

# Important Notice for the DES-40 WAN Encryption Option CD

This CD contains the DES-40 WAN Encryption Option software images that correspond to the Nortel Networks™ BayRS™ and Site Manager versions listed on the CD. You must be running one of these versions before installing this version of software encryption.

If you need to install or upgrade your router software, refer to one of the following manuals:

- *Quick-Starting Routers* -- to install Site Manager from CD
- *Upgrading Routers* -- to upgrade router software from CD
- *Configuring and Managing Routers with Site Manager* -- to use the Image Builder or the Router Files Manager, and to boot routers

To install the DES-40 WAN Encryption Option software:

1. **Start the Image Builder.**
2. **Open the image in your directory for the appropriate hardware platform.**
3. **Click on Details below the Current Components box.**
4. **Select the *wep.exe* file under Baseline Router Software and click on Remove.**

This *wep.exe* file is a placeholder with no functionality. Note that the Component Information box shows its compressed size as less than 1 KB.

5. **Select File > Save to save the modified image.**
6. **Exit Image Builder.**
7. **Insert this encryption software CD into the CD-ROM drive.**
8. **Open the Image Builder directory:**
  - On a PC, the default directory is `wf\builder.dir\rel<release_number>`

For example, `wf\builder.dir\rel1400`

- On a UNIX platform, the default directory is:  
`~/builder/rel<release_number>/<router_platform>`

For example, `~/builder/rel1400/asn`

**Note:** This version of encryption software is compatible ONLY with the BayRS versions listed on this CD. If you choose not to use the default directory, include the number of the BayRS version in the name of the directory in which you place the encryption image.

9. **Open the directory for your router platform; for example, *BN*.**

10. Copy the file `<release_number>/<router_platform>/wep.exe` from the CD-ROM to this directory.

**Note:** When you copy the `wep.exe` file to an HP platform, it is automatically renamed `WEP.EXE;1`. You must rename the file back to `wep.exe`. You can do this by issuing the following command:

```
mv "WEP.EXE;1"wep.exe
```

Note that you must use quotation marks before and after `WEP.EXE;1`.

11. Start the Image Builder again and open the image from which you removed `wep.exe`.
12. Click on Details in the Available Components box, select `wep.exe`, and click on Add.
13. Check the size of the `wep.exe` file.

If it is less than 1 KB, you have *not* loaded encryption software. Repeat this procedure, or call the Nortel Networks Technical Solutions Center for assistance.

14. Save the modified image that includes encryption to a new directory and exit the Image Builder.
15. Use the Router Files Manager to transfer the new image to the router.
16. Perform a named boot with the new image, following the directions in *Configuring and Managing Routers with Site Manager*.

You can now use software encryption on the router.

**Note:** There is a file on the CD called `.WEP_XEO_CD`. Ignore this file.

These commodities, technology, or software were exported from the United States in accordance with the Export Administration Regulations. Diversion contrary to U.S. law prohibited.
