Problems Resolved in This Release

After a few "show running-config" CLI commands, the telnet access to the switch was blocked (**Q01379024-02**).
Telnet session running over a slower link (e.g. dialup) would freeze when "show running-config" was used (**Q01242659**).
Telnet session would hang after executing "show running-config" multiple times (**Q01278933**)
Each time the command "show SNMP-server host" was executed from the CLI, a few hundred bytes of memory were not released causing insatbilty (**Q01427779-04**).
STP enabled ports on standalone unit would not move back to forward state without physical link up once loop was removed. (**Q01300176**)
