machine MAC %mac% for which authentication is failed is now deleted on port %port%.

Message Parameters

| Name | Type |
|------|----------|
| mac | MAC |
| port | SlotPort |

VMT.BndPlcyFail

Description

Policy bind failed because the policy file has syntax errors, SMAC qualifier on ingress direction, or DMAC qualifier on egress direction.

Remedy

Check the policy for errors. If the policy needs to bind on ingress direction, then policy should not have an SMAC qualifier. Similarly, if the policy needs to bind on egress direction, then policy should not have a DMAC qualifier.

Severity

Error

Message Text

Policy name %plcyName% bind failed for %dir% direction.

Message Parameters

| Name | Type |
|----------|--------|
| plcyName | String |
| dir | String |

VMT.InstlDynCntOK

Description

Dynamic ACL counter has been installed to count packet source/destination MAC address matches VM MAC. If direction is ingress then Dynamic ACL counter has been installed to count packet source MAC address matches VM MAC. If direction is egress then Dynamic ACL counter has been installed to count packet destination MAC address matches VM MAC. If direction is both then Dynamic ACL counter has been installed to count packet source and destination MAC address matches VM MAC.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Dynamic ACL counter %counterName% has been installed for VM MAC %mac% on %direction% direction.

Message Parameters

| Name | Type |
|-------------|--------|
| counterName | String |
| mac | MAC |
| direction | String |

VMT.UnInstlDynCntOK

Description

If direction is ingress then Dynamic ACL counter which is already installed to count packet source MAC address matches VM MAC is now being uninstalled. If direction is egress then Dynamic ACL counter which is already installed to count packet destination MAC address matches VM MAC is now being uninstalled. If direction is both then Dynamic ACL counter which is already installed to count packet source and destination MAC address matches VM MAC is now being uninstalled.

Remedy

No action required - Information message only.

Severity

Debug-Summary

Message Text

Dynamic ACL counter %counterName% has been uninstalled for VM MAC %mac% on %direction% direction.

Message Parameters

| Name | Type |
|-------------|--------|
| counterName | String |
| mac | MAC |
| direction | String |

VMT.VMVRNameNotFnd

Description

Specified VR Name does not exist.

Remedy

Create the specified VR Name and then try this configuration.

Severity

Warning

Message Text

Dynamic VLAN with VLAN Tag %vlanTag% cannot be created for VM MAC %mac% because VR Name %vrName% does not exist.

Message Parameters

| Name | Type |
|---------|--------|
| vrName | String |
| vlanTag | uInt32 |
| mac | MAC |

VMT.VMVRNameInv

Description

VR Name cannot be system VR.

Remedy

Specify VR other than system VR.

Severity

Warning

Message Text

Dynamic VLAN with VLAN Tag %vlanTag% for VM MAC %mac% cannot be created on system VR.

Message Parameters

| Name | Type |
|---------|--------|
| vlanTag | uInt32 |
| mac | MAC |

VMT.VPPVRNameNotFnd

Description

Specified VR Name does not exist.

Remedy

Create the specified VR Name and then try this configuration.

Severity

Warning

Message Text

Dynamic VLAN with VLAN Tag %vlanTag% cannot be created for VPP name %vppName% because VR Name %vrName% does not exist.

Message Parameters

| Name | Type |
|---------|--------|
| vrName | String |
| vlanTag | uInt32 |
| vppName | String |

VMT.VPPVRNameInv

Description

VR Name cannot be system VR.

Remedy

Specify VR other than system VR.

Severity

Warning

Message Text

Dynamic VLAN with VLAN Tag %vlanTag% for VPP name %vppName% cannot be created on system VR.

Message Parameters

| Name | Type |
|---------|--------|
| vlanTag | uInt32 |
| vppName | String |

VMT.VMVLANTagInv

Description

VLAN Tag should be in between 1 and 4094.

Remedy

Specify VLAN Tag as per range mentioned.

Severity

Warning

Message Text

Dynamic VLAN Tag %vlanTag% for VM MAC %mac% has invalid range.

Message Parameters

| Name | Type |
|---------|--------|
| mac | MAC |
| vlanTag | uInt32 |

VMT.VPPVLANTagInv

Description

VLAN Tag should be in between 1 and 4094.

Remedy

Specify VLAN Tag as per range mentioned.

Severity

Warning

Message Text

Dynamic VLAN Tag %vlanTag% for VPP name %vppName% has invalid range.

Message Parameters

| Name | Type |
|---------|--------|
| vppName | String |
| vlanTag | uInt32 |

VMT.BndDynVLANTrace

Description

VMT.AssocVMDynVLAN

Description

The virtual machine has been dynamically associated with the VLAN and VR.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Virtual Machine with %mac% on port %slotPort% is dynamically associated to VLAN with tag %vlanTag% on VR %vrName% as %tagged%.

Message Parameters

| Name | Type |
|----------|----------|
| mac | MAC |
| slotPort | SlotPort |
| vlanTag | VLAN-tag |
| vrName | String |
| tagged | String |

VMT.DissocVMDynVLAN

Description

The virtual machine has been dissociated from the VLAN and VR.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

Virtual Machine with %mac% on port %slotPort% is now dissociated from VLAN with tag %vlanTag% on VR %vrName% as %tagged%.

Message Parameters

| Name | Type |
|----------|----------|
| mac | MAC |
| slotPort | SlotPort |
| vlanTag | VLAN-tag |
| vrName | String |
| tagged | String |

VMT.VMVLANTagMsmatch

Description

The VLAN tag of the traffic received from the VM does not match the dynamic VLAN tag configured for the VM. Hence the VM will not be dynamically associated to any VLAN.

Remedy

Misconfiguration needs to be corrected.

Severity

Error

Message Text

VLAN tag %vlanTagRx% of the traffic received from the Virtual Machine with mac %mac% does not match with dynamic VLAN tag %vlanTagCfg% configured for the VM.

Message Parameters

| Name | Type |
|------------|----------|
| mac | MAC |
| vlanTagRx | VLAN-tag |
| vlanTagCfg | VLAN-tag |

VMT.VMVRMsmatch

Description

If a VM has a VR onfigured for dynamic VLAN creation, the VR should be the same as the VR to which the port (on which the VM has been detected) belongs to. If the port does not belong to any VR and if VLAN with the dynamic VLAN tag configured for the VM already exists, the configured VR should match the VR to which the dynamic VLAN belongs to. Hence the VM will not be dynamically associated to any VLAN.

Remedy

Misconfiguration needs to be corrected.

Severity

Error

Message Text

VR %vrCfg% configured for dynamic VLAN for VM with mac %mac% is not same as VR %vrPortVLAN% of the VM's port or existing dynamic VLAN

Message Parameters

| Name | Type |
|------------|--------|
| mac | MAC |
| vrCfg | String |
| vrPortVLAN | String |

VMT.ChgVRAuthVMFail

Description

If a VM has a VR onfigured for dynamic VLAN creation and if the VM is currently authenticated, the VR alone cannot be changed. This is because the dynamic VLAN already created in, say, VR1 cannot be dynamically moved to, say, VR2. Hence the VR can be changed only along with a change in the VLAN tag configuration.

Remedy

Misconfiguration needs to be corrected. If you want the dynamic VLAN to move to another VR with the same VLAN tag, stop the traffic from the VM and clear the FDB entry (or wait till ageout) and when the VM is detected again, it will be placed in the VLAN the same VLAN tag in the changed VR, provided no other client is already configured for the same VLAN tag on a different VR. Another option is to change both the VLAN tag and the VR.

Severity

Error

Message Text

Changing the VR alone from \"%vrCfg%\" to \"%vrChg%\" for authenticated VM with MAC %mac% failed since there is no change in VLAN tag configuration.

Message Parameters

| Name | Type |
|-------|--------|
| mac | MAC |
| vrCfg | String |
| vrChg | String |

VMT.VSMTrace

Description

This message is used for debugging problems related to VM Tracking and Virtual Switch Manager interactions. This is normal and does not indicate a problem.

Remedy

No action required - Informational message only.

Severity

VPEX.AutoConfig.DebugSummary

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

No action required - Informational message only.

Severity

VPEX.AutoConfig.Enbl

Description

VPEX Auto-Configuration has been enabled by CLI command or other configuration agent.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show vpex ports," "show sharing," and "show slot."

Severity

Notice

Message Text

VPEX Auto-Configuration is Enabled by %account%

Message Parameters

| Name | Type |
|---------|-------------|
| account | AccountName |

VPEX.AutoConfig.Dsbl

Description

VPEX Auto-Configuration has been disabled by CLI command or other configuration agent.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show vpex ports," "show sharing," and "show slot."

Severity

Notice

Message Text

VPEX Auto-Configuration is Disabled by %account%

Message Parameters

| Name | Type |
|---------|-------------|
| account | AccountName |

VPEX.AutoConfig.BlkCfgCmd

Description

VPEX Auto-Configuration has blocked an attempt to configure VPEX cascade ports and extended slots via CLI command or other configuration agent.

Remedy

Before configuring VPEX ports and slots by CLI command or other configuration agent, disable VPEX Auto-Configuration using CLI command: "debug vpex disable auto-configuration"

Severity

Error

Message Text

Cannot configure VPEX ports and slots via CLI command or other configuration agent while VPEX Auto-Configuration is enabled.

VPEX.AutoConfig.AllocSlot

Description

Upon discovering a new BPE neighbor on a new port, VPEX Auto-Configuration has allocated an extended slot number and configured the port as the master port of a VPEX cascade port trunk.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show vpex ports," "show sharing," and "show slot."

Severity

Debug-Summary

Message Text

VPEX Auto-Configuration allocating extended slot number %extendedSlot% to cascade port trunk %cascadePort%.

Message Parameters

| Name | Type |
|--------------|----------|
| extendedSlot | Slot |
| cascadePort | SlotPort |

VPEX.AutoConfig.AddPort

Description

Upon discovering a known BPE on a new port, VPEX Auto-Configuration has added the new port to the existing VPEX cascade port trunk.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show vpex ports," "show sharing," and "show slot."

Severity

Notice

Message Text

Add port %newPort% to cascade port load sharing group %cascadePort%

Message Parameters

| Name | Type |
|-------------|----------|
| newPort | SlotPort |
| cascadePort | SlotPort |

VPEX.AutoConfig.DelPort

Description

Upon discovering a change of neighbor on a non-master port of a VPEX cascade port trunk, VPEX Auto-Configuration has deleted the port from the VPEX cascade port trunk.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show vpex ports," "show sharing," and "show slot."

Severity

Notice

Message Text

Delete port %oldPort% from cascade port load sharing group %cascadePort%

Message Parameters

| Name | Type |
|-------------|----------|
| oldPort | SlotPort |
| cascadePort | SlotPort |

VPEX.AutoConfig.FreeSlot

Description

Upon discovering a change of neighbor on a master port of a VPEX cascade port trunk, VPEX Auto-Configuration has unconfigured the VPEX cascade port trunk, and freed its extended slot number.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show vpex ports," "show sharing," and "show slot."

Severity

Notice

Message Text

VPEX Auto-Configuration freeing extended slot number %extendedSlot% and cascade port trunk %cascadePort%.

Message Parameters

| Name | Type |
|--------------|----------|
| extendedSlot | Slot |
| cascadePort | SlotPort |

VPEX.AutoConfig.TrunkCflct

Description

VPEX Auto-Configuration keeps a list of BPE's it has detected, and creates a Cascade Port Trunk upon initial discovery. On subsequent discovery of a known BPE, VPEX Auto-Configuration adds the new port to the Trunk, provided the new port is on the same slot and not already part of a Trunk.

Remedy

This event may occur after moving cables or using CLI commands to modify configuration while VPEX Auto-Configuration is running, or by cabling BPE's together in an unsupported pattern. Use "show log" to look for errors or warnings, and "show config vpex" to see configuration elements added by VPEX Auto-Configuration and other configuration agents.

Severity

Warning

Message Text

Port %port% is already part of a trunk and cannot be added to the cascade port trunk %cascadePort%.

Message Parameters

| Name | Type |
|-------------|----------|
| port | SlotPort |
| cascadePort | SlotPort |

VPEX.AutoConfig.SlotCflct

Description

VPEX Auto-Configuration keeps a list of BPE's it has detected, and creates a Cascade Port Trunk upon initial discovery. On subsequent discovery of a known BPE, VPEX Auto-Configuration adds the new port to the Trunk, provided the new port is on the same slot and not already part of a Trunk.

Remedy

This event may occur after moving cables or using CLI commands to modify configuration while VPEX Auto-Configuration is running, or by cabling BPE's together

in an unsupported pattern. Use "show log" to look for errors or warnings, and "show config vpex" to see configuration elements added by VPEX Auto-Configuration and other configuration agents.

Severity

Warning

Message Text

Port %port% is not on the same slot and cannot be added to the cascade port trunk %cascadePort%.

Message Parameters

| Name | Type |
|-------------|----------|
| port | SlotPort |
| cascadePort | SlotPort |

VPEX.AutoConfig.TermSelf

Description

VPEX Auto-Configuration has disabled itself after detecting conditions beyond its abilities to handle reliably.

Remedy

This event may occur after moving cables or using CLI commands to modify configuration while VPEX Auto-Configuration is running, or by cabling BPE's together in an unsupported pattern. To provide ideal conditions for VPEX Auto-Configuration, power down BPE's, unconfigure the Controlling Bridge and then power it down, check cabling matches a supported pattern, power up all BPE's, and then power-up the Controlling Bridge. Activate VPEX Auto-Configuration. Each tier of BPE's will take between 30 and 60 seconds to come up, and may require a few minutes extra per tier to upgrade firmware. Avoid moving cables or cycling power while the VPEX slots are coming up. Enable log target console via CLI, or invoke the equivalent on a management console to see events as they occur. This version of VPEX Auto-Configuration supports configuration of BPE's connected to both switches of an MLAG pair, but does not support multiple MLAG peers. Inter-system connections must be up for VPEX Auto-Configuration to coordinate configuration between the two MLAG peers to avoid additional delays and time-outs. This version supports only initial configuration, and does not support dynamic re-configuration.

Severity

Notice

Message Text

VPEX Auto-Configuration is terminating itself to avoid conflicts.

VPEX.AutoConfig.Strt

Description

VPEX Auto-Configuration has been initialized and is ready to detect MLAG configuration or to start configuration in non-MLAG mode.

Remedy

No action required - Informational message only. Further details may be seen via CLI commands: "show vpex," and "show vpex auto-configuration."

Severity

Info

Message Text

VPEX Auto-Configuration is ready to start.

VPEX.AutoConfig.ActvNoMLAG

Description

VPEX Auto-Configuration has detected no MLAG configuration and is actively detecting BPE's without waiting for or coordinating with an MLAG peer.

Remedy

No action required - Informational message only. Further details may be seen via CLI commands: "show vpex," "show mlag port," and "show vpex auto-configuration."

Severity

Info

Message Text

VPEX Auto-Configuration is active for non-MLAG configuration.

VPEX.AutoConfig.End

Description

VPEX Auto-Configuration without MLAG support has ended.

Remedy

Reasons for VPEX Auto-Configuration in non-MLAG mode being ended could be that CLI command 'disable vpex auto-configuration' was executed, or connection to MLAG peer was detected. VPEX Auto-Configuration can be re-enabled, but if it is enabled in MLAG mode, existing extended slot configuration will not be synced to the MLAG peer. User intervention might be needed. Further details may be seen via CLI socommands: "show vpex," "show mlag port," and "show vpex auto-configuration."

Severity

Notice

Message Text

VPEX Auto-Configuration in non-MLAG mode has ended.

VPEX.AutoConfig.WaitMLAG

Description

VPEX Auto-Configuration has detected an MLAG configuration and is waiting for connection to MLAG peer and/or CLI enable command.

Remedy

No action required - Informational message only. To begin automatic configuration in MLAG mode, the inter-system-connection port with index 1 must be up, and VPEX Auto-Configuration mode must be enabled by the command "enable vpex auto-configuration."

Severity

Info

Message Text

VPEX Auto-Configuration is waiting for connection to MLAG peer.

VPEX.AutoConfig.MLAGRdy

Description

VPEX Auto-Configuration has detected a connection to an MLAG peer and is waiting for an enable command.

Remedy

No action required - Informational message only. To begin automatic configuration in MLAG mode, the inter-system-connection port with index 1 must be up, and VPEX Auto-Configuration mode must be enabled by the command "enable vpex auto-configuration."

Severity

Info

Message Text

VPEX Auto-Configuration is ready to start configuration in MLAG mode.

VPEX.AutoConfig.ActvMLAGSlotReq

Description

VPEX Auto-Configuration is actively detecting BPE's and requesting slot numbers from an MLAG peer.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show mlag port," and "show vpex auto-configuration."

Severity

Notice

Message Text

VPEX Auto-Configuration is active as a requestor of slot number allocations for an MLAG pair.

VPEX.AutoConfig.ActvMLAGSlotMgr

Description

VPEX Auto-Configuration is actively detecting BPE's, allocating slot numbers, and coordinating with an MLAG peer.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show mlag port," and "show vpex auto-configuration."

Severity

Notice

Message Text

VPEX Auto-Configuration is active as the manager of slot number allocations for an MLAG pair.

VPEX.AutoConfig.MLAGEnd

Description

VPEX Auto-Configuration with MLAG support has ended.

Remedy

Reasons for VPEX Auto-Configuration in MLAG mode being ended could be that CLI command 'disable vpex auto-configuration' was executed on one of Controlling Bridges, connection to MLAG peer went down, or some conflict between MLAG peers was detected. After connection to MLAG peer comes up or conflicts have been manually solved, user could try to re-enable VPEX Auto-Configuration.

Severity

Notice

Message Text

VPEX Auto-Configuration in MLAG mode has ended.

VPEX.AutoConfig.InitTrunkCflct

Description

On initial discovery of a BPE on a port, VPEX Auto-Configuration uses the port to form a cascade port trunk, provided the new port is not already part of a Trunk.

Remedy

This event may occur after moving cables or using CLI commands to modify configuration while VPEX Auto-Configuration is running, or by cabling BPE's together in an unsupported pattern. Use "show log" to look for errors or warnings, and "show config vpx" to see configuration elements added by VPEX Auto-Configuration and other configuration agents.

Severity

Warning

Message Text

Port %port% is already part of a trunk and cannot be reconfigured as a new cascade port trunk.

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

VPEX.AutoConfig.DebugNotice

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

VPEX.AutoConfig.ExtSlotCflctDtect

Description

On discovery of a BPE previously in use as an extended slot, VPEX Auto-Configuration will ignore the BPE to avoid configuring a duplicate extended slot.

Remedy

This event may occur after moving cables or using CLI commands to modify configuration while VPEX Auto-Configuration is running, or by cabling BPE's together in an unsupported pattern. Use "show log" to look for errors or warnings, and "show config vpx" to see configuration elements added by VPEX Auto-Configuration and other configuration agents. After checking that the BPE's are cabled in a supported pattern, modify the configuration manually, or unconfigure the switch to allow VPEX Auto-Configuration to capture the new configuration without conflicts.

Severity

Warning

Message Text

BPE %peMACAddress% discovered on port %slotPort% was previously in use as extended slot %extSlotNum% and cannot be automatically configured with a new slot number.

Message Parameters

| Name | Type |
|--------------|----------|
| peMACAddress | MAC |
| slotPort | SlotPort |
| extSlotNum | Slot |

VPEX.AutoConfig.WaitCfgSlotDtect

Description

Until all configured extended slots have been discovered, VPEX Auto-Configuration cannot allocate new extended slot numbers.

Remedy

This condition may occur normally after a save and a reboot and will resolve itself after a few minutes, or it may occur and persist after moving cables or using CLI commands to modify configuration while VPEX Auto-Configuration is running, or by cabling BPE's together in an unsupported pattern. Use "show log" to look for errors or warnings, and "show config vpex" to see configuration elements added by VPEX Auto-Configuration and other configuration agents. After checking that the BPE's are cabled in a supported pattern, modify the configuration manually, or unconfigure the switch to allow VPEX Auto-Configuration to capture the new configuration without conflicts.

Severity

Warning

Message Text

VPEX Auto-Configuration is waiting for configured BPE's to be discovered.

VPEX.AutoConfig.DoneCfgSlotDtect

Description

All configured extended slots have been discovered, and VPEX Auto-Configuration can allocate new extended slot numbers.

Remedy

No action required - Notification message only. Further details may be seen via CLI commands: "show vpex," "show vpex ports," "show sharing," and "show slot."

Severity

Notice

Message Text

VPEX Auto-Configuration has finished waiting for configured BPE's to be discovered.

VPEX.AutoConfig.MLAGPeerUp

Description

Connection to a MLAG peer comes up.

Remedy

No action required - Notification message only. If VPEX auto-configuration is enabled in non-MLAG mode, this event would end the VPEX auto-configuration.

Severity

Notice

Message Text

Connection to a MLAG peer comes up.

VPEX.AutoConfig.MLAGPeerDown

Description

Connection to MLAG peer goes down.

Remedy

No action required - Notification message only. If VPEX Auto-Configuration is enabled in MLAG mode, this event would end VPEX Auto-Configuration.

Severity

Notice

Message Text

Connection to MLAG peer goes down.

VPEX.AutoConfig.MLAGNotRdyEnblFail

Description

MLAG ISC is down. VPEX Auto-Configuration cannot be enabled.

Remedy

MLAG ISC is configured but is down. To enable VPEX Auto-Configuration, either bring up MLAG ISC or remove configuration of MLAG ISC.

Severity

Notice

Message Text

MLAG ISC is down. VPEX Auto-Configuration cannot be enabled.

VPEX.AutoConfig.EnblTrunk

Description

Upon discovering a new BPE on a port, VPEX Auto-Configuration enables sharing on the port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Enable sharing on port %port%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

VPEX.AutoConfig.DsblTrunk

Description

When a cascade port needs to be unconfigured, VPEX Auto-Configuration disables sharing on the port if sharing was enabled on the port. Or if a new BPE is discovered on master port of an existing trunk port, VPEX Auto-Configuration disables sharing on the port before it tries to configure the port as a cascade port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Disable sharing on port %port%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

VPEX.AutoConfig.CfgCscdPort

Description

Upon discovering a new BPE on a port, VPEX Auto-Configuration assigns slot number for the BPE and configures the port as a cascade port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Configure VPEX cascade on port %port% with slot %slotNum%

Message Parameters

| Name | Type |
|---------|----------|
| port | SlotPort |
| slotNum | Slot |

VPEX.AutoConfig.UnCfgCscdPort

Description

When VPEX Auto-Configuration detects slot number associated with a cascade port needs to be freed, it unconfigures the cascade port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Unconfigure VPEX cascade port %port%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

VPEX.AutoConfig.EnbIMLAGPort

Description

In MLAG setup, VPEX Auto-Configuration configures MLAG port on the native cascade port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Enable MLAG on port %port% with peer %peerName% and MLAG port ID %portId%

Message Parameters

| Name | Type |
|----------|----------|
| port | SlotPort |
| peerName | String |
| portId | ulnt |

VPEX.AutoConfig.DsbIMLAGPort

Description

When a cascade port needs to be unconfigured, VPEX Auto-Configuration also disables MLAG port if MLAG port was enabled on the cascade port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Disable MLAG on port %port%

Message Parameters

| Name | Type |
|------|----------|
| port | SlotPort |

VPEX.AutoConfig.ClrRing

Description

VPEX Auto-Configuration clears the ring when it detects the ring need to be re-formed. It destroys the ring and makes the ring to converge into two independent configured cascades. All ring related data struct will be cleaned. It happens only when ring is Severed.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Clear the ring from ring node %slot% on port %port%

Message Parameters

| Name | Type |
|------|----------|
| slot | Slot |
| port | SlotPort |

VPEX.AutoConfig.CfgCscdMLAGId

Description

In one-armed MLAG setup, VPEX Auto-Configuration creates virtual MLAG port and configures the virtual MLAG port as a cascade port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Configure VPEX cascade on MLAG port %portId% with slot %slotNum%

Message Parameters

| Name | Type |
|---------|------|
| portId | uint |
| slotNum | Slot |

VPEX.AutoConfig.UnCfgCscdMLAGId

Description

When VPEX Auto-Configuration detects slot number associated with a cascade port needs to be freed, it unconfigures cascade port.

Remedy

No action required - Notification message only.

Severity

Notice

Message Text

Unconfigure VPEX cascade port associated with MLAG port ID %portId%

Message Parameters

| Name | Type |
|--------|------|
| portId | ulnt |

VPEX.AutoConfig.CscdUnsuprtSlot

Description

VPEX auto-config detected a cascaded BPE on a BPE slot that does not support cascading. The BPE detection will be ignored and no associated VPEX configuration will be added.

Remedy

Reconnect the subtended BPE to the controlling bridge directly or to another BPE which supports cascading.

Severity

Warning

Message Text

BPE slot %slotNo% does not support cascading

Message Parameters

| Name | Type |
|--------|------|
| slotNo | ulnt |

VPEX.Ring.NodeCfgRdy

Description

Ring Node configuration is ready.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

RingNode slot %slot% configuration ready on ring with native port %nslot%:%nport%

Message Parameters

| Name | Type |
|-------|--------|
| slot | sInt32 |
| nslot | sInt32 |
| nport | sInt32 |

VPEX.Ring.LinkFail

Description

A Ring Link Failure Notification (RLFN) message was received. This message emanates from a cascade port on a BPE whose upstream port has lost its connection to the controlling bridge. The ring is severed, and the BPEs that remain are forming cascades to the controlling bridge. That cascade port becomes upstream for that BPE. BPE that are upstream from the BPE that detected the failure have received and are reacting to the RLFN message, reorienting the data flow direction where required. Use "show vpx topology {detail}" for more information.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Ring Link Failure Notification for BPE upstream port %slot%:%port% with PE CSP address %mac%

Message Parameters

| Name | Type |
|------|--------|
| slot | sInt32 |
| port | sInt32 |
| mac | String |

VPEX.Ring.RebInce

Description

A Ring Link Failure Notification (RLFN) message was received. This message was sent by the controlling bridge to initiate ring rebalancing. The indicated port is one of the ports on the link that will now separate the data plane cascades. The BPEs have been reoriented and the CB will now complete the process.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Ring rebalancing in progress at port %slot%:%port%

Message Parameters

| Name | Type |
|------|--------|
| slot | sInt32 |
| port | sInt32 |

VPEX.Ring.ReblnceFail

Description

A Ring rebalancing attempt was started and failed to complete successfully. A message was sent to a BPE to begin rebalancing and that message was not returned as expected after multiple retries. It is possible that the ring is not functional.

Remedy

If the user notices that traffic flow is impaired, the ring may have to be restarted. In that case, the user should disable both native ports connected to the ring and then re-enable them.

Severity

Warning

Message Text

Ring rebalancing failed on ring at native port %slot%:%port%.

Message Parameters

| Name | Type |
|------|--------|
| slot | sInt32 |
| port | sInt32 |

VPEX.Ring.Notice

Description

A condition has been detected that may interest a developer determining the reason underlying some system behavior. The circumstances may be either very common or completely unexpected, but the information provided in the associated message is such that the internal workings of the system are exposed.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

VPEX.Ring.InvLink

Description

A new ring cannot be formed with this Ring Common Link. The resulting ring could contain a BPE that is already in another ring. This may have been caused by multiple links each connecting different BPEs that are present in the same two cascades. Overlapping rings are not supported. The user should only form rings by connecting the ends of two cascades, or the end of one cascade to a controlling bridge. It is also possible (but unlikely) that this message is due to an attempt to allocate ring data structures when system memory is exhausted.

Remedy

Correct the likely connection problem. If no connection problem exists, use the show memory command

Severity

Notice

Message Text

The link with ports %slot1%:%port1% and %slotr%:%portr% cannot be used as a Ring Common Link, ring creation failed.

Message Parameters

| Name | Type |
|-------|--------|
| slotl | sInt32 |
| portl | sInt32 |
| slotr | sInt32 |
| portr | sInt32 |

VPEX.Ring.Unsuprt

Description

A connection has been discovered between 2 VPEX cascaded daisy chains. However, the specified slot does not support ring topology operation in this version of EXOS.

Remedy

Check whether ring topology is supported on this slot type in a subsequent version of EXOS and consider upgrading if so.

Severity

Warning

Message Text

Slot %slot% does not support ring topology in this version of EXOS which is preventing ring detection between ports %port1% and %port2%

Message Parameters

| Name | Type |
|-------|----------|
| slot | Slot |
| port1 | SlotPort |
| port2 | SlotPort |

VPEX.Ring.SlotCfgTmout

Description

A ring configuration timeout has occurred because a BPE has been unresponsive for a sufficiently long time. The cause may or may not be harmful to the active data path. Depending on the situation, recovery may be possible. Since each situation must be evaluated by the user, rather than attempting to recover the ring, EXOS places the ring into Severed state. The severance occurs at the Ring Common Link so that the data plane will not be (further) disrupted. The ring is then prevented from processing Ring Detect events. In order for future Ring Detect events to cause ring formation, the user must disable or enable any port that is part of the ring connection and is not an active Upstream port. It is recommended that the user disable or enable a port whose link is in Severed state. The user can determine such a port by using the "show vpex topology detail" command and choosing the port designated as a Cascade port on a slot which is marked with the "S" flag. This recommended choice of port should not cause traffic disruption.

Remedy

Inform the administrator and enable ring discovery by disabling or enabling a ring port as described above.

Severity

Error

Message Text

The ring on native port %nport% had a configuration time-out for slot %rslot%. Ring formation is disabled. Disable or enable a Severed port on this ring to allow ring formation.

Message Parameters

| Name | Type |
|-------|----------|
| nport | SlotPort |
| rslot | Slot |

VPEX.Ring.SlotCfgTmoutClr

Description

Ring formation was disallowed due to a configuration timeout. The user allowed ring formation by disabling or enabling a port that is part of the ring formation.

Remedy

No remedy needed.

Severity

Notice

Message Text

Ring formation is now allowed on the ring with native port %nport%.

Message Parameters

| Name | Type |
|-------|----------|
| nport | SlotPort |

VPEX.Ring.RegNodeClbkFail

Description

When the ring is formed and a ring node is programmed, all BPEs on the backup path must be programmed with the reachability information for the ring node. Programming completion is ensured by monitoring the local request queues on the cascade ports for each BPE in the path. When all related requests in each queue have been processed, a marker placed in each queue is encountered. Once all markers for the BPE that occupies the specified slot are encountered, a ring logic callback function is informed. This message means that a failure was encountered when trying to set up for the callback. The failure could be due to memory exhaustion or the lack of presence of a BPE in the path, or some other error. The failure is mitigated by allowing the ring node to immediately become Ready for use since it is not possible to ensure the integrity of the path to the ring node without the callback mechanism described above.

Remedy

No remedy is available. If automatic ring rebalancing mode is enabled, there may also be a failure to subsequently rebalance, which could leave the ring in a state where its re-establishment cannot be successfully completed. If automatic ring rebalancing is not enabled and the ring becomes disrupted before the path to the BPE slot is completely programmed, the same situation could occur. In such cases the user may eventually see a CfgSlotTmout log message.

Severity

Warning

Message Text

Failed to register ring node path programming complete callback for slot %slot%

Message Parameters

| Name | Type |
|------|--------|
| slot | sInt32 |

VPEX.Ring.StrtFailOverProc

Description

A ring failure has been detected and we have begun the process of failing over nodes.

Remedy

No action required - Informational message only.

|-----------|--------|
| timerType | String |
| vlanName | String |
| vrid | uInt16 |
| grpName | String |
| primState | String |

VRRP.Group.BatchMsg

Description

This event indicates that batched messages are sent to other modules. The data presented here will include first VRRP VR's identifiers in the message, batched object type like MAC/IP, first MAC/IP in message, last VRRP VR's identifiers, last MAC/IP in message.

Remedy

No action required - Informational message only.

Severity

Debug-Verbose

Message Text

%format%

Message Parameters

| Name | Type |
|--------|--------|
| format | Printf |

VRRP.System.AllocMemFail

Description

An attempt to allocate the specified amount of memory has failed.

Remedy

Optional remedy here.

Severity

Error

Message Text

Memory allocation of %size% bytes failed.

Message Parameters

| Name | Type |
|------|--------|
| size | ulnt32 |

VRRP.System.VlanNameNotFound

Description

Given the VLAN name, a matching internal data structure was not found.

Remedy

No remedy is available.

Severity

Error

Message Text

Could not find VLAN named %vlanName%

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | String |

VRRP.System.VlanInstNotFound

Description

VLAN lookup failed with the given instance.

Remedy

No remedy is available.

Severity

Error

Message Text

Could not find VLAN with instance %vlanInstance%

Message Parameters

| Name | Type |
|--------------|--------|
| vlanInstance | uInt32 |

VRRP.System.SubSysInitFail

Description

A component upon which VRRP depends did not initialize properly.

Remedy

Check if CLI, CM backend, or VLAN is working properly. If it is, restart the VRRP process or reboot the switch.

Severity

Critical

Message Text

%subsystemName% subsystem failed to initialize

Message Parameters

| Name | Type |
|---------------|--------|
| subsystemName | String |

VRRP.System.NoIPAddr

Description

When looking for an IP address on the named VLAN, none could be found.

Remedy

No remedy is available.

Severity

Warning

Message Text

Found no IP addresses on VLAN %vlanName% %message%

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | String |
| message | Printf |

VRRP.System.VLANDBInv

Description

This indicates inconsistent state in the local VLAN database.

Remedy

No remedy is available.

Severity

Error

Message Text

Local copy of VLAN %vlanName% is missing data!

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | String |

VRRP.System.VLANRegFail

Description

VLAN manager client API failed.

Remedy

No remedy is available.

Severity

Warning

Message Text

Failed to register VRRP on VLAN %vlanName%

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | String |

VRRP.System.VLANUnregFail

Description

VLAN manager client API failed.

Remedy

No remedy is available.

Severity

Warning

Message Text

Failed to deregister VRRP on VLAN %vlanName%

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | String |

VRRP.System.ESRPConflict

Description

VRRP and ESRP are mutually exclusive on a VLAN

Remedy

No remedy is available.

Severity

Warning

Message Text

Cannot enable VRRP on VLAN %vlanName% because ESRP is enabled on that VLAN.

Message Parameters

| Name | Type |
|----------|--------|
| vlanName | String |

VRRP.System.SyscallFail

Description

desc is a brief description of what was being attempted or the result of the failure on VRRP.

Remedy

Check the errno to determine the specific causes.

Severity

Critical

Message Text

System call %syscall%() failed: %errnoMsg%. %desc%

Message Parameters

| Name | Type |
|----------|--------|
| syscall | String |
| errnoMsg | String |
| desc | String |

VRRP.System.CallbackFail

Description

Used when a callback either fails or is made with incorrect data.

Remedy

No remedy is available.

Severity

Error

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

VRRP.System.LibCallFail

Description

A call to an EXOS library or client has failed.

Remedy

Disable and reconfigure the VRRP instance or tracking configuration.

Severity

Warning

Message Text

%message%

Message Parameters

| Name | Type |
|---------|--------|
| message | Printf |

VSM.ParmNull

Description

An internal function was called with a NULL pointer. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on MLAG peer and group configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% is NULL

Message Parameters

| Name | Type |
|------|--------|
| arg | String |

VSM.ParmInv

Description

An internal function was called with an invalid value. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on MLAG peer and group configuration. Also, check the scalability limit and compare this with the current configuration.

Severity

Critical

Message Text

Argument %arg% has an invalid value %val%

Message Parameters

| Name | Type |
|------|---------|
| arg | String |
| val | ulInt32 |

VSM.AllocMemFail

Description

Memory for the displayed object could not be allocated which may be due to the system running low on memory. This will result in incorrect operation of the MLAG feature.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory.

Severity

Error

Message Text

Memory allocation failed when trying to allocate a %obj% structure of size %size%.

Message Parameters

| Name | Type |
|------|--------|
| obj | String |
| size | uInt32 |

VSM.AllocHCMsgFail

Description

Memory for an ISC peer health check message could not be allocated because the system is low on memory. This will result in the MLAG peer node incorrectly declaring this node as down and block traffic on the ISC intended to MLAG ports.

Remedy

Reducing the system configuration may help reclaim memory.

Severity

Error

Message Text

Failed to allocate health check message buffer of %size% bytes

Message Parameters

| Name | Type |
|------|--------|
| size | uInt32 |

VSM.AllocCkptMsgFail

Description

Memory for an ISC peer checkpointing message could not be allocated because the system is low on memory. This will result in MLAG related databases being out-of-sync with those on the MLAG peer. This will result in incorrect operation of the MLAG feature.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory. In addition it is recommended that one of the peer MLAG group ports be disabled so that the remote end of the MLAG group does not receive duplicate traffic.

Severity

Error

Message Text

Failed to allocate checkpoint message of %size% bytes for %type%

Message Parameters

| Name | Type |
|------|--------|
| size | uint32 |
| type | String |

VSM.AllocMSMckptMsgFail

Description

Memory for a MSM checkpointing message could not be allocated because the system is low on memory. This will result in MLAG related databases being out-of-sync with those on the standby MSM. This will result in incorrect operation of the MLAG feature after an MSM failover.

Remedy

Check the scalability limit and compare this with the current configurations. Reducing the system configuration may help reclaim memory. Once sufficient system memory is reclaimed, it is recommended that all MLAG configuration be removed and reconfigured in order for MSMs to be fully in sync.

Severity

Error

Message Text

Failed to allocate checkpoint message of %size% bytes for %action%

Message Parameters

| Name | Type |
|--------|--------|
| size | ulnt32 |
| action | String |

VSM.AllocSockFail

Description

VSM failed to open a socket to talk to peer switches. Socket allocation failures imply no or partial control information exchange between MLAG peers which results in incorrect operation of the MLAG feature. Users may see either duplication or loss of traffic to the remote end of MLAG links

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Failed to create socket error: %errormsg% (%err%)

Message Parameters

| Name | Type |
|----------|--------|
| errormsg | String |
| err | sInt32 |

VSM.SetSockFail

Description

VSM failed to set an option on the socket used to communicate to a MLAG peer. Failure to set correct socket options will result in no or incorrect packets sent to the peer MLAG switch and will result in incorrect working of the MLAG feature

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Failed to set socket %option% error: %errormsg%(%err%)

Message Parameters

| Name | Type |
|----------|--------|
| option | String |
| errormsg | String |
| err | sInt32 |

VSM.BndSockFail

Description

VSM failed to bind a socket to a well-known port. When a socket bind fails, VSM will not be able to receive health-check and checkpointing messages from the peer and will result in incorrect operation of the MLAG feature.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

Failed to bind socket error: %errormsg%(%err%)

Message Parameters

| Name | Type |
|----------|--------|
| errormsg | String |
| err | sInt32 |

VSM.RxCkptPktVerInv

Description

A checkpointing message whose type is displayed was received from an MLAG peer with an unsupported version number. This may be a symptom of EXOS version incompatibility between the MLAG peer switches.

Remedy

Ensure the EXOS versions on the MLAG peers are compatible. One of the MLAG may require an upgrade to a more recent version of EXOS.

Severity

Error

Message Text

Peer %vrid%:%peer%:: Invalid version %ver% in Rx checkpoint message of Type %type%

Message Parameters

| Name | Type |
|------|--------|
| ver | uInt16 |
| type | uInt16 |
| vrid | VRID |
| peer | String |

VSM.RxHCPktVerInv

Description

A ISC Health-check packet was received from an MLAG peer switch with an unsupported version number. This may be a symptom of EXOS version incompatibility between the MLAG peer switches.

Remedy

Ensure the EXOS versions on the MLAG peers are compatible. One of the MLAG may require an upgrade to a more recent version of EXOS.

Severity

Error

Message Text

Peer %vrid%:%peer%: Invalid version %ver% in Health-Check message

Message Parameters

| Name | Type |
|------|--------|
| ver | uint16 |
| vrid | VRID |
| peer | String |

VSM.RxCkptPktInv

Description

This event gets logged when an invalid checkpoint packet is received from a MLAG peer. This could be a symptom of a non-Extreme device trying to spoof a checkpointing message or a software bug.

Remedy

Ensure that no other devices other than Extreme switches are connected to the ISC VLAN. If the issue persists escalate to engineering

Severity

Error

Message Text

Peer %vrid%:%peer%: Checkpointing message field %field% has invalid value %val%

Message Parameters

| Name | Type |
|-------|--------|
| vrid | VRID |
| peer | String |
| field | String |
| val | ulnt32 |

VSM.RxHCPktInv

Description

This event gets logged when an invalid health-check packet is received from a MLAG peer. This could be a symptom of a non-Extreme device trying to spoof a health-check message or a software timing bug.

Remedy

Ensure that no other devices other than Extreme switches are connected to the ISC VLAN. If the issue persists escalate to engineering.

Severity

Error

Message Text

Peer %vrid%:%peer%: Health-check message field %field% has invalid value %val%

Message Parameters

| Name | Type |
|-------|--------|
| vrid | VRID |
| peer | String |
| field | String |
| val | ulnt32 |

VSM.InitSrvrFail

Description

Failed to start the VSM server. This is not expected and is indicative of a serious problem.

Remedy

On dual-MSM systems try failing over to the backup MSM. Stackables or single MSM systems may require a reboot to correct the problem. If the issue persists, please escalate to engineering.

Severity

Error

Message Text

VSM Server failed to start

VSM.TxCkptSockFail

Description

Transmit of a checkpoint message to the displayed peer has failed. Partial checkpoint information exchange between MLAG peers results in incorrect operation of the MLAG feature. Users may see either duplication or loss of traffic to the remote end of MLAG links.

Remedy

This situation will usually correct itself as the checkpointing channel to the peer will be closed and re-opened at both ends. However, if the issue persists, please check if the ISC link is flapping. Else escalate to engineering.

Severity

Warning

Message Text

Peer %vrid%:%peer%: Checkpoint send failed with: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| vrid | VRID |
| peer | String |
| errmsg | String |

VSM.RxCkptSockFail

Description

Receive of a checkpoint message to the displayed peer has failed. Partial checkpoint information exchange between MLAG peers results in incorrect operation of the MLAG feature. Users may see either duplication or loss of traffic to the remote end of MLAG links.

Remedy

This situation will usually correct itself as the checkpointing channel to the peer will be closed and re-opened at both ends. However, if the issue persists, please check if the ISC link is flapping. Else escalate to engineering.

Severity

Warning

Message Text

Peer %vrid%:%peer%: Checkpoint receive failed with: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| vrid | VRID |
| peer | String |
| errmsg | String |

VSM.TxHCSockFail

Description

Transmit of a health-check message to the displayed peer has failed. Failing to send multiple health-check messages results in the MLAG peer switch falsely declaring this node to be down causing it to block traffic from the ISC port to the MLAG ports. This leads to loss of traffic to the remote end of MLAG links when the local MLAG port on this switch fails.

Remedy

If this condition is transient, this situation will usually correct itself once MLAG health check packets are successfully sent out. However, if the issue persists, please check if the ISC link is flapping. Else escalate to engineering.

Severity

Warning

Message Text

Peer %vrid%:%peer%: Health-check send failed with: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| vrid | VRID |
| peer | String |
| errmsg | String |

VSM.RxHCSockFail

Description

Receive of a health-check message has failed. Failing to receive multiple health-check messages results in this node falsely declaring MLAG peers to be down causing it to block traffic from the ISC port to the MLAG ports. This leads to loss of traffic to the remote end of MLAG links when the remote MLAG port on peer switch fails.

Remedy

If this condition is transient, this situation will usually correct itself once MLAG health check packets are successfully received. However, if the issue persists, please check if the ISC link is flapping. Else escalate to engineering.

Severity

Warning

Message Text

Health-check receive failed with: %errmsg%

Message Parameters

| Name | Type |
|--------|--------|
| errmsg | String |

VSM.FndISClfFail

Description

VSM is not able to find the interface associated with the ISC VLAN. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on MLAG peer and VLAN configuration.

Severity

Warning

Message Text

Failed to find interface for instance %inst%

Message Parameters

| Name | Type |
|------|--------|
| inst | uInt32 |

VSM.FndMLAGPortFail

Description

VSM is not able to find the interface associated with the MLAG port. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

Provide technical support information on MLAG peer and group configuration.

Severity

Warning

Message Text

Failed to find the interface associated with the instance %inst%

Message Parameters

| Name | Type |
|------|--------|
| inst | uint32 |

VSM.RmtMLAGPeerDown

Description

VSM has declared the MLAG peer to be down due to non-reception of multiple health-check messages. This condition can happen if the peer MLAG switch is rebooted or the ISC link goes down.

Remedy

Please check the state of the MLAG peer and/or the ISC link connectivity using a diagnostic tool like ping.

Severity

Notice

Message Text

Peer %vrid%:%peer%: Peer is down

Message Parameters

| Name | Type |
|------|--------|
| peer | String |
| vrid | VRID |

VSM.RmtMLAGPortDown

Description

The displayed MLAG peer has indicated that its local MLAG port for the displayed MLAG identifier is down.

Remedy

Please check the state of the local port MLAG on the MLAG peer.

Severity

Info

Message Text

Peer %vrid%:%peer%:: Remote port of MLAG identifier %id% is down

Message Parameters

| Name | Type |
|------|--------|
| vrid | VRID |
| peer | String |
| id | uInt32 |

VSM.LocMLAGPortDown

Description

The local MLAG port for the displayed MLAG identifier is down.

Remedy

Please check the state of the local port MLAG.

Severity

Info

Message Text

Local port %slot%:%port% of MLAG identifier %id% is down

Message Parameters

| Name | Type |
|------|-------------|
| slot | ingressSlot |
| port | ingressPort |
| id | uInt32 |

VSM.RmtMLAGPeerUp

Description

VSM has declared the MLAG peer to be up due to reception of health-check messages.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Peer %vrid%:%peer%: Peer is active

Message Parameters

| Name | Type |
|------|--------|
| peer | String |
| vrid | VRID |

VSM.RmtMLAGPortUp

VSM.InitSrvrDone

Description

This message is used for debugging problems related to VSM Server.

Remedy

No action required - Informational message only.

Severity

Info

Message Text

VSM server initialized successfully

VSM.MSMCkptTrace

Description

This message is for debugging problems related to active-standby MSM checkpointing for the VSM module. This does not indicate a problem.

Remedy

No action required - Informational message intended to help debug problems that may involve active-standby MSM checkpointing

Severity

Debug-Verbose

| format | Printf |

VSM.FastCnvrngCtrlMLAGFail

Description

Switching traffic from an MLAG port to the ISC in fast convergence-control mode has failed. This condition can happen when access-lists are not available for redirecting traffic to the ISC. Due to this failure, the MLAG has been dynamically changed to conserve-access-lists convergence-control mode to properly handle traffic failover. Conserve-access-lists convergence-control mode may result in slower traffic convergence in failure scenarios. Fast convergence-control remains configured and will be used for the next failure.

Remedy

Reducing the number of configured access-lists will allow the system to use fast convergence-control mode the next time an MLAG port fails. When fast convergence-control is configured users should ensure that there are at least as many free access-lists as the number of MLAG ports that can simultaneously fail.

Severity

Warning

Message Text

Fast convergence-control for MLAG id %id% has failed

Message Parameters

| Name | Type |
|------|--------|
| id | uInt16 |

VSM.RmtMLAGAltPathDown

Description

This can happen when either alternate path or remote peer is down or the ISC link has come up.

Remedy

Please check the state of the MLAG peer and/or the ISC link connectivity using a diagnostic tool like ping.

Severity

Notice

Message Text

Peer %vrid%:%peer%: Path is down

Message Parameters

| Name | Type |
|------|--------|
| peer | String |
| vrid | VRID |

VSM.RmtMLAGAltPathUp

Description

VSM has declared the alternate path to the MLAG peer to be up since the ISC link has gone down.

Remedy

No action required - Informational message only.

Severity

Notice

Message Text

Peer %vrid%:%peer%: Path is up

Message Parameters

| Name | Type |
|------|--------|
| peer | String |
| vrid | VRID |

VSM.FndMLAGPortFmVLANFail

Description

VSM is unable to find the MLAG port associated with the ISC VLAN. This condition is not expected and is indicative of a possible memory corruption due to a software bug that needs engineering attention.

Remedy

This is a rare internal condition needing technical assistance. Contact technical support with the following information: "show vlan detail", "show mlag peer", "show mlag ports", "debug show mlag peer" and "debug show mlag ports".

Severity

Error

Message Text

Failed to find the MLAG port associated with the ISC VLAN %vlan%

Message Parameters

| Name | Type |
|------|------|
| vlan | VLAN |

VSM.RxOOBHCPktDump

Description

When this event is enabled, the entire content of every VSM Health check packet received out of band from every MLAG peer gets dumped. Caution: Enabling this causes severe degradation in performance.

Remedy

No action required - Informational message only.

Severity

Debug-Data

Message Text

Peer %vrid%:%peer%: Received an out of band health check packet. Buffer: %pktBuf%
buffer length: %bufLen%.

Message Parameters

| Name | Type |
|--------|---------|
| vrid | VRID |
| peer | String |
| pktBuf | Buf-ptr |
| bufLen | Buf-len |
