Syntax Description

`stpd_name`	Specifies an *STPD* name on the switch.
`on`	Does not propagate received TCN BPDUs and topology changes to other ports.
`off`	Allows the propagation of received TCN BPDUs and topology changes to other ports.
`port_list`	Specifies one or more ports or slots and ports.

Default

The default value is **off**.

Usage Guidelines

Set **restricted-tcn** to **on** to prevent unnecessary address flushing caused by persistent TCNs. Restricting TCNs is a useful when it is not possible to remove the source of the TCNs.

Example

The following example disables the propagation of TCNs in port 1:10 for *STP* domain r1:

```
configure stpd r1 ports restricted-tcn on 1:10
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd priority

```
configure stpd stpd_name priority priority
```

Description

Specifies the bridge priority of the *STPD*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
priority	Specifies the bridge priority of the STPD. The range is 0 through 61,440. • If the bridge priority mode is configured as dot1d and the protocol mode is configured as dot1w, then value can be configured in increments of 1. • If the bridge priority mode is configured as dot1t and the protocol mode is configured as dot1w, then priority value can be configured in increments of 4,096.

Default

The default priority is 32,768.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword **stpd** is optional.

You should not configure any *STP* parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The range for the priority parameter is 0 through 61,440. If the bridge priority mode is configured as dot1d and the protocol mode is configured as dot1w, then value can be configured in increments of 1. If the bridge priority mode is configured as dot1t and the protocol mode is configured as dot1w, then priority value can be configured in increments of 4,096. A setting of 0 indicates the highest priority.

If you have an ExtremeXOS 11.5 or earlier configuration that contains an STP or RSTP bridge priority that is not a multiple of 4,096, the switch rejects the entry and the bridge priority returns to the default value. The *MSTP* implementation already uses multiples of 4,096 to determine the bridge priority.

For example, to lower the numerical value of the priority (which gives the priority a higher precedence), you subtract 4,096 from the default priority: 32,768 - 4,096 = 28,672. If you modify the priority by a value other than 4,096, the switch rejects the entry.

ExtremeXOS 11.5 and Earlier

If you have switches running ExtremeXOS 11.5 and earlier, the priority range is different than switches running ExtremeXOS 11.6 and later.

The range for the priority parameter is 0 through 65,535. A setting of 0 indicates the highest priority.

Example

The following command sets the bridge priority of STPD1 to 16,384:

```
configure stpd stpd1 priority 16384
```

History

This command was first available in ExtremeXOS 10.1.

The priority range and behavior was updated based on support for the 802.1D-2004 standard in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd priority-mode

configure **stpd** *stpd_name* **priority-mode** [**dot1d** | **dot1t**]

Description

Sets *STP* bridge priority values.

Syntax Description

stpd	STP domain/STP global configuration.
stpd_name	STP domain name on the switch.
priority-mode	Control allowable bridge priority values.
dot1d	Allow any bridge priority value. Valid values are 0–65,535 (in increments of 1), with 0 indicating high priority and 65,535 low priority.
dot1t	Allow bridge priority in steps of 4,096. This option is the default bridge priority mode. Valid values are 0–61,440 (in increments of 4,096), with 0 indicating high priority and 61,440 low priority. Values are automatically rounded up or down depending on the dot1t value to which the entered value is closest.

Default

dot1t option is configured by default for operation mode dot1w and *MSTP*.

Example

The following example configures the priority-mode as dot1d:

```
configure stpd s1 priority-mode dot1d
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd tag

`configure stpd` *stpd_name* **tag** *stpd_tag*

Description

Assigns an StpdID to an *STPD*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
stpd_tag	Specifies the *VLAN* ID of the carrier VLAN that is owned by the STPD.

Default

N/A.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any *STP* parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

An STPD ID is used to identify each STP domain. You assign the StpdID when configuring the domain. An STPD ID must be identical to the VLAN ID of the carrier VLAN in that STP domain, and that VLAN cannot belong to another STPD. Unless all ports are running in 802.1D mode, an STPD with ports running in either EMISTP mode or PVST+ mode must be configured with an STPD ID.

You must create and configure the VLAN, along with the tag, before you can configure the STPD tag. To create a VLAN, use the `create vlan` command. To configure the VLAN, use the configure vlan commands.

MSTP Only

MSTP uses two different methods to identify the STPDs that are part of the MSTP network. An instance ID of 0 identifies the CIST. The switch assigns this ID automatically when you configure the CIST STPD. To configure the CIST STPD, use the `configure stpd stpd_name mode [dot1d | dot1w | mstp [cist | mstiinstance]]` command.

An *MSTI* identifier (MSTI ID) identifies each STP domain that is part of an MSTP region. You assign the MSTI ID when configuring the STPD that participates in the MSTP region. Each STPD that participates in a particular MSTP region must have the same MSTI ID. To configure the MSTI ID, use the `configure stpd stpd_name mode [dot1d | dot1w | mstp [cist | mstiinstance]]` command.

Example

The following example assigns an StpdID to the purple_st STPD:

```
configure stpd purple_st tag 200
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd trap new-root

```
configure stpd stpd_name trap new-root [on | off]
```

Description

Enables and disables the new-root trap.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
on	Enables the new-root trap.
off	Disables the new-root trap.

Default

By default, the trap is enabled (**on**).

Usage Guidelines

The new-root trap is sent when the new root bridge is elected.

Example

The following example disables the new-root trap for the *STP* domain r1.

```
configure stpd r1 trap new-root off
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd trap topology-change

```
configure stpd stpd_name trap topology-change {edge-ports}[on | off]
```

Description

Enables and disables the topology change trap for all ports or edge ports only.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
edge-ports	Specifies that topology change traps will be sent only for edge ports.
on	Enables the topology change trap.
off	Disables the topology change trap.

Default

By default, the topology change trap is disabled (**off**) for all ports.

Usage Guidelines

You cannot enable the topology change trap for edge ports if you have disabled the topology change trap for all ports.

Example

The following example disables the topology change trap for edge ports only in the *STP* domain r1.

```
configure stpd r1 trap topology-change edge-ports off
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd tx-hold-count

configure stpd *stpd_name* **tx-hold-count** *tx_hold_count*

Description

Configures the maximum BPDUs transmitted per second.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
tx_hold_count	Specifies the maximum number of BPDUs transmitted per second. The valid range is 1–10.

Default

By default, the maximum number of BPDUs transmitted per second is 6.

Usage Guidelines

The transmit hold count is used by the port transmit state machine to limit BPDU transmission rate.

Example

The following example configures the transmit hold count for *STP* domain r1 to five BPDUs per second:

```
configure stpd r1 tx-hold-count 5
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure switch integrity-check image

```
configure switch integrity-check image [on | off]
```

Description

Enables or disables the NOS image integrity check feature.

Syntax Description

integrity-check	Specifies configuring integrity check.
image	Specifies checking the loaded NOS image.
on	Enables image integrity check feature. You are informed if the integrity check fails.
off	Disables image integrity check feature (default).

Default

By default, ExtremeXOS image integrity check is disabled.

Usage Guidelines

If the image integrity check is enabled, during bootup, the system checks the integrity of the NOS image, and notifies you if it has been compromised or not (an error message is logged).

To view the status and configuration of the image integrity check, use the `show switch management` command.

Example

The following example enables the NOS image integrity check:

```
# configure switch integrity-check image on
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sys-health-check all level

```
configure sys-health-check all level [normal | strict]
```

Description

Configures how the ExtremeXOS software handles faults for the switch.

Syntax Description

normal	Upon a fault detection, the switch only sends a message to the syslog. This is the default setting.
strict	Upon a fault detection, the switch takes the action configured by the `configure sys-recovery-level slot` or the command.

Default

The default setting is normal.

Usage Guidelines

Use this command in conjunction with the `configure sys-recovery-level switch [none | reset | shutdown]` command to implement your network's fault handling strategy.

ExtremeXOS 11.5 enhances the number of switch-fabric tests completed and monitored by the polling module of the system health checker. Additionally with ExtremeXOS 11.5, you can now configure how ExtremeXOS handles a detected fault based on the configuration of the `configure sys-recovery-level slot [all | slot_number] [none | reset | shutdown]` or the `configure sys-recovery-level switch [none | reset | shutdown]` command.

If you configure the strict parameter, the switch takes the action configured by the `configure sys-recovery-level slot` or the `configure sys-recovery-level switch` command, which can include logging only or restarting, rebooting, or shutting down the suspect device.

To maintain a smooth upgrade for devices running ExtremeXOS 11.4 and earlier, the switch-fabric tests introduced in ExtremeXOS 11.5 are set to only log error messages ('normal mode') by default. However, we recommend that you configure 'strict mode' so the system can attempt to recover by utilizing the action configured in the `configure sys-recovery-level slot` or the `configure sys-recovery-level switch` command (which by default is reset).

Depending on your switch configuration, the following table shows how ExtremeSwitching series switches behave when the ExtremeXOS software detects a fault:

Table 19: System Behavior for ExtremeSwitching Series Switches

Fault Handling Configuration	Hardware Recovery Configuration	Behavior
configure sys-health-check all level normal	configure sys-recovery-level switch none	The switch sends messages to the syslog.
Same as above.	configure sys-recovery-level switch reset	Same as above.
Same as above.	configure sys-recovery-level switch shutdown	Same as above.
configure sys-health-check all level strict	configure sys-recovery-level switch none	Same as above.
Same as above.	configure sys-recovery-level switch reset	ExtremeXOS reboots the affected switch.
Same as above.	configure sys-recovery-level switch shutdown	ExtremeXOS shuts down the affected switch.

Displaying the System Health Check Setting

To display the system health check setting, including polling and how ExtremeXOS handles faults on the switch, use the following command:

```
show switch
```

The system health check setting, displayed as SysHealth check, shows the polling setting and how ExtremeXOS handles faults. The polling setting appears as Enabled, and the fault handling setting appears in parenthesis next to the polling setting. In the following truncated output, the system health check setting appears as SysHealth check: Enabled (Normal):

```
SysName:          TechPubs Lab
SysName:          BD-8810Rack3
SysLocation:
SysContact:       support@extremenetworks.com, +1 888 257 3000
System MAC:       00:04:96:1F:A2:60
SysHealth check:  Enabled (Normal)
Recovery Mode:    None
System Watchdog:  Enabled
```

If you use the strict parameter, which configures the switch to take the action configured by the `configure sys-recovery-level slot` or the `configure sys-recovery-level switch` command, (Strict) would appear next to Enabled.

Example

The following command configures the switch to forward faults to be handled by the level set by the `configure sys-recovery-level switch` command:

```
# configure sys-health-check all level strict
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure syslog add

```
configure syslog add [ipaddress {udp-port {udp_port}} | ipPort |
   ipaddress tls_port {tls_port}] {vr vr_name} [local0...local7]
```

Description

Configures the remote Syslog server host address, and filters messages to be sent to the remote Syslog target.

Syntax Description

ipaddress	Specifies the remote Syslog server IP address.
ipPort	Specifies the UDP port number for the Syslog target.
tls_port	Specifies remote Syslog server Transport Layer Security (TLS) for connection type.
tls_port	TLS port number (default is 6514).
vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
local0 ... local7	Specifies the local Syslog facility.

Default

If a virtual router is not specified, *VR-Mgmt* is used. If UDP port is not specified, 514 is used. If TLS port is not specified, 6514 is used.

Usage Guidelines

Options for configuring the remote Syslog server include:

- ipaddress—The IP address of the remote Syslog server host
- ipPort—The UDP port
- vr_name—The virtual router that can reach the Syslog host
- local0-local7—The Syslog facility level for local use

The switch log overwrites existing log messages in a wrap-around memory buffer, which may cause you to lose valuable information once the buffer becomes full. The remote Syslog server does not overwrite log information, and can store messages in non-volatile files (disks, for example).

The `enable syslog` command must be issued in order for messages to be sent to the remote Syslog server(s). Syslog is disabled by default. A total of four Syslog servers can be configured at one time.

When a Syslog server is added, it is associated with the filter DefaultFilter. Use the `configure log target filter` command to associate a different filter.

The Syslog facility level is defined as local0 – local7. The facility level is used to group Syslog data.

Example

The following example adds the remote Syslog server with an IP address of 10.0.0.1:

```
configure syslog add 10.0.0.1 local1
```

The following example adds the remote Syslog server with an IP address of 2001:11::123:

```
configure syslog add 2001:11::123 local1
```

History

This command was first available in ExtremeXOS 10.1.

The **ipPort** parameter was first available in ExtremeXOS 11.0.

The **udp-port** parameter and support for the *EMS (Event Management System)* to send log messages to Syslog servers having IPv6 address was added in ExtremeXOS 21.1.

Transport Layer Security (TLS) option added in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure syslog tls cipher

`configure` **`syslog tls cipher`** `[[`*`cipher`* | **`all`**`]` **`on`** | *`cipher`* **`off`**`]`

Description

Turns on/off ciphers for Syslog Transport Layer Security (TLS) sessions.

Syntax Description

syslog	Specifies configuring the remote Syslog target.
tls	Transport Layer Security (TLS) protocol.
cipher	Specifies configuring the algorithm to use for encrypting Syslog TLS sessions.
cipher	Specifies the cipher name to enable or disable.
all	Specifies all ciphers for enabling.
on	Enable selected cipher. Default is that all ciphers are on.
off	Disables selected cipher.

Default

By default, all ciphers are enabled.

Usage Guidelines

A minimum of one cipher must be enabled.

The following is the list of available ciphers:

- aes128-sha
- aes128-sha256
- aes256-sha256
- dhe-rsa-aes128-sha256
- dhe-rsa-aes256-sha256

To view which ciphers are enabled and disabled, use the command show log configuration on page 2822.

Example

The following example enables all ciphers for Syslog TLS sessions:

```
configure syslog tls cipher all on
```

The following example disables the aes128-sha cipher for Syslog TLS sessions:

```
configure syslog tls cipher aes128-sha off
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure syslog tls ocsp

```
configure syslog tls ocsp [on | off]
```

Description

Enables or disables Online Certificate Status Protocol (OCSP) check for Transport Layer Security (TLS) connections to remote Syslog servers.

Syntax Description

syslog	Specifies configuring the remote Syslog target.
tls	Specifies configuring TLS.
ocsp	Specifies configuring OCSP for real-time certificate revocation status checking.
on	Enables OCSP (default).
off	Disables OCSP.

Default

By default, OCSP is enabled.

Usage Guidelines

While you can disable OCSP, it is not recommended because no certificate revocation status check is performed.

Example

The following example enables OCSP check for TLS connections to remote Syslog servers.

```
# configure syslog tls ocsp on
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW!

configure syslog tls ocsp nonce

```
configure syslog tls ocsp nonce [on | off]
```

Description

Enables or disables Online Certificate Status Protocol (OCSP) nonce for Transport Layer Security (TLS) connections to remote Syslog servers.

Syntax Description

syslog	Specifies configuring the remote Syslog target.
tls	Specifies configuring TLS.
ocsp	Specifies configuring OCSP for real-time certificate revocation status checking.
nonce	Specifies to cryptographically bind an OCSP request and an OCSP response with the extension `id-pkix-ocsp-nonce` to prevent replay attacks.
on	Specifies to include the `id-pkix-ocsp-nonce` extension in the OCSP request and response.
off	Specifies to exclude the extension (default).

Default

Off.

Usage Guidelines

Example

The following example configures nonce:

```
# configure syslog tls ocsp nonce on
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure syslog tls ocsp override

`configure syslog` **`tls tls override`** [*url* | **none**]

Description

This command configures one HTTP Online Certificate Status Protocol (OCSP) override URL for Transport Layer Security (TLS) connections to a remote Syslog server.

Syntax Description

syslog	Specifies configuring the remote Syslog target.
tls	Specifies Transport Layer Security (TLS).
ocsp	Specifies the OCSP attribute.
override	Specifies to override the OCSP server in the AuthorityInformationAccess section of a syslog server's certificate.
url	Specifies the URL of the OCSP overrive server. Default port is 80.
none	Specifies to remove the OCSP override URL configuration (default).

Default

None.

Usage Guidelines

Only HTTP is supported with either FQDN or IP.

Example

The following example configures an override URL of `http://syslogocsp:2022`:

```
# configure radius tls ocsp override http://syslogocsp:2022
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure syslog tls ocsp signer

`configure syslog` **`tls ocsp signer ocsp-nocheck`** `[`**`on`** `|` **`off`**`]`

Description

Enables or disables Online Certificate Status Protocol (OCSP) signer's ocsp-nocheck for Transport Layer Security (TLS) connections to remote Syslog servers.

Syntax Description

syslog	Specifies configuring the remote Syslog target.
tls	Specifies Transport Layer Security (TLS).

ocsp	Specifies configuring OCSP for real-time certificate revocation status checking.
signer	Specifies the OCSP signer that signs the OCSP response.
ocsp-nocheck	Specifies the extension `id-pkix-ocsp-nocheck`. If present in the OCSP signer's certificate, then it is trusted for its lifetime.
on	Specifies to override the `id-pkix-ocsp-nocheck` extension in the OCSP signer's certificate and forces the extension as if it is present.
off	Specifies to behave per the extension's precense in the OCSP signer's certificate. If not present and the OCSP signer is not root CA, then the whole OCSP will fail (default).

Default

Off.

Usage Guidelines

Example

The following example enables OCSP signer's nocheck for TLS connections to a remote Syslog server.

```
# configure syslog tls ocsp signer ocsp-nocheck on
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure syslog tls tcp-user-timeout

`configure syslog` **`tls tcp-user-timeout`** [*seconds* | **`default`**]

Description

Specifies the maximum time that transmitted data may remain unacknowledged before TCP closes the connection to avoid loss of logging to TLS Syslog server.

Syntax Description

tls	Specifies Transport Layer Security protocol.
tcp-user-timeout	Specifies the maximum time that transmitted data may remain unacknowledged before TCP closes the connection.

seconds	Timeout period in seconds. Range = 20–900.
default	Specifies not using value from **tcp-user-timeout** option; use the system default.

Default

The default is to use Linux default—tcp-user-timeout is not enabled.

Usage Guidelines

For Linux, by default, it takes about 15 minutes for kernel to end a TCP connection when transmitted data remains unacknowledged. This results in a potential loss of logs to TLS Syslog server during the 15 minutes window due to link down. This command allows you to reduce this window.

Example

The following example sets the TCP user timeout value to 30 seconds:

```
configure syslog tls tcp-user-timeout 30
```

The following example turns off using the TCP user timeout value and accepts system default:

```
configure syslog tls tcp-user-timeout default
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure syslog delete

```
configure syslog delete [ ipaddress {udp-port {udp_port}} | ipPort |
   ipaddress tls_port {tls_port}] {vr vr_name} [local0...local7 ]] | all
   {local0...local7} {vr vr_name} ]
```

```
configure syslog delete host name/ip {: udp-port} [local0...local7]
```

Description

Deletes a remote Syslog server address.

Syntax Description

ipaddress	Specifies the remote Syslog server IP address.
ipPort	Specifies the UDP port number for the Syslog target.

tls_port	Specifies remote Syslog server Transport Layer Security (TLS) for connection type.
tls_port	TLS port number.
vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
local0 ... local7	Specifies the local Syslog facility.
all	Specifies all remote Syslog servers.

Default

If a virtual router is not specified, *VR-Mgmt* is used.

If a UDP port number is not specified, 514 is used.

If a TLS port number is not specified, 6514 is used.

Usage Guidelines

This command is used to delete a remote Syslog server target.

Example

The following example deletes the remote Syslog server with an IP address of 10.0.0.1:

```
configure syslog delete 10.0.0.1 local1
```

The following example deletes the remote Syslog server with an IP address of 2001:11::123 :

```
configure syslog delete 2001:11::123  local1
```

History

This command was first available in ExtremeXOS 10.1.

The **ipPort** parameter was first available in ExtremeXOS 11.0.

The **udp-port** parameter and support for the EMS to send log messages to Syslog servers having IPv6 address was added in ExtremeXOS 21.1.

Transport Layer Security (TLS) option added in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure syslog reference-identifier

```
configure syslog [all |ipaddress {tls-port tls_port}] {vr vr_name}
   {local} reference-identifier reference_identifier
```

Description

Specifies the remote Syslog server certificate reference identifier.

Syntax Description

all	All specified targets.
ipaddress	Specifies the remote Syslog server IPv4 or IPv6 address.
tls-port	Specifies using a remote Syslog server Transport Layer Security (TLS) port.
tls_port	Specifies the remote Syslog server Transport Layer Security (TLS) port (default is 6514).
vr	Specifies a virtual router.
vr_name	Specifies the virtual router ID.
local	Specifies the remote Syslog server facility: "local0" "local1" "local2" "local3" "local4" "local5" "local6" "local7".
reference-identifier	Remote Syslog server certificate reference identifier.
reference_identifier	Identifier value (for example, the host name). If none is specified, the existing reference identifier configuration is removed.

Default

If a TLS port is not specified, the default is 6514.

Example

The following example specifies the reference identifier as "hostname" for all specified targets on VR "vr1":

```
# configure syslog all vr vr1 reference-identifier hostname
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure system ports notation

```
configure system ports notation [slot:port | slot/port]
```

Description

Configures a standalone switch to be addressed with a slot number.

Syntax Description

system	Configures system settings.
ports	Configures system ports settings.
notation	Configures system port notation settings.
slot:port	Designates slot:port notation. For example, 1:47. (Default on stacks and Extended Edge Switching). Also designates a 5720 slot:port:chennel notation. For example, 5:49:3 for Slot 5 Port 49 Channel 3.
slot	Designates standard slot notation. For example, 1/47.
port	Designates standard port notation. For example, 1/47. Also designates a channelized 5720 port. For example, Port 49 Channel 3.

Default

By default, on standalone switches, port notation is used.

By default, on stacks/Extended Edge Switching, slot:port notation is used.

Usage Guidelines

You can configure a standalone system as a slotted system with this command, which allows for commands which had ‘slot’ arguments to be visible and take in a valid slot number of ‘1’, along with any port arguments specified in ‘slot’:’port’ notation. In turn, any command output would specify ‘slot’ information and ports displayed in ‘slot’:’port’ or slot/port notation.

ExtremeSwitching 5720 series switches use a specified chennelized port number.

Note
5720 VIM-6YE ports are not channelized and map to ports 51-53 and 54-56.

Note
Switches running Release 31.6 or earlier that are connected to a channelized 5720 port will not display the correct port number via the Extreme Discovery Protocol. The port numbers will display correctly via the Link Layer Discovery Protocol.

This command requires a configuration save and reboot to take effect.

To view the port notation status, use the `show management` command.

Example

The following example changes a standalone switch to have slot:port notation:

```
# configure system ports notation slot:port
This command will take effect after the next reboot.
```

History

This command was first available in ExtremeXOS 30.2.

The **slot/port** keyword was added in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sys-recovery-level switch

```
configure sys-recovery-level switch [none | reset | shutdown]
```

Description

Configures a recovery option for instances where a hardware exception occurs on ExtremeSwitching series switches.

Syntax Description

none	Configures the switch to maintain its current state regardless of the detected fault. The switch does not reboot or shutdown. ExtremeXOS logs fault and error messages to the syslog.
reset	Configures the switch to reboot upon detecting a hardware fault. ExtremeXOS logs fault, error, system reset, and system reboot messages to the syslog.
shutdown	Configures the switch to shut down upon detecting a hardware fault. All ports are taken offline in response to the reported errors; however, the management port remains operational for debugging purposes only. If the switch shuts down, it remains in this state across additional reboots or power cycles until you explicitly clear the shutdown state.

Default

The default setting is reset.

Usage Guidelines

Use this command for system auto-recovery upon detection of hardware problems. You can configure ExtremeSwitching series switches to take no action, automatically reboot, or shutdown if the switch detects a hardware fault. This enhanced level of recovery detects faults in the CPU.

You must specify one of the following parameters for the switch to respond to hardware failures:

- **none**—Configures the switch to maintain its current state regardless of the detected fault. The switch does not reboot or shutdown.
- **reset**—Configures the switch to reboot upon detecting a hardware fault.
- **shutdown**—Configures the switch to shutdown upon fault detection. All ports are taken offline in response to the reported errors; however, the management port remains operational for debugging purposes only.

Messages Displayed

If you configure the hardware recovery setting to either none (ignore) or shutdown, the switch prompts you to confirm this action by displaying a message similar to the following:

```
Are you sure you want to shutdown on errors? (y/n)
```

Enter y to confirm this action and configure the hardware recovery level. Enter n or press [Enter] to cancel this action.

Displaying the Hardware Recovery Setting

To display the hardware recovery setting, use the following command:

```
show switch
```

If you change the hardware recovery setting from the default (reset) to either none (ignore) or shutdown, the Recovery Mode output is expanded to include a description of the hardware recovery mode. If you keep the default behavior or return to reset, the Recovery Mode output lists only the software recovery setting.

The following truncated output from a ExtremeSwitching series switch displays the software recovery and hardware recovery settings (displayed as Recovery Mode):

```
SysName:          TechPubs Lab
SysLocation:
SysContact:       support@extremenetworks.com, +1 888 257 3000
System MAC:       00:04:96:1F:A5:71
Recovery Mode:    All, Ignore
System Watchdog:  Enabled
```

If you configure the hardware recovery setting to none, the output displays “Ignore” to indicate that no corrective actions will occur on the switch. “Ignore” appears only if you configure the hardware recovery setting to none.

If you configure the hardware recovery setting to shutdown, the output displays “Shutdown” to indicate that the switch will shutdown if fault detection occurs. “Shutdown” appears only if you configure the hardware recovery setting to shutdown.

If you configure the hardware recovery setting to reset, the output displays only the software recovery mode.

Example

The following command configures the switch to not take an action if a hardware fault occurs:

```
# configure sys-recovery-level switch none
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sys-recovery-level

```
configure sys-recovery-level [all | none]
```

Description

Configures a recovery option for instances where a software exception occurs in ExtremeXOS.

Syntax Description

all	Configures ExtremeXOS to log an error into the syslog and reboot the system after any software task exception occurs.
none	Configures the recovery level to none. No action is taken when a software task exception occurs; there is no system reboot, which can cause unexpected switch behavior. Note: Use this parameter only under the guidance of Extreme Networks Technical Support personnel.

Default

The default setting is all.

Usage Guidelines

If the software fails, the switch automatically reboots or leaves the system in its current state. You must specify one of the following parameters for the system to respond to software failures:

- all—The system will send error messages to the Syslog and reboot if any software task exception occurs.

- none—No action is taken when a software task exception occurs. The system does not reboot, which can cause unexpected switch behavior.

  Note

  Use the none parameter only under the guidance of Extreme Networks Technical Support personnel.

The default setting and behavior is all. Extreme Networks strongly recommends using the default setting.

Displaying the System Recovery Setting

To display the software recovery setting on the switch, use the following command:

```
# show switch
```

This command displays general switch information, including the software recovery level. The following truncated output from an ExtremeSwitching switch displays the software recovery setting (displayed as Recovery Mode):

```
SysName:          TechPubs Lab
SysLocation:
SysContact:       support@extremenetworks.com, +1 888 257 3000
System MAC:       00:04:96:20:B4:13
SysHealth check:  Enabled (Normal)
Recovery Mode:    All
System Watchdog:  Enabled
```

Note

All platforms display the software recovery setting as Recovery Mode.

Example

The following command configures a switch to not take an action when any software task exception occurs:

```
# configure sys-recovery-level none
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tacacs priv-lvl

```
configure tacacs priv-lvl [required | optional]
```

Description

Sets the requirement that the privilege level attribute (priv-lvl) must be specified for TACACS priv-levl authentication to occur.

Syntax Description

priv-levl	Specifies setting the requirement that the privilege level attribute for authentication to occur.
required	Fails login attempt if priv-lvl attribute is not provided.
optional	Allows login to occur with read-only privilege if priv-lvl is not provided. (default).

Default

By default, the priv-lvl is not required.

Usage Guidelines

Using this command to set the privilege level attribute as **required** does not change any behavior associated with values received in the priv-lvl attribute, only the presence/absence of the attribute.

Example

The following example makes the priv-lvl attribute required for TACACS authentication:

```
# configure tacacs priv-lvl required
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tacacs server client-ip

```
configure tacacs [primary | secondary] server [ipaddress | hostname]
   {tcp_port} client-ip ipaddress {vr vr_name}
```

Description

Configures the server information for a TACACS+ authentication server.

Syntax Description

primary	Configures the primary TACACS+ server.
secondary	Configures the secondary TACACS+ server.
ipaddress	The IP address of the TACACS+ server being configured.
hostname	The host name of the TACACS+ server being configured.
tcp_port	The TCP port to use to contact the TACACS+ server.
ipaddress	The IP address used by the switch to identify itself when communicating with the TACACS+ server.
vr_name	Specifies the virtual router on which the client IP is located. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.

Default

TACACS+ uses TCP port 49. The default virtual router is *VR-Mgmt*, the management virtual router.

Usage Guidelines

Use this command to configure the server information for a TACACS+ server.

To remove a server, use the following command:

```
unconfigure tacacs server [primary | secondary]
```

Use of the *hostname* parameter requires that DNS be enabled.

Example

The following command configures server tacacs1 as the primary TACACS+ server for client switch 10.10.20.35 using a virtual router interface of *VR-Default*:

```
configure tacacs primary server tacacs1 client-ip 10.10.20.35 vr vr-Default
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tacacs shared-secret

```
configure tacacs [primary | secondary] shared-secret {encrypted
   encrypted_secret | secret }
```

Description

Configures the shared secret string used to communicate with the TACACS+ authentication server.

Syntax Description

primary	Configures the authentication string for the primary TACACS+ server.
secondary	Configures the authentication string for the secondary TACACS+ server.
encrypted	Indicates that the string is already encrypted.
string	The string to be used for authentication.

Default

N/A.

Usage Guidelines

The secret must be the same between the client switch and the TACACS+ server.

The encrypted keyword is primarily for the output of the show configuration command, so the shared secret is not revealed in the command output. Do not use it to set the shared secret.

Example

The following command configures the shared secret as “purplegreen” on the primary TACACS+ server:

```
configure tacacs-accounting primary shared-secret purplegreen
```

History

This command was first available in ExtremeXOS 10.1.

The encrypted keyword was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tacacs timeout

```
configure tacacs timeout seconds
```

Description

Configures the timeout interval for TACAS+ authentication requests.

Syntax Description

seconds	Specifies the number of seconds for authentication requests. Range is 3 to 120 seconds.

Default

The default is 3 seconds.

Usage Guidelines

Use this command to configure the timeout interval for TACACS+ authentication requests.

To detect and recover from a TACACS+ server failure when the timeout has expired, the switch makes one authentication attempt before trying the next designated TACACS+ server or reverting to the local database for authentication. In the event that the switch still has IP connectivity to the TACACS+ server, but a TCP session cannot be established, (such as a failed TACACS+ daemon on the server), failover happens immediately regardless of the configured timeout value.

For example, if the timeout value is set for 3 seconds (the default value), it will take 3 seconds to fail over from the primary TACACS+ server to the secondary TACACS+ server. If both the primary and the secondary servers fail or are unavailable, it takes approximately 6 seconds to revert to the local database for authentication.

Example

The following command configures the timeout interval for TACACS+ authentication to 10 seconds:

```
configure tacacs timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tacacs-accounting server

```
configure tacacs-accounting [primary | secondary] server [ipaddress |
   hostname] {udp_port} client-ip ipaddress {vr vr_name}
```

Description

Configures the TACACS+ accounting server.

Syntax Description

primary	Configures the primary TACACS+ accounting server.
secondary	Configures the secondary TACACS+ accounting server.
ipaddress	The IP address of the TACACS+ accounting server being configured.
hostname	The host name of the TACACS+ accounting server being configured.
tcp_port	The TCP port to use to contact the TACACS+ server.
ipaddress	The IP address used by the switch to identify itself when communicating with the TACACS+ accounting server.
vr_name	Specifies the virtual router on which the client IP is located. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.

Default

Unconfigured. The default virtual router is *VR-Mgmt*, the management virtual router.

Usage Guidelines

You can use the same TACACS+ server for accounting and authentication.

To remove a server, use the following command:

```
unconfigure tacacs server [primary | secondary]
```

Example

The following command configures server tacacs1 as the primary TACACS+ accounting server for client switch 10.10.20.35 using a virtual router interface of *VR-Default*:

```
configure tacacs-accounting primary server tacacs1 client-ip 10.10.20.35 vr vr-Default
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tacacs-accounting shared-secret

```
configure tacacs-accounting [primary | secondary] shared-secret
   {encrypted encrypted_secret | secret }
```

Description

Configures the shared secret string used to communicate with the TACACS+ accounting server.

Syntax Description

primary	Configures the authentication string for the primary TACACS+ accounting server.
secondary	Configures the authentication string for the secondary TACACS+ accounting server.
string	The string to be used for authentication.

Default

N/A.

Usage Guidelines

Secret needs to be the same as on the TACACS+ server.

The encrypted keyword is primarily for the output of the show configuration command, so the shared secret is not revealed in the command output. Do not use it to set the shared secret.

Example

The following command configures the shared secret as “tacacsaccount” on the primary TACACS+ accounting server:

```
configure tacacs-accounting primary shared-secret tacacsaccount
```

History

This command was first available in ExtremeXOS 10.1.

The encrypted keyword was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tacacs-accounting timeout

```
configure tacacs-accounting timeout seconds
```

Description

Configures the timeout interval for TACACS+ accounting authentication requests.

Syntax Description

seconds	Specifies the number of seconds for accounting requests. Range is 3 to 120 seconds.

Default

The default is 3 seconds.

Usage Guidelines

This command configures the timeout interval for TACACS+ accounting authentication requests.

To detect and recover from a TACACS+ accounting server failure when the timeout has expired, the switch makes one authentication attempt before trying the next designated TACACS+ accounting server or reverting to the local database for authentication. In the event that the switch still has IP connectivity to the TACACS+ accounting server, but a TCP session cannot be established, (such as a failed TACACS+ daemon on the accounting server), failover happens immediately regardless of the configured timeout value.

For example, if the timeout value is set for 3 seconds (the default value), it takes 3 seconds to fail over from the primary TACACS+ accounting server to the secondary TACACS+ accounting server. If both the primary and the secondary servers fail or are unavailable, it takes approximately 6 seconds to revert to the local database for authentication.

Example

The following command configures the timeout interval for TACACS+ accounting authentication to 10 seconds:

```
configure tacacs-accounting timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tech-support add collector

```
configure tech-support add collector [hostname | ip_address] tcp-port
   port {vr vr_name} {from source_ip_address} {ssl [on | off]}
```

Description

This command adds collectors that the switch attempts to connect to for the purpose of forwarding status reports. The collector is identified by its hostname or IP address.

This command also configures the initial value of the TCP port that the collector is listening to, the VR name and source IP address that the switch uses to attempt to connect to the collector, and the SSL mode whether the switch needs to turn SSL on or off when it connects to the collector.

Syntax Description

hostname	Host name of the collector.
ip_address	IPv4 address of the collector.
tcp-port	TCP port number that the collector is listening.
port	Port number. The range is 1-65535.
vr *vr_name*	Specifies the Virtual router and virtual router name. The default name is *VR-Mgmt*.
from *source_ip_address*	Specifies the source and the source IPv4 address. The default source is the IP address on *VLAN* Mgmt.
ssl	Specifies the Secure Sockets Layer.
on	Specifies that SSL is on.
off	Specifies that SSL is off.

Default

Disabled.

Usage Guidelines

This command adds collectors that the switch attempts to connect to for the purpose of forwarding status reports. The collector is identified by its hostname or IP address. Each added collector needs to have a unique hostname or IP address. If the specified hostname or IP address has already existed, an error message '*ERROR: The collector 1.1.1.1 already exists'* is displayed. Other commands use hostname or IP address to specify the collector that the command reconfigures, deletes, runs reports for, or shows configuration and status.

This command also configures the initial value of the TCP port that the collector is listening to, the VR name and source IP address that the switch uses to connect to the collector, and the SSL mode that determines if the switch needs to turn SSL on/off when connecting to the collector. The purpose of having a default collector configured is to minimize the configuration required for a customer to enable techSupport.

Example

The following command adds a collector at address "1.1.1.1" listening to TCP port "1":

```
configure tech-support add collector 1.1.1.1 tcp-port 1
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tech-support collector

```
configure tech-support collector [hostname | ip_address] tcp-port port
   {vr vr_name} {from source_ip_address} {ssl [on | off]}
```

Description

This command reconfigures the TCP port, the VR, the Source IP Address, and SSL mode of an existing collector.

Syntax Description

hostname	Host name of the collector.
ip_address	IPv4 address of the collector.
tcp-port	TCP port number that the collector is listening.
port	Port number. The range is 1-65535.
vr *vr_name*	Specifies the Virtual router and virtual router name. The default name is *VR-Mgmt*.
from *source_ip_address*	Specifies the source and the source IPv4 address. The default source is the IP address on *VLAN* Mgmt.
ssl	Specifies the Secure Sockets Layer.
on	Specifies that SSL is on.
off	Specifies that SSL is off.

Default

Disabled.

Usage Guidelines

This command reconfigures the TCP port, the VR, the Source IP Address, and SSL mode of an existing collector. The collector to be reconfigured is specified by its hostname or IP address. If the specified collector does not exist, an error message `ERROR: The collector 1.1.1.1 does not exists` is displayed.

Example

The following command reconfigures the tech support collector:

```
configure tech-support collector
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tech-support collector data-set

```
configure tech-support collector [ all hostname | ip_address] data-set
   [ summary | detail ]
```

Description

This command configures the amount and type of data that is included in the status report for a collector.

Syntax Description

all	Configures report data set for all existing collectors.
hostname	Specifies the host name of the collector.
ip_address	Specifies the IPv4 address of the collector.
data-set	Specifies the report data set. The default is **detail**.
detail	Specifies the output of `show tech-support` *area* for area general, config, log, *VLAN*, and EPM.
summary	Specifies the output of `show tech-support all` command.

Default

The default is **detail**.

Usage Guidelines

This command configures the amount and type of data that is included in the status report for a collector. When you specify **all**, it configures a report data set for all existing collectors; otherwise report data is set for a particular collector specified by the *hostname* or *IP address*. When the data set is set to **summary**, the status report sent by the switch includes installed ExtremeXOS and Bootrom image versions, the active partition, serial number, equipment type, installed hardware options, stored SRAM contents, basic switch configuration, and log messages. The output of the summary option is

collected from the `show tech-support area` command for the area general, configuration, log, VLAN, and EPM. Changing the report data set to **detail** will send the full output of the `show tech` command. When a collector is added, the data set is set to **detail**.

Example

The following command example configures a specific collector to display a detailed output set:

```
configure tech-support collector 65.222.234.14 data-set detail
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tech-support collector frequency error-detected

```
configure tech-support collector [ all | hostname | ip_address]
   frequency [bootup [on | off] | error-detected [on | off]| daily [on
   {time hour} | off]]
```

Description

This command configures how often the switch sends status reports for a collector.

Syntax Description

all	Configures report mode for all report collectors.
hostname	Configures report mode based on the host name of the collector.
ip_address	Configures report mode based on the IPv4 address of the collector.
bootup	Send status report when the switch boots up. The default value is on.
on	Specifies that the status reporting is on at bootup.
off	Specifies that the status reporting is off at bootup.
error-detected	Specifies that a status report is sent when a critical severity event is logged. The default value is off.
on	Specifies that error-detected reporting is on.
off	Specifies that error-detected reporting is off. This is the default value.
daily	Specifies that status reports are sent once a day. The default value is off.
on time *hour*	Specifies the time to send the report. Specifies the hour 0-23. The default value is 0 (12:00AM).
off	Specifies that the daily status reports are off. This is the default value.

Default

Disabled.

Usage Guidelines

This command configures the frequency that the switch sends status reports for a collector. By specifying **all**, it configures report frequency for all existing collectors; otherwise it configures report frequency for a particular collector specified by the hostname or IP address. If the **bootup** option is set to **on**, the switch sends a status report when the switch boots up. If the **error-detected** option is set to **on**, the switch sends a status report when a critical severity event is logged. If the **daily** option is set to **on**, the switch sends a status report once a day regardless of the switchs' operational status during the last 24 hour period.

Optionally, you can specify the hour that the report is sent. The default hour is 0, and the valid range is 0 to 23, where 0 is 12:00 AM local time and 23 is 11:00 PM local time. You can enable or disable each option (**bootup**, **error-detected** or **daily**) independently. When all three options of a collector are turned off, the switch does not send any status report to that collector even if the report mode of the collector is set to automatic. When a collector is added, the **bootup** option is set to on, and the **error-detected** and **daily** option is set to off.

Example

The following command example configures the report mode on all existing collectors:

```
configure tech-support collector all report
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tech-support collector report

```
configure tech-support collector [hostname | ip_address] report
   [ automatic | manual ]
```

Description

This command configures the report mode for a collector.

Syntax Description

all	Configures report mode for all report collectors.
hostname	Configures report mode based on the host name of the collector.

ip_address	Configures report mode based on the IPv4 address of the collector.
automatic	Automatically reports switch status to the configured collector (Default).
manual	Manually reports switch status to the configured collector through the `run tech-support` report.

Default

Disabled.

If enabled, the automatic collector is the default report setting.

Usage Guidelines

This command configures the report mode for a collector. When you specify **all**, it configures report mode for all existing collectors, otherwise it configures report mode for a particular collector specified by the hostname, or IP address. When the report mode is set to **automatic**, the switch automatically attempts to connect to the cloud-hosted collector, and reports the switch status information based on the frequency and data set setting of the collector. Changing the configuration to **manual** restricts reporting to user initiated mode using the *run tech-support* command for that collector. When a collector is added, the report mode is set to automatic by default.

Example

The following command example configures the report mode on all existing collectors:

```
configure tech-support collector all report
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tech-support delete collector

`configure tech-support delete collector [ **all** | *hostname* | *ip_address*]`

Description

This command deletes existing collectors.

Syntax Description

all	Specifies that you delete all report collectors.
hostname	Specifies the host name of the collector you want to delete.
ip_address	Specifies the IPv4 address of the collector you want to delete.

Default

Disabled.

Usage Guidelines

This command deletes existing collectors. If you specify **all**, it deletes all existing collectors; otherwise it deletes the collector specified by the hostname or IP address. If the specified collector does not exist, an error message `ERROR: The collector 1.1.1.1 does not exist` is displayed.

Example

The following example deletes all collectors :

```
configure tech-support delete collector all
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure telnet access-profile

```
configure telnet access-profile [ access_profile | [[add rule ] [first |
   [[before | after] previous_rule]]] | delete rule | none ]
```

Description

Configures Telnet to use an *ACL* policy or ACL rule for access control.

Syntax Description

access_profile	Specifies an ACL policy.
add	Specifies that an ACL rule is to be added to the Telnet application.
rule	Specifies an ACL rule.
first	Specifies that the new rule is to be added before all other rules.

before	Specifies that the new rule is to be added before a previous rule.
after	Specifies that the new rule is to be added after a previous rule.
previous_rule	Specifies an existing rule in the application.
delete	Specifies that one particular rule is to be deleted.
none	Specifies that all the rules or a policy file is to be deleted.

Default

Telnet is enabled with no ACL policies and uses TCP port 23.

Usage Guidelines

You must be logged in as administrator to configure Telnet parameters.

You can restrict Telnet access in the following ways:

- Implement an ACL policy file that permits or denies a specific list of IP addresses and subnet masks for the Telnet port. You must create the ACL policy file before you can use this command. If the ACL policy file does not exist on the switch, the switch returns an error message indicating that the file does not exist.

  In the ACL policy file for Telnet, the “source-address” field is the only supported match condition. Any other match conditions are ignored.

  Use the none option to remove a previously configured ACL.
- Add an ACL rule to the Telnet application through this command. Once an ACL is associated with Telnet, all the packets that reach a Telnet module are evaluated with this ACL and appropriate action (permit or deny) is taken, as is done using policy files.

  The permit or deny counters are also updated accordingly regardless of whether the ACL is configured to add counters. To display counter statistics, use the `show access-list counters process` **`telnet`** command.

Only the following match conditions and actions are copied to the client memory. Others that may be in the rule are not copied.

Match conditions:

- Source-address—IPv4 and IPv6
- Actions—Permit or Deny

When adding a new rule, use the first, before, and after previous_rule parameters to position it within the existing rules.

If the Telnet traffic does not match any of the rules, the default behavior is deny. To permit Telnet traffic that does not match any of the rules,add a permit all rule at the end of the rule list.

Creating an ACL Policy File

To create an ACL policy file, use the `edit policy` command. For more information about creating and implementing ACL policy files, see the *Policy Manager* and *ACLs* chapters in the *Switch Engine 32.2 User Guide*.

If you attempt to implement a policy that does not exist on the switch, an error message similar to the following appears:

```
Error: Policy /config/MyAccessProfile.pol does not exist on file system
```

If this occurs, make sure the policy you want to implement exists on the switch. To confirm the policies on the switch, use the `configure snmp add community` command. If the policy does not exist, create the ACL policy file.

Viewing Telnet Information

To display the status of Telnet, including the current TCP port, the virtual router used to establish a Telnet session, and whether ACLs are controlling Telnet access, use the following command: `show management`.

Example

The following example applies the ACL policy MyAccessProfile_2 to Telnet:

```
configure telnet access-profile MyAccessProfile_2
```

The following example applies the ACL rule DenyAccess to the Telnet application in the first position in the list:

```
configure telnet access-profile add DenyAccess first
```

The following example removes the association of a single ACL rule from the Telnet application:

```
configure telnet access-profile delete DenyAccess
```

The following example removes the association of an ACL policy or all ACL rules from the Telnet application:

```
configure telnet access-profile none
```

History

This command was first available in ExtremeXOS 11.2.

Support for ACL rules for Telnet was added in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure telnet port

```
configure telnet port [portno | default]
```

Description

Configures the TCP port used by Telnet for communication.

Syntax Description

portno	Specifies a TCP port number. The default is 23. The range is 1 through 65535. The following TCP port numbers are reserved and cannot be used for Telnet connections: 22, 80, and 1023.
default	Specifies the default Telnet TCP port number. The default is 23.

Default

The switch listens for Telnet connections on Port 23.

Usage Guidelines

You must be logged in as administrator to configure the Telnet port.

The portno range is 1 through 65535. The following TCP port numbers are reserved and cannot be used for Telnet connections: 22, 80, and 1023. If you attempt to configure a reserved port, the switch displays an error message similar to the following:

```
configure telnet port 22
Error: port number is a reserved port
```

If this occurs, select a port number that is not a reserved port.

The switch accepts IPv6 connections.

Example

The following command changes the port used for Telnet to port 85:

```
configure telnet port 85
```

The following command returns the port used for Telnet to the default port of 23:

```
configure telnet port default
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 connections was added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure telnet vr

```
configure telnet vr [all | default | vr_name]
```

Description

Configures the virtual router used on the switch for listening for Telnet connections.

Syntax Description

all	Specifies to use all virtual routers for Telnet connections.
default	Specifies to use the default virtual router for Telnet connections. The default router is *VR-Mgmt*.
vr_name	Specifies the name of the virtual router to use for Telnet connections. NOTE: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.

The default is all.

Usage Guidelines

You must be logged in as administrator to configure the virtual router.

The switch accepts IPv6 connections.

If you specify all, the switch listens on all of the available virtual routers for Telnet connections.

The vr_name specifies the name of the virtual router to use for Telnet connections.

If you specify a virtual router name that does not exist, the switch displays an error message similar to the following:

```
configure telnet vr vr-ttt ^ %% Invalid input detected at '^' marker.
```

Example

The following command configures the switch to listen for and receive Telnet requests on all virtual routers:

```
configure telnet vr all
```

History

This command was first available in ExtremeXOS 11.0.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure time

```
configure time month day year hour min sec
```

Description

Configures the system date and time.

Syntax Description

month	Specifies the month. The range is 1-12.
day	Specifies the day of the month. The range is 1-31.
year	Specifies the year in the YYYY format.The range is 2003 to 2036.
hour	Specifies the hour of the day. The range is 0 (midnight) to 23 (11 pm).
min	Specifies the minute. The range is 0-59.
sec	Specifies the second. The range is 0-59.

Default

N/A.

Usage Guidelines

The format for the system date and time is as follows:

```
mm dd yyyy hh mm ss
```

The time uses a 24-hour clock format. You cannot set the year earlier than 2003 or past 2036. You have the choice of inputting the entire time/date string. If you provide one item at a time and press [Tab], the screen prompts you for the next item. Press [cr] to complete the input.

Example

The following command configures a system date of February 15, 2002 and a system time of 8:42 AM and 55 seconds:

```
configure time 02 15 2002 08 42 55
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure time profile

```
create time-profile time_profile_name      start start_hour :
   start_minute { start_month { / start_day { / start_year}}}
   stop [ stop_hour : stop_minute  { stop_month { / stop_day { /
   stop_year }}} | in stop_count stop_units ]
```

Description

Configures a time profile of an appointment starting at a specific time on a specific calendar date.

Syntax Description

time_profile_name	Specifies the name of the time profile.
start	Specifies the appointment starting specification .
start_hour	Specifies the start hour. The range is 0-23.
start_minute	Specifies the start minutes. The range is 0-59.
start_month	Specifies the start month. The range is 1-12.
start_day	Specifies the start day. The range is 1-31.
start_year	Specifies the start year, YYYY.
stop	Specifies the appointment stopping specification.
stop_hour	Specifies the stop hour. The range is 0-23.
stop_minute	Specifies the stop minutes. The range is 0-59.
stop_month	Specifies the stop month. The range is 1-12.
stop_day	Specifies the stop day. The range is 1-31.
stop_year	Specifies the stop year, YYYY.
in	Specifies the stop in time.
stop_count	Specifies the stop count.
stop_units	Specifies the stop units (for example, minutes , hours, days, weeks).

Default

N/A.

Usage Guidelines

Use this command to create a time profile of an appointment starting at a specific time on a specific calendar date.

Example

The following command configures a time profile named *testprofile* to start at 11:30 a.m. on February 24, 2012 :

```
configure time profile testprofile start 11 :  30 { 2 { / 24 { /  2012
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure timezone

```
configure timezone {name tz_name} GMT_offset {autodst {name
   dst_timezone_ID} {dst_offset} {begins [every floatingday | on
   absoluteday] {at time_of_day} {ends [every floatingday | on
   absoluteday] {at time_of_day}}} | noautodst}
```

Description

Configures the Greenwich Mean Time (GMT) offset and Daylight Saving Time (DST) preference.

Syntax Description

tz_name	Specifies an optional name for this timezone specification. May be up to six alphabetic characters in length. The default is an empty string.
GMT_offset	Specifies a Greenwich Mean Time (GMT) offset, in + or - minutes.
autodst	Enables automatic Daylight Saving Time.
dst-timezone-ID	Specifies an optional name for this DST specification. May be up to six characters in length. The default is an empty string.
dst_offset	Specifies an offset from standard time, in minutes. Value is in the range of 1 to 60. Default is 60 minutes.
floatingday	Specifies the day, week, and month of the year to begin or end DST each year. Format is: *week day month* where: *week* is specified as [first | second | third | fourth | last] or 1-5. *day* is specified as [sunday | monday | tuesday | wednesday | thursday | friday | saturday] or 1-7 (where 1 is Sunday). *month* is specified as [january | february | march | april | may | june | july | august | september | october | november | december] or 1-12. Default for beginning is second sunday march; default for ending is first sunday november.

absoluteday	Specifies a specific day of a specific year on which to begin or end DST. Format is: *month day year* where: *month* is specified as 1-12. *day* is specified as 1-31. *year* is specified as 2003-2035. The year must be the same for the begin and end dates.
time_of_day	Specifies the time of day to begin or end Daylight Saving Time. May be specified as an hour (0-23) or as hour:minutes. Default is 2:00.
noautodst	Disables automatic Daylight Saving Time.

Default

Autodst, beginning every second Sunday in March, and ending every first Sunday in November.

Usage Guidelines

Network Time Protocol (NTP) server updates are distributed using GMT time.

To properly display the local time in logs and other timestamp information, the switch should be configured with the appropriate offset to GMT based on geographic location.

The *GMT_offset* is specified in +/- minutes from the GMT time.

Automatic DST changes can be enabled or disabled. The default configuration, where DST begins on the second Sunday in March at 2:00 AM and ends the first Sunday in November at 2:00 AM, applies to most of North America (beginning in 2007), and can be configured with the following syntax: `configure timezone GMT_offst autodst`.

The starting and ending date and time for DST may be specified, as these vary in time zones around the world.

- Use the **every** keyword to specify a year-after-year repeating set of dates (for example, the last Sunday in March every year).
- Use the **on** keyword to specify a non-repeating, specific date for the specified year. If you use this option, you will need to specify the command again every year.
- The **begins** specification defaults to every second Sunday in March.
- The **ends** specification defaults to every first sunday november.
- The ends date may occur earlier in the year than the begins date. This will be the case for countries in the Southern Hemisphere.
- If you specify only the starting or ending time (not both) the one you leave unspecified will be reset to its default.
- The time_of_day specification defaults to 2:00.
- The timezone IDs are optional. They are used only in the display of timezone configuration information in the `show switch` command.

To disable automatic DST changes, re-specify the GMT offset using the noautodst option: `configure timezone gmt_offst noautodst`.

Greenwich Mean Time offsets

NTP updates are distributed using GMT time. To properly display the local time in logs and other timestamp information, the switch should be configured with the appropriate offset to GMT based on geographical location. configure timezone on page 1437 describes the GMT offsets.

GMT Offset in Hours	GMT Offset in Minutes	Common Time Zone References	Cities
+0:00	+0	GMT - Greenwich Mean UT or UTC - Universal (Coordinated) WET - Western European	London, England; Dublin, Ireland; Edinburgh, Scotland; Lisbon, Portugal; Reykjavik, Iceland; Casablanca, Morocco

+14:00	+840	LINT-Line Islands Time	Kiritimati

For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Example

The following example configures GMT offset for Mexico City, Mexico and disables automatic DST:

```
# configure timezone -360 noautodst
```

The following four commands are equivalent, and configure the GMT offset and automatic DST adjustment for the US Eastern timezone, with an optional timezone ID of EST:

```
3 configure timezone name EST -300 autodst name EDT 60 begins every second sunday march
at 2 ends every first sunday november at 2:00
# configure timezone name EST -300 autodst name EDT 60 begins every 1 1 4 at 2:00 ends
every 5 1 10 at 2:00
# configure timezone name EST -300 autodst name EDT
# configure timezone -300 autodst
```

The following example configures the GMT offset and automatic DST adjustment for the Middle European timezone, with the optional timezone ID of MET:

```
# configure timezone name MET 60 autodst name MDT begins every last sunday march at 1
ends every last sunday october at 1
```

The following command configures the GMT offset and automatic DST adjustment for New Zealand. The ending date must be configured each year because it occurs on the first Sunday on or after March 5:

```
# configure timezone name NZST 720 autodst name NZDT 60 begins every first sunday october
at 2 ends on 3/16/2002 at 2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure trusted-ports trust-for dhcp-server

```
configure trusted-ports [ports|all] trust-for dhcp-server
```

Description

Configures one or more trusted *DHCP* ports.

Syntax Description

ports	Specifies one or more ports to be configured as trusted ports.
all	Specifies all ports to be configured as trusted ports.

Default

N/A.

Usage Guidelines

To configure trusted DHCP ports, you must first enable DHCP snooping on the switch. To enable DHCP snooping, use the following command:

```
enable ip-security dhcp-snooping {vlan} vlan_name ports [all |
ports] violation-action [drop-packet {[block-mac | block-port]
[durationduration_in_seconds | permanently] | none]}] {snmp-trap}
```

Trusted ports do not block traffic; rather, the switch forwards any DHCP server packets that appear on trusted ports. Depending on your DHCP snooping configuration, the switch drops packets and can disable the port temporarily, disable the port permanently, blackhole the MAC address temporarily, blackhole the MAC address permanently, and so on.

If you configure one or more trusted ports, the switch assumes that all DHCP server packets on the trusted port are valid.

Displaying DHCP Trusted Server Information

To display the DHCP snooping configuration settings, including DHCP trusted ports if configured, use the following command: `show ip-security dhcp-snooping {vlan} vlan_name`

To display any violations that occur, including those on DHCP trusted ports if configured, use the following command: `show ip-security dhcp-snooping violations {vlan} vlan_name`

Example

The following command configures ports 2:2 and 2:3 as trusted ports:

```
configure trusted-ports 2:2-2:3 trust-for dhcp-server
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure trusted-servers add server

```
configure trusted-servers [dynamic vlan_id |{vlan} vlan_name] add server
   ip_address trust-for dhcp-server
```

Description

Configures and enables a trusted *DHCP* server on the switch.

Syntax Description

vlan_name	Specifies the *VLAN* name.
dynamic	Configuration options for dynamically created VLANs.
vlan_id	VLAN ID tag between 1 and 4,094.
ip_address	Specifies the IP address of the trusted DHCP server.

Default

N/A.

Usage Guidelines

If you configured trusted DHCP server, the switch forwards only DHCP packets from the trusted servers. The switch drops DHCP packets from other DHCP snooping-enabled ports.

You can configure a maximum of eight trusted DHCP servers on the switch.

If you configure a port as a trusted port, the switch assumes that all DHCP server packets on that port are valid.

Displaying DHCP Trusted Server Information

To display the DHCP snooping configuration settings, including DHCP trusted servers if configured, use the following command:

`show ip-security dhcp-snooping {vlan} vlan_name`

To display any violations that occur, including those on the DHCP trusted servers if configured, use the following command:

`show ip-security dhcp-snooping violations {vlan} vlan_name`

Example

The following command configures a trusted DHCP server on the switch:

```
configure trusted-servers vlan purple add server 10.10.10.10 trust-for dhcp-server
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN and VLAN ID options added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure trusted-servers delete server

```
configure trusted-servers [dynamic vlan_id |vlan vlan_name] delete
   server ip_address trust-for dhcp-server
```

Description

Deletes a trusted *DHCP* server from the switch.

Syntax Description

vlan_name	Specifies the *VLAN* name.
ip_address	Specifies the IP address of the trusted DHCP server.
dynamic	Configuration options for dynamically created VLANs.
vlan_id	VLAN ID tag between 1 and 4,094.

Default

N/A.

Usage Guidelines

Use this command to delete a trusted DHCP server from the switch.

Displaying DHCP Trusted Server Information

To display the DHCP snooping configuration settings, including DHCP trusted servers if configured, use the following command:

```
show ip-security dhcp-snooping {vlan} vlan_name
```

To display any violations that occur, including those on the DHCP trusted servers if configured, use the following command:

```
show ip-security dhcp-snooping violations {vlan} vlan_name
```

Example

The following command deletes a trusted DHCP server from the switch:

```
configure trusted-servers vlan purple delete server 10.10.10.10 trust-for dhcp-server
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN and VLAN ID options added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure tunnel ipaddress

```
configure tunnel tunnel_name ipaddress [ipv6-link-local | {eui64}
   ipv6_address_mask ]
```

Description

Configures an IPv6 address/prefix on a tunnel.

Syntax Description

tunnel_name	Specifies an IPv6 tunnel.
ipv6-link-local	Specifies the link-local address for a tunnel.
eui64	Specifies an EUI64 interface identifier for the lower 64 bits of the address.
ipv6_address_mask	Specifies an IPv6 address / IPv6 prefix length.

Default

N/A.

Usage Guidelines

This command will configure an IPv6 address/prefix route on the specified tunnel.

6to4 tunnels must follow the standard address requirement. The address must be of the form `2002:`*`IPv4_source_endpoint`*`::/16`, where *`IPv4_source_endpoint`* is replaced by the IPv4 source address of the endpoint, in hexadecimal, colon separated form. For example, for a tunnel endpoint located at IPv4 address 10.20.30.40, the tunnel address would be 2002:a14:1e28::/16. In hex, 10 is a, 20 is 14, 30 is 1e and 40 is 28.

6in4 tunnels have no restrictions on their address format or prefix allocations.

Note
This command does not work for GRE tunnels. The following error message is displayed:
`Error: IPv6 addresses can not be configured on GRE type tunnels!`

Example

The following example configures the 6in4 tunnel "link39" with the IPv6 link-local address:

```
configure tunnel link39 ipaddress ipv6-link-local
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in the *Switch Engine 32.2 Feature License Requirements* document..

configure tunnel ip tcp adjust-mss

`configure tunnel` *`tunnel_name`* **`ip tcp adjust-mss`** `[`**`off`** `|` **`on`** *`tcp_mss_value`*`]`

Description

Adjusts the TCP Maximum Segment Size (MSS) on GRE Tunnel.

Syntax Description

`tunnel_name`	Specifies an IPv4 tunnel name.
`ip`	Specifies IP networking.
`tcp`	Specifies the TCP protocol.
`adjust-mss`	Specifies to adjust the TCP payload MSS.
`off`	Specifies to turn off TCP MSS adjustment (Default).
`on`	Specifies to turn on TCP MSS adjustment.
`tcp_mss_value`	Specifies the value of TCP MSS in bytes. Range is 536-9130.

Default

Off.

Usage Guidelines

This command is only available for GRE Tunnel.

For the *tcp_mss_value* option, because it is an adjustment, there is no default value. When TCP MSS is off, the value is ignored.

Example

The following example configures tcp adjust-mss for tunnel "mytunnel" with an adjust-mss value of 1300:

```
configure tunnel mytunnel ip tcp adjust-mss on 1300
```

History

This command was first available in ExtremeXOS 31.6.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in the *Switch Engine 32.2 Feature License Requirements* document..

configure twamp endpoint

```
configure twamp [add | delete] endpoint {vr name} ipaddress ip port
   udp_port
```

Description

This command allows you to add and delete the TWAMP endpoints.

Syntax Description

ip	The endpoint IP address, either IPv4 or IPv6.
udp_port	The UDP port the endpoint will listen on; range is 1025 - 65535
name	An optional VR may be used; default is *VR-Default*.

Default

N/A.

Usage Guidelines

Use this command to add and delete the TWAMP endpoints. The user specifies the IP address and UDP port number for the endpoint. Removing the endpoint terminates all test sessions associated with the endpoint.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure twamp key-id

```
configure twamp [ add | delete ] key-id key_name shared_secret
```

Description

This command configures the shared secret used for authentication and encryption.

Syntax Description

key_name	The 80 octet KeyID field in the Set-Up-Response control message from RFC 4656.
shared_secret	The shared secret passphrase, which is used to derive the shared secret key, as defined in RFC 5357.

Default

N/A.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure twamp reflector

```
configure twamp reflector [{sessions count} {timeout ref_wait}]
```

Description

This command allows you to modify the number of test sessions to support and timeout value for those test sessions.

Syntax Description

count	Range 0 – 2000 entries; default 2000.
ref_wait	Range 30 – 3600 seconds; default 900 seconds.

Default

count = 2000

ref_wait = 900

Usage Guidelines

The timeout value is the REFWAIT value specified in RFC 5357.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure twamp server

```
configure twamp server [{sessions count} {timeout serv_wait}]
```

Description

This command allows you to modify the number of concurrent TWAMP control sessions to support and the timeout value for those control sessions.

Syntax Description

count	Range 1 - 64.
serv_wait	Range 30 - 3600 seconds.

Default

count = 64

serv_wait = 900

Usage Guidelines

The application terminates the control session if the timeout value expires without the reception of a TWAMP-Control message. This value is the SERVWAIT value specified in RFC 5357.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure upm event

`configure upm event` *`upm-event`* **`profile`** *`profile-name`* **`ports`** *`port_list`*

Description

Configures a pre-defined event that triggers the named profile.

Syntax Description

`upm-event`	Specifies a pre-defined event type: device-detect, device-undetected, user-authenticate, user-unauthenticated.
`profile-name`	Specifies the profile to be configured.
`port-list`	Attaches the UPM profile to the specified port(s).

Default

N/A.

Usage Guidelines

This command configures a profile to be executed when the specified event occurs on the specified port(s).

You can configure multiple user profiles on the same port(s).

Example

The following example shows how to configure a profile on port 1:1, called “profile 1” that is triggered by the event “device-detect”:

```
# configure upm event device-detect profile "p1" ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure upm profile maximum execution-time

`configure upm profile` *`profile-name`* **`maximum execution-time`** *`seconds`*

Description

Defines a maximum execution period for a profile.

Syntax Description

`seconds`	Defines the execution period in seconds. The range is 2 to 4294967295 seconds.

Default

30 seconds.

Usage Guidelines

If you make a mistake while configuring a profile and the profile loops, it will loop until the end of the maximum execution period. While testing new profiles, consider configuring a relatively short execution time so that any accidental loops do not create long delays during testing.

Example

The following example sets the execution period to 10 seconds:

```
configure upm profile test maximum execution-time 10
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.opic/ph "/>

configure upm timer after

```
configure upm timer timer-name after time-in-secs {every seconds}
```

Description

Creates and names a UPM timer that is activated after the specified time in seconds.

Syntax Description

timer-name	Specifies the name of the UPM timer to be created.
time-in-secs	Configures the interval after which the UPM timer is activated.
seconds	Configures the UPM timer to be activated after every instance of the specified interval.

Default

N/A.

Usage Guidelines

Use this command to configure a timer that activates after the specified time. This is useful for deployment in CLI scripts, because you do not know what the current time will be when the script executes.

When a switch configuration is saved or restored, the UPM timers are activated only at the predetermined timings that were originally configured with the start time.

The periodic timer configured with the every keyword and the one-time timer configured with only the after keyword have a maximum range of one year in seconds (31,622,400 seconds).

Example

The following example configures the UPM timer “A” to be activated every 10 seconds, after an interval of 20 seconds:

```
configure upm  timer "timerA" after 20 every 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure upm timer at

```
configure upm timer timer-name at month day year hour min secs {every
   seconds}
```

Description

Use this command to configure the time setting on a UPM timer.

Syntax Description

timer-name	Specifies the name of the UPM timer to be created.
month	Configures the month when the UPM timer is activated.
day	Configures the day when the UPM timer is activated.
year	Configures the year when the UPM timer is activated.
hour	Configures the hour when the UPM timer is activated.
min	Configures the minute when the UPM timer is activated.
secs	Configures the second when the UPM timer is activated.
seconds	Configures the UPM timer to be activated at every instance of the specified interval.

Default

N/A.

Usage Guidelines

Use this command to when you know the exact time you want an event to execute. If you use this command without the every keyword, the timer is activated once at the specified time. The every keyword configures a periodic timer that is activated at every instance of the time specified in seconds.

When a switch configuration is saved or restored, the UPM timers are activated only at the predetermined timings that were originally configured with the start time.

Example

The following example shows how to configure a timer, T1, that is activated every 10 seconds beginning at 1400 hours on October 16, 2006:

```
# configure upm timer "t1" at 10 16 2006 14 00 00 every 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure upm timer profile

`configure upm timer` *`timer-name`* **`profile`** *`profileName`*

Description

Associates a profile with a UPM timer.

Syntax Description

`timer-name`	Specifies the name of the UPM timer to be associated with the named profile.
`profileName`	Specifies the name of the profile to be associated with the UPM timer.

Default

N/A.

Usage Guidelines

Each timer can be attached to only one profile. Once a timer is configured to a profile, it must be unconfigured from that profile before it can be configured to a different profile.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure virtual-network

```
configure virtual-network vn_name [add | delete] [{vlan vlan_name} |
   {vman vman_name | dynamic {vlan} vlan_id]
```

Description

This command adds/removes a tenant *VLAN* or VMAN to a virtual network.

Syntax Description

vn_name	Alphanumeric string indentifying the Virtual Network to be configured.
add	Add a tenant VLAN to the Virtual Network.
delete	Delete a tenant VLAN from the Virtual Network.
vlan	Specifies VLAN.
vlan_name	Name of the tenant VLAN.
vman	Specifies VMAN.
vman_name	Name of the tenant VMAN.
dynamic	Specifies configuring options for dynamically created VLANs. Adds dynamic VLAN's VID to a VNET. You can save this to the configuration and is it persistent across reboots. After reboot when a dynamic VLAN gets created with matching VID, the VLAN is internally applied to the VNET, so that you do not need to reconfigure this every time after reboot.
vlan	Add or delete a tenant VLAN to the Virtual Network
vlan_id	VLAN ID tag between 2 and 4,094.

Default

N/A.

Usage Guidelines

Only a single VLAN/VMAN can be added to a virtual network.

Example

The following example adds a VLAN to an existing virtual network:

```
# configure virtual-network my_virtual_network add vlan vlan100
```

The following example removes a VLAN from an existing virtual network:

```
# configure virtual-network my_virtual_network delete vlan vlan100
```

The following example adds dynamic VLANs with VID 100 to virtual network "my_virtual_network":

```
# configure virtual-network my_virtual_network add dynamic vlan 100
```

History

This command was first available in ExtremeXOS 21.1.

VMAN option added in ExtremeXOS 22.1.

Configuring dynamic VLANs as tenant VLANs was added in ExtremeXOS 30.3.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network add network ports

`configure` **`virtual-network add network ports`** [**`all`** | *`portlist`*]

Description

Add ports that can terminate tunnels carrying VXLAN or NVGRE encapsulated traffic.

Syntax Description

`add`	Add to existing overlay tunnel termination configuration.
`network`	Configuration related to underlay network.
`ports`	Select ports that can terminate tunnels carrying VXLAN or NVGRE encapsulated traffic.
`all`	Select all ports.
`portlist`	Lists ports to be added.

Default

N/A.

Example

The following example adds ports 1–10 to terminate tunnels carrying VXLAN or NVGRE encapsulated traffic:

```
configure virtual-network add network ports 1-10
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network delete network ports

```
configure virtual-network delete network ports [all | portlist]
```

Description

Deletes ports that can terminate tunnels carrying VXLAN or NVGRE encapsulated traffic.

Syntax Description

delete	Delete from existing overlay tunnel termination configuration.
network	Configuration related to underlay network.
ports	Remove ports that can terminate tunnels carrying VXLAN or NVGRE encapsulated traffic.
all	Select all ports.
portlist	Lists ports to be deleted.

Default

N/A.

Example

The following example deletes ports 1–10 to terminate tunnels carrying VXLAN or NVGRE encapsulated traffic:

```
configure virtual-network delete network ports 1-10
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network dynamic

```
configure virtual-network dynamic [on | off]
```

Description

Globally controls enabling or disabling auto-creation of virtual networks.

Syntax Description

virtual-network	Virtual overlay network.
dynamic	Configure creation of dynamic virtual networks.
on	Enable creation of dynamic virtual networks by applications such as BGP Auto-peering.
off	Disable creation of dynamic virtual networks by applications such as BGP Auto-peering (default).

Default

By default, automatic creation of virtual networks is disabled.

Usage Guidelines

Creating or deleting BGP Auto-peering enables or disables automatic virtual network creation.

You can view the setting from this command in the `show virtual-network {vn_name | vxlan vni vni | [vlan vlan_name | vman vman_name]}` command.

Example

The following example enables automatic creation of virtual networks:

```
# configure virtual-network dynamic on
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network flooding

```
configure virtual-network vn_name flooding [standard | multicast {group
   [<grpipaddress> | none]}]
```

Description

This command modifies the flooding mode of an existing virtual network.

Syntax Description

vn_name	Alphanumeric string identifying the Virtual Network to be configured.
standard	Head-end replication to remote endpoints with standard L2 flooding to tenant ports.
multicast	Multicast flooding to remote endpoints with standard L2 flooding to tenant ports.
group	Configure multicast group for flooding of unknown-destination frames (automatically assigned if unspecified).
grpipaddress	IPv4 multicast group address to be used for flooding.
none	Unconfigure multicast group. Flooding changes to auto-assigned multicast group.

Default

Standard.

Usage Guidelines

For auto-assigning multicast groups, you must configure the following command: **configure virtual-network multicast group**.

This command is not allowed on dynamic virtual networks.

Example

To configure multicast flooding mode (group is auto-assigned):

```
configure virtual-network my_virtual_network flooding multicast
```

To configure multicast flooding mode specifying a multicast group:

```
configure virtual-network my_virtual_network flooding multicast group 232.1.1.1
```

To unconfigure multicast group (flooding changes to auto-assigned group):

```
configure virtual-network my_virtual_network flooding multicast none
```

To configure standard flooding mode:

```
configure virtual-network my_virtual_network flooding standard
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 standalone, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network local endpoint

```
configure virtual-network local-endpoint [ ipaddress ipaddress { vr
   vr_name } | none ]
```

Description

This command configures a local IPv4 address to be used as SIP for encapsulated packets.

Syntax Description

ipaddress	Configure the IP address to be used as source IP address for VXLAN packets encapsulated by this gateway.
ipaddress	An existing interface IPv4 address.
vr	VR/VRF instance the IPv4 address is configured on.
vr_name	An existing VR/VRF name.
none	Remove existing IP address configuration for the local tunnel endpoint for this virtual router.

Default

VR-Default.

Usage Guidelines

The address must have been configured as an interface address prior to issuing this command. Although not mandatory, it is strongly recommended that a loopback *VLAN* IP address be used as the local IP address for tunnels. “VR-Default” is the default for VR/VRF name. ExtremeXOS checks if the given IP address is configured on the VR/VRF. If not configured, the command fails with an appropriate error message. This release of ExtremeXOS supports tunnel termination on a single VR/VRF. That VR/VRF can be a user created. If you intend to change the IP address or the VR/VRF, you can re-issue the same command with a different IP address to effect the change.

Example

To configure a local tunnel endpoint IP address in a user created VR/VRF:

```
configure virtual-network local-endpoint ipaddress 10.10.10.1 vr VR-User
```

To change a local tunnel endpoint to a different IP address within the same VR/VRF:

```
configure virtual-network local-endpoint ipaddress 20.20.20.1 vr VR-User
```

To unconfigure a local tunnel endpoint IP address:

```
configure virtual-network local-endpoint none
```

To change a local tunnel endpoint to a different IP address in a different VR/VRF:

```
configure virtual-network local-endpoint ipaddress 10.10.10.1 vr VR-Default
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network monitor

```
configure virtual-network vn_name monitor [ on | off ]
```

Description

Use this command to enable or disable statistics monitoring (byte/packet counters) on a Virtual Network.

Syntax Description

vn_name	Alphanumeric string identifying the Virtual Network to be configured.
on	Enable statistics.
off	Disable statistics.

Default

N/A.

Usage Guidelines

N/A.

Example

To enable statistics monitoring on an existing Virtual Network:

```
configure virtual-network vnet1 monitor on
```

To disable statistics monitoring on an existing Virtual Network

```
configure virtual-network vnet1 monitor off
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 standalone, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network multicast group

```
configure virtual-network multicast group [grpipaddress netmask | none]
```

Description

This command is used to configure multicast group range to be used for auto-assigned groups.

Syntax Description

grpipaddress	IPv4 multicast group range for flooding of unknown destination frames
netmask	IPv4 multicast group address netmask (format 255.x.x.x).
none	Unconfigure multicast group range.

Default

Standard.

Usage Guidelines

Example

```
configure virtual-network multicast group 232.1.1.1 255.255.255.255
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 standalone, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network name

```
configure virtual-network vn_name name new_name
```

Description

Renames virtual networks.

Syntax Description

virtual-network	Configures virtual networks.
vn_name	Specifies the virtual network to be renamed.
name	Selects renaming the virtual network.
new_name	Specifies the new name for the virtual network.

Default

N/A.

Usage Guidelines

Dynamically created virtual networks are not saved to the configuration. When a dynamically created virtual network is renamed, the virtual network becomes static and is saved to the configuration.

Example

The following example changes the name of the virtual network from "vn1" to "vn2":

```
# configure virtual-network vn name vn2
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network remote-endpoint vxlan ipaddress

```
configure virtual-network vn_name [add | delete] remote-endpoint vxlan
   ipaddress ipaddress {vr vr_name}
```

Description

Use this command to add or remove a remote endpoint to a virtual network.

Syntax Description

vn_name	Alphanumeric string identifying the Virtual Network to be configured.
add	Add configuration to the virtual network.
delete	Delete configuration from the virtual network.
ipaddress	A remote endpoint IP address.
vr	VR/VRF instance the remote endpoint is associated with.
vr_name	An existing VR/VRF name.

Default

VR-Default.

Usage Guidelines

This command is only valid when the virtual network is operating in “flooding standard” mode. The remote endpoint will receive unknown destination frames of all types that enter the virtual network from the local endpoint. For "explicit-remotes" flooding mode, the remote endpoints are added when BUM *FDB* entries are added.

Example

To add a remote endpoint to an existing Virtual Network:

```
configure virtual-network my_virtual_network add remote-endpoint vxlan ipaddress 1.2.3.4
```

To remove a remote endpoint from an existing Virtual Network:

```
configure virtual-network my_virtual_network delete remote-endpoint vxlan ipaddress
1.2.3.4
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network remote-endpoint vxlan ipaddress monitor

```
configure virtual-network remote-endpoint vxlan ipaddress ipaddress { vr
   vr_name } monitor [ on | off ]
```

Description

This command enables or disables statistics monitoring (byte/packet counters) on a Virtual Network remote endpoint.

Syntax Description

ipaddress	An existing interface IPv4 address.
vr	VR/VRF instance the IPv4 address is configured on.
vr_name	An existing VR/VRF name.
on	Enable statistics.
off	Disable statistics.

Default

Off.

Usage Guidelines

The command applied on dynamic remote endpoint is not saved to the configuration. If you want it to be saved, convert the remote endpoint to static using the command `create virtual-network remote-endpoint vxlan ipaddress` *ipaddress* {**vr** *vr_name*}.

Example

To enable statistics monitoring on an existing Virtual Network remote endpoint:

```
configure virtual-network remote-endpoint vxlan ipaddress 10.10.10.146 monitor on
```

To disable statistics monitoring on an existing Virtual Network remote endpoint:

```
configure virtual-network remote-endpoint vxlan ipaddress 10.10.10.146 monitor on
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network replication-role

```
configure virtual-network replication-role [rnve | replicator | leaf
   {selected-replicator-default ipaddress}]
```

Description

Configures the assisted replication role on a switch. In addition, if the switch role is leaf, this command also configures the default selected replicator for all virtual networks created afterwards.

Syntax Description

virtual-network	Designates changing the virtual overlay network configuration.
replication-role	Sets the replication role used for VXLAN replication of unknown unicast, broadcast, and multicast traffic.
rnve	Sets regular network virtualization edge node (RNVE) to use head-end replication (default).
replicator	Sets replicate tunneled broadcast and multicast traffic to leaf nodes.
leaf	Sets tunnel broadcast and multicast traffic to replicator.
selected-replicator-default	Sets the default target to send broadcast and multicast traffic to perform replication.
ipaddress	Sets the IPv4 address of a remote tunnel endpoint configured as a replicator.

Default

If not specified, the replicator role is set to RNVE.

Usage Guidelines

The **selected-replicator-default** value is only applied to currently configured virtual networks if the role is changing to **leaf**. It is always applied to virtual networks you create afterwards. To change the **selected-replicator** for already configured virtual networks, use the command `configure` **virtual-network** *vn_name* **selected-replicator** [**ipaddress** *ipaddress* | **none**].

Do not configure a switch as the new replicator until the prior replicator is unconfigured because packet duplication might occur.

To remove configuration of the assisted replication feature, set the replication role to **rnve**, and the switch reverts back to head-end replication.

Example

The following example configures a node as a replicator:

```
# configure virtual-network replication-role replicator
```

The following example configures a node as a leaf, assigning a default selected replicator for future created virtual networks only:

```
# configure virtual-network replication-role leaf selected-replicator-default 1.2.3.4
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure virtual-network selected-replicator

```
configure virtual-network vn_name selected-replicator [ipaddress
   ipaddress | none]
```

Description

Sets, or removes, the selected replicator for an already configured virtual network.

Syntax Description

virtual-network	Designates changing the virtual overlay network configuration.
vn_name	Sets the alphanumeric string identifying the virtual network to be configured.
selected-replicator	Target to send broadcast and multicast traffic to perform replication when configured as leaf.
ipaddress	Designates configuring the IP address of a remote tunnel-endpoint to be used as replicator.
ipaddress	Sets the IPv4 address of the remote tunnel-endpoint configured as a replicator.
none	Removes an existing default selected replicator for this virtual network.

Default

N/A.

Usage Guidelines

Example

The following example configures the remote tunnel-endpoint at the IP address "10.1.1..100" as the selected replicator for the virtual network "vn-blue":

```
# configure virtual-network vn-blue selected-replicator 10.1.1.100
```

The following example removes the selected replicator from the virtual network "vn-blue":

```
# configure virtual-network vn-blue selected-replicator none
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on the ExtremeSwitching 5520 platform.

configure virtual-network vxlan vni

```
configure virtual-network vn_name vxlan vni [ vni | none]
```

Description

Use this command to assign a VXLAN VNI to a virtual network.

Syntax Description

vn_name	Alphanumeric string identifying the Virtual Network to be configured.
vni	Virtual Network Identifier value between 1 and 16777215.
none	Remove existing VXLAN VNI configuration for this virtual network.

Default

N/A.

Usage Guidelines

The range of supported VNIs is 1-16777215. The VNI needs to be unique and not more than a one VNI can configured for a virtual-network in this release of ExtremeXOS.

Example

To configure a VXLAN VNI value of 10000 to an existing Virtual Network:

```
configure virtual-network my_virtual_network vxlan vni 10000
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure vlan add nsi | isid

```
configure [{vlan} vlan_name |vlan vlan_id] add [nsi nsi | isid isid]
```

Description

Maps a static VLAN to a Network Service Identifier (NSI) or Individual Service Identifier (ISID).

Syntax Description

vlan	Specifies VLAN.
vlan_name	Specifies the name of the VLAN to map.
vlan_id	Specifies the ID of the VLAN to map.
add	Specifies mapping a VLAN to an NSI.
nsi	Specifies an NSI.
nsi	Specifies the ID number of the NSI to map to the VLAN.
isid	Specifies an ISID.
isid	Specifies the ID number of the ISID to map to the VLAN.

Default

N/A.

Usage Guidelines

These static VLAN mappings do not age out of the *LLDP* database, but are removed when the VLAN is deleted or when removed by the command configure vlan delete nsi | isid on page 1475.

You can only map one VLAN to an NSI or ISID.

Example

The following example maps VLAN "vlan1" to NSI "1000":

```
# configure vlan vlan1 add nsi 1000
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan add ports

```
configure [ {vlan} vlan_name | vlan vlan_list] add ports [port_list |
   all] {tagged tag | untagged} {{stpd} stpd_name} {dot1d | emistp |
   pvst-plus}}
```

Description

Adds one or more ports in a *VLAN*.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.
port_list	Specifies a list of ports or slots and ports.
all	Specifies all ports.
tagged *tag*	Specifies the ports should be configured as tagged.
untagged	Specifies the ports should be configured as untagged.
stpd_name	Specifies an *STP* domain name.
dot1d | emistp | pvst-plus	Specifies the BPDU encapsulation mode for these STP ports.

Default

Untagged.

Usage Guidelines

The VLAN must already exist before you can add (or delete) ports: use the `create vlan` command to create the VLAN.

If the VLAN uses 802.1Q tagging, you can specify tagged or untagged port(s). If the VLAN is untagged, the ports cannot be tagged.

Untagged ports can only be a member of a single VLAN. By default, they are members of the default VLAN (named Default). In order to add untagged ports to a different VLAN, you must first remove them from the default VLAN. You do not need to do this to add them to another VLAN as tagged ports. If you attempt to add an untagged port to a VLAN prior to removing it from the default VLAN, you see the following error message:

```
Error: Protocol conflict when adding untagged port 1:2. Either add this port as tagged or
assign another protocol to this VLAN.
```

Note

This message is not displayed if keyword **all** is used as *port_list*.

The ports that you add to a VLAN and the VLAN itself cannot be explicitly assigned to different virtual routers (VRs). When multiple VRs are defined, consider the following guidelines while adding ports to a VLAN:

- A VLAN can belong (either through explicit or implicit assignment) to only one VR.
- If a VLAN is not explicitly assigned to a VR, then the ports added to the VLAN must be explicitly assigned to a single VR.

- If a VLAN is explicitly assigned to a VR, then the ports added to the VLAN must be explicitly assigned to the same VR or to no VR.
- If a port is added to VLANs that are explicitly assigned to different VRs, the port must be explicitly assigned to no VR.

Note

User-created VRs are supported only on the platforms listed for this feature in in the *Switch Engine 32.2 Feature License Requirements* document. On switches that do not support user-created VRs, all VLANs are created in *VR-Default* and cannot be moved.

Refer to the STP section in the *Switch Engine 32.2 User Guide* for more information on configuring Spanning Tree Domains.

Note

If you use the same name across categories (for example, *STPD* and *EAPS* names), we recommend that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

Beginning with ExtremeXOS 11.4, the system returns the following message if the ports you are adding are already EAPS primary or EAPS secondary ports:

```
WARNING: Make sure Vlan1 is protected by EAPS. Adding EAPS ring ports to a VLAN could
cause a loop in the network. Do you really want to add these ports? (y/n)
```

Example

The following example assigns tagged ports 1:1, 1:2, 1:3, and 1:6 to a VLAN named "accounting":

```
configure vlan accounting add ports 1:1, 1:2, 1:3, 1:6 tagged
```

History

This command was first available in ExtremeXOS 10.1.

The **tagged** keyword was added in ExtremeXOS 15.4.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan add ports private-vlan translated

Translation from network *VLAN* tag to each subscriber VLAN tag is done by default in a private VLAN.

```
configure [ {vlan} vlan_name | vlan vlan_id] add ports port_list
   private-vlan translated
```

Description

Adds the specified ports to the specified network VLAN and enables tag translation for all subscriber VLAN tags to the network VLAN tag.

Syntax Description

vlan_name	Specifies the network VLAN to which the ports are added.
vlan_list	Specifies a VLAN list of IDs.
port_list	Specifies the ports to be added to the network VLAN.

Default

N/A.

Usage Guidelines

This command is allowed only when the specified VLAN is configured as a network VLAN on a PVLAN.

Example

The following example adds port 2:1 to VLAN sharednet and enables VLAN translation on that port:

```
configure sharednet add ports 2:1 private-vlan translated
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan add ports stpd

```
configure vlan vlan_name add ports [all | port_list] {tagged {tag} |
   untagged} stpd stpd_name {[dot1d | emistp | pvst-plus]}
```

Description

Adds one or more ports in a *VLAN* to a specified *STPD*.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all of the ports to be included in the STPD.

port_list	Specifies the port or ports to be included in the STPD.
tagged	Specifies the ports should be configured as tagged.
tag	Specifies the port-specific VLAN tag. When there are multiple ports specified in the *port_list*, the same tag is used for all of them. When unspecified port *tag* is equal to the VLAN tag.
untagged	Specifies the ports should be configured as untagged.
stpd_name	Specifies an STPD name on the switch.
dot1d	Specifies the *STP* encapsulation mode of operation to be 802.1d.
emistp	Specifies the STP encapsulation mode of operation to be EMISTP.
pvst-plus	Specifies the STP encapsulation mode of operation to be PVST+.

Default

Ports in the default STPD (s0) are in dot1.d mode.

Ports in user-created STPDs are in emistp mode.

Usage Guidelines

To create a VLAN, use the `create vlan` command. To create an STP domain, use the `create stpd` command.

In an EMISTP or PVST+ environment, this command adds a list of ports to a VLAN and a specified STPD at the same time provided the carrier VLAN already exists on the same set of ports. You can also specify the encapsulation mode for those ports.

In an *MSTP* environment, you do not need a carrier VLAN. A CIST controls the connectivity of interconnecting MSTP regions and sends BPDUs across the regions to communicate region status. You must use the dot1d encapsulation mode in an MSTP environment.

You cannot configure STP on the following ports:

- Mirroring target ports.
- Software-controlled redundant ports.

If you see an error similar to the following:

```
Error: Cannot add VLAN default port 3:5 to STP domain
```

You might be attempting to add:

- A carrier VLAN port to a different STP domain than the carrier VLAN belongs.
- A VLAN/port for which the carrier VLAN does not yet belong.

Note

This restriction is only enforced in an active STP domain and when you enable STP to ensure you have a legal STP configuration.

Naming Conventions

If your VLAN has the same name as another component, for example an STPD, we recommend that you specify the identifying keyword as well as the name. If your VLAN has a name unique only to that VLAN, the keywords vlan and stpd are optional.

STP Encapsulation Modes

You can specify the following STP encapsulation modes:

- dot1d—This mode is reserved for backward compatibility with previous STP versions. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

  This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.
- emistp—This mode sends BPDUs with an 802.1Q tag having an STPD ID in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- pvst-plus—This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs, and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

These encapsulation modes are for STP ports, not for physical ports. When a physical ports belongs to multiple STPDs, it is associated with multiple STP ports. It is possible for the physical port to run in different modes for different domains for which it belongs.

MSTP STPDs use only 802.1D BPDU encapsulation mode. The switch prevents you from configuring EMISTP or PVST+ encapsulation mode for MSTP STPDs.

Specify the port *tag* when you need to put multiple vlans into a broadcast domain.

Automatically Inheriting Ports--MSTP Only

In an MSTP environment, whether you manually or automatically bind a port to an *MSTI* in an MSTP region, the switch automatically binds that port to the CIST. The CIST handles BPDU processing for itself and all of the MSTIs; therefore, the CIST must inherit ports from the MSTIs in order to transmit and receive BPDUs.

Example

The following command adds slot 1, port 2 and slot 2, port 3, members of a VLAN named Marketing, to the STPD named STPD1, and specifies that they be in EMISTP mode:

```
configure vlan marketing add ports 1:2, 2:3 tagged stpd stpd1 emistp
```

The following examples illustrate the *tag* variable in ExtremeXOS 15.4.

The following example configures vlan with tag 100 and port tag of 10 and 11 on two different ports:

```
create vlan exchange tag 100
config vlan exchange add ports 3 tagged 10
config vlan exchange add ports 4 tagged 11
```

The following example configures a VLAN with tag 100, and port tag of 10 and 11 on the same ports:

```
create vlan exchange tag 100
config vlan exchange add ports 3 tagged 10
config vlan exchange add ports 3 tagged 11
```

The following example configures VLAN with tag 100, and port tag of 10 on two ports and 11 on a different port:

```
create vlan exchange tag 100
config vlan exchange add ports 2:3,2:4 tagged 10
config vlan exchange add ports 2:5 tagged 11
```

History

This command was first available in ExtremeXOS 10.1.

The **nobroadcast** keyword was removed in ExtremeXOS 11.4.

The *tag* variable was added in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan add secondary-ipaddress

```
configure [ {vlan} vlan_name | vlan vlan_id]add secondary-ipaddress
   anycast [ip_address {netmask} | ipNetmask]
```

Description

Configures secondary IP addresses on a *VLAN* to support multinetting.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_id	Specifies a VLAN id.
anycast	Specifies that the address functions like any other secondary address on a VLAN, but responds to ARP requests with the anycast MAC address.
ip_address	Specifies an IP address.
netmask	Specifies a network mask.
ipNetmask	Specifies an IP address with network mask.

Default

N/A.

Usage Guidelines

Adding a secondary IP address to a VLAN enables multinetting. Secondary addresses are added to support legacy stub IP networks.

After you have added a secondary IP address to a VLAN, you cannot unconfigure the primary IP address of that VLAN until you delete all of the secondary addresses. To delete the secondary address, use the following command:

`configure [ {vlan} vlan_name | vlan vlan_id] delete secondary-ipaddress [ip_address | all]`

Example

The following example configures the VLAN multi to support the 10.1.1.0/24 subnet in addition to its primary subnet:

```
# configure vlan multi add secondary-ipaddress 10.1.1.1/24
```

History

This command was first available in ExtremeXOS 11.0.

The *vlan_id* variable is first available in ExtremeXOS 16.1.

Anycast capability was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan delete nsi | isid

`configure [{vlan} vlan_name |vlan vlan_id] delete [nsi nsi | isid isid]`

Description

Unmaps a static VLAN from a Network Service Identifier (NSI) or Individual Service Identifier (ISID).

Syntax Description

vlan	Specifies VLAN.
vlan_name	Specifies the name of the VLAN to remove.
vlan_id	Specifies the ID of the VLAN to remove.
delete	Specifies removing the mapping of a VLAN from an NSI.

nsi	Specifies an NSI.
nsi	Specifies the ID number of the NSI to unmap from the VLAN.
isid	Specifies an ISID.
isid	Specifies the ID number of the ISID to unmap from the VLAN.

Default

N/A.

Usage Guidelines

Only mappings created by the command configure vlan add nsi | isid on page 1467 can be removed using this command.

Example

The following example removes VLAN "vlan1" from NSI "1000":

```
# configure vlan vlan1 delete nsi 1000
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan delete ports

```
configure [ {vlan} vlan_name | vlan vlan_list] delete ports [all |
   port_list ]
```

Description

Deletes one or more ports in a *VLAN*.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.
all	Specifies all ports.
port_list	Specifies a list of ports or slots and ports.
tagged *tag*	Specifies the port-specific VLAN tag. When there are multiple ports specified using *port_list*, the same tag is used for all of them.

Default

When unspecified, the port tag is equal to the VLAN tag.

Usage Guidelines

Specify port tag to delete a VLAN port that has a different tag from the VLAN tag.

Example

The following example removes ports 1, 3, and 7 on a switch from a VLAN named accounting:

```
configure accounting delete ports 1,3,7
```

The following example deletes a VLAN port with tag 10:

```
create vlan exchange tag 100
config vlan exchange del ports 3 tag 10
```

The following example deletes a VLAN port tag of 10 on two ports:

```
create vlan exchange tag 100
config vlan exchange d ports 3,4 tag 10
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan delete secondary-ipaddress

```
configure [ {vlan} vlan_name | vlan vlan_id] delete secondary-ipaddress
   [ip_address | all]
```

Description

Removes secondary IP addresses on a *VLAN* that were added to support multinetting.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_id	Specifies a VLAN ID.
ip_address	Specifies an IP address.
all	Specifies deleting all existing secondary and anycast IP addresses.

Default

N/A.

Usage Guidelines

After you have added a secondary IP address to a VLAN (`configure [ {vlan} vlan_name | vlan vlan_id] add secondary-ipaddress anycast [ip_address {netmask} | ipNetmask]`), you cannot unconfigure the primary IP address of that VLAN until you delete all of the secondary addresses. Use the **all** keyword to delete all the secondary and anycast IP addresses from a VLAN.

Example

The following example removes the 10.1.1.0 secondary IP address from the VLAN "multi":

```
# configure vlan multi delete secondary-ipaddress 10.1.1.1
```

History

This command was first available in ExtremeXOS 11.0.

The *vlan_id* variable is first available in ExtremeXOS 16.1.

The capability to delete anycast IP addresses was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan description

`configure {vlan} vlan_name description [vlan-description | none]`

Description

Configures a description for the specified *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN name.
vlan-description	Specifies a VLAN description (up to 64 characters) that appears in show vlan commands and can be read from the ifAlias MIB object for the VLAN.
none	This keyword removes the configured VLAN description.

Default

By default, the VLAN has no description.

Usage Guidelines

The VLAN description must be in quotes if the string contains any space characters. If a VLAN description is configured for a VLAN that already has a description, the new description replaces the old description.

Example

The following example assigns the description "Campus A" to VLAN vlan1:

```
configure vlan vlan1 description "Campus A"
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan dhcp-address-range

`configure vlan` *`vlan_name`* **`dhcp-address-range`** *`ipaddress1`* **`-`** *`ipaddress2`*

Description

Configures a set of *DHCP* addresses for a *VLAN*.

Syntax Description

`vlan_name`	Specifies the VLAN on whose ports DHCP will be enabled.
`ipaddress1`	Specifies the first IP address in the DHCP address range to be assigned to this VLAN.
`ipaddress2`	Specifies the last IP address in the DHCP address range to be assigned to this VLAN.

Default

N/A.

Usage Guidelines

The following error conditions are checked: ipaddress2 >= ipaddress1, the range must be in the VLAN's network, the range does not contain the VLAN's IP address, and the VLAN has an IP address assigned.

Example

The following command allocates the IP addresses between 192.168.0.20 and 192.168.0.100 for use by the VLAN temporary:

```
configure temporary dhcp-address-range 192.168.0.20 - 192.168.0.100
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan dhcp-lease-timer

`configure vlan` *`vlan_name`* **`dhcp-lease-timer`** *`lease-timer`*

Description

Configures the timer value in seconds returned as part of the *DHCP* response.

Syntax Description

`vlan_name`	Specifies the *VLAN* on whose ports netlogin should be disabled.
`lease-timer`	Specifies the timer value, in seconds.

Default

N/A.

Usage Guidelines

The timer value is specified in seconds. The timer value range is 0 - 4294967295, where 0 indicates the default (not configured) value of 7200 second.

Example

The following command configures the DHCP lease timer value for VLAN corp:

```
configure vlan corp dhcp-lease-timer <lease-timer>
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan dhcp-options

```
configure {vlan} vlan_name dhcp-options [code option_number [16-
   bit value1 {value2 {value3 {value4}}} | 32-bit value1 {value2
   {value3 {value4}}} | flag [on | off] | hex string_value |
   ipaddress ipaddress1 {ipaddress2 {ipaddress3 {ipaddress4}}} | string
   string_value] | default-gateway | dns-server {primary | secondary} |
   wins-server] ipaddress
```

Description

Configures the *DHCP* options returned as part of the DHCP response by a switch configured as a DHCP server.

Syntax Description

vlan_name	Specifies the *VLAN* on which to configure DHCP.
code	Specifies the generic DHCP option code.
option_number	Specifies the DHCP Option number.
16-bit	Specifies that one to four 16-bit unsigned integer values associated with selected DHCP option.
32-bit	Specifies that one to four 32-bit unsigned integer values associated with selected DHCP option.
flag	Specifies that 1 byte value associated with selected DHCP option number.
hex	Specifies that hexadecimal string associated with selected DHCP option number.
string	Specifies that a string is associated with selected DHCP option number.
string_value	The string value associated with specified option.
default-gateway	Specifies the router option.
dns-server	Specifies the Domain Name Server (DNS) option.
primary	Specifies the primary DNS option.
secondary	Specifies the secondary DNS option.
wins-server	Specifies the NetBIOS name server (NBNS) option.
ipaddress	The IP address associated with the specified option.

Default

N/A.

Usage Guidelines

This command configures the DHCP options that can be returned to the DHCP client. For the default-gateway option you are only allowed to configure an IP address that is in the VLAN's network range. For the other options, any IP address is allowed.

The options below represent the following BOOTP options specified by RFC2132:

- default-gateway—Router option, number 3.
- dns-server—Domain Name Server option, number 6.
- wins-server—NetBIOS over TCP/IP Name Server option, number 44.

Example

The following command configures the DHCP server to return the IP address 10.10.20.8 as the router option:

```
configure vlan <name> dhcp-options default-gateway 10.10.20.8
```

History

This command was first available in ExtremeXOS 11.0.

The primary and secondary DNS options were added in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan dynamic-vlan uplink-ports

configure vlan dynamic-vlan uplink-ports [**add** {**ports**} *port_list* | **delete** {ports} [*port_list* | **all**]]

Description

Statically provisions uplink ports for all dynamically created *VLAN*s.

Syntax Description

dynamic-vlan	Configuration options for dynamically created VLANs.
uplink-ports	Tagged uplink ports for VLANs created by system applications.
add	Add ports to dynamic VLAN uplink port list.
delete	Remove ports from dynamic VLAN uplink port list.
ports	Ports to be configured as uplink ports.
port_list	List of ports separated by a comma or -.
all	Clear the dynamic VLAN uplink port list.

Default

N/A.

Usage Guidelines

Use this command to statically provision uplink ports for dynamically created VLANs.

Example

```
# conf vlan dynamic-vlan uplink-ports add ports 16-18
# conf vlan dynamic-vlan uplink-ports add 20,22,24
# configure vlan dynamic-vlan uplink-ports delete ports 22
# configure vlan dynamic-vlan uplink-ports delete 16-18
# configure vlan dynamic-vlan uplink-ports delete all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan ipaddress

```
configure [ {vlan} vlan_name | vlan vlan_id] ipaddress
   [ipaddress {netmask} | {ipNetmask} | ipv6-link-local | {eui64}
   ipv6_address_mask]
```

Description

Assigns an IPv4 address and an optional subnet mask or an IPv6 address to the *VLAN*. Beginning with ExtremeXOS 11.2, you can specify IPv6 addresses. You can assign either an IPv4 address, and IPv6 address, or both to the VLAN. Beginning with ExtremeXOS 11.3, you can use this command to assign an IP address to a specified VMAN and enable multicasting on that VMAN.

Note

You can also use this command to assign an IP address to a VMAN on all platforms that support the VMAN feature. For information on which software licenses and platforms support the VMAN feature, see the *Switch Engine 32.2 Feature License Requirements* document.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_id	Specifies a VLAN ID.
ipaddress	Specifies an IPv4 address.

netmask	Specifies an IPv4 subnet mask in dotted-quad notation (for example, 255.255.255.0). This parameter supports 255.255.255.254 for 31-bit prefixes.
ipNetmask	Specifies an IPv4 prefix mask in CIDR notation. This parameter supports /31 for 31-bit prefixes.
ipv6-link-local	Specifies IPv6 and configures a link-local address generated by combining the standard link-local prefix with the automatically generated interface in the EUI-64 format. Using this option automatically generates an entire IPv6 address; this address is only a link-local, or VLAN-based, IPv6 address; that is, ports on the same segment can communicate using this IP address and do not have to pass through a gateway.
eui64	Specifies IPv6 and automatically generates the interface ID in the EUI-64 format using the interface's MAC address. Once you enter this parameter, you must add the following variables: *ipv6_address_mask*. Use this option when you want to enter the 64-bit prefix and use a EUI-64 address for the rest of the IPv6 address.
ipv6_address_mask	Specify the IPv6 address in the following format: x:x:x:x:x:x:x:x/prefix length, where each x is the hexadecimal value of one of the 8 16-bit pieces of the 128-bit wide address.

Default

N/A.

Usage Guidelines

The VLAN must already exist before you can assign an IP address; use the `create vlan` command to create the VLAN (also the VMAN must already exist).

Note

If you plan to use the VLAN as a control VLAN for an *EAPS* domain, do NOT configure the VLAN with an IP address. For information about adding secondary IP addresses to VLANs, see the *IPv4 Unicast Routing* section in the *Switch Engine 32.2 User Guide* .

Beginning with ExtremeXOS 11.2, you can specify IPv6 addresses. For information about IPv6 addresses, see the *IPv6 Unicast Routing* section in the *Switch Engine 32.2 User Guide*.

Beginning with ExtremeXOS 11.3, you can assign an IP address (including IPv6 addresses) to a VMAN. Beginning with version 11.4, you can enable multicasting on that VMAN.

Beginning with ExtremeXOS 15.7.1, you can configure IPv4 addresses with 31-bit prefixes on network VLANs and the Mgmt VLAN.

To enable multicasting on the specified VMAN once you assigned an IP address, take the following steps:

1. Enable IP multicast forwarding.
2. Enable and configure multicasting.

Example

The following examples are equivalent; both assign an IPv4 address of 10.12.123.1 to a VLAN named "accounting":

```
configure vlan accounting ipaddress 10.12.123.1/24
configure vlan accounting ipaddress 10.12.123.1 255.255.255.0
```

The following example assigns a link local IPv6 address to a VLAN named management:

```
configure vlan accounting ipaddress ipv6-link-local
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 parameters were added in ExtremeXOS 11.2.

Support for 31-bit prefixes on IPv4 addresses was added in ExtremeXOS in 15.7.1.

The *vlan_id* variable is first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan l2pt profile

```
configure [[{vlan vlan_name] [vxlan {vr vr_name} rtep rtep_ipv4]] l2pt
   profile [none | profile_name]
```

Description

Configures VLAN L2PT profiles on service interfaces.

Syntax Description

vlan	Specifies the *VLAN* configuration.
vlan_name	Specifies the VLAN name.
vxlan	Specifies Virtual eXtensible LAN.
vr	Specifies Virtual Router.
vr_name	Specifies the Virtual Router Name. If not specified, the VR of the current command context is used.
rtep	Specifies Remote Tunnel End Point.
rtep_ipv4	Specifies the Remote Tunnel End Point IPv4 address.
l2pt	Specifies Layer 2 protocol tunneling.
profile	Specifies the L2PT profile for the RTEP.

none	Specifies that no L2PT profile should be bound to the ports (default).
profile_name	Specifies the L2PT profile to be bound to the ports.

Default

Disabled.

Usage Guidelines

Use this command to configure VLAN L2PT profiles on VXLAN RTEP interfaces.

Example

The following example binds the tenant VLAN to *l2pt-nw* profile with RTEP IP address as 2.2.2.2 of VxLAN service Interface with the action "none":

```
# configure l2pt profile "l2pt-nw" add protocol filter cdp action none
# configure vlan tenant vxlan rtep 2.2.2.2 l2pt profile l2pt-nw
```

The following example unbinds the configured l2pt profile from RTEP IP address 2.2.2.2 associated with tenant VLAN:

```
# configure vlan tenant vxlan rtep 2.2.2.2 l2pt profile none
```

The following example binds the tenant with peer 2.2.2.2 of VxLAN RTEP *l2pt-nw* specifies tunneling actions:

```
# configure l2pt profile "l2pt-nw" add protocol filter cdp action tunnel
# configure tenant vxlan rtep 2.2.2.2 l2pt profile "l2pt-nw"
Error: Cannot tunnel on VxLAN RTEP. Tunnel action may be applied only to ports.
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is supported on the ExtremeSwitching 5520 series switch and stacks with 5520 slots only.

configure vlan name

`configure [ {`**`vlan`**`} vlan_name | `**`vlan`**` vlan_id]`**`name`**` name`

Description

Renames a previously configured *VLAN*.

Syntax Description

vlan_name	Specifies the current (old) VLAN name.
vlan_id	Specifies the VLAN ID.
name	Specifies a new name for the VLAN.

Default

N/A.

Usage Guidelines

You cannot change the name of the default VLAN "Default."

For information on VLAN name requirements and a list of reserved keywords, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Note

If you use the same name across categories (for example, *STPD* and *EAPS* names), we recommend that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

Example

The following example renames VLAN vlan1 to engineering:

```
configure vlan vlan1 name engineering
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_id* variable is first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan netlogin-lease-timer

`configure vlan` *vlan_name* **`netlogin-lease-timer`** *seconds*

Description

Configures the timer value returned as part of the *DHCP* response for clients attached to networklogin-enabled ports.

Syntax Description

vlan_name	Specifies the *VLAN* to which this timer value applies.
seconds	Specifies the timer value, in seconds.

Default

10 seconds.

Usage Guidelines

The timer value is specified in seconds.

This command applies only to the web-based authentication mode of network login.

Example

The following command sets the timer value to 15 seconds for VLAN corp:

```
configure vlan corp netlogin-lease-timer 15
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan qosprofile

```
configure [ {vlan} vlan_name | vlan vlan_list] {qosprofile} [qosprofile
    | none]
```

Description

Configures a *VLAN* traffic group, which links all the ingress ports in the specified VLAN to the specified egress *QoS* profile.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.
qosprofile	Specifies an egress QoS profile. The supported values are: qp1 to qp8 and none.

Default

None.

Usage Guidelines

Extreme switches support eight egress QoS profiles (QP1 to QP8) for each port. The QoS profile QP7 is not available to you on a SummitStack.

Example

The following command configures VLAN accounting to use QoS profile QP3:

```
configure vlan accounting qosprofile qp3
```

History

This command was first available in ExtremeXOS 11.0.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan protocol

```
configure [ {vlan} vlan_name | vlan vlan_list]protocol {filter}
   filter_name
```

Description

Configures a *VLAN* to use a specific protocol filter.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.
protocol_name	Specifies a protocol filter name. This can be the name of a predefined protocol filter, or one you define.The following protocol filters are predefined: IP, IPv6, IPX, NetBIOS, DECNet, IPX_8022, IPX_SNAP, AppleTalk. Using **any** indicates that this VLAN should act as the default VLAN for its member ports.

Default

Protocol **any**.

Usage Guidelines

If the keyword **any** is specified, all packets that cannot be classified into another protocol-based VLAN are assigned to this VLAN as the default for its member ports.

Use the `configure protocol` command to define your own protocol filter.

Protocol Filters

These devices do not forward packets with a protocol-based VLAN set to AppleTalk. To ensure that AppleTalk packets are forwarded on the device, create a protocol-based VLAN set to "any" and define other protocol-based VLANs for other traffic, such as IP traffic. The AppleTalk packets pass on the “any” VLAN, and the other protocols pass traffic on their specific protocol-based VLANs.

Example

The following example configures the protocol filter "my_filter" to vlan v1:

```
configure vlan v1 protocol "my_filter"
configure vlan v1 protocol  filter  "my_filter"
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 parameter was added in ExtremeXOS 11.2.

The **filter** keyword was added in ExtremeXOS 15.5.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan router-discovery add prefix

`configure vlan` *vlan_name* **router-discovery** {**ipv6**} **add prefix** *prefix*

Description

Adds a prefix to the router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
prefix	Specifies the prefix to add.

Default

N/A.

Usage Guidelines

This command adds a prefix to the router advertisement messages for the VLAN. Prefixes defined with this command are only included in the router advertisement messages and have no operational impact on VLANs.

To configure the parameters for this prefix, use the following command:

`configure vlan vlan_name router-discovery {ipv6} set prefix prefix [autonomous-flag auto_on_off | onlink-flag onlink_on_off | preferred-lifetime preflife |valid-lifetime validlife]`

Example

The following command adds the prefix 2001:db8:3456::/64 for the VLAN "top_floor":

```
configure vlan top_floor router-discovery add prefix 2001:db8:3456::/64
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery default-lifetime

`configure vlan vlan_name router-discovery {ipv6} default-lifetime defaultlifetime`

Description

Configures the router lifetime value sent in router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
defaultlifetime	Specifies the router lifetime. Range is 0, or max-interval to 9000 seconds.

Default

1800 seconds.

Usage Guidelines

This command configures the router lifetime value to be included in the router advertisement messages.

The value is specified in seconds and is either 0, or between max-interval and 9000 seconds. A value of 0 indicates that the router is not to be used as a default router.

After a host sends a router solicitation, and receives a valid router advertisement with a non-zero router lifetime, the host must desist from sending additional solicitations on that interface, until an event such as re-initialization takes place.

Example

The following example configures the default-lifetime to be 3600 seconds for the VLAN "top_floor":

```
configure vlan top_floor router-discovery default-lifetime 3600
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery delete prefix

```
configure vlan vlan_name router-discovery {ipv6} delete prefix [prefix |
   all]
```

Description

Deletes prefixes from the router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
prefix	Specifies the prefix to delete.
all	Specifies to delete all prefixes.

Default

N/A.

Usage Guidelines

This command deletes previously defined router advertisement prefixes.

Example

The following example deletes the prefix 2001:db8:3161::/64 for the VLAN "top_floor":

```
configure vlan top_floor router-discovery delete 2001:db8:3161::/64
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery link-mtu

```
configure vlan vlan_name router-discovery {ipv6} link-mtu linkmtu
```

Description

Configures the link MTU value sent in router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
linkmtu	Specifies the link MTU. Range is 0 to 9216.

Default

0, meaning that no link MTU information is sent.

Usage Guidelines

This command configures the link MTU placed into the router advertisement messages. Advertisement of the MTU helps ensure use of a consistent MTU by hosts on the VLAN.

The minimum value is 0, and the maximum value is 9216. The default value is 0, which means that no link MTU information is included in the router discovery messages.

Example

The following example configures the link MTU to be 5126 for the VLAN "top_floor":

```
configure vlan top_floor router-discovery link-mtu 5126
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery managed-config-flag

```
configure vlan vlan_name router-discovery {ipv6} managed-config-flag
   on_off
```

Description

Configures the managed address configuration flag value sent in router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
on_off	Specifies setting the flag to on or off.

Default

Off.

Usage Guidelines

This command configures the contents of the managed address configuration flag in the router advertisement messages.

A value of *on* tells hosts to use the administered (stateful) protocol *DHCP* for address autoconfiguration in addition to any addresses autoconfigured using stateless address autoconfiguration. A value of *off* tells hosts to use stateless address autoconfiguration. If this command is not entered, the default value is off.

Example

The following example configures the managed address configuration flag to be on for the VLAN "top_floor":

```
configure vlan top_floor router-discovery managed-config-flag on
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery max-interval

```
configure vlan vlan_name router-discovery {ipv6} max-interval
   maxinterval
```

Description

Configures the maximum time between unsolicited router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
maxinterval	Specifies the maximum time between advertisements, in seconds. Range is 4 to 1800.

Default

600 seconds.

Usage Guidelines

This command configures the maximum amount of time before an unsolicited router advertisement message is advertised over the links corresponding to the VLAN.

Example

The following example configures the max-interval to be 300 seconds for the VLAN "top_floor":

```
configure vlan top_floor router-discovery max-interval 300
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery min-interval

```
configure vlan vlan_name router-discovery {ipv6} min-interval
   mininterval
```

Description

Configures the minimum time between unsolicited router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
mininterval	Specifies the minimum time between advertisements, in seconds. Range is 3 to 1350 (see guidelines).

Default

200 seconds, or max-interval × .33 (see guidelines).

Usage Guidelines

This command configures the minimum amount of time before an unsolicited router advertisement message is advertised over the links corresponding to the VLAN.

The minimum value is three seconds. The maximum time is (.75 × max-interval) seconds. If you do not explicitly set this value, the min-interval value is reset whenever the max-interval is configured. Min-interval will then be dynamically adjusted to .33 times the max-interval.

Example

The following example configures the min-interval to be 300 seconds for the VLAN "top_floor":

```
configure vlan top_floor router-discovery min-interval 300
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery other-config-flag

```
configure vlan vlan_name router-discovery {ipv6} other-config-flag
   on_off
```

Description

Configures the other stateful configuration flag value sent in router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
on_off	Specifies setting the flag to on or off.

Default

Off.

Usage Guidelines

This command configures the contents of the other stateful configuration flag in the router advertisement messages.

When set to *on*, hosts use the administered (stateful) protocol (*DHCP*) for autoconfiguration of other (non-address) information. If this command is not entered, the default value is *off*.

Example

The following example configures the other stateful configuration flag to be on for the VLAN "top_floor":

```
configure vlan top_floor router-discovery other-config-flag on
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery reachable-time

```
configure vlan vlan_name router-discovery {ipv6} reachable-time
   reachabletime
```

Description

Configures the reachable time value in router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
reachabletime	Specifies the reachable time value in advertisements, in milliseconds. Range is 0 to 3,600,000 (one hour).

Default

30,000 milliseconds.

Usage Guidelines

The reachable time is the time, in milliseconds, that a node assumes a neighbor is reachable after having received a reachability confirmation. A value of 0 means the time is unspecified by this router. The maximum value is 3,600,000 (1 hour).

Example

The following example configures the reachable time to be 3,600,000 milliseconds for the VLAN "top_floor":

```
configure vlan top_floor router-discovery reachable-time 3600000
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery retransmit-time

```
configure vlan vlan_name router-discovery {ipv6} retransmit-time
   retransmittime
```

Description

Configures the retransmit time value in router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
retransmittime	Specifies the reachable time value in advertisements, in milliseconds. Range is 0 to 4,294,967,295 (approximately 50 days).

Default

1,000 milliseconds.

Usage Guidelines

This command configures the retransmit time value in the router advertisement messages.

The retransmit time, in milliseconds, is the time between retransmitted neighbor solicitation messages. A value of 0 means the value is unspecified by this router. The maximum value is 4,294,967,295.

Example

The following example configures the retransmit time to be 604,800,000 milliseconds (one week) for the VLAN "top_floor":

```
configure vlan top_floor router-discovery retransmit-time 604800000
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan router-discovery set prefix

```
configure vlan vlan_name router-discovery {ipv6} set prefix prefix
   [autonomous-flag auto_on_off | onlink-flag onlink_on_off | preferred-
   lifetime preflife |valid-lifetime validlife]
```

Description

Sets the parameters for a prefix in the router discovery advertisements on the *VLAN*.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
prefix	Specifies which prefix's parameters to set.
auto_on_off	Specifies the autonomous flag.
onlink_on_off	Specifies the on link flag.
preflife	Specifies the preferred lifetime in seconds. Maximum value is 4,294,967,295.
validlife	Specifies the valid lifetime in seconds. Maximum value is 4,294,967,295.

Default

The prefix parameter defaults are:

- Valid lifetime—2,592,000 seconds (30 days)
- On-link flag—on

- Preferred lifetime—604,800 seconds (7 days)
- Autonomous flag—on

Usage Guidelines

This command configures the attributes associated with the specified prefix.

The **autonomous-flag** flag option modifies the autonomous flag of the prefix. The autonomous flag value specifies whether the prefix can be used for autonomous address configuration (on) or not (off).

The **onlink-flag** option modifies the on link flag of the prefix. The on link flag specifies whether the prefix can be used for on link determination (on) or not (off). The default value of the on link flag is on.

The **preferred-lifetime** option modifies the preferred lifetime of a prefix. The preferred lifetime value is the time (from when the packet is sent) that addresses generated from the prefix via stateless address autoconfiguration remain preferred. The maximum value is 4,294,967,295. The default value is 604,800 seconds (7 days).

The **valid-lifetime** option modifies the valid lifetime of a prefix. The valid lifetime value is the time (from when the packet was sent) that the prefix is valid for the purpose of on-link determination. The maximum value is a 4,294,967,295. The default value is 2,592,000 seconds (30 days).

Example

The following example sets the on link parameter of the prefix 2001:db8:3161::/64 to off, for the VLAN "top_floor":

```
configure vlan top_floor router-discovery set prefix 2001:db8:3161::/64 onlink-flag off
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the in the *Switch Engine 32.2 Feature License Requirements* document..

configure router-discovery vrrp-lla-only

```
configure {vlan} vlan_name router-discovery {ipv6} vrrp-lla-only on_off
```

Description

Configures the router discovery advertisements to send only with VRRP link local address on the VRRP-enabled VLAN interface.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
router-discovery	IPv6 Router Discovery configuration
ipv6	IPv6 Router Discovery configuration.
vrrp-lla-only	Router advertisement is sent only with VRRP's virtual link local address.
on_off	Specifies setting the flag to on or off. Default is off.

Default

Default is off.

Usage Guidelines

This command configures the router advertisements to use only VRRP's link local address and avoid VLAN link local address on VRRP-enabled VLAN interfaces.

When set to on, VRRP's link local address is used in router advertisements. If this command is not entered, the default value is off and VLAN link local address is used in router advertisements.

Note

You need to explicitly set this value to "off" when VRRP is disabled on the VLAN.

Example

The following example configures the router discovery advertisements to use VRRP link local address for the VLAN "top_floor":

```
# configure vlan top_floor router-discovery vrrp-lla-only on
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on all platforms that support the Advanced Edge License as shown in the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan subvlan

```
configure vlan vlan_name [add | delete] subvlan sub_vlan_name
```

Description

Adds or deletes a subVLAN to a superVLAN.

Syntax Description

vlan_name	Specifies a superVLAN name.
add	Adds the subVLAN to the superVLAN.
delete	Deletes the subVLAN from the superVLAN.
sub_vlan_name	Specifies a subVLAN name.

Default

N/A.

Usage Guidelines

The following properties apply to *VLAN* aggregation operation:

- All broadcast and unknown traffic remain local to the subVLAN and does not cross the subVLAN boundary. All traffic within the subVLAN are switched by the subVLAN, allowing traffic separation between subVLANs (while using the same default router address among the subVLANs).
- Hosts can be located on the superVLAN or on subVLANs. Each host can assume any IP address within the address range of the superVLAN router interface. Hosts on the subVLAN are expected to have the same network mask as the superVLAN and have their default router set to the IP address of the superVLAN.
- All IP unicast traffic between subVLANs is routed through the superVLAN. For example, no *ICMP* redirects are generated for traffic between subVLANs, because the superVLAN is responsible for subVLAN routing. Unicast IP traffic across the subVLANs is facilitated by the automatic addition of an ARP entry (similar to a proxy ARP entry) when a subVLAN is added to a superVLAN. This feature can be disabled for security purposes.

Example

The following example adds the subVLAN "vsub1" to the superVLAN "vsuper":

```
configure vlan vsuper add subvlan vsub1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan subvlan-address-range

```
configure vlan vlan_name subvlan-address-range ipaddress1 ipaddress2
```

Description

Configures subVLAN address ranges on each subVLAN to prohibit the entry of IP addresses from hosts outside of the configured range.

Syntax Description

vlan_name	Specifies a subVLAN name.
ipaddress1	Specifies an IP address.
ipaddress2	Specifies another IP address.

Default

N/A.

Usage Guidelines

There is no error checking to prevent the configuration of overlapping subVLAN address ranges between multiple subVLANs. Doing so can result in unexpected behavior of ARP within the superVLAN and associated subVLANs.

Example

The following example configures the subVLAN vsuper to prohibit the entry of IP addresses from hosts outside of the configured range of IP addresses:

```
configure vlan vsuper subvlan-address-range 10.1.1.1 - 10.1.1.255
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan suppress

```
configure vlan vlan_name suppress [arp-only |none]
```

Description

This command enables or disables ARP suppression on VXLAN tenant VLANs.

Syntax Description

vlan_name	VLAN name.
suppress	Specifies suppression of ARP on VXLAN tenant VLANs.
arp-only	Specifies ARP suppression. Requests may be proxied.
none	Disable ARP suppression (default).

Default

ARP is suppressed.

Usage Guidelines

This command is allowed on VXLAN tenant VLANs only.

Example

The following example enables ARP suppression on VXLAN tenant VLAN "tenant1":

```
configure vlan tenant1 suppress arp-only
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure vlan tag

configure {**vlan**} *vlan_name* **tag** *tag* {**remote-mirroring**}

Description

Assigns a unique 802.1Q tag to the *VLAN*.

Syntax Description

vlan_name	Specifies a VLAN name.
tag	Specifies a value to use as an 802.1Q tag. The valid range is from 2 to 4095.
remote-mirroring	Specifies that the tagged VLAN is for remote mirroring.

Default

The default VLAN uses an 802.1Q tag (and an internal VLANid) of 1.

Usage Guidelines

If any of the ports in the VLAN use an 802.1Q tag, a tag must be assigned to the VLAN. The valid range is from 2 to 4094 (tag 1 is assigned to the default VLAN, and tag 4095 is assigned to the management VLAN).

The 802.1Q tag is also used as the internal VLANid by the switch.

You can specify a value that is currently used as an internal VLANid on another VLAN; it becomes the VLANid for the VLAN you specify, and a new VLANid is automatically assigned to the other untagged VLAN.

Example

The following command assigns a tag (and internal VLANid) of 120 to a VLAN named accounting:

```
configure accounting tag 120
```

History

This command was first available in ExtremeXOS 10.1.

The **remote-mirroring** option was added in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan udp-profile

`configure vlan` *vlan_name* **udp-profile** [*profilename* | **none**]

Description

Associates a UDP forwarding profile to a *VLAN*.

Syntax Description

vlan_name	Specifies a VLAN name.
profilename	Specifies a policy file to use for the UDP forwarding profile.
none	Removes any UDP forwarding profile from the VLAN.

Default

No UDP profiles are associated with the VLAN.

Usage Guidelines

You can apply a UDP forwarding policy only to an L3 VLAN (a VLAN having at least one IP address configured on it). If there is no IP address configured on the VLAN, then the command is rejected.

A UDP forwarding policy must contain only the following attributes. Unrecognized attributes are ignored.

- Match attributes
  - Destination UDP port number (destination-port)
  - Source IP address (source-ipaddress)
- Action modified (set) attributes
  - Destination IP address (destination-ipaddress)
  - VLAN name (vlan)

Policy files used for UDP forwarding are processed differently from standard policy files. Instead of terminating when an entry's match clause becomes true, each entry in the policy file is processed and the corresponding action is taken for each true match clause.

For example, if the following policy file is used as a UDP forwarding profile, any packets destined for UDP port 67 are sent to IP address 20.0.0.5 *and* flooded to VLAN to7:

```
entry one {
if match all {
    destination-port 67 ;
} then {
    destination-ipaddress 20.0.0.5 ;
}
}
entry two {
if match all {
    destination-port 67 ;
} then {
    vlan "to7" ;
}
}
```

If you include more than one VLAN set attribute or more than one destination-ipaddress set attribute in one policy entry, the last one is accepted and the rest are ignored.

Note

Although the ExtremeXOS Policy manager allows you to set a range for the destination-port, you should not specify the range for the destination-port attribute in the match clause of the policy statement for the UDP profile. If a destination-port range is configured, the last port in the range is accepted and the rest are ignored.

You can have two valid set statements in each entry of a UDP forwarding policy; one a destination-ipaddress and one a VLAN. ExtremeXOS currently allows a maximum of eight entries in a UDP

forwarding policy, so you can define a maximum of 16 destinations for one inbound broadcast UDP packet: eight IP addresses and eight VLANs.

Note

It is strongly advised to have no more than eight entries in a UDP forwarding profile. The UDP forwarding module processes those entries even if the entries do not contain any attributes for UDP forwarding. Having more than eight entries drastically reduces system performance. If the inbound UDP traffic rate is very high, having more than eight entries could cause the system to freeze or become locked.

If you rename a VLAN referred to in your UDP forwarding profile, you must manually edit the policy to reflect the new name, and refresh the policy.

You can also validate whether the UDP profile has been successfully associated with the VLAN by using the command `show policy {policy-name | detail}`. UDP forwarding is implemented as part of the netTools process, so the command does display netTools as a user of the policy.

Example

The following example associates the UDP forwarding profile "port123_to_corporate" to VLAN "to-sales":

```
configure vlan to-sales udp-profile port123_to_corporate
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan untagged-ports auto-move

`configure vlan untagged-ports auto-move [on | off |inform]`

Description

Globally, allows untagged ports to be moved directly from untagged *VLAN*s to either different untagged VLANs or tagged VLANs.

Syntax Description

on	Auto-move global setting is *on*, which allows you to move untagged ports from untagged VLANs without first removing the port VLAN configuration.
off	Auto-move global setting is *off*; you cannot directly move untagged ports from untagged VLANs without first removing the port VLAN configuration.
inform	Auto-move global setting is *on*, but you are informed when such a move occurs (default): `Port # untagged has been auto-moved from VLAN "x" to "y".`

Default

The default is **inform**.

Usage Guidelines

The global setting of this command impacts the following configuration commands:

- configure vlan add ports on page 1468
- configure vman add ports on page 1519

Moving tagged ports is not impacted by this global setting. You can move tagged ports directly without having to enable the auto-move global setting.

Example

The following example turns on the auto-move global setting:

```
configure vlan untagged-ports auto-move on
```

The following example turns on the auto-move global setting with the **inform** option:

```
configure vlan untagged-ports auto-move inform
```

When the **inform** keyword is used, you can directly move an untagged port, but you are informed that this has occurred:

```
configure vlan untagged-ports auto-move inform
configure vlan v2 add ports 1 untagged
Port 1 untagged has been auto-moved from VLAN "Default" to "v2".
```

History

This command was first available in ExtremeXOS 22.1.

The default was changed from **off** to **inform** in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vlan-translation add loopback-port

```
configure {vlan} vlan_name vlan-translation add loopback-port port
```

Description

Adds the specified port as a loopback port for the specified member *VLAN*.

Syntax Description

vlan_name	Specifies the name of the member VLAN to which you want to add the loopback port.
port	Specifies the port that serves as the loopback port.

Default

N/A.

Usage Guidelines

If two or more member VLANs have overlapping ports (where the same ports are assigned to both VLANs), each of the member VLANs with overlapping ports must have a dedicated loopback port.

The loopback port can be added to the member VLAN when the member VLAN is created, or you can use this command to add the loopback port at a later time.

Example

The following example adds port 2:1 as a loopback port for the member VLAN leafvlan:

```
configure leafvlan vlan-translation add loopback-port 2:1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the VLAN Translation feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan-translation add member-vlan

```
configure {vlan} vlan_name vlan-translation add member-vlan
   member_vlan_name {loopback-port port}
```

Description

Adds a member *VLAN* to a translation VLAN.

Syntax Description

vlan_name	Specifies the name of the translation VLAN to which you want to add the member VLAN.
member_vlan_name	Specifies the member VLAN to be added to the translation VLAN.
port	Specifies the port that serves as the loopback port.
loopback-port	If two or more member VLANs have overlapping ports (where the same ports are assigned to both VLANs), each of the member VLANs with overlapping ports must have a dedicated loopback port.

Default

N/A.

Usage Guidelines

This command configures VLAN tag translation between the two VLANs specified. The member VLAN is added to the list maintained by translation VLAN. A translation VLAN can have multiple member VLANs added to it.

Example

The following example adds member VLAN leafvlan to the translation VLAN branchvlan:

```
configure branchvlan vlan-translation add member-vlan leafvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the VLAN Translation feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan-translation delete loopback-port

configure {**vlan**} *vlan_name* **vlan-translation delete loopback-port**

Description

Deletes the loopback port from the specified member *VLAN*.

Syntax Description

vlan_name	Specifies the name of the member VLAN from which you want to delete the loopback port.

Default

N/A.

Usage Guidelines

This command disables and deletes the loopback port from the specified member VLAN. This command does not delete the member VLAN.

Example

The following example deletes the loopback port from the member VLAN leafvlan:

```
configure leafvlan vlan-translation delete loopback-port
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the VLAN Translation feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vlan-translation delete member-vlan

```
configure {vlan} vlan_name vlan-translation delete member-vlan
   [member_vlan_name | all]
```

Description

Deletes one or all member *VLAN*s from a translation VLAN.

Syntax Description

vlan_name	Specifies the name of the translation VLAN from which you want to delete the member VLAN.
member_vlan_name	Specifies the member VLAN to be deleted from the translation VLAN.
all	Deletes all member VLANs from the specified translation VLAN.

Default

N/A.

Usage Guidelines

This command removes the link between the translation VLAN and the specified member VLANs, but it does not remove the VLANs from the switch.

Example

The following example deletes member VLAN leafvlan from the translation VLAN branchvlan:

```
configure branchvlan vlan-translation delete member-vlan leafvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the VLAN Translation feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vm add | delete ports

`configure` **`vm`** *`vm_name`* {**`add`** | **`delete`**} **`ports`** *`portlist`*

Description

Adds or deletes dedicated Application Hosting (IAH) or management ports to a virtual machine (VM).

Syntax Description

`vm`	Designates a virtual machine.
`vm_name`	Specifies the VM name to add or delete ports to.
`add`	Designates adding IAH ports to a VM.
`delete`	Designates deleting IAH ports from a VM.
`ports`	Designates adding or deleting ports.
portlist	Selects the IAH ports to add or delete.

Default

N/A.

Usage Guidelines

Multiple VMs cannot use the same sideband port, but they can share the management port. To view ports for an existing VM, use the command `show` **`vm`** {*`vm_name`* | **`detail`**}.

This command does not take effect until the next time the guest VM is started.

The IAH feature requires the Solid State Storage Device SSD-120.

Example

The following example adds port 1–5 to VM "vm1":

```
# configure vm vm1 add ports 1-5
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

configure vm add virtual-interface

configure **vm** *vm_name* **add virtual-interface port** *port* {**vlan** *vlan_id*} {**name** *vf_name*}

Description

Adds a virtual interface to a guest virtual machine (VM).

Syntax Description

vm	Virtual machine.
vm_name	Specifies the VM to add the virtual interface to.
add	Specifies adding a virtual interface.
virtual-interface	Specifies the virtual interface to add.
name	Specifies adding an optional name to the virtual interface.
vf_name	Specifies an optional name (unique within this VM) for the virtual interface to add to the VM.
port	Specifies the associated dedicated port (physical function for this virtual interface).
port	Specifies the dedicated port number.
vlan	Specifies an optional VLAN mapped to this virtual interface.
vlan_id	Specifies the VLAN ID tag between 1 and 4,094.

Default

N/A.

Usage Guidelines

The maximum number of virtual interfaces that you can attach is 16. The dedicated port specified cannot already be a dedicated port within the VM.

To delete a virtual interface from a guest VM, use the `configure` **`vm`** *`vm_name`* **`delete virtual-interface`** [**`name`** *`vf_name`* | **`mac`** *`mac_addr`*] command.

Example

The following example add a virtual interface to the VM "vm1" on port 7:

```
# configure vm vm1 add virtual-interface port 7
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

configure vm delete virtual-interface

`configure` **`vm`** *`vm_name`* **`delete virtual-interface`** [**`name`** *`vf_name`* | **`mac`** *`mac_addr`*]

Description

Deletes a virtual interface from a guest virtual machine (VM).

Syntax Description

`vm`	Virtual machine.
`vm_name`	Specifies the VM to delete the virtual interface from.
`delete`	Specifies deleting a virtual interface.
`virtual-interface`	Specifies which virtual interface to delete.
`name`	Specifies deleting a virtual interface by specifying its optional name.
`vf_name`	Specifies the optional name (unique within this VM) of the virtual interface to delete from the VM.
`mac`	Specifies deleting a virtual interface by specifying its MAC address.
`mac_addr`	Specifies the virtual interface MAC address.

Default

N/A.

Usage Guidelines

To add a virtual interface to a guest VM, use the `configure` **`vm`** *`vm_name`* **`add virtual-interface port`** *`port`* {**`vlan`** *`vlan_id`*} {**`name`** *`vf_name`*} command.

Example

The following example deletes the virtual interface "my_vf" from the VM "vm1":

```
# configure vm vm1 delete virtual-interface my_vf
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

configure vm cpus

`configure` **`vm`** *`vm_name`* **`cpus`** *`num_cpus`*

Description

Configures an existing virtual machine (VM) CPU allocation.

Syntax Description

`vm`	Designates a virtual machine.
`vm_name`	Specifies the VM name to configure.
`cpus`	Designates specifying the number of CPUs to allocate to the VM.
`num_cpus`	Specifies the number of CPUs to allocate to the VM. Range is 1–2. The default is 1.

Default

By default, the number of CPUs allocated is 1.

Usage Guidelines

The number of CPUs allocated to a VM is set when the VM is created (default is 1), but you can change the allocation with this command. To view the number of CPUs currently allocated to a VM, use the command `show` **`vm`** {*vm_name* | **`detail`**}.

This command does not take effect until the next time the guest VM is started.

The Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

Example

The following example changes the number of CPUs allocated to VM "vm1" to 2:

```
# configure vm vm1 cpus 2
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

configure vm disk bus-type

`configure` **`vm`** *vm_name* **`disk bus-type`** *bus_type*

Description

Configures the virtual machine's (VM's) disk bus or controller.

Syntax Description

`vm`	Specifies VMs.
vm_name	Specifies the name of the VM.
`disk`	Specifies disk configuration.
`bus-type`	Specifies configuring the disk bus type.
bus_type	Specifies the disk bus type (default is VirtIO).

Default

The default is VirtIO.

Usage Guidelines

This command allows you to configure the VM's disk bus or controller. The default bus type is VirtIO, but some operating systems are do not support this, and as a consequence, the VM will fail to boot. In this case, you can configure the bus type to IDE or SCSI.

Example

The following example configures the VM "vm1" to the bus type to IDE:

```
# configure vm vm1 disk bus-type IDE
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

configure vm memory

`configure` **`vm`** *`vm_name`* **`memory`** *`memory_size`*

Description

Changes the amount of memory assigned to an existing virtual machine (VM).

Syntax Description

`vm`	Designates creating a virtual machine.
`vm_name`	Specifies the VM name to change memory for.
`memory`	Designates specifying the amount of RAM allocated to the VM.
`memory_size`	Specifies the amount of RAM (in MB) allocated to the VM. The default is 4,096.

Default

By default, the amount of RAM allocated to a VM is 4,096.

Usage Guidelines

The amount of RAM allocated to a VM is set when the VM is created (default is 4,096 MB), but you can change the allocation with this command. To view the amount of RAM currently allocated to a VM, use the command `show` **`vm`** {*`vm_name`* | **`detail`**}.

This command does not take effect until the next time the guest VM is started.

The Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

Example

The following example changes the amount of RAM allocated to VM "vm1" to 2,000 MB:

```
# configure vm vm1 memory 2000
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

configure vm vnc

`configure` **`vm`** *`vm_name`* **`vnc`** [**`none`** | *`vnc_display`*]

Description

Configures the VNC display for a virtual machine (VM).

Syntax Description

`vm`	Designates a virtual machine.
`vm_name`	Specifies the VM name to configure the VNC display for.
`vnc`	Specifies providing a display number for VNC access.
`none`	Disables VNC access (default).
`vnc_display`	Specifies the VNC screen number. Range is 0–15.

Default

By default, VNC access is disabled.

Usage Guidelines

For the VNC display number (or screen number), you can use the values from 0 to 15. These correspond to TCP ports 5,900 to 5,915.

Multiple VMs can be configured with the same VNC display, but VMs configured with the same display number cannot run at the same time. A VM cannot be started if the VNC port is already in use.

For security reasons, the VNC display is only accessible using SSH tunnel.

Example

The following example enables VNC on VM "vm1" with display number 3:

```
# configure vm vm1 vnc 3
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

configure vman add ports

```
configure vman vman_name add ports [port_list | all] {tagged | untagged
   {port-cvid port_cvid} | cep [ cvid cvid_first { - cvid_last }
   { translate cvid_first_xlate { - cvid_last_xlate } } | port-cvid
   port_cvid ]
```

Description

Adds one or more ports to a VMAN.

Syntax Description

vman-name	Specifies the name of the VMAN to configure.
vman_id	Specifies the ID of the VMAN to configure
all	Specifies all switch ports.
port_list	Specifies a list of ports.
untagged	Configures the specified ports as Customer Network Ports (CNPs).
tagged	Configures the specified ports as Provider Network Ports (PNPs), which are also called VMAN network ports.
port-cvid	Port's customer *VLAN* ID used for untagged packets.
port_cvid	Customer VLAN ID assigned to untagged packets from 1.

Default

If you do not specify a parameter, the default value is untagged, which creates a CNP.

Usage Guidelines

This command adds ports as either CNPs or PNPs. To add a port to a VMAN as a CEP, use the following command:

configure vman add ports cep on page 1521

The VMAN must already exist before you can add (or delete) ports. VMAN ports can belong to load-sharing groups.

When a port is configured serve as a CNP for one VMAN and A PNP for another VMAN, it inspects the VMAN ethertype in received packets. Packets with a matching ethertype are treated as tagged and switched across the associated PNP VMAN. Packets with a non-matching ethertype are treated as untagged and forwarded into the associated CNP VMAN.

When a port is configured only as a CNP (an untagged VMAN member), whether the VMAN ethertype is 0x8100 or otherwise, all received packets ingress the associated VMAN regardless of the packet's tagging.

Note

If you use the same name across categories (for example, *STPD* and *EAPS* names), we recommend that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

The following guidelines apply to all platforms:

- You must enable or disable jumbo frames before configuring VMANs. You can enable or disable jumbo frames on individual ports or on the entire switch. See "Configuring Ports on a Switch" in the *Switch Engine 32.2 User Guide* for more information on configuring jumbo frames.
- Each port can serve in only one VMAN role per VMAN. When multiple roles are configured on a port, each role must be configured for a different VMAN.
- Multiple VMAN roles can be combined on one port with certain VLAN types as shown in the following table.

Example

The following example assigns ports 1:1, 1:2, 1:3, and 1:6 to a VMAN named accounting:

```
configure vman accounting add ports 1:1, 1:2, 1:3, 1:6 tag 100
```

History

This command was first available in ExtremeXOS 11.0.

The **cvid** keyword was added in ExtremeXOS 15.3.2.

The *vman_id* variable was added in ExtremeXOS 16.1.

The **cvid** keyword was removed in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vman add ports cep

```
configure [{vman} vman_name | vman vman_id] add ports port_list
   cep cvid cvid_first {- cvid_last} {translate cvid_first_xlate {-
   cvid_last_xlate }} | port-cvid port_cvid ]}
```

Description

Adds one or more switch ports to the specified VMAN as Customer Edge Ports (CEPs), and configures the CVIDs on those ports to map to the VMAN.

Syntax Description

vman_name	Specifies the VMAN to configure.
vman_id	Specifies the VMAN ID to configure.
port_list	Specifies a list of ports.
cvid_first	Specifies a CVLAN ID (CVID) or the first in a range of CVIDs that the CEP will accept and map to the specified VMAN. Valid values are 1-4095.
cvid_last	Specifies the last in a range of CVIDs that the CEP will accept and map to the VMAN. Valid values are 1-4095.
translate	Enables translation of the specified CEP CVID range to the specified VMAN CVID range.
cvid_first_xlate	Specifies a VMAN CVID or the first in a range of VMAN CVIDs to which the CEP CVIDs will map. Valid values are 1-4095.
cvid_last_xlate	Specifies the last in a range of VMAN CVIDs to which the CEP CVIDs will map. Valid values are 1-4095. The number of VMAN CVIDs in this range must equal the number of CEP CVIDs specified in this command.
port-cvid	Port's customer *VLAN* ID used for untagged packets.
port_cvid	Customer VLAN ID assigned to untagged packets from 1.

Default

N/A.

Usage Guidelines

If you specify only one CVID or a range of CVIDs without translation, the specified CVIDs are mapped to the specified VMAN and appear unchanged in the VMAN.

If you specify CVID translation, the CEP CVIDs map to different VMAN CVIDs. The number of CEP CVIDs specified must equal the number of VMAN CVIDs specified. The first CEP CVID in the specified

range maps to the first CVID in the range specified for the VMAN. The difference between cvid_first and cvid_first_xlate establishes an offset N that maps CEP CVIDs to VMAN CVIDs. (Offset N = cvid_first_xlate - cvid_first.) The translated VMAN CVID that corresponds to a CEP CVID can be determined as follows:

VMAN CVID = CEP CVID + N

Note
CVID translation can reduce the number of CVIDs that can be mapped to VMANs.

After you enable and configure a CEP with this command, you can use the following command to map additional CVIDs on the port to the VMAN:

```
configure [ {vman} vman_name | vman vman_id] ports port_list
add cvid cvid_first {- cvid_last} {translate cvid_first_xlate {-
cvid_last_xlate}}
```

When this command specifies multiple ports, each port gets an independent CVID map; the ports do not share a common map. Changes to the CVID map affect only the ports specified in the configuration command. For example, consider the following commands:

```
configure vman vman1 add port 1-2 cep cvid 10

configure vman vman1 port 1 add cvid 11
```

After these commands are entered, port 1 maps CVIDs 10 and 11 to VMAN vman1, and port 2 maps only CVID 10 to vman1.

You can add the same port as a CEP to multiple VMANs. A port can also support multiple VMANs in different roles as shown in `configure vman vman_name add ports`.

To view the CEP CVID configuration for a port, use the show vman command.

ExtremeXOS 21.1 adds an optional port CVID parameter to the existing untagged and CEP VMAN port configuration options. When present, any untagged packet received on the port will be double tagged with the configured port CVID and the SVID associated with the VMAN. If the port is untagged, packets received with a single CVID will still have the SVID added as usual. If the port is CEP, only untagged and any specifically configured CVIDs will be allowed. As double tagged packets are received from tagged VMAN ports and forwarded to untagged VMAN ports, the SVID associated with the VMAN is stripped. Additionally, the CVID associated with the configured Port CVID is also stripped in the same operation. If the port is CEP and CEP egress filtering is enabled, only the specified port-cvid and cvids are allowed to egress.

Example

The following example configures port 1 as a CEP for VMAN vman1 and specifies that CEP CVID 5 maps to CVID 5 on the VMAN:

```
configure vman vman1 add port 1 cep cvid 5
```

The following example configures port 1 as a CEP for VMAN vman1 and enables the port to translate CEP CVIDs 10-19 to VMAN CVIDs 20-29:

```
configure vman vman1 add port 1 cep cvid 10 - 19 translate 20 - 29
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

The CVID translation feature is available on all platforms.

configure vman delete ports

```
configure vman [vman_name | vman_list] delete ports [all | port_list]
```

Description

Deletes one or more ports from a VMAN.

Syntax Description

vman-name	Specifies a VMAN name.
vman_list	Specifies a VMAN list name.
all	Specifies all ports in the VMAN.
port_list	Specifies a list of ports.

Default

N/A.

Usage Guidelines

The VMAN must already exist before you can delete ports.

Example

The following example deletes ports 1, 2, 3, and 6 on a switch for a VMAN named accounting:

```
configure vman accounting delete ports 1,2,3,6
```

History

This command was first available in ExtremeXOS 11.0.

The *vman_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vman ethertype

```
configure vman ethertype value [primary | secondary]
```

Description

Changes the default ethertype for the VMAN header.

Syntax Description

value	Specifies an ethertype value in the format of 0xffff.
primary	Assigns the ethertype as the primary Ethernet value.
secondary	Assigns the ethertype as the secondary Ethernet value.

Default

Ethertype value of 0x88a8 and type primary.

Usage Guidelines

The software supports two VMAN ethertype values: a primary value and a secondary value. By default, the primary ethertype applies to all VMANs. To use the secondary ethertype, define the ethertype with this command, and then assign the secondary ethertype to ports with the following command:

```
configure port port_list ethertype {primary | secondary}
```

If your VMAN transits a third-party device (other than an Extreme Networks device), you must configure the ethertype for the VMAN tag as the ethertype that the third-party device uses. If you configure both primary and secondary ethertypes, you can connect to devices that use either of the two values assigned.

The system supports all VMAN ethertypes, including the standard ethertype of 0x8100.

Example

The following command changes the VMAN ethertype value to 8100:

```
configure vman ethertype 0x8100
```

History

This command was first available in ExtremeXOS 11.0.

Support for a secondary ethertype was added in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vman ports add cvid

```
configure vman vman_name ports [port_list | all] add [cvid cvid_first
   { - cvid_last } { translate cvid_first_xlate { - cvid_last_xlate } }
   | port-cvid port_cvid]
```

Description

Adds one or more CVIDs to a CEP.

Syntax Description

vman_name	Specifies the VMAN to configure.
vman_id	Specifies the VMAN ID to configure.
port_list	Specifies a list of ports.
cvid_first	Specifies a Customer *VLAN* ID (CVID) or the first in a range of CVIDs that the CEP will accept and map to the specified VMAN. Valid values are 1-4095.
cvid_last	Specifies the last in a range of CVIDs that the CEP will accept and map to the VMAN. Valid values are 1-4095.
translate	Enables translation of the specified CEP CVID range to the specified VMAN CVID range.
cvid_first_xlate	Specifies a VMAN CVID or the first in a range of VMAN CVIDs to which the CEP CVIDs will map. Valid values are 1-4095.
cvid_last_xlate	Specifies the last in a range of VMAN CVIDs to which the CEP CVIDs will map. Valid values are 1-4095. The number of VMAN CVIDs in this range must equal the number of CEP CVIDs specified in this command.
port-cvid	Port's customer VLAN ID used for untagged packets.
port_cvid	Customer VLAN ID assigned to untagged packets from 1.

Default

N/A.

Usage Guidelines

Before you can add CVIDs to CEPs, you must configure the target physical ports as CEPs using the following command:

configure vman add ports on page 1519

If you specify only one CVID or a range of CVIDs without translation, the specified CVIDs are mapped to the specified VMAN and appear unchanged in the VMAN.

If you specify CVID translation, the CEP CVIDs map to different VMAN CVIDs. The number of CEP CVIDs specified must equal the number of VMAN CVIDs specified. The first CEP CVID in the specified range maps to the first CVID in the range specified for the VMAN. The difference between cvid_first and cvid_first_xlate establishes an offset N that maps CEP CVIDs to VMAN CVIDs. (Offset N = cvid_first_xlate - cvid_first.) The translated VMAN CVID that corresponds to a CEP CVID can be determined as follows:

VMAN CVID = CEP CVID + N

Note

CVID translation can reduce the number of CVIDs that can be mapped to VMANs.

When this command specifies multiple ports, each port gets an independent CVID map; the ports do not share a common map. Changes to the CVID map affect only the ports specified in the configuration command. For example, consider the following commands:

```
configure vman vman1 add port 1-2 cep cvid 10
configure vman vman1 port 1 add cvid 11
```

After these commands are entered, port 1 maps CVIDs 10 and 11 to VMAN vman1, and port 2 maps only CVID 10 to vman1.

To view the CEP CVID configuration for a port, use the `show vman` command.

Example

The following example adds CVIDs 20-29 to port 1 and VMAN vman1 and enables translation to CVIDs 30-39:

```
configure vman vman1 port 1 add cvid 20 - 29 translate 30 - 99
```

History

This command was first available in ExtremeXOS 12.6.

The *vman_id* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on all platform.

configure vman ports delete cvid

```
configure vman vman_name ports [port_list | all] delete [cvid cvid_first
   { - cvid_last } | port-cvid port_cvid]
```

Description

Deletes one or more CVIDs from a CEP.

Syntax Description

vman_name	Specifies the VMAN to configure.
vman_list	Specifies the VMAN list to configure.
port_list	Specifies a list of ports.
cvid_first	Specifies a CVID or the first in a range of CVIDs that are to be deleted. Valid values are 1-4095.
cvid_last	Specifies the last in a range of CVIDs that are to be deleted. Valid values are 1-4095.

Default

N/A.

Usage Guidelines

Each CEP has its own CVID map, and this command deletes CVIDs only from the ports specified with this command.

If all the CVIDs are deleted from a CEP, the CEP is deleted from the VMAN.

To view the CEP CVID configuration for a port, use the `show vman` command.

Example

The following command deletes CVID 15 on port 1 from VMAN vman1:

```
configure vman vman1 port 1 delete cvid 15
```

History

This command was first available in ExtremeXOS 12.6.

The *vman_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vman protocol

`configure vman [`*vman_name* `|` *vman_list*`]` **protocol** `{`**filter**`}` *filter_name*

Description

Configures a VMAN to use a specific protocol filter.

Syntax Description

vman_name	Specifies a VMAN name.
vman_list	Specifies a VMAN list.
protocol	Specifies a protocol filter.
filter	Specifies a protocol filter.
filter_name	Specifies a protocol filter name.

Default

N/A.

Usage Guidelines

Use this command to configure a VMAN to use a specific protocol filter.

Protocol Filters

These devices do not forward packets with a protocol-based *VLAN* set to AppleTalk. To ensure that AppleTalk packets are forwarded on the device, create a protocol-based VLAN set to “any” and define other protocol-based VLANs for other traffic, such as IP traffic. The AppleTalk packets pass on the “any” VLAN, and the other protocols pass traffic on their specific protocol-based VLANs.

Example

The following example configures the protocol filter “my_filter” to vlan v1:

```
configure vlan v1 protocol my_filter
configure vlan v1 protocol  filter  my_filter
```

History

This command was first available in ExtremeXOS 10.1.

The **filter** keyword was added in ExtremeXOS 15.5.

The *vman_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vman tag

```
configure vman vman_name tag tag
```

Description

Assigns a tag to a VMAN.

Syntax Description

vman_name	Specifies a VMAN name.
tag	Specifies a value to use as the VMAN tag. The valid range is from 2 to 4094.

Default

N/A.

Usage Guidelines

Every VMAN requires a unique tag.

You can specify a value that is currently used as an internal *VLAN* ID on another VLAN; it becomes the VLAN ID for the VLAN you specify, and a new VLAN ID is automatically assigned to the other untagged VLAN.

Example

The following example assigns a tag of 120 to a VMAN named "accounting":

```
configure vman accounting tag 120
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking authentication database-order

```
configure vm-tracking authentication database-order [[nms] | [vm-map] |
   [local] | [nms local] | [local nms] | [nms vm-map] | [vm-maplocal] |
   [local vm-map] | [nms vm-map local] | [localnmsvm-map]]
```

Description

Configures the authentication database options and sequence for VM authentication.

Syntax Description

nms	Specifies the configured Network Management System (NMS).
vm-map	Specifies the configured VMMAP file.
local	Specifies the configured local database.

Default

nms vm-map local.

Usage Guidelines

The switch attempts VM authentication in the sequence specified. For example, in the default configuration, the switch attempts NMS authentication first, VMMAP authentication second, and local authentication third. If nms is specified, the switch always attempts NMS authentication before attempting VMMAP file authentication.

Example

The following command configures the database authentication order:

```
# configure vm-tracking authentication database-order local nms vm-map
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking blackhole

```
configure vm-tracking blackhole [policy policy_name | dynamic-rule
   rule_name | none]
```

Description

Specifies a policy file or dynamic *ACL* rule to apply to VMs during periods that are outside of the approved time slot for that VM.

Syntax Description

policy_name	Specifies the name of a policy file to apply to the VM authentication request.
rule_name	Specifies the name of an ACL rule to apply to the VM authentication request.

Default

N/A.

Usage Guidelines

This command is not supported in this software release. It will be supported in a future release.

The none option applies no policy name or ACL rule during periods that are outside of the approved time slot for that VM.

Note
This command is provided to support future identity management features. It serves no practical purpose in this release.

Example

The following command applies no policy name or ACL rule during periods that are outside of the authorized authentication period:

```
# configure vm-tracking blackhole none
```

History

This command was first visible in ExtremeXOS 12.5, but it is not supported in this release. This command will be supported in a future release.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking local-vm

```
configure vm-tracking local-vm mac-address mac [name name | ip-address
   ipaddress | vpp vpp_name] | vlan-tag tag {vr vr_name}]
```

Description

Configures the parameters associated with a local VM database entry to be used for VM MAC local authentication.

Syntax Description

mac	Specifies the MAC address for the VM database entry you want to configure.
name	Specifies a name to represent this VM in show vm-tracking command display.
ipaddress	Specifies the IP address for the VM. This must match the IP address configured on the VM.
vpp_name	Specifies the name of a VPP to apply to the local VM.
tag	*VLAN* tag between 1 and 4094.
vr_name	Virtual router name.

Default

N/A.

Usage Guidelines

Before you configure a VM entry in the local VM database, you must create the entry with the `create vm-tracking local-vm` command.

Before you assign an VPP to a VM entry in the local VM database, you must create the VPP with the `create vm-tracking vpp` command.

Example

The following command configures an IP address for the VM entry specified by the MAC address:

```
# configure vm-tracking local-vm mac-address 00:E0:2B:12:34:56 ip-address 10.10.10.1
```

History

This command was first available in ExtremeXOS 12.5.

The **ingress-vpp** and **egress-vpp** options were replaced with the vpp option in ExtremeXOS 12.6.

The **vlan-tag** and **vr-name** options were added in ExtremeXOS15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking nms timeout

`configure vm-tracking nms timeout` *seconds*

Description

Configures the timeout period for authentication attempts with the configured NMS servers.

Syntax Description

seconds	Specifies the timeout period in seconds.

Default

3 seconds.

Usage Guidelines

None.

Example

The following command configures the switch to allow 1 minute for successful authentication of a VM with the NMS server:

```
# configure vm-tracking nms timeout 60
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking nms

```
configure vm-tracking nms [primary | secondary] server [ipaddress |
   hostname] {udp_port} client-ip client_ip shared-secret {encrypted
   encrypted_secret | secret } {vr vr_name}
```

Description

Configures the switch *RADIUS* client to an NMS for VM authentication.

Syntax Description

primary | secondary	Specifies the whether you are configuring the primary or secondary NMS.
ipaddress	Specifies the NMS IP address.
hostname	Specifies the NMS DNS hostname.

udp_port	Specifies the UDP port number of the NMS application.
client_ip	Specifies the client IP address, which is the switch IP address on the interface leading to the NMS.
encrypted	Specifies that the secret key for communications with the NMS is encrypted.
secret	Specifies a key or password for communications with the NMS.
vr_name	Specifies the VR that is used to access the NMS.

Default

N/A.

Usage Guidelines

The NMS is a RADIUS server such as the one provided with Ridgeline.

Example

The following command configures the switch to authenticate VMs through the primary NMS server Ridgeline using the password password:

```
# configure vm-tracking nms primary server Ridgeline client-ip 10.10.3.3 shared-secret
password
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking repository

```
configure vm-tracking repository [primary | secondary] server [ipaddress
   | hostname] {vr vr_name} {refresh-interval seconds} {path-name
   path_name} {user user_name {encrypted encrypted_password | password }
```

Description

Configures FTP file synchronization for NVPP and VMMAP files.

Syntax Description

primary | secondary	Specifies the whether you are configuring the primary or secondary FTP server.
ipaddress	Specifies the FTP server IP address.

vr_name	Specifies the VR that is used to access the FTP server.
seconds	Specifies how often the switch updates the local files that are synchronized with the FTP server. The range is 40 to 3600 seconds.
path_name	Specifies the path to the repository server files from the FTP server root directory. The default directory for repository server files is: pub.
user_name	Specifies a user name for FTP server access. If no username is specified, the switch uses user name anonymous.
encrypted	This keyword indicates that the specified password is encrypted.
password	Specifies the password for the specified user name.

Default

Refresh interval: 600 seconds.

Usage Guidelines

Some jitter is added to the refresh interval period to prevent all switches from downloading files at the same time.

Example

The following example configures the switch to refresh the VMMAP and NVPP files from primary FTP server ftp1 every five minutes:

```
# configure vm-tracking repository primary server ftp1 refresh-interval 300
```

History

This command was first available in ExtremeXOS 12.5.

Support for specifying an FTP user name was added in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking timers

`configure vm-tracking timers` **`reauth-period`** *`reauth_period`*

Description

Configures the *RADIUS* reauthentication period for VM MAC addresses.

Syntax Description

reauth_period	Specifies the reauthentication period in seconds. The ranges are 0 and 30-7200 seconds.

Default

0 seconds.

Usage Guidelines

One way to periodically apply Virtual Port Profiles (VPPs) to VM MAC addresses is to configure a reauthentication period. At the end of each reauthentication period, the switch reauthenticates each VM MAC address and applies any updated VPPs.

This command applies to only those VMs that authenticate through RADIUS. Reauthentication is disabled when the reauthentication period is set to 0 seconds. When reauthentication is disabled, the VM MAC address remains authenticated until the *FDB* entry for that VM expires.

Example

The following command enables RADIUS server reauthentication at 2 minute intervals:

```
# configure vm-tracking timers reauth-period 120
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking vpp add

```
configure vm-tracking vpp vpp_name add [ingress | egress] [policy
   policy_name | dynamic-rule rule_name] {policy-order policy_order}
```

Description

Configures an LVPP to use the specified policy or *ACL* rule.

Syntax Description

vpp_name	Specifies the name of an existing LVPP.
add	Specifies whether the LVPP should start using the specified policy or rule.
ingress	Specifies that the policy mapped to the LVPP is for ingress traffic.

egress	Specifies that the policy mapped to the LVPP is for egress traffic.
policy_name	Specifies a policy to add to or delete from the LVPP.
rule_name	Specifies a dynamic ACL rule to add to or delete from the LVPP.

Default

N/A.

Usage Guidelines

Multiple ACL or policy files can be mapped to each LVPP. A maximum of 8 ingress and 4 egress ACL or policies are available to be mapped to each LVPP. If the policy file or dynamic rule specified in this command fails to bind, then the CLI command is rejected.

Before you can configure an LVPP, you must first create it with the `create vm-tracking vpp` command.

Example

The following command configures LVPP vpp1 to use the dynamic ACL rule named rule1 for ingress traffic:

```
# configure vm-tracking vpp vpp1 add ingress dynamic-rule rule1
```

History

This command was first available in ExtremeXOS 12.5.

The ingress and egress keywords were added in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking vpp counters

```
configure vm-tracking vpp vpp_name counters [ingress-only | egress-only
    | both | none]
```

Description

Configures whether counters need to be installed for Virtual Machine MAC which receives this VPP mapping.

Syntax Description

ingress-only	Only counts packets ingressing the switch whose source MAC address matches VM MAC.
egress-only	Only counts packets egressing the switch whose source MAC address matches VM MAC.
both	Counts packets ingressing and egressing the switch whose source MAC address matches VM MAC.
none	No packets will be counted.

Default

N/A.

Usage Guidelines

Use this command to configure whether counters need to be installed for Virtual Lachine MAC which receives this VPP mapping.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking vpp delete

```
configure vm-tracking vpp vpp_name delete [ingress | egress] [policy
   policy_name | dynamic-rule rule_name] {policy-order policy_order}
```

Description

Specifies that the LVPP should stop using the specified policy or rule.

Syntax Description

vpp_name	Specifies the name of an existing LVPP.
delete	Specifies whether the LVPP should stop using the specified policy or rule.
ingress	Specifies that the policy mapped to the LVPP is for ingress traffic.

egress	Specifies that the policy mapped to the LVPP is for egress traffic.
policy_name	Specifies a policy to add to or delete from the LVPP.
rule_name	Specifies a dynamic *ACL* rule to add to or delete from the LVPP.

Default

N/A.

Usage Guidelines

Multiple ACL or policy files can be mapped to each LVPP. A maximum of 8 ingress and 4 egress ACL or policies are available to be mapped to each LVPP. If the policy file or dynamic rule specified in this command fails to bind, then the CLI command is rejected.

Before you can configure an LVPP, you must first create it with the `create vm-tracking vpp` command.

Example

The following command configures LVPP vpp1 to use the dynamic ACL rule named rule1 for ingress traffic:

```
# configure vm-tracking vpp vpp1 add ingress dynamic-rule rule1
```

History

This command was first available in ExtremeXOS 12.5.

The ingress and egress keywords were added in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vm-tracking vpp vlan-tag

`configure vm-tracking vpp` *vpp_name* **vlan-tag** *tag* {**vr** *vr_name*}

Description

This command configures the *VLAN* tag and VR name for VPP. If the detected VM MAC uses this VPP, then the port in which the VM MAC is detected will be placed on this VR/VLAN.

Syntax Description

vpp_name	Specifies a name for the LVPP.
tag	Specifies a name for the VLAN tag.
vr_name	Specifies a name for the Virtual Router.

Default

N/A.

Usage Guidelines

Use this command to configure the VLAN tag and VR name for VPP. If the detected VM MAC uses this VPP, then the port in which the VM MAC is detected will be placed on this VR/VLAN.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vpex auto-configuration mlag-id

```
configure vpex auto-configuration mlag-id [cascade | ring]
```

Description

Sets a preference for when Auto-Configuration configures the virtual MLAG ID. The default (cascade) configures the virtual MLAG ID whenever a 2nd-tier BPE is detected remotely, but not locally.

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).
auto-configuration	Specifies the VPEX Auto-Configuration of cascade ports and VPEX slots.
mlag-id	Specifies setting a unique MLAG identifier of the MLAG port attached to the bridge port extender (BPE).

cascade	Specifies to configure the virtual MLAG identifier when a 2nd-tier BPE is detected on the other controlling bridge, but not locally (default).
ring	Specifies to configure the virtual MLAG identifier when a ring is detected.

Default

cascade.

Usage Guidelines

The **ring** option provides more cabling time if you need to cable the chain of BPEs as duel-homed instead of single-homed.

This command is applicable only when VPEX Auto-Configuration is enabled in MLAG mode.

Example

The following example configures the default cascade option:

```
# configure vpex auto-configuration mlag-id cascade
```

The following example displays output when VPEX Auto-Configuration is not enabled in MLAG mode:

```
# configure vpex auto-configuration mlag-id ring
Error: VPEX Auto-Configuration is not in MLAG mode. Bring up MLAG peer, disable then
re-enable VPEX Auto-Configuration.
```

History

This command was first available in ExtremeXOS 31.7.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

configure vpex mlag-id peer

configure **vpex mlag-id** *mlag_id* **peer** *peer_name* **slot** *slot_num*

Description

In an Extended Edge Switching topology, allows the bridge port extender (BPE) slot assignment to be applied to an identifier on the specified MLAG peer when the port connected to the BPE is physically connected to the MLAG peer switch.

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).
mlag-id	Specifies setting a unique MLAG identifier of the MLAG port attached to the bridge port extender (BPE).
mlag_id	Sets the MLAG identifier value of the MLAG port attached to the BPE. Range is 1–65,000.
peer	Specifies naming the MLAG peer switch.
peer_name	Name of the MLAG peer switch.
slot	Specifies configuring the slot identifier for the attached BPE.
slot_num	Specifies the BPE slot number. Range is 100–162.

Default

N/A

Usage Guidelines

An Extended Edge Switching topology allows the BPE slot assignment to be applied to an MLAG identifier on the specified MLAG peer when the port connected to the BPE is physically connected to the MLAG peer switch.

The same Extended Edge Switching slot number must have been declared on the MLAG peer that has a port in the MLAG. On the peer with the MLAG port, either this form of the command can be used, or the traditional form where a controlling bridge port is related to a slot number.

Example

The following example for MLAG peer switch "cb2" declares slot 100 on MLAG "11":

```
# configure vpex mlag-id 11 peer cb2 slot 100
```

History

This command was first available in ExtremeXOS 22.7.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

configure vpex ports

configure **vpex ports** *port_list* **slot** *slot_num*

Description

Allows you to associate a bridge port extender (BPE) to a slot.

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).
ports	Specifies the switch ports attached to the BPE.
port_list	Specifies the switch ports attached to the BPE. Must be in the format *slot*:*port*. Only a single port can be configured at a time. Note: If the switch port is a LAG, the port specified must be the master port.
slot	Specifies VPEX BPE slot assignment.
slot_num	Specifies VPEX BPE slot assignment. Value must be between 100–162.

Default

N/A

Usage Guidelines

You must enable VPEX mode (`enable` **vpex**) before using this command.

The behavior of this command is similar to assigning slots within a chassis. After assigning a slot number to the port extender, you can make port-level configuration choices with the familiar *slot*:*port* notation in other commands involving the port extender's ports (for example, `configure vlan v1 add port 100:1`).

This command causes jumbo frames to be enabled on the specified ports.

Example

The following example assigns a BPE attached to switch port 1:23 to slot 100:

```
# configure vpex ports 1:23 slot 100
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

configure vpex ring rebalancing

`configure vpex` **ring rebalancing** [**auto** | **off**]

Description

In an Extended Edge Switching ring topology, places the "ring common" link between approximately equal length cascades.

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).
ring	Specifies ring topology changes.
rebalancing	Places the ring common link between approximately equal length cascades.
auto	Ring re-balancing will automatically run at the next ring convergence.
off	Automatic ring re-balancing is disabled (default).

Default

By default, ring re-balancing is disabled.

Usage Guidelines

This command controls the Extended Edge Switching ring re-balancing operation. Re-balancing may or may not take place at the time that ring formation is complete, depending on the setting of this command. An Extended Edge Switching ring consists of two configured Extended Edge Switching cascades of BPEs that are connected at their ends. The connected link is called the ring common link. The ring forms automatically. Two control plane cascades span all bridge port extenders (BPEs) in the ring, with each originating from a controlling bridge (CB) port and ending at the BPE that is connected to the other CB port. However, the data plane cascades remain as configured (that is, no data plane traffic crosses the common link). Re-balancing moves the ring common link so that the data plane cascades are approximately equal in length. The cost of doing this is a data plane disruption to some BPEs in the ring that is the same as that which would have occurred had a single link in the ring been broken. Re-balancing is a dynamic operation. It does not change the cascade configurations.

Changing this setting takes effect the next time that a ring experiences a new ring formation. There is no immediate effect.

You can view your re-balancing selection with the `show vpex` command.

Example

The following example turns off ring re-balancing:

```
# configure vpex ring rebalancing off
```

History

This command was first available in ExtremeXOS 22.7.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

configure vpls

```
configure vpls vpls_name {dot1q [ethertype hex_number | tag [include |
   exclude]]} {mtu number}
```

Note

This command has been replaced with the following command: `configure l2vpn [vpls vpls_name | vpwsvpws_name] {dot1q [ethertypehex_number | tag [include | exclude]]} {mtunumber}`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Configures VPLS parameters.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
dot1q	Specifies the action the switch performs with respect to the 802.1Q ethertype or tag.
ethertype	Overwrites the ethertype value for the customer traffic sent across the PW.
hex_number	Identifies the ethertype, uses the format of 0xN.
tag	Specifies the action the switch performs with respect to the 802.1Q tag.
include	Includes the 802.1Q tag when sending packets over the VPLS L2 VPN.
exclude	Strips the 802.1Q tag before sending packets over the VPLS L2 VPN.
mtu	Specifies the MTU value of the VPLS transport payload packet.
number	The size (in bytes) of the MTU value. The configurable MTU range is 1492 through 9216. The default VPLS MTU value is 1500.

Default

dot1q tag - excluded.

ethertype - the configured switch ethertype is used.

number (MTU) - 1500.

Usage Guidelines

This command configures the VPLS parameters. PWs are point-to-point links used to carry VPN traffic between two devices within the VPLS. Each device must be configured such that packets transmitted

between the endpoints are interpreted and forwarded to the local service correctly. The optional ethertype keyword may be used to overwrite the Ethertype value for the customer traffic sent across the PW. By default, the configured switch ethertype is used. If configured, the ethertype in the outer 802.1q field of the customer packet is overwritten using the configured ethertype value. The ethertype value is ignored on receipt.

Optionally, the switch can be configured to strip the 802.1q tag before sending packets over the VPLS L2 VPN. This capability may be required to provide interoperability with other vendor products or to emulate port mode services. The default configuration is to include the 802.1q tag.

The mtu keyword optionally specifies the MTU value of the VPLS transport payload packet (customer packet). The MTU value is exchanged with VPLS-configured peer nodes. All VPLS peer nodes must be configured with the same MTU value. If the MTU values do not match, PWs cannot be established between VPLS peers. The MTU values are signaled during PW establishment so that endpoints can verify that MTU settings are equivalent before establishing the PW. By default the VPLS MTU is set to 1500. The configurable MTU range is 1492 through 9216. Changing the MTU setting causes established PWs to terminate. VPLS payload packets may be dropped if the VPLS MTU setting is greater than the *MPLS* MTU setting for the PW interface.

Note

The maximum MTU value supported depends on the current configuration options. For more information, see Configuring the Layer 2 VPN MTU in the *Switch Engine 32.2 User Guide*.

Example

The following commands change the various parameters of a particular VPLS:

```
configure vpls vpls1 dot1q ethertype 0x8508
configure vpls vpls1 dot1q ethertype 0x8509 mtu 2500
configure vpls vpls1 dot1q tag exclude mtu 2430
configure vpls vpls1 dot1q mtu 2500
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure vpls add peer

```
configure vpls vpls_name add peer ipaddress {core {full-mesh | primary |
   secondary} | spoke}
```

Note

This command has been replaced with the following command: . This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

```
configure l2vpn [vpls vpls_name | vpws vpws_name] add peer ipaddress
{core {full-mesh | primary | secondary} | spoke}
```

Description

Configures a VPLS or H-VPLS peer for the node you are configuring.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring a peer.
ipaddress	Specifies the IP address of the peer node.
core	Specifies that the peer is a core node.
full-mesh	Specifies that the peer is a core full-mesh node. This is the default setting if neither the core or spoke options are specified.
primary	Specifies that the peer is an H-VPLS core node and configures a primary H-VPLS connection to that core node.
secondary	Specifies that the peer is an H-VPLS core node and configures a secondary H-VPLS connection to that core node.
spoke	Specifies that the peer is a H-VPLS spoke node.

Default

N/A.

Usage Guidelines

Up to 32 core nodes can be configured for each VPLS. H-VPLS spoke nodes can peer with core nodes. Nodes can belong to multiple VPLS instances. The ipaddress parameter identifies the VPLS node that is the endpoint of the VPLS PW.

Core nodes must be configured in a full-mesh with other core nodes. Thus, all core nodes in the VPLS must have a configured PW to every other core node serving this VPLS. By default, the best LSP is chosen for the PW. The underlying LSP used by the PW can be configured by specifying the named LSP using the CLI command `configure l2vpn [vpls vpls_name | vpwsvpws_name] peeripaddress [add | delete] mpls lsplsp_name` .

Spoke nodes establish up to two point-to-point connections to peer with core nodes. If both primary and secondary peers are defined for a spoke node, the spoke node uses one of the peers for all communications. If both peers are available, the spoke node uses the connection to the primary peer. If the primary peer connection fails, the spoke node uses the secondary peer. If the primary peer later recovers, the spoke node reverts back to using the primary peer.

Example

The following command adds a connection from the local core switch to the core switch at 1.1.1.202:

```
configure vpls vpls1 add peer 1.1.1.202
```

The following command adds a connection from the local core switch to the spoke switch at 1.1.1.201:

```
configure vpls vpls1 add peer 1.1.1.201 spoke
```

The following command adds a primary connection from the local spoke switch to the core switch at 1.1.1.203:

```
configure vpls vpls1 add peer 1.1.1.203 core primary
```

History

This command was first available in ExtremeXOS 11.6.

Support for H-VPLS was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure vpls delete peer

`configure vpls` *`vpls_name`* **`delete peer`** [*`ipaddress`* | **`all`**]

Note

This command has been replaced with the command below. This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

`configure l2vpn [vpls` *`vpls_name`* `| vpws` *`vpws_name`*`] delete peer [`*`ipaddress`*` | all]`

Description

Deletes a VPLS peer from the specified `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
ipaddress	Specifies the IP address for the peer node that is the endpoint of the VC-LSP.
all	Deletes all VPLS peers.

Default

N/A.

Usage Guidelines

This command deletes a VPLS peer from the specified vpls_name. When the VPLS peer is deleted, VPN connectivity to the VPLS peer is terminated. The all keyword may be used to delete all peers associated with the specified VPLS.

Example

The following example removes connectivity to 1.1.1.202 from VPLS1:

```
configure vpls vpls1 delete peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in in the *Switch Engine 32.2 Feature License Requirements* document.

configure vpls delete service

```
configure vpls vpls_name delete service [{vlan} vlan_name | {vman}
   vman_name]
```

Note

This command has been replaced with the following command: `configure l2vpn [vpls vpls_name | vpws vpws_name] delete service [{vlan} vlan_name | {vman} vman_name]`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Deletes local VPLS service from the specified `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS interface within the switch (character string).
vlan_name	Logically binds the *VLAN* to the specified VPLS.
vman_name	Adds the named VMAN to the VPLS.

Default

N/A.

Usage Guidelines

This command deletes the local VPLS service from the specified *vpls_name*. Specifying the *vlan_name* or *vman_name* deletes the service from the VPLS. If there are no services configured for the VPLS, all PWs within the VPLS are terminated from the switch.

Example

The following example removes a service interface from a VPLS:

```
configure vpls vpls1 delete vman vman1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure vpls health-check vccv

```
configure vpls [vpls_name | all] health-check vccv {interval
   interval_seconds} {fault-multiplier fault_multiplier_number}
```

Note

This command has been replaced with the following command: `configure l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]] health-check vccv {intervalinterval_seconds} {fault-multiplierfault_multiplier_number}` .

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Configures the VCCV health check test and fault notification intervals for the specified VPLS instance.

Syntax Description

vpls_name	Identifies the VPLS instance for which health check is to be configured.
all	Specifies that the configuration applies to all VPLS instances on the local node.
interval_seconds	Defines the interval between health check tests. The range is 1 to 10 seconds.
fault_multiplier_ number	Specifies how long health check waits before a warning level message is logged. The wait period is the *interval_seconds* multiplied by the *fault_multiplier_number*. The *fault_multiplier_number* range is 2 to 6.

Default

Interval is 5 seconds.

Fault mulitplier is 4.

Usage Guidelines

The VCCV health-check configuration parameters can be configured at anytime after the VPLS has been created.

The `show l2vpn {vpls {{vpls_name} | vpws {{vpws_name}} {peeripaddress} {detail} | summary}` command displays the configured `interval_seconds` and `fault-multiplier_number` values for the VPLS and the VCCV activity state.

Example

The following command configures the health check feature on the VPLS instance myvpls:

```
configure vpls myvpls health-check vccv interval 10 fault-notification 40
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure vpls peer l2pt profile

```
configure {l2vpn} vpls vpls_name peer ipaddress l2pt profile [none |
   profile_name]
```

Description

Configures L2PT profiles on service interfaces.

Syntax Description

l2vpn	Specifies the Layer 2 Virtual Private Network.
vpls*vpls_name*	Specifies Virtual Private LAN Service over *MPLS*, and the alphanumeric string identifying the VPLS VPN.
peer *ipaddress*	Specifies the VPLS peer, and the IPv4 address.
l2pt profile	Specifies Layer 2 protocol tunneling and the L2PT profile for the PW.
none	Specifies that no L2PT profile should be bound to the PW (default).
profile_name	Specifies the L2PT profile to be bound to the PW.

Default

Disabled.

Usage Guidelines

Use this command to configure L2PT profiles on service interfaces.

Example

The following example unbind the L2PT profile from peer 1.1.1.1 of VPLS cust2:

```
configure l2vpn vpls cust2 peer 1.1.1.1 l2pt profile none
```

The following example binds *my_l2pt_prof* with peer 1.1.1.1 of VPLS cust1. *my_l2pt_prof* specifies tunneling actions:

```
configure l2vpn vpls cust1 peer 1.1.1.1 l2pt profile my_l2pt_prof
Error: Tunnel action may be applied only to ports.
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vpls peer mpls lsp

```
configure vpls vpls_name peer ipaddress [add | delete] mpls lsp lsp_name
```

Note

This command has been replaced with the following command: `configure l2vpn [vpls vpls_name | vpwsvpws_name] peer ipaddress [add | delete] mpls lsplsp_name` .

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Configures a named LSP to be used for the PW to the specified VPLS peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP.
add	Permits addition of up to four RSVP-TE LSPs to the VPLS peer.
delete	Removes the LSP specified by the lsp_name parameter from the PW-LSP aggregation list.
lsp_name	Removes the specified lsp.

Default

N/A.

Usage Guidelines

This command configures a named LSP to be used for the PW to the specified VPLS peer. The delete keyword removes the LSP specified by the lsp_name. If all the named LSPs are deleted to the configured VPLS peer, VPLS attempts to use the best-routed path LSP, if one exists. The delete portion of this command cannot be used to remove a named LSP that was selected by the switch as the best LSP. If no LSPs exist to the VPLS peer, VPN connectivity to the VPLS peer is lost. Currently, the VPLS PW uses only one LSP.

In ExtremeXOS 15.4, this command is modified to display an informational message when multiple transport LSPs are configured for a VPLS PW, when LSP sharing is not enabled. This message is only displayed once per switch boot.

Example

The following examples add and remove a named LSP:

```
configure vpls vpls1 peer 1.1.1.202 add mpls lsp "to-olympic4"
configure vpls vpls1 peer 1.1.1.202 delete mpls lsp "to-olympic4"

configure vpls vpls1 peer 20.20.20.83 add mpls lsp lsp2
```

Note

To share LSPs in HW, use the `enable l2vpn sharing` command.

History

This command was first available in ExtremeXOS 11.6.

This command was modified, in ExtremeXOS 15.4, to display an informational message when multiple transport LSPs are configured for a VPLS PW, and LSP sharing is not enabled.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure vpls peer

`configure vpls` *`vpls_name`* **`peer`** *`ipaddress`* [**`limit-learning`** *`number`* | **`unlimited-learning`**]

Note

This command has been replaced with the following command: `configure l2vpn [vpls` *`vpls_name`* `| vpws`*`vpws_name`*`] peer`*`ipaddress`* `[limit-learning`*`number`* `| unlimited-learning]`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Configures the maximum number of MAC SAs (Source Addresses) that can be learned for a given VPLS and peer.

Syntax Description

`vpls_name`	Identifies the VPLS within the switch (character string).
`ipaddress`	Specifies the IP address for the peer node that is the endpoint of the PW-LSP.
`limit-learning`	Specifies a limit to the number of MAC SAs to be learned for the specified VPLS and peer.

number	The maximum number of MAC SAs that can be learned for the specified VPLS and peer.
unlimited-learning	Specifies no limit to the number of MAC SAs to be learned for the specified VPLS and peer.

Default

Unlimited.

Usage Guidelines

This command configures the maximum number of MAC SAs (Source Addresses) that can be learned for a given VPLS and peer. This parameter can only be modified when the specified VPLS is disabled. The **unlimited-learning** keyword can be used to specify that there is no limit. The default value is **unlimited-learning**.

Example

The following example causes no more than 20 MAC addresses to be learned on VPLS1's PW to 1.1.1.202:

```
configure vpls vpls1 peer 1.1.1.202 limit-learning 20
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure vpls snmp-vpn-identifier

`configure vpls` *vpls_name* **snmp-vpn-identifier** *identifier*

Description

Configures a *SNMP* VPN identifier for traps from the specified VLPLS.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring the identification string.
identifier	Specifies a text string to identify the VPLS in SNMP traps.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures the identifier vpls1trap for SNMP VPN traps on VPLS vpls1:

```
configure vpls vpls1 snmp-vpn-identifier vpls1trap
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure vr add ports

`configure vr` *vr-name* **`add ports`** *port_list*

Description

Assigns a list of ports to the specified VR.

Syntax Description

vr-name	Specifies the name of the VR.
port_list	Specifies the ports to add to the VR.

Default

By default, all ports are assigned to *VR-Default*.

Usage Guidelines

When a new VR is created, by default, no ports are assigned, no *VLAN* interface is created, and no support for any routing protocols is added. Use this command to assign ports to a VR. Since all ports are initially assigned to VR-Default, you might need to delete the desired ports first from the VR where they reside before you add them to the desired VR.

If you plan to assign VR ports to a VLAN, be aware that the ports that you add to a VLAN and the VLAN itself cannot be explicitly assigned to different VRs. When multiple VRs are defined, consider the following guidelines while adding ports to a VR:

- A VLAN can belong (either through explicit or implicit assignment) to only one VR.
- If a VLAN is not explicitly assigned to a VR, then the ports added to the VLAN must be explicitly assigned to a single VR.
- If a VLAN is explicitly assigned to a VR, then the ports added to the VLAN must be explicitly assigned to the same VR or to no VR.
- If a port is added to VLANs that are explicitly assigned to different VRs, the port must be explicitly assigned to no VR.

Example

The following example adds all the ports on slot 2 to the VR "vr-acme":

```
configure vr vr-acme add ports 2:*
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vr add protocol

```
configure vr vr_name [add | delete] protocol [ospf | ospfv3 | rip |
   ripng | bgp | isis | pim | mpls]
```

Description

Starts a Layer 3 protocol instance for a VR or VRF.

Syntax Description

vr_name	Specifies the name of a VR or a VRF.
protocol	Specifies a Layer 3 protocol that you can add or delete.
name	Specifies the name of a VR or a VRF. The following protocols are supported on VRs: *RIP*, *RIPng*, *OSPF*, *OSPFv3*, *BGP*, PIM. IS-IS, and *MPLS*. The following protocols are supported on VRFs: BGP, OSPFv3.
add	Adds a routing protocol to VRF for PE – CE communication .
delete	Specifies the name of a VR or a VRF.

Default

By default, none of the dynamic protocols are added to a User VR or a VRF.

Usage Guidelines

When a new VR or VRF is created, by default, no ports are assigned, no *VLAN* interface is created, and no support for any routing protocols is added.

MPLS is the only protocol that you can add to or delete from *VR-Default*. When MPLS is enabled on a switch, the default configuration adds MPLS to VR-Default. You cannot add or delete any other protocols from VR-Default, and you cannot add or delete any protocols from the other system VRs, *VR-Mgmt* and *VR-Control*.

Note
You must delete the MPLS protocol from VR-Default before you can add it to a user VR. MPLS can be active on only one VR within a switch.

When you add a protocol to a VRF, the parent VR starts that protocol, if it was not already running, and adds a protocol instance to support the VRF.

Note
OSPFv3 protocol can be added only to the user VR and non-VPN VRF.

If a previously configured protocol instance is deleted, the CE routes imported from that protocol into the VRF RIB is removed.

Example

The following example starts RIP on the VR "vr-acme":

```
configure vr vr-acme add protocol rip
```

The following example starts a BGP protocol instance for VRF "vr-widget":

```
configure vr vr-widget add protocol bgp
```

History

This command was first available in ExtremeXOS 11.0.

MPLS protocol support was added in ExtremeXOS 12.4.

Support for the OSPFv3 and RIPng protocols on user VRs was added in ExtremeXOS 12.5.

Support for the BGP protocol on VRFs was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on ExtremeSwitching 5420, 5520, 5720 series switches.

configure vr delete ports

```
configure vr vr-name delete ports port_list
```

Description

Removes a list of ports from the VR specified.

Syntax Description

vr-name	Specifies the name of the VR.
port_list	Specifies the ports to remove from the VR.

Default

By default, all ports are assigned to *VR-Default*.

Usage Guidelines

When a new VR is created, by default, no ports are assigned, no *VLAN* interface is created, and no support for any routing protocols is added. Use this command to remove ports from a VR. Since all ports are initially assigned to VR-Default, you might need to delete the desired ports first from the VR where they reside before you add them to the desired VR.

Example

The following example removes all the ports on slot 2 from the VR "vr-acme":

```
configure vr vr-acme delete ports 2:*
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vr description

```
configure vr vr_name {description desc_string }
```

Description

Use this command to configure a description for the specified VR or VRF.

Syntax Description

vr_name	Specifies the name of a user VR or a VRF.
desc_string	Specifies a text string to describe the VR. If the text string contains space characters, the entire string must be enclosed with double quotes (" ").

Default

No description.

Usage Guidelines

This command allows you to add comments about a VRF/VR entity. Entering a NULL string on the CLI will unconfigure the description string for the VRF/VR. If the description string has spaces in it, then the string must be enclosed within double quotes (" ").

This text message appears in the `show virtual-router` command display when the command specifies a VR name. For VPN VRFs, this message is returned for a mplsL3VPN MIB query of the MIB variable mplsL3VpnVrfDescription.

Example

The following example configures a description for the VRF "corporate":

```
configure vr corporate description "VRF for the corporate intranet"
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure vrrp group

```
configure vrrp group group_name add [primary-vr | secondary-vr] [{vlan}
   vlan_name vrid vridval | vlan vlan_list {vrid vrid_list}]

configure vrrp group group_name delete [primary-vr | secondary-vr
   [{vlan} vlan_name vrid vridval | vlan vlan_list {vrid vrid_list} |
   all] ]
```

Description

The first version of this command adds a primary VR or secondary VR to a specified group by supplying a *VLAN* name and VRID. The second version of the command deletes a primary VR or secondary VR from a specified group by supplying a VLAN name and VRID.

Syntax Description

group	Form a group of *VRRP* VRs to operate in high-scale mode.
group_name	Specifies the VRRP group name.
add	Adds a VR to a VRRP group.
primary-vr	Specifies adding/deleting a primary VR of the VRRP group that sends VRRP advertisement at configured intervals.
secondary-vr	Specifies adding/deleting a secondary VR of the VRRP group that sends VRRP advertisement at a slower rate than the primary VR.
vlan	Specifies a VLAN for the VR.
vlan_name	Specifies the VLAN name for the VR.
vrid	Specifies a VRID for the VR.
vridval	Specifies the VRID for the VR.
delete	Deletes VR(s) from the VRRP group.
all	Specifies that all VRs (secondary and primary) are deleted from the VRRP group.
vlan_list	List of VLAN ID tags (1–4,094).

Default

When adding multiple secondary VRs at once, if no VRIDs are specified, all VRs configured on the specified VLANs are added to the group.

Example

The following example adds a primary VR VLAN "v1", VRID "1" for VRRP group "ExtremeNet":

```
configure vrrp group ExtremeNet add primary-vr vlan v1 vrid 1
```

The following example adds a set of VRRP VRs configured on VLANs having VLAN IDs ranging from 11 to 20. Out of all of the VRs configured on these VLANs only VRs with VRID ranging from 1 to 2 are added to the VRRP group:

```
Configure vrrp group ExtremeNet add secondary-vr vlan 11-20 vrid 1-2
```

The following example adds all VRs configured on given VLANs to the group as secondary VRs:

```
configure vrrp group ExtremeNet add secondary-vr vlan 11-20
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp fabric-routing

```
configure vrrp vlan [vlan_name | vlan_list] vrid [vridval | vrid_list]
   {group group_name }fabric-routing [on | off]
```

Description

This command configures fabric routing.

Syntax Description

group	Specifies *VRRP* VRs information that form the group.
group_name	Name of the specific VRRP group.
fabric-routing	Configures fabric routing on all members of the group.
on	Enables fabric routing capability.
off	Disables fabric routing capability.
port_list	Port list separated by a comma or –.
vlan_name	Specifies the name of a VRRP *VLAN*.
vlan_list	VLAN list (1–4,094).
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
vrid_list	List of virtual router IDs (1–255).

Default

N/A

Usage Guidelines

This configuration can be present on all VRRP routers, regardless of the VRRP state of the router. Fabric routing is enabled only when the VRRP router is in backup state.

You need to configure fabric routing on all members of group when a member's VRID is reused in another group.

Example

The following command turns on fabric routing capability on all VR members of the group "ExtremeNet":

```
configure vrrp group ExtremeNet fabric-routing on
```

History

This command was first available in ExtremeXOS 22.2.

VLAN and VR list options added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid accept-mode

```
configure vrrp vlan vlan_name vrid vridval accept-mode [on | off]
```

Description

Configures a backup *VRRP* router instance to accept or reject packets addressed to the IP address owner when operating as the VRRP master.

Additionally, this command provides capability for switches to configure the VRRP virtual IP as NTP server address.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
on	Specifies that the VRRP instance is to accept packets addressed to the IP address owner.
off	Specifies that the VRRP instance not accept packets addressed to the IP address owner. Note: Ping packets are accepted, regardless of the configuration for this command.

Default

Off.

Usage Guidelines

When a backup VRRP router operates as master, it accepts VRRP traffic and routes traffic. The backup router in master mode also accepts ping packets and IPv6 neighbor solicitations and advertisements. However, because the backup router is not the IP address owner, the default configuration rejects all other traffic addressed to the IP address owner.

If your network requires that a backup VRRP router in master mode accept all traffic addressed to the IP address owner, use this command to configure accept-mode on.

In the ExtremeXOS 15.3 release, NTP VRRP Virtual IP support is added. This feature allows you to configure the VRRP virtual IP as NTP server address. The NTP server when configured on the VRRP master will listen on the physical and virtual IP address for NTP clients. For this feature to work correctly, you need to enable accept mode in VRRP. Enabling accept mode allows the switch to process non-ping packets that have a destination IP set to the virtual IP address.

Example

The following example configures a backup VRRP router in master mode to accept packets addressed to the IP address owner:

```
configure vrrp vlan vlan-1 vrid 1 accept-mode on
```

History

This command was first available in ExtremeXOS 12.7.

NTP VRRP Virtual IP support was added in ExtremXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid add ipaddress

`configure vrrp` **`vlan`** [*`vlan_name`* | *`vlan_id`*] **`vrid`** *`vridval`* **`add`** *`ipaddress`*

Description

Associates a virtual IP address with a specific *VRRP* instance.

Syntax Description

`vlan_name`	Specifies the name of a VRRP *VLAN*.
`vlan_id`	VLAN ID tag (1–4,094).
`vridval`	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
`ipaddress`	Specifies a virtual IPv4 or IPv6 address to be assigned to the VRRP instance.

Default

N/A.

Usage Guidelines

Each VRRP instance is identified by an ID number, VLAN name, and virtual IP address. When two or more routers are configured with the same VRRP ID number, VLAN name, and virtual IP address, the routers with matching parameters are all part of the same VRRP instance. One router within the instance will become the VRRP instance master, and the others will become backup routers for the VRRP instance.

Most routers within a VRRP instance will have a virtual IP address that is different from the actual IP addresses configured on the router. If the virtual IP address for a VRRP instance matches an IP address configured on a host router, the VRRP instance is known as the IP address owner. On the IP address owner, the VRRP instance priority defaults to 255, and by default, the IP address owner becomes the VRRP master when VRRP is enabled.

Note
There is no requirement to configure an IP address owner within a VRRP instance.

Before each VRRP router is enabled, it must be configured with at least one virtual IPv4 or IPv6 address. You can repeat this command to add additional virtual IP addresses to the VRRP router. If a virtual IPv4 address is added to a VRRP router, you cannot later add a virtual IPv6 address. Similarly, if a virtual IPv6 address is added to a VRRP router, you cannot later add a virtual IPv4 address.

Each IPv6 VRRP instance is associated with one and only one virtual link local address, which serves as the source IP address for subsequent router announcement packets generated by the master VRRP router. The virtual link local address can be explicitly configured or generated automatically. One way to explicitly configure the virtual link local address is to add it to the virtual IP address list with this command.

Example

The following example associates virtual IPv4 address 10.1.2.3 to VRRP router instance 1:

```
configure vrrp vlan vlan-1 vrid 1 add 10.1.2.3
```

The following example associates virtual IPv6 address 2001:db8::3452 to VRRP router instance 2:

```
configure vrrp vlan vlan-1 vrid 2 add 2001:db8::3452
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 addresses was added in ExtremeXOS 12.7.

The *vlan_id* option was added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid add track-iproute

```
configure vrrp vlan vlan_name vrid vridval add track-iproute ipaddress/
   masklength
```

Description

Creates a tracking entry for the specified route. When this route becomes unreachable, this entry is considered to be failing.

Syntax Description

vlan_name	Specifies the name of a *VRRP VLAN*.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
ipaddress	Specifies the IPv4 or IPv6 prefix of the route to track.
masklength	Specifies the length of the route's prefix.

Default

N/A.

Usage Guidelines

The route specified in this command might not exist in the IP routing table. When you create the entry for a route, an immediate VRRP failover might occur.

Note

VRRP tracking is not supported on *MPLS* LSPs.

Example

The following command enables IP route failure tracking for routes to the specified subnet:

```
configure vrrp vlan vlan-1 vrid 1 add track-iproute 3.1.0.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid add track-ping

```
configure vrrp vlan vlan_name vrid vridval add track-ping ipaddress
   frequency seconds miss misses {success successes}
```

Description

Creates a tracking entry for the specified IP address. The entry is tracked using pings to the IP address, sent at the specified frequency.

Syntax Description

vlan_name	Specifies the name of a *VRRP VLAN*.
vrid *vridval*	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
ipaddress	Specifies the IPv4 or IPv6 address to be tracked.
frequency *seconds*	Specifies the number of seconds between pings to the target IP address. The range is 1 to 600 seconds.
miss *misses*	Specifies the number of misses allowed before this entry is considered to be failing. The range is 1 to 255 pings.
success *successes*	Sets how many ping successes are required for tracking success. Range is 1–255. (Default is 10 × *misses*.)

Default

If the number of successes is not specified, the default is ten times the number of misses specified.

Usage Guidelines

Adding an entry with the same IP address as an existing entry causes the new values to overwrite the existing entry's frequency and miss number.

Example

The following command enables ping tracking for the external gateway at 3.1.0.1, pinging every 3 seconds, and considering the gateway to be unreachable if no response is received to 5 consecutive pings:

```
configure vrrp vlan vlan-1 vrid 1 add track-ping 3.1.0.1 frequency 3 miss 5
```

History

This command was first available in ExtremeXOS 10.1.

The **success** option was added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document./ph "/>

configure vrrp vlan vrid add track-vlan

```
configure vrrp vlan vlan_name vrid vridval add track-vlan
   target_vlan_name
```

Description

Configures a *VRRP VLAN* to track port connectivity to a specified VLAN. When this VLAN is in the down state, this entry is considered to be failing.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
target_vlan_name	Specifies the name of the VLAN to track.

Default

N/A.

Usage Guidelines

Up to eight VLANs can be tracked.

Deleting a tracked VLAN does not constitute a failover event for the VRRP VLAN tracking it, and the tracking entry is deleted.

Example

The following command enables VRRP VLAN vlan-1 to track port connectivity to VLAN vlan-2:

```
configure vrrp vlan vlan-1 vrid 1 add track-vlan vlan-2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid add virtual-link-local

```
configure vrrp vlan vlan_name vrid vridval add virtual-link-local
   vll_addr
```

Description

Specifies a virtual IPv6 link local address for the *VRRP* router instance.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
vll_addr	Specifies a virtual link local address to be assigned to the VRRP instance.

Usage Guidelines

Each IPv6 VRRP instance is associated with one and only one virtual link local address, which serves as the source IP address for subsequent router announcement packets generated by the master VRRP router. The virtual link local address can be explicitly configured or generated automatically.

One way to explicitly configure the virtual link local address is to add it to the virtual IP address list with this command. The new link local address must match the FE80::/64 subnet, and it must match the address in use on all other router in this VRRP instance.

If no virtual link local address is configured, an appropriate address is generated automatically.

Note

If an IPv4 address has been added to a VRRP router, you cannot later add any IPv6 address, so you cannot add a link local address.

Example

The following example associates virtual IPv6 link local address fe80::1111 to VLAN vlan-1:

```
configure vrrp vlan vlan-1 vrid 1 add virtual-link-local fe80::1111
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid advertisement-interval

```
configure vrrp vlan vlan_name vrid vridval advertisement-interval
   interval [{seconds} | centiseconds]
```

Description

Configures the time between *VRRP* advertisements in seconds or centiseconds.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
interval	Specifies an interval value for the time between advertisements. The range is 1 through 40 seconds or 10 through 4095 centiseconds.
seconds	Specifies that the interval value is in seconds. If you do not specify seconds or centiseconds, the interval value is applied as seconds.
centiseconds	Specifies that the interval value is in centiseconds.

Default

The advertisement interval is 1 second.

Usage Guidelines

The advertisement interval specifies the interval between advertisements sent by the master router to inform the backup routers that its alive. You must use whole integers when configuring the advertisement interval.

An extremely busy CPU can create a short dual master situation. To avoid this, increase the advertisement interval.

Note

The milliseconds keyword is replaced by the centiseconds keyword, but the milliseconds keyword is still recognized to support existing configurations and scripts. Any values specified in milliseconds are converted to centiseconds. All new configurations and scripts should specify the interval in either seconds or centiseconds. The maximum value for an interval specified in seconds is 40. However, the software supports older configurations and scripts that specify values up to 255, which were supported prior to ExtremeXOS Release 12.7.

To view your VRRP configuration, including the configured advertisement interval, use one of the following commands:

- `show vrrp {virtual-router {vr-name}} {detail}`
- `show vrrp vlan vlan_name {stats}`

If you enter a number that is out of the seconds or centiseconds range, the switch displays an error message. For example, if the interval value is set to 999 and the centiseconds keyword is missing, the switch displays an error message similar to the following:

```
configure vrrp blue vrid 250 advertisement-interval 999 Error:
Advertisement interval must be between 1 and 255 seconds. 999 out of
range
```

Example

The following command configures the advertisement interval for 15 seconds:

```
configure vrrp vlan vrrp-1 vrid 1 advertisement-interval 15
```

The following command configures the advertisement interval for 200 centiseconds:

```
configure vrrp vlan vrrp-1 vrid 1 advertisement-interval 200 centiseconds
```

History

This command was first available in ExtremeXOS 10.1.

The milliseconds and seconds keywords were added in ExtremeXOS 11.5.

The centiseconds keyword replaced the milliseconds keyword, and the maximum value for intervals specified in seconds was reduced to 40 in ExtremeXOS 12.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid delete track-iproute

```
configure vrrp vlan vlan_name vrid vridval delete track-iproute
   ipaddress/masklength
```

Description

Deletes a tracking entry for the specified route.

Syntax Description

vlan_name	Specifies the name of a *VRRP VLAN*.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
ipaddress	Specifies the IPv4 or IPv6 prefix of the route.
masklength	Specifies the length of the route's prefix.

Default

N/A.

Usage Guidelines

Deleting a tracking entry while VRRP is enabled causes the VRRP VRs state to be re-evaluated for failover.

Example

The following command disables tracking of routes to the specified subnet for VLAN vlan-1:

```
configure vrrp vlan vlan-1 vrid 1 delete track-iproute 3.1.0.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid delete track-ping

`configure vrrp vlan` *vlan_name* **`vrid`** *vridval* **`delete track-ping`** *ipaddress*

Descriptioin

Deletes a tracking entry for the specified IP address.

Syntax Description

vlan_name	Specifies the name of a *VRRP VLAN*.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
ipaddress	Specifies the IP address to be tracked.

Default

N/A.

Usage Guidelines

Deleting a tracking entry while VRRP is enabled causes the VRRP VRs state to be re-evaluated for failover.

A VRRP node with a priority of 255 might not recover from a ping-tracking failure if there is a Layer 2 switch between it and another VRRP node. In cases where a Layer 2 switch is used to connect VRRP nodes, we recommend that those nodes have priorities of less than 255.

Example

The following command disables ping tracking for the external gateway at 3.1.0.1:

```
configure vrrp vlan vlan-1 vrid 1 delete track-ping 3.1.0.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid delete track-vlan

```
configure vrrp vlan vlan_name vrid vridval delete track-vlan
   target_vlan_name
```

Description

Deletes the tracking of port connectivity to a specified *VLAN*.

Syntax Description

vlan_name	Specifies the name of a *VRRP* VLAN.
vridval	Specifies the VRID of the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
target_vlan_name	Specifies the name of the tracked VLAN.

Default

N/A.

Usage Guidelines

Deleting a tracking entry while VRRP is enabled causes the VRRP VRs state to be re-evaluated for failover.

Example

The following command disables the tracking of port connectivity to VLAN vlan-2:

```
configure vrrp vlan vlan-1 vrid 1 delete track-vlan vlan-2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid delete ipaddress

`configure vrrp` **`vlan`** `[`*`vlan_name`* `|`*`vlan_id`*`]` **`vrid`** *`vridval`* **`delete`** *`ipaddress`*

Description

Deletes a virtual IPv4 or IPv6 address from a specific *VRRP* router.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vlan_id	VLAN ID tag (1–4,094).

vridval	Specifies the VRID of the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
ipaddress	Specifies the virtual IP address to be deleted from the VRRP instance. This is common for IPv4/IPv6 addresses.

Usage Guidelines

When a VRRP router is enabled, it must have at least one virtual IP address. When the VRRP router is not enabled, there are no restrictions on deleting the IP address.

Example

The following command removes IP address 10.1.2.3 from VLAN vlan-1:

```
configure vrrp vlan vlan-1 vrid 1 delete 10.1.2.3
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_id* option was added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid dont-preempt

`configure vrrp vlan` *vlan_name* **vrid** *vridval* **dont-preempt**

Description

Specifies that a higher priority backup router does not preempt a lower priority master.

Syntax Description

vlan_name	Specifies the name of a *VRRP VLAN*.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.

Default

The default setting is preempt.

Usage Guidelines

The preempt mode controls whether a higher priority backup router preempts a lower priority master. dont-preempt prohibits preemption. The router that owns the virtual IP address always preempts, independent of the setting of this parameter.

Example

The following command disallows preemption:

```
configure vrrp vlan vlan-1 vrid 1 dont-preempt
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid host-mobility

```
configure vrrp [{vlan} [vlan_name | vlan_list] vrid [vridval | vrid_list
   | all]] host-mobility [{on | off} {exclude-ports [add | delete]
   port_list}]
```

Description

All instances of *VRRP* have host-mobility off by default. Configuring host-mobility to “on” state starts ARP route learning. By default, all ports perform the route learning. Configuring host-mobility excluded-ports will disable the route learning on the port list provided. All ports of the VRRP *VLAN* that are connected to another router should be excluded. If ports are not excluded, routes are created for devices as if they are directly connected and this may cause traffic to take a longer route.

Syntax Description

host-mobility	Exportable Host Route learning via ARP/ND on the specified VLAN and VRID.
on	Advertise host routes for hosts learned via ARP/ND.
off	Do not advertise host routes for hosts learned via ARP/ND.
exclude-ports	Exclude ports from host-mobility route learning (Default: no ports are excluded).
add	Add ports to host-mobility exclude list; host-mobility routes will not be learned on the ports.
delete	Delete ports from host-mobility exclude list.

port_list	Port list separated by a comma or –“ .
vlan_name	Specifies the name of a VRRP *VLAN*.
vlan_list	VLAN list (1–4,094).
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
vrid_list	List of virtual router IDs (1–255).
all	Selects all VRRP virtual routers.

Default

Off.

Usage Guidelines

Configuring host-mobility excluded-ports will disable the route learning on the port list provided. All ports that are connected to another router should be excluded. If ports are not excluded, routes will be created for devices as if they are directly connected and may cause traffic to take a longer route.

Example

```
configure vrrp vlan vlan1 vrid 1 host-mobility on excluded-ports add 1,10
```

History

This command was first available in ExtremeXOS 21.1.

VLAN and VR list options added in ExtremeXOS 22.3.

The **all** option was added in ExtremeXOS 22.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid ipv4 checksum

```
configure vrrp {vlan} vlan_name vrid vridval ipv4 checksum [include-
   pseudo-header | exclude-pseudo-header]
```

Description

This command allows you to eliminate the pseudo header for VRRPv3 IPv4 Checksum calculation.

Default

Include.

Example

```
configure vrrp vlan "v1" vrid 1 ipv4 checksum exclude-pseudo-header
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *VRRP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid preempt

configure vrrp vlan *vlan_name* **vrid** *vridval* **preempt** {**delay** *seconds*}

Description

Specifies that a higher priority backup router preempts a lower priority master.

Syntax Description

vlan_name	Specifies the name of a *VRRP VLAN*.
vridval	Specifies the VRID for a VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
seconds	Specifies a preempt delay period in seconds. The value range is 1 to 3600 seconds, or 0, which selects the original preempt delay period.

Default

Preempt enabled.

Delay configuration: 0.

Usage Guidelines

The preempt option enables a higher-priority backup router to preempt a master with a lower priority. When a VRRP enabled router receives a lower priority VRRP advertisement and preemption is enabled,

the higher-priority VRRP enabled router takes over as master. The new master starts sending VRRP advertisements and the old, lower-priority master relinquishes mastership.

Note

The router that owns the virtual IP address always preempts, independent of the setting of this parameter.

When a VRRP enabled router preempts the master, it does so in one of the following ways:

- If the preempt delay timer is configured for between 1 and 3600 seconds and the lower-priority master is still operating, the router preempts the master when the timer expires.
- If the preempt delay timer is configured for 0, the router preempts the master after 3 times the hello interval.
- If the higher priority router stops receiving advertisements from the current master for 3 times the hello interval, it takes over mastership immediately.

Note

The preempt feature can be disabled with the `configure vrrp vlan vrid dont-preempt` command.

Example

The following command allows preemption:

```
configure vrrp vlan vlan-1 vrid 1 preempt
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid priority

```
configure vrrp vlan [vlan_name | vlan_list] vrid [vridval | vrid_list]
   priority priorityval
```

Description

Configures the priority value of a *VRRP* router instance.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vlan_list	VLAN list (1–4,094).
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
vrid_list	List of virtual router IDs (1–255).
priorityval	Specifies the priority value of the router. The default is 100. The priority range is 1-255.

Default

The default priority is 100.

Usage Guidelines

This command changes the priority of a VRRP router. If the VRRP router is the IP address owner (which means that the VRRP router IP address matches the VRRP VLAN IP address), the priority is 255 and cannot be changed. If the VRRP router is not the IP address owner, the priority can be changed to values in the range of 1 to 254.

To change the priority of the IP address owner or to make a different VRRP router the IP address owner, disable VRRP and reconfigure the affected switches to use VRRP router addresses that support the priorities you want to assign.

Example

The following command configures a priority of 150 for VLAN vrrp-1:

```
configure vrrp vlan vrrp-1 vrid 1 priority 150
```

History

This command was first available in ExtremeXOS 10.1.

VLAN and VR list options added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid track-mode

```
configure vrrp vlan vlan_name vrid vridval track-mode [all | any]
```

Description

Defines the conditions under which the router automatically relinquishes master status when the tracked entities fail.

Syntax Description

vlan_name	Specifies the name of a *VRRP VLAN*.
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
all	Specifies that the mastership is relinquished when one of the following events occur: All of the tracked VLANs failAll of the tracked routes failAll of the tracked PINGs fail
any	Specifies that the mastership is relinquished when any of the tracked VLANs, routes, or PINGs fail.

Default

The default setting is all.

Usage Guidelines

None.

Example

The following command configures the track mode to any:

```
configure vrrp vlan vrrp-1 vrid 1 track-mode any
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure vrrp vlan vrid version

`configure vrrp vlan` *vlan_name* **vrid** *vridval* **version** [**v3-v2** | **v3** | **v2**]

Description

Selects the *VRRP* version to apply to the VRRP router instance.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
v3-v2	Specifies VRRP v3 with VRRP v2 compatibility.
v3	Selects VRRP v3.
v2	Specifies VRRP v2.

Default

VRRP v3 with VRRP v2 compatibility.

Note

Configurations created by earlier ExtremeXOS software releases have an implied version of v2. If the configuration is subsequently saved, the version is explicitly set to v2.

Usage Guidelines

None.

Example

The following command configures the VRRP router instance to use VRRP v3 only:

```
configure vrrp vlan vrrp-1 vrid 1 version v3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure web http access-profile

```
configure web http access-profile [[[add rule ] [first | [[before |
   after] previous_rule]]] | delete rule | none ]
```

Description

Configures HTTP to use an *ACL* rule for access control.

Syntax Description

add	Specifies that an ACL rule is to be added to the website.
rule	Specifies an ACL rule.
first	Specifies that the new rule is to be added before all other rules.
before	Specifies that the new rule is to be added before a previous rule.
after	Specifies that the new rule is to be added after a previous rule.
previous_rule	Specifies an existing rule in the application.
delete	Specifies that one particular rule is to be deleted.
none	Specifies that all the rules or a policy file is to be deleted.

Default

N/A.

Usage Guidelines

You must be logged in as administrator to configure HTTP parameters.

Use this command to restrict HTTP access by adding an ACL rule to the HTTP application. Once an ACL is associated with HTTP, all the packets that reach a HTTP module are evaluated with this ACL and appropriate action (permit or deny) is taken, as is done using policy files.

The permit or deny counters are also updated accordingly regardless of whether the ACL is configured to add counters. To display counter statistics, use the tftp put on page 3367 http command.

Only the following match conditions and actions are copied to the client memory. Others that may be in the rule are not copied.

Match conditions

- Source-address—IPv4 and IPv6

Actions

- Permit
- Deny

When adding a new rule, use the first, before, and after previous_rule parameters to position it within the existing rules.

If the *SNMP* traffic does not match any of the rules, the default behavior is permit. To deny SNMP traffic that does not match any of the rules, add a deny all rule at the end or the rule list.

Example

The following example copies the ACL rule, DenyAccess to the HTTP application in first place:

```
configure web http access-profile add DenyAccess first
```

The following example removes the association of the ACL rule DenyAccess from the HTTP application:

```
configure web http access-profile delete DenyAccess
```

The following example removes the association of all ACL rules from the HTTP application:

```
configure web http access-profile none
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure xml-notification target add/delete

```
configure xml-notification target target [add | delete] module
```

Description

Adds or deletes an ExtremeXOS module to or from the Web server target.

Syntax Description

target	Specifies an alpha numeric string that identifies the configured target.
module	Specifies the name of the ExtremeXOS module.

Default

N/A.

Usage Guidelines

Use the add option to attach a module to the Web server target in order to receive events from that application and send them to the targeted Web server. There is no limitation to the number of modules that can be attached.

Only Identity Management and EMS are supported targets.

Use the delete option to detach ExtremeXOS modules from the Web server target in order to stop receiving events from that module.

Example

The following command deleted the target test2 from EMS:

```
configure xml-notification target test2 ems
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure xml-notification target

```
configure xml-notification target target [url url {vr vr_name} | user
   [none | user] | [encrypted-auth encrypted-auth] | [queue-size queue-
   size]]
```

Description

Configures the Web server target in the XML client.

Syntax Description

target	Specifies an alpha numeric string that identifies the configured target.
url	Specifies the Web server URL.
vr_name	Specifies the virtual router over which the XML client process can connect to a Web server to send push notifications.
user	Specifies the alpha numeric string identifying the Web server user.
encrypted-auth	Specifies the encrypted user authentication string.
queue-size	Specifies in numeric format, the size of the buffer that stores incoming events from ExtremeXOS software.

Default

N/A.

Usage Guidelines

Use this command to configure the Web server target in XML client process.

Example

The following command configures the target target2 for the user admin:

```
configure xml-notification target target2 user admin
```

History

This command was first available in ExtremeXOS 12.4.

The virtual router option was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure l2pt encapsulation dest-mac

```
configure l2pt encapsulation dest-mac mac_address
```

Description

Configures the destination address MAC that L2PT encapsulated packets use.

Syntax Description

encapsulation	Specifies Layer 2 protocol tunneling encapsulation.
dest-mac	Specifies the destination MAC address to use for encapsulated PDUs.
mac_addr	Specifies the MAC address.

Default

Usage Guidelines

NA

Example

The following example sets the L2PT destination address MAC to 01:00:00:01:01:02:

```
configure l2pt encapsulation dest-mac 01:00:00:01:01:02
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

cp

```
cp old_name new_name
```

Description

Copies a file from the specified file system or relative to the current working directory to another file on the specified file system or relative to the current working directory.

Syntax Description

old_name	Specifies the name of the file that you want to copy.
new_name	Specifies the name of the newly copied configuration or policy file.

Default

N/A.

Usage Guidelines

Use this command to copy a file from the specified file system, or relative to the current working directory to another file on the specified file system, or relative to the current working directory. If you provide a different name, the new file can be created in the same directory as the existing file.

When you copy a configuration or policy file, remember the following:

- XML-formatted configuration files have a `.cfg` file extension. The switch only runs `.cfg` files.
- ASCII-formatted configuration files have a `.xsf` file extension. For more information, see *Software Upgrade and Boot Options* in the *Switch Engine 32.2 User Guide* .
- Policy files have a `.pol` file extension.
- Core dump files have a `.gz` file extension.

When you copy a configuration or policy file from the system, make sure you specify the appropriate file extension. For example, when you want to copy a policy file, specify the file name and `.pol`.

When you copy a file on the switch, the switch displays a message similar to the following:

```
Copy config test.cfg to config test1.cfg on switch? (y/n)
```

Type `y` to copy the file. Type `n` to cancel this process and not copy the file.

When you type `y`, the switch copies the file with the new name and keeps a backup of the original file with the original name. After the switch copies the file, use the `ls` command to display a complete list of files. In this example, the switch displays the original file named `test.cfg` and the copied file named `test_rev2.cfg`.

The following is sample output from the `ls` command:

```
...
-rw-r--r--    1 root     root       100980 Sep 23 09:16 test.cfg
-rw-r--r--    1 root     root       100980 Oct 13 08:47 test_rev2.cfg
...
```

When you enter `n`, the switch displays a message similar to the following:

```
Copy cancelled.
```

Case-sensitive Filenames

File names are case-sensitive. In this example, you have a configuration file named `Test.cfg`. If you attempt to copy the file with the incorrect case, for example `test.cfg`, the switch displays a message similar to the following:

```
Error: cp: /config/test.cfg: No such file or directory
```

Since the switch is unable to locate `test.cfg`, the file is not copied.

Local File Name Character Restrictions

When specifying a local file name, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Dash (-).
- Underscore (_).

Internal Memory and Core Dump Files

Core dump files have a `.gz` file extension. The file name format is: `core.process-name.pid.gz` where `process-name` indicates the name of the process that failed and `pid` is the numerical identifier of that process.

By making a copy of a core dump file you can easily compare new debug information with the old file if needed.

If you have a USB 2.0 storage device installed, you can copy the core dump file to that location. To copy files to a USB device, specify the file path `/usr/local/ext`.

For information about configuring and sending core dump information to the internal memory card, see the `configure debug core-dumps [` **`off`** `|` *`directory_path`*`]` and `save debug tracefiles` *`directory_path`* commands.

For more detailed information about core dump files, see *Troubleshooting* in the *Switch Engine 32.2 User Guide*.

Example

The following example makes a copy of a configuration file named `test.cfg` and gives the copied file a new name of test_rev2.cfg:

```
# cp test.cfg test_rev2.cfg
```

The following example makes a copy of a configuration file named primary.cfg on the switch and stores the copy on the removable storage device with the same name, `primary.cfg`:

```
# cp primary.cfg /usr/local/ext
```

The above command performs the same action as entering:

```
# cp primary.cfg /usr/local/ext
```

Or

```
# cp primary.cfg /usr/local/ext/primary.cfg
```

History

This command was first available in ExtremeXOS 11.0.

The **memorycard** option was added in ExtremeXOS 11.1.

The **internal-memory** option was added in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Pathname support was added in ExtremeXOS 15.5.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create access-list

`create access-list` *dynamic_rule conditions actions* {**non_permanent**}

Description

Creates a dynamic *ACL*.

Syntax Description

dynamic_rule	Specifies the dynamic ACL name. The name can be from 1-32 characters long.
conditions	Specifies the match conditions for the dynamic ACL.
actions	Specifies the actions for the dynamic ACLs.
non_permanent	Specifies that the ACL is not to be saved.

Default

By default, ACLs are permanent.

Usage Guidelines

This command creates a dynamic ACL rule. Use the `configure access-list add` command to apply the ACL to an interface.

The conditions parameter is a quoted string of match conditions, and the actions parameter is a quoted string of actions. Multiple match conditions or actions are separated by semi-colons. A complete listing of the match conditions and actions is in the *ACLs* section of the *Switch Engine 32.2 User Guide*.

Dynamic ACL rule names must be unique, but can be the same as used in a policy-file based ACL. Any dynamic rule counter names must be unique. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

By default, ACL rules are saved when the save command is executed, and persist across system reboots. Configuring the optional keyword non-permanent means the ACL will not be saved.

Example

The following example creates a dynamic ACL that drops all *ICMP* echo-request packets on the interface:

```
create access-list icmp-echo "protocol icmp;icmp-type echo-request" "deny"
```

The created dynamic ACL will take effect after it has been configured on the interface. The previous example creates a dynamic ACL named icmp-echo that is equivalent to the following ACL policy file entry:

```
entry  icmp-echo {
    if  {
        protocol  icmp;
        icmp-type  echo-request;
    } then {
        deny;
    }
```

The following example creates a dynamic ACL that accepts all the UDP packets from the 10.203.134.0/24 subnet that are destined for the host 140.158.18.16, with source port 190 and a destination port in the range of 1200 to 1250:

```
create access-list udpacl "source-address 10.203.134.0/24;destination-address
140.158.18.16/32;protocol  udp;source-port 190;destination-port  1200 - 1250;" "permit"
```

The previous example creates a dynamic ACL entry named udpacl that is equivalent to the following ACL policy file entry:

```
entry  udpacl {
if  {
        source-address 10.203.134.0/24;
        destination-address 140.158.18.16/32;
        protocol  udp;
        source-port 190;
        destination-port  1200 - 1250;
    } then {
        permit;
    }
}
```

History

This command was first available in ExtremeXOS 11.3.

The **non_permanent** option was added in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create access-list network-zone

```
create access-list network-zone zone_name
```

Description

Creates a network-zone with a specified name.

Syntax Description

access-list	Access list
network-zone	Network zone
zone_name	Network zone name

Default

N/A.

Usage Guidelines

Use this command to create a network-zone with a specified name. The network-zone can then be associated with the policy file using either the "source-zone" or "destination-zone" attribute.

Example

```
Switch# create access-list network-zone zone1
```

If the user tries to create a network-zone that was already created, the following error message will be displayed on the console, and the command will be rejected.

```
Switch#create access-list network-zone zone1
Error:  Network Zone "zone1" already exists.
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create access-list zone

```
create access-list zone name zone-priority number
```

Description

Creates a dynamic *ACL* zone, and sets the priority of the zone.

Syntax Description

name	Specifies the dynamic ACL zone name. The name can be from 1-32 characters long.
zone-priority *number*	Specifies priority of the zone. The range is from 1 (highest priority) to 4294967295 (lowest priority).

Default

The denial of service, system, and security zones are configured by default, and cannot be deleted.

Usage Guidelines

This command creates a dynamic ACL zone. You can configure the priority of the zone in relation to the default zones or to other configured zones.

Example

The following command creates a new zone, called myzone, with a priority of 2:

```
create access-list myzone zone-priority 2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create account

```
create account [admin | user | lawful-intercept] account-name {encrypted
   encrypted_password | password}
```

Description

Creates a new user account.

Syntax Description

admin	Specifies an access level for admin account type. This user has read and write privileges.
user	Specifies an access level for user account type. This user has read-only privileges.
lawful-intercept	Specifies an access level for lawful intercept account type.
account-name	Specifies a new user account name.
encrypted	Caution: Using this option incorrectly can result in you being locked out of your switch account. This option specifies that the entered password is in encrypted hash format, not that the resulting password will be stored in encrypted form. Generally, this option should not be used. Using this option with a plain text password, as opposed to a hashed version of a password, can result in the user being locked out of the account.
password	Specifies a user password.

Default

N/A.

User Account Levels

By default, the switch is configured with two accounts with the access levels shown in the table below.

Account Name	Access Level
admin	You can access and change all manageable parameters. The admin account cannot be deleted.
user	You can view (but not change) all manageable parameters, with the following exceptions: • You cannot view the user account database. • You cannot view the *SNMP* community strings. • You cannot view SSL settings. This user has access to the ping command.
lawful-intercept	This user has special lawful intercept and read-only privileges. Note: Only a single lawful-intercept account can exist at any one time on the system.

You can use the default names (admin and user), or you can create new names and passwords for the accounts. Default accounts do not have passwords assigned to them. For name creation guidelines and a list of reserved names, see *Object Name*s in the *Switch Engine 32.2 User Guide*.

Usage Guidelines

The switch can have a total of 16 user accounts.

The system must have one administrator account.

When you use the **encrypted** keyword, the following password that you specify should be in encrypted hash format. Administrators should not use the encrypted option and should enter the password in plain text. Using this option with a plain text password, as opposed to a hashed version of a password, can result in the user being locked out of the account. Generally, this option should not be used. A valid use of this option would be when transferring account information between switches using the output of the show configuration on page 2563 command, where the displayed password is in hashed form. You can copy this hashed password and enter it as the password with the **encrypted** option. The switch will de-crypt the hashed password into the plain text password that as specified for the original account.

The system prompts you to specify a password after you enter this command and to reenter the password. If you do not want a password associated with the specified account, press **[Enter]** twice.

You must have administrator privileges to change passwords for accounts other than your own. User names are not case-sensitive. Passwords are case-sensitive. User account names must have a minimum of 1 character and can have a maximum of 32 characters. Passwords must have a minimum of 0 characters and can have a maximum of 32 characters. For user names, only alphanumeric, dash (-), and underscore (_) characters may be used. If you use a hashtag (#), everything after it is ignored.

Note
User names cannot begin with a number.

Note
If the account is configured to require a specific password format, the minimum is eight characters. See `configure account password-policy char-validation` for more information.

Example

The following example creates a new account named "John2" with administrator privileges:

```
create account admin John2
```

History

This command was first available in ExtremeXOS 10.1.

The **encrypted** option was added in ExtremeXOS 11.5.

The **lawful intercept** option was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create auto-peering bgp

```
create auto-peering bgp routerid ipaddress AS-number asNumber
```

Description

This command creates and enables BGP auto-peering using specified *BGP* router ID and AS number.

Syntax Description

routerid	Designates a BGP router ID.
ipaddress	Specifies the BGP router ID as an IP address in IPv4 format (x.y.z.w).
AS-number	Designates unique BGP Autonomous System (AS) number.
asNumber	Specifies the AS number (1–4,294,967,295).

Default

N/A

Usage Guidelines

This command creates VLANs dynamically. It also creates a loopback VLAN with an IP address of the BGP router ID. Within BGP, the router ID, AS number, and easyBGP capability are configured along with redistribution of host-mobility routes. Dynamic VLANs are created if no VLANs are specified.

A save and reboot is required if ECMP exceeds 16.

To view BGP auto-peering status, use the command `show auto-peering {bgp | ospf}`.

Example

The following example creates auto-peering using BGP router ID at 10.3.4.2 with AS 52:

```
# create auto-peering bgp routerid 10.3.4.2 AS-number 52
```

History

This command was first available in ExtremeXOS 22.5.

The requirement to specify a VLAN range was made optional in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

This feature requires the Advanced Edge license. For more information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

create auto-peering ospf

```
create auto-peering ospf routerid ipaddress
```

Description

Creates and enables OSPFv2 auto-peering.

Syntax Description

auto-peering	Specifies configuring Auto-peering.
ospf	Specifies configuring OSPF Auto-peering.
routerid	Specifies providing an OSPF router ID.
ipaddress	Sets the OSPF router IP address in IPv4 format (x.y.z.w).

Default

N/A.

Usage Guidelines

This command creates a loopback VLAN with the IP address of the supplied OSPF router ID. Within OSPF, the router ID, VXLAN-extensions are configured along with redistribution of host-mobility routes.

ECMP between two switches is not supported with OSPFv2 auto-peering. Only one link forms an adjacency, and traffic is lost on failover. Link aggregation is the preferred configuration for the topology.

To view OSPFv2 auto-peering status, use the command `show auto-peering {bgp | ospf}`.

Example

The following example creates and enables OSPFv2 auto-peering using with the OSPF router ID set to "10.3.4.2":

```
# create auto-peering ospf routerid 10.3.4.2
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the OSPFv2 Auto-peering feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create bgp evpn instance

```
create bgp evpn instance evpn_instance_name
```

Description

Creates an EVPN instance.

Syntax Description

bgp	BGP capability.
evpn	EVPN protocol.
instance	Specifies creating an EVPN instance
evpn_instance_name	Name of the EVPN instance.

Default

N/A.

Usage Guidelines

The EVPN instance will become active if the configured VNI matches the configured VNI of a virtual network.

Example

The following example creates an EVPN instance named "my_evpn":

```
# create bgp evpn instance my_evpn
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create bgp neighbor peer-group

```
create bgp neighbor remoteaddr peer-group peer-group-name {multi-hop}
```

Description

Creates a new neighbor and makes it part of the peer group.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor.
peer-group-name	Specifies a peer group.
multi-hop	Specifies to allow connections to EBGP peers that are not directly connected.

Default

N/A.

Usage Guidelines

You can specify an IPv4 or IPv6 address for the BGP peer. The address can be a global unicast or a link-local address. IPv6 link-local remote addresses are supported only for EBGP single-hop peerings.

If you are adding an IPv4 peer to a peer group and no IPv4 address family capabilities are assigned to the specified peer group, the IPv4 unicast and multicast address families are automatically enabled for that peer group. If you adding an IPv6 peer to a peer group and no IPv6 address family capabilities are assigned to the peer group, you must explicitly enable the IPv6 address family capabilities you want to support.

Note

If the peer group or any member of the peer group has been configured with an IPv4 or IPv6 address family, the peer group only accepts peers that are configured to use that family. For example, if a peer group is configured for the IPv4 unicast address family, the switch will not allow you to add an IPv6 peer. LIkewise, an IPv6 peer group cannot accept an IPv4 peer.

If the multihop keyword is not specified, the IP addresses of the EBGP speaker and peer must belong to the same subnet.

All the parameters of the neighbor are inherited from the peer group. The peer group should have the remote AS configured.

To add an existing neighbor to a peer group, use the following command:

`configure bgp neighbor [`**`all`**` | `*`remoteaddr`*`] `**`peer-group`**` [`*`peer-group-name`*` | `**`none`**`] {`**`acquire-all`**`}`

If you do not specify acquire-all, only the mandatory parameters are inherited from the peer group. If you specify acquire-all, all of the parameters of the peer group are inherited. This command disables the neighbor before adding it to the peer group.

Example

The following command creates a new neighbor and makes it part of the peer group outer:

```
create bgp neighbor 192.1.1.22 peer-group outer
```

The following example specifies how to create a neighbor peer group in a VRF (PE – CE neighbor session):

```
virtual-router <vr_vrf_name>
create bgp neighbor <remoteaddr> remote-AS-number <asNumber> {multi-hop}
create bgp neighbor <remoteaddr> peer-group <peer-group-name> {multi-hop}
delete bgp [{neighbor} <remoteaddr> | neighbor all ]
[create | delete] bgp peer-group <peer-group-name>
```

BGP maintains a separate RIB (RIB-In, RIB-Loc and RIB-Out) for each of the VRF it is configured to run. So routes received from a peer in VRF1 are not mixed up with routes from a peer in VRF2. Additionally, BGP routes in a VRF are regular IPv4 routes of address family ipv4. The BGP decision algorithm occurs inside a VRF and is not impacted by any BGP activity in other VRF.There can be two BGP neighbors with the same peer IP address in two different VRFs.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for L3 VPN was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

create bgp neighbor remote-AS-number

`create bgp neighbor` *`remoteaddr`* **`remote-AS-number`** *`as-number`* {**`multi-hop`**}

Description

Creates a new *BGP* peer.

Syntax Description

`remoteaddr`	Specifies an IP address of the BGP neighbor.
`as-number`	Specifies a remote AS number. The range is 1 to 4294967295.
`multi-hop`	Specifies to allow connections to EBGP peers that are not directly connected.

Default

N/A.

Usage Guidelines

You can specify an IPv4 or IPv6 address for the BGP peer. The address can be a global unicast or a link-local address. IPv6 link-local remote addresses are supported only for EBGP single-hop peerings.

If the multihop keyword is not specified, the IP addresses of the EBGP speaker and peer must belong to the same subnet.

The AS number is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

If the AS number is the same as the AS number provided in the configure bgp as command, then the peer is consider an IBGP peer, otherwise the neighbor is an EBGP peer. The BGP session to a newly created peer is not started until the enable bgp neighbor command is issued.

Example

The following command specifies a BGP peer AS number using the ASPLAIN 4-byte AS number format:

```
create bgp neighbor 10.0.0.1 remote-AS-number 65540
```

The following command specifies a BGP peer AS number using the ASDOT 4-byte AS number format:

```
create bgp neighbor 10.0.0.1 remote-AS-number 1.5
```

The following command specifies a BGP peer using an IPv6 address:

```
create bgp neighbor fe80::204:96ff:fe1e:a8f1%vlan1 remote-AS-number 200
```

The following example specifies how to create a neighbor peer group in a VRF (PE – CE neighbor session):

```
  virtual-router <vr_vrf_name>
create bgp neighbor <remoteaddr> remote-AS-number <asNumber> {multi-hop}
create bgp neighbor <remoteaddr> peer-group <peer-group-name> {multi-hop}
delete bgp [{neighbor} <remoteaddr> | neighbor all ]
[create | delete] bgp peer-group <peer-group-name>
```

BGP maintains a separate RIB (RIB-In, RIB-Loc and RIB-Out) for each of the VRF it is configured to run. So routes received from a peer in VRF1 are not mixed up with routes from a peer in VRF2. Additionally, BGP routes in a VRF are regular IPv4 routes of address family ipv4. The BGP decision algorithm occurs inside a VRF and is not impacted by any BGP activity in other VRF.There can be two BGP neighbors with the same peer IP address in two different VRFs.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for L3 VPN was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create bgp peer-group

```
create bgp peer-group peer-group-name
```

Description

Creates a new peer group.

Syntax Description

peer-group-name	Specifies a peer group.

Default

N/A.

Usage Guidelines

You can use *BGP* peer groups to group together up to 512 BGP neighbors. All neighbors within the peer group inherit the parameters of the BGP peer group. The following mandatory parameters are shared by all neighbors in a peer group:

- source-interface
- out-nlri-filter
- out-aspath-filter
- out-route-policy
- send-community
- next-hop-self

The BGP peer group name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see the *Switch Engine 32.2 Feature License Requirements* document..

No IPv4 or IPv6 address family capabilities are added a to a new peer group. When the first IPv4 peer is added to a peer group, the IPv4 unicast and multicast families are enabled by default. No IPv6 address family capabilities are automatically added when an IPv6 peer is added to a peer group; you must explicitly add any IPv6 address family capabilities that you want for a peer group.

Example

The following command creates a new peer group named outer:

```
create bgp peer-group outer
```

The following example specifies how to create a neighbor peer group in a VRF (PE – CE neighbor session):

```
virtual-router <vr_vrf_name>
create bgp neighbor <remoteaddr> remote-AS-number <asNumber> {multi-hop}
create bgp neighbor <remoteaddr> peer-group <peer-group-name> {multi-hop}
delete bgp [{neighbor} <remoteaddr> | neighbor all ]
[create | delete] bgp peer-group <peer-group-name>
```

BGP maintains a separate RIB (RIB-In, RIB-Loc and RIB-Out) for each of the VRF it is configured to run. So routes received from a peer in VRF1 are not mixed up with routes from a peer in VRF2. Additionally, BGP routes in a VRF are regular IPv4 routes of address family ipv4. The BGP decision algorithm occurs inside a VRF and is not impacted by any BGP activity in other VRF.There can be two BGP neighbors with the same peer IP address in two different VRFs.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for L3 VPN was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create cfm domain dns md-level

`create cfm domain dns` *`name`* **`md-level`** *`level`*

Description

Creates a maintenance domain (MD) in the DNS name format and assigns an MD level to that domain.

Syntax Description

`name`	Assigns the name you want for this domain, using the DNS name format. Enter alphanumeric characters for this format; the maximum is 43 characters.
`level`	Specifies the MD level you are assigning to this domain. Enter a value between 0 and 7.

Default

N/A.

Usage Guidelines

You can have up to 8 domains on a switch, and each one must have a unique MD level.

You assign each domain a maintenance domain (MD) level, which function in a hierarchy for forwarding CFM messages. The levels are from 0 to 7; with the highest number being superior in the hierarchy.

The IEEE standard 801.2ag specifies different levels for different network users, as follows:

- 5 to 7 for end users
- 3 and 4 for Internet service providers (ISPs)
- 0 to 2 for operators (entities carrying the information for the ISPs)

Note

MEPs with intervals 3 and 10 cannot be created in this domain as the domain name format is of dns type.

Example

The following command creates a domain, using the DNS name format, named extreme and assigns that domain an MD level of 2:

```
create cfm domain dns extreme md-level 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create cfm domain mac md-level

```
create cfm domain mac mac-addr int md-level level
```

Description

Creates a maintenance domain (MD) in the MAC address + 2-octet integer format and assigns an MD level to that domain.

Syntax Description

mac-addr	Enter a MAC address in the format XX:XX:XX:XX:XX:XX to specify part of the domain name.
int	Enter the 2-octet integer you want to append to the MAC address to specify the domain name.
level	Specifies the MD level you are assigning to this domain. Enter a value between 0 and 7.

Default

N/A.

Usage Guidelines

You can have up to 8 domains on a switch, and each one must have a unique MD level.

You assign each domain a maintenance domain (MD) level, which function in a hierarchy for forwarding CFM messages. The levels are from 0 to 7; with the highest number being superior in the hierarchy.

The IEEE standard 801.2ag specifies different levels for different network users, as follows:

- 5 to 7 for end users
- 3 and 4 for Internet service providers (ISPs)
- 0 to 2 for operators (entities carrying the information for the ISPs)

Example

The following command creates a domain, using the MAC + 2-octet integer format, with the MAC address of 11:22:33:44:55:66 and an integer value of 63; it also assigns that domain an MD level of 2:

```
create cfm domain mac 11:22:33:44:55:66 63 md-level 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create cfm domain string md-level

```
create cfm domain string str_name md-level level
```

Description

Creates a maintenance domain (MD) in the string name format and assigns an MD level to that domain.

Syntax Description

str_name	Enter a character string to specify part of the domain name. The maximum length is 43 characters.
level	Specifies the MD level you are assigning to this domain. Enter a value between 0 and 7.

Default

N/A.

Usage Guidelines

You can have up to 8 domains on a switch, and each one must have a unique MD level.

You assign each domain a maintenance domain (MD) level, which function in a hierarchy for forwarding CFM messages. The levels are from 0 to 7; with the highest number being superior in the hierarchy.

The IEEE standard 801.2ag specifies different levels for different network users, as follows:

- 5 to 7 for end users
- 3 and 4 for Internet service providers (ISPs)
- 0 to 2 for operators (entities carrying the information for the ISPs)

Example

The following command creates a domain, using the string format having a value of extreme; it also assigns that domain an MD level of 2:

```
create cfm domain string extreme md-level 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create cfm segment destination

```
create cfm segment segment_name destination mac_addr {copy
   segment_name_to_copy}
```

Description

Creates a CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
mac_addr	Specifies the MAC address.
segment_name_to_copy	Specifies the CFM segment whose configuration is to be copied.

Default

N/A.

Usage Guidelines

Use this command to explicitly create a CFM segment where the segment name is a 32-byte long alpha-numeric character string.

Example

The following command creates a CFM segment named segment-new using MAC address 00:11:22:11:33:11 and copying segment-old:

```
create cfm segment segment-new destination 00:11:22:11:33:11 copy segment-old
```

Here, the `copy existing cfm segment` is an optional parameter, and if used, the following configurations from the existing CFM segment are copied to the newly created segment:

- DMM transmission interval
- Class of service
- Threshold values
- Measurement window size
- Timeout value

Note

The copy option is not shown in "show config" as it is used only for copying the existing values when creating a segment.

If you later configure any of the above mentioned information in segment-new, the old value(s) which were copied from segment-old will be overwritten with the new one in segment-new, as is done for any other commands. The same will not be true on the reverse case. If you modify the values of segment-old, the modified value will NOT be propagated to the CFM segments which use segment-old's configurations. In other words, the configurations of segment-old that are at the time of creating segment-new will alone be copied and not any other changes that are made to segment-old later on.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create database

```
create database database_name
```

Description

Creates an Automation Edge remote *VXLAN* network identifier (VNI)-device database.

Syntax Description

database	Creates a remote VNI-database.
database_name	Specifies the name of the new database.

Default

N/A.

Usage Guidelines

You can only create one VNI-device database.

Example

The following example creates a database called "database1":

```
# create database database1
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create eaps shared-port

```
create eaps shared-port ports
```

Description

Creates an *EAPS* shared port on the switch.

Syntax Description

ports	Specifies the port number of the common link port.

Default

N/A.

Usage Guidelines

To configure a common link, you must create a shared port on each switch on either end of the common link.

Example

The following command creates a shared port on the EAPS domain.

```
create eaps shared-port 1:2
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create eaps

```
create eaps name
```

Description

Creates an *EAPS* domain with the specified name.

Syntax Description

name	Specifies the name of an EAPS domain to be created. Can be up to 32 characters in length.

Default

N/A.

Usage Guidelines

An EAPS domain name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command creates EAPS domain eaps_1:

```
create eaps eaps_1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create erps ring

```
create erps ring-name {ring-id ring_id}
```

Description

Creates an *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
ring-id	Specifies configuring a unique integer ID for ERPS ring.
ring_id	Sets the ERPS ring ID value. Range is 1 to 239.

Default

N/A.

Usage Guidelines

Use this command to create an ERPS ring, and optionally the ring ID.

Example

The following command creates an ERPS ring named “ring1” with ring ID "50":

```
create erps ring1 ring-id 50
```

History

This command was first available in ExtremeXOS 15.1.

Ring ID was added in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create esrp

```
create esrp esrp_domain {type [vpls-redundancy | standard]}
```

Description

Creates an *ESRP* domain with the specified name on the switch.

Syntax Description

esrp_domain	Specifies the name of an ESRP domain to be created. Can be up to 32 characters in length.

Default

The ESRP domain is disabled and in the “Aware” state.

When you create an ESRP domain, it has the following default parameters:

- Operational version—Extended
- Priority—0
- *VLAN* interface—none
- VLAN tag—0
- Hello timer—2 seconds
- Neighbor timer—8 seconds
- Premaster timer—6 seconds
- Neutral timer—4 seconds
- Neighbor restart timer—30 seconds
- VLAN tracking—none
- Ping tracking—none
- IP route tracking—none

Usage Guidelines

The type keyword specifies the type of ESRP domain when a new ESRP domain is created. The only types supported are vpls-redundancy and standard. Not specifying the optional ESRP domain type results in the creation of an ESRP domain of type standard. The standard ESRP domain is equivalent

to the legacy ESRP domain type that was implicitly created. The vpls-redundancy domain type is only specified when redundant access to an *MPLS* VPLS network is desired.

An ESRP domain name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For ESRP domain name guidelines and a list of reserved names, see Object Names in the *Switch Engine 32.2 User Guide*.

Each ESRP domain name must be unique and cannot duplicate any other named ESRP domains on the switch. If you are uncertain about the ESRP names on the switch, use the `show esrp` command to view the ESRP domain names.

You can create a maximum of 128 ESRP domains.

Configuring ESRP-Aware Switches

For an Extreme Networks switch to be ESRP-aware, you must create an ESRP domain on the aware switch, add a master VLAN to that ESRP domain, add a member VLAN to that ESRP domain if configured, and configure a domain ID if necessary.

For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

Example

The following command creates ESRP domain esrp1 on the switch:

```
create esrp esrp1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create fdb mac-tracking entry

```
create fdb mac-tracking entry mac_addr
```

Description

Adds a MAC address to the MAC address tracking table.

Syntax Description

mac_addr	Specifies a device MAC address, using colon-separated bytes.

Default

The MAC address tracking table is empty.

Usage Guidelines

None.

Example

The following command adds a MAC address to the MAC address tracking table:

```
create fdb mac-tracking entry 00:E0:2B:12:34:56
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create fdb vlan ports

```
create fdb mac_addr vlan vlan_name [ports port_list {tagged tag} |
   blackhole | vxlan { vr vr_name } {ipaddress} remote_ipaddress ]
   | broadcast vlan vlan_name vxlan { vr vr_name } {ipaddress}
   remote_ipaddress | unknown-multicast vlan vlan_name vxlan { vr
   vr_name } {ipaddress} remote_ipaddress | unknown-unicast vlan
   vlan_name vxlan { vr vr_name } {ipaddress} remote_ipaddress ]
```

Description

Creates a permanent static *FDB* entry.

Syntax Description

mac_addr	Specifies a device MAC address, using colon-separated bytes.
vlan_name	Specifies a *VLAN* name associated with a MAC address.
port_list	Specifies one or more ports or slots and ports associated with the MAC address.
tagged *tag*	Specifies the port-specific VLAN tag. When there are multiple ports specified in *port_list*, the same tag is used for all of them.

blackhole	Enables the blackhole option. Any packets with either a source MAC address or a destination MAC address matching the FDB entry are dropped.
broadcast	Forwarding destination(s) for broadcast traffic.
unknown-unicast	Forwarding destination(s) for unknown unicast traffic.
unknown-unicast	Forwarding destination(s) for unknown multicast traffic.
vxlan	The MAC address is reachable through a VXLAN Tunnel.
vr	VR/VRF instance the IPv4 address is configured on.
vr_name	An existing VR/VRF name.
ipaddress	Configure the IP address of the remote tunnel endpoint to which the MAC needs to be bound.
remote_ipaddress	IPv4 address of the remote tunnel endpoint.

Default

N/A.

Usage Guidelines

Permanent entries are retained in the database if the switch is reset or a power off/on cycle occurs. A permanent static entry can either be a unicast or multicast MAC address. After they have been created, permanent static entries stay the same as when they were created. If the same MAC address and VLAN is encountered on another virtual port that is not included in the permanent MAC entry, it is handled as a blackhole entry. The static entry is not updated when any of the following take place:

- A VLAN identifier (VLANid) is changed.
- A port is disabled.
- A port enters blocking state.
- A port goes down (link down).

A permanent static FDB entry is deleted when any of the following take place:

- A VLAN is deleted.
- A port mode is changed (tagged/untagged).
- A port is deleted from a VLAN.

Permanent static entries are designated by spm in the flags field of the show fdb output. You can use the `show fdb` command to display permanent FDB entries.

If the static entry is for a PVLAN VLAN that requires more than one underlying entry, the system automatically adds the required entries. For example, if the static entry is for a PVLAN network VLAN, the system automatically adds all required extra entries for the subscriber VLANs.

You can create FDB entries to multicast MAC addresses and list one or more ports. If more than one port number is associated with a permanent MAC entry, packets are multicast to the multiple destinations.

IGMP snooping rules take precedence over static multicast MAC addresses in the IP multicast range (01:00:5e:xx:xx:xx) unless IGMP snooping is disabled.

Note

When a multiport list is assigned to a unicast MAC address, load sharing is not supported on the ports in the multiport list.

In ExtremeXOS 21.1, this command was extended to add a remote VTEP as a destination to a MAC address. Three new tokens “broadcast”, “unknown-multicast” and “unknown-unicast” have been added to this command. When you want to specify a destination to forward all broadcast or unknown unicast traffic on that VLAN, these token are used. For “broadcast”, “unknown-multicast” and “unknown-unicast” only remote VTEPs (and not port_list or blackhole) can be specified in this release of ExtremeXOS. These entries can only be created when the virtual-network is in explicit-remote flooding mode.

Example

The following command adds a permanent, static entry to the FDB for MAC address 00 E0 2B 12 34 56, in VLAN marketing on port 4 on a switch:

```
create fdb 00:E0:2B:12:34:56 vlan marketing port 4
```

The following example adds a permanent, static entry to the FDB for MAC address 00:01:02:03:04:05, in VLAN marketing, on a VLAN port that has tag 100 on port 3 on a switch:

```
create fdb 00:01:02:03:04:05 vlan msk ports 3 tag 100
```

History

This command was first available in ExtremeXOS 10.1.

The ability to create a multicast FDB with multiple entry ports was added in ExtremeXOS 11.3.

The **blackhole** option was first available for all platforms in ExtremeXOS 12.1.

In ExtremeXOS 12.3, the **fdb** keyword was introduced as an alias to the **fdbentry** keyword to avoid interference with the syntax of the MAC-Tracking feature commands. Both keywords execute; however, the syntax helper (tab completion) does not recognize the **fdbentry** keyword.

The **tag** keyword and example was added in ExtremeXOS 15.4.

Three new tokens “broadcast”, “unknown-multicast” and “unknown-unicast” were added to this command in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create flow-redirect

```
create flow-redirect flow_redirect_name
```

Description

Creates a named flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.

Default

N/A.

Usage Guidelines

Use this command to create a named flow redirection policy to which nexthop information can be added.

For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Example

The following example creates a flow redirection policy names flow3:

```
create flow-redirect flow3
```

History

This command was first available in ExtremeXOS 12.1.

The maximum number of flow redirects was increased to 4096 in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! create flowmon collector

```
create flowmon collector collector_name
```

Description

Creates a collector where Flow Monitor sends information.

Syntax Description

collector	Specifies to send flow information to a collector.
collector_name	Specifies the name of the created collector. Range is 32 characters.

Default

N/A.

Usage Guidelines

Up to eight external collectors are supported. The created collector must be configured before it can be added to a group, and a collector can be used by many groups.

The system will reject any attempt to create a collector that already exists.

Example

The following command creates a collector with the name 'src-ipv4-address':

```
# create flowmon collector src-ipv4-address
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! create flowmon group

```
create flowmon group group_name
```

Description

Creates a Flow Monitor group.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.

Default

N/A.

Usage Guidelines

The system will reject any attempt to create a group that already exists.

Example

The following command creates a group with the name 'max-flow-age':

```
# create flowmon group max-flow-age
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! create flowmon key

```
create flowmon key key_name
```

Description

Creates a Flow Monitor key.

Syntax Description

key	Specifies the Flow Monitor key.
key_name	Specifies the assigned name of the Flow Monitor key. Range is 32 characters.

Default

N/A.

Usage Guidelines

The system will reject any attempt to create a key that already exists.

Example

The following command creates a key with the name 'src-ipv4-addr':

```
# create flowmon key src-ipv4-addr
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

create identity-management role

```
create identity-management role role_name match-criteria match_criteria
   {priority pri_value}
```

Description

Creates and configures an identity management role.

Syntax Description

role_name	Specifies a name for the new role (up to 32 characters).
match_criteria	Specifies an expression that identifies the users to be assigned to the new role.
pri_value	Specifies the role priority; the lower the priority number, the higher the priority. The range of values is 1 to 255. Value 1 represents the highest priority, and value 255 represents the lowest priority.

Default

Priority=255.

Usage Guidelines

The identity management feature supports a maximum of 64 roles.

The role name can include up to 32 characters. Role names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. Role names cannot match reserved keywords, or the default role names reserved by identity manager. For more information on role name requirements and a list of reserved keywords, see *Object Names* in the *Switch Engine 32.2 User Guide*. The role names reserved by identity manager are:

- authenticated.
- blacklist.

- unauthenticated.
- whitelist.

The match-criteria is an expression or group of expressions consisting of identity attributes, operators and attribute values. The maximum number of attribute value pairs in a role match criteria is 16. The variables in the match criteria can be matched to attributes retrieved for the identity from an LDAP server, or they can be matched to attributes learned locally by identity manager.

Table 20 lists match criteria attributes that can be retrieved from an LDAP server.

Table 21 on page 1619 lists locally learned attributes that can be used for match criteria.

Table 22 on page 1620 lists the match criteria operators.

Table 20: LDAP Match Criteria Attributes

LDAP Attribute Name	Value Type
l or location	String
company	String
co or country	String
department	String
employeeID	String
st or state	String
title	String
mail or email	String
memberOf	String

Table 21: Locally Learned Match Criteria Attributes

Attribute Description	Attribute Name	Value Type	Example
LLDP device name	device-model	String	`device-name == Avaya4300`
LLDP device capabilities	device-capability	String:OtherRepeaterBridgeWLAN accessportRouterPhoneDOCSIS cable deviceStation only	`device-capability == Telephone`
LLDP device manufacturer name	device-manufacturer-name	String	`device-manufacturer-name == Avaya`
LLPD system description	device-description	String	`device-description==Dell EqualLogic Storage Array`

Table 21: Locally Learned Match Criteria Attributes (continued)

Attribute Description	Attribute Name	Value Type	Example
MAC address	mac	MAC	`mac == 00:01:e6:00:00:00/ ff:ff:ff:00:00:00`
MAC OUI	mac-oui	MAC	`mac-oui == 00:04:96`
IP address	ip-address	IP	`ip-address == 10.1.1.0/20`
User name	username	String	`userName == adam`
Port list	ports	Portlist	`ports == 1,5-8`

Table 22: Match Criteria Operators

Operator	Description
==	Equal. Creates a match when the value returned for the specified attribute matches the value specified in the role.
!=	Not equal. Creates a match when the value returned for the specified attribute does not match the value specified in the role.
AND	And. Creates a match when the two expressions joined by this operator are both true.
contains	Contains. Creates a match when the specified attribute contains the text specified in the role definition.
;	Semicolon. This delimiter separates expressions within the match criteria.

The role priority determines which role a user is mapped to when the user's attributes match the match-criteria of more than 1 role. If the user's attributes match multiple roles, the highest priority (lowest numerical value) role applies. If the priority is the same for all matching roles, the role for which the priority was most recently set or modified is used.

Example

The following examples create roles for the conditions described in the comments that precede the commands:

```
# Creates a role named "India-Engr" that matches employees from the Engineering
# department who work in India
* Switch.22 # create identity-management role "India-Engr" match-criteria
"country==India; AND department==Engineering;"
# Creates a role named "US-Engr" that matches employees whose title is Engineer and
# who work in United States
* Switch.23 # create identity-management role US-Engr match-criteria "title contains
Engineer; AND country == US;" priority 100
# Creates a role named "Avaya4300Device" for Avaya phones of type 4300 that are
# manufactured by Avaya
* Switch.24 # create identity-management role "Avaya4300Device" match-criteria "device-
```

```
capability == Phone; AND device-name == Avaya4300; AND device-manufacturer-name == Avaya;"
# Creates a role for all Extreme Networks switches with MAC-OUI "00:04:96"
* Switch.25 # create identity-management role "ExtremeSwitch" match-criteria "mac-oui ==
00:04:96;"
# Creates a role for all identities with IP address 1.2.3.1 - 1.2.3.255
* Switch.26 # create identity-management role "EngineeringDomain" match-criteria "ip-
Address == 1.2.3.0/255.255.255.0;"
# Creates a role for all phone devices with MAC_OUI of "00:01:e6"
* Switch.27 # create identity-management role "Printer" match-criteria "mac ==
00:01:e6:00:00:00/ff:ff:ff:00:00:00; device-capability == Phone;"
# Creates a role for the user name "adam" when he logs in from IP address 1.2.3.1 -
# 1.2.3.255.
* Switch.28 # create identity-management role "NotAccessibleUser" match-criteria
"userName == adam; AND "ip-Address == 1.2.3.0/24;"
# Creates a role named "secureAccess" for users who log in on ports 1, 5, 6, 7, and 8
# with IP addresses in the range of 10.1.1.1 to 10.1.1.255
create identity-management role "SecureAccess" match-criteria "ports == 1,5-8; AND ip-
address == 10.1.1.0/20;"
# Creates a role named “Prod-Engineers” for all the engineers who are under LDAP group
'Production'.
Create identity-management role “Prod-Engineers” match-criteria “title==Engineer; AND
memberOf==Production;”
```

History

This command was first available in ExtremeXOS 12.5.

Support for matching locally learned attributes was added in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create ip nat rule

```
create ip nat rule rule_name type [ source-nat | napt | destination-
   napt]
```

Description

Creates an IP Network Address Translation (NAT) rule.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies creating a NAT rule.
rule_name	Specifies the NAT rule name.
type	Specifies the NAT translation type.
source-nat	Specifies modifying the source IP address for outbound traffic.

napt	Specifies modifying the source IP address and transport identifier for outbound traffic (Network Address Port Translation).
destination-napt	Specifies modifying the destination IP address and transport identifier for inbound traffic.

Default

N/A.

Usage Guidelines

The **type** option specifies the kind of translation that is carried out for the NAT rule.

To delete a rule, run the command `delete` **ip nat rule** *rule_name*.

User-created rules cannot be created with a name starting with “SYS_NAT_RULE_”.

Example

The following example creates an IP NAT rule named "rule1" where the translation modifies the source IP address for outbound traffic:

```
# create ip nat rule rule1 type source-nat
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

create isis area

`create isis area` *area_name*

Description

This command creates an IS-IS router process in the current virtual router.

Syntax Description

area_name	Defines a name for the new IS-IS router process.

Default

N/A.

Usage Guidelines

No PDUs are sent until after the following events:

- The router process has been enabled
- The router process has been assigned a system ID and area address
- The router process has at least one interface (*VLAN*) that has IPv4 or IPv6 forwarding enabled.

By default, newly created IS-IS router processes are Level 1/Level 2 routers if a level 2 router process does not already exist in the current virtual router. No more than one IS-IS router process may be configured as a level 2 router. IS-IS router processes on different virtual routers may have the same name, but this is not recommended as it may cause confusion when administering the switch. The router process name supplied with this command may be optionally used as the hostname for this router process when dynamic hostname exchange support is enabled.

The area name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

A maximum of one area can be created per VR in this release.

Example

The following command creates a new IS-IS router process named areax:

```
create isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

create keychain

```
create keychain keychain_name
```

Description

This command creates a keychain.

Syntax Description

keychain_name	Defines a name for the new keychain. The range is 1-31.

Default

N/A.

Usage Guidelines

Use this command to create a keychain.

Example

The following command creates a new OSPFv3 keychain:

```
create keychain ospfv3-keys1
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create l2pt profile

`create l2pt` **`profile`** *`profile_name`*

Description

Creates an L2PT profile.

Syntax Description

`l2pt`	Creates a Layer 2 protocol tunneling profile.
`profile`	Profile that defines L2PT configuration for L2 protocols.
`profile_name`	Specifies a profile name (maximum 32 characters).

Default

Disabled.

Usage Guidelines

Use this command to create an L2PT profile.

Example

The following example create a new L2PT profile named "my_l2pt_prof":

```
create l2pt profile my_l2pt_prof
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create l2vpn fec-id-type pseudo-wire

```
create l2vpn [vpls vpls_name | vpws vpws_name] fec-id-type pseudo-wire
   pwid
```

Description

Creates a Layer 2 VPN, which can be either a VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string). The vpls_name string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.
vpws_name	Identifies the VPWS within the switch (character string). The vpws_name string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.
pwid	Specifies a PW ID. Must be a non-zero 32-bit value that has network-wide significance.

Default

For the VPLS dot1q tag, the default value is exclude.

Usage Guidelines

Each VPLS or VPWS is a member of a single VPN, and each VPN can have only one associated VPLS or VPWS per switch. External to the switch, each VPN has an identifier.

A VPLS or VPWS name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name

is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Any non-zero 32-bit value that has network-wide significance can be specified for the identifier. This `pwid` is used on all pseudo-wires in the VPLS.

The **`l2vpn`** keyword is introduced in ExtremeXOS Release 12.4 and is required when creating a VPWS. For backward compatibility, the l2vpn keyword is optional when creating a VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Note
The switch's LSR ID must be configured before a VPLS or VPWS can be created.

Example

This example creates a VPLS with 99 as the PW ID:

```
create vpls vpls1 fec-id-type pseudo-wire 99
```

The following example creates a VPWS with 101 as the PW ID:

```
create l2vpn vpws vpws1 fec-id-type pseudo-wire 101
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

create ldap domain

```
create ldap domain domain_name {default}
```

Description

This command is used to add an LDAP domain. The new domain can be added as the default. Older default domains, if any, will no longer be the default since once only one domain can be default at a time.

Syntax Description

domain_name	Name of new LDAP domain to be added

Default

N/A.

Usage Guidelines

Use this command to add an LDAP domain.

You can see the LDAP domains added by using the show ldap domain command.

Supporting multiple domains gives ExtremeXOS the capabilty to send LDAP queries to gather information about users belonging to different domains but connected to the same switch.

You can add upto 8 LDAP domains.

Example

The following command creates an LDAP domain with the name "sales.XYZCorp.com and marks it as the default domain:

```
create ldap domain sales.XYZCorp.com default
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create log filter

```
create log filter name {copy filter_name}
```

Description

Creates a log filter with the specified name.

Syntax Description

name	Specifies the name of the filter to create.
copy	Specifies that the new filter is to be copied from an existing one.
filter_name	Specifies the existing filter to copy.

Default

N/A.

Usage Guidelines

This command creates a filter with the name specified. A filter is a customizable list of events to include or exclude, and optional parameter values. The list of events can be configured by component or subcomponent with optional severity, or individual condition, each with optional parameter values. See the commands `configure log filter events` and `configure log filter events match` for details on how to add items to the filter.

The filter can be associated with one or more targets using the `configure log target filter` command to control the messages sent to those targets. The system has one built-in filter named DefaultFilter, which itself may be customized. Therefore, the `create log filter` command can be used if a filter other than DefaultFilter is desired. As its name implies, DefaultFilter initially contains the default level of logging in which every ExtremeXOS component and subcomponent has a pre-assigned severity level.

If another filter needs to be created that will be similar to an existing filter, use the copy option to populate the new filter with the configuration of the existing filter. If the copy option is not specified, the new filter will have no events configured and therefore no incidents will pass through it.

The total number of supported filters, including DefaultFilter, is 20.

Example

The following command creates the filter named fdb2, copying its configuration from the filter DefaultFilter:

```
create log filter fdb2 copy DefaultFilter
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create log message

```
create log message text
```

Description

This command logs an event using the text provided as the message.

Syntax Description

log	Configure log service.
message	Message to be logged.
text	Text of log message.

Default

N/A.

Usage Guidelines

Use this command to log an event using the *text* as provided as the message.

Example

```
# create log message "Creating the test VLAN"
# show log
08/06/2012 14:11:28.28 <Info:System.userComment> Creating the test VLAN
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create log target upm

```
create log target upm {upm_profile_name}
```

Description

Creates a new UPM target profile.

Syntax Description

upm_profile_name	Specifies the name of an existing UPM profile.

Default

N/A.

Usage Guidelines

After configuration, a UPM log target links an EMS filter with a UPM profile. This command creates the UPM log target.

The default configuration for a new log target binds the target to the EMS filter defaultFilter, which is used for all system events. To configure the log target, use the command: `configure log target upm {upm_profile_name} filterfilter-name {severity [[severity] {only}]}`.

The default status of a new UPM log target is disabled. To enable the log target, use the command: `enable log target upm {upm_profile_name}`.

To view the log target, use the command: `show log configuration target upm {upm_profile_name}`.

Example

The following example creates a new UPM log target named testprofile1:

```
create log target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create log target xml-notification

```
create log target xml-notification [ target_name | xml_target_name ]
```

Description

Creates a Web server XML-notification target name.

Syntax Description

target_name	Specifies the name of a non-existing XML notification target.
xml_target_name	Specifies the name of an already existing XML notification target.

Default

N/A.

Usage Guidelines

Use this command to create a web server XML-notification target name for EMS.

Example

The following command creates the target name test2:

```
create log target xml-notification text2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create macsec connectivity-association

```
create macsec connectivity-association ca_name pre-shared-key ckn ckn
   cak [encrypted encrypted_cak | cak]
```

Description

Creates a named connectivity-association (CA) object that holds MAC Security (MACsec) key authentication data.

Syntax Description

connectivity-association	Secures connectivity provided between MACsec stations.
ca_name	Defines CA object name.
pre-shared-key	Selects static MACsec key consisting of both a CKN and CAK:
ckn	Selects CA key name. This public (non-secret) key name allows each of the MKA participants to select which connectivity association k ey (CAK) to use to process a received MACsec key agreement (MKA) protocol packets (MKPDU).
ckn	Sets the CA key name. Length allowed is 1–32 characters, entered as ASCII or an octet string preceded with 0x.
cak	Sets the connectivity association key (CAK). If you are using 256-bit cipher suite, then the CAK must be 32 octets. The 128-bit cipher suite can use either a 16- or 32-octet CAK. This is a long-lived secret key used to derive short-lived lower-layer keys (ICK, KEK, and SAK) which are used for key distribution and data encryption.

cak	Sets the non-encrypted CAK value. Must be entered as an octet string (for example: “0x859e72f0...”). A 128-bit (16 octet) CAK requires 32 hexadecimal digits, and a 256-bit (32 octet) CAK requires 64 hexadecimal digits. These values are secret and should be generated off switch with a suitable pseudorandom number generator.
encrypted	Designates that secret key value is in encrypted format.
encrypted_cak	Sets the value for the secret key. The encrypted CAK value is generated by the `show configuration macsec` command for previously configured CAKs.

Default

N/A.

Usage Guidelines

Up to 64 unique CA profiles can be created.

Example

The following example creates the CA object "testca" with a CKN of "the blue key" and 128-bit CAK of “0x0102030405060708091011121314151 6”:

```
# create macsec connectivity-association testca pre-shared-key ckn “the blue key” cak
“0x01020304050607080910111213141516”
```

The following example creates the CA object "testca2" with a CKN of "the red key" and 256-bit CAK of “0x0102030405060708091011121314151617181920212223242526272829303132”:

```
# create macsec connectivity-association testca2 pre-shared-key ckn “the red key” cak
“0x0102030405060708091011121314151617181920212223242526272829303132”
```

```
# show macsec connectivity-association
MACsec CAK Bit
CA Name Ports Length CAK Name (CKN)
 -------------------------------- --------------------
testca None 128 the blue key
testca2 None 256 the red key
```

Note

The CAKs shown here are examples. Use your own random number for maximum security.

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

create meter

```
create meter meter-name
```

Description

This command creates a meter for ingress traffic rate limiting.

Syntax Description

meter-name	Specifies the meter name.

Default

N/A.

Usage Guidelines

Meter names must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but they cannot contain spaces. The maximum allowed length for a name is 32 characters. For meter name guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Example

The following command creates the meter maximum_bandwidth:

```
create meter maximum_bandwidth
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create mirror control_index

```
create mirror control_index
```

Description

Creates a "control group" mirror referenced by a unique control index.

Syntax Description

control_index	Mirror destination control index in the form of a number 1–4. Also know as. etsysMirrorDestinationControlIndex. Each comprises a group of mirror names.

Default

N/A.

Usage Guidelines

You can apply mirrors to policy profile rules by using a "control group" mirror referenced by a unique control index number (1–4). These control group mirrors are etsysMirrorDestinationControlEntry entries in the ENTERASYS-MIRROR-CONFIG-MIB (Mirror MIB). A Mirror MIB instance (designated by a control index) can be associated with up to four "physical" mirrors, each being one destination port (or tunnel). To create physical mirrors, use the command `create mirror` *mirror_name* {**to** [**port** *port* | **port-list** *port_list* **loopback-port** *port*] **{ remote-tag** *rtag* } | **remote-ip** *remote_ip_address* {{ **vr** } {*vr_name* } {**from** [*source_ip_address* | **auto-source-ip**]}{**ping-check** [**on** | **off**]} **priority** *priority_value*]} {**description** *mirror-desc*}.

Example

The following example creates a control group mirror with control index number of "1":

```
# create mirror 1
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create mirror

```
create mirror mirror_name {to [port port | port-list port_list loopback-
   port port] { remote-tag rtag } | remote-ip remote_ip_address {{ vr }
   {vr_name } {from [ source_ip_address | auto-source-ip]}{ping-check
   [on | off]} priority priority_value ]} {description mirror-desc}
```

Description

Creates a named mirror instance with an optional description, and optional "to port" definition, or remote IP address destination.

Syntax Description

mirror_name	Specifies the mirror name.
port	Specifies the mirror output port.
port_list	Specifies the list of ports where traffic is to be mirrored.
loopback-port	Specifies an otherwise unused port required when mirroring to a port_list. The loopback-port is not available for switching user data traffic.
port	Specifies a single loopback port that is used internally to provide this feature.
remote-tag	Specifies the value of the *VLAN* ID used by the mirrored packets when egressing the monitor port.
description	Specifies a description of the named mirror instance.
mirror-desc	The specified mirror description.
remote-ip	Specifies to send mirrored packets to specified remote destination IP address.
remote_ip_address	Specifies the destination remote IP address for mirrored packets.
vr	Specifies a virtual router of the remote IP address.
vr_name	Specifies the virtual router name. If not specified, VR of current command context is used.
from	Configures source IP address of encapsulated mirrored packets.
source_ip_address	Specifies the local source IPv4 address for encapsulated mirrored packets.
auto-source-ip	Automatically use source IP address of egress VLAN to be used to reach remote IP address.
ping-check	Configure ping health check for remote IP address.
on	Only send mirrored packets to remote IP address if periodic pings to remote IP address are successful (default).
off	Send mirrored packets to remote IP address without any ping health check, assuming MAC address and port of next hop IP address are static or learned.

priority	Configures a unique priority value for each redundant remote IP address of a mirror instance.
priority_value	Sets the unique priority value for the remote IP address. The priority value must be unique for each remote IP address in the mirror instance. The range is from 1 (least preferred) to 100 (most preferred). The default is 50.

Default

Disabled.

Ping health check of the remote IP address is enabled unless otherwise specified.

If a VR is not specified, the VR of the current command context is used.

The default priority value is 50.

Usage Guidelines

Use this command to create a named mirror instance with an optional description and optional "to port" or remote IP address definitions. You can create 15 named instances (the instance "DefaultMirror" is created automatically).

For high availability, you can add up to four redundant remote IP addresses. When creating a mirror with this command, you can add one IP address. To add additional remote IP addresses, use the `configure mirror` *mirror_name* {**to** [**port** *port* | **port-list** *port_list* | **loopback port** *port*] **| remote-ip** {**add**} *remote_ip_address* {{**vr**} *vr_name* } {**from** [*source_ip_address* | **auto-source-ip**]} {**ping-check** [**on** | **off**]}] {**remote-tag** *rtag* | **port none**} {**priority** *priority_value*}command.

Example

The following example creates a mirror instance on port 3, slot 4 :

```
create mirror to port 3:4
```

History

This command was first available in ExtremeXOS 15.3.

The remote IP address option was added in ExtremeXOS 22.4.

Redundant remote IP addresses capability was added in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create mlag peer

```
create mlag peer peer_name { authentication [ md5 key {encrypted
   encrypted_auth_key | auth_key ]}] }
```

Description

Creates an peer switch association structure.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.
authentication	Authentication for MLAG checkpoint connection.
md5	*MD5* authentication type.
key	Authentication key for checkpoint connection to the MLAG peer.
encrypted	Authentication key in in encrypted format.
auth_key	Authetication key used for checkpoint connection.

Default

N/A.

Usage Guidelines

This command creates an MLAG peer switch association structure.

You must use a unique name for the peer switch. If you attempt to create an MLAG peer with a name that already exists, the following error message is displayed:

```
ERROR: MLAG peer with specified name already exists
```

Example

The following command creates a peer switch structure switch101:

```
# create mlag peer switch101
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create mpls rsvp-te path

```
create mpls rsvp-te path path_name
```

Description

Creates an RSVP-TE routed path resource.

Syntax Description

path_name	Identifies the path within the switch. The character string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.

Default

N/A.

Usage Guidelines

This command creates an RSVP-TE path resource.

The path_name parameter must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

The maximum number of configurable paths is 255.

Note

The RSVP-TE LSP is not signaled along the path until an LSP is created and then configured with the specified *path_name*.

Example

The following example creates an RSVP-TE path:

```
create mpls rsvp-te path path598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

create mpls rsvp-te lsp

```
create mpls rsvp-te lsp lsp_name destination ipaddress
```

Description

Creates internal resources for an RSVP-TE LSP.

Syntax Description

lsp_name	Specifies a name for the LSP you are creating. The character string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.
ipaddress	Specifies the endpoint of the LSP.

Default

N/A.

Usage Guidelines

This command creates internal resources for an RSVP-TE LSP.

The LSP name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

The ipaddress specifies the endpoint of the LSP. The LSP is not signaled until a path is specified for the LSP using the `configure mpls rsvp-te lsp lsp_name add path` command. When multiple LSPs are configured to the same destination, IP traffic is load-shared across active LSPs that have IP transport enabled. The maximum number of RSVP-TE LSPs that can be created is 1024.

Note
The LSP must be created before it can be configured.

Example

The following command creates an RSVP-TE LSP:

```
create mpls rsvp-te lsp lsp598 destination 11.100.100.8
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

create mpls rsvp-te profile fast-reroute

```
create mpls rsvp-te profile profile_name fast-reroute
```

Description

Creates an LSP container to hold FRR configuration parameters.

Syntax Description

profile_name	Specifies a name for the new RSVP-TE fast-reroute profile. The character string must begin with an alphabetic character and may contain up to 31 additional alphanumeric characters.

Default

N/A.

Usage Guidelines

A profile name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Example

The following command creates a new FRR profile named frrprofile:

```
create mpls rsvp-te profile frrprofile fast-reroute
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

create mpls rsvp-te profile

```
create mpls rsvp-te profile profile_name {standard}
```

Description

Creates configured RSVP-TE profile with the specified profile name.

Syntax Description

profile_name	Identifies the RSVP-TE profile. The character string must begin with an alphabetic character and may contain up to 31 additional alphanumeric characters.
standard	The standard option differentiates this command version from the command that creates a fast-reroute profile. If you do not specify an option, a standard RSVP-TE profile is created.

Default

N/A.

Usage Guidelines

This command creates a configured RSVP-TE profile with the specified profile name. The default profile cannot be deleted. If a profile is associated with a configured LSP, the profile cannot be deleted.

A profile name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Example

The following command creates an RSVP-TE profile:

```
create mpls rsvp-te profile prof598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

create mpls static lsp

```
create mpls static lsp lsp_name destination ipaddress
```

Description

Creates internal resources for a static LSP and assigns a name to the LSP.

Syntax Description

lsp_name	Identifies the LSP to be created.
ipaddress	Specifies the endpoint of the LSP.

Default

N/A.

Usage Guidelines

An LSP name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Example

The following command creates a static LSP:

```
create mpls static lsp lsp598 destination 11.100.100.8
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

create msdp mesh-group

```
create msdp mesh-group mesh-group-name {vr vrname}
```

Description

Creates an *MSDP* mesh-group.

Syntax Description

mesh-group-name	Specifies the name for the MSDP mesh-group.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

A mesh-group is a group of MSDP peers with fully meshed MSDP connectivity. Create a mesh-group to:

- Reduce SA message flooding.
- Simplify peer-RPF flooding.

SA messages received from a peer in a mesh-group are not forwarded to other peers in the same mesh-group, which reduces SA message flooding.

A mesh group name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Example

The following example creates a mesh-group called "verizon:":

```
create msdp mesh-group verizon
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create msdp peer

```
create msdp peer remoteaddr {remote-as remote-AS} {vr vrname}
```

Description

Creates an *MSDP* peer.

Syntax Description

remoteaddr	Specifies the IP address of the MSDP router to configure as an MSDP peer.
remote-AS	Specifies the autonomous system (AS) number of the MSDP peer. This optional parameter is deprecated in ExtremeXOS 12.1, though the option is still available in the CLI for backward compatibility. The software ignores this parameter.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

The *BGP* route database is used by MSDP to determine the AS number for the peer. You can display the AS number (which can be a 2-byte for 4-byte AS number) using the command:

`show msdp [peer {detail} | {peer} **remoteaddr**] {vr*vrname*}.`

Example

The following example creates an MSDP peer:

```
create msdp peer 192.168.45.43 remote-as 65001
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create netlogin local-user

```
create netlogin local-user user-name {encrypted} encrypted_password |
   password } {vlan-vsa [[{tagged | untagged} [vlan_name] | vlan_tag]]}
   {security-profile security_profile}
```

Description

Creates a local network login user name and password.

Syntax Description

user-name	Specifies a new local network login user name. User names must have a minimum of 1 character and a maximum of 32 characters.
encrypted	The encrypted option is used by the switch to encrypt the password. Do not use this option through the command line interface (CLI).
password	Specifies a local network login user password. Passwords must have a minimum of 0 characters and a maximum of 32 characters.
tagged	Specifies that the client be added as tagged.
untagged	Specifies that the client be added as untagged.
vlan_name	Specifies the name of the destination *VLAN*.
vlan_tag	Specifies the VLAN ID, tag, of the destination VLAN.
security_profile	Specifies a security profile string during account creation.

Default

N/A.

Usage Guidelines

Use this command to create a local network login account and to configure the switch to use its local database for network login authentication. This method of authentication is useful in the following situations:

- If both the primary and secondary (if configured) *RADIUS* servers timeout or are unable to respond to authentication requests.
- If no RADIUS servers are configured.
- If the RADIUS server used for network login authentication is disabled.

If any of the above conditions are met, the switch checks for a local user account and attempts to authenticate against that local account.

Extreme Networks recommends creating a maximum of 64 local accounts. If you need more than 64 local accounts, we recommend using RADIUS for authentication. For more information about RADIUS authentication, see the *Switch Engine 32.2 User Guide*.

You can also specify the destination VLAN to enter upon a successful authentication.

Note

If you do not specify a password or the keyword encrypted, you are prompted for one.

Additional Requirements

This command applies only to the web-based and MAC-based modes of network login. 802.1X network login does not support local database authentication.

You must have administrator privileges to use this command. If you do not have administrator privileges, the switch displays a message similar to the following:

```
This user does not have permissions for this command.
```

User names are not case-sensitive. Passwords are case-sensitive. User names must have a minimum of 1 character and a maximum of 32 characters. Passwords must have a minimum of 0 characters and a maximum of 32 characters. If you use RADIUS for authentication, we recommend that you use the same user name and password for both local authentication and RADIUS authentication.

If you attempt to create a user name with more than 32 characters, the switch displays the following messages:

```
%% Invalid name detected at '^' marker. %% Name cannot exceed 32 characters.
```

If you attempt to create a password with more than 32 characters, the switch displays the following message after you re-enter the password:

```
Password cannot exceed 32 characters
```

Modifying an Existing Account

To modify an existing local network login account, use the following command:

```
configure netlogin local-user user-name {vlan-vsa [[{tagged | untagged} [vlan_name | vlan_tagw]] | none]}
```

Displaying Local Network Login Accounts

To display a list of local network login accounts on the switch, including VLAN information, use the following command:

```
show netlogin local-users
```

Example

The following command creates a local network login user name and password:

```
create netlogin local-user megtest
```

After you enter the local network login user name, press [Enter]. The switch prompts you to enter a password (the switch does not display the password):

```
password:
```

After you enter the password, press [Enter]. The switch then prompts you to re-enter the password:

```
Reenter password:
```

The following command creates a local network login user name, password, and associates a destination VLAN with this account:

```
create netlogin local-user accounting vlan-vsa blue
```

As previously described, the switch prompts you to enter and confirm the password.

History

This command was first available in ExtremeXOS 11.2.

The **vlan-vsa** parameter and associated options were added in ExtremeXOS 11.3.

The **security-profile** parameter was added in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create ntp key

```
create ntp key keyid [md5 | sha256] {encrypted encrypted_key_string |
   key_string}
```

Description

Enables an NTP key for an NTP session.

Syntax Description

keyid	Specifies the key ID as a value from 1 to 65534.
key_string	Specifies an alphanumeric key string, from 5 to 20 numbers or characters, or a combination of both.
md5	Specifies MD5 authentication type. This authentication type is not allowed when FIPS mode is on.
sha256	Specifies SHA-265 authentication type.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command enables an NTP key using RSA Data Security, Inc. *MD5* Message-Digest Algorithm encryption on the switch:

```
create ntp key 1 md5 oklahoma
```

History

This command was first available in ExtremeXOS 12.7.

Key string length was changed to 20 in ExtremeXOS 30.3.

SHA-256 option was added in ExtremeXOS 30.4.

The **md5** option is not allowed when FIPS mode is on in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create ospf area

```
create ospf area area-identifier
```

Description

Creates an *OSPF* area.

Syntax Description

area-identifier	Specifies an OSPF area.

Default

Area 0.0.0.0.

Usage Guidelines

Area 0.0.0.0 does not need to be created. It exists by default.

Example

The following command creates an OSPF area:

```
create ospf area 1.2.3.4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

create ospfv3 area

```
create ospfv3 area area_identifier
```

Description

Creates an *OSPFv3* area.

Syntax Description

area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.

Default

Area 0.0.0.0.

Usage Guidelines

Area 0.0.0.0 does not need to be created. It exists by default.

Example

The following command creates a non-backbone OSPFv3 area:

```
create ospfv3 area 1.2.3.4
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

create policy access-list

```
create policy access-list list_dot_rule {matches [ {app-signature
   group group name name} {ether ether {mask ether_mask}} {icmp6type
   icmp6type {mask icmp6_mask}} {icmptype icmptype {mask icmp_mask}}
   {ipdestsocket ipdestsocket {mask ipdest_mask}} {ipfrag} {ipproto
   ipproto {mask ipproto_mask}} {ipsourcesocket ipsourcesocket {mask
   ipsrc_mask}} {iptos iptos {mask iptos_mask}} {ipttl ipttl {mask
   ipttl_mask} {tcpdestportIP tcpdestportIP {mask tcpdest_mask}}
   {tcpsourceportIP tcpsourceportIP {mask tcpsrc_mask}} {udpdestportIP
   udpdestportIP {mask udpdest_mask}} {udpsourceportIP udpsourceportIP
   {mask udpsrc_mask}} ] } {actions [ {cos cos} {drop | forward}
   {mirror-destination control_index} {syslog}]}
```

Description

Creates policy access-list match criteria.

Syntax Description

access-list	Specifies access-list rule model to select multiple match criteria per rule.
list_dot_rule	Specifies the access-list name and rule name in the format *list_name.rule_name*.
matches	Selects up to 5 match criteria.
app-signature	Associates an application signature to a policy profile. Note: Not supported on the ExtremeSwitching X435 series switches.
group	Associates an application signature group to a policy profile.
group	Defines the application signature group name.
name	Associates an application signature name to a policy profile.
name	Defines the name assigned to the application signature (range 1–32).
ether	Selects the type field in Ethernet II packet.
ether	Defines the type field in Ethernet II packet (data: 0–65535 or 0x0–0xFFFF; mask: 1–16).
mask	Selects a mask.
ether_mask	Selects the number of most significant bits to match data value (range 1–16).
icmp6type	Selects ICMPv6 type.code.
icmp6type	Defines the ICMPv6 type.code (data: 123.456 (dotted-decimal) or AB-CD (dashed-hexadecimal)).
icmp6_mask	Specifies the number of most significant bits to match data value (range 1–16).
icmptype	Selects an ICMP type.code.
icmptype	Specifies the ICMP type.code - (data: a.b; mask: 1-16).
icmp_mask	Specifies the number of most significant bits to match data value (range 1–16).
ipdestsocket	Specifies a destination IP address with optional post-fixed port or port-range.
ipdestsocket	Defines the destination IP address with optional post-fixed port or port-range - (data: a.b.c.d [:ab (0-65535) [-cd (0-65535)]]; mask: 1-48,64).
ipdest_mask	Specifies the number of most significant bits to match data value (range 1–64).
ipfrag	Selects IP fragmentation flag.
ipproto	Specifies protocol field in IP packet.
ipproto	Defines the protocol field in IP packet (data: 0–255 or 0x0-0xFF; mask: 1–8). IPv4 only (ICMP).
ipproto_mask	Specifies the number of most significant bits to match the data value (range 1–8).

ipsourcesocket	Specifies the source IP address with optional post-fixed port or port-range.
ipsourcesocket	Defines the source IP address with optional post-fixed port or port-range - (data: a.b.c.d [:ab (0–65535) [-cd (0-65535)]]; mask: 1-48, 64).
ipsrc_mask	Specifies the number of most significant bits to match data value (range 1–64).
iptos	Specifies IPv4 type of service/IPv6 traffic class field.
iptos	Defines the IPv4 type of service/IPv6 traffic class field (data: 0–255; mask: 1–8).
iptos_mask	Specifies the number of most significant bits to match data value (range 1–8).
ipttl	Specifies IP time to live.
ipttl	Defines the IP time to live (data: 0–255 or 0x0–0xFF; mask:1–8).
ipttl_mask	Specifies the number of most significant bits to match data value (range 1–8).
tcpdestportIP	Specifies TCP port/port-range destination with optional post-fix IPv4 address.
tcpdestportIP	Defines the TCP port/port-range destination with optional post-fix IPv4 address (data: ab [-cd] [:c.d.e.f]); mask: 1–64).
tcpdest_mask	Specifies the number of most significant bits to match data value (range 1–64).
tcpsourceportIP	Specifies TCP port/port-range source with optional post-fix IPv4 address.
tcpsourceportIP	Defines the TCP port/port-range source with optional post-fix IPv4 address (data: ab [-cd] [:c.d.e.f]); mask: 1–64).
tcpsrc_mask	Specifies the number of most significant bits to match data value (range 1–64).
udpdestportIP	Specifies UDP port/port-range destination with optional post-fix IPv4 address.
udpdestportIP	Defines the UDP port/port-range destination with optional post-fix IPv4 address (data: ab [-cd] [:c.d.e.f]); mask:1-64).
udpdest_mask	Specifies the number of most significant bits to match data value (range 1–64).
udpsourceportIP	Specifies UDP port/port-range source with optional post-fix IPv4 address.
udpsourceportIP	Defines the UDP port/port-range source with optional post-fix IPv4 address (data: ab [-cd] [:c.d.e.f]).
udpsrc_mask	Specifies the number of most significant bits to match data value (range 1–64).
actions	Specifies selecting one or more actions to occur when there is a match.
cos	Specifies Class of Service (CoS) as an action.

cos	Defines the CoS (0–255), or -1 for no CoS, or CoS with no forwarding behavior to remove the existing forwarding settings.
drop	Specifies dropping any packets that match this rule.
forward	Specifies forwarding any packets that match this rule.
mirror-destination	Specifies mirroring any packets that match this rule.
control_index	Defines which mirror destination control index (1–4).
syslog	Enables, disables, or prohibits Syslog using event Policy.LogRuleHit on first rule use.

Default

N/A.

Usage Guidelines

To use this command, the policy rule model must be set to access-list (use command `configure policy` **`rule-model`** [**`access-list`** | **`hierarchical`**]).

The following combinations are not allowed:

- ipfrag with icmp, tcp, udp or ip with port rules
- tcp/udp source rules with ipSrc rule with port
- tcp/udp rules dest rule with ipDest rule with port
- icmp with tcp, udp or ip with port rules

Example

The following example creates the policy access list "ACL1.ace3" with match criteria of IP source address "10.1.1.1" and mask "32" with the action to forward with Class of Service level "2":

```
# create policy access-list ACL1.ace3 matches ipsource 10.1.1.1 mask 32 actions forward
cos 2
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create policy access-list action-set

```
create policy access-list action-set set-id [{drop | forward} {cos cos}
   {mirror-destination control_index} {syslog}]
```

Description

Creates a pre-defined set for use in RADIUS Change of Authorization (CoA) and Extreme Dynamic ACL via Radius VSA 232.

Syntax Description

access-list	Specifies access-list features.
action-set	Defines a set of actions that can be applied to multiple sets of match conditions.
set-id	Identifies the global action-set ID (range 1–63).
drop	Specifies dropping any packets that match this rule.
forward	Specifies forwarding any packets that match this rule.
cos	Specifies setting Class of Service (CoS).
cos	Specifies the CoS value: 0–255, or -1 for no CoS, or CoS with no forwarding behavior to remove forwarding behavior.
mirror-destination	Specifies setting a mirror destination control index.
control_index	Specifies setting the mirror destination control index (1–4).
syslog	Specifies Syslog logging using event Policy.LogRuleHit when first rule use occurs.

Default

N/A.

Usage Guidelines

You can view your configurations made with this command using the `show policy` **access-list action-set** {*set_id*} command.

Example

The following example creates an action set "1" with CoS level of 3 and Syslog behavior:

```
# create policy access-list action-set 1 cos 3 syslog
```

This command will be accepted only if the mode is set to access-list and slices must be shared by entering the command **configure policy slices shared 2 and configure policy slices tci-overwrite 2**.

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create ports group

```
create ports group port_group
```

Description

This command creates a generic port-group name that can be associated with a list of ports. The *port_group* option could be implemented in configure or show commands that currently accept a *port_list*. The *QoS* commands are expanded to accept the *port_group* option. QoS commands that use port groups are updated automatically if the ports group is removed or if ports are added or removed from the group.

Syntax Description

port_group	Specifies a port group name.

Default

N/A.

Usage Guidelines

Use this command to create a generic port-group name to be associated with a list of ports.

Example

```
create ports group testGroup
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create private-vlan

```
create private-vlan name {vr vr_name}
```

Description

Creates a PVLAN framework with the specified name.

Syntax Description

name	Specifies a name for the new PVLAN.
vr_name	Specifies the VR in which the PVLAN is created.

Default

N/A.

Usage Guidelines

The PVLAN is a framework that links network and subscriber *VLANs*; it is not an actual VLAN.

A private VLAN name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For private VLAN naming guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

If no VR is specified, the PVLAN is created in the default VR context.

Example

The following example creates a PVLAN named "companyx":

```
create private-vlan companyx
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

create process executable

```
create process name executable exe {start [auto | on-demand]} {node
   node} {vr vr-name} {description description} {arg1 {arg2 { arg3
   { arg4 { arg5 { arg6 { arg7 { arg8 { arg9 }}}}}}}}}
```

Description

Adds a C executable process compiled using the C-based SDK.

Syntax Description

process	User application process.
name	Name of the user application process. Range 1-31.
executable	Executable.
exe	Name of the executable relative to `/usr/local/cfg`.
start	Startup behavior.
auto	Create a daemon process and start it immediately
on-demand	Create a run-to-completion process and use `\"start process\`.
node	Node in stack in which to create the process.
node	Primary node, backup node, or both (default is primary).
vr	Virtual router in which to start the process.
vr-name	Virtual router name (Default is *VR-Mgmt*).
description	Description.
arg1-9	Variable value.

Default

VR-Mgmt is the default VR used if not specified.

If no selection is made, the process runs on-demand.

If no node is selected, the default is the primary node.

Usage Guidelines

The executable must be uploaded to `/usr/local/cfg` using the normal mechanisms (for example, TFTP).

Fields are provided by the user and passed directly into an epmrc entry. Not all epmrc fields are available.

This command adds C executable processes. To add a Python module, use the create process python-module on page 1657 command.

A process must first exist on the primary node if you are creating it only on the backup node, If a process already exists on the primary node, you cannot create it on both the primary and secondary node. Also, if the backup node is down, a new process cannot be created on it.

Example

```
create process foo_userd executable foobard start auto vr VR-Default description “Run
foobard on the default VR” “arg1” “arg2 with spaces”
```

The following error is displayed if an attempt is made to create a process with an invalid name:

```
Error: Process name %s is invalid.  Process names must begin with a letter, contain only
alphanumeric and
"_" characters, and be less than 32 characters long.
```

History

This command was first available in ExtremeXOS 15.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create process python-module

```
create process name python-module python-module {start [auto | on-
   demand]} {node node} {vr vr-name} {description description} {arg1
   {arg2 {arg3 {arg4 {arg5 {arg6 {arg7 {arg8 {arg9}}}}}}}}}
```

Description

Adds a Python module process.

Syntax Description

process	User application process.
name	Name of the user application process. Range 1-31.
python-module	The Python module to import and run.
python-module	The module relative to `/usr/local/cfg`.
start	Startup behavior.
auto	Create a daemon process and start it immediately.
on-demand	Create a run-to-completion process and use `\start process\`.
node	Node in stack in which to create the process.
node	Primary node, backup node, or both (default is primary).
vr	Virtual router in which to start the process.
vr-name	Virtual router name.
description	Description.
arg1-9	Variable value.

Default

VR-Mgmt is the default VR used if not specified.

If no selection is made, the process runs on-demand.

If no node is selected, the default is the primary node.

Usage Guidelines

The executable must be uploaded to `/usr/local/cfg` using the normal mechanisms (for example, TFTP).

From EPM's perspective, a Python-based process is an instance of the "expy" executable with some arguments, namely the Python module.

This command adds a Python module. To add a C executable processes, use the create process executable on page 1655 command.

A process must first exist on the primary node if you are creating it only on the backup node, If a process already exists on the primary node, you cannot create it on both the primary and secondary node. Also, if the backup node is down, a new process cannot be created on it.

Example

The following are examples of create process python-module commands.

```
python-module foo_program start auto vr vr-default
create process foo_user1 python-module "foo.run" "arg1 to foo.main"
create process foo_user2 python-module "foo.noargs.needed"
create process foo_user3 python-module "foo.daemon" start auto "arg1 to foo.main"
```

The following error is displayed if an attempt is made to create a process with an invalid name:

```
Error: Process name %s is invalid.  Process names must begin with a letter, contain only
alphanumeric and
"_" characters, and be less than 32 characters long.
```

History

This command was first available in ExtremeXOS 15.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create protocol

```
create protocol {filter} filter_name
```

Description

Creates a user-defined protocol filter.

Syntax Description

filter	Specifies a protocol filter.
filter_name	Specifies a protocol filter name. The protocol filter name can have a maximum of 31 characters.

Default

N/A.

Usage Guidelines

Protocol-based VLANs enable you to define packet filters that the switch can use as the matching criteria to determine if a particular packet belongs to a particular *VLAN*.

After you create the protocol, you must configure it using the configure protocol command. To assign it to a VLAN, use the `configure {vlan} vlan_name protocol {filter} filter_name` command.

Example

The following command creates a protocol named "my_filter", and a protocol filter named "my_other_filter":

```
create protocol "my_filter"
create protocol  filter  "my_other_filter"
```

History

This command was first available in ExtremeXOS 10.1.

The **filter** keyword was added in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create qosprofile

`create qosprofile [QP2| QP3 | QP4 | QP5 | QP6 | QP7]`

Description

Creates a *QoS* profile.

Syntax Description

QP2....QP7	Specifies the QoS profile you want to create.

Default

N/A.

Usage Guidelines

ExtremeSwitching series switches allow dynamic creation and deletion of QoS profiles QP2 to QP7. Creating a QoS profile dynamically does not cause loss of traffic.

QoS profiles QP1 and QP8 are part of the default configuration and cannot be deleted. You must create a QoS profile in the range of QP2 to QP7 before you can configure it or assign it to traffic groups.

Qos profile QP7 cannot be created in a SummitStack; this queue is reserved for control traffic.

Note

The sFlow application uses QP2 to sample traffic on SummitStack and ExtremeSwitching series switches; any traffic grouping using QP2 can encounter unexpected results when sFlow is enabled on these specific devices.

Example

The following command creates QoS profile QP3:

```
create qosprofile qp3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create snmp trap

```
create snmp trap severity severity event EventName msg
```

Description

Creates and sends an *SNMP* trap containing the information defined in the command.

Syntax Description

severity	Specifies one of the eight severity levels defined in the ExtremeXOS software. Enter one of the following values: critical, error, warning, notice, info, debug-summary, debug-verbose, debug-data.
EventName	Specifies the event name. Enter a name using alphanumeric characters.
msg	Specifies a message. Enter the message using alphanumeric characters.

Default

N/A.

Usage Guidelines

None.

Example

The following example sends a trap of severity info for event AAA with the message user XYZ logged in:

```
create snmp trap severity info event AAA "user XYZ logged in"
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create sshd2 key-file

`create sshd2 key-file {`**`host-key`** `|` **`user-key`**`}` *`key_name`*

Description

Creates a file for the user-key or host-key.

Syntax Description

host-key	Specifies the name of the host-key.
user-key	Specifies the name of the user-key.
key_name	Specifies the name of the public key.

Default

N/A.

Usage Guidelines

This command is used to write the user or the host public key in a file. The key files will be created with a .ssh file extension; this enables the administrator to copy the public key files to another server.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create sshd2 user-key

```
create sshd2 user-key key_name key {subject subject} {comment comment}
```

Description

Creates a user key.

Syntax Description

key_name	Specifies the name of the public key.
key	Specifies the key. Note: The key cannot have any spaces in it.
subject	Specifies the subject.
comment	Specifies the comment (an optional field).

Default

N/A.

Usage Guidelines

This command is used to enter, or cut and paste, your public key. You can also enter the public key into the switch by using the SCP or SFTP client that is connected to the switch.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create stpd

```
create stpd stpd_name {description stpd-description}
```

Description

Creates a user-defined *STPD*.

Syntax Description

stpd_name	Specifies a user-defined STPD name to be created. May be up to 32 characters in length.
stpd-description	Specifies an *STP* domain description string.

Default

The default device configuration contains a single STPD called s0.

When an STPD is created, the STPD has the following default parameters:

- State—disabled.
- StpdID—none.
- Assigned *VLAN*s—none.
- Bridge priority—32,768.
- Maximum BPDU age—20 seconds.
- Hello time—2 seconds.
- Forward delay—15 seconds.
- Operational mode—802.1D.
- Rapid Root Failover—disabled.
- Default Binding Mode (encapsulation mode)—Ports in the default STPD (s0) are in 802.1d mode. Ports in user-created STPDs are in emistp mode.
- Maximum hop count (when configured for *MSTP*)—20 hops.
- STP domain description string—empty.

Usage Guidelines

The maximum length for a name is 32 characters. Names can contain alphanumeric characters and underscores (_) but cannot be any reserved keywords, for example, stp or stpd. Names must start with an alphabetical character, for example, a, Z. For name creation guidelines and a list of reserved names, see Object Names on page 11.

Each STPD name must be unique and cannot duplicate any other named STPDs on the switch. If you are uncertain about the STPD names on the switch, use the `show stpd` command to view the STPD names.

You can, however, re-use names across multiple categories of switch configuration. For example, you can use the name Test for an STPD and a VLAN. If you use the same name, we recommend that you specify the appropriate keyword when configuring the STPD. If you do not specify the appropriate keyword, the switch displays a message similar to the following:

```
%% Ambiguous command: "configure Test"
```

To view the names of the STPDs on the switch, enter configure and press [Tab]. Scroll to the end of the output to view the names.

The maximum length for an STPD description is 180 characters. The description must be in quotes if the string contains any spaces. To display the description, use the `show stpd` *stpd_name* command.

Each STPD has its own Root Bridge and active path. After the STPD is created, one or more VLANs can be assigned to it.

Example

The following example creates an STPD named purple_st:

```
create stpd purple_st
```

History

This command was first available in ExtremeXOS 10.1.

The STPD description option was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create time profile

```
create time-profile time_profile_name start start_hour : start_minute
   {start_month {/start_day/start_year}}stop [stop_hour:stop_minute
   {stop_month {/stop_day { / stop_year }}} | in stop_count
   stop_units ] { recur [ daily every daily_interval days |weekly
   every weekly_interval weeks {on [weekdays | weekends | weekly_day]}
   |monthly every monthly_interval months {on [monthly_day day |
   monthly_week week ] } |yearly every yearly_interval years{ on
   yearly_week week of yearly_month }] {begins begin_month/begin_day
   {/begin_year}ends [ end_month/end_day/end_year} | after recur_count
   recurrences ]}}
```

Description

Configures a time profile of an appointment starting at a specific time on a specific calendar date.

Syntax Description

time_profile_name	Specifies the name of the time profile.
start	Specifies the appointment starting specification .
start_hour	Specifies the start hour. The range is 0-23.
start_minute	Specifies the start minutes. The range is 0-59.
start_month	Specifies the start month. The range is 1-12.
start_day	Specifies the start day. The range is 1-31.
start_year	Specifies the start year, YYYY.
stop	Specifies the appointment stopping specification.
stop_hour	Specifies the stop hour. The range is 0-23.
stop_minute	Specifies the stop minutes. The range is 0-59.
stop_month	Specifies the stop month. The range is 1-12.
stop_day	Specifies the stop day. The range is 1-31.
stop_year	Specifies the stop year, YYYY.
in	Specifies the stop in time.
stop_count	Specifies the stop count.
stop_units	Specifies the stop units (for example, minutes , hours, days, weeks).

Default

N/A.

Usage Guidelines

Use this command to create a time profile of an appointment starting at a specific time on a specific calendar date.

Example

The following example configures a time profile named "testprofile" to start at 11:30 a.m. on February 24, 2012:

```
configure time profile testprofile start 11 :  30 { 2 { / 24 { /  2012
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create time profile recur

```
create time-profile time_profile_name {recur [daily every daily_interval
   days |weekly every weekly_interval weeks {on [weekdays | weekends |
   weekly_day ]} |monthly every monthly_interval months {on [monthly_day
   day | monthly_week week]} |yearly every yearly_interval years{on
   yearly_week week of yearly_month}] {begins begin_month/begin_day { /
   begin_year}ends [end_month/end_day {/end_year } | after recur_count
   recurrences]}}
```

Description

Configures a recurring time profile using a day of the week .

Syntax Description

time_profile_name	Specifies the name of the time profile.
recur	Specifies that the time profile recurs.
daily every	Specifies if the recurrence is daily, or on specified days.
daily_interval **days**	Specifies the recurrence rate. The range is 1-7
weekly every	Specifies if the recurrence is every week, or on specified weeks.
weekly_interval **weeks**	Specifies the recurrence rate. The range is 1-52.
on	Specifies that the recurrent profile is on a specified week or month.
weekdays	Specifies the recurrence is on weekdays.
weekends	Specifies the recurrence is on weekends.
monthly every	Specifies the recurrence is every month or on a specified month.
monthly_interval **months**	Specifies the stop month. The range is 1-12.
stop_day	Specifies the stop day. The range is 1-31.
stop_year	Specifies the stop year, YYYY.
in	Specifies the stop in time.
stop_count	Specifies the stop count.
stop_units	Specifies the stop units (for example, minutes , hours, days, weeks).

Default

N/A.

Usage Guidelines

Use this command to create a time profile of an appointment starting at a specific time on a specific calendar date.

Example

The following command configures a time profile named "testprofile" to start at 11:30 a.m. on February 24, 2012:

```
configure time profile testprofile start 11 :  30 { 2 { / 24 { /  2012
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create tunnel 6to4

`create tunnel` *`tunnel_name`* **`6to4 source`** *`source-address`*

Description

Creates an IPv6-to-IPv4 (6to4) tunnel.

Syntax Description

`tunnel_name`	Specifies an IPv6 tunnel.
`source-address`	Specifies an IPv4 address for the tunnel.

Default

N/A.

Usage Guidelines

This command will create a new IPv6-to-IPv4 (also known as a 6to4 tunnel), and add it to the system. Only one 6to4 tunnel can be configured on any particular VR.

The tunnel name must be unique and cannot overlap the same name space as VLANs, other tunnels, or VRs. The name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed lengthfor a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

The source address of the tunnel must be one of the IPv4 addresses already configured on the switch. You cannot remove an IPv4 address from the switch if a tunnel that uses it still exists.

Example

The following example creates the 6to4 tunnel "link35" with source address 192.168.10.1:

```
create tunnel link35 6to4 source 192.168.10.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in the *Switch Engine 32.2 Feature License Requirements* document.

create tunnel gre destination source

```
create tunnel tunnel_name gre destination destination-address source
   source-address {vr vr_name} {payload-vr payload_vr_name}
```

Description

Allows you to add a GRE tunnel. This command is in-line with adding an ipv6-in-ipv4 tunnel.

Syntax Description

gre	Generic Routing Encapsulation tunnel.
destination-address	IPv4 destination address of the tunnel.
source-address	IPv4 source address of the tunnel.
vr	Specifies configuring the tunnel on specific VR.
vr_name	Specifies which VR to configure the tunnel on. This VR if the VR of the tunnel itself, where *source-address* is configured. It is the underlay/delivery. This is the source outer IP address. The default is the VR of the current context.
payload-vr	Specifies a tunnel payload VR (VR of the tunnel interface).
payload_vr_name	Specifies the tunnel payload VR name. It is the VR of the L3 interface of the tunnel, that is, the payload/overlay. The default is the VR of the tunnel.

Default

No GRE tunnels exist in the system.

When adding tunnels, the VR of the current context is the default unless otherwise specified.

By default, the payload VR is the VR of the tunnel.

Usage Guidelines

Use this command to add a GRE tunnel.

Example

```
create tunnel myGREtunnel gre destination 10.0.0.2 source 10.0.0.1
```

History

This command was first available in ExtremeXOS 15.3.

Ability to configure GRE tunnels on user VRs was added in ExtremeXOS 31.3.

Platform Availability

This command is available on the platforms listed for the GRE feature in the *Switch Engine 32.2 Feature License Requirements* document.

create tunnel ipv6-in-ipv4

```
create tunnel tunnel_name ipv6-in-ipv4 destination destination-address
   source source-address
```

Description

Creates an IPv6-in-IPv4 (6in4) tunnel.

Syntax Description

tunnel_name	Specifies an IPv6 tunnel.
source-address	Specifies an IPv4 address for the tunnel.

Default

N/A.

Usage Guidelines

This command creates a new IPv6-in-IPv4 (otherwise known as a configured tunnel or a 6in4 tunnel) and add it to the system. A maximum of 255 tunnels (including one 6to4 tunnel) can be configured on the system.

The tunnel name must be unique and cannot overlap the same name space as VLANs, other tunnels, or VRs. The name must begin with an alphabetical character and may contain alphanumeric characters

and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

The source address of the tunnel must be one of the IPv4 addresses already configured on the switch. You cannot remove an IPv4 address from the switch if a tunnel is still exists that uses it.

Example

The following example creates the 6in4 tunnel "link39" with destination address 10.10.10.10 and source address 192.168.10.15:

```
create tunnel link39 ipv6-in-ipv4 destination 10.10.10.10 source 192.168.10.15
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in the *Switch Engine 32.2 Feature License Requirements* document.

create upm profile

```
create upm profile profile-name
```

Description

Creates a new profile of a specified type.

Syntax Description

profile-name	Specifies the UPM profile to be created.

Default

N/A.

Usage Guidelines

Use this command to create a profile and name it. The maximum profile size is 5000 characters.

A UPM profile name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names on page 11.

There is a limited capability to edit the profile with this command. If you enter a period (.) as the first and the only character on a line, you terminate the editing of the file. Use the command: `edit upm profile profile-name` for block mode capability.

Example

The following example shows how to create a profile named "P2":

```
# create upm profile p2
enable port 2:*
disable port 3:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create upm timer

`create upm timer timer-name`

Description

Creates and names a UPM timer.

Syntax Description

timer-name	Specifies the name of the UPM timer to be created.

Default

N/A.

Usage Guidelines

You can create UPM timers with a name. A profile can be associated with eight timers, but a timer can be bound to only one profile at any point in time. You can create a maximum of 32 timers. A name space for the timers is available to help when you are typing the commands.

A UPM timer name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create virtual-network

```
create virtual-network vn_name {flooding [standard | explicit-remotes|
   multicast {group grpipaddress]}
```

Description

This command creates a virtual network instance in ExtremeXOS. The virtual network instance maps to a bridge instance within ExtremeXOS.

Syntax Description

vn_name	Alphanumeric string identifying the Virtual Network to be created.
flooding	Configure flooding method for unknown-destination frames.
standard	Standard L2 flooding behavior to remote endpoints and tenant ports.
explicit-remotes	Explicitly configured flooding to remote endpoints with standard L2 flooding to tenant ports.
multicast	Multicast flooding to remote endpoints with standard L2 flooding to tenant ports.
group	Configure multicast group for flooding of unknown-destination frames.
grpipaddress	IPv4 multicast group address to be used for flooding (Automatically assigned if unspecified).

Default

Standard.

Usage Guidelines

For auto-assigning multicast groups, you must configure the following command: **configure virtual-network multicast group**.

This bridge instance is not dependent on the overlay encapsulation scheme. The virtual network name can be a maximum of 32 characters. The current restrictions on naming objects in ExtremeXOS apply. Virtual network names are added to a new namespace within ExtremeXOS. Virtual networks may use one of two flooding methods for flooding to remote endpoints. The “standard” mode offers handling

of unknown destination frames very similar to standard Layer 2. The unknown destination frames are flooded to all local ports and remote endpoints. The “explicit-remotes” mode offers granular control of which remote endpoints receive certain types of unknown destination frames. Different remote endpoint sets may be configured for; broadcast, unknown unicast, and unknown multicast. These sets are configured with `create fdb` and `configure fdb` commands

Example

The following example creates the virtual network "my_virtual_network":

```
create virtual-network my_virtual_network
```

The following example deletes the virtual network "my_virtual_network":

```
delete virtual-network my_virtual_network
```

History

This command was first available in ExtremeXOS 21.1.

Multicast flooding support was made available in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create virtual-network remote-endpoint vxlan ipaddress

`create virtual-network remote-endpoint vxlan ipaddress` *`ipaddress`* {**`vr`** *`vr_name`*}

Description

This command creates a remote endpoint.

Syntax Description

`ipaddress`	A remote endpoint IP address.
`vr`	VR/VRF instance the remote endpoint is associated with
`vr_name`	An existing VR/VRF name.

Default

VR-Default

Usage Guidelines

This command is useful when you want to explicitly add a remote endpoint in addition to the ones learnt dynamically (*OSPF* extensions). In flood mode explicit, you must create a remote-endpoint using this command, if the configurations on remote-endpoint (like monitor) need to be saved to the configuration. Otherwise, the configuration will be lost after the switch reboots.

Example

To create a remote endpoint:

```
create virtual-network vxlan remote-endpoint ipaddress 1.2.3.4
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create virtual-router

To create virtual routers, use the following command:

```
create virtual-router vr-name {type [vrf | vpn-vrf {vr parent_vr_name}]}
```

To create local-only virtual routers (ExtremeSwitching 5320-24T/P and 5320-16P only), use the following command:

```
create virtual-router vr-name local-only {type [vrf | vpn-vrf {vr
parent_vr_name}]}
```

Description

Use the create virtual-router command to create a user VR or VRF.

Syntax Description

vr-name	Virtual router name.
type	Specifies the type of virtual router you are creating.
local-only	Specifies local-only VR. For ExtremeSwitching 5320-24T/P and 5320-16P series switches and stacks only.
vrf	Specifies that you are creating a new L3 or IP routing domain.
vpn-vrf	Specifies that you are creating a new L3 or IP routing domain that supports L3VPNs. Not supported on Universal platforms.
parent_vr_name	Specifies the parent VR that supports the VRF you are creating.

Default

If no **type** is specified, then the default is to create a user virtual router. A virtual router creates separate L3 Routing Domains.

If *parent_vr_name* parameter is not specified, the VRF will be created under the VR of the current CLI context. The default is *VR-Default*.

Usage Guidelines

All VRFs are created under default VR or a user created VR. VPN-VRFs can be created in any VR but for L3VPNs to work, VPN-VRFs should be created under a parent VR where *MPLS* is configured. There is a single namespace maintained by the configuration manager and it contains VRs and VRFs. Hence the name for a VR or a VRF must be unique in ExtremeXOS.

A VR or VRF name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 31 characters. The name must be unique among the object names on the switch, and the name is case insensitive. For information on VR and VRF name guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

When a new VR is created, by default, no ports are assigned, no *VLAN* interface is created, and no support for any routing protocols is added. A protocol process is started in the parent VR when a protocol instance is added to a VRF. If you do not specify a VR type, this command creates a user VR.

VRFs are supported as children of user VRs or VR-Default. If a *parent_vr_name* is specified when a VRF is created, the new VRF is created under that parent, provided that the parent supports VRFs. If no parent is specified, the VRF is assigned to the VR for the current VR context, or to VR-Default if the current VR context does not support VRFs.

Note
To support Layer 3 VPNs, a VPN VRF must be created under the VR that supports MPLS. The software supports MPLS on only one VR.

Starting with ExtremeXOS 22.6, you can create "local-only" virtual routers that have separate logical IP lookup tables used only for IP packets to or from the switch's local IP addresses. This feature is only applicable for ExtremeSwitching X440-G2 and X620 series switches and stacks with these switches. All other platforms support separate logical IP lookup tables in hardware, so "local-only" is not specified.

Example

The following example creates the VR "vr-acme":

```
create virtual-router vr-acme
```

The following example creates the non-VPN VRF vrf1:

```
create virtual-router vrf1 type vrf
```

The following example creates the local-only VR "vrl" (on 5320-24T/P and 5320-16P series switches only):

```
create virtual-router vr1 local-only
```

History

This command was first available in ExtremeXOS 11.0.

Support for non-VPNVRFs was added in ExtremeXOS 12.5.

Support for VPN VRFs was added in ExtremeXOS 12.6.0-BGP.

Support for L3 VPN VRFs was added in ExtremeXOS 15.3.

Support for local-only VRs was added in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create vlan

```
create vlan [ vlan_name {tag tag} | vlan_list ] {description vlan-
   description } {vr name }
```

Description

Creates a named *VLAN*.

Syntax Description

vlan_name	Specifies a VLAN name (up to 32 characters).
vlan_list	Specifies a VLAN list of IDs.
tag	Specifies a value to use as an 802.1Q tag. The valid range is from 2 to 4095.
vlan-description	Specifies a VLAN description (up to 64 characters) that appears in `show vlan` commands and can be read from the ifAlias MIB object for the VLAN.
name	Specifies a VR or virtual routing and forwarding (VRF) instance in which to create the VLAN. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document. On switches that do not support user-created VRs, all VLANs are created in *VR-Default* and cannot be moved.

Default

A VLAN named Default exists on all new or initialized Extreme switches:

- It initially contains all ports on a new or initialized switch, except for the management port(s), if there are any.
- It has an 802.1Q tag of 1.
- The default VLAN is untagged on all ports.
- It uses protocol filter any.

A VLAN named Mgmt exists on switches that have management ports:

- It initially contains the management port(s) the switch.
- It is assigned the next available internal VLANid as an 802.1Q tag.

If you do not specify the VR, the VLAN is created in the current VR.

If the VLAN description contains one or more space characters, you must enclose the complete name in double quotation marks.

Usage Guidelines

A newly-created VLAN has no member ports, is untagged, and uses protocol filter any until you configure it otherwise. Use the various configure vlan commands to configure the VLAN to your needs.

Internal VLANids are assigned automatically using the next available VLANid starting from the high end (4094) of the range.

The VLAN name can include up to 32 characters. VLAN names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. VLAN names cannot match reserved keywords. For more information on VLAN name requirements and a list of reserved keywords, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Note

If you use the same name across categories (for example, *STPD* and EAPS names), we recommend that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

VLAN names are locally significant. That is, VLAN names used on one switch are only meaningful to that switch. If another switch is connected to it, the VLAN names have no significance to the other switch.

You must use mutually exclusive names for:

- VLANs
- VMANs
- Ipv6 tunnels
- BVLANs
- SVLANs
- CVLANs

Note

The VLAN description is stored in the ifAlias MIB object.

If you do not specify a VR when you create a VLAN, the system creates that VLAN in the default VR (VR-Default). The management VLAN is always in the management VR (*VR-Mgmt*).

Once you create VRs, ExtremeXOS allows you to designate one of these as the domain in which all your subsequent configuration commands, including VLAN commands, are applied. If you create VRs, ensure that you are creating the VLANs in the desired virtual-router domain.

Note

User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.. On switches that do not support user-created VRs, all VLANs are created in VR-Default and cannot be moved.

Example

The following example creates a VLAN named accounting on the current VR:

```
create vlan accounting description "Accounting Dept"
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

The *vlan-description* option was added in ExtremeXOS 12.4.4.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create vm image

```
create vm vm_name image image_file {memory memory_size} {cpus num_cpus}
   {slot slot_ID}{vnc [none | vnc_display]}
```

Description

Creates a guest virtual machine (VM) from a disk image file.

Syntax Description

vm	Designates creating a virtual machine.
vm_name	Specifies the VM name.
image	Designates using a disk image file to create the VM.
image_file	Specifies the disk image file to use in qcow2 or any QEMU-supported (including VMDK) format.
memory	Designates specifying the amount of RAM allocated to the VM.

memory_size	Specifies the amount of RAM (in MB) allocated to the VM. The default is 4,096.
cpus	Designates specifying the number of CPUs to allocate to the VM.
num_cpus	Specifies the number of CPUs to allocate to the VM. Range is 1–2. The default is 1.
slot	Specifies assigning the VM to run on a slot.
slot_ID	Specifies the slot number that the VM will run on.
vnc	Specifies providing a display number for VNC access.
none	Disables VNC access (default).
vnc_display	Specifies the VNC screen number. Range is 0–15.

Default

The default memory size to run the VM on is 4,096 MB.

The default number of CPUs to allocate to the VM is one.

By default, VNC access is disabled.

Usage Guidelines

The disk image must be a qcow2 or any QEMU-compatible file.

If the VM storage device has not been initialized when this command is run, you are prompted to run the `clear` **`vm storage`** command to initiate partitioning, file system creation, and initialization of the file/directory structure on the device.

The Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

For the VNC display number (or screen number), you can use the values from 0 to 15. These correspond to TCP ports 5,900 to 5,915. Multiple VMs can be configured with the same VNC display, but VMs configured with the same display number cannot run at the same time. A VM cannot be started if the VNC port is already in use. For security reasons, the VNC display is only accessible using SSH tunnel. VNC cannot be configured on non-primary stack nodes.

Example

The following example creates a VM called "vm1" with disk image file "my_file" with 2,000 MB as the amount of RAM allocated to the VM:

```
# create vm vm1 image my_file memory 2000
```

History

This command was first available in ExtremeXOS 30.3.

VMDK format support was added in ExtremeXOS 30.4.

VNC capability and support for any QEMU-compatible disk was added in ExtremeXOS 30.5.

Stacking support was added in ExtremeXOS 30.6.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

create vm ova

```
create vm vm_name ova ova_file {memory memory_size} {cpus num_cpus}
   {slot slot_ID} {vnc [none | vnc_display]}
```

Description

Creates a guest virtual machine (VM) from an Open Virtual Appliance (OVA) file.

Syntax Description

vm	Designates creating a virtual machine.
vm_name	Specifies the VM name.
ova	Designates using an OVA file to create the VM.
ova_file	Specifies the OVA file to use.
memory	Designates specifying the amount of RAM allocated to the VM.
memory_size	Specifies the amount of RAM (in MB) allocated to the VM. The default is 4,096.
cpus	Designates specifying the number of CPUs to allocate to the VM.
num_cpus	Specifies the number of CPUs to allocate to the VM. Range is 1–2. The default is 1.
slot	Specifies assigning the VM to run on a slot.
slot_ID	Specifies the slot number that the VM will run on.
vnc	Specifies providing a display number for VNC access.
none	Disables VNC access (default).
vnc_display	Specifies the VNC screen number. Range is 0–15.

Default

The default memory size to run the VM on is 4,096 MB.

The default number of CPUs to allocate to the VM is one.

By default, VNC access is disabled.

Usage Guidelines

If the VM storage device has not been initialized when this command is run, you are prompted to run the `clear` **`vm storage`** command to initiate partitioning, file system creation, and initialization of the file/directory structure on the device.

Compatibility issues may occur when using third-party OVA files. The image format qcow2 is generally more reliable.

The Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

For the VNC display number (or screen number), you can use the values from 0 to 15. These correspond to TCP ports 5,900 to 5,915. Multiple VMs can be configured with the same VNC display, but VMs configured with the same display number cannot run at the same time. A VM cannot be started if the VNC port is already in use. For security reasons, the VNC display is only accessible using SSH tunnel. VNC cannot be configured on non-primary stack nodes.

Example

The following example creates a VM called "vm1" with OVA file "my_ova" with 2,000 MB as the amount of RAM allocated to the VM:

```
# create vm vm1 ova my_ova memory 2000
```

History

This command was first available in ExtremeXOS 30.3.

VNC capability was added in ExtremeXOS 30.5.

Stacking support was added in ExtremeXOS 30.6.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

create vman

`create vman [`*`vman-name`*` | `*`vman_list`*`] {`**`learning-domain`**`} {`**`vr`** *`vr_name`*`}`

Description

Creates a VMAN.

Syntax Description

`vman-name`	Specifies a VMAN name using up to 32 characters.
`vman_list`	Specifies the VMAN tag range or VMAN Tag List (Ex: 2-4 or 2,3).

learning-domain	Specifies that this VMAN is a learning domain, which supports inter-VMAN forwarding.
vr	Specifies a virtual router.
vr_name	Specifies a virtual router name. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document. On switches that do not support user-created VRs, all VLANs are created in *VR-Default* and cannot be moved.

Default

N/A.

Usage Guidelines

For information on VMAN name requirements and a list of reserved keywords, see Object Names on page 11. You must use mutually exclusive names for:

- VLANs
- VMANs
- IPv6 tunnels

The keyword learning-domain enables you to create a VMAN that serves as a learning domain for inter-VMAN forwarding.

If you do not specify the virtual router, the VMAN is created in the current virtual router. After you create the VMAN, you must configure the VMAN tag and add the ports that you want.

Example

The following example creates a VMAN named "fred":

```
create vman fred
```

History

This command was first available in ExtremeXOS 11.0.

The *vman_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create vm-tracking local-vm

```
create vm-tracking local-vm mac-address mac {name name | ipaddress
   ipaddress vpp vpp_name | vlan-tag tag {vr vr_name}}
```

Description

Creates a local VM database entry to be used for VM MAC local authentication, with optional parameters.

Syntax Description

mac	Specifies the MAC address for the VM. This must match the MAC address configured on the VM and be unique among the locally configure VM addresses.
name	Specifies a name to represent this VM in show vm-tracking command display.
ipaddress	Specifies the IP address for the VM. This must match the IP address configured on the VM.
vpp_name	Specifies the virtual port profile to apply for the local VM.
tag	*VLAN* tag between 1 and 4094.
vr_name	Virtual router name.

Default

N/A.

Usage Guidelines

A VM name can include up to 32 characters. VM names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. VM names cannot match reserved keywords. For more information on VM name requirements and a list of reserved keywords, see Object Names.

The following command creates a VM entry named VM1 in the local VM database:

```
# create vm-tracking local-vm mac-address 00:E0:2B:12:34:56 name VM1
```

The following command creates a VM entry and assigns IP address 10.10.2.2 to the entry:

```
# create vm-tracking local-vm mac-address 00:E0:2B:12:34:57 ip-address 10.10.2.2
```

The following command creates a VM entry and assigns VPP vpp1 to it:

```
# create vm-tracking local-vm mac-address 00:E0:2B:12:34:58 vpp vpp1
```

History

This command was first available in ExtremeXOS 12.5.

The ingress-vpp and egress-vpp options were replaced with the vpp option in ExtremeXOS 12.6.

The vlan-tag and vr-name options were added in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create vm-tracking vpp

```
create vm-tracking vpp vpp_name
```

Description

Creates a Local VPP (LVPP).

Syntax Description

vpp_name	Specifies a name for the new VPP.

Default

N/A.

Usage Guidelines

A VPP name can include up to 32 characters. VPP names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. VPP names cannot match reserved keywords. For more information on VPP name requirements and a list of reserved keywords, see Object Names on page 11.

Example

The following example creates a VPP named vpp1:

```
# create vm-tracking vpp vpp1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

create vpls fec-id-type pseudo-wire

```
create vpls vpls_name fec-id-type pseudo-wire pwid
```

Note

This command has been replaced with the following command: `create l2vpn [vpls vpls_name | vpwsvpws_name] fec-id-type pseudo-wire pwid` .

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Creates a VPLS instance with the specified *vpls_name*.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string). The *vpls_name* string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.
pwid	Specifies a PW ID. Must be a non-zero 32-bit value that has network-wide significance.

Default

For the VPLS dot1q tag, the default value is exclude.

Usage Guidelines

This command creates a VPLS instance with the specified *vpls_name*. Each VPLS represents a separate virtual switch instance (VSI).

The *vpls_name* parameter must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see *Object Names* in the *Switch Engine 32.2 User Guide*.

Each VPLS is a member of a single VPN and each VPN may have only one associated VPLS per switch. External to the switch, each VPN has an identifier.

Any non-zero 32-bit value that has network-wide significance can be specified for the identifier. This `pwid` is used on all pseudowires in the VPLS.

Note

The switch's LSR ID must be configured before a VPLS can be created.

Example

This example creates a VPLS with 99 as the PW ID:

```
create vpls vpls1 fec-id-type pseudo-wire 99
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

create vrrp group

```
create vrrp group group_name
```

Description

This command defines a *VRRP* group to operate in high-scale mode.

Syntax Description

group	Specifies setting up a VRRP group for high-scale mode.
group_name	Specifies the VRRP group name.

Default

None.

Example

The following example creates a VRRP group called "vrrp1".

```
create vrrp group vrrp1
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create vrrp vlan vrid

```
create vrrp vlan [vlan_name | vlan_list] vrid [vridval | vrid_list]
```

Description

Creates a *VRRP* instance on the switch.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vlan_list	VLAN list (1–4,094).
vridval	Specifies a VRID for the VRRP instance. The value can be in the range of 1-255.
vrid_list	List of virtual router IDs (1–255).

Default

N/A.

Usage Guidelines

VRRP Router IDs can be used across multiple VLANs. You can create multiple VRRP routers on different VLANs. VRRP router IDs need not be unique to a specific VLAN.

Note

The total number of supported VRRP router instances is dependent on the switch hardware. For more information, see the ExtremeXOS Release Notes.

Before configuring any VRRP router parameters, you must first create the VRRP instance on the switch. If you define VRRP parameters before creating the VRRP, you might see an error similar to the following:

```
Error: VRRP VR for vlan vrrp1, vrid 1 does not exist.
Please create the VRRP VR before assigning parameters.
Configuration failed on backup MSM, command execution aborted!
```

If this happens, create the VRRP instance and then configure its parameters.

Example

The following command creates a VRRP router on VLAN vrrp-1, with a VRRP router ID of 1:

```
create vrrp vlan vrrp-1 vrid 1
```

History

This command was first available in ExtremeXOS 10.1.

VLAN and VR list options added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

create xml-notification target url

```
create xml-notification target new-target url url {vr vr_name} {user
   [none | user]} {encrypted-auth encrypted-auth} {queue-size queue-
   size}
```

Description

Creates the Web server target in the XML client.

Syntax Description

new-target	Specifies a name for the target being created.
url	Specifies the Web server URL.
vr_name	Specifies the name of the virtual router over which the XML client process can connect to the Web server.
user	Specifies the name of the user.
encrypted-auth	Specifies the encrypted user authentication string.
queue-size	Specifies, in numeric format, the size of the buffer that stores incoming events from ExtremeXOS.

Default

N/A.

Usage Guidelines

Use this command to create the Web server target in the XML client process.

Note

You cannot enter a password in the CLI directly. It is a two-step process similar to creating a user account in ExtremeXOS.

Example

The following command creates a target target2 on http://10.255.129.22:8080/xos/webservice with a queue size of 100:

create xml-notification target target2 url http://10.255.129.22:8080/xos/webservice queue-size 100

History

This command was first available in ExtremeXOS 12.4.

The virtual router option was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete access-list

```
delete access-list dynamic_rule
```

Description

Deletes a dynamic *ACL*.

Syntax Description

dynamic_rule	Specifies the dynamic ACL name.

Default

N/A.

Usage Guidelines

This command deletes a dynamic ACL rule. Before you delete a dynamic ACL, it must be removed from any interfaces it is applied to. Use the configure access-list delete command to remove the ACL from an interface.

Example

The following command deletes the dynamic ACL icmp-echo:

```
delete access-list icmp-echo
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete access-list network-zone

```
delete access-list network-zone zone_name
```

Description

This command is used to delete a network-zone and all configurations that belong to that zone.

Syntax Description

zone_name	Network-zone name

Default

N/A.

Usage Guidelines

Use this command to delete a network-zone and all configurations belonging to that zone.

Example

```
Switch# delete access-list network-zone zone1
```

If the user tries to delete a network-zone that is bound with one or more policy files, the following error message will be displayed, and the command will be rejected.

```
Switch # delete access-list network-zone zone1
Error:  Network Zone "zone1" - Unable to delete zone. Zone has one
or more policies.
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete access-list zone

```
delete access-list zone name
```

Description

Deletes an *ACL* zone.

Syntax Description

name	Specifies the zone name.

Default

N/A.

Usage Guidelines

This command deletes an ACL zone. You must remove all applications from a zone before you can delete the zone. To delete an application from a zone, use the command configure access-list zone *name* delete application *appl-name* .

You cannot delete the default zones.

Example

The following command deletes the zone my_zone:

```
delete access-list zone my_zone
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete account

```
delete account name
```

Description

Deletes a specified user account.

Syntax Description

name	Specifies a user account name.

Default

N/A.

Usage Guidelines

Use the show accounts command to determine which account you want to delete from the system.

The show accounts output displays the following information in a tabular format:

- The user name.
- Access information associated with each user.
- User login information.
- Session information.

Depending on the software version running on your switch and the type of switch you have, additional account information may be displayed.

You must have administrator privileges to delete a user account. The system must have one administrator account; the command will fail if an attempt is made to delete the last administrator account on the system.

To ensure security, change the password on the default account, but do not delete it. The changed password will remain intact through configuration uploads and downloads.

If you must delete the default account, first create another administrator-level account.

Example

The following command deletes account John2:

```
delete account John2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete auto-peering

```
delete auto-peering
```

Description

This command deletes auto-peering (either OSPF or BGP), removing all of the auto-peering configuration. This command deletes the VLAN list, loopback, and *BGP* configuration created with enabling auto-peering.

Syntax Description

This command has no arguments or variables.

Default

N/A

Usage Guidelines

Important

Deleting auto-peering when executed on a large leaf-spine topology causes massive change in the network with many route withdrawals and updates.

Example

The following example deletes auto-peering:

```
# delete auto-peering
```

History

This command was first available in ExtremeXOS 22.5.

Ability to delete OSPFv2 Auto-peering was added in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

This feature requires the Advanced Edge license. For more information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

delete bgp evpn instance

`delete` **`bgp evpn instance`** *`evpn_instance_name`*

Description

Deletes an EVPN instance.

Syntax Description

bgp	BGP capability.
evpn	EVPN protocol.
instance	Specifies deleting an EVPN instance.
evpn_instance_name	Name of the EVPN instance.

Default

N/A.

Example

The following example deletes an EVPN instance named "my_evpn":

```
# delete bgp evpn instance my_evpn
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

delete bgp neighbor

`delete bgp neighbor [`*`remoteaddr`*` | `**`all`**`]`

Description

Deletes one or all *BGP* neighbors.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of the BGP neighbor to be deleted.
all	Specifies all IPv4 and IPv6 neighbors.

Default

N/A.

Usage Guidelines

You can use global unicast remote addresses to delete all BGP peer types. You can use link-local remote address to delete only EBGP single-hop peers.

Example

The following command deletes the specified IPv4 BGP neighbor:

```
delete bgp neighbor 192.168.1.17
```

The following command deletes the specified IPv6 BGP neighbor:

```
delete bgp neighbor fe80::204:96ff:fe1e:a8f1%vlan1
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete bgp peer-group

```
delete bgp peer-group peer-group-name
```

Description

Deletes a peer group.

Syntax Description

peer-group-name	Specifies a peer group.

Default

N/A.

Usage Guidelines

Use this command to delete a specific *BGP* peer group.

Example

The following command deletes the peer group named outer:

```
delete bgp peer-group outer
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete cfm domain

```
delete cfm domain domain
```

Description

Deletes the specified maintenance domain (MD) from the switch, as well as all configuration setting related to this MD.

Syntax Description

domain	Enter the name of the domain you want to delete.

Default

N/A.

Usage Guidelines

This command deletes all configuration settings related to the domain—for example, all MAs, MIPs, and MEPs—as well as the domain itself.

Example

The following command deletes the domain atlanta (as well as all settings related to this domain):

```
delete cfm domain atlanta
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete cfm segment

```
delete cfm segment [segment_name | all]
```

Description

Deletes one or all CFM segments.

Syntax Description

segment_name	An alpha-numeric string identifying the segment name.
all	Specifies all CFM segments.

Default

N/A.

Usage Guidelines

Use this command to delete one or all CFM segments.

Example

The following example deletes the CFM segment "segment-new":

```
delete cfm segment segment-new
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete database

`delete` **`database`** *database_name*

Description

Deletes an Automation Edge remote *VXLAN* network identifier (VNI)-device database.

Syntax Description

database	Deletes a remote VNI-database.
database_name	Specifies the name of the database to delete.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example deletes a database called "database1":

```
# delete database database1
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

delete eaps shared-port

```
delete eaps shared-port ports
```

Description

Deletes an *EAPS* shared port on a switch.

Syntax Description

ports	Specifies the port number of the Common Link port.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes shared port 1:1.

```
delete eaps shared-port 1:1
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete eaps

```
delete eaps name
```

Description

Deletes the *EAPS* domain with the specified name.

Syntax Description

name	Specifies the name of an EAPS domain to be deleted.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes EAPS domain eaps_1:

```
delete eaps eaps_1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete erps

```
delete erps ring-name
```

Description

Deletes an *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to delete an ERPS ring.

Example

The following command deletes an ERPS ring named “ring1”:

```
delete erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

delete esrp

`delete esrp` *esrpDomain*

Description

Deletes the *ESRP* domain with the specified name.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain to be deleted.

Default

N/A.

Usage Guidelines

You must first disable an ESRP domain before you delete it. To disable an ESRP domain, use the `disable esrp` command.

You do not have to remove the master or member VLANs from an ESRP domain before you delete it. When you delete an ESRP domain, All VLANs are automatically removed from the domain.

For ESRP domains configured of type VPLS-redundancy, you need to unconfigure all associated VPLS instances from the ESRP domain using the unconfigure vpls redundancy command before deleting the domain.

Example

The following command deletes ESRP domain esrp1 from the switch:

```
delete esrp esrp1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete fdb mac-tracking entry

```
delete fdb mac-tracking entry [mac_addr | all]
```

Description

Deletes a MAC address from the MAC address tracking table.

Syntax Description

mac_addr	Specifies a device MAC address, using colon-separated bytes.
all	Specifies that all MAC addresses are to be deleted from the MAC address tracking table.

Default

The MAC address tracking table is empty.

Usage Guidelines

None.

Example

The following example deletes a MAC address from the MAC address tracking table:

```
delete fdb mac-tracking entry 00:E0:2B:12:34:56
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete fdb

```
delete fdb [all | mac_address [vlan vlan_name ] |vxlan { vr vr_name }
   {ipaddress} remote_ipaddress ] | broadcast vlan vlan_name vxlan
   { vr vr_name } {ipaddress} remote_ipaddress | unknown-multicast
   vlan vlan_name vxlan { vr vr_name } {ipaddress} remote_ipaddress
   | unknown-unicast vlan vlan_name vxlan { vr vr_name } {ipaddress}
   remote_ipaddress ]
```

Description

Deletes one or all permanent *FDB* entries.

Syntax Description

all	Specifies all FDB entries.
mac_address	Specifies a device MAC address, using colon-separated bytes.
vlan_name	Specifies the specific *VLAN* name.
broadcast	Forwarding destination(s) for broadcast traffic.
unknown-unicast	Forwarding destination(s) for unknown unicast traffic.
unknown-unicast	Forwarding destination(s) for unknown multicast traffic.
vxlan	The MAC address is reachable through a VXLAN Tunnel.
vr	VR/VRF instance the IPv4 address is configured on.
vr_name	An existing VR/VRF name.
ipaddress	Configure the IP address of the remote tunnel endpoint to which the MAC needs to be bound.
remote_ipaddress	IPv4 address of the remote tunnel endpoint.

Default

N/A.

Usage Guidelines

In ExtremeXOS 21.1, this command was extended to delete a remote VTEP as a destination to a MAC address. Three new tokens “broadcast”, “unknown-multicast” and “unknown-unicast” have been added to this command. When you want to specify a destination to forward all broadcast or unknown unicast traffic on that VLAN, these token are used. For “broadcast”, “unknown-multicast” and “unknown-unicast” only remote VTEPs (and not port_list or blackhole) can be specified in this release of ExtremeXOS. These entries can only be created when the virtual-network is in explicit-remote flooding mode.

Example

The following example deletes a permanent entry from the FDB:

```
delete fdb 00:E0:2B:12:34:56 vlan marketing
```

The following example deletes all permanent entries from the FDB:

```
delete fdb all
```

History

This command was first available in ExtremeXOS 11.0.

In ExtremeXOS 12.3, the **fdb** keyword was introduced as an alias to the **fdbentry** keyword to avoid interference with the syntax of the MAC-Tracking feature commands. Both keywords execute; however, the syntax helper (tab completion) does not recognize the **fdbentry** keyword.

Three new tokens “broadcast”, “unknown-multicast” and “unknown-unicast” were added to this command in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete flow-redirect

```
delete flow-redirect flow_redirect_name
```

Description

Deletes the named flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.

Default

N/A.

Usage Guidelines

Use this command to delete a named flow-redirection policy. Before it can be deleted, all nexthop information must be deleted, otherwise an error message is displayed.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! delete flowmon collector

```
delete flowmon collector collector_name
```

Description

Deletes a Flow Monitor collector.

Syntax Description

collector	Specifies to send flow information to a collector.
collector_name	Specifies the name of the created collector. Range is 32 characters.

Default

N/A.

Usage Guidelines

The system will reject any attempt to delete a collector that does not exist.

Example

The following command deletes a collector with the name 'src-ipv4-address':

```
# delete flowmon collector src-ipv4-address
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! delete flowmon group

```
delete flowmon group group_name
```

Description

Deletes a Flow Monitor group.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.

Default

N/A.

Usage Guidelines

An enabled group can't be deleted and the system will reject any attempt to do so. Groups must be disabled before deleting.

The system will also reject any attempt to delete a group that does not already exist.

Example

The following command deletes a group with the name 'max-flow-age':

```
# delete flowmon group max-flow-age
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! delete flowmon key

```
delete flowmon key key_name
```

Description

Deletes a Flow Monitor key.

Syntax Description

key	Specifies the Flow Monitor key.
key_name	Specifies the assigned name of the Flow Monitor key. Range is 32 characters.

Default

N/A.

Usage Guidelines

If a key has been added to a group and the delete command is used, the key is automatically deleted from the group. The related template key is disassociated and only deleted when there are no more keys or groups referencing it.

The system will reject any attempt to delete a key that does not already exist.

Example

The following command deletes a key with the name 'src-ipv4-addr':

```
# delete flowmon key src-ipv4-addr
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

delete identity-management role

```
delete identity-management role {role_name | all}
```

Description

Deletes one or all roles.

Syntax Description

role_name	Specifies a name of an existing role to delete.
all	Specifies that all roles are to be deleted.

Default

N/A.

Usage Guidelines

Any policy applied to users of a deleted role gets reverted. The users are placed under one of the other roles based on their attributes. Parent and child relationships to other roles are also deleted. For example, all child roles under the deleted role become orphans and hence they and their descendants no longer inherit the policies of the deleted role.

Example

The following example deletes the role named India-Engr:

```
* Switch.99 # delete identity-management role "India-Engr"
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete ip nat rule

`delete` **`ip nat rule`** *`rule_name`*

Description

Deletes an IP Network Address Translation (NAT) rule.

Syntax Description

`ip`	Specifies Internet Protocol (IP).
`nat`	Specifies NAT.
`rule`	Specifies deleting a NAT rule.
`rule_name`	Specifies the NAT rule name to delete.

Default

N/A.

Usage Guidelines

To create a rule, run the command `create` **`ip nat rule`** *`rule_name`* **`type`** [**`source-nat`** | **`napt`** | **`destination-napt`**].

Example

The following example deletes the NAT rule named "rule1"

```
# delete ip nat rule rule1
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

delete isis area

`delete isis area [`**`all`** | *`area_name`*]

Description

This command disables and deletes the specified IS-IS router process in the current virtual router.

Syntax Description

`all`	Deletes all IS-IS router processes.
`area_name`	Specifies the name of the IS-IS router process to be deleted.

Default

None.

Usage Guidelines

All configuration for the specified router is lost. All routes learned from this router process are purged from the routing tables.

Example

The following command deletes the IS-IS process named areax:

```
delete isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

delete keychain

```
delete keychain keychain_name
```

Description

This command deletes a keychain.

Syntax Description

keychain_name	Defines a name for the keychain. The range is 1-31.

Default

N/A.

Usage Guidelines

Use this command to delete a key from the keychain.

Example

The following command deletes a keychain:

```
delete keychain ospfv3-keys
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete l2pt profile

```
delete l2pt profile profile_name
```

Description

Deletes an L2PT profile.

Syntax Description

l2pt	Deletes a Layer 2 protocol tunneling profile.
profile	Profile that defines L2PT configuration for L2 protocols.
profile_name	Specifies a profile name (maximum 32 characters).

Default

Disabled.

Usage Guidelines

Use this command to delete an L2PT profile.

Example

The following example deletes *my_l2pt_prof* that is currently in use by a service:

```
delete l2pt profile my_l2pt_prof
```

The following example deletes *my_l2pt_prof* that is not associated with any service:

```
delete l2pt profile my_l2pt_prof
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete l2vpn

```
delete l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]]
```

Description

Deletes the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

N/A.

Usage Guidelines

All PWs established to VPLS or VPWS peers are terminated.

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4 and is required when deleting a VPWS. For backward compatibility, the **l2vpn** keyword is optional when deleting a VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

This commands deletes the VPLS myvpls:

```
delete vpls myvpls
```

This commands deletes the VPWS myvpws:

```
delete l2vpn vpws myvpws
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

delete ldap domain

```
delete ldap domain [domain_name | all]
```

Description

This command is used to delete one or all LDAP domains.

When an LDAP domain is deleted, all LDAP servers added under that domain are also deleted. Also all LDAP configurations done for that domain are deleted.

Syntax Description

domain_name	Name of the LDAP domain that wil be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete one or all LDAP domains.

When an LDAP domain is deleted, all LDAP servers added under that domain are also deleted. All LDAP configurations for that domain are also deleted.

Example

This command deletes the LDAP domain sales.XYZCorp.com

```
delete ldap domain sales.XYZCorp.com
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete log filter

`delete log filter [`*`filter-name`* `|` **`all`**`]`

Deletes a log filter with the specified name.

Syntax Description

filter-name	Specifies the filter to delete.
all	Specifies that all filters, except DefaultFilter, are to be deleted

Default

N/A.

Usage Guidelines

This command deletes the specified filter, or all filters except for the filter DefaultFilter. The specified filter must not be associated with a target. To remove that association, associate the target with DefaultFilter instead of the filter to be deleted, using the following command:

`configure log target` *`target`* `filter DefaultFilter`

Example

The following command deletes the filter named fdb2:

```
delete log filter fdb2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete log target upm

`delete log target upm {`*`upm_profile_name`*`}`

Description

Deletes the specified UPM log target.

Syntax Description

upm_profile_name	Specifies the name of the UPM log target to be deleted.

Default

N/A.

Usage Guidelines

This command deletes the log target and any configurations applied to that target. To disable a target and retain the target configuration, use the following command:

`disable log target upm {`*`upm_profile_name`*`}`.

Example

The following command deletes the UPM log target testprofile1:

```
delete log target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete log target xml-notification

```
delete log target xml-notification xml_target_name
```

Description

Deletes a Web server target.

Syntax Description

xml_target_name	Specifies the name of the xml notification target.

Default

N/A.

Usage Guidelines

Use this command to delete a Web server target.

Example

The following command deleted the Web server target target2:

```
delete log target xml-notification target2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete macsec connectivity-association

```
delete macsec connectivity-association ca_name
```

Description

Deletes a previously created connectivity-association (CA) object that holds MAC Security (MACsec) key authentication data.

Syntax Description

connectivity-association	Secures connectivity provided between MACsec stations.
ca_name	Selects the CA to delete.

Default

N/A.

Usage Guidelines

Prior to deletion, ports assigned to the CA must be removed with the `configure macsec` **connectivity-association** *ca_name* [**pre-shared-key** {**ckn** *ckn*} {**cak** [**encrypted** *encrypted_cak*] | *cak*} | **ports** [*port_list*] [**enable** | **disable**]] command using the **disable** option.

Example

The following example deletes the CA "testca":

```
# delete macsec connectivity-association testca
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

delete meter

```
delete meter meter-name
```

Description

Deletes a meter.

Syntax Description

meter-name	Specifies the meter name.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the meter maximum_bandwidth:

```
delete meter maximum_bandwidth
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete mirror name

```
delete mirror mirror_name {control_index} | all]
```

Description

Deletes a user-defined mirroring instance, and unconfigures the "DefaultMirror" instance.

Syntax Description

mirror_name	Specifies a specific mirror name to delete.
control_index	Mirror destination control index (1–4). Also know as: etsysMirrorDestinationControlIndex. Each comprises a group of mirror names.
all	Specifies that you delete all named mirror instances.

Default

Disabled.

Usage Guidelines

Use this command to delete a user-defined mirroring instance and unconfigure the "DefaultMirror" instance. Mirroring instances must be in the "disabled" state in order to be deleted. The `all` command will fail if any mirroring instance is in the "enabled" state.

Example

The following example deletes all mirroring instances:

```
delete mirror all
```

History

This command was first available in ExtremeXOS 15.3.

Variable **control_index** to support policy-based mirrors was added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete mlag peer

```
delete mlag peer peer_name
```

Description

Deletes a peer switch from the structure.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.

Default

N/A.

Usage Guidelines

This command deletes an MLAG peer switch from the association structure.

Before you delete an MLAG peer switch, you must disable it. If it is not disabled, the following error message is displayed:

```
ERROR: MLAG ports currently associated with peer. First disable MLAG
ports using "disable mlag port <port>" before deleting MLAG peer
```

Example

The following command deletes a peer switch structure switch101:

```
# delete mlag peer switch101
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete mpls rsvp-te lsp

```
delete mpls rsvp-te lsp [lsp_name | all]
```

Description

Deletes internal resources for the specified RSVP-TE LSP.

Syntax Description

lsp_name	Specifies the LSP within the switch to be deleted.
all	Deletes all RSVP-TE configured LSPs.

Default

N/A.

Usage Guidelines

This command deletes internal resources for the specified RSVP-TE LSP. The LSP is first withdrawn if it is currently active. Deleting an LSP may cause a PW to fail. Any static routes configured to a deleted LSP are also removed.

Example

The following command deletes the configured RSVP-TE LSP named lsp598:

```
delete mpls rsvp-te lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

delete mpls rsvp-te path

```
delete mpls rsvp-te path [path_name | all]
```

Description

Deletes a configured RSVP-TE routed path with the specified path name.

Syntax Description

path_name	Specifies a path within the switch to be deleted.
all	Deletes all paths not associated with an LSP.

Default

N/A.

Usage Guidelines

This command deletes a configured RSVP-TE routed path with the specified name. All associated configuration information for the specified path is deleted. If the all keyword is specified, all paths not associated with an LSP are deleted.

Note
A path cannot be deleted as long as the path name is associated with an LSP.

Example

The following command deletes the configured RSVP-TE path named path598:

```
delete mpls rsvp-te path path598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

delete mpls rsvp-te profile

```
delete mpls rsvp-te profile [profile_name | all]
```

Description

Deletes a configured RSVP-TE profile with the specified profile name.

Syntax Description

profile_name	Specifies a configured RSVP-TE profile to be deleted.
all	Deletes all profiles not associated with an LSP, except the default profile.

Default

N/A.

Usage Guidelines

This command deletes a configured RSVP-TE profile with the specified profile name. If the all keyword is specified, all profiles not associated with an LSP are deleted (except for the default profile).

Note
A profile cannot be deleted as long as the profile name is associated with a configured LSP. The **default** profile cannot be deleted.

Example

The following command deletes the configured RSVP-TE profile named prof598:

```
delete mpls rsvp-te profile prof598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

delete mpls static lsp

```
delete mpls static lsp [lsp_name | all]
```

Description

Deletes internal resources for one or all static LSPs.

Syntax Description

lsp_name	Identifies the LSP to be deleted.
all	Specifies that all LSPs are to be deleted.

Default

N/A.

Usage Guidelines

All resources associated with the specified LSPs are released. Static LSPs cannot be deleted when the LSP is configured for an IP route or VPLS configuration.

Example

The following command deletes a static LSP:

```
delete mpls static lsp lsp598
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

delete msdp mesh-group

```
delete msdp mesh-group mesh-group-name {vr vrname}
```

Description

Removes an *MSDP* mesh-group.

Syntax Description

mesh-group-name	Specifies the name of the MSDP mesh-group. The character string can be a maximum of 31 characters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

A mesh-group is a group of MSDP peers with fully meshed MSDP connectivity. Mesh-groups are used to achieve two goals:

- Reduce SA message flooding.
- Simplify peer-RPF flooding.

SA messages received from a peer in a mesh-group are not forwarded to other peers in the same mesh-group.

Use the delete msdp mesh-group command only if you created a mesh-group that you want to remove. By default, there is no MSDP mesh-group.

Example

The following example removes a mesh-group called "verizon":

```
delete msdp mesh-group verizon
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete msdp peer

```
delete msdp peer [all | remoteaddr] {vr vr_name}
```

Description

Deletes an *MSDP* peer.

Syntax Description

all	Deletes all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP router to configure as an MSDP peer.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes an MSDP peer:

```
delete msdp peer 192.168.45.43
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete netlogin local-user

```
delete netlogin local-user user-name
```

Description

Deletes a specified local network login user name and its associated password.

Syntax Description

user-name	Specifies a local network login user name.

Default

N/A.

Usage Guidelines

Use the `show netlogin local-users` command to determine which local network login user name you want to delete from the system. The `show netlogin local-users` output displays the user name and password in a tabular format.

This command applies only to web-based and MAC-based modes of network login. 802.1X network login does not support local database authentication.

You must have administrator privileges to use this command.

Example

The following command deletes the local network login megtest along with its associated password:

```
delete netlogin local-user megtest
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete ntp key

```
delete ntp key [keyid | all]
```

Description

Deletes an NTP key; it cannot be used for outgoing or incoming NTP sessions.

Syntax Description

keyid	Specifies the key ID as a value from 1 to 65534.
all	Deletes all keys.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command deletes NTP key 5 on the switch:

```
delete ntp key 5
```

The following command deletes all NTP keys on the switch:

```
delete ntp key all
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete ospf area

```
delete ospf area [area-identifier | all]
```

Description

Deletes an *OSPF* area or all OSPF areas.

Syntax Description

area-identifier	Specifies an OSPF area.
all	Specifies all areas.

Default

N/A.

Usage Guidelines

An OSPF area cannot be deleted if it has an associated interface. Also, area 0.0.0.0 cannot be deleted.

Example

The following command deletes an OSPF area:

```
delete ospf area 1.2.3.4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

delete ospfv3 area

```
delete ospfv3 area [area_identifier | all]
```

Description

Deletes an *OSPFv3* area or all OSPFv3 areas.

Syntax Description

area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
all	Specifies all areas.

Default

N/A.

Usage Guidelines

An OSPFv3 area cannot be deleted if it has an associated interface. Also, area 0.0.0.0 cannot be deleted.

Example

The following command deletes an OSPFv3 area:

```
delete ospfv3 area 1.2.3.4
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

delete policy access-list

delete policy **access-list** [**all-rules** | *list_dot_rule*]

Description

Deletes previously created access list and their rules.

Syntax Description

access-list	Configures access list rule model.
all-rules	Deletes all access lists and their rules.
list_dot_rule	Defines the access list name with optional rule name in the format *list_name.rule_name*.

Default

N/A.

Usage Guidelines

You can remove a specific rule or remove all the rules from an access list, or remove all access lists and their rules.

Example

The following example deletes the access list rule"ACL1.rule1":

```
# delete policy access-list ACL1.ace2
```

The following example deletes the access list "ACE":

```
# delete policy access-list ACE
```

The following example deletes all access lists and their rules:

```
# delete policy access-list all-rules
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete policy access-list action-set

`delete policy` **`access-list action-set`** *`set-id`*

Description

Deletes a pre-defined action set.

Syntax Description

`access-list`	Specifies access-list features.
`action-set`	Specifies deleting an action set, which is a defined a set of actions that can be applied to multiple sets of match conditions.
`set-id`	Specifies which action set to delete by its global action set ID.

Default

N/A.

Example

The following example deletes action set "1":

```
# delete policy access-list action-set 1
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete ports group

```
delete ports group port_group
```

Description

This command deletes a generic port-group name that can be associated with a list of ports. The *port_group* option could be implemented in configure or show commands that currently accept a *port_list*. The *QoS* commands are expanded to accept the *port_group* option. QoS commands that use port groups are updated automatically if the ports group is removed or if ports are added or removed from the group.

Syntax Description

port_group	Specifies a port group name.

Default

N/A.

Usage Guidelines

Use this command to delete a generic port-group name associated with a list of ports.

Example

```
delete port-group testGroup
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete private-vlan

```
delete private-vlan name
```

Description

Deletes the PVLAN framework with the specified name.

Syntax Description

name	Specifies the name of the PVLAN to be deleted.

Default

N/A.

Usage Guidelines

The PVLAN is a framework that links network and subscriber *VLAN*s; it is not an actual VLAN.

This command deletes the PVLAN framework, but it does not delete the associated VLANs. If the ports in the network VLAN were set to translate, they are changed to tagged.

Example

The following example deletes the PVLAN named "companyx":

```
delete private-vlan companyx
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

delete process

```
delete process
```

Description

This command provides the ability for an end-user to delete dynamically-created processes.

Syntax Description

This command has no arguments or variables.

Default

N/A

Usage Guidelines

Use this command to delete dynamically-created processes only.

History

This command was first available in ExtremeXOS 15.7..

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete protocol

```
delete protocol {filter} filter_name
```

Description

Deletes a user-defined protocol.

Syntax Description

filter	Deletes a protocol filter.
filter_name	Specifies a protocol filter name to delete.

Default

N/A.

Usage Guidelines

If you delete a protocol that is in use by a *VLAN*, the protocol associated with than VLAN becomes none.

Example

The following examples delete a protocol named "my_filter" and a protocol filter named "my_other_filter":

```
delete protocol "my_filter"
delete protocol filter "my_other_filter"
```

History

This command was first available in ExtremeXOS 10.1.

The **filter** keyword was added in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete qosprofile

```
delete qosprofile [QP2| QP3 | QP4 | QP5 | QP6 | QP7]
```

Description

Deletes a user-created *QoS* profile.

Syntax Description

QP2....QP7	Specifies the user-created QoS profile you want to delete.

Default

N/A.

Usage Guidelines

You cannot delete the default QoS profiles of QP1 and QP8. On a SummitStack, you also cannot delete QoS profile QP7. If you attempt to delete QoS profile QP7, the system returns an error.

All configuration information associated with the specified QoS profile is removed.

Example

The following command deletes the user-created QoS profile QP3:

```
delete qosprofile qp3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete sshd2 user-key

```
delete sshd2 user-key key_name
```

Description

Deletes a user key.

Syntax Description

key_name	Specifies the name of the public key to be deleted.

Default

N/A.

Usage Guidelines

This command is used to delete a user key. The key is deleted regardless of whether or not it is bound to a user.

Note

If a user is bound to the key, they are first unbound or unassociated, and then the key is deleted.

Example

The following example shows the SSH user key id_dsa_2048 being deleted:

```
delete sshd2 user-key id_dsa_2048
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete stpd

```
delete stpd stpd_name
```

Description

Removes a user-defined *STPD* from the switch.

Syntax Description

stpd_name	Specifies a user-defined STPD name on the switch.

Default

N/A.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If you do not specify the stpd keyword, an error message similar to the following is displayed:

```
%% Ambiguous command: "delete Test"
```

In this example, to delete the STPD Test, enter delete stpd Test.

If you created an STPD with a name unique only to that STPD, the keyword stpd is optional.

The default STPD, s0, cannot be deleted.

In an *MSTP* environment, you cannot delete or disable a CIST if any of the MSTIs are active in the system.

Example

The following example deletes an STPD named "purple_st":

```
delete stpd purple_st
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete tunnel

```
delete tunnel tunnel_name
```

Description

Deletes an IPv6 tunnel.

Syntax Description

tunnel_name	Specifies an IPv6 tunnel.

Default

N/A.

Usage Guidelines

This command will destroy a previously created tunnel. The command acts on either a 6to4 or a 6in4 tunnel. When the tunnel interface is removed, all dynamic routes through that interface are purged from the system. The configured static routes are removed from the hardware tables and become inactive.

Example

The following example deletes the tunnel link39:

```
delete tunnel link39
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in the *Switch Engine 32.2 Feature License Requirements* document.

delete upm profile

`delete upm profile` *`profile-name`*

Description

Deletes the specified profile.

Syntax Description

`profile-name`	Specifies the UPM profile to be deleted.

Default

N/A.

Example

The following command deletes a UPM profile called sample_1:

```
delete upm profile sample_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete upm timer

```
delete upm timer timer-name
```

Description

Deletes the specified UPM timer.

Syntax Description

timer-name	Specifies the name of the UPM timer to be deleted.

Default

N/A.

Usage Guidelines

You can delete a UPM timer by specifying its name.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete var

```
delete var varname
```

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: `enable cli scripting {permanent}`.

Description

Deletes a variable.

Syntax Description

varname	Specifies the name of the scripting variable to be deleted.

Default

N/A.

Usage Guidelines

The format of a local variable (case insensitive) is: $VARNAME.

Example

The following example deletes local variable x:

```
delete var x
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete var key

`delete var key` *key*

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: `enable cli scripting {permanent}`.

Description

Deletes the variables that have been saved using a key.

Syntax Description

key	Specifies that variables associated with the specified key must be deleted.

Default

N/A.

Usage Guidelines

CLI scripting must be enabled to use this command. The user is responsible for generating unique keys for each variable. The system has a limited amount of memory to store these variables.

Example

The following command deletes all variables associated with the key “red:”

```
delete var key red
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete virtual-network

delete **virtual-network** *vn_name*

Description

This command deletes a virtual network.

Syntax Description

virtual-network	Designates deleting a virtual network.
vn_name	Specifies which virtual network.

Default

N/A.

Example

The following example deletes the virtual network "my_virtual_network":

```
delete virtual-network my_virtual_network
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete virtual-network remote-endpoint vxlan ipaddress

```
delete virtual-network remote-endpoint vxlan ipaddress ipaddress {vr
   vr_name}
```

Description

This command deletes a remote endpoint.

Syntax Description

ipaddress	A remote endpoint IP address.
vr	VR/VRF instance the remote endpoint is associated with
vr_name	An existing VR/VRF name.

Default

N/A.

Usage Guidelines

This command is useful when user wants to delete a remote endpoint in addition to the ones learned dynamically (*OSPF* extensions).

Example

To remove a remote endpoint:

```
delete virtual-network vxlan remote-endpoint ipaddress 1.2.3.4
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete virtual-router

```
delete virtual-router vr-name
```

Description

This command deletes a VR or VRF.

Syntax Description

vr-name	Specifies the name of the VR or VRF.

Default

N/A.

Usage Guidelines

Only user VRs and VRFs can be deleted.

Before you delete a user VR, you must delete all VLANs and protocols assigned to the VR, and you must delete any child VRFs. All of the ports assigned to a deleted VR are made available to assign to other VRs.

Before you delete a VRF, you must delete all VLANs and stop all protocols that are assigned to that VRF. All of the ports assigned to a deleted VRF are deleted and made available to assign to other VRs and VRFs. Any routing protocol instance that is assigned to the VRF is deleted gracefully.

Example

The following example deletes the VR "vr-acme":

```
delete virtual-router vr-acme
```

The following example deletes the VRF "vrf1":

```
delete virtual-router vrf1
```

History

This command was first available in ExtremeXOS 11.0.

Support for non-VPNVRFs was added in ExtremeXOS 12.5.

Support for VPN VRFs was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete vlan

```
delete [ {vlan} vlan_name | vlan vlan_list]
```

Description

Deletes a *VLAN*.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.

Default

N/A.

Usage Guidelines

If you delete a VLAN that has untagged port members and you want those ports to be returned to the default VLAN, you must add them back explicitly using the `configure svlan delete ports` command.

Note
The default VLAN cannot be deleted. Before deleting an ISC VLAN, you must delete the peer.

Example

The following command deletes the VLAN accounting:

```
delete accounting
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete vman

```
delete vman [vman-name | vman_list]
```

Description

Deletes a previously created VMAN.

Syntax Description

vman-name	Specifies a VMAN name.
vman_list	Specifies a VMAN list.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the VMAN accounting:

```
delete vman accounting
```

History

This command was first available in ExtremeXOS 11.0.

The *vman_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete vm

delete vm *vm_name*

Description

Deletes an existing virtual machine (VM).

Syntax Description

vm	Designates a virtual machine.
vm_name	Specifies the VM name to delete.

Default

N/A.

Usage Guidelines

The Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

Example

The following example deletes the vm "vm1":

```
# delete vm vm1
```

History

This command was first available in ExtremeXOS 30.3.

Stop the VM before attempting to delete it (`stop` **`vm`** *`vm_name`* [**`forceful`** | **`graceful`**]).

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

delete vm-tracking local-vm

`delete vm-tracking local-vm {`**`mac-address`** *`mac`*`}`

Description

Deletes the specified VM entry in the local VM database.

Syntax Description

mac	Specifies the MAC address for a VM entry to delete.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the VM entry for MAC address 00:E0:2B:12:34:56 in the local VM database:

```
# delete vm-tracking local-vm mac-address 00:E0:2B:12:34:56
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete vm-tracking vpp

```
delete vm-tracking vpp {vpp_name}
```

Description

Deletes the specified LVPP.

Syntax Description

vpp_name	Specifies a name for the LVPP to delete.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the VPP named vpp1:

```
# delete vm-tracking vpp vpp1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

delete vpls

```
delete vpls [vpls_name | all]
```

Note

This command has been replaced with the following command: `delete l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]]`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Deletes the VPLS with the specified *vpls_name*.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
all	Specifies all VPLS.

Default

N/A.

Usage Guidelines

This command deletes the VPLS with the specified *vpls_name*. All PWs established to VPLS peers are terminated. The **all** keyword may be used to indicate that all VPLS instances are to be deleted.

Example

This commands deletes the VPLS myvpls:

```
delete vpls myvpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

delete vrrp group

```
delete vrrp group group_name
```

Description

This command deletes a *VRRP* group used to operate in high-scale mode.

Syntax Description

group	Specifies deleting a VRRP group.
group_name	Specifies the VRRP group name.

Default

None.

Example

The following example deletes a VRRP group called "vrrp1".

```
delete vrrp group vrrp1
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete vrrp vlan vrid

```
delete vrrp vlan vlan_name vrid vridval
```

Description

Deletes a specified *VRRP* instance.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the VRRP instance on the VLAN vrrp-1 identified by VRID 2:

```
delete vrrp vlan vrrp-1 vrid 2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

delete xml-notification target

`delete xml-notification target` *`target`*

Description

Deletes the Web server target on the XML client process.

Syntax Description

target	Specifies the configured target.

Default

N/A.

Usage Guidelines

Use this command to delete the Web server target on the XML client process.

Example

The following command deletes the target test2:

```
delete xml-notification target test2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable access-list permit to-cpu

```
disable access-list permit to-cpu
```

Description

Allows special packets to be blocked by low priority *ACL*s.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command allows ACLs to deny certain special packets from reaching the CPU, even if the packets match ACLs that would otherwise deny them. The special packets include *STP* and *EAPS* BPDUs, and ARP replies for the switch.

When this feature is disabled, these same packets will be denied if an ACL is applied that contains a matching entry that denies the packets. Contrary to expectations, the packets will still be denied if there is a higher precedence entry that permits the packets.

To enable this feature, use the following command:

```
enable access-list permit to-cpu
```

Example

The following example enables ACLs to deny STP BPDU packets from reaching the switch CPU:

```
disable access-list permit to-cpu
```

History

This command was first available in ExtremeXOS 11.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable access-list refresh blackhole

```
disable access-list refresh blackhole
```

Description

Disables blackholing of packets during *ACL* refresh.

Syntax Description

This command has no arguments or variables.

Default

The feature is enabled.

Usage Guidelines

When access control lists (ACLs) are refreshed, this feature provides that any packets arriving during the refresh will be blackholed.

If you disable this feature, the ACLs will be refreshed as described in the refresh policy command.

To enable this feature, use the following command:

```
enable access-list refresh blackhole
```

Example

The following command disables dropping of packets during an ACL refresh:

```
disable access-list refresh blackhole
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable account

```
disable account [all {admin|user | name]
```

Description

Disables the specified account locally.

Syntax Description

all	Specifies that all accounts, or all accounts of a certain type, will be disable.
admin	Specifies that all administrative accounts will be disabled locally.
user	Specifies that all user accounts, including Lawful-Intercept accounts, will be disabled locally.
name	Specifies the name of the account that will be disabled locally.

Default

Enabled.

Usage Guidelines

If the user is disabled locally, the user's login will fail.

Disabling accounts affects the following northbound interfaces:

- Console
- TELNET
- SSH
- HTTP
- XML

If you disable all administrative accounts, you can use the failsafe account.

Example

The following example disables all user accounts.

```
disable account all user
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable auto-provision

```
disable auto-provision
```

Description

Disables the auto provision capability.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to disable the auto provision capability.

To display the status of auto provision on the switch, use the `show auto-provision` command.

Example

The following command disables the auto provision capability:

```
disable auto-provision
```

The following message is displayed:

```
# disable auto-provision
This setting will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable avb

```
disable avb
```

Description

This command is a macro command that can be used to disable all AVB protocols globally on the switch. It is equivalent to issuing the following three commands:

```
disable mvrp

disable msrp

disable network-clock gptp
```

Syntax Description

avb	Audio Video Bridging

Default

Disabled.

Usage Guidelines

Use this command to disable all AVB protocols globally on the switch.

Example

```
disable avb
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable avb ports

```
disable avb ports [port_list | all]
```

Description

This command is a macro command that can be used to disable all AVB protocols on the given ports. It is equivalent to issuing the following three commands:

```
disable mvrp ports [port_list | all]

disable msrp ports [port_list | all]

disable network-clock gptp ports [port_list | all]
```

Syntax Description

avb	Audio Video Bridging.
port_list	Port list separated by a comma or "-".
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to disable all AVB protocols on the given ports.

Example

```
disable avb ports all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable bgp

```
disable bgp
```

Description

Disables *BGP*.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disable BGP on the router.

Example

The following command disables BGP:

```
disable bgp
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp advertise-inactive-route

```
disable bgp {address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast
    | ipv6-multicast]} advertise-inactive-route
```

Description

Disables advertisement of *BGP* inactive routes, which are defined as those routes that rated best by BGP and not best in the IP routing table.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default address family.

Usage Guidelines

This command can be successfully executed only when BGP is globally disabled. If you want to disable inactive route advertisement and BGP is enabled, you must disable BGP (`disable bgp`), disable this feature, and then enable BGP (`enable bgp`).

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command disables inactive route advertisement for IPv4 unicast traffic:

```
disable bgp address-family ipv4-unicast advertise-inactive-route
```

History

This command was first available in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp aggregation

```
disable bgp aggregation
```

Description

Disables *BGP* route aggregation.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Route aggregation is the process of combining the characteristics of several routes so that they are advertised as a single route. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Reducing the information that is stored and exchanged also reduces the size of the routing table.

Use this command to disable BGP route aggregation.

Example

The following command disables BGP route aggregation:

```
disable bgp aggregation
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp always-compare-med

```
disable bgp always-compare-med
```

Description

Disables *BGP* from comparing Multi Exit Discriminators (MEDs) for paths from neighbors in different Autonomous Systems (AS).

Syntax Description

This command has no arguments or variables.

Default

ExtremeXOS does not compare MEDs for paths from neighbors in different AS.

Usage Guidelines

The MED is one of the parameters that is considered when selecting the best path among many alternative paths. The path with a lower MED is preferred over a path with a higher MED. By default, during the best path selection process, MED comparison is done only among paths from the same AS.

BGP must be disabled before you can change the configuration with this command.

Example

The following command disables MED from being used in comparison among paths from different AS:

```
disable bgp always-compare-med
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp community format

```
disable bgp community format AS-number : number
```

Description

Disables the AS-number:number format of display for communities in the output of show commands.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Using this command, communities are displayed as a single decimal value.

Example

The following command disables the AS-number:number format of display for communities:

```
disable bgp community format AS-number : number
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp export vr

```
disable bgp export {vr} vr_name route_type {address-family} vpnv4
```

Description

For IPv4 and IPv6 routes, this command disables the PE router to export and redistribute local VRF routes to remote PE routers through *BGP*.

Syntax Description

vr	Specifies the source VPN VRF of the exported routes.
vr_name	Specifies the name of the source VPN VRF.
route_type	Specifies the source or origin of the route types to be exported to remote PE routers. Valid Types: blackhole, direct, and bgp.
address-family	Specifies the address family for the exported routes. Valid types are ipv4-unicast, vpnv4.
vpn4	Specifies that routes from the VRF are exported as vpnv4 routes over MPBGP.

Default

Disabled.

Usage Guidelines

This command disables a PE router to advertise learned routes from CE routers to remote PE routers in a Service Provider's backbone. Executing this command allows the PE router to convert VRF native IPv4 routes into VPN-IPv4 route,s and advertise to all remote PE BGP neighbors as VPN-IPv4 routes.

- For Layer 3 VPNs, you must enter the `disable bgp export vr` command in the context of the VRF that supports the Layer 3 VPN.
- When the export source is the Layer 3 VPN, you can specify direct, or remote-vpn to disable route export to the VRF. The destination address family must be ipv4-unicast.
- This export command is applicable in Parent VR context only. If you execute it in a VRF context, an error message is returned.
- The source VPN VRF must be a child of the Parent VR.
- BGP need not be added to a VPN VRF to export routes from a VPN VRF.
- The direction of where the redistribution is targeted is implicit on the keywords used, For eg:- remote-vpn only applies to remote routes from PE redistributed to CE, hence we cannot use it with address family vpnv4. Similarly bgp only applies to EBGP routes from CE exported as VPN routes, hence we use it only with address family vpnv4. Other sources such as “static” and “direct” are redistributed both ways.

Example

The following command disables BGP to advertise a vpnv4 route named "corp1_vpn_vrf":

```
disable bgp export "corp1_vpn_vrf" bgp address-family vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

The blackhole option was added in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp export

disable bgp export *route_type* {{**address-family**} *address_family*}

For Layer 3 VPNs:

disable bgp export *route_type* {{**address-family**} *address_family*}

Description

Disables *BGP* from exporting routes from other protocols to BGP peers.

Syntax Description

bgp	For Layer 3 VPNs, this specifies that BGP routes learned from CE routers are to be exported to remote PE routers.
route_type	Specifies the BGP export route type.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

The exporting of routes between any two routing protocols is a discrete configuration function. For example, you must configure the switch to export routes from *OSPF* to BGP and, if desired, you must configure the switch to export routes from BGP to OSPF. You must first configure both protocols and then verify the independent operation of each. Then you can configure the routes to export from OSPF to BGP, and the routes to export from BGP to OSPF.

You can use policies to associate BGP attributes including Community, NextHop, MED, Origin, and Local Preference with the routes. Policies can also be used to filter out exported routes.

Using the export command to redistribute routes complements the redistribution of routes using the `configure bgp add network` command. The `configure bgp add network` command adds the route to BGP only if the route is present in the routing table. The `enable bgp export` command redistributes an individual route from the routing table to BGP. If you use both commands to redistribute routes, the routes redistributed using the network command take precedence over routes redistributed using the export command.

Note

For this command to execute, the specified protocol must support the specified address family. For example, the command fails if you specify OSPF and the IPv6 unicast address family. You can specify blackhole, direct, static, and IS-IS routes with IPv4 or IPv6 address families.

For Layer 3 VPNs, the disable bgp export command must be entered in the context of the VRF that supports the Layer 3 VPN.

When the export source is the Layer 3 VPN, you can specify direct, or remote-vpn to disable route export to the VRF. The destination address family must be ipv4-unicast.

When the export source is the VRF, you can specify direct, or bgp to disable route export to the VPN. The destination address family must be vpnv4.

Example

The following command disables BGP from exporting routes from the OSPF protocol to BGP peers:

```
disable bgp export ospf
```

The following command disables the export of BGP routes from a VRF to a VPN:

```
disable bgp export bgp address-family vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

The blackhole option was added in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp export [static | direct] l2vpn-evpn

```
disable bgp export [static | direct] {address-family address_family}
   l2vpn-evpn {vr vr_name}
```

Description

Disables export of direct, static, and BGP routes from a VRF into BGP, running on the specified VR, as EVPN routes to be advertised by BGP as Type 5 routes.

Syntax Description

bgp	Specifies showing the BGP configuration.
export	Specifies redistributing information from another routing protocol.
static	Specifies static routes.
direct	Specifies direct routes.
address-family	Specifies the address family.
address_family	Sets the address family type.
l2vpn-evpn	Specifies the L2VPN EVPN address family.
vr	Specifies the source VR.
vr_name	Designates the source VR name. Both VPN-VRFs and non-VPN-VRFs are supported.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example disables exports of static routes on VR "vr-a" as EVPN routes to be advertised by BGP as Type 5 routes:

```
# disable bgp export static l2vpn-evpn vr vr-a
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp fast-external-fallover

```
disable bgp fast-external-fallover
```

Description

Disables *BGP* fast external fallover functionality.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables the BGP fast external fallover on the router. This command applies to all directly-connected external BGP neighbors.

When BGP fast external fallover is enabled, the directly-connected EBGP neighbor session is immediately reset when the connecting link goes down.

If BGP fast external fallover is disabled, BGP waits until the default hold timer expires (3 keepalives) to reset the neighboring session. In addition, BGP might teardown the session somewhat earlier than hold timer expiry if BGP detects that the TCP session and it's directly connected link is broken (BGP detects this while sending or receiving data from TCP socket).

Example

The following command disables BGP fast external fallover:

```
disable bgp fast-external-fallover
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp mpls-next-hop

```
disable bgp mpls-next-hop
```

Description

Disables IP forwarding over calculated *MPLS* LSPs to subnets learned via *BGP*.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables IP forwarding over calculated MPLS LSPs to subnets learned via BGP. (Calculated refers to an LSP that only reaches part of the way to the destination). By default, IP forwarding over MPLS LSPs to subnets learned via BGP is disabled.

Example

The following command disables BGP's use of MPLS LSPs to reach BGP routes:

```
disable bgp mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp multipath-relax

```
disable bgp multipath-relax
```

Description

Disables BGP multipath-relax feature, which modifies the definition of an equal cost BGP route.

Syntax Description

multipath-relax	Selects BGP multipath relax feature.

Default

This feature is disabled by default.

Usage Guidelines

This feature modifies the definition of equal cost BGP routes as specified in *RFC-4271*. In particular, routes with the same AS-path length, but differing AS numbers in the path are not considered equal cost by default. However, with multipath-relax enabled, routes with the same AS-path length can have differing AS number values in the AS-path and still be considered equal cost.

BGP must be disabled (`disable bgp `) first to disable this feature.

Example

The following example disables the BGP multipath-relax feature:

```
disable bgp multipath-relax
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp neighbor address-family l2vpn-evpn

```
disable bgp {neighbor [remoteaddr | all]} {{address-family} l2vpn-evpn}
   next-hop-unchanged
```

Description

Disables overriding the *BGP* specification behavior with respect to the next-hop of routes advertised to EBGP peers.

Syntax Description

bgp	Specifies BGP.
neighbor	Specifies BGP neighbor.
remoteaddr	Specifies BGP neighbor IP address.
all	Specifies all BGP neighbors.
address-family	Specifies address family.
l2vpn-evpn	Specifies L2VPN EVPN address-family type.
next-hop-unchanged	Enables preserving the BGP next-hop when routes are advertised to EBGP peers (default is disabled).

Default

Default is that next-hop-unchanged is disabled.

Usage Guidelines

This command disables overriding the specification behavior with respect to the next-hop of routes advertised to EBGP peers. Specifically, disabling with this command does not maintain the BGP next-hop for routes advertised to EBGP peers instead of replacing the next-hop with either the outgoing interface IP address or the local loopback address.

Example

The following example disables next-hop unchanged for BGP neighbor at 192.168.66.2:

```
# disable bgp neighbor 192.168.66.2 l2vpn-evpn next-hop-unchanged
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp neighbor capability address-family vpnv4

```
disable bgp {neighbor} [all | remoteaddr] capability address-family
   vpnv4 type [community | ext-community | prefix] {[send | receive |
   both]}
```

Description

This command disables neighbor capability for one or all *BGP* neighbors on a Layer 3 VPN.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors.
remoteaddr	Specifies the IPv4 address of a BGP neighbor.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
community	Disables neighbor capability for communities.
ext-community	Disables neighbor capability for extended communities.
prefix	Disables neighbor capability for prefixes.
send	Disables neighbor capability filter list send capability.
receive	Disables neighbor capability filter list receive capability.
both	Disables neighbor capability filter list send and receive capability.

Default

Disabled.

If the direction is not specified, the both option applies.

Usage Guidelines

Enter this command multiple times to configure the address family, type, and direction attributes.

Example

The following command disables the neighbor capability feature for a Layer 3 VPN neighbor:

```
disable bgp neighbor 1.1.1.1 capability address-family vpnv4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp neighbor capability

```
disable bgp neighbor [all | remoteaddr] capability [ipv4-unicast | ipv4-
   multicast | ipv6-unicast | ipv6-multicast | vpnv4 | route-refresh |
   ipv4-vxlan | l2vpn-evpn]
```

Description

This command disables an address family or the route refresh capability for one or all neighbors.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
route-refresh	Specifies ROUTE-REFRESH message capabilities.
ipv4-vxlan	Specifies IPv4 VXLAN capability.
l2vpn-evpn	Specifies L2 VPN EVPN address family.

Default

The following capabilities are enabled by default for IPv4 peers: IPv4 unicast, IPv4 multicast, and route refresh.

The following capabilities are enabled by default for IPv6 peers: route refresh.

Usage Guidelines

This command applies to the current VR or VRF context.

Note

To inter-operate with Cisco routers for BGP graceful restart, you must enable IPv4 unicast address capability.

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Example

The following example disables the route-refresh feature for all neighbors:

```
disable bgp neighbor all capability route-refresh
```

The following example disables the VPNv4 address family for a neighbor:

```
disable bgp neighbor 192.168.96.235 capability vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Support for IPv4 VXLAN was added in ExtremeXOS 22.3.

Support for L2 VPN EVPN address family was added in ExtremeXOS.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp neighbor originate-default

```
disable bgp [{neighbor} remoteaddr | neighbor all] {address-family
   [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast]}
   originate-default
```

Description

Removes a default route to a single *BGP* neighbor or to all BGP neighbors.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified, the configuration applies to the IP Unicast family on all IPv4 peers. If an IPv4 address family is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled. BGP does not automatically originate and advertise default routes to BGP neighbors.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

This command can be successfully executed at any time, irrespective of whether local BGP or the remote BGP peer is enabled or disabled.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command removes default routes for IPv4 unicast traffic for all BGP peer nodes:

```
disable bgp neighbor all originate-default
```

History

This command was first available in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp neighbor remove-private-AS-numbers

```
disable bgp neighbor [remoteaddr | all] remove-private-AS-numbers
```

Description

Disables the removal of private AS numbers from the AS path in route updates sent to EBGP peers.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor.
all	Specifies all IPv4 and IPv6 neighbors.

Default

Disabled.

Usage Guidelines

Private AS numbers are AS numbers in the range 64512 through 65534. You can remove private AS numbers from the AS path attribute in updates that are sent to external BGP (EBGP) neighbors. Possible reasons for using private AS numbers include:

- The remote AS does not have officially allocated AS numbers.
- You want to conserve AS numbers if you are multi-homed to the local AS.

Private AS numbers should not be advertised on the Internet. Private AS numbers can only be used locally within an administrative domain. Therefore, when routes are advertised out to the Internet, the private AS number can be stripped out from the AS paths of the advertised routes using this feature.

This command applies to the current VR or VRF context.

Example

The following command disables the removal of private AS numbers from the AS path in route updates sent to the EBGP peers:

```
disable bgp neighbor 192.168.1.17 remove-private-AS-numbers
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp neighbor soft-in-reset

```
disable bgp neighbor [all | remoteaddr] {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} soft-in-reset
```

Description

Disables the soft input reset feature.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified, the configuration applies to the IP Unicast family on all IPv4 peers. If an IPv4 address family is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

Disabled.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

Disabling the soft input reset feature can potentially limit the amount of system memory consumed by the RIB-in.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Before you can change the configuration with this command, you must disable BGP, and you must disable the corresponding BGP neighbor session using the following command:

`disable bgp neighbor [remoteaddr | all]`

To disable this feature on Layer 3 VPNs, you must do so in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

This command applies to the current VR or VRF context.

Example

The following command disables the soft input reset for the neighbor at 192.168.1.17:

```
disable bgp neighbor 192.168.1.17 soft-in-reset
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp neighbor

`disable bgp neighbor [remoteaddr | all]`

Description

Disables the *BGP* session.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.

Default

Disabled.

Usage Guidelines

After the session has been disabled, all the information in the route information base (RIB) for the neighbor is flushed.

This command applies to the current VR or VRF context.

Example

The following command disables the BGP session:

```
disable bgp neighbor 192.168.1.17
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp peer-group capability address-family vpnv4

```
disable bgp peer-group peer-group-name capability address-family vpnv4
   type [community | ext-community] {[send | receive | both]}
```

Description

This command disables peer-group capability for a peer group on a Layer 3 VPN.

Syntax Description

remoteaddr	Specifies the IPv4 address of a *BGP* neighbor.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
community	Disables peer-group capability for communities.
ext-community	Disables peer-group capability for extended communities.
send	Disables peer-group capability filter list send capability.
receive	Disables peer-group capability filter list receive capability.
both	Disables peer-group capability filter list send and receive capability.

Default

Disabled.

If the direction is not specified, the both option applies.

Usage Guidelines

Enter this command multiple times to configure the address family, type, and direction attributes.

By specifying the address-family, type and direction in multiple commands, you can better control the actual ORF capabilities sent to a peer. In the case where a particular address-family is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

ORF capabilities can only be enabled for IPv4 neighbors, and only for IPv4 address families. If configured for IPv6 neighbors or address-families the command is rejected with the following error message:

```
Outbound-route-filtering not supported for IPv6 neighbors
```

or

```
Outbound-route-filtering not supported for address family <addr_family>
```

Example

The following command disables the peer-group capability feature for a Layer 3 VPN peer group:

```
disable bgp peer-group vpn capability address-family vpnv4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp peer-group capability

```
disable bgp peer-group peer-group-name capability [ipv4-unicast | ipv4-
   multicast |ipv6-unicast | ipv6-multicast |vpnv4 |route-refresh]
```

Description

This command disables an address family or the route-refresh capability for a peer group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
route-refresh	Specifies ROUTE-REFRESH message capabilities.

Default

All capabilities are enabled for IPv4 peer groups by default.

Only the route refresh capability is enabled for peer groups by default.

Usage Guidelines

This command applies to the current VR or VRF context.

Note

To inter-operate with Cisco routers for *BGP* graceful restart, you must enable IPv4 unicast address capability.

Example

The following command disables the route-refresh feature for the peer group outer:

```
disable bgp peer-group outer route-refresh
```

The following command disables the VPNv4 address family for a peer group:

```
disable bgp peer-group backbone capability vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp peer-group next-hop-unchanged

```
disable bgp peer-group peer-group-name 12vpn-evpn next-hop-unchanged
```

Description

Disables a peer group and with respect to the next-hop of routes advertised to EBGP peers.

Syntax Description

peer-group-name	Specifies a peer group.
12vpn-evpn	Specifies L2VPN EVPN address-family type.
next-hop-unchanged	Enables preserving the BGP next-hop when routes are advertised to EBGP peers (default is disabled).

Default

Default is that next-hop-unchanged is disabled.

Usage Guidelines

This command disables overriding the specification behavior with respect to the next-hop of routes advertised to EBGP peers. Specifically, disabling with this command does not maintain the BGP next-hop for routes advertised to EBGP peers.

Example

The following command disables next-hop unchanged for the BGP peer group pg2 :

```
disable bgp peer-group pg2 l2vpn-evpn next-hop-unchanged
```

History

This command was first available in ExtremeXOS 31.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp peer-group originate-default

```
disable bgp {peer-group} peer-group-name {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast]} originate-default
```

Description

Removes default routes to all *BGP* neighbors in the specified peer group.

Syntax Description

peer-group-name	Specifies the BGP peer group for which the default routes are removed.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled. BGP does not automatically originate and advertise default routes to BGP neighbors.

Usage Guidelines

This command can be successfully executed at any time, irrespective of whether local BGP or the remote BGP peers are enabled or disabled.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Example

The following command removes default routes for IPv4 unicast traffic for all nodes in the test BGP peer group:

```
disable bgp peer-group test originate-default
```

History

This command was first available in ExtremeXOS 12.2.2.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp peer-group remove-private-AS-numbers

`disable bgp peer-group` *`peer-group-name`* **`remove-private-AS-numbers`**

Description

Disables the removal of private autonomous system (AS) numbers from the AS_Path attribute of outbound updates.

Syntax Description

`peer-group-name`	Specifies a peer group.

Default

Disabled.

Usage Guidelines

This command applies to the current VR or VRF context.

Example

The following command disables the *BGP* peer group outer from removing private AS numbers:

```
disable bgp peer-group outer remove-private-AS-numbers
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp peer-group soft-in-reset

```
disable bgp peer-group peer-group-name {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast]} soft-in-reset
```

Description

Disables the soft input reset feature.

Syntax Description

peer-group-name	Specifies a peer group.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

Disabling the soft input reset feature can potentially limit the amount of system memory consumed by the RIB-in.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Example

The following command disables the soft input reset feature:

```
disable bgp peer-group outer soft-in-reset
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bgp peer-group

`disable bgp peer-group` *`peer-group-name`*

Description

Disables a *BGP* peer group and all its BGP neighbors.

Syntax Description

`peer-group-name`	Specifies a peer group.

Default

Disabled.

Usage Guidelines

This command applies to the current VR or VRF context.

Example

The following command disables the BGP peer group outer:

```
disable bgp peer-group outer
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bootp vlan

```
disable bootp {ipv4} | dhcp {ipv4 | ipv6} ] vlan [vlan | all]
```

Description

Disables the generation and processing of BOOTP packets on a *VLAN* to obtain an IP address for the VLAN from a BOOTP server.

Syntax Description

bootp	Disable BOOTP client.
ipv4	IPv4 client. (default)
dhcp	Disable *DHCP* client.
ipv6	IPv6 client.
vlan	Specify VLAN to configure BOOTP/DHCP client for.
vlan	Specifies a VLAN name.
all	Disables all VLANs.

Default

Disabled.

Usage Guidelines

If the IPv4/IPv6 keyword is not specified, IPv4 is taken as default for the mentioned VLAN.

Example

The following example disables the generation and processing of BOOTP packets on a VLAN named accounting:

```
disable bootp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** and **ipv6** keywords were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable bootprelay ipv6

```
disable bootprelay { ipv4 | ipv6} {vlan vlan_name} | { vr vr_name} | all
   {vr vr_name}
```

Description

Disables BOOTPRelay v6. This can be done across the VR or on a per *VLAN* basis.

Syntax Description

bootprelay	BOOTP Relay service.
IPv4	DHCPv4 BOOTP Relay service.
IPv6	DHCPv6 BOOTP Relay service.
vlan_name	Specifies the VLAN name
vr_name	Specifies the vrtual router name.
all	Disables all VLANs.

Default

N/A.

Usage Guidelines

Use this command to disable BOOTP Relay across the VR or on a per VLAN basis.

Example

The following command displays IPv6 bootprelay information:

```
* switch # show bootprelay ipv6
BOOTP Relay: DHCPv6 BOOTP Relay enabled on virtual router "VR-Default"
Include Secondary : Disabled
    BOOTP Relay Servers :2001::1
                         3001::1
                         4001::1
VLAN "Default"         :
    BOOTP Relay        : Enabled
```

```
    Interface ID       : 3999 (Default)
    Remote ID          : 00:04:96:52:08:76 (Default)
    Prefix Snooping    : Disabled
VLAN "v1"              :
    BOOTP Relay        : Enabled
    Interface ID       : Interface-Sring1
    Remote ID          :
* switch #
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable bootprelay

```
disable bootprelay {{vlan} [vlan_name] | {{vr} vr_name} | all [{vr}
   vr_name]}
```

Description

Disables the BOOTP relay function on one or all *VLAN*s for the specified VR or VRF.

Syntax Description

vlan_name	Specifies a single VLAN on which to disable the BOOTP relay feature.
vr_name	Specifies a single VR on which to disable the BOOTP relay feature.
all	Specifies that BOOTP relay is to be disabled for all VLANs on the specified VR or VRF.

Default

The BOOTP relay function is disabled on all VLANs and VRs.

Usage Guidelines

Because VLAN names are unique on the switch, you can specify only a VLAN name (and omit the VR name) to disable BOOTP relay. When you disable BOOTP relay on a VR or VRF, BOOTP relay is disabled on all VLANs for that VR. If you enter the command without specifying a VLAN or a VR, the functionality is disabled for all VLANs in the current VR context.

Example

The following command disables the forwarding of BOOTP requests on all VLANs in the current VR context:

```
disable bootprelay
```

You can use either of the following commands to disable the forwarding of BOOTP requests on VLAN unit2:

```
disable bootprelay unit2
disable bootprelay vlan unit2
```

You can use any one of the following commands to disable the forwarding of BOOTP requests on all VLANs in VR zone3:

```
disable bootprelay zone3
disable bootprelay vr zone3
disable bootprelay all zone3
disable bootprelay all vr zone3
```

History

This command was first available in ExtremeXOS 10.1.

The capability to disable BOOTP relay on a VLAN was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cdp ports

```
disable cdp ports [port_list | all]
```

Description

Disables CDP on a port.

Syntax Description

port_list	Specifies the list of ports to disable CDP on.
all	Specifies that you disable CDP on all ports.

Default

Enabled.

Usage Guidelines

Example

The following command disables CDP on all ports on the switch:

```
disable cdp ports all
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cfm segment frame-delay measurement

```
disable cfm segment frame-delay measurement segment_name {mep mep_id}
```

Description

Stops DMM frame transmission.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
mep *mep_id*	Specifies the maintenance association End Point that helps trigger a particular MEP level session on that segment. The range is 1-8191. The default is all MEPs on the segment.

Default

N/A.

Usage Guidelines

Use this command to stop transmission of DMM frames for a selected CFM segment. This command stops transmission that has been triggered using the command `enable cfm segment frame-delay measurement`.

This stops the transmission for both continuous and on-demand mode.

Example

The following command stops frame transmission on the CFM segment segment-first:

```
disable cfm frame-delay measurement segment-first
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cfm segment frame-loss measurement mep

This stops the transmission for both continuous and on-demand mode.

disable cfm segment frame-loss measurement *segment_name* **mep** *mep_id*

Description

This command stops the transmission of the LMM frames for a particular cfm segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

This below command stops the transmission of the LMM frames for a particular cfm segment. This stops the transmission for both continuous and on-demand mode.

Example

```
disable cfm segment cs2 frame-loss measurement mep 3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable clear-flow

```
disable clear-flow
```

Description

Disable the CLEAR-Flow agent.

Syntax Description

This command has no arguments or variables.

Default

CLEAR-Flow is disabled by default.

Usage Guidelines

When the CLEAR-Flow agent is disabled, sampling stops and the and all rules are left in the current state. It will not reset actions that were taken while CLEAR-Flow was enabled.

Example

The following example disables CLEAR-Flow on the switch:

```
disable clear-flow
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli history expansion

```
disable cli history expansion {session | permanent}
```

Description

Disables command line history expansion.

Syntax Description

cli	Command line interface settings.
history	Command history settings.
expansion	Substitute occurrences of '!n:w' with the corresponding line 'n' and word 'w+1' from command history (default disabled).
session	Configures history expansion for this CLI session only (default).
permanent	Configures history expansion for this CLI session, and all future sessions.

Default

CLI history expansion is disabled by default.

Usage Guidelines

To view the status of CLI history expansion on the switch, use the `show management` command.

Example

The following command disables CLI history expansion for this session and all future sessions:

```
disable cli history expansion permanent
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli prompting

`disable cli prompting`

Description

Disables CLI prompting for the session.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Use this command to have all CLI user prompts automatically continue with the default answer.

This applies to the current session only.

To re-enable CLI prompting for the session, use the `enable cli prompting` command.

To view the status of CLI prompting on the switch, use the `show management` command.

Example

The following command disables prompting:

```
disable cli prompting
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli refresh

`disable cli refresh {`**`session`** | **`permanent`**`}`

Description

This command allows you to disable the default auto refresh behavior. The auto refresh behavior is used for some "show" commands.

Syntax Description

`session`	Use refresh setting for this CLI session only.
`permanent`	Use refresh setting for this CLI session, and all future sessions (default).

Default

Permanent.

Usage Guidelines

Use this command to disable the show command auto refresh or add the no-refresh option to the individual command. Since the default for the session may be set to `disable cli refresh`, the

commands that take a **no-refresh** option now allow for the alternate **refresh** case if you want to selectively enable a refreshed display.

The **permanent** option is only valid for admin level users.

Example

The following is sample output showing the CLI refresh information.

```
# show management
CLI idle timeout                 : Enabled (20 minutes)
CLI max number of login attempts : 3
CLI max number of sessions       : 8
CLI paging                       : Enabled (this session only)
CLI space-completion             : Disabled (this session only)
CLI configuration logging        : Disabled
CLI scripting                    : Disabled (this session only)
CLI scripting error mode         : Ignore-Error (this session only)
CLI persistent mode              : Persistent (this session only)
CLI prompting                    : Enabled (this session only)
CLI refresh                      : Enabled (this session only)
Telnet access                    : Enabled (tcp port 23 vr all)
                                 : Access Profile : not set
SSH Access                       : ssh module not loaded.
Web access                       : Enabled (tcp port 80)
                                 : Access Profile : not set
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli scripting

```
disable cli scripting {permanent}
```

Description

Disables the use of the CLI scripting commands. When used without the permanent option, it disables the CLI scripting commands for the current session and is a per session setting. The permanent option affects new sessions only and is saved across switch reboots.

Syntax Description

permanent	Disables the CLI scripting commands for new sessions only; this setting is saved across switch reboots.

Default

CLI scripting commands are disabled by default.

Usage Guidelines

You can disable the CLI scripting commands for the session only after this feature has been enabled.

Example

The following command disables the CLI scripting commands for the current session:

```
disable cli scripting
```

History

This command was first available in ExtremeXOS 11.6.

The permanent option was added in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli scripting output

```
disable cli scripting output
```

Description

Disables the display of CLI commands and responses during script operation.

Syntax Description

This command has no arguments or variables.

Default

During interactive script sessions: CLI scripting output enabled.

During load script command operation: CLI scripting output disabled.

Usage Guidelines

When the CLI scripting output is disabled, the only script output displayed is the `show var {varname}` command and its output. All other commands and responses are not displayed.

When the `load script filename {arg1} {arg2} ... {arg9}` command is entered, the software disables CLI scripting output until the script is complete, and then CLI scripting output is

enabled. Use the enable cli scripting output and disable cli scripting output commands to control what a script displays when you are troubleshooting.

Example

The following command disables CLI scripting output for the current session or until the enable cli scripting output command is entered:

```
disable cli scripting output
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli space-completion

```
disable cli space-completion
```

Description

Disables the ExtremeXOS feature that completes a command automatically with the spacebar. If you disable this feature, the [Tab] key can still be used for auto-completion.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables using the spacebar to automatically complete a command:

```
disable cli space-completion
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli config-logging

```
disable cli config-logging
```

Description

Disables the logging of CLI configuration commands to the switch Syslog.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Every command is displayed in the log window which allows you to view every command executed on the switch.

The `disable cli-config-logging` command discontinues the recording of all switch configuration changes and their sources that are made using the CLI via Telnet or the local console. After you disable configuration logging, no further changes are logged to the system log.

To view the status of configuration logging on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for configuration logging.

Example

The following command disables the logging of CLI configuration command to the Syslog:

```
disable cli config-logging
```

History

This command was first available in ExtremeXOS 11.0.

The **`cli-config-logging`** keyword was split into **`cli config-logging`** in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli-config-logging expansion

```
disable cli-config-logging expansion
```

Description

When CLI logging is enabled, disables showing fully expanded commands, rather than abbreviations, in the log.

Syntax Description

expansion	Disables command expansion in logs.

Default

Expansion is disabled by default.

Usage Guidelines

When CLI logging is enabled (see enable cli config-logging on page 2091), this command disables showing fully expanded commands, rather than abbreviations, in the log.

For example, with command expansion disabled, a command entered in abbreviated format, such as

```
config por 33 auto of spee 10000 duplex ful
```

appears in the log exactly as it was entered in the command line.

If command expansion is enabled, the command appears in the log in expanded form:

```
configure ports 33 auto off speed 10000 duplex full
```

To see the status of command expansion, use show management on page 2848.

Example

The following example turns off command expansion:

```
disable cli-config-logging expansion
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli paging

```
disable cli paging {session | permanent}
```

Description

Disables pausing at the end of each show screen.

Syntax Description

session	Disables viewing output of commands one screenful at a time for the current user session only (default).
permanent	Disables viewing output of commands one screenful at a time permanently (setting persists after rebooting).

Default

Clipaging is enabled per session by default.

Usage Guidelines

The command line interface (CLI) is designed for use in a VT100 environment.

Most show command output pauses when the display reaches the end of a page. This command disables the pause mechanism and allows the display to print continuously to the screen.

To view the status of CLI paging on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for CLI paging.

Example

The following command disables cli paging permanently (persists after rebooting) and allows you to print continuously to the screen:

```
disable cli paging permanent
```

History

This command was first available in ExtremeXOS 10.1.

The **session** and **permanent** options were added in ExtremeXOS 22.5.

The **clipaging** option was split into two keywords in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cpu-monitoring

```
disable cpu-monitoring
```

Description

Disables CPU monitoring on the switch.

Syntax Description

This command has no arguments or variables.

Default

CPU monitoring is enabled and occurs every 5 seconds.

Usage Guidelines

Use this command to disable CPU monitoring on the switch.

This command does not clear the monitoring interval. Therefore, if you altered the CPU monitoring interval, this command does not return the CPU monitoring interval to 5 seconds. To return to the default frequency level, use the `enable cpu-monitoring {interval` *`seconds`*`}` `{threshold`*`percent`*`}` and specify 5 for the interval.

Example

The following command disables CPU monitoring on the switch:

```
disable cpu-monitoring
```

History

This command was first available in an ExtremeXOS 11.2.

The default value shown began in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dhcp ports vlan

```
disable dhcp ports port_list vlan vlan_name
```

Description

Disables *DHCP* on a specified port in a *VLAN*.

Syntax Description

port_list	Specifies the ports for which DHCP should be disabled.
vlan_name	Specifies the VLAN on whose ports DHCP should be disabled.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables DHCP for port 6:9 in VLAN corp:

```
disable dhcp ports 6:9 vlan corp
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dhcp vlan

```
disable dhcp [ipv4 | ipv6] vlan [vlan_name | all]
```

Description

Disables the generation and processing of *DHCP* packets on a *VLAN* to obtain an IP address for the VLAN from a DHCP server.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

If the IPv4/IPv6 keyword is not specified, IPv4 is taken as default for the mentioned VLAN.

Usage Guidelines

None.

Example

The following command disables the generation and processing of DHCP packets on a VLAN named accounting:

```
disable dhcp vlan accounting

disable dhcp ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 15.6 to include the **ipv4** and **ipv6** keywords

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable diffserv examination ports

```
disable diffserv examination ports [port_list | all]
```

Description

Disables the examination of the DiffServ field in an IP packet.

Syntax Description

port_list	Specifies a list of ports or slots and ports to which the parameters apply.
all	Specifies that DiffServ examination should be disabled for all ports.

Default

Disabled.

Usage Guidelines

The diffserv examination feature is disabled by default.

Example

The following command disables DiffServ examination on the specified ports:

```
disable diffserv examination ports 5:3,5:5,6:6
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable diffserv replacement ports

```
disable diffserv replacement ports [port_list | all] {{qosprofile}
   qosprofile}
```

Description

Disables the replacement of DiffServ code points in packets transmitted by the switch.

Syntax Description

port_list	Specifies a list of ports or slots and ports on which Diffserv replacement will be disabled.
all	Specifies that DiffServ replacement should be disabled for all ports.
qosprofile	Disables DiffServ on a *QoS* profile. Note: If this option is not specified it will disable DiffServ replacement on all qosprofiles.
qosprofile	Specifies the QoS profile number.

Default

The DiffServ replacement feature is disabled by default.

Usage Guidelines

N/A.

Example

The following example disables DiffServ replacement on selected ports:

```
disable diffserv replacement ports 1:2,5:5,6:6
```

History

This command was first available in ExtremeXOS 11.0.

The **qosprofile** keyword and *qosprofile* variable were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dns cache

```
disable dns cache {{vlan} vlan_name | {vr} vr_name}
```

Description

Disables the Domain Name System (DNS) cache on a virtual router (VR) or *VLAN*.

Syntax Description

dns	Domain name system.
cache	Specifies disabling the DNS cache.
vlan	Specifies disabling DNS cache on a VLAN.
vlan_name	Specifies the VLAN name.
vr	Specifies disabling DNS cache on a VR.
vr_name	Specifies the VR name. If not specified, the VR of the current command context is used.

Default

If no VR name is specified, the VR of the current command context is used.

Usage Guidelines

To view the DNS cache configuration, use the command `show` **dns cache configuration** `{{`**vlan**`} vlan_name | {`**vr**`} vr_name}`

Example

The following example disables DNS cache on VLAN "VLAN1":

```
# disable dns cache vlan VLAN1
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dns cache analytics

```
disable dns cache analytics {{vr} vr_name}
```

Description

Disables Domain Name System (DNS) analytics.

Syntax Description

dns	Domain Name System.
cache	Specifies DNS cache.
analytics	Specifies disabling DNS cache analytics. Analytics provides more insight into DNS queries when DNS cache is enabled. Default is disabled.
vr	Specifies disabling DNS analytics on a VR.
vr_name	Specifies the VR name. If not specified, the VR of the current command context is used.

Default

DNS analytics is disabled by default.

Usage Guidelines

To enable DNS analytics, use the command `enable dns cache analytics {{vr} vr_name}`.

Example

The following example disables DNS analytics on VR "vr1":

```
# disables dns cache analytics vr vr1
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dns cache dnssec

```
disable dns cache {dnssec}
```

Description

Disables validating DNS replies and cache data for DNSSEC (Domain Name System Security Extensions).

Syntax Description

dnssec	Disables validating DNS replies and cache data for DNSSEC. Default is disabled.

Default

By default, DNSSEC is disabled.

Usage Guidelines

You cannot disable DNSSEC if DNS cache is enabled.

Example

The following example disables DNSSEC:

```
# disable dns cache dnssec
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dos-protect

```
disable dos-protect
```

Description

Disables denial of service protection.

Syntax Description

There are no arguments or variables for this command.

Default

Default is disabled.

Usage Guidelines

None.

Example

The following command disables denial of service protection:

```
disable dos-protect
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dot1p examination inner-tag ports

```
disable dot1p examination inner-tag ports [all | port_list]
```

Description

Used with VMANs, and instructs the switch to examine the 802.1p value of the outer tag, or added VMAN header, to determine the correct egress queue on the egress port.

Syntax Description

all	Specifies all ports.
port_list	Specifies a list of ports or slots and ports.

Default

Disabled.

Usage Guidelines

Use this command to instruct the system to refer to the 802.1p value contained in the outer tag, or VMAN encapsulation tag, when assigning the packet to an egress queue at the egress port of the VMAN.

Note

See “Quality of Service” in the *Switch Engine 32.2 User Guide* for information on configuring and displaying the current 802.1p and DiffServ configuration for the inner, or original header, 802.1p value.

Example

The following example uses the 802.1p value on the outer tag, or VMAN encapsulation, to put the packet in the egress queue on the VMAN egress port:

```
disable dot1p examination inner-tag port 3:2
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dot1p examination ports

```
disable dot1p examination ports [port_list | all]
```

Description

Prevents examination of the 802.1p priority field as part of the *QoS* configuration.

Syntax Description

port_list	Specifies a list of ports or slots and ports.
all	Specifies that dot1p replacement should be disabled for all ports.

Default

Enabled.

Usage Guidelines

The 802.1p examination feature is enabled by default. To free *ACL* resources, disable this feature whenever another QoS traffic grouping is configured. (For information on available ACL resources, see *ACLs* in the *Switch Engine 32.2 User Guide*)

Note

If you disable this feature when no other QoS traffic grouping is in effect, 802.1p priority enforcement of 802.1q tagged packets continues.

SummitStack Only.

Dot1p examination cannot be disabled for priority values 5 and 6. However, the precedence of the examination is lowered so that all other traffic grouping precedences are higher. The mappings you configure with the `configure dot1p type` command remain in effect.

As part of the COS global status enable action, COS will automatically enable dot1p examination on all ports. An internal status will track this event. The disable dot1p examination command will print an additional warning message in the event that COS was configured via *SNMP*. If the COS global status is disabled via SNMP, the internal status will be cleared and the additional WARNING message will not be displayed.

Example

The following command disables 802.1p value examination on ports 1 to 5:

```
disable dot1p examination ports 1-5
```

History

This command was available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable dot1p replacement ports

```
disable dot1p replacement ports [port_list | all] {{qosprofile}
   qosprofile}
```

Description

Disables the ability to overwrite 802.1p priority values for a given set of ports.

Syntax Description

port_list	Specifies a list of ports or slots and ports to which the parameters apply.
all	Specifies that 802.1p replacement should be disabled for all ports.
qosprofile	Disables 802.1p on a *QoS* profile. Note: If this option is not specified it will disable dot1p replacement for all qosprofiles.
qosprofile	Specifies the QoS profile number.

Default

N/A.

Usage Guidelines

The dot1p replacement feature is disabled by default.

Beginning with ExtremeXOS version 11.4 on the 1 Gigabit Ethernet ports, 802.1p replacement always happens when you configure the DiffServ traffic grouping.

Example

The following example disables 802.1p value replacement on all ports:

```
disable dot1p replacement ports all
```

History

This command was first available in ExtremeXOS 11.0.

The **qosprofile** keyword and *qosprofile* variable were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable eaps

```
disable eaps {name}
```

Description

Disables the *EAPS* function for a named domain or for an entire switch.

Syntax Description

name	Specifies the name of an EAPS domain.

Default

Disabled for the entire switch.

Usage Guidelines

To prevent loops in the network, the switch displays by default a warning message and prompts you to disable EAPS for a specific domain or the entire switch. When prompted, do one of the following:

- Enter y to disable EAPS for a specific domain or the entire switch.
- Enter n or press [Return] to cancel this action.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the `configure eaps config-warnings off`.

Example

The following command disables the EAPS function for entire switch:

```
disable eaps
```

The switch displays the following warning message and prompts you to confirm this action:

`WARNING: Disabling EAPS on the switch could cause a loop in the network!` Are you sure you want to disable EAPS? (y/n) Enter y to disable EAPS on the switch. Enter n to cancel this action.

The following command disables the EAPS function for the domain eaps-1:

```
disable eaps eaps-1
```

The switch displays the following warning message and prompts you to confirm this action:

`WARNING: Disabling specific EAPS domain could cause a loop in the network!`

```
Are you sure you want to disable this specific EAPS domain? (y/n)
```

Enter y to disable the EAPS function for the specified domain. Enter n to cancel this action.

History

This command was first available in ExtremeXOS 11.0.

The interactive messages were added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable edp ports

```
disable edp ports [ports | all]
```

Description

Disables the *EDP* on one or more ports.

Syntax Description

ports	Specifies one or more ports or slots and ports, including management port.
all	Specifies all ports on the switch, including management port.

Default

Enabled.

Usage Guidelines

You can use the `disable edp ports` command to disable EDP on one or more ports when you no longer need to locate neighbor Extreme Networks switches.

Example

The following command disables EDP on ports 2 and 4 on a switch:

```
disable edp ports 2,4
```

History

This command was first available in ExtremeXOS 10.1.

Ability to disable EDP on management port was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable elrp-client

```
disable elrp-client
```

Description

Disables the ELRP client (standalone ELRP) globally.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables the ELRP globally so that none of the ELRP *VLAN* configurations take effect.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the `enable elrp-client` command to globally enable the ELRP client.

Example

The following command globally disables the ELRP client:

```
disable elrp-client
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable elsm ports

`disable elsm ports` *`port_list`*

Description

Disables the ELSM protocol for the specified ports.

Syntax Description

`port_list`	Specifies the port or ports for which ELSM should be disabled.

Default

The default is disabled.

Usage Guidelines

ELSM works between two connected ports, and each ELSM instance is based on a single port. When you disable ELSM on the specified ports, the ports no longer send ELSM hello messages to their peers and no longer maintain ELSM states.

When you enable ELSM on the specified ports, the ports participate in ELSM with their peers and begin exchanging ELSM hello messages. To enable ELSM, use the following command:

`enable elsm ports port_list`

For more information about ELSM, see the command `enable elsm ports`.

Example

The following command disables ELSM for slot 2, ports 1-2 on the switch:

```
disable elsm ports 2:1-2:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable elsm ports auto-restart

`disable elsm ports port_list` **`auto-restart`**

Description

Disable ELSM automatic restart for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which ELSM auto-restart is being disabled.

Default

The default is enabled.

Usage Guidelines

If you disable ELSM automatic restart, the ELSM-enabled port can transition between the following states multiple times: Up, Down, and Down-Wait. When the number of state transitions is greater than or equal to the sticky threshold, the port enters and remains in the Down-Stuck state.

The ELSM sticky threshold specifies the number of times a port can transition between the Up and Down states. The sticky threshold is not user-configurable and has a default value of 1. That means a port can transition only one time from the Up state to the Down state. If the port attempts a subsequent transition from the Up state to the Down state, the port enters the Down-Stuck state.

If the port enters the Down-Stuck state, you can clear the stuck state and have the port enter the Down state by using one of the following commands:

`clear elsm ports port_list auto-restart`

`enable elsm ports port_list auto-restart`

If you use the `enable elsm ports` command, automatic restart is always enabled; you do not have to use the `clear elsm ports` command to clear the stuck state.

Enabling Automatic Restart

To enable ELSM automatic restart, you must explicitly configure this behavior on each ELSM-enabled port. If you enable ELSM automatic restart and an ELSM-enabled port goes down, ELSM bypasses the Down-Stuck state and automatically transitions the down port to the Down state, regardless of the number of times the port goes up and down.

To enable automatic restart, use the following command:

`enable elsm ports port_list auto-restart`

If you configure automatic restart on one port, we recommend that you use the same configuration on its peer port.

Example

The following example disables ELSM automatic restart for slot 2, ports 1-2 on the switch:

```
disable elsm ports 2:1-2:2 auto-restart
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable erps

`disable erps`

Description

Disable *ERPS*/ITU-T G.8032 standard).

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to disable ERPS.

Example

The following command disables ERPS:

```
disable erps
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

disable erps block-vc-recovery

`disable erps` *`ring-name`* **`block-vc-recovery`**

Description

Disables the ability on *ERPS* rings to block virtual channel recovery to avoid temporary loops .

Syntax Description

`ring-name`	Alphanumeric string that identifies the ERPS ring.
`block-vc-recovery`	Block on Virtual channel recovery.

Default

N/A.

Usage Guidelines

Use this command to disable the ability on ERPS rings to block on virtual channel recovery to avoid temporary loops. This is done on interconnected nodes for sub-ring configurations.

Example

The following example disables a virtual channel recovery block on “ring1”:

```
diable erps ring1 block-vc-recovery
```

History

This command was first available in ExtremeXOS 15.13.

Platform Availability

This command is available on all platforms that are running ExtremeXOS.

disable erps ring-name

```
disable erps ring-name
```

Description

Disable an existing *ERPS* ring/sub-ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to disable an existing ERPS ring/sub-ring.

Example

The following example disables an existing ERPS ring identified as “ring1”:

```
disable erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

disable erps topology-change

```
disable erps ring-name topology-change
```

Description

Disable the ability of *ERPS* to set the topology-change bit to send out Flush events.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS sub-ring.
topology-change	Topology change propagation control.

Default

N/A.

Usage Guidelines

Use this command to disable the ability of ERPS to set the topology-change bit to send out Flush events.

Example

The following example disables the ability to set the topology-change bit for an existing ERPS sub-ring identified as “ring1”:

```
disable erps ring1 topology-change
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

disable esrp

```
disable esrp {esrpDomain}
```

Description

Disables *ESRP* for a named domain or for the entire switch.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.

Default

Disabled for the entire switch.

Usage Guidelines

If you do not specify a domain name, ESRP is disabled for the entire switch.

If you disable an ESRP domain, the domain enters the Aware state, the switch notifies its neighbor that the ESRP domain is going down, and the neighbor clears its neighbor table. If the master switch receives this information, it enters the neutral state to prevent a network loop. If the slave switch receives this information, it enters the neutral state.

Example

The following command disables ESRP for the entire switch:

```
disable esrp
```

The following command disables ESRP for the domain esrp1:

```
disable esrp esrp1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ethernet oam ports link-fault-management

```
disable ethernet oam ports [port_list | all] link-fault-management
```

Description

Disables Ethernet OAM on ports.

Syntax Description

port_list	Specifies the particular ports.
all	Specifies all fiber ports.

Default

Ethernet OAM is disabled on all ports.

Usage Guidelines

Use this command to disable Ethernet OAM on one or more specified ports or on all fiber ports.

When operating as a stack master, the ExtremeSwitching switch can process this command for ports on supported platforms.

Example

The following command disables Ethernet OAM on port 1:

```
# disable ethernet oam ports 1 link-fault-management
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable fdb static-mac-move

```
disable fdb static-mac-move
```

Description

Disables EMS and *SNMP* reporting of discovered MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following example disables this feature:

```
disable fdb static-mac-move
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable flooding ports

With this command you can further identify the type of packets for which to block flooding.

```
disable flooding [all_cast | broadcast | multicast | unicast] ports
    [port_list | all]
```

Description

Disables Layer 2 egress flooding on one or more ports.

Syntax Description

all_cast	Specifies disabling egress flooding for all packets on specified ports.
broadcast	Specifies disabling egress flooding only for broadcast packets.
multicast	Specifies disabling egress flooding only for multicast packets.
unicast	Specifies disabling egress flooding only for unknown unicast packets.
port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled for all packet types.

Usage Guidelines

Note

If an application requests specific packets on a specific port, those packets are not affected by the `disable flooding ports` command.

You might want to disable egress flooding to do the following:

- enhance security
- enhance privacy

- improve network performance

This is particularly useful when you are working on an edge device in the network. The practice of limiting flooded egress packets to selected interfaces is also known as upstream forwarding.

Note
If you disable egress flooding with static MAC addresses, this can affect many protocols, such as IP and ARP.

The following guidelines apply to enabling and disabling egress flooding:

- Disabling multicasting egress flooding does not affect those packets within an *IGMP* membership group at all; those packets are still forwarded out. If IGMP snooping is disabled, multicast packets are not flooded.
- Egress flooding can be disabled on ports that are in a load-sharing group. In a load-sharing group, the ports in the group take on the egress flooding state of the master port; each member port of the load-sharing group has the same state as the master port.
- On all platforms *FDB* learning takes place on ingress ports and is independent of egress flooding; either can be enabled or disabled independently.
- Disabling unicast or all egress flooding to a port also stops packets with unknown MAC addresses to be flooded to that port.
- Disabling broadcast or all egress flooding to a port also stops broadcast packets to be flooded to that port.

You can disable egress flooding for unicast, multicast, or broadcast MAC addresses, as well as for all packets on the ports of the switch. The default behavior is enabled egress flooding for all packet types.

Example

The following example disables unicast flooding on ports 10-12::

```
# disable flooding unicast port 10-27
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable flow-control ports

```
disable flow-control [tx-pause {priority priority} | rx-pause
   {qosprofile qosprofile}] ports [all | port_list]
```

Description

Disables specified flow control configurations.

Syntax Description

tx-pause	Specifies transmission pause processing.
priority	Specifies all priorities or single priorities--dot1p priority for tagged packets and internal priority for untagged packets. Used with priority flow control only.
rx-pause	Specifies reception pause processing.
qosprofile	Specifies a *QoS* profile ("qp1" "qp2" "qp3" "qp4" "qp5" "qp6" "qp7" "qp8") to pause for priority flow control packet reception. Used with priority flow control only.
all	Specifies all ports or slots.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

IEEE 802.3x-Flow Control

Use this command to disable the processing of IEEE 802.3x pause flow control messages received from the remote partner. Disabling rx-pause processing avoids dropping packets in the switch and allows for better overall network performance in some scenarios where protocols such as TCP handle the retransmission of dropped packets by the remote partner.

To disable RX flow-control, TX flow-control must first be disabled. Refer to the `disable flow-control ports` command. If you attempt to disable RX flow-control with TX flow-control enabled, an error message is displayed.

IEEE 802.1Qbb-Priority Flow Control

Use this command to disable the processing of IEEE 802.1Qbb priority flow control messages received from the remote partner. Disabling TX stops the port from transmitting PFC packets for that priority, regardless of congestion. Disabling RX stops the processing of PFC packets received on that port for the specific QoS profile.

Example

IEEE 802.3x

The following command disables the tx flow-control feature on ports 5 through 7 on an ExtremeSwitching switch:

```
# disable flow-control tx-pause ports 5-7
```

IEEE 802.1Qbb

The following command disables TX for priority 3 on port 3:

```
# disable flow-control tx-pause priority 3 ports 3
```

The following command disables RX for QoS profile qp4 on port 6:

```
# disable flow-control rx-pause qosprofile qp4 port 6
```

History

This command was first available in ExtremeXOS 12.1.3.

The priority function (PFC) was added in ExtremeXOS 12.5.

Platform Availability

IEEE 802.3x

The basic TX-pause and RX-pause functions of this command are available on all switches.

IEEE 802.1Qbb

The priority function (PFC) is available only on 10G ports.

NEW! disable flowmon

```
disable flowmon
```

Description

Disables Flow Monitor.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Modification rules for groups, keys, and collectors remain active after Flow Monitor is disabled. A new group can be created and configured with its parameters, collector, template portions, and added keys. The group can also be enabled or disabled.

Enabling a group while Flow Monitor is disabled will program the hardware, but the flow collection for the group will be disabled.

Example

The following command disables Flow Monitor:

```
# disable flowmon
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! disable flowmon group

```
disable flowmon group group_name
```

Description

Disables a Flow Monitor group.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.

Default

N/A.

Usage Guidelines

Example

The following command disables a Flow Monitor group with the name 'max-flow-age':

```
# disable flowmon group max-flow-age
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

disable icmp ipv6

```
disable icmp ipv6 [ignore-multicasts | ignore-anycasts]
```

Description

Disables the *ICMP* IPv6 reply to multicast or anycast echo request.

Syntax Description

ignore-multicasts	Specifies to reply to ICMP echo requests destined to an IP multicast address. Default is ignore (disable).
ignore-anycasts	Specifies to reply to ICMP echo requests destined to an IP anycast address. Default is ignore (disable).

Default

Ignore (disable).

Usage Guidelines

Use this command to disable ignoring a reply packet to multicast or anycast echo request.

Example

The following example specifies to reply to ICMP multicast echo requests:

```
disable icmp ipv6 ignore-multicasts
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable icmp redirects ipv6 fast-path

```
disable icmp redirects ipv6 fast-path
```

Description

When disabled (default), only slow path packets (packets that cannot be forwarded by hardware) may trigger *ICMP* redirects.

Syntax Description

fast-path	Only slow path packets (packets that cannot be forwarded by hardware) may trigger ICMP redirects.

Default

Disabled.

Usage Guidelines

Use this command so that only slow path packets (packets that cannot be forwarded by hardware) may trigger ICMP redirects.

Example

The enabled or disabled setting is displayed when entering the command:

```
# show ipconfig ipv6
Route Sharing                : Disabled
ICMP Redirect for Fast Path : Enabled
Max Shared Gateways          : Current: 4   Configured: 4

Interface              IPv6 Prefix                                        Flags
v1                     2001::1/24                                      -EUf---R-
v1                     fe80::204:96ff:fe1e:ec00%v1/64                  -EUfP--R-
Flags : D - Duplicate address detected on VLAN, T - Tentative address
E - Interface enabled, U - Interface up, f - IPv6 forwarding enabled,
i - Accept received router advertisements enabled,
R - Send redirects enabled, r - Accept redirects enabled
P - Prefix address
BD-8810.2 #
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable icmp redirects

`disable icmp redirects {`**`ipv4`**`} {`**`vlan all`** `|{`**`vlan`**`} {`*`name`*`}}`

Description

Disables the generation of *ICMP* redirect messages on one or all *VLAN*s.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Disables the generation of ICMP redirects (type 5) to hosts who direct routed traffic to the switch where the switch detects that there is another router in the same subnet with a better route to the destination.

Example

The following example disables ICMP redirects from VLAN "accounting":

```
disable icmp redirects vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable icmp useredirects

```
disable icmp useredirects
```

Description

Disables the modification of route table information when an *ICMP* redirect message is received.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This option only applies to the switch when the switch is not in routing mode.

If the switch has a route to a destination network, the switch uses that router as the gateway to forward the packets to. If that router knows about a better route to the destination, and the next hop is in the same subnet as the originating router, the second router sends an ICMP redirect message to the first router. If ICMP useredirects is disabled, the switch disregards these messages and continues to send the packets to the second router.

Example

The following example disables the changing of routing table information:

```
disable icmp useredirects
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable identity-management

```
disable identity-management
```

Description

Disables the identity management feature, which tracks users and devices that connect to the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Only admin-level users can execute this command.

Note

If the identity management feature is running and then disabled, all identity management database entries are removed and cannot be retrieved. If identity management is enabled later, the identity management feature starts collecting information about currently connected users and devices.

Example

The following command disables the identity management feature:

```
disable identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli idletimeout

```
disable cli idle-timeout
```

Description

Disables the timer that disconnects idle sessions from the switch.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Timeout 20 minutes.

Usage Guidelines

When idle time-outs are disabled, console sessions remain open until the switch is rebooted or until you logoff.

Telnet sessions remain open until you close the Telnet client.

If you have an SSH2 session and disable the idle timer, the SSH2 connection times out after 61 minutes of inactivity.

To view the status of idle time-outs on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for idle time-outs.

Example

The following command disables the timer that disconnects all sessions to the switch:

```
disable cli idle-timeout
```

History

This command was first available in ExtremeXOS 10.1.

The **cli** keyword was added and the **idletimeout** keyword was changed to **idle-timeout** in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable igmp

```
disable igmp {vlan name}
```

Description

Disables *IGMP* on a router interface. If no *VLAN* is specified, IGMP is disabled on all router interfaces.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

IGMP is a protocol used by an IP host to register its IP multicast group membership with a router. Periodically, the router queries the multicast group to see if the group is still in use. If the group is still active, hosts respond to the query, and group registration is maintained.

IGMP is enabled by default on the switch. However, the switch can be configured to disable the generation and processing of IGMP packets. IGMP should be enabled when the switch is configured to perform IP multicast routing.

This command disables IGMPv2 and IGMPv3.

Example

The following example disables IGMP on VLAN accounting:

```
disable igmp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable igmp snooping vlan fast-leave

```
disable igmp snooping {vlan} name fast-leave
```

Description

Disables the *IGMP* snooping fast leave feature on the specified *VLAN*.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables the IGMP snooping fast leave feature on the default VLAN:

```
disable igmp snooping "Default" fast-leave
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable igmp snooping

```
disable igmp snooping {forward-mcrouter-only | with-proxy | vlan name}
```

Description

Disables *IGMP* snooping.

Syntax Description

forward-mcrouter-only	Specifies that the switch forwards all multicast traffic to the multicast router only.
with-proxy	Disables the IGMP snooping proxy.
name	Specifies a *VLAN*.

Default

IGMP snooping and the with-proxy option are enabled by default, but forward-mcrouter-only option is disabled by default.

Usage Guidelines

If a VLAN is specified, IGMP snooping is disabled only on that VLAN, otherwise IGMP snooping is disabled on all VLANs.

This command applies to both IGMPv2 and IGMPv3.

If the switch is in the forward-mcrouter-only mode, then the command `disable igmp snooping forward-mcrouter-only` changes the mode so that all multicast traffic is forwarded to any IP router. If not in the forward-mcrouter-mode, the command `disable igmp snooping forward-mcrouter-only` has no effect.

To change the snooping mode you must disable IP multicast forwarding. Use the command: `disable ipmcforwarding`

The **with-proxy** option can be used for troubleshooting purpose. It should be enabled for normal network operation.

Enabling the proxy allows the switch to suppress the duplicate join requests on a group to forward to the connected Layer 3 switch. The proxy also suppresses unnecessary IGMP leave messages so that they are forwarded only when the last member leaves the group.

Example

The following example disables IGMP snooping on the VLAN accounting:

```
disable igmp snooping accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable igmp ssm-map

```
disable igmp ssm-map {vr vr-name}
```

Description

Disables *IGMP* SSM mapping.

Syntax Description

vr-name	Specifies a virtual router name. If the VR name is omitted, the switch disables mapping on the VR specified by the current CLI VR context.

Default

Disabled on all interfaces.

Usage Guidelines

None.

Example

The following command disables IGMP-SSM mapping on the VR in the current CLI VR context:

```
disable igmp ssm-map
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable inline-power

```
disable inline-power [{fast {ports [port_list | all]}} | perpetual]
```

Description

Disables *PoE*, and perpetual PoE to all ports; or fast PoE to all ports, or selected ports, for some platforms.

Syntax Description

fast	Disables delivery of PoE power to devices at the time of switch power on without waiting for boot up based on last saved PoE state. The default is disabled.
ports	For fast PoE, specifies selecting ports. ExtremeSwitching 5320, 5420, 5520, and 5720 series switches only.
port_list	For fast PoE, specifies the port list separated by a comma or -. ExtremeSwitching 5320, 5420, 5520, and 5720 series switches only.
all	For fast PoE, specifies selecting all ports. ExtremeSwitching 5320, 5420, 5520, and 5720 series switches only.
perpetual	Disable preserving PoE power delivery to devices during reboot. Perpetual PoE is a switch-wide setting. The default is disabled.

Default

By default:

- PoE is enabled.
- Fast PoE is disabled.
- Perpetual PoE is disabled.

Usage Guidelines

You can control whether inline power is provided to the system by using the `disable inline-power` command and the `enable inline power` command. Using the `disable inline-power` command shuts down inline power currently provided on the entire switch or to specified ports and slots. Disabling inline power to a switch, port, or slot immediately removes power to any connected PDs. By default, inline power provided to all ports is enabled. Additionally, you can disable delivery of PoE power to devices at the time of switch power on without waiting for boot up (fast PoE) based on last saved PoE state. Per-port fast PoE is available on certain platforms. You can also elect to not preserve PoE power delivery to devices during reboot (perpetual PoE). The default for both PoE options is disabled.

Note

Disabling inline power using the `disable inline-power` command does not affect the data traffic traversing the port. And, disabling the port using the `disable port` command does not affect the inline power supplied to the port.

Note
Inline power cannot be delivered to connected PDs unless the switch is powered on.

Example

The following command shuts down inline power currently provided to all ports and all slots:

```
disable inline-power
```

The following example turns off perpetual PoE for the switch:

```
# disable inline-power perpetual
```

The following example turns off fast PoE for ports 1,2, and 5:

```
# disable inline-power fast ports 1,2,5
```

History

This command was first available in ExtremeXOS 11.1.

The **fast** and **perpetual** PoE options were added in ExtremeXOS 30.3.

Per-port fast PoE was added for ExtremeXOS 31.1.

Platform Availability

This command is available on the PoE devices listed in *Extreme Networks PoE Devices* in the *Switch Engine 32.2 User Guide*.

The **fast** and **perpetual** options are only available on the ExtremeSwitching 5320, 5420, 5520, and 5720 (per port) series switches.

disable inline-power ports

```
disable inline-power ports [all | port_list]
```

Description

Shuts down *PoE* power currently provided to all ports or to specified ports.

Syntax Description

all	Disables inline power to all ports on the switch.
port_list	Disables inline power to the specified ports.

Default

Enable.

Usage Guidelines

Disabling inline power to ports immediately removes power to any connected PDs. By default, the capability to provide inline power to all ports is enabled.

Note

Disabling inline power using the `disable inline-power` command does not affect the data traffic traversing the port. And, disabling the port using the `disable port` command does not affect the inline power supplied to the port.

Disabling inline power to a port providing power to a PD immediately removes power to the PD.

Example

The following command shuts down inline power currently provided to ports 4 and 5 on a switch:

```
disable inline-power ports 4,5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

disable inline-power slot

```
disable inline-power [fast | perpetual] slot slot
```

Description

Shuts down *PoE*, and fast and perpetual PoE, power currently provided to the specified slot.

Syntax Description

slot	Selects the slot to disable inline power, or fast/perpetual PoE power on.
fast	Disable delivery of PoE power to devices at the time of switch power on without waiting for boot up based on last saved PoE state. The default is disabled.
perpetual	Disable preserving PoE power delivery to devices during reboot. Perpetual PoE is a switch-wide setting. The default is disabled.

Default

By default:

- PoE is enabled.

- Fast PoE is disabled.
- Perpetual PoE is disabled.

Usage Guidelines

Disabling inline power to a slot immediately removes power to any connected PDs. By default, the capability to provide inline power to a slot is enabled. Additionally, you can disable delivery of PoE power to devices at the time of switch power on without waiting for boot up (fast PoE) based on last saved PoE state. You can also elect to not preserve PoE power delivery to devices during reboot (perpetual PoE). The default for both PoE options is disabled.

Note

You can set the reserved power budget to 0 for a slot if, and only if, you first issue this command.

On a stack if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Example

The following command removes power to all PDs on slot 3:

```
disable inline-power slot 3
```

The following example turns off perpetual PoE for slot 3:

```
# disable inline-power perpetual slot 3
```

History

This command was first available in ExtremeXOS 11.1.

The **fast** and **perpetual** PoE options were added in ExtremeXOS 30.3.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

disable ip anycast

```
disable ip anycast {vlan} vlan_name
```

Description

Disables IP anycast on a VLAN.

Syntax Description

ip	Layer 3 Internet Protocol.
anycast	Disables IP anycast on a VLAN.
vlan	Selects the VLAN.
vlan_name	Specifies the VLAN name.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example disables IP anycast on the VLAN "vlan1":

```
# disable ip anycast vlan vlan1
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip nat

```
disable ip nat
```

Description

Globally disables Network Address Translation (NAT).

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies enabling NAT.

Default

N/A.

Usage Guidelines

NAT maps IP addresses from one address domain (typically private IP address spaces) to an another address domain (typically a public Internet IP address space) to provide transparent routing to end hosts. This translation is accomplished transparently by having a NAT device translate the IP address and/or Layer 4 port of the packets.

To view IP NAT information, run the command `show` **`ip nat`**.

Example

The following example disables IP NAT:

```
# disable ip nat
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ip nat rule

`disable` **`ip nat rule`** *`rule_name`*

Description

Disables Network Address Translation (NAT) rules.

Syntax Description

`ip`	Specifies Internet Protocol (IP).
`nat`	Specifies NAT.
`rule`	Specifies disabling a NAT rule.
`rule_name`	Specifies the NAT rule to disable.

Default

N/A.

Usage Guidelines

You must disable a rule to make configuration changes to it.

Example

The following example the disables the IP NAT rule "rule1":

```
# disables ip nat rule rule1
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

disable iparp checking

```
disable iparp {vr vr_name} checking
```

Description

Disable checking if the ARP request source IP address is within the range of the local interface or *VLAN* domain.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example disables IP ARP checking:

```
disable iparp checking
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable iparp gratuitous protect vlan

```
disable iparp gratuitous protect [ {vlan} vlan_name | vlan vlan_list]
```

Description

Disables gratuitous ARP protection on the specified *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN.
vlan_list	Specifies a VLAN list of IDs.

Default

Disabled.

Usage Guidelines

Hosts can launch man-in-the-middle attacks by sending out gratuitous ARP requests for the router's IP address. This results in hosts sending their router traffic to the attacker, and the attacker forwarding that data to the router. This allows passwords, keys, and other information to be intercepted.

To protect against this type of attack, the router will send out its own gratuitous ARP request to override the attacker whenever a gratuitous ARP broadcast with the router's IP address as the source is received on the network.

This command disables gratuitous ARP protection.

Example

The following example disables gratuitous ARP protection for VLAN corp:

```
disable iparp gratuitous protect vlan corp
```

History

This command was first available in ExtremeXOS 11.2.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable iparp refresh

```
disable iparp {vr vr_name} refresh
```

Description

Disables IP ARP to refresh its IP ARP entries before timing out.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

The purpose of disabling ARP refresh is to reduce ARP traffic in a high node count Layer 2 switching only environment.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example disables IP ARP refresh:

```
disable iparp refresh
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ipforwarding broadcast

```
disable ipforwarding broadcast [ {vlan} vlan_name | vlan vlan_list]
```

Description

Disables routing (or routing of broadcasts) for one or all *VLAN*s. If no argument is provided, disables routing for all VLANs.

Syntax Description

broadcast	Specifies broadcast IP forwarding.
vlan_name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

Disabling IP forwarding also disables broadcast forwarding. Broadcast forwarding can be disabled without disabling IP forwarding. When new IP interfaces are added, IP forwarding (and IP broadcast forwarding) is disabled by default.

Other IP related configuration is not affected.

Example

The following example disables forwarding of IP broadcast traffic for a VLAN "accounting":

```
disable ipforwarding broadcast vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **ignore-broadcast** and **fast-direct-broadcast** keywords were added in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ipforwarding broadcast

```
disable ipforwarding broadcast [ {vlan} vlan_name | vlan vlan_list]
```

Description

Disables routing (or routing of broadcasts) for one or all *VLAN*s. If no argument is provided, disables routing for all VLANs.

Syntax Description

broadcast	Specifies broadcast IP forwarding.
vlan_name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

Disabling IP forwarding also disables broadcast forwarding. Broadcast forwarding can be disabled without disabling IP forwarding. When new IP interfaces are added, IP forwarding (and IP broadcast forwarding) is disabled by default.

Other IP related configuration is not affected.

Example

The following example disables forwarding of IP broadcast traffic for a VLAN "accounting":

```
disable ipforwarding broadcast vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **ignore-broadcast** and **fast-direct-broadcast** keywords were added in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ipforwarding ipv6

```
disable ipforwarding ipv6 [ {vlan} vlan_name | vlan vlan_list] | tunnel
   tunnel_name | vr vr_name}
```

Description

Disables routing for one or all interfaces. If no argument is provided, disables routing for all interfaces on the current VR or VRF.

Syntax Description

vlan_name	Specifies an IPv6 configured *VLAN*.
vlan_list	Specifies a VLAN list of IDs.
tunnel_name	Specifies an IPv6 tunnel.
vr_name	Specifies a VR or VRF.

Default

Disabled.

Usage Guidelines

When new IPv6 interfaces are added, IPv6 forwarding is disabled by default.

Example

The following example disables forwarding of IPv6 traffic for a VLAN "accounting":

```
disable ipforwarding ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

disable ipmcforwarding ipv6

```
disable ipmcforwarding ipv6 {{vlan} name}
```

Description

Disables IPv6 multicast forwarding on a router interface.

Syntax Description

name	Specifies a *VLAN* name.

Default

Disabled.

Usage Guidelines

If no options are specified, all configured IPv6 interfaces are affected. When new IPv6 interfaces are created, IPv6 multicast forwarding is disabled by default.

Disabling IPv6 multicast forwarding disables any Layer 3 IPv6 multicast routing for the streams coming to the interface.

Example

The following example disables IPv6 multicast forwarding on VLAN accounting:

```
disable ipmcforwarding ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv6 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ipmcforwarding

```
disable ipmcforwarding {vlan name}
```

Description

Disables IP multicast forwarding on a router interface.

Syntax Description

name	Specifies a *VLAN* name.

Default

Disabled.

Usage Guidelines

If no options are specified, all configured IP interfaces are affected. When new IP interfaces are added, IP multicast forwarding is disabled by default.

IP forwarding must be enabled before enabling IP multicast forwarding.

Disabling IP multicast forwarding disables any Layer 3 multicast routing for the streams coming to the interface.

Example

The following example disables IP multicast forwarding on the VLAN accounting:

```
disable ipmcforwarding vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ip option loose-source-route

```
disable ip option loose-source-route
```

Description

Disables processing of the loose source route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Disables the switch from forwarding IP packets with the IP option for loose source routing turned on. Packets with the loose-source-route option enabled are dropped by the switch.

Example

The following example disables processing of the loose source route IP option:

```
# disable ip option loose-source-route
```

History

This command was first available in ExtremeXOS 10.1.

This command was removed in ExtremeXOS 30.1, and then re-introduced in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip option strict-source-route

```
disable ip option strict-source-route
```

Description

Disables processing the strict source route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Disables the switch from forwarding IP packets that have the strict source routing IP option turned on. The switch drops packets that have the strict source routing IP option enabled.

Example

The following example disables processing of the strict source route IP option:

```
# disable ip option strict-source-route
```

History

This command was first available in ExtremeXOS 10.1.

This command was removed in ExtremeXOS 30.1, and then re-introduced in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable iproute bfd

```
disable iproute bfd {gateway} ip_addr {vr vrname}
```

Description

Disables BFD client services for IPv4 static routes.

Syntax Description

ip_addr	Specifies the IPv4 address of a neighbor for which BFD services are to be stopped.
vrname	Specifies the VR or VRF name for which BFD services are being disabled.

Default

Disabled.

Usage Guidelines

When the BFD client is disabled, BFD services for all static IP routes terminates. This command does not disable services for other BFD clients (such as the *MPLS* BFD client).

Example

The following example disables BFD client protection for communications with neighbor 10.10.10.1:

```
# disable iproute bfd 10.10.10.1
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable iproute bfd strict

```
disable iproute {protection} bfd strict
```

Description

Turns off "strict" Bidirectional Forwarding Detection (BFD) session control, which brings up the static route during switch reboot if the static route nexthop BFD session is in the INIT state.

Syntax Description

protection	Enables or disables route protection.
bfd	BFD protect static routes to next hop gateway.
strict	Disables considering that protected static routes are not up if the BFD session is in INIT state. Default is disabled.

Default

By default, strict BFD session control is disabled.

Usage Guidelines

If the BFD session is down, but BFD protected static route is still in the routing table after reboot, the BFD session is never established, because during reboot, the BFD session is in the INIT state, and the static route is brought up without considering BFD session state. This can cause traffic loss because the link to the gateway actually is down. This command turns off strict BFD session control, which means that the static route is brought up during reboot even if the BFD session is in the INIT state. A reboot is required to make the command take effect.

Example

The following example disables BFD strict session control:

```
# disable iproute bfd strict
WARNING: Please reboot the switch for the strict BFD to take effect.
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable iproute compression

```
disable iproute compression {vr vrname}
```

Description

Disables IPv4 route compression.

Syntax Description

vrname	VR or VRF name for which the IP route compression is being disabled. If the VR or VRF name is not specified, route compression is disabled for the VR context from which CLI command is issued.

Default

Enabled.

Usage Guidelines

Disables IPv4 route compression for a specified VR or VRF.

Example

The following example disables IP route compression:

```
disable iproute compression
```

History

This command was first available in ExtremeXOS 12.0.

Default changed to enabled in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable iproute ipv6 compression

```
disable iproute ipv6 compression {vr vr_name}
```

Description

This command disables IPv6 route compression.

Syntax Description

vr_name	Specifies a VR or VRF. If not specified, the current CLI context is used.

Default

By default, IPv6 route compression is disabled for all address families and VRs.

Usage Guidelines

This command disables IPv6 route compression for the IPv6 address family and VR. This command decompresses previously compressed prefixes in the IPv6 prefix database.

Example

The following example disables IPv6 route compression for the IPv6 address family and the VR of the current CLI context:

```
disable iproute ipv6 compression
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

disable iproute ipv6 sharing

```
disable iproute ipv6 sharing {{{vr} vr_name} | {{vr} all}}
```

Description

This command disables IPv6 route sharing.

Syntax Description

vr_name	Specifies a VR or VRF. If not specified, the current CLI context is used
all	Specifies all VR or VRF.

Default

By default, IPv6 route sharing is disabled.

Usage Guidelines

This command disables IPv6 route sharing for the IPv6 address family and VR.

Example

The following example disables IPv6 route sharing for the IPv6 address family and the VR of the current CLI context:

```
disable iproute ipv6 sharing
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

The ability to enable and disable *ECMP* for IPv6 is supported for all platforms.

disable iproute mpls-next-hop

```
disable iproute mpls-next-hop
```

Description

Disables IP forwarding over *MPLS* LSPs for the default VR.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables IP forwarding over MPLS LSPs for the default VR. When disabled, any route with an MPLS LSP as its next hop becomes inactive and is not used to tunnel IP traffic across the MPLS network. By default, IP forwarding over MPLS LSPs is disabled.

Example

This command disables IP forwarding over MPLS LSPs.

```
disable iproute mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable iproute protection ping

```
disable iproute {ipv4 | ipv6} protection ping
```

Description

Globally disables ping protection for static routes added with ping protection for IPv4 and IPv6. Routes are up in the routing table, and ping health check monitoring is not performed.

Syntax Description

ipv4	Specifies IPv4 (default).
ipv6	Specifies IPv6.

protection	Disables route protection.
ping	Globally disables ping protection for static routes added with ping protection (default is enabled).

Default

Enabled is the default. If not specified, IPv4 is the default.

Example

The following example disables ping protection for static routes added with ping protection for IPv4:

```
# disable iproute ipv4 protection ping
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on all platforms with any license level as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable iproute sharing

```
disable iproute {ipv4} sharing {{vr} vrname} | {vr} {all}
```

Description

Disables IPv4 route sharing.

Syntax Description

vrname	VR or VRF name for which IP route sharing is being disabled.

Default

Disabled.

Usage Guidelines

If a VR is not specified, this command disables IP route sharing in the current VR context.

Example

The following example disables load sharing for multiple routes:

```
disable iproute sharing
```

History

This command was first available in ExtremeXOS 12.1.

The **vr** option was added in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security anomaly-protection icmp

```
disable ip-security anomaly-protection icmp {slot [ slot | all ]}
```

Description

Disables *ICMP* size and fragment checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables ICMP size and fragment checking. This checking takes effect for both IPv4 and IPv6 TCP packets. When enabled, the switch drops ICMP packets if one of following condition is true:

- Fragmented ICMP packets for IPv4 packets.
- IPv4 ICMP pings packets with payload size greater than the maximum IPv4 ICMP-allowed size. (The maximum allowed size is configurable.)
- IPv6 ICMP ping packets with payload size > the maximum IPv6 ICMP-allowed size. (The maximum allowed size is configurable.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security anomaly-protection ip

```
disable ip-security anomaly-protection ip { slot [ slot | all ] }
```

Description

Disables source and destination IP address checking.

Syntax Description

slot	Specifies the slot.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables source and destination IP addresses checking. This checking takes effect for both IPv4 and IPv6 packets. When enabled, the switch drops IPv4/IPv6 packets if its source IP address are the same as the destination IP address. In most cases, the condition of source IP address being the same as the destination IP address indicates a Layer 3 protocol error. (These kind of errors are found in LAND attacks.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security anomaly-protection l4port

```
disable ip-security anomaly-protection l4port [tcp | udp | both] {slot
   [ slot | all ]}
```

Description

Disables TCP and UDP ports checking.

Syntax Description

tcp	Specifies that the TCP port be disabled for checking.
udp	Specifies that the UDP port be disabled for checking.

both	Specifies both the TCP and UDP ports be disabled for checking.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables TCP and UDP ports checking. This checking takes effect for both IPv4 and IPv6 TCP and UDP packets. When enabled, the switch drops TCP and UDP packets if its source port is the same as its destination port. In most cases, when the condition of source port is the same as that of the destination port, it indicates a Layer4 protocol error. (This type of error can be found in a BALT attack.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security anomaly-protection notify

```
disable ip-security anomaly-protection notify [log | snmp | cache] {slot
   [ slot | all ]}
```

Description

Disables protocol anomaly notification.

Syntax Description

log	Specifies the switch to send the notification to a log file.
snmp	Specifies the switch to send an *SNMP* trap when an event occurs.
cache	Specifies the switch to send the notification to cache.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables anomaly notification. When enabled, any packet failed to pass enabled protocol checking is sent to XOS Host CPU and notifies the user. There are three different types of notifications:

- log: log anomaly events in the switch log system; you can view and manage this log with the show log and configure log commands.
- snmp: the anomaly events generate SNMP traps.
- cache: logs the most recent and unique anomaly events in memory; rebooting the switch will cause all the logged events to be lost (the number of cached events is configured by command).

When disabled, the switch drops all violating packets silently.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security anomaly-protection tcp flags

```
disable ip-security anomaly-protection tcp flags {slot [ slot | all ]}
```

Description

Disables TCP flag checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables TCP flag checking. This checking takes effect for both IPv4 and IPv6 TCP packets. When enabled, the switch drops TCP packets if one of following condition is true:

- TCP SYN flag==1 and the source port<1024
- TCP control flag==0 and the sequence number==0
- TCP FIN, URG, and PSH bits are set, and the sequence number==0
- TCP SYN and FIN both are set.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security anomaly-protection tcp fragment

```
disable ip-security anomaly-protection tcp fragment {slot [ slot |
   all ]}
```

Description

Disables TCP fragment checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables TCP fragment checking. This checking takes effect for IPv4/IPv6. When it is enabled, the switch drops TCP packets if one of following condition is true:

- For the first IPv4 TCP fragment (its IP offset field==0), if its TCP header is less than the minimum IPv4 TCP header allowed size.
- If its IP offset field==1 (for IPv4 only).

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security anomaly-protection

```
disable ip-security anomaly-protection {slot [ slot | all ]}
```

Description

Disables all anomaly checking options.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This commands disables all anomaly checking options, including IP address, UDP/TCP port, TCP flag and fragment, and *ICMP* anomaly checking.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security arp gratuitous-protection

```
disable ip-security arp gratuitous-protection [dynamic | {vlan}
   vlan_name |all ]
```

Description

Disables gratuitous ARP protection on one or all *VLAN*s on the switch.

Syntax Description

all	Specifies all VLANs configured on the switch.
vlan-name	Specifies the VLAN.
dynamic	Configuration options for dynamically created VLANs.

Default

By default, gratuitous ARP protection is disabled.

Usage Guidelines

Beginning with ExtremeXOS 11.6, this command replaces the `disable iparp gratuitous protect vlan` command.

Hosts can launch man-in-the-middle attacks by sending out gratuitous ARP requests for the router's IP address. This results in hosts sending their router traffic to the attacker, and the attacker forwarding that data to the router. This allows passwords, keys, and other information to be intercepted.

To protect against this type of attack, the router will send out its own gratuitous ARP request to override the attacker whenever a gratuitous ARP broadcast with the router's IP address as the source is received on the network.

This command disables gratuitous ARP protection.

Example

The following command disables gratuitous ARP protection for VLAN corp:

```
disable ip-security arp gratuitous-protection vlan corp
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN option added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security arp learning learn-from-arp

```
disable ip-security arp learning learn-from-arp [dynamic | {vlan}
   vlan_name] ports [all | ports]
```

Description

Disables ARP learning on the specified *VLAN* and member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN to which this rule applies.
dynamic	Configuration options for dynamically created VLANs.
all	Specifies all ingress ports.
ports	Specifies one or more ingress ports.

Default

By default, ARP learning is enabled.

Usage Guidelines

You can disable ARP learning so that the only entries in the ARP table are either manually added or those created by *DHCP* secured ARP; the switch does not add entries by tracking ARP requests and replies. By disabling ARP learning and adding a permanent entry or configuring DHCP secured ARP, you can centrally manage and allocate client IP addresses and prevent duplicate IP addresses from interrupting network operation.

To manually add a permanent entry to the ARP table, use the following command:

`configure iparp add` *`ip_addr`* `{vr` *`vr_name`*`}` *`mac`*

To configure DHCP secure ARP as a method to add entries to the ARP table, use the following command:

`enable ip-security arp learning learn-from-dhcp` **`vlan`** *`vlan_name`* **`ports`** `[`**`all`**` |` *`ports`*`] {poll-interval` *`interval_in_seconds`*`} {`**`retries`** *`number_of_retries`*`}`

Displaying ARP Information

To display how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports, use the following command:

`show ip-security arp learning {vlan}` *`vlan_name`*

To view the ARP table, including permanent and DHCP secured ARP entries, use the following command:

`show iparp {`*`ip_address`*` | `*`mac`*` | vlan`*`vlan_name`*` | permanent} {vr`*`vr_name`*`}`

Note

DHCP secured ARP entries are stored as static entries in the ARP table.

Example

The following command disables ARP learning on port 1:1 of the VLAN learn:

```
disable ip-security arp learning learn-from-arp vlan learn ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN option was added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security arp learning learn-from-dhcp

```
disable ip-security arp learning learn-from-dhcp [dynamic vlan | {vlan}
   vlan_name ports [all | ports]
```

Description

Disables *DHCP* secured ARP learning for the specified *VLAN* and member ports.

Syntax Description

dynamic	Configuration options for dynamically created VLANs.
vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ingress ports.
ports	Specifies one or more ingress ports.

Default

By default, DHCP secured ARP learning is disabled.

Usage Guidelines

Use this command to disable DHCP secured ARP learning.

Displaying ARP Information

To display how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports, use the following command:

```
show ip-security arp learning {vlan} vlan_name
```

To view the ARP table, including permanent and DHCP secured ARP entries, use the following command:

```
show iparp {ip_address | mac | vlanvlan_name | permanent} {vrvr_name}
```

Example

The following command disables DHCP secured ARP learning on port 1:1 of the VLAN learn:

```
disable ip-security arp learning learn-from-dhcp vlan learn ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN support was added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security arp validation

```
disable ip-security arp validation [dynamic | {vlan} vlan_name] [all |
   ports]
```

Description

Disables ARP validation for the specified *VLAN* and member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN to which this rule applies.
dynamic	Configuration options for dynamically created VLANs.
all	Specifies all ports.
ports	Specifies one or more ports.

Default

By default, ARP validation is disabled.

Usage Guidelines

Use this command to disable ARP validation.

Displaying ARP Validation Information

To display information about ARP validation, use the following command:

```
show ip-security arp validation {vlan} vlan_name
```

Example

The following command disables ARP validation on port 1:1 of the VLAN valid:

```
disable ip-security arp validation vlan valid ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN option added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security dhcp-bindings restoration

```
disable ip-security dhcp-bindings restoration
```

Description

Disables the download and upload of *DHCP* bindings.

Syntax

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The command allows you to disable the download and upload of the DHCP bindings, essentially disabling the DHCP binding functionality. The default is disabled.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security dhcp-snooping

```
disable ip-security dhcp-snooping [dynamic | {vlan} vlan_name] ports
   [all | ports]
```

Description

Disables *DHCP* snooping on the switch.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping *VLAN*.
dynamic	Configuration options for dynamically created VLANs.

all	Specifies all ports to stop receiving DHCP packets.
ports	Specifies one or more ports to stop receiving DHCP packets.

Default

By default, DHCP snooping is disabled.

Usage Guidelines

Use this command to disable DHCP snooping on the switch.

Example

The following command disables DHCP snooping on the switch:

```
disable ip-security dhcp-snooping vlan snoop ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN option added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ip-security source-ip-lockdown ports

```
disable ip-security source-ip-lockdown ports [all | ports]
```

Description

Disables the source IP lockdown feature on one or more ports.

Syntax Description

all	Specifies all ports for which source IP lockdown should be disabled.
ports	Specifies one or more ports for which source IP lockdown should be disabled.

Default

By default, source IP lockdown is disabled on the switch.

Usage Guidelines

To display the source IP lockdown configuration on the switch, use the following command:

`show ip-security source-ip-lockdown`

Example

The following command disables source IP lockdown on ports 1:1 and 1:4:

```
disable ip-security source-ip-lockdown ports 1:1, 1:4
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable iqagent

`disable iqagent`

Description

Disables the ExtremeCloud™ IQ Agent.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Disabling IQ Agent prevents all access to ExtremeCloud IQ. Any current activity with ExtremeCloud IQ, including remote SSH sessions, are disconnected immediately. Re-enabling IQ Agent can only occur by using the `enable iqagent` command using either console or Telnet or SSH access. Disabling IQ Agent deactivates automatic DHCP access on VLAN Mgmt, which is required for Zero-Touch Provisioning (ZTP).

To view the state if the IQ Agent, use the command `show` **`iqagent discovery`** without the **`discovery`** option.

Example

The following example disables the IQ Agent:

```
# disables iqagent
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on the ExtremeSwitching 5520 platform.

disable irdp

```
disable irdp {vlan name}
```

Description

Disables the generation of *ICMP* router advertisement messages on one or all *VLAN*s.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

If no optional argument is specified, all the IP interfaces are affected.

Example

The following example disables IRDP on VLAN "accounting":

```
disable irdp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

disable isis

```
disable isis {area area_name}
```

Description

This command disables the specified IS-IS router process on the current virtual router.

Syntax Description

area_name	Specifies the name of the IS-IS router process to be disabled.

Default

Disabled.

Usage Guidelines

IS-IS PDUs are no longer sent or processed on this IS-IS router process. The LSP and neighbor databases are purged. IS-IS routes are purged from the routing table. This command should only be used during planned network outages. This command has no effect on router processes that are already disabled.

Example

The following command disables the IS-IS process named areax:

```
disable isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable isis area adjacency-check

```
disable isis area area_name adjacency-check {ipv4| ipv6}
```

Description

This command disables the checking of the following TLVs when forming adjacencies: Protocols Supported and IP Interface Address.

Syntax Description

area_name	Specifies the name of the IS-IS router process that should no longer perform the adjacency check.
ipv4	Specifies that the adjacency check should no longer be performed on IPv4 interfaces.
ipv6	Specifies that the adjacency check should no longer be performed on IPv6 interfaces.

Default

IPv4: Enabled.

IPv6: Enabled.

Usage Guidelines

When adjacency checking is disabled, adjacencies may be formed on interfaces that do not reside on the same subnet or do not support IPv4 (if disabled for IPv4) or IPv6 (if disabled for IPv6). If neither ipv4 nor ipv6 is specified, this command applies to IPv4.

Example

The following command directs the IS-IS process named areax to disable adjacency checks on IPv6 interfaces:

```
disable isis area areax adjacency-check ipv6
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable isis area dynamic-hostname

`disable isis area` *area_name* **dynamic-hostname**

Description

This command disables the dynamic hostname feature.

Syntax Description

area_name	Specifies the name of the IS-IS process for which the dynamic-hostname feature is to be disabled.

Default

Disabled.

Usage Guidelines

The specified router process no longer includes code 137 TLVs in its LSPs and names are no longer displayed in show commands.

Example

The following command disables the display of area names or *SNMP* names instead of system IDs:

```
disable isis area areax dynamic-hostname
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable isis area export ipv6

```
disable isis area area_name export ipv6 route-type
```

Description

This command disables IPv6 route redistribution of the specified type into IS-IS.

Syntax Description

area_name	Specifies the IS-IS router process for which route redistribution is disabled.
route-type	Selects the type of export route to disable. The valid route types are: direct, ospfv3, ospfv3-extern1, ospfv3-extern2, ospfv3-inter, ospfv3-intra, ripng, bgp, and static.

Default

All types are disabled.

Usage Guidelines

None.

Example

The following command disables *RIPng* route distribution into areax:

```
disable isis area areax export ipv6 ripng
```

History

This command was first available in ExtremeXOS 12.1.

Support for *BGP* was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable isis area export

```
disable isis area area_name export {ipv4} route-type
```

Description

This command disables IPv4 route redistribution of the specified type into IS-IS.

Syntax Description

area_name	Specifies the IS-IS router process for which route redistribution is disabled.
ipv4	Specifies that the configuration change is for IPv4 IS-IS routing.
route-type	Selects the type of export route to disable. The valid route types are: bgp, direct, e-bgp, i-bgp, ospf, ospf-extern1, ospf-extern2, ospf-inter, ospf-intra, rip, and static.

Default

All types are disabled.

Usage Guidelines

None.

Example

The following command disables *RIP* route distribution into areax:

```
disable isis area areax export rip
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable isis area originate-default

```
disable isis area area_name originate-default {ipv4 | ipv6}
```

Description

This command disables the generation of one or all default routes in the LSPs for the specified router process.

Syntax Description

area_name	Specifies the name of the IS-IS router process that should no longer generate the default route.
ipv4	Specifies that the router process should no longer generate the default IPv4 route.
ipv6	Specifies that the router process should no longer generate the default IPv6 route.

Default

IPv4: Disabled.

IPv6: Disabled.

Usage Guidelines

This applies to level 2 routing only. By default this command disables IPv4 default route origination. The optional ipv6 keyword disables IPv6 default route origination. This command has no effect on router processes that are already disabled for default route origination on level 1-only router processes.

Example

The following command directs the IS-IS process named areax to stop generating the default IPv4 route in it's LSPs:

```
disable isis area areax originate-default
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable isis area overload-bit

`disable isis area` *`area_name`* **`overload-bit`**

Description

This command disables the overload-bit feature.

Syntax Description

area_name	Specifies the area name of the IS-IS process for which this feature is to be disabled.

Default

Disabled.

Usage Guidelines

Disabling the overload bit feature causes an SPF recalculation throughout the network. In addition, external and interlevel router redistribution is no longer suppressed if those options were included when the overload bit was enabled. If the overload bit is currently set as a result of the overload-bit on-startup command, this command overrides the configuration and disables this feature.

Example

The following command disables the overload bit feature for areax:

```
disable isis area areax overload-bit
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable isis hello-padding

```
disable isis [vlan all | {vlan} vlan_name] hello-padding
```

Description

This command disables the padding of Hello PDUs for one or all IS-IS *VLAN*s.

Syntax Description

vlan all	Disables hello padding on all IS-IS VLANs.
vlan_name	Specifies a single VLAN on which to disable hello padding.

Default

Enabled.

Usage Guidelines

Implicit adjacency MTU verification is not performed when hello padding is disabled.

Example

The following command disables hello padding on all IS-IS VLANs:

```
disable isis vlan all hello-padding
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable isis restart-helper

```
disable isis restart-helper
```

Description

This command disables the IS-IS restart helper.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

When this feature is disabled, the router does not act as a restart helper and may time out a restarting router's adjacency per normal operation.

Example

The following command disables the IS-IS restart helper:

```
disable isis restart-helper
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable jumbo-frame ports

```
disable jumbo-frame ports [all | port_list]
```

Description

Disables jumbo frame support on a port.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

Use this command to disable jumbo frames on individual ports.

Example

The following command disables jumbo frame support on a switch:

```
disable jumbo-frame ports all
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable l2vpn

```
disable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]]
```

Description

Disables the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

All newly created VPLS instances are enabled.

Usage Guidelines

When a VPLS or VPWS instance is disabled, all sessions to its configured peers are terminated. Any locally attached service *VLAN*/VMAN is immediately isolated from other devices residing in the VPN. If this is an H-VPLS core node, then all spoke nodes connected to this peer are isolated unless redundant core access is configured.

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4 and is required when disabling a VPWS. For backward compatibility, the **l2vpn** keyword is optional when disabling a VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command disables the VPLS named myvpls:

```
disable vpls myvpls
```

The following command disables the VPWS named myvpws:

```
disable l2vpn vpws myvpws
```

History

This command was first available in ExtremeXOS 11.6.

The **l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable l2vpn health-check vccv

```
disable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]] health-
   check vccv
```

Description

Disables the VCCV health check feature on the specified VPLS or VPWS instances.

Syntax Description

vpls_name	Identifies the VPLS for which health check is to be disabled.
vpws_name	Identifies the VPWS for which health check is to be disabled.
all	Specifies that health check is to be disabled on all VPLS instances on the local node.

Default

Health check is disabled.

Usage Guidelines

The **l2vpn** keyword was introduced in ExtremeXOS Release 12.4 and is required when disabling health check for a VPWS instance. For backward compatibility, the **l2vpn** keyword is optional when disabling health check for VPLS instance. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command disables the health check feature on the VPLS instance myvpls:

```
disable l2vpn vpls myvpls health-check vccv
```

History

This command was first available in ExtremeXOS 12.1.

The **l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable l2vpn service

```
disable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]] service
```

Description

Disables the configured services for the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

Enabled.

Usage Guidelines

When services are disabled, the VPLS or VPWS is removed from all peer sessions. The keyword all disables services for all VPLS instances.

The **l2vpn** keyword was introduced in ExtremeXOS Release 12.4 and is required when disabling a service for a VPWS peer. For backward compatibility, the **l2vpn** keyword is optional when disabling a service for a VPLS peer. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command disables the configured services for VPLS myvpls:

```
disable l2vpn vpls myvpls service
```

History

This command was first available in ExtremeXOS 11.6.

The**l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable l2vpn sharing

```
disable l2vpn sharing
```

Description

Disables LSP sharing for Layer 2 VPN pseudo-wires.

Syntax Description

This command has no keywords or arguments.

Default

Disabled.

Usage Guidelines

This command disables LSP sharing for L2VPN PWs. When LSP sharing is disabled, only 1 named LSP is used for a PW. When LSP sharing is enabled, up to 16 named LSPs are used for a PW.

If LSP Sharing is disabled, and more than 1 Transport LSP is programmed into HW, all but 1 Transport LSP is removed from HW, and the configuration is preserved. If LSP Sharing is enabled, and more than 1 Transport LSP was previously configured, the remaining LSPs is programmed into HW as they become available for use.

Example

The following command disables LSP sharing for L2VPN PWs:

```
disable l2vpn sharing
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available only on the platforms that support as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable l2vpn vpls peer fdb send-mac-withdrawal

disable **l2vpn vpls peer** [*ipaddress* | **all**] **fdb send-mac-withdrawal**

Description

Disables the MAC address withdrawal capability.

Syntax Description

l2vpn	Designates L2 VPN configuration.
vpls	Designates VPLS of MPLS configuration.
peer	Designates VPLS peer.
ipaddress	Selects the VPLS peer of the provided IP address.
all	Selects all VPLS peers.
fdb	Designates FDB.
send-mac-withdrawal	Disables sending the MAC address withdrawal message.

Default

Enabled.

Usage Guidelines

When disabled, the switch does not send MAC address withdrawal messages. If a MAC address withdrawal message is received from another VPLS peer, the local peer processes the message and withdraws the specified MAC addresses from its *FDB*, regardless of the MAC address withdrawal configuration.

Example

The following command disables MAC address withdrawal message for all VPLS peers:

```
# disable l2vpn vpls peer all fdb send-mac-withdrawal
```

History

This command was first available in ExtremeXOS 12.1.

The **l2vpn** keyword was added in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable learning iparp sender-mac

```
disable learning iparp {vr vr_name} sender-mac
```

Description

Disables MAC address learning from the payload of IP ARP packets.

Syntax Description

vr_name	Specifies a virtual router.

Default

Disabled.

Usage Guidelines

To view the configuration for this feature, use the following command: `show iparp`

Example

The following example disables MAC address learning from the payload of IP ARP packets:

```
disable learning iparp sender-mac
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable learning port

```
disable learning {drop-packets | forward-packets} port [port_list | all]
```

Description

Disables MAC address learning on one or more ports for security purposes.

Syntax Description

drop-packets	Specifies that packets with unknown source MAC addresses be dropped. When disable learning is configured, this is the default behavior.
forward-packets	Specifies that packets with unknown source MAC addresses be forwarded.
port	Specifies the port.
port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports and slots.

Default

Enabled.

Usage Guidelines

Use this command in a secure environment where access is granted via permanent forwarding databases (FDBs) per port.

Example

The following command disables MAC address learning on port 4 on a switch:

```
disable learning ports 4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable learning vxlan ipaddress

```
disable learning {forward-packets | drop-packets} vxlan {vr vr_name}
   ipaddress remote_ipaddress
```

Description

This command disables learning a remote endpoint.

Syntax Description

forward-packets	Forward packets with unknown source MAC addresses.
drop-packets	Drop packets with unknown source MAC addresses.
vr	VR/VRF instance the IPv4 address is configured on.
vr_name	An existing VR/VRF name.

Default

N/A.

Usage Guidelines

N/A.

Example

To disable learning on a remote endpoint:

```
disable learning vxlan ipaddress 1.2.3.4
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, and 5720 series switches, and stacks with 5320, 5420, 5520, and 5720 slots only.

disable led locator

```
disable led locator { slot [slot | all ]}
```

Description

Disables the front panel LEDs from flashing on a switch.

Syntax Description

slot *slot*	Slot number.
all	All slots.

Default

N/A.

Usage Guidelines

None.

Example

The following example disables the front panel LEDs on all slots:

```
disable led locator all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable lldp ports

```
disable lldp ports [all | port_list] {receive-only | transmit-only}
```

Description

Disables *LLDP* transmit mode, receive mode, or transmit and receive mode on the specified port or ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
receive-only	Specifies that only the receive mode for LLDP is disabled.
transmit-only	Specifies that only the transmit mode for LLDP is disabled.

Default

Enabled.

Usage Guidelines

If you do not specify an option, both LLDP modes (transmit and receive) are disabled.

Example

The following example disables the LLDP receive mode on ports 1:2 to 1:6.

```
disable lldp ports 1:2-1:6 receive-only
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable log debug-mode

```
disable log debug-mode
```

Description

Disables debug mode. The switch stops generating debug events.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables debug mode. Debug mode must be enabled prior to configuring advanced debugging capabilities. These include allowing debug messages, which can severely degrade performance. For typical network device monitoring, debug mode should remain disabled, the default setting. Debug mode should only be enabled when advised by technical support, or when advanced diagnosis is required. The debug mode setting is saved to FLASH.

The following configuration options require that debug mode be enabled:

- Including a severity of debug-summary, debug-verbose, or debug-data when configuring filters.

- Target format options process-name, process-id, source-function, and source-line.

Example

The following command disables debug mode:

```
disable log debug-mode
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable log display

```
disable log display
```

Description

Disables the sending of messages to the console display.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If the log display is disabled, log information is no longer written to the serial console.

This command setting is saved to FLASH and determines the initial setting of the console display at boot up.

You can also use this following command to control logging to different targets:

This command is equivalent to `disable log target console-display` command.

Example

The following command disables the log display:

```
disable log display
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable log target

```
disable log target [console | memory-buffer | nvram |primary-node |
   backup-node | session | syslog [all | ipaddress udp-port {udp_port}
   | ipPort | ipaddress tls_port {tls_port}] {vr vr_name} {local0 ...
   local7}]]
```

Description

Stops sending log messages to the specified target.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
primary-node	Specifies the primary node in a stack.
backup-node	Specifies the backup node in a stack.
session	Specifies the current session (including console display).
syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog host name or IP address.
ipPort	Specifies the UDP port number for the syslog target.
tls_port	Specifies remote Syslog server Transport Layer Security (TLS) for connection type.
tls_port	TLS port number.

vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document..
local0 ... local7	Specifies the local syslog facility.

Default

Enabled, for memory buffer, NVRAM, primary node, and backup node; all other targets are disabled by default.

Usage Guidelines

This command stops sending messages to the specified target. By default, the memory buffer, NVRAM, primary node, and backup node targets are enabled. Other targets must be enabled before messages are sent to those targets.

Configuration changes to the session target are in effect only for the duration of the console display or Telnet session, and are not saved in FLASH. Changes to the other targets are saved to FLASH.

You can also use the following command to disable displaying the log on the console: `disable log display`

The `disable log display` command is equivalent to disable log target console-display command.

Example

The following example disables log messages to the current session:

```
disable log target session
```

History

This command was first available in ExtremeXOS 10.1.

The **ipPort** parameter was first available in ExtremeXOS 11.0.

The udp port parameter was added in ExtremeXOS 21.1.

Transport Layer Security (TLS) option added in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable log target upm

```
disable log target upm {upm_profile_name}
```

Description

Disables the specified UPM log target.

Syntax Description

upm_profile_name	Specifies the name of the UPM log target to be disabled.

Default

N/A.

Usage Guidelines

This command disables the log target and retains any configurations applied to that target. To delete a target and any configuration applied to the target, use the following command:

`delete log target upm {upm_profile_name}`

Example

The following example disables the UPM log target "testprofile1":

```
disable log target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable log target xml-notification

`disable log target xml-notification xml_target_name`

Description

Disables a Web server target.

Syntax Description

xml_target_name	Specifies the name of the xml-notification target.

Default

N/A.

Usage Guidelines

Use this command to disable a web server EMS target.

Example

The following command disables the Web server target target2:

```
disable log target xml-notification target2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable loopback-mode vlan

```
disable loopback-mode [ {vlan} vlan_name | vlan vlan_list]
```

Description

Disallows a *VLAN* to be placed in the UP state without an external active port. This allows (disallows) the VLANs routing interface to become active.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.

Default

N/A.

Usage Guidelines

Use this command to specify a stable interface as a source interface for routing protocols. This decreases the possibility of route flapping, which can disrupt connectivity.

Example

The following example disallows the VLAN accounting to be placed in the UP state without an external active port:

```
disable loopback-mode vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable mac-lockdown-timeout ports

```
disable mac-lockdown-timeout ports [all | port_list]
```

Description

Disables the MAC address lock down timeout feature for the specified port or group of ports or for all ports on the switch.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

By default, the MAC address lock down feature is disabled.

Usage Guidelines

If you disable the MAC lock down timer on a port, existing MAC address entries for the port will time out based on the *FDB* aging period.

Example

The following command disables the MAC address lock down timer set for ports 2:3 and 2:4:

```
disable mac-lockdown-timeout ports 2:3, 2:4
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable mac-locking ports

```
disable mac-locking ports [port_list | all]
```

Description

Disables MAC locking on the specified port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports.

Default

MAC locking is disabled by default.

Usage Guidelines

None.

Example

The following example disables MAC locking on port 14:

```
disable mac-locking ports 14
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable mac-locking

```
disable mac-locking
```

Description

Disables MAC locking globally on the switch.

Syntax Description

This command has no arguments or variables.

Default

MAC locking is disabled by default.

Usage Guidelines

If you disable MAC locking globally, you cannot enable MAC locking on a specific port.

Example

The following example disables MAC locking on the switch.

```
disable mac-locking
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable mirror

```
disable mirror [mirror_name | all]
```

Description

Disables a mirror instance.

Syntax Description

mirror_name	Specifies the mirror name.
all	Specifies all mirror instance are deleted.

Default

Disabled.

Usage Guidelines

Use this command to disable mirrors. Disabling an instance only changes the state, its configuration remains as defined (a change from current operation, which loses some configuration parameters).

Example

The following example disable a mirror instance named "mirror1" :

```
disable mirror mirror1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable mirror control_index

disable mirror *control_index* {**mirror** *mirror_name*}

Description

Disables a Mirror MIB instance or the assigned instance to an existing mirror.

Syntax Description

control_index	Selects the Mirror MIB instance to disable. Range is 1 through 4.
mirror	Designates specifying a mirror name associated within the specified control index.
mirror_name	Specifies the mirror name associated within the specified control index.

Default

Disabled.

Usage Guidelines

Specifying a mirror name only disables that mirror within the Mirror MIB group (control index).

Example

The following example disables Mirror MIB specified by control index "1":

```
# disable mirror 1
```

The following example disables the mirror named "m1" within the Mirror MIB specified by control index "1":

```
# disable 1 mirror m1
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable mlag port

```
disable mlag port port
```

Description

Removes a local port or *LAG* from an .

Syntax Description

port	Specifies a local member port of the MLAG group.

Default

N/A.

Usage Guidelines

Use this command to remove a local port or LAG from an MLAG.

Example

The following command unbinds the local member port 2:

```
# disable mlag port 2
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, 5720 series switches.

disable mlag port reload-delay

```
disable mlag port reload-delay
```

Description

This command disables reload-delay on Multi-switch Link Aggregation Group (MLAG) ports.

Syntax Description

This command has no arguments or variables.

Default

MLAG reload-delay is disabled by default.

Usage Guidelines

There are cases where MLAG ports comes up quicker than ISC ports after a switch reboot causing traffic loss during this time gap. This command disables this timer feature.

Example

The following example disables the MLAG reload-delay timer:

```
# disable mlag port reload-delay
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, 5720 series switches.

disable mld

```
disable mld {vlan name}
```

Description

Disables MLD on a router interface. If no *VLAN* is specified, MLD is disabled on all router interfaces.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

MLD is a protocol used by an IPv6 host to register its IPv6 multicast group membership with a router. Periodically, the router queries the multicast group to see if the group is still in use. If the group is still active, hosts respond to the query, and group registration is maintained.

MLD is disabled by default on the switch. However, the switch can be configured to enable the generation and processing of MLD packets. MLD should be enabled when the switch is configured to perform IPv6 unicast or IPv6 multicast routing.

This command disables all MLD versions. When MLD is disabled, the MLDv2 compatibility mode setting is lost. If compatibility mode is not specified in the command when MLD is enabled again, MLDv1 compatibility mode is set.

Example

The following example disables MLD on VLAN accounting:

```
disable mld vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

disable mld snooping

```
disable mld snooping {with-proxy | vlan name}
```

Description

Disables MLD snooping.

Syntax Description

with-proxy	Disables the MLD snooping proxy.
name	Specifies a *VLAN*.

Default

The **with-proxy** option is enabled by default.

Usage Guidelines

If a VLAN is specified, MLD snooping is disabled only on that VLAN, otherwise MLD snooping is disabled on all VLANs.

The with-proxy option can be used for troubleshooting purpose. It should be enabled for normal network operation.

Enabling the proxy allows the switch to suppress the duplicate join requests on a group to forward to the connected Layer 3 switch. The proxy also suppresses unnecessary MLD done messages so that they are forwarded only when the last member leaves the group.

Example

The following example disables MLD snooping on the VLAN accounting:

```
disable mld snooping accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

disable mld-ssm map

```
disable mld-ssm map {{vr} vr_name}
```

Description

Disables MLD SSM mapping on a VR.

Syntax Description

vr *vr_name*	Specifies a virtual router name.

Default

Disabled.

Usage Guidelines

Use this command to disable MLD SSM mapping on a VR.

Example

The following example disables SSM mapping on VR1:

```
disable mld-ssm map vr vr1
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls

```
disable mpls
```

Description

Disables *MPLS* on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When MPLS is disabled, no label traffic is received or transmitted, and all MPLS-related protocol peer sessions are terminated.

Example

The following command globally disables MPLS on the switch:

```
disable mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls bfd

```
disable mpls bfd [vlan all | {vlan} vlan_name] {delete-sessions}
```

Description

Disables the Bidirectional Forwarding Detection (BFD) client for *MPLS* on the specified *VLAN* or on all VLANs.

Syntax Description

vlan_name	Specifies the VLAN on which to disable the MPLS BFD client.
delete-sessions	Specifies to delete all MPLS BFD sessions.

Default

Keep existing MPLS BFD sessions.

Usage Guidelines

This command instructs MPLS to cease the establishment of new BFD sessions with neighbors as LSPs are established with those neighbors. The default behavior retains the existing BFD sessions and ignores status updates from those existing sessions. The **delete-sessions** option instructs MPLS to request the deletion of existing sessions. Whether the sessions are deleted or not, the link state presented to the upper MPLS layers reverts to the normal link operational status.

Note

Deleting existing sessions can result in a neighbor DOWN indication from BFD to MPLS on the other end of the session (the peer switch) and a subsequent interface DOWN indication presented to the upper layers of MPLS on that peer switch. These actions can cause MPLS to reroute or fail the affected LSPs.

To disable the MPLS BFD client and delete all BFD sessions without disrupting the LSPs between two switches, do the following:

- Log into switch A as an admin user and issue the command: `disable mpls bfd vlanx`.
- Log into switch B as an admin user and issue the command: `disable mpls bfd vlanx delete-sessions`

Example

The following command disables the MPLS BFD client on VLAN vlan1:

```
disable mpls bfd vlan1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls exp examination

```
disable mpls exp examination
```

Description

Disables assigning an *MPLS* packet to a *QoS* profile based on the MPLS packet's EXP value.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables assigning an MPLS packet to a QoS profile based on the MPLS packet's EXP value.

When disabled, all received MPLS packets are assigned to QoS profile **qp1**.

Example

The following command disables the assignment of an MPLS packet to a QoS profile based on the MPLS packet's EXP value:

```
disable mpls exp examination
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls exp replacement

```
disable mpls exp replacement
```

Description

Disables setting an *MPLS* packet's EXP value based on the packet's *QoS* profile.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables setting an MPLS packet's EXP value based on the packet's QoS profile. The QoS profiles to EXP value mappings are configured using the `configure mpls exp replacement` command.

When disabled, all MPLS packets are transmitted with an EXP value of zero.

Example

The following command disables the setting of an MPLS packet's EXP value based on the packet's QoS profile:

```
disable mpls exp replacement
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls ldp bgp-routes

```
disable mpls ldp bgp-routes
```

Description

Disables LDP's use of IP prefixes learned from *BGP* when establishing LDP LSPs.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command disables LDP's establishment of LSPs to routes learned via BGP, thus reducing the internal resources used by LDP. Note that *MPLS* LSPs can still be used to transport packets to routes learned via BGP through the use of the `enable bgp mpls-next-hop` command.

When enabled, LDP uses routes learned via BGP when establishing LDP LSPs. As each established LSP consumes internal resources, it is recommended that this setting be used only in BGP environments where the number of BGP routes is controlled.

Example

The following command disables the use of BGP routes by LDP:

```
disable mpls ldp bgp-routes
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls ldp loop-detection

```
disable mpls ldp loop-detection
```

Description

Disables LDP loop detection on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Loop detection provides a mechanism for finding looping LSPs and for preventing Label Request messages from looping in the presence of non-merge-capable LSRs. The mechanism makes use of Path Vector and Hop Count TLVs carried by Label Request and Label Mapping messages.

When LDP loop detection is disabled, LDP does not attempt to detect routing loops.

Example

The following command globally disables LDP loop detection on the switch:

```
disable mpls ldp loop-detection
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls ldp

```
disable mpls ldp [{vlan} vlan_name | vlan all]
```

Description

Disables LDP for the specified *MPLS*-configured *VLAN*s.

Syntax Description

vlan	Disables LDP for one or more specific VLANs.
vlan_name	Disables LDP on the specified VLAN.
vlan all	Disables LDP for all VLANs that have been added to MPLS.

Default

Disabled.

Usage Guidelines

When LDP is disabled, all LDP-advertised labels are withdrawn and all LDP peer sessions are terminated on the specified VLAN(s). By default, LDP is disabled for all VLANs. Specifying the optional all keyword disables LDP for all VLANs that have been added to MPLS.

Example

The following command disables LDP for all VLANs:

```
disable mpls ldp vlan all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls php

```
disable mpls php [{vlan} vlan_name | vlan all]
```

Description

Disables penultimate hop popping (PHP) on the specified *VLAN*. When enabled, PHP is requested on all LSPs advertised over that VLAN for which the switch is the egress LSR.

Syntax Description

vlan	Disables PHP for one or more specific VLANs.
vlan_name	Disables PHP on the specified VLAN.
vlan all	Disables PHP for all VLANs that have been added to *MPLS*.

Default

Disabled

Usage Guidelines

When PHP is disabled on a VLAN, penultimate hop popping is not requested on any LSPs advertised over that VLAN for which the switch is the egress LSR. Therefore, the Implicit Null Label is not used for any advertised mapping. Extreme's MPLS implementation always performs penultimate hop popping when requested to do so by a peer LSR. When the all VLANs option is selected, PHP is disabled on all existing MPLS interfaces.

Note

PHP is sometimes used to reduce the number of MPLS labels in use. If PHP is enabled on any MPLS interface, a unique MPLS label is consumed for every label advertised over that interface. Therefore, if PHP is being disabled to reduce label consumption, it should be done on all interfaces for minimal label consumption.

In ExtremeXOS, this command can be executed while MPLS is enabled.

Example

The following command disables penultimate hop popping (PHP) on the specified VLAN:

```
disable mpls php vlan vlan1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls protocol ldp

```
disable mpls protocol ldp
```

Description

Disables LDP for the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When LDP is disabled, all advertised LDP labels are withdrawn and LDP peer sessions are terminated. Note that this includes any LDP peer sessions established for L2 VPNs. By default, LDP is globally disabled. While LDP is transitioning to the enabled state, only the *MPLS* show commands are accepted.

Example

The following command globally disables LDP on the switch:

```
disable mpls protocol ldp
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls protocol rsvp-te

```
disable mpls protocol rsvp-te
```

Description

Disables RSVP-TE for the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When RSVP-TE is disabled, all TE LSPs are released and TE LSPs cannot be established or accepted. While RSVP-TE is transitioning to the disabled state, only the *MPLS* show commands are accepted.

Example

The following command globally disables RSVP-TE on the switch:

```
disable mpls protocol rsvp-te
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls rsvp-te bundle-message

```
disable mpls rsvp-te bundle-message [{vlan} vlan_name | vlan all]
```

Description

Disables the bundling of RSVP-TE messages for the specified *VLAN* interface.

Syntax Description

vlan	Specifies that message-bundling is to be disabled on a specific VLAN.
vlan_name	Identifies the VLAN interface on which message bundling is disabled.
vlan all	Specifies that message bundling is disabled on all VLAN interfaces that have been added to *MPLS*.

Default

Disabled.

Usage Guidelines

This command disables the bundling of RSVP-TE messages for the VLAN specified interface. By default, message bundling is disabled. Specifying the **all** keyword disables message bundling on all VLANs that have been added to MPLS.

Example

The following command disables message bundling on the specified VLAN:

```
disable mpls rsvp-te bundle-message vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls rsvp-te fast-reroute

```
disable mpls rsvp-te fast-reroute
```

Description

Disables the *MPLS* RSVP-TE fast reroute (FRR) protection feature.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

When FRR is disabled on the LSR, all established FRR LSPs on the local LSR are torn down, and only standard LSPs can be signaled and processed. The configuration for any existing FRR LSPs is retained, but it is not used until the FRR protection feature is enabled. This command can be used to test the performance of an LSR without the FRR functionality or when the LSR doesn't behave as expected for either standard or FRR LSPs.

Example

The following command disables FRR protection on the local switch:

```
disable mpls rsvp-te fast-reroute
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls rsvp-te lsp

```
disable mpls rsvp-te lsp [lsp_name | all]
```

Description

Disables an RSVP-TE LSP.

Syntax Description

lsp_name	Specifies the LSP within the switch to be disabled.
all	Disables all RSVP-TE configured LSPs.

Default

Enabled.

Usage Guidelines

This command disables an RSVP-TE LSP. When an RSVP-TE LSP is disabled, the switch terminates the LSP by signaling the destination by sending a PATH_TEAR message. If there are other LSPs configured to the same destination, traffic may continue to be transmitted to the destination over another LSP. Disabling an LSP does not otherwise change its configuration.

Example

The following command disables the LSP named lsp598:

```
disable mpls rsvp-te lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls rsvp-te summary-refresh

```
disable mpls rsvp-te summary-refresh [{vlan} vlan_name | vlan all]
```

Description

Disables the sending of summary refresh messages, instead of path messages, to refresh RSVP-TE path state for the specified *VLAN* interface.

Syntax Description

vlan	Specifies that summary refresh messages cannot refresh the RSVP-TE path state on one or more VLAN interfaces.
vlan_name	Specifies the VLAN interface for which RSVP-TE summary refresh messages are to be disabled.
vlan all	Specifies that summary refresh messages are to be disabled on all VLAN interfaces that have been added to *MPLS*.

Default

Disabled.

Usage Guidelines

This command disables the sending of summary refresh messages to refresh RSVP-TE path state for the specified VLAN interface. By default, summary refresh is disabled. Specifying the **all** keyword disables summary refresh on all VLANs that have been added to MPLS.

Example

The following command disables summary refresh on the specified VLAN:

```
disable mpls rsvp-te summary-refresh vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls rsvp-te

```
disable mpls rsvp-te te [{vlan} vlan_name | vlan all]
```

Description

Disables RSVP-TE for the specified *MPLS*-configured *VLAN*.

Syntax Description

vlan	Specifies that RSVP-TE is to be disabled on a specific VLAN.
vlan_name	Specifies the VLAN for which RSVP-TE is disabled.
vlan all	Disables RSVP-TE on all VLANS that have been added to MPLS.

Default

Disabled.

Usage Guidelines

This command disables RSVP-TE for the specified MPLS configured VLANs. When RSVP-TE is disabled, all TE LSPs are released and TE LSPs cannot be established or accepted. By default, RSVP-TE is disabled for all MPLS configured VLANs. Specifying the optional **all** keyword disables RSVP-TE for all VLANs that have been added to MPLS.

Example

The following command disables RSVP-TE on the named VLAN:

```
disable mpls rsvp-te vlan vlan_10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls static lsp

```
disable mpls static lsp {lsp_name | all }
```

Description

Administratively disables one or all static LSPs.

Syntax Description

lsp_name	Identifies an LSP to be disabled.
all	Specifies that all static LSPs on this LSR are to be disabled.

Default

N/A.

Usage Guidelines

On executing this command, the software de-activates the specified LSPs by setting the administrative state of each LSP to down.

Example

The following command disables a static LSP:

```
disable mpls static lsp lsp598
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable mpls vlan

```
disable mpls [{vlan} vlan_name | vlan all]
```

Description

Disables the *MPLS* interface for the specified *VLAN*(s).

Syntax Description

vlan	Disables an MPLS interface for one or more specific VLANs.
vlan_name	Disables an MPLS interface on the specified VLAN.
vlan all	Disables an MPLS interface for all VLANs that have been added to MPLS.

Default

The MPLS interface is disabled for a VLAN.

Usage Guidelines

Disabling MPLS causes all LSPs to be released and all LDP and RSVP-TE peer sessions to be terminated on the specified VLAN(s).

Example

The following command disables an MPLS interface for the specified VLAN:

```
disable mpls vlan vlan-nyc
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable msdp

```
disable msdp {vr vrname}
```

Description

Disables *MSDP* on a virtual router.

Syntax Description

vrname	Specifies the name of the virtual router on which MSDP is being enabled or disabled. If a name is not specified, it is extracted from the current CLI context.

Default

MSDP is disabled by default.

Usage Guidelines

Use this command to disable MSDP on a virtual router.

Example

The following command disables MSDP on a virtual router:

```
disable msdp
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.ature-link-22.1"/>

disable msdp data-encapsulation

```
disable msdp data-encapsulation {vr vrname}
```

Description

Disables the encapsulation of locally originated SA messages with multicast data (if available).

Syntax Description

vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, multicast data packet encapsulation is enabled for locally originated SA messages.

Usage Guidelines

None.

Example

The following command disables multicast data packet encapsulation:

```
disable msdp data-encapsulation
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *MSDP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable msdp export local-sa

```
disable msdp export local-sa {vr vrname}
```

Description

Disables the advertisement of local sources to groups for which the router is an RP.

Syntax Description

vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the export of local sources is enabled. All sources are advertised if the router is an RP for the groups. Use this command to disable it.

Usage Guidelines

You can create a policy to filter out some of the local sources so that they are not advertised to *MSDP* peers and exposed to the external multicast domain. To configure an export filter, you must first disable the export of local sources (with the `disable msdp export local-sa` command), and then re-enable it with an export filter (with the `enable msdp export local-sa export-filter` command).

Example

The following example disables the advertisement of local sources:

```
disable msdp export local-sa
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable msdp peer

```
disable msdp [{peer} remoteaddr | peer all] {vr vr_name}
```

Description

Configures the administrative state of an *MSDP* peer.

Syntax Description

remoteaddr	Specifies the IP address of the MSDP peer to disable.
all	Disables all MSDP peers.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, MSDP peers are disabled.

Usage Guidelines

Use this command to administratively disable MSDP peers to stop exchanging SA messages.

Example

The following command disables an MSDP peer:

```
disable msdp peer 192.168.45.43
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable msdp process-sa-request

```
disable msdp [{peer} remoteaddr | peer all] process-sa-request {vr
   vrname}
```

Description

This command configures a router to reject SA request messages from a specified peer or all peers.

Syntax Description

peer all	Specifies all *MSDP* peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, all SA request messages are accepted from all peers.

Usage Guidelines

Use this command to configure the router to reject SA request messages from a specified peer or all peers.

You cannot change an SA request filter while SA request processing is enabled for an MSDP peer. You must first disable SA request processing for a peer and then re-enable it with an SA request filter.

You can use the following policy attributes in an SA request policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit
  - deny

Example

The following example disables processing of SA request messages received from a peer with the IP address 192.168.45.43:

```
disable msdp peer 192.168.45.43 process-sa-request
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable msrp

```
disable msrp
```

Description

Disables MSRP on the switch.

Syntax Description

msrp	Multiple Stream Registration Protocol.

Default

Disabled.

Usage Guidelines

Use this command to disable MSRP on a switch.

Example

The following command disables MSRP:

```
disable msrp
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms if the AVB feature pack license is installed on the switch.

disable mvr

```
disable mvr
```

Description

Disables MVR on the system.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following example disables MVR on the system:

```
disable mvr
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable mvrp

```
disable mvrp
```

Description

Disables MVRP globally on a switch.

Syntax Description

mvrp	Multiple *VLAN* Registration Protocol.

Default

Disabled.

Usage Guidelines

Use this command to disable MVRP globally on a switch. MVRP is run on the MVRP enabled ports only if the global setting is enabled. By default, MVRP is disabled globally and on individual ports. When MVRP is disabled globally, all MVRP packets are forwarded transparently.

Example

The following command disables MVRP:

```
disable mvrp
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable mvrp ports

```
disable mvrp ports [port_list | all]
```

Description

Disable MVRP on a given set of ports.

Syntax Description

mvrp	Multiple *VLAN* Registration Protocol.
port_list	Port(s) on which MVRP is to be enabled.
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to disable MVRP on given set of ports. MVRP is run on the MVRP enabled ports only if the global setting is enabled. By default MVRP is disabled globally and on individual ports. When MVRP is disabled globally, all MVRP packets will be forwarded transparently.

Example

The following command disables MVRP on ports 4 and 5:

```
disable mvrp ports 4-5
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable neighbor-discovery refresh

```
disable neighbor-discovery {vr vr_name} refresh
```

Description

Prevents the IPv6 neighbor cache from refreshing an entry before the timeout period expires.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

None.

Example

The following example disables the refresh of neighbor discovery cache entries:

```
disable neighbor-discovery refresh
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

disable netlogin authentication failure vlan ports

```
disable netlogin authentication failure vlan ports [ports | all]
```

Description

Disables the configured authentication failure *VLAN* on the specified ports.

Syntax Description

all	Specifies all ports included in the authentication failure VLAN.
ports	Specifies one or more ports or slots and ports on which the authentication failure VLAN is enabled.

Default

All ports.

Usage Guidelines

Use this command to disable the configured authentication failure VLAN on either the specified ports, or all ports.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable netlogin authentication service-unavailable vlan ports

```
disable netlogin authentication service-unavailable vlan ports [ports |
   all]
```

Description

Disable the configured authentication service-unavailable *VLAN* on the specified ports.

Syntax Description

ports	Specifies one or more ports or slots and ports on which the authentication service-unavailable VLAN is enabled.
all	Specifies all ports included in the authentication service-unavailable VLAN.

Default

All ports.

Usage Guidelines

Use this command to disable the configured authentication service-unavailable VLAN on the specified ports, or on all ports.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable netlogin dot1x guest-vlan ports

```
disable netlogin dot1x guest-vlan ports [all | ports]
```

Description

Disables the guest *VLAN* on the specified 802.1X network login ports.

Syntax Description

all	Specifies all ports included in the guest VLAN.
ports	Specifies one or more ports included in the guest VLAN.

Default

Disabled.

Usage Guidelines

Use this command to disable the guest VLAN feature.

Enabling Guest VLANs

To enable the guest VLAN, use the following command:

```
enable netlogin dot1x guest-vlan ports [all | ports]
```

Example

The following command disables the guest VLAN on all ports:

```
disable netlogin dot1x guest-vlan ports all
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable netlogin logout-privilege

```
disable network login logout-privilege
```

Description

Disables network login logout window pop-up.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command controls the logout window pop-up on the web-based network client. This command applies only to the web-based authentication mode of network login. When disabled, the logout window pop-up will no longer appear. However, if session refresh is enabled, the login session will be terminated after the session refresh timeout.

Example

The following command disables network login logout-privilege:

```
disable netlogin logout-privilege
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable netlogin ports

```
disable netlogin ports ports [{dot1x} {mac} {web-based}]
```

Description

Disables network login on a specified port for a particular method.

Syntax Description

ports	Specifies the ports for which network login should be disabled.
dot1x	Specifies 802.1X authentication.
mac	Specifies MAC-based authentication.
web-based	Specifies web-based authentication.

Default

Network login is disabled by default.

Usage Guidelines

Network login must be disabled on a port before you can delete a *VLAN* that contains that port.

This command applies to the MAC-based, web-based, and 802.1X mode of network login. To control which authentication mode is used by network login, use the following commands:

`enable netlogin [{dot1x} {mac} {web-based}]` `disable netlogin [{dot1x} {mac} {web-based}]`

Example

The following command disables dot1x and web-based network login on port 2:9:

```
disable netlogin ports 2:9 dot1x web-based
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable netlogin reauthenticate-on-refresh

```
disable netlogin reauthenticate-on-refresh
```

Description

Disables network login reauthentication on refresh.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The web-based Netlogin client's session is periodically refreshed by sending an HTTP request which acts as a keep-alive without actually re-authenticating the user's credentials with the back-end *RADIUS* server or local database. If reauthenticate-on-refresh is enabled, re-authentication occurs with the session refresh.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable netlogin redirect-page

```
disable netlogin redirect-page
```

Description

Disables the network login redirect page function.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command disables the network login redirect page so that the client is sent to the originally requested page.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable netlogin session-refresh

```
disable netlogin session-refresh
```

Description

Disables network login session refresh.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Network login sessions can refresh themselves after a configured timeout. After the user has been logged in successfully, a logout window opens which can be used to close the connection by clicking on the LogOut link. Any abnormal closing of this window is detected on the switch and the user is logged out after a time interval as configured for session refresh. The session refresh is enabled and set to three minutes by default.

This command applies only to the web-based authentication mode of network login.

Example

The following command disables network login session refresh:

```
disable netlogin session-refresh
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable netlogin

```
disable netlogin [{dot1x} {mac} {web-based}]
```

Description

Disables network login modes.

Syntax Description

dot1x	Specifies 802.1X authentication.
mac	Specifies MAC-based authentication.
web-based	Specifies web-based authentication.

Default

All types of authentication are disabled.

Usage Guidelines

Any combination of authentication types can be disabled on the same switch. To enable an authentication mode, use the following command:

```
enable netlogin [{dot1x} {mac} {web-based}]
```

Example

The following command disables MAC-based network login:

```
disable netlogin mac
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable network-clock gptp ports

```
disable network-clock gptp ports [port_list {only} | all]
```

Description

Disables gPTP on one or more ports.

Syntax Description

port_list	Specifies one or more the the switch's physical ports.
only	Apply change only to specified port, even if port is master of a load sharing group.
all	Specifies all of the switch's physical ports.

Default

Disabled.

Usage Guidelines

Use this command to configure on which ports gPTP runs. gPTP runs on no ports if it is not enabled in the switch by `enable network-clock gptp`.

Example

```
disable network-clock gptp ports 1-3
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms if the AVB feature pack license is installed on the switch.

disable network-clock gptp

```
disable network-clock gptp
```

Description

Disables gPTP on the switch.

Syntax Description

network-clock	Network clock.
gptp	IEEE 802.1AS Generalized Precision Time Protocol (gPTP).

Default

Disabled.

Usage Guidelines

Use this command to disable gPTP after having enabled it.

Example

```
disable network-clock gptp
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable nodealias ports

disable nodealias ports [*port_list* | **all**]

Description

This command disables the Node Alias feature on specified ports. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

nodealias	Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis.
ports	Designates that Node Alias should be disabled on specified ports.
port_list	Specifies on which ports to have Node Alias disabled. Designated as a port list separated by comma (,) or dash (-).
all	Specifies that all ports have Node Alias disabled.

Default

Node Alias is disabled by default on all ports.

Usage Guidelines

If the port is part of a *LAG*, Node Alias should be disabled separately on each LAG port.

Example

The following example disables Node Alias on all ports:

```
disable nodealias ports all
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable nodealias protocol

```
disable nodealias protocol [protocol_name | any]
```

Description

This command designates the specific protocols to remove from the list of detected protocols for the Node Alias feature. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

nodealias	Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis.
protocol	Designates selection of protocols to detect.
protocol_name	Specifies disabling a protocol to detect (one at a time). The following protocols are enabled by default: IPv4, IPv6, *OSPF*, *BGP*, *VRRP*, DHCPS, DHCPC, BOOTPS, BOOTPC, UDP, BPDU, LLMNR, SSDP, and mDNS.
any	Specifies disabling all protocols.

Default

The following protocols are enabled by default: IPv4, IPv6, OSPF, BGP, VRRP, DHCPS, DHCPC, BOOTPS, BOOTPC, UDP, BPDU, LLMNR, SSDP, and mDNS.

Note

- ARP is categorized under IP.
- UDP entry is created when destination IP address is broadcast.
- BPDU means *STP* and GVRP frames.

Usage Guidelines

By default, the following protocols are enabled (IPv4, IPv6, OSPF, BGP, VRRP, DHCPS, DHCPC, BOOTPS, BOOTPC, UDP, BPDU, LLMNR, SSDP, mDNS). You can optionally disable any of these protocols (and then enable them back if desired).

Example

The following example disables BGP from being detected:

```
disable nodealias protocol bgp
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ntp

```
disable ntp
```

Description

Disables NTP globally on the switch.

Syntax Description

N/A.

Default

NTP is disabled by default.

Usage Guidelines

N/A.

Example

The following command disables NTP globally on the switch:

```
disable ntp
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ntp authentication

```
disable ntp authentication
```

Description

Disables NTP authentication globally on the switch.

Syntax Description

N/A.

Default

NTP authentication is disabled by default.

Usage Guidelines

If authentication is disabled, NTP will not use any authentication mechanism to a server or from clients. To use authentication for a specific server, enable NTP authentication globally, and then configure an RSA Data Security, Inc. *MD5* Message-Digest Algorithm or SHA256 key index for the specific server.

Example

The following command disables NTP authentication globally on the switch:

```
# disable ntp authentication
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ntp broadcast-client

```
disable ntp broadcast-client {{vr} vr_name}
```

Description

Disables an NTP broadcast client on the switch.

Syntax Description

broadcast-client	Specifies enabling NTP broadcast client.
vr	Specifies disabling NTP broadcast client for a VR.
vr_name	Specifies the VR name. If a VR name is not specified, the VR of current command context is used.

Default

An NTP broadcast client is enabled by default.

If a VR name is not specified, the VR of current command context is used.

Usage Guidelines

If the broadcast client function is enabled, the system can receive broadcast-based NTP messages and process them only if a *VLAN* is enabled for NTP and the VLAN is active.

Example

The following command disables an NTP broadcast client on the switch:

```
disable ntp broadcast client
```

History

This command was first available in ExtremeXOS 12.7.

The **vr** was added in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ntp broadcast-server

```
disable ntp {vlan} vlan-name broadcast-server
```

Description

Prevents NTP from sending broadcast messages to a *VLAN*.

Syntax Description

vlan-name	Specifies the name of a particular VLAN.

Default

NTP does not send broadcast messages to a VLAN by default.

Usage Guidelines

N/A.

Example

The following command prevents NTP from sending broadcast messages to a VLAN called “Northwest”:

```
disable ntp vlan Northwest broadcast-server
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ntp vlan

```
disable ntp [{vlan} vlan-name | all] {{vr} vr_name}
```

Description

Disables NTP on a *VLAN*.

Syntax Description

disable	Disables NTP on a VLAN.
vlan-name	Specifies the name of a particular VLAN on which to enable or disable NTP.
all	Enables or disables NTP on all VLANs.
vr	Specifies disabling NTP on a VR.
vr_name	Specifies the VR name to disable NTP on. If a VR name is not specified, the VR of current command context is used.

Default

NTP is disabled on all VLANs by default.

Usage Guidelines

N/A.

Example

The following command disables NTP on all VLANs:

```
disable ntp all
```

The following command disables NTP on specific VLAN:

```
disable ntp vlan vlan-1
```

History

This command was first available in ExtremeXOS 12.7.

The **vr** option was added in ExtremeXOS 22.2

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ntp vr

```
disable ntp vr vr_name
```

Description

This command disables NTP from the specified VR.

Syntax Description

vr	Specifies disabling NTP on a VR.
vr_name	Specifies the VR name to disable NTP from. If a VR name is not specified, the VR of current command context is used.

Default

If a VR name is not specified, the VR of current command context is used.

Example

The following example disables NTP from a VR named "vr1".

```
disable ntp vr vr1
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ospf

```
disable ospf
```

Description

Disables the *OSPF* process for the router.

Syntax Description

This command has no keywords or arguments.

Default

N/A.

Usage Guidelines

Not applicable.

Example

The following command disables the OSPF process for the router:

```
disable ospf
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable ospf capability opaque-lsa

```
disable ospf capability opaque-lsa
```

Description

Disables opaque LSAs across the entire system.

Syntax Description

This command has no keywords or arguments.

Default

Enabled.

Usage Guidelines

Opaque LSAs are a generic *OSPF* mechanism used to carry auxiliary information in the OSPF database. Opaque LSAs are most commonly used to support OSPF traffic engineering.

Normally, support for opaque LSAs is auto-negotiated between OSPF neighbors. In the event that you experience interoperability problems, you can disable opaque LSAs.

If your network uses opaque LSAs, all routers on your OSPF network should support opaque LSAs. Routers that do not support opaque LSAs do not store or flood them. At minimum a well-interconnected subsection of your OSPF network needs to support opaque LSAs to maintain reliability of their transmission.

On an OSPF broadcast network, the designated router (DR) must support opaque LSAs or none of the other routers on that broadcast network will reliably receive them. You can use the OSPF priority feature to give preference to an opaque-capable router, so that it becomes the elected DR.

For transmission to continue reliably across the network, the backup designated router (BDR) must also support opaque LSAs.

Example

The following command disables opaque LSAs across the entire system:

```
disable ospf capability opaque-lsa
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable ospf export

```
disable ospf export [bgp | direct | host-mobility |e-bgp | i-bgp | rip |
   static | isis | isis-level-1| isis-level-1-external | isis-level-2 |
   isis-level-2-external]
```

Description

Disables redistribution of routes to *OSPF*.

Syntax Description

bgp	Specifies *BGP* routes.
direct	Specifies direct routes.
host-mobility	Specifies host mobility.
e-bgp	Specifies E-BGP routes.
i-bgp	Specifies I-BGP routes.
rip	Specifies *RIP* routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routes.
isis-level-1-external	Specifies ISIS Level 1 External routes.
isis-level-2	Specifies ISIS Level 2 routes.
isis-level-2-external	Specifies ISIS Level 2 External routes.

Default

The default setting is disabled.

Usage Guidelines

Use this command to stop OSPF from exporting routes derived from other protocols.

Example

The following command disables OSPF to export BGP-related routes to other OSPF routers:

```
disable ospf export bgp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable ospf mpls-next-hop

```
disable ospf mpls-next-hop {vr vrf_name}
```

Description

Disables IP forwarding over calculated *MPLS* LSPs to subnets learned via *OSPF*.

Syntax Description

vrf_name	Specifies OSPF on a particular VRF.

Default

Disabled.

Usage Guidelines

This command disables IP forwarding over calculated MPLS LSPs to subnets learned via OSPF. (Calculated refers to an LSP that only reaches part of the way to the destination). By default, IP forwarding over MPLS LSPs to subnets learned via OSPF is disabled.

In order to disable OSPF on a particular VRF, you must supply the optional vr *vr-name* CLI parameter.

Example

The following command disables OSPF's use of MPLS LSPs to reach OSPF routes:

```
disable ospf mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

The **vr** keyword and *vrf_name* variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable ospf originate-default

```
disable ospf originate-default
```

Syntax Description

There are no keywords or variables for this command.

Default

Not applicable.

Usage Guidelines

Not applicable.

Example

The following command disables generating a default external LSA:

```
disable ospf originate-default
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable ospf restart-helper-lsa-check

```
disable ospf [vlan [all | vlan-name] | area area-identifier | virtual-
   link router-identifier area-identifier] restart-helper-lsa-check
```

Description

Disables the restart helper router from terminating graceful *OSPF* restart when received LSAs would affect the restarting router.

Syntax Description

all	Specifies all *VLAN*s.
vlan-name	Specifies a VLAN name.
router-identifier	Specifies the router ID of the remote router of the virtual link.
area-identifier	Specifies an OSPF area.

Default

The default is enabled.

Usage Guidelines

This command disables the restart helper router from terminating graceful OSPF restart when received LSAs would affect the restarting router.

Example

The following command disables a router from terminating graceful OSPF restart for all routers in area 10.20.30.40 if it receives an LSA that would affect routing:

```
disable ospf area 10.20.30.40 restart-helper-lsa-check
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable ospf use-ip-router-alert

```
disable ospf use-ip-router-alert
```

Description

Disables the router alert IP option in outgoing *OSPF* control packets.

Syntax Description

This command has no keywords or arguments.

Default

Disabled.

Usage Guidelines

Not applicable.

Example

The following command disables the OSPF router alert IP option:

```
disable ospf use-ip-router-alert
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable ospf vxlan-extensions

```
disable ospf vxlan-extensions
```

Description

This command disables the OSPFv2 VXLAN extensions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

N/A.

Example

```
# disable ospf vxlan-extensions
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on ExtremeSwitching 5420 and 5520 series switches, and stacks with 5420 and 5520 slots only.

disable ospfv3

```
disable ospfv3
```

Description

Disables *OSPFv3* for the router.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables OSPFv3 for the router:

```
disable ospfv3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable ospfv3 restart-helper-lsa-check

```
disable ospfv3 [[vlan | tunnel] all | vlanvlan-name | {tunnel} tunnel-
   name | area area-identifier] restart-helper-lsa-check
```

Description

This command configures the restart helper router to terminate *OSPFv3* graceful restart when received LSAs would affect the restarting router. This occurs when the restart helper receives an LSA that is flooded to the restarting router or when there is a changed LSA on the restarting router's retransmission list when graceful restart is initiated.

Syntax Description

vlan	*VLAN*.
all	All VLANs.
vlan-name	VLAN name.
area	OSPFv3 area.
area-identifier	Area identifier.
restart-helper-lsa-check	Terminate graceful restart mode when there is a change to an LSA.

Default

LSA check is enabled by default.

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ospfv3 export

```
disable ospfv3 export [direct | ripng | static | isis | isis-level-1
   | isis-level-1-external | isis-level-2 | isis-level-2-external | bgp
   e-bgp i-bgp]
```

Description

Disables redistribution of routes to *OSPFv3*.

Syntax Description

direct	Specifies direct routes.
ripng	Specifies *RIP* routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routes.
isis-level-1-external	Specifies IS-IS Level 1 External routes.
isis-level-2	Specifies IS-IS Level 2 routes.
isis-level-2-external	Specifies IS-IS Level 2 External routes.
bgp	Specifies *BGP* IPv6 routes.
e-bgp	Specifies EBGP routes.
i-bgp	Specifies EBGP routes.

Default

The default setting is disabled.

Usage Guidelines

Use this command to stop OSPFv3 from exporting routes derived from other protocols.

Example

The following command disables OSPFv3 to export *RIPng* routes to other OSPFv3 routers:

```
disable ospfv3 export ripng
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable ospfv3 virtual-link restart-helper-lsa-check

```
disable ospfv3 virtual-link {routerid} router-identifier {area} area-
   identifier restart-helper-lsa-check
```

Description

This command configures the restart helper router to terminate *OSPF* graceful restart when received LSAs would affect the restarting router. This occurs when the restart helper receives an LSA that will be flooded to the restarting router or when there is a changed LSA on the restarting router's retransmission list when graceful restart is initiated.

Syntax Description

virtual-link	*OSPFv3* virtual link.
routerid	OSPFv3 router ID.
router-identifier	Router ID of neighbor OSPFv3 router.
area	OSPFv3 area.
area-identifier	Transit area ID of virtual link.
restart-helper-lsa-check	Terminates graceful restart helper mode when there is a change to an LSA (default is enabled).

Default

Enabled.

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable pim iproute sharing

```
disable pim {ipv4 | ipv6} iproute sharing
```

Description

Disables the PIM *ECMP* feature.

Syntax Description

iproute	IP Route
sharing	Equal Cost Multipath Routing

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables the PIM ECMP feature:

```
disable pim ipv4 iproute sharing
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable pim snooping

```
disable pim snooping {{vlan} name}
```

Description

Disables PIM snooping and clears all the snooping PIM neighbors, joins received on the *VLAN*, and the forwarding entries belonging to one or all VLANs.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables PIM snooping for all VLANs on the switch:

```
disable pim snooping
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable pim ssm vlan

```
disable pim {ipv4 | ipv6} ssm vlan [vlan_name | all]
```

Description

Disables PIM SSM on a router interface.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
vlan_name	Specifies a *VLAN* name.
all	Specifies all VLANs.

Default

Disabled on all interfaces.

Usage Guidelines

This command disables PIM-SSM on the specified Layer 3 VLAN.

IGMPv3 include messages for multicast addresses in the SSM range is only processed by PIM if PIM-SSM is enabled on the interface. Any non-IGMPv3 messages in the SSM range are not processed by PIM on any switch interface, whether SSM is enabled or not.

Example

The following example disables PIM-SSM multicast routing on VLAN accounting:

```
disable pim ssm vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable pim

```
disable pim {ipv4 | ipv6}
```

Description

Disables PIM on the system.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.

Default

Disabled.

Usage Guidelines

None.

Example

The following example disables PIM on the system:

```
disable pim ipv4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable policy

```
disable policy
```

Description

This command disables the ONEPolicy functionality.

Syntax Description

This command has no arguments or variables.

Default

None.

Usage Guidelines

None.

Example

The following example shows how to disable ONEPolicy:

```
X450G2-48t-10G4.4 # disable policy
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable port

```
disable port [port_list | all]
```

Description

Disables one or more ports on the switch.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled.

Usage Guidelines

Use this command for security, administration, and troubleshooting purposes.

When a port is disabled, the link is brought down.

Example

The following command disables ports 3, 5, and 12 through 15 on a stand-alone switch:

```
disable ports 3,5,12-15
```

The following command disables ports 3, 5, and 12 through 15 on a switch:

```
disable port 3,5,12-15
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ports mlag-id

`disable ports [`**`mlag-id`** *`mlag_id`*`]`

Description

Disables the current ports associated with the given ID.

Syntax Description

`mlag-id`	Port associated with MLAG.
`mlag_id`	MLAG identifier value of the MLAG port. Range is 1–65,000.

Default

N/A.

Usage Guidelines

If any ports are added or deleted from the LAG, the port state for those ports is not changed.

In MLAG orchestration mode, this command is executed on the other MLAG peer before it is executed on the MLAG peer on which the command is run. In orchestration mode, if the MLAG port numbers are not same on both the peers, it is possible that a different set of port numbers are disabled on the

different MLAG peers. This command helps ensure that the correct set of ports associated with the MLAG ID are disabled.

If the port associated with the given MLAG ID is a load shared port, all the member ports associated with this load shared group are disabled.

If the port associated with the given MLAG ID is a virtual port, the command is ignored.

Example

The following example disables the ports associated with MLAG ID "123":

```
# disable ports mlag-id 123
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, 5720 series switches.

disable radius

```
disable radius {mgmt-access | netlogin}
```

Description

Disables the *RADIUS* client.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.

Default

RADIUS authentication is disabled for both switch management and network login by default.

Usage Guidelines

Use the mgmt-access keyword to disable RADIUS authentication for switch management functions.

Use the netlogin keyword to disable RADIUS authentication for network login.

If you do not specify a keyword, RADIUS authentication is disabled on the switch for both management and network login.

Example

The following command disables RADIUS authentication on the switch for both management and network login:

```
disable radius
```

The following command disables RADIUS authentication on the switch for network login:

```
disable radius netlogin
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable radius-accounting

```
disable radius-accounting {mgmt-access | netlogin}
```

Description

Disables *RADIUS* accounting.

Syntax Description

mgmt-access	Specifies the switch management RADIUS accounting server.
netlogin	Specifies the network login RADIUS accounting server.

Default

RADIUS accounting is disabled for both switch management and network login by default.

Usage Guidelines

Use the mgmt-access keyword to disable RADIUS accounting for switch management functions.

Use the netlogin keyword to disable RADIUS accounting for network login.

If you do not specify a keyword, RADIUS accounting is disabled on the switch for both management and network login.

Example

The following command disables RADIUS accounting on the switch for both management and network login:

```
disable radius-accounting
```

The following command disables RADIUS accounting on the switch for network login:

```
disable radius-accounting netlogin
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable radius dynamic-authorization

```
disable radius dynamic-authorization
```

Description

Disables dynamic authorization on *RADIUS* client.

Syntax Description

This command has no arguments or variables.

Default

RADIUS dynamic authorization is disabled by default.

Example

The following command disables dynamic authorization RADIUS authentication on the switch:

```
disable radius dynamic-authorization
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable rip

```
disable rip
```

Description

Disables *RIP* for the whole router.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

RIP has a number of limitations that can cause problems in large networks, including:

- A limit of 15 hops between the source and destination networks.
- A large amount of bandwidth taken up by periodic broadcasts of the entire routing table.
- Slow convergence.
- Routing decisions based on hop count; no concept of link costs or delay.
- Flat networks; no concept of areas or boundaries.

Example

The following command disables RIP for the whole router:

```
# disable rip
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable rip aggregation

```
disable rip aggregation
```

Description

Disables the *RIP* aggregation of subnet information on a RIP version 2 (RIPv2) router.

Syntax Description

This command has no arguments or variables.

Default

RIP aggregation is disabled by default.

Usage Guidelines

The disable RIP aggregation command disables the RIP aggregation of subnet information on a switch configured to send RIPv2-compatible traffic. The switch summarizes subnet routes to the nearest class network route. The following rules apply when using RIP aggregation:

- Within a class boundary, no routes are aggregated.
- If aggregation is disabled, subnet routes are never aggregated, even when crossing a class boundary.

Example

The following command disables RIP aggregation on the interface:

```
# disable rip aggregation
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable rip export

```
disable rip export [bgp | direct | e-bgp | i-bgp | ospf | ospf-
   extern1 | ospf-extern2 | ospf-inter | ospf-intra | static | isis
   | isis-level-1| isis-level-1-external | isis-level-2| isis-level-2-
   external ]
```

Description

Disables *RIP* from redistributing routes from other routing protocols.

Syntax Description

bgp	Specifies *BGP* routes.
direct	Specifies interface routes (only interfaces that have IP forwarding enabled are exported).
e-bgp	Specifies external *BGP* routes.
i-bgp	Specifies internal BGP routes.
ospf	Specifies all *OSPF* routes.
ospf-extern1	Specifies OSPF external route type 1.
ospf-extern2	Specifies OSPF external route type 2.
ospf-inter	Specifies OSPF-inter area routes.
ospf-intra	Specifies OSPF-intra area routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routes.
isis-level-1-external	Specifies ISIS Level 1 External routes.
isis-level-2	Specifies ISIS Level 2 routes.
isis-level-2-external	Specifies ISIS Level 2 External routes.

Default

Disabled.

Usage Guidelines

This command disables the exporting of BGP, static, direct, and OSPF-learned routes into the RIP domain.

Example

The following command disables RIP from redistributing any routes learned from OSPF:

```
# disable rip export ospf
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable rip originate-default

```
disable rip originate-default
```

Description

Disables the advertisement of a default route.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command unconfigures a default route to be advertised by *RIP* if no other default route is advertised:

```
# disable rip originate-default
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable rip poisonreverse

```
disable rip poisonreverse
```

Description

Disables poison reverse algorithm for *RIP*.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Like split horizon, poison reverse is a scheme for eliminating the possibility of loops in the routed topology. In this case, a router advertises a route over the same interface that supplied the route, but the route uses a hop count of 16, defining it as unreachable.

Example

The following command disables the split horizon with poison reverse algorithm for RIP:

```
# disable rip poisonreverse
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable rip splithorizon

```
disable rip splithorizon
```

Description

Disables the split horizon algorithm for *RIP*.

Syntax Description

This command has no arguments or variable.

Default

Enabled.

Usage Guidelines

Split horizon is a scheme for avoiding problems caused by including routes in updates sent to the router from which the route was learned. Split horizon omits routes learned from a neighbor in updates sent to that neighbor.

Example

The following command disables the split horizon algorithm for RIP:

```
# disable rip splithorizon
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable rip triggerupdates

```
disable rip triggerupdates
```

Description

Disables the trigger update mechanism. Triggered updates are a mechanism for immediately notifying a router's neighbors when the router adds or deletes routes or changes their metric.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Triggered updates occur whenever a router changes the metric for a route and it is required to send an update message immediately, even if it is not yet time for a regular update message to be sent. This will generally result in faster convergence, but may also result in more *RIP*-related traffic.

Example

The following command disables the trigger update mechanism:

```
# disable rip triggerupdate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable rip use-ip-router-alert

```
disable rip use-ip-router-alert
```

Description

Disables router alert IP option in outgoing *RIP* control packets.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables the RIP router alert IP option:

```
# disable rip use-ip-router-alert
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable ripng

```
disable ripng
```

Description

Disables *RIPng* for the whole router.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables RIPng for the whole router:

```
disable ripng
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ripng export

```
disable ripng export [direct | ospfv3 | ospfv3-extern1 | ospfv3-extern2
   | ospfv3-inter | ospfv3-intra | static | isis | isis-level-1| isis-
   level-1-external | isis-level-2| isis-level-2-external | bgp e-bgp i-
   bgp]
```

Description

Disables *RIPng* from redistributing routes from other routing protocols.

Syntax Description

direct	Specifies directly reachable subnets from the router (only interfaces that have IP forwarding enabled are exported).
ospfv3	Specifies all *OSPFv3* routes.
ospfv3-extern1	Specifies OSPFv3 external route type 1.
ospfv3-extern2	Specifies OSPFv3 external route type 2.
ospfv3-inter	Specifies OSPFv3-inter area routes.
ospfv3-intra	Specifies OSPFv3-intra area routes.

static	Specifies user configured static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routes.
isis-level-1-external	Specifies IS-IS Level 1 External routes.
isis-level-2	Specifies IS-IS Level 2 routes.
isis-level-2-external	Specifies IS-IS Level 2 External routes.
bgp	Specifies *BGP* IPv6 routes
e-bgp	Specifies EBGP routes.
i-bgp	Specifies IBGP routes.

Default

Disabled.

Usage Guidelines

This command disables the exporting of static, direct, IS-IS, and *OSPF*-learned routes from the switch routing table into the RIPng domain.

Example

The following command disables RIPng from redistributing any routes learned from OSPFv3:

```
disable ripng export ospfv3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ripng originate-default

```
disable ripng originate-default
```

Description

Disables the advertisement of a default route to the neighbors.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command unconfigures a default route to be advertised by *RIPng* if no other default route is advertised:

```
disable ripng originate-default
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ripng poisonreverse

```
disable ripng poisonreverse {vlan vlan-name | tunnel tunnel_name | [vlan
    | tunnel] all}
```

Description

Disables poison reverse algorithm for *RIPng*.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Like split horizon, poison reverse is a scheme for eliminating the possibility of loops in the routed topology. In this case, a router advertises a route over the same interface that supplied the route, but the route uses a hop count of 16, defining it as unreachable.

Example

The following command disables the split horizon with poison reverse algorithm for RIPng:

```
disable ripng poisonreverse
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ripng splithorizon

```
disable ripng splithorizon {vlan vlan-name | tunnel tunnel_name | [vlan
    | tunnel] all}
```

Description

Disables the split horizon algorithm for *RIPng*.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Split horizon is a scheme for avoiding problems caused by including routes in updates sent to the router from which the route was learned. Split horizon omits routes learned from a neighbor in updates sent to that neighbor.

Example

The following command disables the split horizon algorithm for RIPng:

```
disable rip splithorizon
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

disable ripng triggerupdate

```
disable ripng triggerupdate {vlan vlan-name | tunnel tunnel_name | [vlan
    | tunnel] all}
```

Description

Triggered updates are a mechanism for immediately notifying a router's neighbors when the router adds or deletes routes or changes their metric. This command disables the trigger update mechanism.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Triggered updates occur whenever a router changes the metric for a route and it is required to send an update message immediately, even if it is not yet time for a regular update message to be sent. This will generally result in faster convergence, but may also result in more *RIPng*-related traffic.

When this feature is disabled, any metric change on the interface, or an interface going down will not be communicated until the next periodic update. To configure how often periodic updates are sent, use the following command:

`configure ripng updatetime`

Example

The following command disables the trigger update mechanism:

```
disable ripng triggerupdate
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

disable rmon

```
disable rmon
```

Description

Disables the collection of RMON statistics on the switch.

Syntax Description

This command has no arguments or variables.

Default

By default, RMON is disabled. However, even in the disabled state, the switch responds to RMON queries and sets for alarms and events.

Usage Guidelines

The switch supports four out of nine groups of Ethernet RMON statistics. In a disabled state, the switch continues to respond queries of statistics. Collecting of history, alarms, and events is stopped; however, the switch still queries old data.

To view the status of RMON polling on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for RMON polling.

To view the RMON memory usage statistics for a specific memory type (for example, statistics, events, logs, history, or alarms) or for all memory types, use the following command:

`show rmon memory {detail | memoryType}`

Example

The following command disables the collection of RMON statistics on the switch:

```
disable rmon
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable router-discovery

```
disable router-discovery {ipv6} vlan vlan_name
```

Description

Disables router discovery advertisements on the *VLAN* and the processing of router discovery messages.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

None.

Example

The following example disables router discovery for the VLAN "top_floor":

```
disable router-discovery vlan top_floor
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

disable sflow ports

```
disable sflow ports port_list
```

Description

Disables sFlow statistical packet sampling and statistics gathering on a particular list of ports.

Syntax Description

port_list	Specifies a list of ports.

Default

Disabled.

Usage Guidelines

This command disables sFlow on a particular list of ports. Once sFlow is disabled on a port, sampling and polling will stops. If sFlow is disabled globally, all sampling and polling stops

Use the following command to disable sFlow globally:

`disable sflow`

Example

The following command disables sFlow sampling on port 3:1:

```
disable sflow ports 3:1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable sflow

```
disable sflow
```

Description

Globally disables sFlow statistical packet sampling.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables sFlow globally on the switch. When you disable sFlow globally, the individual ports are also put into the disabled state. If you later enable the global sFlow state, individual ports return to their previous state.

Example

The following command disables sFlow sampling globally:

```
disable sflow
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable sharing

`disable sharing` *`port`*

Description

Disables a load-sharing group of ports, also known as a *LAG*.

Syntax Description

`port`	Specifies the logical port of a load-sharing group or link aggregation group (LAG). Specifies a port or a combination of the slot and port number.

Default

Disabled.

Usage Guidelines

When sharing is disabled, the logical port retains all configuration including *VLAN* membership. All other member ports are removed from all VLANs to prevent loops and their configuration is reset to default values.

Any attempt to disable sharing on ports that have configuration is denied with the following error message:

```
ERROR: Sharing configuration on MLAG ports cannot be modified. Use
"disable mlag port <port>" to remove port from MLAG group first.
```

Example

The following command disables sharing on master logical port 9, which contains ports 9 through 12, on a switch:

```
disable sharing 9
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable slpp guard

```
disable slpp guard ports [port_list | all]
```

Description

Disable the Simple Loop Protection Protocol (SLPP) Guard feature.

Syntax Description

slpp	Specifies disabling SLPP.
guard	Specifies not using the SLPP Guard feature, which disables a port as soon as an SLPP PDU is received.
ports	Specifies selecting ports on which to disable SLPP guard.
port_list	Selects which ports on which to disable SLPP guard.
all	Specifies disabling SLPP guard on all ports.

Default

By default, SLPP Guard is disabled on all ports.

Usage Guidelines

SLPP is an application that detects loops in a Split Multi-link Trunking (SMLT) network. SLPP Guard is a complementary feature that helps prevent loops in networks by administratively disabling an edge port if a switch receive an SLPP PDU from an SMLT network.

Example

The following example disables SLPP Guard on port 5:

```
# disable slpp guard ports 5
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable smartredundancy

```
disable smartredundancy port_list
```

Description

Disables the Smart Redundancy feature.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

The Smart Redundancy feature works in concert with the software-controlled redundant feature. When Smart Redundancy is disabled, the switch attempts only to reset the primary port to active if the redundant port fails. That is, if you disable Smart Redundancy, the traffic does not automatically return to the primary port once it becomes active again; the traffic continues to flow through the redundant port even after the primary port comes up again.

Example

The following command disables the Smart Redundancy feature on ports 1 through 4 on a switch:

```
disable smartredundancy 1-4
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp access vr

```
disable snmp access vr [vr_name | all]
```

Description

Selectively disables *SNMP* access on virtual routers.

Syntax Description

vr_name	Specifies the virtual router name.
all	Specifies all virtual routers.

Default

Enabled on all virtual routers.

Usage Guidelines

Use this command to disable SNMP access on any or all virtual routers.

When SNMP access is disabled on a virtual router, the incoming SNMP request is dropped and an EMS message is logged.

To enable SNMP access on virtual routers use the `enable snmp access vr` command.

To display the SNMP configuration and statistics on a specified virtual router, use the `show snmp vr_name` command.

Example

The following command disables SNMP access on the virtual router vr-finance:

```
disable snmp access vr vr-finance
```

History

This command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp access

```
disable snmp access {snmp-v1v2c | snmpv3}
```

Description

Selectively disables *SNMP* on the switch.

Syntax Description

snmp-v1v2c	Specifies SNMPv1/v2c access only.
snmpv3	Specifies SNMPv3 access only.

Default

Disabled.

Usage Guidelines

Disabling SNMP access does not affect the SNMP configuration (for example, community strings). However, if you disable SNMP access, you will be unable to access the switch using SNMP.

This command allows you to disable either all SNMP access, v1/v2c access only, or v3 access only.

To allow access, use the following command:

```
enable snmp access {snmp-v1v2c | snmpv3}
```

Example

The following command disables all SNMP access on the switch:

```
disable snmp access
```

History

This command was first available in ExtremeXOS 10.1.

SNMPv3 was added to ExtremeXOS 12.2. It was also included in ExtremeXOS 11.6.4 and 12.1.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp community

```
disable snmp community [encrypted enc_community_name | community_name |
   alphanumeric-community-string | hex hex_community_name]
```

Description

Disables *SNMP* community strings on the switch.

Syntax Description

encrypted	Community name is encrypted.
enc_community_name	Encrypted community name.
community_name	Community name in ASCII format.
hex	Provide value in hexadecimal.
hex_community_name	Community name in hexadecimal.
alphanumeric-community-string	Specifies the SNMP community string name.

Default

N/A.

Usage Guidelines

This command allows the administrator to disable an snmp community. It sets the row status of the community to NotInService. When disabled, SNMP access to the switch using the designated community is not allowed.

Example

The following command disables the community string named extreme:

```
disable snmp community hex 61:01
```

History

This command was first available in ExtremeXOS 12.1.

The **hex** keyword and *hex_community_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp notification-log

```
disable snmp notification-log [ default | name | hex hex_name |all]
```

Description

Controls the administrative state of a log.

Syntax Description

default	The default log.
name	Specifies the name of the log.
hex	Provide value in hexadecimal.
hex_name	Name of the log in hexadecimal.
all	Specifies all logs.

Default

Disabled.

Usage Guidelines

Use this command to control the administrative state of a log.

Example

The following example disables *nmslog1*:

```
disable snmp notification-log hex 01:02
```

History

This command was first available in ExtremeXOS 15.5.

The **default** and **hex** keywords and *hex_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp trap l3vpn

```
disable snmp trap l3vpn {vr name}
```

Description

This command disables Layer 3 VPN MIB notification traps for the child VPN VRFs of the specified VR.

Syntax Description

vr-name	Specifies the name of the parent VR where this RFC 4382 scalar is applied. If vr-*name* is not provided, then this command is applied to the VR in the current context.

Default

Disabled.

Usage Guidelines

None.

Example

The following example disables *SNMP* traps for Layer 3 VPNs on the default VR:

```
disable snmp traps l3vpn vr vr-default
```

History

This command was first available in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp traps

```
disable snmp traps
```

Description

Prevents *SNMP* traps from being sent from the switch.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command does not clear the SNMP trap receivers that have been configured. The command prevents SNMP traps from being sent from the switch even if trap receivers are configured.

To view if SNMP traps are being sent from the switch, use the `show management` command. The `show management` command displays information about the switch including the enabled/disabled state of SNMP traps being sent.

Example

The following command prevents SNMP traps from being sent from the switch to the trap receivers:

```
disable snmp traps
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp traps bfd

`disable snmp traps bfd` **`session down | session-up`**

Description

This command disables session up/down trap reception for BFD.

Syntax Description

snmp	Configure *SNMP* specific settings.
traps	Configure SNMP Trap generation settings.
bfd	BFD-specific traps.
session-down	Generate trap when BFD session goes down.
session-up	Generate trap when BFD session goes up.

Default

Both session-down and session-up.

Usage Guidelines

Use this command to disable trap reception for BFD session up/down.

Example

The following command will disable trap generation for BFD session down events.

```
# disable snmp traps bfd session-down
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp traps configuration

```
disable snmp traps configuration [save | change]
```

Description

Disables sending *SNMP* trap when saving or changing the switch configuration.

Syntax Description

configuration	Sends SNMP trap for switch configuration.
save	Disables SNMP trap when switch configuration is saved (default is disabled).
change	Disables SNMP trap when switch configuration is changed (default is disabled).

Default

The default is that SNMP traps are disabled for switch configuration changes/saves.

Example

The following example disables SNMP traps for switch configuration saves:

```
disable snmp traps configuration save
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches..

disable snmp traps fdb mac-tracking

```
disable snmp traps fdb mac-tracking
```

Description

Disables SNMP trap generation when MAC-tracking events occur for a tracked MAC address.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following example disables SNMP traps for MAC-tracking events:

```
disable snmp traps fdb mac-tracking
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

disable snmp traps identity-management

```
disable snmp traps identity-management
```

Description

Disables the identity management feature to send *SNMP* traps for low memory conditions.

Syntax Description

This command has no arguments or variables.

Default

No traps are sent.

Usage Guidelines

None.

Example

The following command disables the identity management SNMP trap feature:

```
disable snmp traps identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp traps l2vpn

```
disable snmp traps l2vpn
```

Description

Disables *SNMP* traps associated with Layer 2 VPNs for all *MPLS* configured VLANs.

Syntax Description

This command has no arguments or variables.

Default

All Layer 2 VPN traps are disabled.

Example

The following command disables SNMP traps associated with Layer 2 VPNs:

```
disable snmp traps l2vpn
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable snmp traps l3vpn

```
disable synmp traps l3vpn {vr vr_name}
```

Description

Use this command to turn off *SNMP* trap support for L3 VPN.

Syntax Description

vr_name	Specifies the name of the parent VR where this RFC 4382 scalar is applied. If *vr_name* is not provided, then this command is applied to the VR in the current context.

Default

Enabled.

Usage Guidelines

Use this command to disable L3VPN SNMP traps.

Example

The following example disables L3 VPN SNMP traps support on the switch:

```
disable snmp traps l3vpn vr vr-default
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp traps lldp

```
disable snmp traps lldp {ports [all | port_list]}
```

Description

Disables the sending of *LLDP*-specific *SNMP* traps on the specified port or ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

If you do not specify any ports, the system stops sending LLDP traps from all ports on the switch.

Example

The following example disables sending LLDP SNMP traps on all switch ports:

```
disable snmp traps lldp ports all
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp traps lldp-med

```
disable snmp traps lldp-med {ports [all | port_list]}
```

Description

Disables the sending of *LLDP* MED-specific *SNMP* traps on the specified port or ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

If you do not specify any ports, the system stops sending LLDP MED traps from all ports on the switch.

Example

The following example disables sending LLDP MED SNMP traps on all switch ports:

```
disable snmp traps lldp-med ports all
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmp traps mpls

```
disable snmp traps mpls
```

Description

Disables *SNMP* traps associated with *MPLS* for all MPLS configured VLANs.

Syntax Description

This command has no arguments or variables.

Default

All MPLS traps are disabled.

Example

The following command disables SNMP traps associated with MPLS:

```
disable snmp traps mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable snmp traps ospf

```
disable snmp traps ospf
```

Description

Disables the *OSPF* module from sending traps on various OSPF events.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables the OSPF process:

```
disable snmp traps ospf
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable snmp traps ospfv3

```
disable snmp traps ospfv3
```

Description

Disables the transmission of *OSPFv3 SNMP* notifications.

Syntax Description

ospfv3	OSPFv3-related traps.

Default

The default is disabled.

Example

The following example disables the transmission of OSPFv3 SNMP notifications:

```
disable snmp traps ospfv3
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

disable snmp traps port-up-down ports

```
disable snmp traps port-up-down ports [port_list | all]
```

Description

Disables port up/down trap reception for specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled.

Usage Guidelines

Use this command to stop receiving *SNMP* trap messages when a port transitions between being up and down.

Example

The following command stops ports 3, 5, and 12 through 15 on a stand-alone switch from receiving SNMP trap messages when the port goes up/down:

```
disable snmp traps port-up-down ports 3,5,12-15
```

History

This command was first available in ExtremeXOS 10.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmpv3

```
disable snmpv3 default-group
```

Description

Disables SNMPv3 default-group access on the switch.

Syntax Description

default-group	Specifies SNMPv3 default-group.

Default

Enabled.

Usage Guidelines

This command is used to disable SNMPv3 default-group access.

Disabling SNMPv3 default-group access removes access to default-users and user-created users who are part of the default-group. The user-created authenticated SNMPv3 users (who are part of a user-created group) are able to access the switch.

The default groups are: admin, initial, v1v2c_ro, v1v2c_rw.

Example

The following command disables the default group on the switch:

```
disable snmp default-group
```

History

This command was available in ExtremeXOS 12.2.

It was also included in ExtremeXOS 11.6.4 and ExtremeXOS 12.1.2.

The default-user option was removed in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable snmpv3 community

```
disable snmpv3 community [ community_index | hex hex_community_index ]
```

Description

This command disables a community entry specified by the community index.

Syntax Description

community_index	Community index in ASCII.
hex	Provide value in hexadecimal.
hex_community_index	Community index in hexadecimal.

Default

Enabled.

Usage Guidelines

This command is used to disable a community entry specified by the community index.

Example

```
disable snmpv3 community hex 61:62:63:64
```

History

This command was available in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable sntp-client

```
disable sntp-client
```

Description

Disables the *SNTP* client.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

SNTP can be used by the switch to update and synchronize its internal clock from a Network Time Protocol (NTP) server. After the SNTP client has been enabled, the switch sends out a periodic query to the indicated NTP server, or the switch listens to broadcast NTP updates. In addition, the switch supports the configured setting for Greenwich Mean Time (GMT) offset and the use of Daylight Savings Time (DST).

Example

The following command disables the SNTP client:

```
disable sntp-client
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable ssh2

```
disable ssh2
```

Description

Disables the SSH2 server for incoming SSH2 sessions to switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

SSH2 options (non-default port setting) are not saved when SSH2 is disabled.

To view the status of SSH2 on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for SSH2.

Example

The following command disables the SSH2 server:

```
disable ssh2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable stacking

`disable stacking {`**`node-address`** *`node-address`*`}`

Description

This command disables the stacking on one or all nodes in the stack topology.

Syntax Description

`node-address`	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the `show stacking` command.

Default

Default value is stacking disabled.

Usage Guidelines

If you do not specify the node-address, stacking is disabled on all nodes in the stack topology.

If the node-address parameter is present, stacking is disabled on the node with the specified node-address. This is the MAC address assigned to the stackable by the factory.

A node in the stack topology that is disabled for stacking does not forward the customer's data through its stacking links and does not become a member of the active topology.

A disabled node becomes its own master and processes and executes its own configuration independently.

When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified
node(s).
```

Use `show stacking configuration` command to see the current configuration of the stack. Verify the flags in `show stacking configuration` output to confirm that stacking is disabled on the specified node(s).

Example

The following example disables stacking on an 8 node stack:

```
* Switch.3 # disable stacking
This command will take effect at the next reboot of the specified node(s).
```

The following example disables stacking on the node with the factory assigned MAC address 00:04:96:26:6b:ed:

```
* Switch.3 # disable stacking node-address 00:04:96:26:6b:ed
This command will take effect at the next reboot of the specified node(s).
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable stacking-support

```
disable stacking-support
```

Description

This command disables the stacking-support option on a switch with dual-purpose hardware.

Syntax Description

This command does not have additional syntax.

Default

Disabled.

Usage Guidelines

The Stacking-Support Option Control column in Table 18 on page 1352 displays Yes in the rows for switch configurations for which you can disable the stacking-support option.

After you disable the stacking-support option, you must reboot the switch to activate the configuration change.

If you disable the stacking-support option on a switch and reboot, stacking communication stops and the data ports listed in Table 18 on page 1352 use Ethernet protocols instead of stacking protocols.

Example

To disable the stacking ports, enter the following command:

```
# disable stacking-support
This setting will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable stpd

```
disable stpd {stpd_name}
```

Description

Disables the *STP* protocol on a particular *STPD* or for all STPDs.

Syntax Description

stpd_name	Specifies an STPD name on the switch.

Default

Disabled.

Usage Guidelines

After you have created the STPD with a unique name, the keyword stpd is optional.

If you want to disable the STP protocol for all STPDs, do not specify an STPD name.

In an *MSTP* environment, you cannot delete or disable a CIST if any of the MSTIs are active in the system.

Example

The following command disables an STPD named purple_st:

```
disable stpd purple_st
```

The following command disables the STP protocol for all STPDs on the switch:

```
disable stpd
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable stpd auto-bind

```
disable stpd stpd_name auto-bind [ {vlan} vlan_name | vlan vlan_list]
```

Description

Disables the ability to automatically add ports to an *STPD* when they are added to a member *VLAN*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
vlan_name	Specifies the name of a member VLAN with autobind enabled.
vlan_list	Specifies a VLAN list of IDs.

Default

The autobind feature is disabled on user-created STPDs. The autobind feature is enabled on the default VLAN that participates in the default STPD S0.

Usage Guidelines

Note
Ports already in the STPD remain in that domain (as if they were added manually).

If you create an STPD and a VLAN with unique names, the keywords **stpd** and **vlan** are optional.

Ports added to the STPD automatically when autobind is enabled are not removed when autobind is disabled. The ports are present after a switch reboot.

To view *STP* configuration status of the ports in a VLAN, use the following command:

```
show {vlan} {vlan_name | vlan_list} stpd
```

Example

The following example disables autobind on an STPD named s8:

```
disable stpd s8 auto-bind v5
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable stpd ports

Disables *STP* on one or more ports for a given *STPD*.

```
disable stpd stpd_name ports [all | port_list]
```

Syntax Description

stpd_name	Specifies an STPD name on the switch.
all	Specifies all ports for a given STPD.
port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

If you create the STPD with a unique name, the keyword stpd is optional.

Disabling STP on one or more ports puts those ports in the forwarding state; all BPDUs received on those ports are disregarded and dropped.

Use the all keyword to specify that all ports of a given STPD are disabled.

Use the port_list parameter to specify a list of ports of a given STPD are disabled.

If you do not use the default STPD, you must create one or more STPDs and configure and enable the STPD before you can use the `disable stpd ports` command.

Example

The following command disables slot 2, port 4 on an STPD named Backbone_st:

```
disable stpd backbone_st ports 2:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable stpd rapid-root-failover

`disable stpd` *`stpd_name`* **`rapid-root-failover`**

Description

Disables rapid root failover for *STP* recovery times.

Syntax Description

`stpd_name`	Specifies an *STPD* name on the switch.

Default

Disabled.

Usage Guidelines

This command is applicable for STPDs operating in 802.1D.

After you have created the STPD with a unique name, the keyword stpd is optional.

To view the status of rapid root failover on the switch, use the `show stpd` command. The `show stpd` command displays information about the STPD configuration on the switch including the enable/disable state for rapid root failover.

Example

The following command disables rapid root fail over on STPD Backbone_st:

```
disable stpd backbone_st rapid-root-failover
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable switch bluetooth

disable **switch bluetooth** {**discovery** | **pairing** }

Description

Disables Bluetooth capability on a switch.

Syntax Description

switch	Designates disabling switch capabilities.
bluetooth	Designates disabling Bluetooth capabilities on a switch.
discovery	Disables discoverable mode of the switch. Default is enabled.
pairing	Disables pairing ability with other Bluetooth-capable devices. Default is enabled.

Default

By default, discovery and pairing modes are enabled.

Usage Guidelines

Using the command with no options disables Bluetooth capability on the switch. The **discovery** and **pairing** options disable discoverable mode and pairing ability, respectively.

To enable Bluetooth capabilities, use the enable **switch bluetooth** {**discovery** | **pairing** } command.

To view Bluetooth and discovery/pairing status, use the show **switch bluetooth** [**statistics** | **inventory**] command.

Example

The following example disables Bluetooth capability on a switch:

```
# disable switch bluetooth
```

The following example disables discovery mode on a switch:

```
# disable switch bluetooth discovery
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable switch locally-administered-address

```
disable switchlocally-administered-address
```

Description

Disables the switch from generating locally administered per-port MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

This feature is disabled by default.

Usage Guidelines

ExtremeXOS switches do not use a unique per-port MAC address when transmitting bridge protocol data units (BPDUs). As a result, switch management can become inaccessible when switch MAC addresses are learned on the wrong L2 path (corresponding to a blocking port). This command allows you to disable the switch from generating locally administered MAC addresses.

Example

The following example disables the switch from generating locally administered MAC addresses:

```
disable switch locally-administered-address
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable switch usb

```
disable switch usb
```

Description

Disables use of the switch's USB port.

Syntax Description

usb	Specifies USB port on switch.

Default

Enabled by default.

Usage Guidelines

This command requires a reboot to take effect.

Stack support is not available. You need to run this command individually on each node in a stack.

Running `unconfigure switch all` removes this USB setting and returns to the default of enabled.

Example

The following example disables use of the USB port:

```
disable switch usb
This setting will take effect at the next system reboot.
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable syslog

```
disable syslog
```

Description

Disables logging to all remote syslog server targets.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Disables logging to all remote syslog server targets, not to the switch targets. This setting is saved in FLASH, and will be in effect upon boot up.

Example

The following command disables logging to all remote syslog server targets:

```
disable syslog
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable subvlan-proxy-arp vlan

```
disable subvlan-proxy-arp vlan [vlan-name | all]
```

Description

Disables the automatic entry of subVLAN information in the proxy ARP table.

Syntax Description

vlan-name	Specifies a superVLAN name.
all	Specifies all VLANs.

Default

Enabled.

Usage Guidelines

To facilitate communication between subVLANs, by default, an entry is made in the IP ARP table of the superVLAN that performs a proxy ARP function. This allows clients on one subVLAN to communicate with clients on another subVLAN. In certain circumstances, intra-subVLAN communication may not be desired for isolation reasons.

Note
The isolation option works for normal, dynamic, ARP-based client communication.

Example

The following example disables the automatic entry of subVLAN information in the proxy ARP table of the superVLAN "vsuper":

```
disable subvlan-proxy-arp vlan vsuper
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable tacacs

```
disable tacacs
```

Description

Disables TACACS+ authentication.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables TACACS+ authentication for the switch:

```
disable tacacs
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable tacacs-accounting

```
disable tacacs-accounting
```

Description

Disables TACACS+ accounting.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables TACACS+ accounting:

```
disable tacacs-accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable tacacs-authorization

```
disable tacacs-authorization
```

Description

Disables TACACS+ authorization.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This disables CLI command authorization but leaves user authentication enabled.

Example

The following command disables TACACS+ CLI command authorization:

```
disable tacacs-authorization
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable tech-support collector

```
disable tech-support collector
```

Description

Disables the tech support feature.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables the tech-support feature. In the ExtremeXOS 15.4 release, the feature is disabled by default. When the feature is disabled, the previous scheduled reports are canceled, and the bootup event and critical severity events are ignored.

Example

The following command disables the tech-support feature:

```
disable tech-support collector
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable telnet

```
disable telnet
```

Description

Disables external Telnet services on the system.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

You must be logged in as an administrator to enable or disable Telnet.

Note

Telnet sessions between the nodes of a stack are not affected by this command.

Example

With administrator privilege, the following command disables external Telnet services on the switch:

```
disable telnet
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable tunnel

```
disable {tunnel} tunnel_name
```

Description

Allows GRE tunnels to be disabled.

Syntax Description

tunnel_name	GRE tunnel name.

Default

Enabled.

Usage Guidelines

Use this command to disable GRE tunnels.

Example

This exanple disables the tunnel named "myGREtunnel":

```
disable myGREtunnel
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable twamp reflector

```
disable twamp reflector {restrict}
```

Description

This command disables the Session-Reflector.

Syntax Description

restrict	Restricts only TWAMP control sessions to create test sessions and reflector does not respond to TWAMP-test packets tgat do not match a test session created by a control session.

Default

N/A.

Usage Guidelines

If the you disable the Session-Reflector, the application terminates all current TWAMP test sessions. If you specify the **restrict** keyword, only TWAMP control sessions may create test sessions and the reflector will not respond to TWAMP-test packets that do not match a test session created by a control session.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable twamp server

```
disable twamp server
```

Description

This command disables the TWAMP server.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

If you disable the TWAMP server, all current TWAMP control sessions are terminated and any test sessions set up by the control sessions are deleted.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

The command is available on all platforms.

disable udp-echo-server

```
disable udp-echo-server {vr vrid}
```

Description

Disables UDP echo server support.

Syntax Description

vrid	Specifies a VR or VRF.

Default

Disabled.

Usage Guidelines

UDP echo packets are used to measure the transit time for data between the transmitting and receiving end.

Example

The following example disables UDP echo server support:

```
disable udp-echo-server
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable upm profile

```
disable upm profile profile-name
```

Description

Disables the use of the specified Universal Port profile on the switch.

Syntax Description

profile-name	Specifies the UPM profile to be disabled.

Default

A UPM profile is enabled by default.

Example

The following command disables a UPM profile called sample_1 on the switch:

```
disable upm profile sample_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable virtual-network remote-endpoint vxlan

```
disable virtual-network remote-endpoint vxlan [ ipaddress ipaddress {vr
   vr_name} | all ]
```

Description

Disables a *VXLAN* remote endpoint.

Syntax Description

virtual-network	Virtual overlay network.
remote-endpoint	Remote tunnel endpoint information.
vxlan	VXLAN virtual networks remote endpoint.
ipaddress	Specifies an IP address of a remote endpoint.
ipaddress	Specifies the IP address of the desired remote endpoint.
vr	Specifies a VR/VRF instance the remote endpoint is associated with.
vr_name	Specifies the desired existing VR/VRF instance the remote endpoint is associated with. Default is VR-Default.
all	Specifies all remote tunnel endpoints.

Default

If a VR is not specified, VR-Default is the VR.

Usage Guidelines

Extreme Loop Recognition Protocol (ELRP) detects loops across VXLAN tunnels. If a loop is detected across the tunnel, ELRP takes down the VXLAN remote endpoint. You can use this command to disable a remote endpoint manually.

Example

The following example disables the remote endpoint at 100.1.1.1 on VR-Default (not specified, command default):

```
# disable virtual-network remote-endpoint vxlan ipaddress 100.1.1.1
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

disable virtual-router

disable **virtual-router** *vrf-name*

Description

Disables a VRF.

Note
This command is only applicable for VRFs.

Syntax Description

vrf-name	Specifies the name of the VRF.

Default

Enabled.

Usage Guidelines

When you disable a VRF, the software does the following:

- Disables Layer 3 protocols.
- Marks static routes as inactive and removes them from the hardware forwarding tables.
- Flushes the IP ARP and IPv6 neighbor-discovery caches.

Example

The following example disables VRF "vrf1":

```
disable virtual-router vrf1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable vlan

```
disable [ {vlan} vlan_name | vlan vlan_list]
```

Description

Use this command to disable the specified *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN you want to disable.
vlan_list	Specifies the VLAN list of IDs to disable.

Default

Enabled.

Usage Guidelines

This command allows you to administratively disable specified VLANs. The following guidelines apply to working with disabling VLANs:

- Disabling a VLAN stops all traffic on all ports associated with the specified VLAN.
- You cannot disable a VLAN that is running Layer 2 protocol control traffic for protocols such as *EAPS*, *STP*, or *ESRP*.

  When you attempt to disable a VLAN running Layer 2 protocol control traffic, the system returns a message similar to the following:

  ```
  VLAN accounting cannot be disabled because it is actively used by an L2 Protocol
  ```
- You can disable the default VLAN; ensure that this is necessary prior to disabling the default VLAN.
- You cannot disable the management VLAN.
- You cannot bind Layer 2 protocols to a disabled VLAN.
- You can add ports to or delete ports from a disabled VLAN.

Caution
Disabling the Mgmt VLAN disables access to the Ethernet Management port on a switch (`disable vlan Mgmt`).

Example

The following example disables the VLAN named "accounting":

```
disable vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

The ability to add ports to a disabled VLAN was added in ExtremeXOS 12.5.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable vm autostart

```
disable vm vm_name autostart
```

Description

Disables automatic start-up of guest virtual machines (VMs).

Syntax Description

vm	Designates a virtual machine.
vm_name	Specifies the VM name.
autostart	Specifies disabling automatic start-up of the specified VM. Default is disabled.

Default

By default, automatic start-up is disabled.

Usage Guidelines

This command disables automatically starting up a specific VM when the system starts.

You must reboot the switch for this command to take effect.

To enable automatic start-up, use the command `enable` **`vm`** *vm_name* **`autostart`**.

The Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

Example

The following example disables automatic start-up of VM "vm1":

```
# disable vm vm1 autostart
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

disable vm-tracking dynamic-vlan ports

`disable vm-tracking dynamic-vlan ports` *port_list*

Description

This command disables VM-tracking dynamic *VLAN* on specific ports.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disable VM-tracking dynamic VLAN on specific ports. The ALL option is not supported because VM-tracking dynamic VLAN should not be enabled on a switch's uplink port.

Example

This example disables VM-tracking dynamic VLAN on port 2:1:

```
# disable vm-tracking dynamic-vlan ports 2:1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable vm-tracking

```
disable vm-tracking
```

Description

Disables the *Extreme Network Virtualization (XNV)* feature on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables the XNV feature, which tracks virtual machines (VMs) that connect to the switch.

Note

When the VM tracking feature is disabled, file synchronization with the FTP server stops.

Example

The following command disables the XNV feature:

```
# disable vm-tracking
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable vm-tracking ports

```
disable vm-tracking ports port_list
```

Description

Disables the *XNV* feature on the specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

This command disables VM tracking on the specified ports.

Example

The following command disables VM tracking on port 2:1:

```
# disable vm-tracking ports 2:1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable vman cep egress filtering ports

```
disable vman cep egress filtering ports {port_list | all}
```

Description

Disables the egress filtering of CVIDs that are not configured in the CVID map for a CEP.

Syntax Description

port_list	Specifies a list of ports.
all	Specifies all switch ports.

Default

Egress CVID filtering is disabled.

Usage Guidelines

To view the configuration setting for the egress CVID filtering feature, use the `show ports information` command.

Note

When CVID egress filtering is enabled, it reduces the maximum number of CVIDs supported on a port. The control of CVID egress filtering applies to fast-path forwarding. When frames are forwarded through software, CVID egress filtering is always enabled.

Example

The following example disables egress CVID filtering on port 1:

```
disable vman cep egress filtering port 1
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable vpex

```
disable vpex
```

Description

Disables VPEX mode for using bridge port extenders (BPEs).

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).

Default

N/A.

Usage Guidelines

Disabling VPEX mode removes all BPE slot number assignments made using `configure` **vpex ports** *port_list* **slot** *slot_num*. A reboot of the switch is required for this command to take effect.

Example

The following example disables VPEX mode:

```
# disable vpex
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

disable vpex auto-configuration

`disable` **vpex auto-configuration**

Description

Disables automatic configuration of the Extended Edge Switching architecture (controlling bridge (CB) and bridge port extenders (BPEs)).

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).
auto-configuration	Specifies disabling automatic configuration of the Extended Edge Switching architecture.

Default

Disabled.

Usage Guidelines

Auto-configuration allows the controlling bridge switch to detect new BPEs connected to ports not configured as cascade ports, and automatically configure cascade ports, LAG membership, ports, and extended slots. This command disables this auto-configuring capability.

To disable auto-configuration, you must first enter VPEX mode (see enable vpex on page 2347).

Example

The following example disables auto-configuration mode:

```
# disable vpex auto-configuration
```

History

This command was first available in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

disable vpex auto-upgrade

```
disable vpex auto-upgrade
```

Description

Disables automatic upgrading on Extended Edge Switching topologies.

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).
auto-upgrade	Specifies that the controlling bridge (CB) automatically upgrades bridge port extender (BPE) slots in mode (default is enabled).

Default

Automatic upgrading is enabled by default.

Usage Guidelines

Automatic upgrading can occur only when both CBs in the MLAG have the same BPE xmod versions installed, and only after all slots are synchronized between the CBs.

To disable automatic upgrading, you must first enter VPEX mode (see enable vpex on page 2347). To view the status of automatic upgrading, use the command `show vpex`.

Example

The following example disables automatic upgrading:

```
# disable vpex auto-upgrade
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

disable vpls

`disable vpls [vpls_name | all]`

Note

This command has been replaced with the following command: `disable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]]`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Disables the VPLS instance specified by `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
all	Specifies all VPLS.

Default

All newly created VPLS instances are enabled.

Usage Guidelines

This command disables the VPLS instance specified by *vpls_name*. When a VPLS instance is disabled, all sessions to its configured peers are terminated. Any locally attached service *VLAN*/VMAN is immediately isolated from other devices residing in the VPN. If this is an H-VPLS core node, then all spoke nodes connected to this peer are isolated unless redundant core access is configured.

Example

The following example disables the VPLS named "myvpls":

```
disable vpls myvpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable vpls fdb mac-withdrawal

```
disable vpls fdb mac-withdrawal
```

Note

This command has been replaced with the following command: `disable l2vpn vpls fdb` **`mac-withdrawal`** .

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Disables the VPLS MAC address withdrawal capability.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

When disabled, the switch does not send MAC address withdrawal messages. If a MAC address withdrawal message is received from another VPLS peer, the local VPLS peer processes the message and withdraws the specified MAC addresses from its *FDB*, regardless of the MAC address withdrawal configuration.

Example

The following command disables MAC address withdrawal:

```
disable vpls fdb mac-withdrawal
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable vpls health-check vccv

```
disable vpls [vpls_name | all] health-check vccv
```

Note

This command has been replaced with the following command: `disable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]] health-check vccv` .

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Disables the VCCV health check feature on one or all VPLS instances on the local node.

Syntax Description

vpls_name	Identifies the VPLS for which health check is to be disabled.
all	Specifies that health check is to be disabled on all VPLS instances on the local node.

Default

Health check is disabled.

Usage Guidelines

None.

Example

The following command disables the health check feature on the VPLS instance myvpls:

```
disable vpls myvpls health-check vccv
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable vpls service

```
disable vpls [vpls_name | all] service
```

Note

This command has been replaced with the following command: `disable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]] service`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Disables the configured VPLS services for the specified *vpls_name*.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
all	Specifies all VPLS.

Default

Enabled.

Usage Guidelines

When services are disabled, the VPLS is removed from all peer sessions. The keyword **all** disables services for all VPLS instances.

Example

The following command disables the configured VPLS services for the specified VPLS:

```
disable vpls myvpls service
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

disable vrrp group

```
disable vrrp group group_name {configuration | members}
```

Description

This command disables group mode on member VRs so that they can operate in individual VR mode.

Syntax Description

group	Form a group of *VRRP* VRs to operate in high-scale mode.
group_name	Specifies the VRRP group name.
configuration	Removes group configuration on individual VRs (default).
members	Disables all VRs that are members of the group.

Default

If you do not specify, group configuration is removed from individual VRs.

Example

The following example disables administratively all member VRs of the group. This may be useful for debugging issues:

```
disable vrrp group ExtremeNet members
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable vrrp vrid

```
disable vrrp {vlan [vlan_name | vlan_list] vrid [vridval | vrid_list]}
```

Description

Disables a specific *VRRP* instance or all VRRP instances.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vlan_list	VLAN list (1–4,094).
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.
vrid_list	List of virtual router IDs (1–255).

Default

N/A.

Usage Guidelines

This disables a specific VRRP instance on the switch. If no VRRP VLAN is specified, all VRRP instances on the switch are disabled.

Example

The following command disables all VRRP instances on the switch:

```
disable vrrp
```

History

This command was first available in ExtremeXOS 10.1.

VLAN and VR list options added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

disable watchdog

```
disable watchdog
```

Description

Disables the system watchdog timer.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

The watchdog timer monitors the health of the switch hardware and software events. For example, the watchdog timer reboots the switch if the system cannot reset the watchdog timer. This can be caused by a long CPU processing loop, any unhandled exception, or a hardware problem with the communication channel to the watchdog. In most cases, if the watchdog timer expires, the switch captures the current CPU status and posts it to the console and the system log. In some cases, if the problem is so severe that the switch is unable to perform any action, the switch reboots without logging any system status information prior to reboot.

This command takes affect immediately.

The watchdog settings are saved in the configuration file.

To display the watchdog state of your system, use the `show switch` command.

Example

The following command disables the watchdog timer:

```
disable watchdog
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable web http

```
disable web http
```

Description

Disables the hypertext transfer protocol (HTTP) access to the switch on the default port (80).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disallow users from connecting with HTTP. Disabling HTTP access forces a user to use a secured HTTPS connection if web HTTPS is enabled.

Use the following command to enable web HTTPS:

```
enable web https
```

Example

The following command disables HTTP on the default port:

```
disable web http
```

History

This command was first available in the ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable web https

```
disable web https
```

Description

Disables the secure socket layer (SSL) access to the switch on the default port (443).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disable SSL before changing the certificate or private key.

Example

The following command disables SSL on the default port:

```
disable web https
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable cli xml-mode

```
disable cli xml-mode
```

Description

Disables XML configuration mode on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disable the XML configuration mode on the switch. XML configuration mode is not supported for end users.

See the command:

enable xml-mode

Example

The following command disables XML configuration mode on the switch:

```
disable cli xml-mode
```

History

This command was first available in an ExtremeXOS 11.2.

The **cli** keyword was added for syntax consistency in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

disable msrp ports

disable msrp ports [*port_list* | **all**]

Description

Disables MSRP on the ports listed in the command after the keyword **ports**.

Syntax Description

msrp	Multiple Stream Registration Protocol.
port_list	Port list separated by a comma or "-".
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to disable MSRP in the ports listed or all ports.

Example

```
disable msrp ports all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms if the AVB feature pack license is installed on the switch.

download bootrom

```
download bootrom [[ipaddress | hostname] filename {{vr} vrname} {block-
   size block_size}] {slot slotid} {install} {reboot}}
```

Description

Downloads a BootROM image after the switch has booted.

The downloaded image replaces the BootROM in the onboard FLASH memory.

Syntax Description

ipaddress	Specifies the IP address of the TFTP server.
hostname	Specifies the host name of the TFTP server. Use of the *hostname* option requires that DNS be enabled.
filename	The name of the bootROM file (.xtr extension).
vrname	Specifies the name of the virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
block_size	Specifies the data block size, excluding TFTP header. Data block size ranges from 24-65,000 bytes.
slotid	This parameter is available only on the SummitStacks. On a SummitStack, the *slotid* specifies the slot number of the node on which the image should be downloaded.
install	Specifies installing the system image after download.
reboot	Specifies rebooting after installation.

Default

The default block size is 1,400 bytes.

Usage Guidelines

Upgrade the BootROM image only when asked to do so by an Extreme Networks technical representative.

The BootROM image file is designated with a `.xtr` file extension.

Prior to downloading the BootROM image on the switch, you must download the image you received from Extreme Networks to a TFTP server on your network. You can also download the image to a USB 2.0 storage device.

When you download a BootROM image, you are prompted to install the image immediately after the download is finished. You can also use the **install** option to choose in advance to install the bootROM image. If you choose to install the image at a later time, use the `install bootrom [from-image | fname | local-file] {slot slot-number} {reboot}` command to install the software on the switch.

If this command does not complete successfully it could prevent the switch from booting. If the switch does not boot properly, some boot option functions can be accessed through a special Bootloader menu.

Displaying the BootROM Versions

To display the BootROM version for the switch, use the `show version` command.

Host Name and Remote IP Address Character Restrictions

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

Local and Remote File Name Character Restrictions

When specifying a local or remote file name, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/) Permitted only for remote files

SummitStack Only

You can run this command only from the master node. The file to be downloaded has to be compatible with the type of switch in the specified slot.

If you do not specify a slot number and you elect to install the image after downloading, an attempt is made to install the BootROM image on all active nodes. The BootROM image is not installed on any node if the BootROM image specified is not compatible with all active nodes.

Example

The following example downloads a BootROM image from the TFTP server "tftphost" with the file name "bootimage":

```
# download bootrom tftphost bootimage
```

History

This command was first available in ExtremeXOS 11.0.

The **slot** parameter was added to support SummitStack in ExtremeXOS 12.0.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Block size support was added in ExtremeXOS 15.7.1.

The **memorycard** option was removed in ExtremeXOS 30.7.

The **install** and **reboot** options were added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

download image

Using TFTP: `download [url` *`url`* `{vr` *`vrname`*`} | image [active | inactive] [[`*`hostname`*` | `*`ipaddress`*`] `*`filename`*` {{vr} `*`vrname`*`} {block-size `*`block_size`*`}] {`*`partition`*`} {install {reboot}}`

To download an image to a stack: `download image [[`*`hostname`*` | `*`ipaddress`*`] `*`filename`*` {{vr} `*`vrname`*`} {block-size `*`block_size`*`}] {`*`partition`*`} {install {reboot}}`

Description

Downloads a new version of the ExtremeXOS software image or a new Fabric Engine image when changing the switch's network operating system.

The image file can be downloaded using TFTP (which is not a secure method), or SFTP and SCP2 (which are secure methods). The procedure using TFTP begins above and using SFTP/SCP2.

Syntax Description

url	Uniform Resource Locator (URL) of the file to download, which is of a supported type (for example, `cfg`, `lic`, `lst`, `pol`, `py`, `Fabric Engine`, `xmod`, `xos`, `xsf`, `xtr`).
url	Specifies the URL of the supported file (for example, `http://ipaddress/path.xos` or `ftp://ipaddress:port/path.xmod` or `ftp://ipaddress/some_list.lst`)

active	Specifies automatic determination for active (primary) partition. Note: Not applicable Fabric Engine specifying a Fabric Engine image.
inactive	Specifies automatic determination for inactive (secondary) partition. Note: Not applicable when specifying a Fabric Engine image.
hostname	Specifies the hostname of the TFTP server from which the image should be obtained.
ipaddress	Specifies the IP address of TFTP server from which the image should be obtained.
filename	Specifies the file name of the new image. Uou can use this command to change the operating system to Fabric Engine by downloading and installing a Fabric Engine image.
vrname	Specifies the name of the virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
block_size	Specifies the maximum block size, not including the TFTP header. The range is 24–65000 bytes.
partition	Specifies which partition the image should be saved to: primary or secondary. Select primary to save the image to the primary partition and secondary to save the image to the secondary partition. Note: Not applicable when specifying a Fabric Engine image.
install	Specifies installing the image after download.
reboot	Specifies rebooting after installation.

Default

Stores the downloaded image in the alternate (inactive) partition.

SFTP and SCP2 provide secure methods of downloading the ExtremeXOS software image files, *.xos or *.xmod. You can use one of three procedures:

- From the switch, running the command SCP2. connect to and “get” from a remote server. This is similar to the `download image` command.
- From outside the switch, connect to the switch that is acting as the server and “put” from the remote server. There is no TFTP equivalent for this method.
  - Using SFTP
  - Using SCP2

If you do not specify block size, the default value is 1,400 bytes.

Usage Guidelines

Prior to downloading an image on the switch, you must download the image you received from Extreme Networks to a TFTP server on your network. If your switch has a removable storage device, you can also download the image to that device.

Note

The `download image` command causes the switch to use the newly downloaded software image during the next switch reboot. To modify or reset the software image used during a switch reboot, use the `use image` command. Use this command after downloading and installing the image for it to be effective.

Specify the IP address or host name parameters to download an image from a TFTP server on the network. Use of the host name parameter requires that DNS be enabled.

When you download and install a new version of an ExtremeXOS image, the system automatically compares the currently installed bootROM image against the bootROM image contained in the new ExtremeXOS image. If the installed version is older, the system automatically upgrades to the bootROM version contained in the new ExtremeXOS image.

Core Software Images

A switch can store up to two core images: an active and inactive. When downloading a new image, you must select on which partition to install the new image. You must install the software image to the inactive partition, and must specify that partition while downloading the image to the switch.

Image Filenames

The software image file can be an .xos file, which contains a Switch Engine core image, or an .xmod file, which contains a Switch Engine modular software package.

As of ExtremeXOS 16.1, the `download` command now accepts a URL as the name of the file to download. URL protocols can be tftp, http, ftp. The format of a URL is:

- http://10.10.10.1/filename.xos
- tftp://10.10.10.1/filename.xos
- ftp://10.10.10.1/filename.xmod

In addition to accepting a URL that ends in `.xos` or `.xmod`, the URL file name can end in `.lst`. A `.lst` file contains file names at the same location as the `.lst` file URL and is downloaded/installed one after the other. The `.lst` file method defines bundles of downloads for:

- aspen, summit480 –image file size issues
- SSH installs with ExtremeXOS
- Customer files ending in '.cfg', '.xsf', '.pol', '.lic', '.py', '.ssh'
- Other bundling that makes it easier to download with a single command

For additional installation requirements, see the sections *Installing a Core Image* and *Installing a Modular Software Package* in the *Switch Engine 32.2 User Guide*.

Changing the Switch Network Operating System to Fabric Engine

For ExtremeSwitching Universal platforms, you can change the switch's network operating system to Fabric Engine by specifying a Fabric Engine image in *filename*.

Caution
Changing your network operating systems deletes all configuration files, debug information, logs, events, statistics, and license information of the previous network operating system.

Displaying the Software Image Versions

To display the software image version running on the switch, use the `show version` or `show switch` commands.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Local and Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for local and remote filenames.

When specifying a local or remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/) Permitted only for remote files

When naming a local or remote file, remember the requirements listed above.

Messages Displayed by the Switch

When you download a new image, you will see the following message:

```
Do you want to install image after downloading? (y - yes, n - no, <cr> - cancel)
```

Do one of the following:

- Enter `y` if you want to install the image after download.
- Enter `n` if you want to install the image at a later time.
- Press **[Enter]** if you want to cancel the download.

The Image Integrity Check feature was added in ExtremeXOS 16.1. The CLI output of this command is modified:

1. If the signature is verified and there is no error, there is no change to the output.
2. If the downloaded image does not have a signature, the following messages are added. This is considered as a warning, since it could be simply a downgrading. The user is given the choice to continue or quit the installation.
   ```
   Warning: Signature Validation - Image is not digitally signed. Do you want to continue? (y/N)
   ```

   If the user decides to continue, then it follows the normal installation path; if the user decides to stop here, the following message is printed and then the installation is canceled.

   ```
   Installation canceled
   ```
3. If the certificate (keys) to verify the image is missing, the following messages are added. This is considered as a non-fatal and rare error, digital signature verification is bypassed. The user is given the choice to continue or quit the installation.
   ```
   Warning: Signature Validation - Certificates missing; Image signature validation will be bypassed. Do you want to continue? (y/N)
   ```

   If the user decides to continue, then it follows the normal installation path; if the user decides to stop here, the following message is printed and then the installation is canceled.

   ```
   Installation canceled
   ```
4. If the certificate (keys) itself cannot be verified, the following messages are added. This is STILL considered as a non-fatal and rare error, digital signature verification is bypassed. You have the choice to continue or quit the installation.
   ```
   Warning: Signature Validation - Certificates verification failed; Image signature validation will be bypassed. Do you want to continue? (y/N)
   ```

   If you decide to continue, the normal installation continues. If you decide to stop here, the following message appears and the installation is canceled.

   ```
   Installation canceled
   ```
5. If the image digital signature validation fails, the following message is added as a new reason why download fails. This is considered a fatal error like a CRC check failure, installation is terminated immediately.
   ```
   Error: Failed to download image - Error: Image signature cannot be validated.
   ```

SummitStack Only

You can issue this command only from the master node.

If a slot is not specified, the image is downloaded to every node in the active topology. If a slot is specified, the image is downloaded to that slot only.

If all nodes to be downloaded are not running the same partition, the command is not executed and following message is displayed:

```
Error: all nodes do not have the same image partition selected.
```

If all nodes to be downloaded have the same partition selected but the ExtremeXOS is currently running from the selected partition, the command is not executed and the following message appears:

```
Error: the image partition selected must not be the active partition.
```

Downloading a New Image

For information about upgrading `.xos` and `.xmod` images, see the *Software Upgrade and Boot Options* section in the *Switch Engine 32.2 User Guide*.

Example

The following example shows how the .lst file can contain filenames ending in .lst to get a list of lists (of lists etc...) from an HTTP server on 10.68.9.7 port 8080 for directory 16.1/cougar/cougar/release:

cat big.lst – big.lst contains other list file names:

- xos.lst
- xmod.lsts
- cript.lst

cat xos.lst – xos.lst contains an ExtremeXOS image:

- summitX-16.1.0.18.xos

cat xmod.lst – xmod.lst :contains a number of .xmod filenames:

- summitX-16.1.0.18-debug.xmod
- summitX-16.1.0.18-LegacyCLI.xmod
- summitX-16.1.0.18-reachnxt-1.8.1.8.xmod
- summitX-16.1.0.18-techSupport.xmod

cat script.lst – script.lst contains a number of Python scripts the user wants to download to a switch:

- jsonrpc.py
- jsontest.py
- otst.py
- ping.py
- readvr.py

A single download command downloads all of the above files.

```
# download url
http://10.68.9.7/big.lst
http://10.68.9.7/xos.lst
Downloading http://10.68.9.7/summitX-16.1.0.18.xos

Downloading to Switch.........................................
Installing to primary partition!

Installing to Switch.........................................
```

```
Image installed successfully
This image will be used only after rebooting the switch!

Image installed successfully
http://10.68.9.7:8080/xmod.lst

```

The following example changes the operating system to Fabric Engine:

```
# download image 10.68.9.9 voss-8.2.tgz
Do you want to install image after downloading? (y - yes, n - no, <cr> - cancel)
Downloading to Slot-1.................................................................
................................................................................
.....................................................
WARNING: The specified image is for the VOSS Network Operating System and the EXOS
Network Operating System is currently running.  If you continue, all configuration, logs,
and debug will be cleared and VOSS will be installed.  Continue? (y - yes, n - no, <cr> -
cancel)
```

History

This command was first available in ExtremeXOS 10.1.

The **memorycard** option was added in ExtremeXOS 11.0.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Block size support was added in ExtremeXOS 15.7.1.

The **memorycard** keyword was removed in ExtremeXOS 30.7.

Support for downloading Fabric Engine images and the **install** and **reboot** options were added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

download ssl certificate

```
download ssl ipaddress certificate {ssl-cert | trusted-ca | ocsp-
   signature-ca | {csr-cert {ocsp [on | off]}} file_name
```

Description

Permits downloading of certificate file(s) from files stored on a TFTP server.

Syntax Description

ipaddress	Specifies the IP address of the TFTP server.
ssl-cert	Specifies SSL/TLS certificate (default).
trusted-ca	Specifies CA certificates.
ocsp-signature-ca	Specifies signature CA files.
file_name	Specifies the name of the certificate file.
csr-cert	Specifies an SSL/TLS certificate signed through a Certificate Signing Request (CSR) generated by the switch. Trust chain verification is performed during download.
ocsp	Specifies using or not using Online Certificate Status Protocol (OCSP) for certificate checking.
on	Enables OCSP for SSL/TLS certificate signed through CSR generated by switch.
off	Disables OCSP for SSL/TLS certificate signed through CSR generated by switch (off).

Default

If no option is selected, SSL/TLS certificate (**ssl-cert**) is the default.

By default, OCSP is disabled.

Usage Guidelines

If the download operation is successful, any existing certificate is overwritten. For SSL/TLS certificates, after a successful download, the software attempts to match the public key in the certificate against the private key stored. If the private and public keys do not match, the switch displays a warning message similar to the following: Warning: The Private Key does not match with the Public Key in the certificate. This warning acts as a reminder to also download the private key.

Note
You can only download a certificate key in the *VR-Mgmt* virtual router.

Downloaded certificates and keys are not saved across switch reboots unless you save your current switch configuration. After you issue the `save` command, the downloaded certificate is stored in the configuration file and the private key is stored in the EEPROM.

You can purchase and obtain SSL certificates from Internet security vendors.

Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for remote IP addresses.

When specifying a remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Colon (:).

When configuring an IP address for your network server, remember the requirements listed above.

Remote File Name Character Restrictions

This section provides information about the characters supported by the switch for remote file names.

When specifying a remote file name, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Dash (-).
- Underscore (_).
- Slash (/).

When naming a remote file, remember the requirements listed above.

Example

The following command downloads a certificate from a TFTP server with the IP address of 123.45.6.78:

```
# download ssl 123.45.6.78 certificate g0ethner1
```

The following command downloads a trusted-ca certificate:

```
# download ssl 10.120.89.79 certificate trusted-ca cacert.pem
```

The following command downloads an ocsp-signature-ca certificate:

```
# download ssl 10.120.89.79 certificate ocsp-signature-ca oscrcert.pem
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

The **trusted-ca** and **ocsp-signature-ca** options were added in ExtremeXOS 22.1.

The **csr-cert** and **ocsp** were added in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

download ssl privkey

download ssl *ipaddress* **privkey** *key_file*

Description

Permits downloading of a private key from files stored in a TFTP server.

Syntax Description

ipaddress	Specifies the IP address of the TFTP server.
key_file	Specifies the name of the private key file.

Default

N/A.

Usage Guidelines

If the operation is successful, the existing private key is overwritten.

After a successful download, a check is performed to find out whether the private key downloaded matches the public key stored in the certificate. If the private and public keys do not match, the switch displays a warning similar to the following: Warning: The Private Key does not match with the Public Key in the certificate. This warning acts as a reminder to also download the corresponding certificate.

The certificate and private key file should be in PEM format and generated using RSA as the cryptography algorithm.

Downloaded certificates and keys are not saved across switch reboots unless you save your current switch configuration. Once you issue the save command, the downloaded certificate is stored in the configuration file and the private key is stored in the EEPROM.

Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for remote IP addresses.

When specifying a remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Colon (:).

When configuring an IP address for your network server, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Dash (-).
- Underscore (_).
- Slash (/).

When naming a remote file, remember the requirements listed above.

Example

The following command downloads a private key from a TFTP server with the IP address of 123.45.6.78:

```
download ssl 123.45.6.78 privkey t00Ts1e
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

edit policy

```
edit policy filename
```

Description

Edits a policy text file.

Syntax Description

filename	Specifies the filename of the policy text file.

Default

N/A.

Usage Guidelines

This command edits policy text files that are on the switch. All policy files use ".pol" as the filename extension, so to edit the text file for the policy boundary use boundary.pol as the filename. If you specify the name of a file that does not exist, you will be informed and the file will be created.

This command spawns a VI-like editor to edit the named file. For information on using VI, if you are not familiar with it, do a web search for "VI editor basic information", and you should find many resources. The following is only a short introduction to the editor.

Edit operates in one of two modes; command and input. When a file first opens, you are in the command mode. To write in the file, use the keyboard arrow keys to position your cursor within the file, then press one of the following keys to enter input mode:

- i - To insert text ahead of the initial cursor position.
- a- To append text after the initial cursor position.

To escape the input mode and return to the command mode, press the Escape key.

There are several commands that can be used from the command mode. The following are the most commonly used:

- dd - To delete the current line.
- yy - To copy the current line.
- p - To paste the line copied.
- :w - To write (save) the file.
- :q - To quit the file if no changes were made.
- :q! - To forcefully quit the file without saving changes.
- :wq - To write and quit the file.

Refresh Policy

After you have edited the text file for a policy that is currently active, you will need to refresh the policy if you want the changes to be reflected in the policy database. When you refresh the policy, the text file is read, the syntax is checked, the policy information is added to the policy manager database, and the policy then takes effect. Use the following command to refresh a policy:

`refresh policy policy-name`

If you just want to check to be sure the policy contains no syntax errors, use the following command:

`check policypolicy-name{access-list}`

Example

The following command allows you to begin editing the text file for the policy boundary:

```
edit policy boundary.pol
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

edit upm profile

`edit upm profile profile-name`

Description

Allows you to edit the specified profile.

Syntax Description

profile-name	Specifies the UPM profile to be edited.

Default

N/A.

Usage Guidelines

Use the command to have VI-like editor features for editing the profile. Changes appear when you close the file for editing, not when you save it.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

eject usb

```
eject usb-device
```

Description

Ensures that USB 2.0 storage device can be safely removed from the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

After the switch writes to a USB 2.0 storage device, and before you can view the contents on the device, you must ensure it is safe to remove the device from the switch. Use this command to prepare the device for removal. After you run this command, you can manually remove the device.

If you have configured the configure debug core-dumps on page 393 command to write files to the device that you are trying to eject, you are reminded to select another location to write the bebug files to:

```
Note: The destination of debug core dump is still configured to memorycard.
If a memory card will not be present, it is recommended to use
"configure debug core-dumps" to change the core dump destination.
```

For more information about removing a USB 2.0 storage device, see the hardware documentation.

To access and read the data on the card, use a PC with appropriate hardware such as a compact flash reader/writer and follow the manufacturer's instructions to access the compact flash card and read the data.

Example

The following command prepares a compact flash card or USB 2.0 storage device to be removed from the switch:

```
# eject usb
```

History

This command was first available in ExtremeXOS 11.1.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

The **memorycard** was deprecated in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

ELSE

ELSE

Note

This is a script statement and operates only in scripts when scripting is enabled with the following command: `enable cli scripting {permanent}` .

Description

Command block to be executed if the condition specified in the associated IF statement is not met.

Syntax Description

statements	Actions to be executed when the conditions specified in the associated IF statement are not met.

Default

N/A.

Usage Guidelines

CLI scripting must be enabled before using this command.

This command must be preceded by IF *_expression* THEN *statements* and followed by ENDIF.

You can insert comments by using a number sign (#).

Example

The following example executes the show switch command if the value of the variable x is greater than 2, and execute the show vlan command otherwise:

```
IF ($x > 2) THEN

    show switch
```

```
ELSE

    show vlan

ENDIF
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable access-list permit to-cpu

```
enable access-list permit to-cpu
```

Description

Enables control packets to reach CPU, even if an *ACL* would deny them.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command allows control packets to reach the CPU, even if the packets match ACLs that would otherwise deny them. The control packets include *STP* and *EAPS* BPDUs, and ARP replies for the switch.

If this feature is disabled, these same packets will be denied if an ACL is applied that contains a matching entry that denies the packets. Contrary to expectations, when this feature is disabled, the packets will still be denied if there is a higher precedence entry that permits the packets.

To disable this feature, use the following command:

```
disable access-list permit to-cpu
```

Example

The following command enables STP BPDU packets to reach the switch CPU, despite any ACL:

```
enable access-list permit to-cpu
```

History

This command was first available in ExtremeXOS 11.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable access-list refresh blackhole

Enables blackholing of packets during *ACL* refresh.

```
enable access-list refresh blackhole
```

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

When access control lists (ACLs) are refreshed, this command provides that any packets arriving during the refresh will be blackholed. As the ACL is being refreshed, packets may arrive while the ACL is in an indeterminate state, and packets may be permitted that otherwise are dropped. This feature protects the switch during an ACL refresh.

To disable this feature, use the following command:

```
disable access-list refresh blackhole
```

Example

The following command enables dropping of packets during an ACL refresh:

```
enable access-list refresh blackhole
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable account

```
enable account [all {admin|user | name } ]
```

Description

Enables the specified account locally.

Syntax Description

all	Specifies that all accounts, or all accounts of a certain type, will be enabled locally.
admin	Specifies that adminstrative privileged accounts will be enabled locally.
user	Specifies that user privileged accounts, including lawful intercept accounts, will be enabled locally.
name	Specifies the name of the account that will be enabled locally.

Default

Enabled.

Usage Guidelines

Enabling accounts affects the following northbound interfaces:

- Console
- TELNET
- SSH
- HTTP
- XML

Example

The following example enables all accounts locally:

```
enable account all
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable avb

```
enable avb
```

Description

This command is a macro command that can be used to enable all AVB protocols globally on the switch. It is equivalent to issuing the following three commands:

```
enable mvrp

enable msrp

enable network-clock gptp
```

Syntax Description

avb	Audio Video Bridging.

Default

Disabled.

Usage Guidelines

Use this command to enable all AVB protocols globally on the switch.

Note
AVB is not supported on 5720 VIM ports in Release 32.2.

Example

```
enable avb
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable avb ports

```
enable avb ports [port_list | all]
```

Description

This command is a macro command that can be used to enable all AVB protocols on a given set of ports. It is equivalent to issuing the following three commands:

```
enable mvrp ports
```

```
enable msrp ports

enable network-clock gptp ports
```

Syntax Description

avb	Audio Video Bridging.
port_list	Port list separated by a comma or "-".
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to enable all AVB protocols on the given ports.

Example

```
enable avb ports 1-5
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable bgp

```
enable bgp
```

Description

Enables *BGP*.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables the Border Gateway Protocol (BGP) on the router. Before invoking this command, the local AS number and BGP router ID must be configured.

Example

The following command enables BGP:

```
enable bgp
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp advertise-inactive-route

```
enable bgp {address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast
    | ipv6-multicast]} advertise-inactive-route
```

Description

Enables advertisement of *BGP* inactive routes, which are defined as those routes that are rated best by BGP and not best in the IP routing table.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default address family.

Usage Guidelines

This command can be successfully executed only when BGP is globally disabled. It is best to enable this feature before you enable BGP (enable bgp). If BGP is enabled, you must disable BGP (disable bgp), enable this feature, and then enable BGP.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command enables inactive route advertisement for IPv4 unicast traffic:

```
enable bgp address-family ipv4-unicast advertise-inactive-route
```

History

This command was first available in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp aggregation

```
enable bgp aggregation
```

Description

Enables *BGP* route aggregation.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Route aggregation is the process of combining the characteristics of several routes so that they are advertised as a single route. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Reducing the information that is stored and exchanged also reduces the size of the routing table.

To use BGP route aggregation, follow these steps:

1. Enable aggregation using the following command:

   ```
   enable bgp aggregation
   ```

2. Create an aggregate route using the following command:

   ```
   configure bgp add aggregate-address {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast]} ipaddress/masklength
   {as-match | as-set} {summary-only} {advertise-policy policy}
   {attribute-policy policy}
   ```

Example

The following command enables BGP route aggregation:

```
enable bgp aggregation
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp always-compare-med

```
enable bgp always-compare-med
```

Description

Enables *BGP* to use the Multi Exit Discriminator (MED) from neighbors in different autonomous systems (ASs) in the route selection algorithm.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

MED is only used when comparing paths from the same AS, unless always-compare-med is enabled. When this command is issued, MEDs from different AS are used in comparing paths. A MED value of zero is treated as the lowest MED and therefore the most preferred route.

BGP must be disabled before you can change the configuration with this command.

Example

The following command enables BGP to use the Multi Exit Discriminator (MED) from neighbors in different autonomous systems in the route selection algorithm:

```
enable bgp always-compare-med
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp community format

`enable bgp community format` **`AS-number : number`**

Description

Enables the as-number:number format of display for the communities in the output of `show` commands.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If not enabled, the communities are displayed as a single decimal value.

Example

The following command enables the AS-number:number format of display for communities:

```
enable bgp community format AS-number : number
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp export

For IPv4 and IPv6 routes:

```
enable bgp export route_type {{address-family} address_family} {export-
   policy policy-name}
```

For VPNv4 routes:

```
enable bgp export remote-vpn {{address-family} ipv4-unicast} {export-
   policy policy-name}
```

Description

For IPv4 and IPv6 routes, this command enables the export of routes learned from *BGP* peers to the specified protocol.

For VPNv4 routes, this command enables the exchange of routes between a BGP PE router and a CE router.

Syntax Description

bgp	For Layer 3 VPNs, this specifies that BGP routes learned from CE routers are to be exported to remote PE routers.
route_type	Specifies the BGP export route type. Valid *route_type* values are: blackhole; direct; isis; isis-level-1; isis-level-2; isis-level-1-external; isis-level-2-external; ospf; ospf-extern1; ospf-extern2; ospf-inter; ospf-intra; rip; static; ospfv3; ospfv3-extern1; ospfv3-extern2; ospfv3-inter; ospfv3-intra; ripng;
address-family	Valid *address_family* values are: ipv4-unicast; ipv4-multicast; ipv6-unicast; ipv6-multicast
remote-vpn	For Layer 3 VPNs, this specifies that BGP routes learned from remote PE routers are to be exported to the local VRF.
policy-name	Name of policy to be associated with network export. Policy can filter and/or change the route parameters.

Default

Disabled.

If no address family is specified for an IPv6 protocol, the default IPv6 unicast family applies; otherwise if no address family is specified, IPv4 unicast is the default.

Usage Guidelines

The exporting of routes between any two routing protocols is a discrete configuration function. For example, you must configure the switch to export routes from *OSPF* to BGP and, if desired, you must configure the switch to export routes from BGP to OSPF. You must first configure both protocols and then verify the independent operation of each. Then, you can configure the routes to export from OSPF to BGP, and the routes to export from BGP to OSPF.

You can use a policy to associate BGP attributes including Community, NextHop, MED, Origin, and Local Preference with the routes. A policy can also be used to filter out exported routes.

Using the export command to redistribute routes complements the redistribution of routes using the `configure bgp add network` command. The `configure bgp add network` command adds the route to BGP only if the route is present in the routing table. The `enable bgp export` command redistributes an individual route from the routing table to BGP. If you use both commands to redistribute routes, the routes redistributed using the network command take precedence over routes redistributed using the export command.

Note

For this command to execute, the specified protocol must support the specified address family. For example, the command fails if you specify OSPF and the IPv6 unicast address family. You can specify blackhole, direct, static, and IS-IS routes with IPv4 or IPv6 address families.

To export Layer 3 VPN routes to the CE peer in a VPN VRF, the source must be remote-vpn and destination address family must be ipv4-unicast.

Example

The following command enables BGP to export OSPF routes to other BGP routers:

```
enable bgp export ospf
```

The following command enables export of Layer 3 VPN Routes recevied from the PE Core in a VPN-VRF to its CE peers:

```
enable bgp export remote-vpn address-family ipv4-unicast
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

The blackhole option was added in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp export vr

```
enable bgp export {vr} vr_name route_type {address-family} vpnv4
   {export-policy policy_name}
```

Description

For IPv4 and IPv6 routes, this command enables the PE router to export and redistribute local VRF routes to remote PE routers through *BGP*.

Syntax Description

vr	Specifies the source VPN VRF of the exported routes .
vr_name	Specifies the name of the source VPN VRF.
route_type	Specifies the source or origin of the route types to be exported to remote PE routers. Valid Types: blackhole, direct, and bgp, and static .
address-family	Specifies the address family for the exported routes. Valid types are vpnv4.
export-policy vpnv4	(Optional) The export policy can be specified when you enable bgp export. Specifies that routes from the VRF are exported as vpnv4 routes over MPBGP.
policy_name	Name of export policy to be associated with export of VRF routes into BGP's VPN-IPv4 domain for advertisement to other PE routers.

Default

Disabled.

Usage Guidelines

This command enables a PE router to advertise learned routes from CE routers to remote PE routers in a Service Provider's backbone. Executing this command allows the PE router to convert VRF native IPv4 routes into VPN-IPv4 route,s and advertise to all remote PE BGP neighbors as VPN-IPv4 routes.

- This export command is applicable in Parent VR context only. If you execute it in a VRF context, an error message is returned.
- The source VPN VRF must be a child of the Parent VR.

- BGP need not be added to a VPN VRF to export routes from a VPN VRF.
- The direction of where the redistribution is targeted is implicit on the keywords used. Similarly bgp only applies to EBGP routes from CE exported as VPN routes, hence we use it only with address family vpnv4. Other sources such as “static” and “direct” are redistributed both ways.
- Use `show vr parent_vr_name` to check routes exported from various VPN VRFs into the MBGP’s VPN-IPv4 domain.
- Use `show vr vpn_vrf_name` to check routes exported from a VPN VRF into the MBGP’s VPN-IPv4 domain.

Example

The following command enables BGP to advertise a vpnv4 route named "corp1_vpn_vrf":

```
switch 19 # enable bgp export "corp1_vpn_vrf" bgp address-family vpnv4
```

History

This command was first added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp export [static | direct] l2vpn-evpn

```
enable bgp export [static | direct] {address-family address_family}
   l2vpn-evpn {vr vr_name}
```

Description

Exports direct, static, and BGP routes from a VRF into BGP, running on the specified VR, as EVPN routes to be advertised by BGP as Type 5 routes.

Syntax Description

bgp	Specifies showing the BGP configuration.
export	Specifies redistributing information from another routing protocol.
static	Specifies static routes.
direct	Specifies direct routes.
address-family	Specifies the address family.
address_family	Sets the address family type.
l2vpn-evpn	Specifies the L2VPN EVPN address family.

vr	Specifies the source VR.
vr_name	Designates the source VR name. Both VPN-VRFs and non-VPN-VRFs are supported.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example exports static routes on VR "vr-a" as EVPN routes to be advertised by BGP as Type 5 routes:

```
# enable bgp export static l2vpn-evpn vr vr-a
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp fast-external-fallover

```
enable bgp fast-external-fallover
```

Description

Enables *BGP* fast external fallover functionality.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables the BGP fast external fallover on the router. This command applies to all directly-connected external BGP neighbors.

When BGP fast external fallover is enabled, the directly-connected EBGP neighbor session is immediately reset when the connecting link goes down.

If BGP fast external fallover is disabled, BGP waits until the default hold timer expires (3 keepalives) to reset the neighboring session. In addition, BGP might teardown the session somewhat earlier than hold timer expiry if BGP detects that the TCP session and it's directly connected link is broken (BGP detects this while sending or receiving data from TCP socket).

Example

The following command enables BGP fast external fallover:

```
enable bgp fast-external-fallover
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp mpls-next-hop

```
enable bgp mpls-next-hop
```

Description

Enables IP forwarding over calculated *MPLS* LSPs to subnets learned via *BGP*.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables IP forwarding over calculated MPLS LSPs to subnets learned via BGP. (Calculated refers to an LSP that only reaches part of the way to the destination). IP forwarding over

MPLS LSPs must be enabled to forward over calculated LSPs. By default, IP forwarding over MPLS LSPs to subnets learned via BGP is disabled.

Example

The following command enables BGP's use of MPLS LSPs to reach BGP routes:

```
enable bgp mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp multipath-relax

`enable bgp` **`multipath-relax`**

Description

Enables BGP multipath-relax feature, which modifies the definition of an equal cost BGP route.

Syntax Description

`multipath-relax`	Selects BGP multipath relax feature.

Default

This feature is disabled by default.

Usage Guidelines

This feature modifies the definition of equal cost BGP routes as specified in *RFC-4271*. In particular, routes with the same AS-path length, but differing AS numbers in the path are not considered equal cost by default. However, with multipath-relax enabled, routes with the same AS-path length can have differing AS number values in the AS-path and still be considered equal cost.

BGP must be disabled (`disable bgp`) first to enable this feature.

Example

The following example enables BGP multipath-relax feature:

```
enable bgp multipath-relax
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp neighbor

```
enable bgp neighbor [remoteaddr | all]
```

Desription

Enables the *BGP* session. The neighbor must be created before the BGP neighbor session can be enabled.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.

Default

Disabled.

Usage Guidelines

To create a new neighbor and add it to a BGP peer group, use the following command:

```
create bgp neighbor remoteaddr peer-group peer-group-name {multi-hop}
```

This command applies to the current VR or VRF context.

Example

The following command enables the BGP neighbor session:

```
enable bgp neighbor 192.168.1.17
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp neighbor address-family l2vpn-evpn

```
enable bgp {neighbor [remoteaddr | all]} {{address-family} l2vpn-evpn}
   next-hop-unchanged
```

Description

Enables overriding the *BGP* specification behavior with respect to the next-hop of routes advertised to EBGP peers.

Syntax Description

bgp	Specifies BGP.
neighbor	Specifies BGP neighbor.
remoteaddr	Specifies BGP neighbor IP address.
all	Specifies all BGP neighbors.
address-family	Specifies address family.
l2vpn-evpn	Specifies L2VPN EVPN address-family type.
next-hop-unchanged	Enables preserving the BGP next-hop when routes are advertised to EBGP peers (default is disabled).

Default

Default is that next-hop-unchanged is disabled.

Usage Guidelines

This command enables overriding the specification behavior with respect to the next-hop of routes advertised to EBGP peers. Specifically, it maintains the BGP next-hop for routes advertised to EBGP peers instead of replacing the next-hop with either the outgoing interface IP address or the local loopback address.

When enabling the address family l2vpn-evpn in an EBGP configuration, the option **next-hop-unchanged** must also be enabled.

Example

The following example enables next-hop unchanged for BGP neighbor at 192.168.66.2:

```
# enable bgp neighbor 192.168.66.2 l2vpn-evpn next-hop-unchanged
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp neighbor capability

```
enable bgp neighbor [all |remoteaddr] capability [ipv4-unicast | ipv4-
   multicast | ipv6-unicast | ipv6-multicast | vpnv4 | route-refresh |
   ipv4-vxlan | l2vpn-evpn]
```

Description

This command enables multi protocol *BGP* (MBGP) and route-refresh capabilities for one or all BGP neighbors.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies VPN ipv4 unicast address family for a BGP neighbor. This is a required configuration for PE to PE BGP neighbor session. You must configure it before you enable a neighbor.
route-refresh	Specifies ROUTE-REFRESH message capabilities.
ipv4-vxlan	Specifies IPv4 VXLAN capability.
l2vpn-evpn	Specifies L2 VPN EVPN address family.

Default

The following capabilities are enabled by default for IPv4 peers: IPv4 unicast, IPv4 multicast, and route refresh.

The following capabilities are enabled by default for IPv6 peers: route refresh.

Note
For IPv4 peers, the IPv4 unicast and IPv4 multicast capabilities are enabled by default to support legacy peers that do not support MBGP. All other capabilities (except route-refresh) are disabled by default.

Usage Guidelines

When you change the capability configuration, you must enable the BGP neighbor before the configuration becomes active. If the BGP neighbor was enabled before the change, you must disable and enable the BGP neighbor. After the capabilities have been enabled, the BGP neighbor announces its capabilities to neighbors in an OPEN message.

When one or more address families are enabled, routes from the specified address families are updated, accepted, and installed. If more than one address family capability is enabled,or if the VPNv4 address family is enabled,the MBGP extension is automatically enabled. To disable MBGP, you must disable all enabled address families.

To support Layer 3 VPNs, you must enable the VPNv4 address family for all MBGP peers that will distribute VPNv4 routes across the service provider backbone. The VPNv4 address family must be enabled on the *MPLS*-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Use the **vpnv4** keyword for all PE to PE BGP neighbor sessions. This instructs BGP to negotiate the vpnv4 address family in an open message with other PE routers. If this command is executed when a BGP neighbor session is established, it will take effect only after BGP session is reset. We recommend that you execute this command when a BGP neighbor is operationally down. Do not issue this command for a neighbor that is part of a VRF (PE – CE), or a warning message will be displayed.

Note
To inter-operate with Cisco routers for BGP graceful restart, you must enable the IPv4 unicast address capability.

This command applies to the current VR or VRF context.

Note
For an IPv6 peer, an IPv6 address family must be specified. From 21.1 ExtremeXOS allows IPV4 peering sessions to carry IPV6 routes and IPV6 peering sessions to carry IPV4 routes for the Unicast and Multicast sub-address families.

Note
You must enable a VPN IPv4 unicast address family for a BGP neighbor for a PE to PE BGP neighbor session before you enable the neighbor.

Example

The following command enables the route-refresh feature for all neighbors:

```
enable bgp neighbor all capability route-refresh
```

The following command enables the VPNv4 address family for a BGP neighbor:

```
virtual router corp1_vrf
enable bgp neighbor 192.168.96.235 capability vpnv4
```

The following command enables VXLAN capability for the BGP neighbor at 192.168.68.1:

```
enable bgp neighbor 192.168.68.1 capability ipv4-vxlan
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Support for IPv4 VXLAN was added in ExtremeXOS 22.3.

Support for L2 VPN EVPN address family was added in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp neighbor capability address-family vpnv4

```
enable bgp {neighbor} [all | remoteaddr] capability address-family vpnv4
   type [community | ext-community] {[send | receive | both]}
```

Description

This command enables Outbound Route Filtering (ORF) for one or all *BGP* neighbors on a Layer 3 VPN.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors.
remoteaddr	Specifies the IPv4 address of a BGP neighbor.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
community	Enables neighbor capability for communities.
ext-community	Enables neighbor capability for extended communities.
send	Enables neighbor capability filter list send capability.

receive	Enables neighbor capability filter list receive capability.
both	Enables neighbor capability filter list send and receive capability.

Default

Disabled.

If the direction is not specified, the both option applies.

Usage Guidelines

Enter this command multiple times to configure the address family, type, and direction attributes.

By specifying the address-family, type and direction in multiple commands, you can better control the actual ORF capabilities sent to a peer. In the case where a particular address-family is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

ORF capabilities can only be enabled for IPv4 neighbors, and only for IPv4 address families. If configured for IPv6 neighbors or address-families the command is rejected with the following error message:

```
Outbound-route-filtering not supported for IPv6 neighbors
```
or
```
Outbound-route-filtering not supported for address family addr_family
```

Example

The following examples enables the neighbor capability feature for a Layer 3 VPN neighbor:

```
enable bgp neighbor 1.1.1.1 capability address-family vpnv4
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp neighbor originate-default

```
enable bgp [{neighbor} remoteaddr | neighbor all] {address-family [ipv4-
   unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast]} originate-
   default {policy policy-name}
```

Description

Enables the origination and advertisement of a default route to a single *BGP* neighbor or to all BGP neighbors.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified, the configuration applies to the IP Unicast family on all IPv4 peers. If an IPv4 address family is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
policy-name	Specifies a policy to be applied to the default route origination.

Default

Disabled. BGP does not automatically originate and advertise default routes to BGP neighbors.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

This command can be successfully executed at any time, irrespective of whether local BGP or the remote BGP peer is enabled or disabled. The default route or routes are created regardless of whether or not there are matching entries in the IP route table.

When a BGP neighbor is added to a peer group, it does not inherit the default route origination configuration from the peer group. Also, default route origination for a neighbor and the associated peer group can be different.

If a policy is configured and specified in the command, a default route can be originated only if there is a route in the local BGP RIB that matches the policy's match rules. The default route's attribute can be modified using the same policy file by including statements in the set block of the policy.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command enables the origination and advertisement of default routes for IPv4 unicast traffic for all BGP peer nodes:

```
enable bgp neighbor all originate-default
```

History

This command was first available in ExtremeXOS 12.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp neighbor remove-private-AS-numbers

```
enable bgp neighbor [remoteaddr | all] remove-private-AS-numbers
```

Description

Enables the removal of private AS numbers from the AS path in route updates sent to EBGP peers.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor.
all	Specifies all IPv4 and IPv6 neighbors.

Default

Disabled.

Usage Guidelines

Private AS numbers are AS numbers in the range 64512 through 65534. You can remove private AS numbers from the AS path attribute in updates that are sent to external BGP (EBGP) neighbors. Possible reasons for using private AS numbers include:

- The remote AS does not have officially allocated AS numbers.
- You want to conserve AS numbers if you are multi-homed to the local AS.

Private AS numbers should not be advertised on the Internet. Private AS numbers can only be used locally within an administrative domain. Therefore, when routes are advertised out to the Internet, the routes can be stripped out from the AS paths of the advertised routes using this feature.

This command applies to the current VR or VRF context.

Example

The following command enables the removal of private AS numbers from the AS path in route updates sent to the EBGP peers:

```
enable bgp neighbor 192.168.1.17 remove-private-AS-numbers
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp neighbor soft-in-reset

```
enable bgp neighbor [all | remoteaddr] {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} soft-in-reset
```

Description

Enables the soft input reset feature.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified, the configuration applies to the IP Unicast family on all IPv4 peers. If an IPv4 address family is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

Disabled.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

Before you can change the configuration with this command, you must disable BGP, and you must disable the corresponding BGP neighbor session using the following command:

`disable bgp neighbor [remoteaddr | all]`

To enable this feature on Layer 3 VPNs, you must do so in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Example

The following command enables the soft recognition feature:

```
enable bgp neighbor 192.168.1.17 soft-in-reset
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp peer-group

```
enable bgp peer-group peer-group-name
```

Description

Enables a peer group and all the neighbors of a peer group.

Syntax Description

peer-group-name	Specifies a peer group.

Default

Disabled.

Usage Guidelines

You can use *BGP* peer groups to group together up to 200512 BGP neighbors. All neighbors within the peer group inherit the parameters of the BGP peer group. The following mandatory parameters are shared by all neighbors in a peer group:

- source-interface
- out-nlri-filter
- out-aspath-filter
- out-route-map
- send-community
- next-hop-self

This command applies to the current VR or VRF context.

Example

The following command enables the BGP peer group outer and all its neighbors:

```
enable bgp peer-group outer
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp peer-group capability

```
enable bgp peer-group peer-group-name capability {[address-family [ipv4-
   unicast | ipv4-multicast]} type [community | ext-community | prefix]
   {[send | receive | both]}
```

Description

This command enables ORF capabilities for a particular peer, peer-group, or all peers for one or all address-families and ORF types (for example, communities, extended communities and prefixes). The command specifies whether ORF capabilities are sent to the peer, and if they are honoured if received from the peer, or both.

Syntax Description

peer-group-name	Specifies a peer group.
address-family	Specifies outbound route filtering.
ipv4-unicast	Specifies an IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
community	Enables ORF for communities.
ext-community	Enables ORF for extended communities.
prefix	Enables ORF for prefixes.
send	Enables ORF filter list send capability.
receive	Enables ORF filter list receive capability.
both	Enables ORF filter list send and receive capability.

Default

- ORF is disabled globally.
- ORF capabilities are assumed to be disabled by default for all neighbors.
- If address family is not specified, **ipv4-unicast** is assumed.
- If direction is not specified, **both** is assumed.

Note
prefix is not supported for vpnv4 address family.

The route refresh capability is enabled for IPv6 peer groups by default.

Usage Guidelines

By specifying the *address-family*, *type* and *direction* in multiple commands you can better control the ORF capabilities sent to a peer. In cases where a particular *address-family* is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

ORF capabilities can only be enabled for IPv4 neighbors and only for IPv4 address families. If configured for IPv6 neighbors or address-families the command is rejected with the following error message:

`Outbound-route-filtering not supported for IPv6 neighbors`, or `Outbound-route-filtering not supported for address family` *`addr_family`* .

Example

The following command enables send only ORF capabilities for an ipv4 multicast peer group:

```
enable bgp peer-group capability orf address-family ipv4-multicast type community send
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp peer-group capability

```
enable bgp peer-group peer-group-name capability [ipv4-unicast | ipv4-
   multicast |ipv6-unicast | ipv6-multicast |vpnv4 |route-refresh ]
```

Description

This command enables *BGP* Multiprotocol (MP) and route-refresh capabilities for a peer-group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
route-refresh	Specifies ROUTE-REFRESH message capabilities.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

All capabilities are enabled for IPv4 peer groups by default.

The route refresh capability is enabled for IPv6 peer groups by default.

Usage Guidelines

This command enables BGP Multiprotocol or route-refresh capabilities for a peer group. When you change the capability configuration, you must enable the BGP peer group before the configuration becomes active. If the BGP peer group was enabled before the change, you must disable and enable the BGP peer group. After the capabilities have been enabled, the BGP peer announces its capabilities to neighbors in an OPEN message.

When one or more address families are enabled, routes from the specified address families are updated, accepted, and installed. If more than one address family capability is enabled,or if the VPNv4 address family is enabled,the MBGP extension is automatically enabled. To disable MBGP, you must disable all enabled address families.

A peer group can be configured for either IPv4 or IPv6 address families, but not both. Because a peer-group cannot support both IPv4 and IPv6 peers, the switch prevents the enabling of address families that are not compatible with peers that are already in the peer-group. Similarly if a particular address family is enabled for the peer-group, a peer that is incompatible with the existing peer-group configuration cannot be added to the group.

To support Layer 3 VPNs, you must enable the VPNv4 address family for all MBGP peers that will distribute VPNv4 routes across the service provider backbone. The VPNv4 address family must be enabled on the *MPLS*-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

This command applies to the current VR or VRF context.

Note
To inter-operate with Cisco routers for BGP graceful restart, you must enable IPv4 unicast address capability.

Example

The following command enables the route-refresh feature for the peer group outer:

```
enable bgp peer-group outer capability route-refresh
```

The following command enables the VPNv4 address family for a peer group:

```
enable bgp peer-group backbone capability vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp peer-group capability address-family vpnv4

```
disable bgp peer-group peer-group-name capability address-family vpnv4
   type [community | ext-community] {[send | receive | both]}
```

Description

This command disables peer-group capability for a peer group on a Layer 3 VPN.

Syntax Description

remoteaddr	Specifies the IPv4 address of a *BGP* neighbor.
vpn4	Specifies the VPNv4 address family for Layer 3 VPN support.
community	Disables peer-group capability for communities.
ext-community	Disables peer-group capability for extended communities.
send	Disables peer-group capability filter list send capability.
receive	Disables peer-group capability filter list receive capability.
both	Disables peer-group capability filter list send and receive capability.

Default

Disabled. If the direction is not specified, the **both** option applies.

Usage Guidelines

Enter this command multiple times to configure the address family, type, and direction attributes.

By specifying the address-family, type and direction in multiple commands, you can better control the actual ORF capabilities sent to a peer. In the case where a particular address-family is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

ORF capabilities can only be enabled for IPv4 neighbors, and only for IPv4 address families. If configured for IPv6 neighbors or address-families the command is rejected with the following error message:

```
Outbound-route-filtering not supported for IPv6 neighbors, orOutbound-
route-filtering not supported for address family addr_family .
```

The following command disables the peer-group capability feature for a Layer 3 VPN peer group:

```
disable bgp peer-group vpn capability address-family vpnv4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp peer-group next-hop-unchanged

```
enable bgp peer-group peer-group-name 12vpn-evpn next-hop-unchanged
```

Description

Enables a peer group and with respect to the next-hop of routes advertised to EBGP peers.

Syntax Description

peer-group-name	Specifies a peer group.
12vpn-evpn	Specifies L2VPN EVPN address-family type.
next-hop-unchanged	Enables preserving the BGP next-hop when routes are advertised to EBGP peers (default is disabled).

Default

Default is that next-hop-unchanged is disabled.

Usage Guidelines

This command enables overriding the specification behavior with respect to the next-hop of routes advertised to EBGP peers. Specifically, it maintains the BGP next-hop for routes advertised to EBGP peers.

When enabling the address family l2vpn-evpn in an EBGP configuration, the option **next-hop-unchanged** must also be enabled.

Example

The following command enables next-hop unchanged for the BGP peer group pg2 :

```
enable bgp peer-group pg2 l2vpn-evpn next-hop-unchanged
```

History

This command was first available in ExtremeXOS 31.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp peer-group originate-default

```
enable bgp {peer-group} peer-group-name {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast]} originate-default
   {policy policy_name}
```

Description

Enables the origination and advertisement of default routes to all *BGP* neighbors in the specified peer group.

Syntax Description

peer-group *peer-group-name*	Specifies the BGP peer group for which the default routes are originated and advertised.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
policy_name	Specifies a policy to be applied to the default routes during origination.

Default

Disabled. BGP does not automatically originate and advertise default routes to BGP neighbors.

Usage Guidelines

This command can be successfully executed at any time, irrespective of whether local BGP or the remote BGP peers are enabled or disabled. The default routes are created regardless of whether or not there are matching entries in the IGP route table.

When a BGP neighbor is added to a peer group, it does not inherit the default route origination configuration from the peer group. Also, default route origination for a neighbor and the associated peer group can be different.

If a policy is configured and specified in the command, a default route can be originated only if there is a route in the local BGP RIB that matches the policy's match rules. The default route's attribute can be modified using the same policy file by including statements in the set block of the policy.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Example

The following command enables the origination and advertisement of default routes for IPv4 unicast traffic for all nodes in the test BGP peer group:

```
enable bgp peer-group test originate-default
```

History

This command was first available in ExtremeXOS 12.2.2.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp peer-group remove-private-AS-numbers

`enable bgp peer-group` *`peer-group-name`* **`remove-private-AS-numbers`**

Description

Enables the removal of private autonomous system (AS) numbers from the AS_Path attribute of outbound updates.

Syntax Description

`peer-group-name`	Specifies a peer group.

Default

Disabled.

Usage Guidelines

This command applies to the current VR or VRF context.

Example

The following command enables the *BGP* peer group outer from removing private AS numbers:

```
enable bgp peer-group outer remove-private-AS-numbers
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bgp peer-group soft-in-reset

```
enable bgp peer-group peer-group-name {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast |ipv6-multicast |vpnv4]}soft-in-reset
```

Description

Enables the soft input reset feature.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

Disabling the soft input reset feature can potentially limit the amount of system memory consumed by the RIB-in.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command defaults to IPv4 unicast if no address family is specified. This command fails if an IPv6 address family is specified for an IPv4 peer-group.

Example

The following command enables the soft input reset feature:

```
enable bgp peer-group outer soft-in-reset
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 *BGP*.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bootp vlan

```
enable bootp {ipv4} | dhcp {ipv4 | ipv6} ] vlan [vlan | all]
```

Description

Enables the generation and processing of BOOTP packets on a *VLAN* to obtain an IP address for the VLAN from a BOOTP server.

Syntax Description

bootp	Enable BOOTP client.
ipv4	IPv4 client.
dhcp	Enable *DHCP* client.
ipv6	IPv6 client.
vlan	Specifies a VLAN name.
all	Specifies all VLANs.

Default

Disabled.

Usage Guidelines

If IPv4/IPv6 keyword is not specified , ipv4 would be taken as default for the mentioned VLAN.

Example

The following example enables the generation and processing of BOOTP packets on a VLAN named "accounting":

```
enable bootp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** and **ipv6** keywords were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable bootprelay ipv6

```
enable bootprelay {ipv4 | ipv6} {vlan vlan_name} | {vr vr_name} | all
   {vr vr_name}
```

Description

Enables BOOTP Relay v6. This can be done across the VR or on a per *VLAN* basis.

Syntax Description

bootprelay	BOOTP Relay service.
ipv4	DHCPv4 BOOTP Relay service.
ipv6	DHCPv6 BOOTP Relay service.
vlan_name	Specifies a VLAN name
vr	Uses a specific virtual router name.
vr_name	Specifies a virtual router name.
all	Enables all VLANs.

Default

IPv4.

Usage Guidelines

Use this command to enable BOOTP Relay across the VR or on a per VLAN basis.

Example

The following example displays IPv6 bootprelay information:

```
* switch #  show bootprelay ipv6
BOOTP Relay: DHCPv6 BOOTP Relay enabled on virtual router "VR-Default"
    BOOTP Relay Servers : 2001:0db8:85a3:0000:0000:8a2e:0370:7334
                          2001:0db8:85a3:0000:0000:8a2e:0370:7335
                          2001:0db8:85a3:0000:0000:8a2e:0370:7336
                          2001:0db8:85a3:0000:0000:8a2e:0370:7337
VLAN "Default":
   BOOTP Relay          : Disabled
VLAN "v1":
   BOOTP Relay          : Enabled
   BOOTP Relay Servers  : 2001:0db8:85a3:0000:0000:8a2e:0370:7338
   Interface ID         : v1-12
   Remote ID            :v1_remId
   Prefix Snooping      : Disabled
VLAN"v2":
   BOOTP Relay          : Enabled
   BOOTP Relay Servers  : 2001:0db8:85a3:0000:0000:8a2e:0370:7339
   Interface ID         : 100 (Default)
   Remote ID            : 00:04:96:52:A7:1B (Default)
   Prefix Snooping      : Disabled
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable bootprelay

```
enable bootprelay {{vlan} [vlan_name] | {{vr} vr_name} | all [{vr}
   vr_name]}
```

Description

Enables the BOOTP Relay function on one or all *VLAN*s for the specified VR or VRF.

Syntax Description

vlan_name	Specifies a single VLAN on which to enable the BOOTP Relay feature.
vr_name	Specifies a single VR or VRF on which to enable the BOOTP Relay feature. If not specified, VR or VRF of current command context is used.
all	Specifies that BOOTP Relay is to be enabled for all VLANs on the specified VR or VRF.

Default

The BOOTP Relay function is disabled on all VLANs and VRs.

If not specified, VR of current command context is used.

Usage Guidelines

Because VLAN names are unique on the switch, you can specify only a VLAN name (and omit the VR name) to enable BOOTP Relay on a particular VLAN. When you enable BOOTP Relay on a VR or VRF, BOOTP Relay is enabled on all VLANs for that VR. If you enter the command without specifying a VLAN or a VR, the functionality is enabled for all VLANs in the current VR context.

Note

If *DHCP*/BOOTP Relay is enabled on a per VLAN basis, make sure it is enabled on both the client-side and server-side VLANs.

Example

The following example enables the forwarding of BOOTP requests for all VLANs in the current VR context:

```
enable bootprelay
```

You can use either of the following commands to enable the forwarding of BOOTP requests for VLAN client1:

```
enable bootprelay "client1"
enable bootprelay vlan "client1"
```

You can use any one of the following commands to enable the forwarding of BOOTP requests for all VLANs on VR zone3:

```
enable bootprelay zone3
enable bootprelay vr zone3
enable bootprelay all zone3
enable bootprelay all vr zone3
```

History

This command was first available in ExtremeXOS 10.1.

The capability to enable BOOTP Relay on a VLAN was added in ExtremeXOS 12.4.2.

The capability to enable BOOTP Relay on VPN-VRF is added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cdp ports

`enable cdp ports [`*`port_list`* `|` **`all`**`]`

Description

Enables Cisco Discovery Protocol (CDP) on a port.

Syntax Description

port_list	Specifies the list of ports to enable CDP on.
all	Specifies that you enable CDP on all ports.

Default

Enabled.

Usage Guidelines

Example

The following command enables CDP on all ports on the switch:

```
enable cdp ports all
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cfm segment frame-delay measurement

```
enable cfm segment frame-delay measurement segment_name { mep mep_id }
   [continuous | count value]
```

Description

Triggers DMM frame transmission.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
mep	Specifies the maintenance association End Point that helps trigger a particular MEP level session on that segment.
mep_id	Specifies the MEP-ID. The range is 1-8191. The default is all MEPs on the segment.
continuous	Specifies that frames are to be sent continuously until stopped.
count	Specifies that a number of frames are to be sent.
value	Specifies the number of frames to send. The range is 1 to 4294967295.

Default

N/A.

Usage Guidelines

Use this command to trigger DMM frames at the specified transmit interval configured using the command `configure cfm segment transmit-interval`.

Continuous transmission continues until it is stopped with the command `disable cfm segment frame-delay measurement` or `delete cfm segment`.

Note

If you try to trigger the DMM frames for a segment that is not completely configured, the frames are not transmitted for that segment, and an error message is displayed on the console.

Example

The following example triggers continuous frame transmission on the CFM segment segment-first:

```
enable cfm frame-delay measurement segment-first continuous
```

History

This command was first available in ExtremeXOS 12.3.

The **mep** keyword was added in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cfm segment frame-loss measurement mep

If the user specifies the mode as continuous, the LMM transmission will continue till it is stopped by the user.

```
enable cfm segment frame-loss measurement segment_name mep mep_id
   [continuous | count frames]
```

Description

This command is used to trigger LMM frames at the configured transmit-interval.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
continuous	Specifies that frames are to be sent continuously until stopped.
count	Specifies that a number of frames are to be sent.
frames	Specifies the number of frames to send. The range is 1 to 4294967295.

Default

N/A.

Usage Guidelines

This command is used to trigger LMM frames at the configured transmit-interval. If the user specifies the mode as continuous, the LMM transmission will continue till it is stopped by the user.

Note
If the user tries to trigger the LMM frames for a segment which is not completely configured, the frames will not be transmitted for that segment, and an error message will be thrown.

Example

```
enable cfm segment cs2 frame-loss measurement mep 3 count 10
enable cfm segment cs2 frame-loss measurement mep 3 continuous
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable clear-flow

```
enable clear-flow
```

Description

Enable the CLEAR-Flow agent.

Syntax Description

This command has no arguments or variables.

Default

CLEAR-Flow is disabled by default.

Usage Guidelines

When the CLEAR-Flow agent is enabled, sampling begins and actions are taken based on the CLEAR-Flow rules that are configured on the switch.

Example

The following example enables CLEAR-Flow on the switch:

```
# enable clear-flow
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, 5720 series switches.

enable cli history expansion

```
enable cli history expansion {session | permanent}
```

Description

Performs command line history expansion similar to the Linux shell.

Syntax Description

cli	Command line interface settings.
history	Command history settings.
expansion	Substitute occurrences of '!n:w' with the corresponding line 'n' and word 'w+1' from command history (default disabled).
session	Configures history expansion for this CLI session only (default).
permanent	Configures history expansion for this CLI session, and all future sessions.

Default

CLI history expansion is disabled by default. If not specified when enabling, CLI history expansion is enabled for the current session only.

Usage Guidelines

The history expansion character '!' can be used to specify command from the history that is substituted into the command line. All occurrences of the form "!n:w" in the command are replaced with the w'th word from the n'th line in the command history. Specification of the word is optional.

If you enable CLI history expansion, and then try to reference a history that does not exist, the following error appears:

```
# show !58:1 Error: History event not found. If you were not attempting a history
expansion using the format '!n:w', and believe the command to be valid, please retry the
command after 'disable cli history expansion'.
```

To view the status of CLI history expansion on the switch, use the `show management` command.

Example

The following command enables CLI history expansion for this session and all future sessions:

```
enable cli history expansion permanent
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli prompting

```
enable cli prompting
```

Description

Enables CLI prompting for the session.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Use this command to enable CLI prompting from a disabled state.

To view the status of CLI prompting on the switch, use the `show management` command.

Example

The following command enables prompting:

```
enable cli prompting
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli refresh

```
enable cli refresh {session | permanent}
```

Description

This command allows you to configure the default auto refresh behavior. The auto refresh behavior is used for some `show` commands.

Syntax Description

session	Use refresh setting for this CLI session only.
permanent	Use refresh setting for this CLI session, and all future sessions (default).

Default

Permanent.

Usage Guidelines

The auto refresh behavior is used for some 'show' commands. You must use the `disable cli refresh` command to disable the show command auto refresh or add the no-refresh option to the individual command. For example:

- `show ports config` – will display and refresh the first <n> ports of a switch until the **[ESC]** key is pressed.
- `disable cli refresh`
- `show ports config` – will act as if `show ports config no-refresh` was entered and page through all ports

Since the default for the session may be set to `disable cli refresh` the commands that take a **no-refresh** option now allow for the alternate **refresh** case if the user wants to selectively enable a refreshed display.

The **permanent** option is only valid for admin level users.

Example

The following sample output displays the CLI refresh information.

```
# show management
CLI idle timeout                 : Enabled (20 minutes)
CLI max number of login attempts : 3
CLI max number of sessions       : 8
CLI paging                       : Enabled (this session only)
CLI space-completion             : Disabled (this session only)
CLI configuration logging        : Disabled
CLI scripting                    : Disabled (this session only)
CLI scripting error mode         : Ignore-Error (this session only)
CLI persistent mode              : Persistent (this session only)
```

```
CLI prompting                    : Enabled (this session only)
CLI refresh                      : Enabled (this session only)
Telnet access                    : Enabled (tcp port 23 vr all)
                                 : Access Profile : not set
SSH Access                       : ssh module not loaded.
Web access                       : Enabled (tcp port 80)
                                 : Access Profile : not set
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli scripting

```
enable cli scripting {permanent}
```

Description

Enables the use of CLI scripting commands. When used without the permanent option, it enables the CLI scripting commands for the current session and is a per session setting. The permanent option enables the CLI scripting commands for new sessions only and is saved across switch reboots.

Syntax Description

permanent	Enables the CLI scripting commands for new sessions only; this setting is saved across switch reboots.

Default

The CLI scripting commands are disabled by default.

Usage Guidelines

You must enable the CLI scripting commands on the switch to use the scripting keywords in the script, and before you can configure or execute a script.

Note

CLI scripting commands cannot be enabled when CLI space auto completion is enabled with the `enable cli space-completion` command.

Example

The following command enables the CLI scripting commands for the current session:

```
enable cli scripting
```

History

This command was first available in ExtremeXOS 11.6.

The permanent option was added in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli scripting output

```
enable cli scripting output
```

Description

Enables the display of CLI commands and responses during script operation.

Default

During interactive script sessions: CLI scripting output enabled.

During load script command operation: CLI scripting output disabled.

Usage Guidelines

When the CLI scripting output is enabled, all script commands and responses are displayed.

When the `load script filename {arg1} {arg2} ... {arg9}` command is entered, the software disables CLI scripting output until the script is complete, and then CLI scripting output is enabled. Use the enable cli scripting output and disable cli scripting output commands to control what a script displays when you are troubleshooting.

Example

The following command enables CLI scripting output for the current session or until the disable cli scripting output command is entered:

```
enable cli scripting output
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli space-completion

```
enable cli space-completion
```

Description

Enables the ExtremeXOS feature that completes a command automatically with the spacebar. The [Tab] key can also be used for auto-completion.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

CLI space auto completion cannot be enabled while CLI scripting is enabled with the `enable cli scripting` command.

Example

The following command enables using the spacebar to automatically complete a command:

```
enable cli space-completion
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli config-logging

```
enable cli config-logging
```

Description

Enables the logging of CLI configuration commands to the Syslog for auditing purposes.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

ExtremeXOS allows you to record all configuration changes and their sources that are made using the CLI by way of Telnet or the local console. The changes are logged to the system log. Each log entry includes the user account name that performed the changes and the source IP address of the client (if Telnet was used). Configuration logging applies only to commands that result in a configuration change.

To view the status of configuration logging on the switch, use the `show management` command. This command displays information about the switch including the enable/disable state for configuration logging.

Example

The following command enables the logging of CLI configuration commands to the Syslog:

```
enable cli config-logging
```

History

This command was first available in ExtremeXOS 11.0.

The **cli-config-logging** keyword was split into **cli config-logging** in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli-config-logging expansion

`enable cli-config-logging` **`expansion`**

Description

When CLI logging is enabled, enables showing fully expanded commands, rather than abbreviations, in the log.

Syntax Description

expansion	Enables command expansion in logs.

Default

Expansion is disabled by default.

Usage Guidelines

When CLI logging is enabled (see enable cli config-logging on page 2091), this command enables showing fully expanded commands, rather than abbreviations, in the log.

For example, with command expansion enabled, a command entered in abbreviated format, such as

```
config por 33 auto of spee 10000 duplex ful
```

appears in the log as:

```
configure ports 33 auto off speed 10000 duplex full
```

Whereas, if command expansion is turned off, the command appears in the log in the exact format as it was typed into the command line.

To see the status of command expansion, use show management on page 2848.

Example

The following example turns on command expansion:

```
enable cli-config-logging expansion
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli paging

```
enable cli paging {session | permanent}
```

Description

Enables the pause mechanism and does not allow the display to print continuously to the screen.

Syntax Description

session	Enables viewing output of commands one screenful at a time for the current user session only (default).
permanent	Enables viewing output of commands one screenful at a time permanently (setting persists after rebooting).

Default

Enabled per session.

Usage Guidelines

The command line interface (CLI) is designed for use in a VT100 environment.

Most show command output pauses when the display reaches the end of a page.

To view the status of CLI paging on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for CLI paging.

If CLI paging is enabled and you use the `show tech-support` command to diagnose system technical problems, the CLI paging feature is disabled.

Example

The following command enables cli paging permanently (setting persists across reboots) and does not allow the display to print continuously to the screen:

```
enable cli paging permanent
```

History

This command was first available in ExtremeXOS 10.1.

The **session** and **permanent** options were added in ExtremeXOS 22.5.

The **clipaging** option was split into two keywords in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cpu-monitoring

`enable cpu-monitoring {`**`interval`** *`seconds`*`} {`**`threshold`** *`percent`*`}`

Description

Enables CPU monitoring on the switch.

Syntax Description

seconds	Specifies the monitoring interval, in seconds. The default is 5 seconds, and the range is 5 to 60 seconds.
threshold	Specifies the CPU threshold value. CPU usage is measured in percentages. The default is 90%, and the range is 0% to 100%.

Default

CPU monitoring is enabled and occurs every 5 seconds. The default CPU threshold value is 90%.

Usage Guidelines

CPU monitoring allows you to monitor the CPU utilization and history for all of the processes running on the switch. By viewing this history on a regular basis, you can see trends emerging and identify processes with peak utilization. Monitoring the workload of the CPU allows you to troubleshoot and identify suspect processes before they become a problem.

To specify the frequency of CPU monitoring, use the interval keyword. We recommend the default setting for most network environments.

CPU usage is measured in percentages. By default, the CPU threshold value is 90%. When CPU utilization of a process exceeds 90% of the regular operating basis, the switch logs an error message specifying the process name and the current CPU utilization for the process. To modify the CPU threshold level, use the threshold keyword. The range is 0% to 100%.

Example

The following command enables CPU monitoring every 30 seconds:

```
enable cpu-monitoring interval 30
```

History

This command was first available in ExtremeXOS 11.2.

The default values shown began in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dhcp ports vlan

`enable dhcp ports` *`port_list`* **`vlan`** *`vlan_name`*

Description

Enables *DHCP* on a specified port in a *VLAN*.

Syntax Description

`port_list`	Specifies the ports for which DHCP should be enabled.
`vlan_name`	Specifies the VLAN on whose ports DHCP should be enabled.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables DHCP for port 5:9 in VLAN corp:

```
enable dhcp ports 5:9 vlan corp
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dhcp vlan

```
enable dhcp [ipv4 | ipv6] [vlan_name | all]
```

Description

Enables the generation and processing of *DHCP* packets on a *VLAN* to obtain an IP address for the VLAN from a DHCP server.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

If the IPv4/IPv6 keyword is not specified, IPv4 is taken as default for the mentioned VLAN | all.

Usage Guidelines

None.

Example

The following command enables the generation and processing of DHCP packets on a VLAN named accounting:

```
enable dhcp vlan accounting

enable dhcp ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 15.6 to include the **ipv4** and **ipv6** keywords.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable diffserv examination ports

```
enable diffserv examination ports [port_list | all]
```

Description

Enables the DiffServ field of an IP packet to be examined in order to select a *QoS* profile.

Syntax Description

port_list	Specifies a list of ports or slots and ports to which the parameters apply.
all	Specifies that DiffServ examination is enabled for all ports.

Default

Disabled.

Usage Guidelines

The Diffserv examination feature is disabled by default.

Example

The following command enables DiffServ examination on selected ports:

```
enable diffserv examination ports 1:1,5:5,6:2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable diffserv replacement ports

```
enable diffserv replacement ports [port_list | all] {{qosprofile}
   qosprofile}
```

Description

Enables the DiffServ code point to be overwritten in IP packets transmitted by the switch.

Syntax Description

port_list	Specifies a list of ingress ports or slots and ports on which to enable Diffserv replacement.
all	Specifies that DiffServ replacement should be enabled for all ports.
qosprofile	Enables DiffServ replacement on a *QoS* profile. Note: DiffServ replacement will be enabled for all QoS profiles if this option is not specified.
qosprofile	Specifies the QoS profile number.

Default

N/A.

Usage Guidelines

The Diffserv replacement feature functions for IPv4 and IPv6 traffic and is disabled by default.

Note

The port in this command is the ingress port.

This command affects only that traffic in traffic groupings based on explicit packet class of service information and physical/logical configuration.

Example

The following example enables DiffServ replacement on specified ports:

```
enable diffserv replacement ports 5:3,5:5,6:2
```

History

This command was first available in ExtremeXOS 11.0.

The **qosprofile** keyword and *qosprofile* variable were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dns cache

```
enable dns cache {{vlan} vlan_name | {vr} vr_name}
```

Description

Enables the Domain Name System (DNS) cache on a virtual router (VR) or *VLAN*.

Syntax Description

dns	Domain name system.
cache	Specifies enabling the DNS cache.
vlan	Specifies enabling DNS cache on a VLAN.
vlan_name	Specifies the VLAN name.
vr	Specifies enabling DNS cache on a VR.
vr_name	Specifies the VR name. If not specified, VR of current command context is used.

Default

If no VR name is specified, the VR of the current command context is used.

Usage Guidelines

To view the DNS cache configuration, use the command `show` **dns cache configuration** `{{`**vlan**`} vlan_name | {`**vr**`} vr_name}`

Example

The following example enables DNS cache on VLAN "VLAN1":

```
# enable dns cache vlan VLAN1
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dns cache dnssec

```
enable dns cache {dnssec}
```

Description

Validates DNS replies and cache data for DNSSEC (Domain Name System Security Extensions).

Syntax Description

dnssec	Validate DNS replies and cache data for DNSSEC. Default is disabled.

Default

By default, DNSSEC is disabled.

Usage Guidelines

You cannot enable DNSSEC if DNS cache is enabled.

Example

The following example enables DNSSEC:

```
# enable dns cache dnssec
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dns cache analytics

```
enable dns cache analytics {{vr} vr_name}
```

Description

Enables Domain Name System (DNS) analytics.

Syntax Description

dns	Domain Name System.
cache	Specifies DNS cache.
analytics	Specifies enabling DNS cache analytics. Analytics provides more insight into DNS queries when DNS cache is enabled. Default is disabled.
vr	Specifies enabling DNS analytics on a VR.
vr_name	Specifies the VR name. If not specified, the VR of the current command context is used.

Default

DNS analytics is disabled by default.

Usage Guidelines

To disable DNS analytics, use the command `disable` **`dns cache analytics`** {{**`vr`**} *`vr_name`*}.

Example

The following example enables DNS analytics on VR "vr1":

```
# enable dns cache analytics vr vr1
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dos-protect simulated

```
enable dos-protect simulated
```

Description

Enables simulated denial of service protection.

Syntax Description

This command has no arguments or variables.

Default

The default is disabled.

Usage Guidelines

If simulated denial of service is enabled, no ACLs are created. This mode is useful to gather information about normal traffic levels on the switch. This will assist in configuring denial of service protection so that legitimate traffic is not blocked.

Example

The following command enables simulated denial of service protection:

```
enable dos-protect simulated
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dos-protect

```
enable dos-protect
```

Description

Enables denial of service protection.

Syntax Description

This command has no arguments or variables.

Default

The default is disabled.

Usage Guidelines

None.

Example

The following command enables denial of service protection.

```
enable dos-protect
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dot1p examination inner-tag port

```
enable dot1p examination inner-tag port [all | port_list]
```

Description

Used with VMANs, and instructs the switch to examine the 802.1p value of the inner tag, or header of the original packet, to determine the correct egress queue on the egress port.

Syntax Description

all	Specifies all ports.
port_list	Specifies a list of ports or slots and ports.

Default

Disabled.

Usage Guidelines

Use this command to instruct the system to refer to the 802.1p value contained in the inner, or original, tag when assigning the packet to an egress queue at the egress port of the VMAN.

Note

For information about configuring and displaying the current 802.1p and DiffServ configuration for the inner, or original header, 802.1p value, see the *Quality of Service* section in the *Switch Engine 32.2 User Guide*.

Example

The following example puts the packets in the egress queue of the VMAN egress port according to the 802.1p value on the inner tag:

```
enable dot1p examination inner-tag port 3:2
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dot1p examination ports

```
enable dot1p examination ports [port_list | all]
```

Description

Enables egress *QoS* profile selection based on the 802.1p bits in the incoming frame.

Syntax Description

port_list	Specifies a list of ports on which to enable the dot1p examination feature.
all	Specifies that dot1p examination should be enabled for all ports.

Default

Enabled.

Usage Guidelines

To increase available *ACL*s, you can disable the 802.1p examination feature if you are not running QoS or are running QoS using DiffServ. See the *Switch Engine 32.2 User Guide* for information on ACL limitations on these platforms.

Use this command to re-enable the 802.1p examination feature.

As part of the COS global status enable action, COS will automatically enable dot1p examination on all ports. An internal status will track this event. The disable dot1p examination command will print an additional warning message in the event that COS was configured via *SNMP*. If the COS global status is disabled via SNMP, the internal status will be cleared and the additional warning message will not be displayed.

Example

The following command enables dot1p examination on ports 1 to 5:

```
enable dot1p examination ports 1-5
```

History

This command was available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable dot1p replacement ports

```
enable dot1p replacement ports [port_list | all] {{qosprofile}
   qosprofile}
```

Description

Allows the 802.1p priority field to be overwritten on egress according to the *QoS* profile to 802.1p priority mapping for a given set of ports.

Syntax Description

port_list	Specifies a list of ports or slots and ports.
all	Specifies that dot1p replacement should be enabled for all ports.
qosprofile	Enables dot1p on a QoS profile.
qosprofile	Specifies the QoS profile number.

Default

N/A.

Usage Guidelines

The dot1p replacement feature is disabled by default.

By default, 802.1p priority information is not replaced or manipulated, and the information observed on ingress is preserved when transmitting the packet.

Note
The port in this command is the ingress port.

If 802.1p replacement is enabled, the 802.1p priority information that is transmitted is determined by the hardware queue that is used when transmitting the packet.

Note
This command affects only that traffic in traffic groupings based on explicit packet class of service information and physical/logical configuration.

Beginning with ExtremeXOS version 11.4 on the 1 Gigabit Ethernet ports, 802.1p replacement always happens when you configure the DiffServ traffic grouping.

Note
Enabling dot1p replacement on all ports may take some time to complete.

Example

The following example enables dot1p replacement on all ports:

```
enable dot1p replacement ports all
```

History

This command was available in ExtremeXOS 11.0.

The **qosprofile** keyword and *qosprofile* variable were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable eaps

```
enable eaps {name}
```

Description

Enables the *EAPS* function for a named domain or for an entire switch.

Syntax Description

name	Specifies the name of an EAPS domain.

Default

Disabled.

Default command enables EAPS for the entire switch.

Usage Guidelines

Note

If you use the same name across categories (for example, *STPD* and EAPS names), you must specify the identifying keyword as well as the actual name.

To configure and enable an EAPS, complete the following steps:

1. Create EAPS domain and assign the name.
2. Configure the control *VLAN*.
3. Configure the protected VLAN(s).
4. Add the control VLAN to EAPS domain.
5. Add the protected VLAN(s) to EAPS domain.
6. Configure EAPS mode, master or transit.

7. Configure EAPS port, secondary and primary.
8. If desired, configure timeout and action for failtimer expiration*.
9. If desired, configure the hello time for the health-check packets*.
10. Enable EAPS for the entire switch.
11. If desired, enable Fast Convergence*.
12. Enable EAPS for the specified domain.

Although you can enable EAPS prior to configuring these steps, the EAPS domain(s) does not run until you configure these parameters.

* These steps can be configured at any time, even after the EAPS domains are running.

You must enable EAPS globally and specifically for each named EAPS domain.

Example

The following command enables the EAPS function for entire switch:

```
enable eaps
```

The following command enables the EAPS function for the domain eaps-1:

```
enable eaps eaps-1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable edp ports

```
enable edp ports [ports | all]
```

Description

Enables the *EDP* on one or more ports.

Syntax Description

ports	Specifies one or more ports or slots and ports, including management port.
all	Specifies all ports on the switch, including management port.

Default

Enabled.

Usage Guidelines

On a SummitStack, *ports* can be a list of slots and ports. On a stand-alone switch, *ports* can be one or more port numbers. For a detailed explanation of port specification, see Port Numbering in Command Reference Overview

EDP is useful when Extreme Networks switches are attached to a port.

The EDP is used to locate neighbor Extreme Networks switches and exchange information about switch configuration. When running on a normal switch port, EDP is used to by the switches to exchange topology information with each other. Information communicated using EDP includes the following:

- Switch MAC address (switch ID).
- Switch software version information.
- Switch IP address.
- Switch *VLAN* information.
- Switch port number.
- Switch port configuration data: duplex, and speed.

Example

The following command enables EDP on port 3 on a switch:

```
enable edp ports 3
```

History

This command was first available in ExtremeXOS 10.1.

The port configuration data was added in ExtremeXOS 11.0.

Ability to enable EDP on management port was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable elrp-client

```
enable elrp-client {software | hardware-assist}
```

Description

Enables the Extreme Loop Recovery Protocol (ELRP) client (standalone ELRP) globally.

Syntax Description

software	Select software ELRP (Default).
hardware-assist	Select hardware-assisted ELRP. Not available on the ExtremeSwitching X435 series switches.

Default

By default, ELRP is disabled.

By default, ELRP, when enabled, is software ELRP.

Usage Guidelines

Configure loopback port before enabling hardware-assisted ELRP. Note that hardware-assisted ELRP is not available on the ExtremeSwitching X435 series switches.

The ELRP client must be enabled globally in order for it to work on any *VLAN*s.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the `disable elrp-client` command to globally disable the ELRP client.

The ExtremeXOS does not support ELRP and Network Login on the same port.

Example

The following command globally enables the ELRP client:

```
# enable elrp-client
```

The following example enables hardware-assisted ELRP client:

```
# enable elrp-client hardware-assist
```

History

This command was first available in ExtremeXOS 11.1.

Hardware-assisted ELRP option added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable elsm ports

`enable elsm ports` *`port_list`*

Description

Enables the ELSM protocol for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which ELSM should be enabled.

Default

The default is disabled.

Usage Guidelines

The ELSM protocol allows you to detect CPU and remote link failures in the network. ELSM operates on a point-to-point basis; you only configure ELSM on the ports that connect to other devices within the network, but you must configure ELSM on both sides of the peer connections.

The Layer 2 connection between the ports determines the peer. You can have a direct connection between the peers or hubs that separate peer ports. In the first instance, the peers are also considered neighbors. In the second instance, the peer is not considered a neighbor.

An Extreme Networks device with ELSM enabled detects CPU and remote link failures by exchanging hello messages between two ELSM peers. If ELSM detects a failure, the ELSM-enabled port responds by blocking traffic on that port. For example, if a peer stops receiving messages from its peer, ELSM brings down that connection by blocking all incoming and outgoing data traffic on the port and notifying applications that the link is down.

When you enable ELSM on a port, ELSM immediately blocks the port and it enters the Down state. When the port detects an ELSM-enabled peer, the peer ports exchange ELSM hello messages. At this point, the ports enter the transitional Down-Wait state. If the port receives Hello+ messages from its peer and does not detect a problem, the peers enter the Up state. If a peer detects a problem or there is no peer port configured, the port enters the Down state.

For more information about the types of ELSM hello messages, see the `configure elsm ports hellotime` command.

Note

ELSM and mirroring are mutually exclusive. You can enable either ELSM, or mirroring, but not both.

If you try to enable ELSM on a port that is already configured as a mirrored port, the switch displays a message similar to the following:`Cannot enable ELSM on port 1. Port is configured as mirror monitor port`

Configuring the Hello Timer Interval

ELSM ports use hello messages to communicate information about the health of the network to its peer port. You can also configure the interval by which the ELSM-enabled ports sends hello messages. For more information about configuring the hello interval, see the command `configure elsm ports hellotime`.

Disabling ELSM

ELSM works between two connected ports, and each ELSM instance is based on a single port. When you disable ELSM on the specified ports, the ports no longer send ELSM hello messages to their peers and no longer maintain ELSM states. To disable ELSM, use the following command:

`disable elsm ports port_list`

Example

The following command enables ELSM for ports 1-2 on the switch:

```
enable elsm ports 1-2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable elsm ports auto-restart

`enable elsm ports port_list auto-restart`

Description

Enables ELSM automatic restart for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which ELSM auto-restart is being enabled.

Default

The default is enabled.

Usage Guidelines

You must explicitly configure this behavior on each ELSM-enabled port; this is not a global command.

By default, ELSM automatic restart is enabled. If an ELSM-enabled port goes down, ELSM bypasses the Down-Stuck state and automatically transitions the down port to the Down state, regardless of the number of times the port goes up and down.

If you disable ELSM automatic restart, the ELSM-enabled port can transition between the following states multiple times: Up, Down, and Down-Wait. When the number of state transitions is greater than or equal to the sticky threshold, the port enters the Down-Stuck state.

The ELSM sticky threshold specifies the number of times a port can transition between the Up and Down states. The sticky threshold is not user-configurable and has a default value of 1. That means a port can transition only one time from the Up state to the Down state. If the port attempts a subsequent transition from the Up state to the Down state, the port enters the Down-Stuck state.

If the port enters the Down-Stuck state, you can clear the stuck state and enter the Down state by using one of the following commands:

`clear elsm ports port_list auto-restart`

OR

`enable elsm ports port_list auto-restart`

If you use the `enable elsm ports port_list auto-restart` command, automatic restart is always enabled; you do not have to use the `clear elsm ports port_list auto-restart` command to clear the stuck state.

To disable automatic restart, use the following command:

`disable elsm ports port_list auto-restart`

If you configure automatic restart on one port, Extreme Networks recommends that you use the same configuration on its peer port.

Example

The following command enables ELSM automatic restart for slot 2, ports 1-2 on the switch:

```
enable elsm ports 2:1-2:2 auto-restart
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable erps

`enable erps`

Description

Enable (*ERPS*/ITU-T G.8032 standard).

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to enable ERPS.

Example

```
enable erps
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

enable erps block-vc-recovery

`enable erps` *ring-name* **`block-vc-recovery`**

Description

Enable ability on *ERPS* rings to block virtual channel recovery to avoid temporary loops .

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
block-vc-recovery	Block on Virtual channel recovery.

Default

N/A.

Usage Guidelines

Use this command to enable ability on ERPS rings to block on virtual channel recovery to avoid temporary loops. This is done on interconnected nodes for sub-ring configurations.

Example

The following example enables a virtual channel recovery block on “ring1”:

```
enable erps ring1 block-vc-recovery
```

History

This command was first available in ExtremeXOS 15.13.

Platform Availability

This command is available on all platforms that are running ExtremeXOS.

enable erps ring-name

```
enable erps ring-name
```

Description

Enable an existing *ERPS* ring/sub-ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to enable an existing ERPS ring/sub-ring.

Example

The following example enables an existing ERPS ring identified as “ring1”:

```
enable erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

enable erps topology-change

```
enable erps ring-name topology-change
```

Description

Enable the ability of *ERPS* to set the topology-change bit to send out Flush events.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS sub-ring.
topology-change	Topology change propagation control.

Default

N/A.

Usage Guidelines

Use this command to enable the ability of ERPS to set the topology-change bit to send out Flush events.

Example

The following example enables the ability to set the topology-change bit for an existing ERPS sub-ring identified as “ring1”:

```
enable erps ring1 topology-change
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

enable esrp

```
enable esrp esrpDomain
```

Description

Enables *ESRP* for a named domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.

Default

Disabled.

Usage Guidelines

Before you enable an ESRP domain, it must have a domain ID. The ESRP domain ID is determined from one of the following user-configured parameters:

- ESRP domain number created with the `configure esrp domain-id` command
- 802.1Q tag (VLANid) of the tagged master *VLAN*

If you do not have a domain ID, you cannot enable ESRP on that domain. A message similar to the following appears:

```
ERROR: Cannot enable ESRP Domain "esrp1" ; No domain id configured!
```

If you add an untagged master VLAN to the ESRP domain, make sure to create an ESRP domain ID with the `configure esrp domain-id` command before you attempt to enable the domain.

Example

The following command enables ESRP for the domain esrp1:

```
enable esrp esrp1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ethernet oam ports link-fault-management

```
enable ethernet oam ports [port_list | all] link-fault-management
```

Description

Enables Ethernet OAM on ports.

Syntax Description

port_list	Specifies the particular ports.
all	Specifies all fiber ports.

Default

Ethernet OAM is disabled on all ports.

Usage Guidelines

Use this command to enable Ethernet OAM on one or more specified ports or on all fiber ports. Unidirectional link fault management is supported only on fiber ports.

Before enabling Ethernet OAM, autonegotiation must be turned off. The link should be a full duplex link.

If some ports cannot be enabled because, for instance, autonegotiation is not turned off, the command is executed for those ports that can be enabled and reasons for the failed ports are displayed.

To display the Ethernet OAM configuration, use the `show ethernet oam` command.

When operating as a stack master, the ExtremeSwitching X450e switch can process this command for ports on supported platforms.

Example

The following command enables Ethernet OAM on all fiber ports:

```
# enable ethernet oam ports all link-fault-management
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable fdb static-mac-move

```
enable fdb static-mac-move
```

Description

Enables EMS and *SNMP* reporting of discovered MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables reporting only. All packets that arrive from a duplicate MAC address on another port (other than the statically configured port) are dropped.

The switch reports the source MAC address, port, and *VLAN* for each duplicate MAC address.

Example

The following command enables this feature:

```
enable fdb static-mac-move
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable flooding ports

```
enable flooding [all_cast | broadcast | multicast | unicast] ports
   [port_list | all]
```

Description

Enables egress flooding on one or more ports. You can further identify the type of packets to flood on the specified ports.

Syntax Description

all_cast	Specifies enabling egress flooding for all packets on specified ports.
broadcast	Specifies enabling egress flooding only for broadcast packets.
multicast	Specifies enabling egress flooding only for multicast packets.
unicast	Specifies enabling egress flooding only for unknown unicast packets.
port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled for all packet types.

Usage Guidelines

Use this command to re-enable egress flooding that you previously disabled using the `disable flooding ports` command.

The following guidelines apply to enabling and disabling egress flooding:

- Disabling multicasting egress flooding does not affect those packets within an *IGMP* membership group at all; those packets are still forwarded out. If IGMP snooping is disabled, multicast packets are not flooded.
- Egress flooding can be disabled on ports that are in a load-sharing group. If that is the situation, the ports in the group take on the egress flooding state of the master port; each member port of the load-sharing group has the same state as the master port.
- *FDB* learning is independent of egress flooding. FDB learning and egress flooding can be enabled or disabled independently.
- Disabling unicast or all egress flooding to a port also stops packets with unknown MAC addresses to be flooded to that port.
- Disabling broadcast or all egress flooding to a port also stops broadcast packets to be flooded to that port.

You can disable egress flooding for unicast, multicast, or broadcast MAC addresses, as well as for all packets on the ports. The default behavior is enabled egress flooding for all packet types.

Example

The following command enables unicast flooding on ports 13-17 on a switch:

```
enable flooding unicast port 13-17
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable flow-control ports

```
enable flow-control [tx-pause {priority priority} | rx-pause {qosprofile
   qosprofile}] ports [all | port_list]
```

Description

Enables flow control or priority flow control (PFC) on the specified ports.

Syntax Description

tx-pause	Specifies transmit pause frames.
priority	Specifies all priorities or single priorities--dot1p priority for tagged packets and internal priority for untagged packets. Used with priority flow control only.
rx-pause	Specifies received pause frames.
qosprofile	Specifies a *QoS* profile (“qp1” “qp2” “qp3” “qp4” “qp5” “qp6” “qp7” “qp8”) to pause for priority flow control packet reception. Used with priority flow control only.
all	Specifies all ports or slots.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

With autonegotiation enabled, the switches advertise the ability to support pause frames. This includes receiving, reacting to (stopping transmission), and transmitting pause frames. However, the switch does not actually transmit pause frames unless it is configured to do so.

IEEE 802.3x-Flow Control

IEEE 802.3x flow control provides the ability to configure different modes in the default behaviors.

Use this command to configure the switch to transmit link-layer pause frames when congestion is detected. This stops all traffic on the configured port when there is buffer congestion for any traffic type. Use it also to configure the switch to return to the default behavior of processing received pause frames.

To enable TX flow-control, RX flow-control must first be enabled. If you attempt to enable TX flow-control with RX flow-control disabled, an error message is displayed.

IEEE 802.1Qbb-Priority Flow Control

IEEE 802.1Qbb priority flow control provides the ability to configure the switch to transmit link-layer pause frames to stop only a portion of the traffic when congestion is detected.

When IEEE 802.1Qbb priority flow control is enabled on a port, IEEE 802.3x pause functionality is no longer available on that port.

Priority is established for reception of PFC packets with a QoS profile value on the ExtremeXOS switch and for transmission with a priority value added to the PFC packet.

- QoS profile—Ingress traffic is associated with a QoS profile for assignment to one of eight hardware queues in the system that define how the traffic flows with respect to bandwidth, priority, and other parameters. By default, there are two QoS profiles (QP1 and QP8) defined in these supported

platforms and PFC works with this default. To segregate the ingress traffic with more granularity, you will want to define other QoS profiles.

- Priority—The traffic that is paused is based on the priority bits in the *VLAN* header for tagged packets. You can specify this transmit priority independently from the QoS profile to associate it with the reception of a PFC packets thus giving flexibility in the configuration of the network.

It is suggested that the priority in the VLAN header match the QoS profile priority when traffic ingresses at the edge of the network so that the traffic can be more easily controlled as it traverses through the network.

IEEE 802.3x

The following command enables the TX flow-control feature on ports 5 through 7 on a switch:

```
enable flow-control tx-pause ports 5-7
```

IEEE 802.1Qbb

The following command enables the priority flow control feature on a switch:

```
enable flow-control tx-pause priority 3 ports 2
```

History

This command was first available in ExtremeXOS 12.1.3.

IEEE 802.1Qbb priority flow control (PFC) was added in ExtremeXOS 12.5.

Platform Availability

IEEE 802.3x

The basic TX-pause and RX-pause functions of this command are available on all switches.

IEEE 802.1Qbb

The priority function (PFC) is available only on 10G ports.

NEW! enable flowmon

```
enable flowmon
```

Description

Enables Flow Monitor to collect and export flows for configured keys in enabled groups.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Example

The following command enables Flow Monitor:

```
# enable flowmon
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! enable flowmon group

```
enable flowmon group group_name
```

Description

Enables a Flow Monitor group.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.

Default

N/A.

Usage Guidelines

While a group is being enabled, it can't be modified except to add or delete keys.

Before a group can be enabled, it must have at least one key and one collector added to it. A template key portion is present once a key has been added.

Example

The following command enables a Flow Monitor group with the name 'max-flow-age':

```
# enable flowmon group max-flow-age
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

enable icmp ipv6

```
enable icmp ipv6 [ignore-multicasts | ignore-anycasts]
```

Description

Enables the *ICMP* IPv6 reply to multicast or anycast echo request.

Syntax Description

ignore-multicasts	Specifies to ignore ICMP echo requests destined to an IP multicast address. Default is ignore (disable).
ignore-anycasts	Specifies to ignore ICMP echo requests destined to an IP anycast address. Default is ignore (disable).

Default

Ignore (disable).

Usage Guidelines

Use this command to enable an ignore reply to multicast or anycast echo request.

Example

The following example specifies to ignore ICMP multicast echo requests:

```
enable icmp ipv6 ignore-multicasts
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable icmp redirects ipv6 fast-path

```
enable icmp redirects ipv6 fast-path
```

Description

When enabled, IPv6 packets forwarded by hardware (fast path) may trigger *ICMP* redirects.

Syntax Description

fast-path	IPv6 packets forwarded by hardware may trigger ICMP redirects

Default

Disabled.

Usage Guidelines

Use this command to trigger ICMP redirects when IPv6 packets are forwarded by hardware (fast-path).

Example

The enabled or disabled setting is displayed when using the command:

```
# show ipconfig ipv6
Route Sharing               : Disabled
ICMP Redirect for Fast Path : Enabled
Max Shared Gateways         : Current: 4   Configured: 4

Interface              IPv6 Prefix                                      Flags
v1                     2001::1/24                                    -EUf---R-
v1                     fe80::204:96ff:fe1e:ec00%v1/64                -EUfP--R-
Flags : D - Duplicate address detected on VLAN, T - Tentative address
E - Interface enabled, U - Interface up, f - IPv6 forwarding enabled,
i - Accept received router advertisements enabled,
R - Send redirects enabled, r - Accept redirects enabled
P - Prefix address
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable icmp redirects

```
enable icmp redirects {ipv4} {vlan all | {vlan} {name}}
```

Description

Enables the generation of *ICMP* redirect messages on one or all *VLAN*s.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

This option only applies to the switch when the switch is in routing mode.

ICMP redirects are used in the situation where there are multiple routers in the same subnet. If a host sends a packet to one gateway, the gateway router looks at its route table to find the best route to the destination. If it sees that the best route is through a router in the same subnet as the originating host, the switch sends an ICMP redirect (type 5) message to the host that originated the packet, telling it to use the other router with the better route. The switch also forwards the packet to the destination.

ICMP redirects are only generated for IPv4 unicast packets that are "slowpath" forwarded by the CPU. That is, IPv4 packets that contain IP Options, or packets whose Destination IP is not in the Layer 3 forwarding hardware table.

Example

The following example enables the generation of ICMP redirect messages on all VLANs:

```
enable icmp redirects
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable icmp useredirects

```
enable icmp useredirects
```

Description

Enables the modification of route table information when an *ICMP* redirect message is received.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If the switch has a route to a destination network, the switch uses that router as the gateway to forward the packets to. If that router knows about a better route to the destination, and the next hop is in the same subnet as the originating router, the second router sends an ICMP redirect message to the originating router. If ICMP useredirects is enabled, the switch adds a route to the destination network using the third router as the next hop and starts sending the packets to the third router.

Example

The following example enables the modification of route table information:

```
enable icmp useredirects
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable identity-management

```
enable identity-management
```

Description

Enables the identity management feature, which tracks users and devices that connect to the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Only admin-level users can execute this command.

After identity management is enabled, the software creates two dynamic *ACL* rules named idm_black_list and idm_white_list. These rules are removed if identity management is disabled.

Note

FDB entries are flushed on identity management enabled ports when this command is executed.

Example

The following command enables the identity management feature:

```
enable identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli idle-timeout

```
enable cli idle-timeout
```

Description

Enables a timer that disconnects Telnet, SSH2, and console sessions after a period of inactivity (20 minutes is default).

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Timeout 20 minutes.

Usage Guidelines

You can use this command to ensure that a Telnet, Secure Shell (SSH2), or console session is disconnected if it has been idle for the required length of time.

This ensures that there are no hanging connections.

To change the period of inactivity that triggers the timeout for a Telnet, SSH2, or console session, use the `configure timezone` command.

To view the status of idle timeouts on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for idle timeouts. You can configure the length of the timeout interval.

Example

The following command enables a timer that disconnects any Telnet, SSH2, and console sessions after 20 minutes of inactivity:

```
enable cli idle-timeout
```

History

This command was first available in ExtremeXOS 10.1.

The **cli** keyword was added and the **idletimeout** keyword was changed to **idle-timeout** in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable igmp

```
enable igmp {vlan vlan name } {IGMPv1 | IGMPv2 | IGMPv3}
```

Description

Enables *IGMP* on a router interface. If no *VLAN* is specified, IGMP is enabled on all router interfaces.

Syntax Description

vlan name	Specifies a VLAN name.
IGMPv1	Specifies the compatibility mode as IGMPv1.
IGMPv2	Specifies the compatibility mode as IGMPv2.
IGMPv3	Specifies the compatibility mode as IGMPv3.

Default

Enabled, set to IGMPv2 compatibility mode.

Usage Guidelines

IGMP is a protocol used by an IP host to register its IP multicast group membership with a router. Periodically, the router queries the multicast group to see if the group is still in use. If the group is still active, IP hosts respond to the query, and group registration is maintained.

IGMPv2 is enabled by default on the switch. However, the switch can be configured to disable the generation and processing of IGMP packets. IGMP should be enabled when the switch is configured to perform IP multicast routing.

Example

The following example enables IGMPv2 on the VLAN accounting:

```
enable igmp vlan accounting
```

The following example enables IGMPv3 on the VLAN finance:

```
enable igmp vlan finance igmpv3
```

History

This command was first available in ExtremeXOS 10.1.

The **IGMPv1**, **IGMPv2**, and **IGMPv3** options were added in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable igmp snooping

```
enable igmp snooping {forward-mcrouter-only | {vlan} name | with-proxy
   vr vrname}
```

Description

Enables *IGMP* snooping on one or all *VLAN*s.

Syntax Description

forward-mcrouter-only	Specifies that the switch forward all multicast traffic to the multicast router only.
name	Specifies a VLAN or VMAN on which to enable IGMP snooping.
with-proxy vr *vrname*	Controls how join and leave messages are forwarded from the specified virtual router. If this option is specified, one join message per query is forwarded, and a leave message is forwarded only if it is from the last receiver on the VLAN.

Default

Enabled.

Usage Guidelines

This command applies to both IGMPv2 and IGMPv3.

IGMP snooping is enabled by default on the switch. If you are using multicast routing, IGMP snooping can be enabled or disabled. If IGMP snooping is disabled, all IGMP and IP multicast traffic floods within a given VLAN or VMAN.

The **forward-mcrouter-only**, **vlan**, and **with-proxy** options control three separate and independent features. You can manage one feature at a time with this command, and you can enter the command multiple times as needed to control each feature. For example, you can enter the command twice to enable both the **forward-mcrouter-only** and **with-proxy** options.

If a VLAN or VMAN name is specified with this command, IGMP snooping is enabled only on that VLAN or VMAN. If no options are specified, IGMP snooping is enabled on all VLANs.

Note
IGMP snooping is not supported on SVLANs on any platform.

The with-proxy option enables the IGMP snooping proxy feature, which reduces the number of join and leave messages forwarded on the virtual router as described in the table above. This feature is enabled by default.

An optional optimization for IGMP snooping is the strict recognition of routers only if the remote devices are running a multicast protocol. Two IGMP snooping modes are supported:

- The **forward-mcrouter-only** mode forwards all multicast traffic to the multicast router (that is, the router running PIM, DVMRP or CBT).

- When not in the forward-mcrouter-only mode, the switch forwards all multicast traffic to any IP router (multicast or not), and any active member port to the local network that has one or more subscribers.

  Note
  The forward-mcrouter-only mode for IGMP snooping is enabled/disabled on a switch-wide basis, not on a per-VLAN basis. In other words, all the interfaces enabled for IGMP snooping are either in the forward-mcrouter-only mode or in the non-forward-mcrouter-only mode, and not a mixture of the two modes.

To change the snooping mode you must disable IP multicast forwarding. To disable IP multicast forwarding, use the command:

```
disable ipmcforwarding {vlan name}
```

To change the IGMP snooping mode from the non-forward-mcrouter-only mode to the forward-mcrouter-only mode, use the commands:

```
disable ipmcforwarding

enable igmp snooping forward-mcrouter-only

enable ipmcforwarding {vlan name}
```

To change the IGMP snooping mode from the forward-mcrouter-only mode to the non-forward-mcrouter-only mode, use the commands:

```
disable ipmcforwarding

disable igmp snooping forward-mcrouter-only

enable ipmcforwarding {vlan name}
```

Example

The following command enables IGMP snooping on the switch:

```
enable igmp snooping
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable igmp snooping vlan fast-leave

```
enable igmp snooping {vlan} name fast-leave
```

Description

Enables the *IGMP* snooping fast leave feature on the specified *VLAN*.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

The fast leave feature operates only with IGMPv2.

To view the fast leave feature configuration, use the `show configuration msmgr` command. This show command displays the fast leave configuration only when the feature is enabled.

Example

The following example enables the IGMP snooping fast leave feature on the default VLAN:

```
enable igmp snooping "Default" fast-leave
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.topic/ph "/>

enable igmp snooping with-proxy

```
enable igmp snooping with-proxy {{vr} vr_name}
```

Description

Enables the *IGMP* snooping proxy. The default setting is enabled.

Syntax Description

vr_name	Specifies a VR.

Default

Enabled.

Usage Guidelines

Enabling the proxy allows the switch to suppress the duplicate join requests on a group to forward to the connected Layer 3 switch. The proxy also suppresses unnecessary IGMP leave messages so that they are forwarded only when the last member leaves the group.

This command can be used for troubleshooting purpose. It should be enabled for normal network operation. The command does not alter the snooping setting.

This feature can be enabled when IGMPv3 is enabled; however, it is not effective for IGMPv3.

Example

The following command enables the IGMP snooping proxy:

```
enable igmp snooping with-proxy
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable igmp ssm-map

```
enable igmp ssm-map {vr vr-name}
```

Description

Enables *IGMP* SSM mapping on a VR.

Syntax Description

vr-name	Specifies a virtual router name. If the VR name is omitted, the switch uses the VR specified by the current CLI VR context.

Default

Disabled on all interfaces.

Usage Guidelines

Configure the range of multicast addresses for PIM SSM before you enable IGMP SSM mapping. IGMP SSM mapping operates only with IPv4.

Example

The following example enables IGMP-SSM mapping on the VR in the current CLI VR context:

```
enable igmp ssm-map
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable inline-power

```
enable inline-power [{fast {ports [port_list | all]}} | perpetual]
```

Description

Enables *PoE*, and perpetual PoE to all ports; or fast PoE to all ports, or selected ports, for some platforms.

Syntax Description

fast	Deliver PoE power to devices at the time of switch power on without waiting for boot up based on last saved PoE state. The default is disabled.
ports	For fast PoE, specifies selecting ports. ExtremeSwitching5520 and 5720 series switches only.
port_list	For fast PoE, specifies the port list separated by a comma or -. ExtremeSwitching 5520 and 5720 series switches only.
all	For fast PoE, specifies selecting all ports. ExtremeSwitching 5520 and 5720 series switches only.
perpetual	Preserves PoE power delivery to devices during reboot. Perpetual PoE is a switch-wide setting. The default is disabled.

Default

By default:

- PoE is enabled.
- Fast PoE is disabled.
- Perpetual PoE is disabled.

Usage Guidelines

You can control whether inline power is provided to the system by using the `disable inline-power` command and the `enable inline-power` command. By default, inline power provided to all ports is enabled. Additionally, you can opt to deliver PoE power to devices at the time of switch power on without waiting for boot up (fast PoE) based on last saved PoE state. Per-port fast PoE is available on certain platforms. You can also elect to preserve PoE power delivery to devices during reboot (perpetual PoE). The default for both PoE options is disabled.

Enabling inline power starts the PoE detection process used to discover, classify, and power remote PDs.

Disabling inline power using the `disable inline-power` command does not affect the data traffic traversing the port. And, disabling the port using the `disable port` command does not affect the inline power supplied to the port.

Note
Inline power cannot be delivered to connected PDs unless the switch is powered on.

Example

The following command enables inline power currently provided to all ports:

```
# enable inline-power
```

The following example turns on perpetual PoE for the switch:

```
# enable inline-power perpetual
```

The following example turns on fast PoE for ports 1,2, and 5:

```
# enable inline-power fast ports 1,2,5
```

History

This command was first available in ExtremeXOS 11.1.

The **`fast`** and **`perpetual`** PoE options were added in ExtremeXOS 30.3.

Per-port fast PoE was added for ExtremeXOS 31.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

The **fast** and **perpetual** options are only available on the ExtremeSwitching 5520 and 5720 (per port) series switches.

enable inline-power ports

```
enable inline-power ports [all | port_list]
```

Description

Enables *PoE* power currently provided to all ports or to specified ports.

Syntax Description

all	Enables inline power to all ports on the switch.
port_list	Enables inline power to the specified ports.

Default

Enable.

Usage Guidelines

Disabling inline power to a port immediately removes power to any connected PD. By default, inline power provided to all ports is enabled.

Disabling inline power using the `disable inline-power` command does not affect the data traffic traversing the port. And, disabling the port using the `disable port` command does not affect the inline power supplied to the port.

Example

The following command enables inline power to ports 4 and 5 on a switch:

```
enable inline-power ports 4-5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

enable inline-power slot

```
enable inline-power [fast | perpetual] slot slot
```

Description

Enables *PoE* power, and fast and perpetual PoE power to the specified node (slot) on SummitStacks.

Syntax Description

slot	Enables inline power to specified slot.
fast	Deliver PoE power to devices at the time of switch power on without waiting for boot up based on last saved PoE state. The default is disabled.
perpetual	Preserves PoE power delivery to devices during reboot. Perpetual PoE is a switch-wide setting. The default is disabled.

Default

By default:

- PoE is enabled.
- Fast PoE is disabled.
- Perpetual PoE is disabled.

Usage Guidelines

Disabling inline power to a slot immediately removes power to any connected PDs. By default, inline power provided to all slots is enabled. Additionally, you can opt to deliver PoE power to devices at the time of switch power on without waiting for boot up (fast PoE) based on last saved PoE state. You can also elect to preserve PoE power delivery to devices during reboot (perpetual PoE). The default for both PoE options is disabled.

To deliver inline power to slots, you must reserve power for that slot using the `configure inline-power budget` command. By default, each PoE module has 50 W of power reserved for inline power.

Disabling inline power using the `disable inline-power` command does not affect the data traffic traversing the slot. And, disabling the slot using the `disable slot` command does not affect the inline power supplied to the slot.

If you do not specify a slot number, the command operates on all active nodes in the stack. This command operates only on nodes in the active topology.

Example

The following command makes inline power available to slot 3:

```
# enable inline-power slot 3
```

The following example turns on perpetual PoE to slot 3:

```
# enable inline-power perpetual slot 3
```

History

This command was first available in ExtremeXOS 11.1.

The **fast** and **perpetual** PoE options were added in ExtremeXOS 30.3.

Platform Availability

This command is available on SummitStack when the stack contains switches listed in Extreme Networks PoE Devices.

enable ip anycast

```
enable ip anycast {vlan} vlan_name
```

Description

Enables IP anycast on a VLAN.

Syntax Description

ip	Layer 3 Internet Protocol.
anycast	Enables IP anycast-enabled VLANs to use the anycast MAC on that VLAN.
vlan	Selects the VLAN.
vlan_name	Specifies the VLAN name.

Default

N/A.

Usage Guidelines

To configure the anycast gateway MAC address that is used by VLANs that enable IP anycast, use the command `configure` **`ip anycast mac`** `[`**`none`** `|` *`mac`*`]`.

Example

The following example enables IP anycast on the VLAN "vlan1":

```
# enable ip anycast vlan vlan1
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip nat

```
enable ip nat
```

Description

Globally enables Network Address Translation (NAT).

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies enabling NAT.

Default

N/A.

Usage Guidelines

NAT maps IP addresses from one address domain (typically private IP address space) to an another address domain (typically a public Internet IP address space) to provide transparent routing to end hosts. This translation is accomplished transparently by having a NAT device translate the IP address and/or Layer 4 port of the packets.

To view IP NAT information, run the command `show ip nat`.

Example

The following example enables IP NAT:

```
# enables ip nat
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ip nat rule

```
enable ip nat rule rule_name
```

Description

Enables Network Address Translation (NAT) rules.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies enabling a NAT rule.
rule_name	Specifies the NAT rule to enable.

Default

N/A.

Usage Guidelines

A rule is programmed in hardware only after global NAT and the specific rule are enabled.

Enabling a rule is allowed only after all of the necessary configurations for the rule are complete. After a rule is enabled, configuration changes (IP address, egress VLAN, etc.) are not allowed for the rule. You must disable a rule to make configuration changes to it.

Example

The following example the enables the IP NAT rule "rule1":

```
# enable ip nat rule rule1
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

enable iparp checking

```
enable iparp {vr vr_name} checking
```

Description

Enables checking if the ARP request source IP address is within the range of the local interface or *VLAN* domain.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example enables IP ARP checking:

```
enable iparp checking
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable iparp gratuitous protect

```
enable iparp gratuitous protect [ {vlan} vlan_name | vlan vlan_list]
```

Description

Enables gratuitous ARP protection on the specified *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN.
vlan_list	Specifies a VLAN list of IDs.

Default

By default, gratuitous ARP is disabled.

Usage Guidelines

Beginning with ExtremeXOS 11.6, this command replaces this command for configuring gratuitous ARP.

Hosts can launch man-in-the-middle attacks by sending out gratuitous ARP requests for the router's IP address. This results in hosts sending their router traffic to the attacker, and the attacker forwarding that data to the router. This allows passwords, keys, and other information to be intercepted.

To protect against this type of attack, the router will send out its own gratuitous ARP request to override the attacker whenever a gratuitous ARP broadcast with the router's IP address as the source is received on the network.

Example

The following example enables gratuitous ARP protection for VLAN corp:

```
enable iparp gratuitous protect vlan corp
```

History

This command was first available in ExtremeXOS 11.2.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable iparp refresh

```
enable iparp {vr vr_name} refresh
```

Description

Enables IP ARP to refresh its IP ARP entries before timing out.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

If ARP refresh is enabled, the switch resends ARP requests for the host at 3/4 of the configured ARP timer value.

For example: If the ARP timeout is set to 20 minutes, the switch attempts to resend an ARP request for the host when the host entry is at 15 minutes. If the host replies, the ARP entry is reset back to 0, and the timer starts again.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example enables IP ARP refresh:

```
enable iparp refresh
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ipforwarding ipv6

```
enable ipforwarding ipv6 [ {vlan} vlan_name | vlan vlan_list] | tunnel
   tunnel_name | vr vr_name}
```

Description

Enables IPv6 routing *VLAN*s. If no argument is provided, enables IPv6 routing for all VLANs and tunnels that have been configured with an IPv6 address on the current VR or VRF.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
vr_name	Specifies a VR or VRF.

Default

Disabled.

Usage Guidelines

When new IPv6 interfaces are added, IPv6 forwarding is disabled by default.

Example

The following example enables forwarding of IPv6 traffic for all VLANs in the current VR context with IPv6 addresses:

```
enable ipforwarding ipv6
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

enable ipforwarding

```
enable ipforwarding {ipv4 | broadcast} {vlan vlan_name}
```

Description

Enables IPv4 routing or IPv4 broadcast forwarding for one or all *VLAN*s. If no argument is provided, enables IPv4 routing for all *VLAN*s that have been configured with an IP address on the current VR or VRF.

Syntax Description

ipv4	Specifies IPv4 forwarding.
broadcast	Specifies broadcast IP forwarding.
vlan_name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

IP forwarding must first be enabled before IP broadcast forwarding can be enabled. When new IP interfaces are added, IP forwarding (and IP broadcast forwarding) is disabled by default.

The broadcast, ignore-broadcast, and fast-directbroadcast options each prompt with a warning message when executed while the IP forwarding on the corresponding VLAN is disabled. The hardware and software are NOT programmed until IP forwarding is enabled on the VLAN.

The fast-direct-broadcast and ignore-broadcast options cannot be enabled simultaneously. These are mutually exclusive.

The broadcast option can be enabled in conjunction with fast-direct-broadcast and ignore-broadcast.

Example

The following command enables forwarding of IP traffic for all VLANs in the current VR context with IP addresses:

```
enable ipforwarding
```

The following command enables forwarding of IP broadcast traffic for a VLAN named accounting:

```
enable ipforwarding broadcast vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The ipv4 keyword was added in ExtremeXOS 11.2.

The ignore-broadcast and the fast-direct-broadcast keywords were added in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ipmcforwarding ipv6

```
enable ipmcforwarding ipv6 {vlan name }
```

Description

Enables IPv6 multicast forwarding on a router interface.

Syntax Description

name	Specifies a *VLAN* name.

Default

Disabled.

Usage Guidelines

If no options are specified, all configured IPv6 interfaces are affected. When new IPv6 interfaces are created, IPv6 multicast forwarding is disabled by default.

IPv6 forwarding must be enabled before enabling IPv6 multicast forwarding.

Example

The following example enables IPv6 multicast forwarding on VLAN accounting:

```
enable ipmcforwarding ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv6 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ipmcforwarding

```
enable ipmcforwarding {vlan name}
```

Description

Enables IP multicast forwarding on an IP interface.

Syntax Description

name	Specifies a *VLAN* name.

Default

Disabled.

Usage Guidelines

If no options are specified, all configured IP interfaces are affected. When new IP interfaces are added, IPMC forwarding is disabled by default.

IP forwarding must be enabled before enabling IPMC forwarding.

Example

The following example enables IPMC forwarding on the VLAN accounting:

```
enable ipmcforwarding vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ip option loose-source-route

```
enable ip option loose-source-route
```

Description

Enables processing of the loose source route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This enables the switch to forward IP packets that have the loose source route IP option (0x83) enabled.

Source routing is used when a sending host specifies the router interfaces that the packet must traverse on it's way to it's destination.

With loose source routing enabled, the packet is forwarded if the routing table has a reverse path to the source IP address of the packet.

Example

The following command enables processing of the loose source route IP option:

```
# enable ip-option loose-source-route
```

History

This command was first available in ExtremeXOS 10.1.

This command was removed in ExtremeXOS 30.1, and then re-introduced in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip option strict-source-route

```
enable ip option strict-source-route
```

Description

Enables processing of the strict source route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This enables the switch to forward IP packets that have the strict source route IP option (0x89) enabled.

Source routing is used when a sending host specifies the router interfaces that the packet must traverse on its way to its destination.

When strict source routing is used, it means that the packet must use the exact path of routers that lie in the designated router path.

With strict source routing enabled, the switch forwards IP packets with the strict source route option enabled, only if the switch's IP is in the designated list and as long as the next hop in the list is directly attached to one of the router's interfaces.

Example

The following example enables processing of the strict source route IP option:

```
# enable ip-option strict-source-route
```

History

This command was first available in ExtremeXOS 10.1.

This command was removed in ExtremeXOS 30.1, and then re-introduced in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable iproute bfd

```
enable iproute bfd {gateway} ip_addr {vr vrname}
```

Description

Enables the BFD client to provide services for IPv4 static routes.

Syntax Description

ip_addr	Specifies the IPv4 address of a neighbor to which BFD services are to be provided.
vrname	Specifies the VR or VRF name for which BFD services are being enabled.

Default

Disabled.

Usage Guidelines

To enable BFD services to an IPv4 neighbor, you must do the following:

- Execute this command on the switches at both ends of the link.
- Enable BFD for specific IPv4 static routes with the `configure iproute add [destination network] [gateway] bfd` command.

Once a BFD session is established between two neighbors, BFD notifies the Route Manager process of the BFD session status and any changes. If other BFD clients (such as the *MPLS* BFD client) are configured between the same neighbors, the clients share a single session between the neighbors.

Example

The following example enables BFD client protection for communications with neighbor 10.10.10.1:

```
# enable iproute bfd 10.10.10.1
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable iproute bfd strict

```
enable iproute {protection} bfd strict
```

Description

Turns on "strict" Bidirectional Forwarding Detection (BFD) session control, which brings down the static route during switch reboot if the static route nexthop BFD session is in the INIT state.

Syntax Description

protection	Enables or disables route protection.
bfd	BFD protect static routes to next hop gateway.
strict	Enables considering that protected static routes are not up if the BFD session is in INIT state. Default is disabled.

Default

By default, strict BFD session control is disabled.

Usage Guidelines

If the BFD session is down, but BFD protected static route is still in the routing table after reboot, the BFD session is never established, because during reboot, the BFD session is in the INIT state, and the static route is brought up without considering BFD session state. This can cause traffic loss since the link to the gateway actually is down. This command turns down the static route during reboot if BFD session is in the INIT state. This behavior is different from other BFD clients (such as *OSPF*) in the same INIT situation. A reboot is required to make the command take effect.

Example

The following example enables BFD strict session control:

```
# enable iproute bfd strict
WARNING: Please reboot the switch for the strict BFD to take effect.
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable iproute compression

```
enable iproute compression {vr vrname}
```

Description

Enables IPv4 route compression.

Syntax Description

vrname	VR or VRF name for which the IP route compression is being enabled.

Default

Enabled.

Usage Guidelines

Enables IPv4 route compression for the specified VR or VRF. If the VR name is not specified, route compression is enabled for the VR context from which the CLI command is issued.

The command applies a compression algorithm on each of the IP prefixes in the routing table. Essentially, routes with longer network masks might not be necessary if they are a subset of other routes with shorter network masks using the same gateway(s). When IP route compression is enabled, these unnecessary routes are not provided to the Forwarding Information Base (FIB).

Example

The following example enables IP route compression:

```
enable iproute compression
```

History

This command was first available in ExtremeXOS 12.0.

Default changed to enabled in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable iproute ipv6 compression

```
enable iproute ipv6 compression {vr vrname}
```

Description

Enables IPv6 route compression.

Syntax Description

vrname	Specifies a VR or VRF.

Default

If no VR name is specified, the current CLI context is used.

Usage Guidelines

This command enables IPv6 route compression for the VR. This command applies a compression algorithm to each IPv6 prefix in the IPv6 prefix database.

Example

The following example enables IPv6 route compression in the current VR context.

```
enable iproute ipv6 compression
```

History

This command was first available in ExtremeXOS 12.0.

Default changed to enabled in ExtremeXOS 15.6.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

enable iproute mpls-next-hop

```
enable iproute mpls-next-hop
```

Description

Enables IP forwarding over *MPLS* LSPs for the default VR.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables IP forwarding over MPLS LSPs for the default VR. When enabled, LSP next hops can be used to tunnel IP traffic across the MPLS network. By default, IP forwarding over MPLS LSPs is disabled.

Example

The following command enables IP forwarding over MPLS LSPs:

```
enable iproute mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable iproute protection ping

```
enable iproute {ipv4 | ipv6} protection ping
```

Description

Globally enables ping protection for static routes added with ping protection for IPv4 and IPv6.

Syntax Description

ipv4	Specifies IPv4 (default).
ipv6	Specifies IPv6.
protection	Enables route protection.
ping	Globally enables ping protection for static routes added with ping protection (default is enabled).

Default

Enabled is the default. If not specified, IPv4 is the default.

Example

The following example enables ping protection for static routes added with ping protection for IPv4:

```
# enable iproute ipv4 protection ping
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on all platforms with any license level as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable iproute sharing

```
enable iproute {ipv4 |ipv6} sharing {{vr} vrname} | {{vr} all}}
```

Description

Enables load sharing if multiple routes to the same destination are available. When multiple routes to the same destination are available, load sharing can be enabled to distribute the traffic to multiple destination gateways. Only paths with the same lowest cost are shared.

Syntax Description

vrname	VR or VRF name for which IP route sharing is being enabled.

Default

Disabled.

Usage Guidelines

IP route sharing allows multiple equal-cost routes to be used concurrently. IP route sharing can be used with static routes or with *OSPF*, *BGP*, or IS-IS routes. In OSPF, BGP, and IS-IS, this capability is referred to as *ECMP* routing.

Configure static routes and OSPF, BGP, or IS-IS as you would normally. The ExtremeXOS software supports route sharing across up to 64 way ECMP for OSPFv2, BGP, and static routes, or up to 64-way ECMP for *OSPFv3* and 8 way for ISIS. However, on SummitStack, and ExtremeSwitching series switches, by default, up to four routes are supported. To support 2, 4, 8, 16, 32, or 64 routes on these switches, use the following command:

```
configure iproute sharing max-gateways max_gateways
```

If a VR is not specified, this command enables IP route sharing in the current VR context.

Example

The following example enables load sharing for multiple routes:

```
enable iproute sharing
```

History

This command was first available in ExtremeXOS 11.1.

The **vr** option was added in ExtremeXOS 12.5.

The **ipv6** option was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security anomaly-protection icmp

```
enable ip-security anomaly-protection icmp {slot [ slot | all ]}
```

Description

Enables *ICMP* size and fragment checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enables ICMP size and fragment checking. This checking takes effect for both IPv4 and IPv6 TCP packets. When enabled, the switch drops ICMP packets if one of following condition is true:

- Fragmented ICMP packets.
- IPv4 ICMP pings packets with payload size greater than the maximum IPv4 ICMP-allowed size. (The maximum allowed size is configurable.)
- IPv6 ICMP ping packets with payload size > the maximum IPv6 ICMP-allowed size. (The maximum allowed size is configurable.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security anomaly-protection ip

```
enable ip-security anomaly-protection ip { slot [ slot | all ] }
```

Description

Enables source and destination IP address checking.

Syntax Description

slot	Specifies the slot.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enables source and destination IP addresses checking. This checking takes effect for both IPv4 and IPv6 packets. When enabled, the switch drops IPv4/IPv6 packets if its source IP address are the same as the destination IP address. In most cases, the condition of source IP address being the same as the destination IP address indicates a Layer 3 protocol error. (These kind of errors are found in LAND attacks.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security anomaly-protection l4port

```
enable ip-security anomaly-protection l4port [tcp | udp | both] {slot
   [ slot | all ]}
```

Description

Enables TCP and UDP ports checking.

Syntax Description

tcp	Specifies that the TCP port be enabled for checking.
udp	Specifies that the UDP port be enabled for checking.
both	Specifies both the TCP and UDP ports be enabled for checking.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enabled TCP and UDP ports checking. This checking takes effect for both IPv4 and IPv6 TCP and UDP packets. When enabled, the switch drops TCP and UDP packets if its source port is the same as its destination port. In most cases, when the condition of source port is the same as that of the destination port, it indicates a Layer4 protocol error. (This type of error can be found in a BALT attack.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security anomaly-protection notify

```
enable ip-security anomaly-protection notify [log | snmp | cache] {slot
   [ slot | all ]}
```

Description

Enables protocol anomaly notification.

Syntax Description

log	Specifies the switch to send the notification to a log file.
snmp	Specifies the switch to send an SNMP trap when an event occurs.
cache	Specifies the switch to send the notification to cache.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enables anomaly notification. When enabled, any packet failed to pass enabled protocol checking is sent to XOS Host CPU and notifies the user. There are three different types of notifications:

- log: The anomaly events are logged into EMS log.
- snmp: The anomaly events generate SNMP traps.
- cache: The most recent and unique anomaly events are stored in memory for review and investigation.

When disabled, the switch drops all violating packets silently.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security anomaly-protection tcp flags

```
enable ip-security anomaly-protection tcp flags {slot [ slot | all ]}
```

Description

Enables TCP flag checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command Enables TCP flag checking. This checking takes effect for both IPv4 and IPv6 TCP packets. When enabled, the switch drops TCP packets if one of following condition is true:

- TCP SYN flag==1 and the source port<1024
- TCP control flag==0 and the sequence number==0

- TCP FIN, URG, and PSH bits are set, and the sequence number==0
- TCP SYN and FIN both are set.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security anomaly-protection tcp fragment

```
enable ip-security anomaly-protection tcp fragment {slot [ slot | all ]}
```

Description

Enables TCP fragment checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enables TCP fragment checking. This checking takes effect for IPv4/IPv6. When it is enabled, the switch drops TCP packets if one of following condition is true:

- For the first IPv4 TCP fragment (its IP offset field==0), if its TCP header is less than the minimum IPv4 TCP header allowed size.
- For the first IPv6 TCP fragment (its IP offset field==0), if its TCP header is less than the minimum IPv6 TCP header allowed size.
- If its IP offset field==1 (for IPv4 only).

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security anomaly-protection

```
enable ip-security anomaly-protection {slot [ slot | all ]}
```

Description

Enables all anomaly checking options.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This commands enables all anomaly checking options, including IP address, UDP/TCP port, TCP flag and fragment, and *ICMP* anomaly checking.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security arp gratuitous-protection

```
enable ip-security arp gratuitous-protection [dynamic | {vlan} all |
   vlan_name]
```

Description

Enables gratuitous ARP protection on one or all *VLAN*s on the switch.

Syntax Description

all	Specifies all VLANs configured on the switch.
vlan_name	Specifies the VLAN.
dynamic	Configuration options for dynamically created VLANs.

Default

By default, gratuitous ARP protection is disabled.

Dynamic VLAN option added in ExtremeXOS 30.2.

Usage Guidelines

Beginning with ExtremeXOS 11.6, this command replaces the `enable iparp gratuitous protect` command.

Hosts can launch man-in-the-middle attacks by sending out gratuitous ARP requests for the router's IP address. This results in hosts sending their router traffic to the attacker, and the attacker forwarding that data to the router. This allows passwords, keys, and other information to be intercepted.

To protect against this type of attack, the router will send out its own gratuitous ARP request to override the attacker whenever a gratuitous ARP broadcast with the router's IP address as the source is received on the network.

Beginning with ExtremeXOS 11.6, if you enable both *DHCP* secured ARP and gratuitous ARP protection, the switch protects its own IP address and those of the hosts that appear as secure entries in the ARP table.

To protect the IP addresses of the hosts that appear as secure entries in the ARP table, use the following commands to enable DHCP snooping, DHCP secured ARP, and gratuitous ARP on the switch:

- `enable ip-security dhcp-snooping {vlan} vlan_name ports [all | ports] violation-action [drop-packet {[block-mac | block-port] [durationduration_in_seconds | permanently] | none]}] {snmp-trap}`
- `enable ipsecurity arp learning learn-from-arp`
- `enable ip-security arp gratuitous-protection {vlan} [all | vlan_name]`

Displaying Gratuitous ARP Information

To display information about gratuitous ARP, use the following command:

`show ip-security arp gratuitous-protection`

Example

The following command enables gratuitous ARP protection for VLAN corp:

```
enable ip-security arp gratuitous-protectection vlan corp
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN option added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security arp learning learn-from-arp

```
enable ip-security arp learning learn-from-arp [dynamic | {vlan}
   vlan_name] ports [all | ports]
```

Description

Enables ARP learning for the specified *VLAN* and member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN to which this rule applies.
dynamic	Configuration options for dynamically created VLANs.
all	Specifies all ingress ports.
ports	Specifies one or more ingress ports.

Default

By default, ARP learning is enabled.

Usage Guidelines

ARP is part of the TCP/IP suite used to associate a device's physical address (MAC address) with its logical address (IP address). The switch broadcasts an ARP request that contains the IP address, and the device with that IP address sends back its MAC address so that traffic can be transmitted across the network. The switch maintains an ARP table (also known as an ARP cache) that displays each MAC address and its corresponding IP address.

By default, the switch builds its ARP table by tracking ARP requests and replies, which is known as ARP learning.

Displaying ARP Information

To display how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports, use the following command:

```
show ip-security arp learning {vlan} vlan_name
```

To view the ARP table, including permanent and *DHCP* secured ARP entries, use the following command:

```
show iparp {ip_addre |mac | vlanvlan_name | permanent} {vrvr_name}
```

Example

The following command enables ARP learning on port 1:1 of the VLAN learn:

```
enable ip-security arp learning learn-from-arp vlan learn ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN option added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security arp learning learn-from-dhcp

```
enable ip-security arp learning learn-from-dhcp [dynamic vlan | {vlan}
   vlan_name] ports [all | ports]
```

Description

Enables *DHCP* secured ARP learning for the specified *VLAN* and member ports.

Syntax Description

dynamic	Configuration options for dynamically created VLANs.
vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ingress ports.
ports	Specifies one or more ingress ports.

Default

By default, DHCP secured ARP learning is disabled.

Usage Guidelines

Use this command to configure the switch to add the MAC address and its corresponding IP address to the ARP table as a secure ARP entry. The switch does not update secure ARP entries, regardless of the ARP requests and replies seen by the switch. DHCP secured ARP is linked to the “DHCP snooping” feature. The same DHCP bindings database created when you enabled DHCP snooping is also used by

DHCP secured ARP to create secure ARP entries. The switch only removes secure ARP entries when the corresponding DHCP entry is removed from the trusted DHCP bindings database.

Note

If you enable DHCP secured ARP on the switch, ARP learning continues, which allows insecure entries to be added to the ARP table.

The default ARP timeout (configure iparp timeout) and ARP refresh (enable iparp refresh) settings do not apply to DHCP secured ARP entries. The switch removes DHCP secured ARP entries upon any DHCP release packet received from the DHCP client.

Displaying ARP Information

To display how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports, use the following command:

```
show ip-security arp learning {vlan} vlan_name
```

To view the ARP table, including permanent and DHCP secured ARP entries, use the following command:

```
show iparp {ip_address |mac | vlanvlan_name | permanent} {vrvr_name}
```

Example

The following command enables DHCP secured ARP learning on port 1:1 of the VLAN learn and uses the default polling and retry intervals:

```
enable ip-security arp learning learn-from-dhcp vlan learn ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN support was added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security arp validation violation-action

```
enable ip-security arp validation {destination-mac} {source-mac} {ip}
   [dynamic vlan_id |{vlan} vlan_name] [all | ports] violation-
   action [drop-packet {[block-port] [duration duration_in_seconds |
   permanently]}] {snmp-trap}
```

Description

Enables ARP validation for the specified VLAN and member ports.

Syntax Description

destination-mac	Specifies that the switch checks the ARP payload for the MAC destination address in the Ethernet header and the receiver's host address in the ARP response.
source-mac	Specifies that the switch checks ARP requests and responses for the MAC source address in the Ethernet header and the sender's host address in the ARP payload.
ip	Specifies the switch checks the IP address in the ARP payload and compares it to the DHCP bindings database. If the IP address does exist in the DHCP bindings table, the switch verifies that the MAC address is the same as the sender hardware address in the ARP request. If not, the packet is dropped.
dynamic	Configuration options for dynamically created VLANs.
vlan_id	VLAN ID tag between 1 and 4,094.
vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ports to participate in ARP validation.
ports	Specifies one or more ports to participate in ARP validation.
drop-packet	Specifies that the switch drops the invalid ARP packet.
block-port	Indicates that the switch blocks invalid ARP requests on the specified port.
duration_in_seconds	Specifies the switch to temporarily disable the specified port upon receiving an invalid ARP request. The range is seconds.
permanently	Specifies the switch to permanently disable the port upon receiving an invalid ARP request.
snmp-trap	Specifies the switch to send an SNMP trap when an event occurs.

Default

By default, ARP validation is disabled.

Usage Guidelines

The violation action setting determines what action(s) the switch takes when an invalid ARP is received.

Depending on your configuration, the switch uses the following methods to check the validity of incoming ARP packets:

- Drop packet—The switch confirms that the MAC address and its corresponding IP address are in the DHCP binding database built by DHCP snooping. This is the default behavior when you enable ARP validation. If the MAC address and its corresponding IP address are in the DHCP bindings database, the entry is valid. If the MAC address and its corresponding IP address are not in the DHCP bindings database, the entry is invalid, and the switch drops the ARP packet.
- IP address—The switch checks the IP address in the ARP payload. If the switch receives an IP address in the ARP payload that is in the DHCP binding database, the entry is valid. If the switch receives an IP address that is not in the DHCP binding database, for example 255.255.255.255 or an IP multicast address, the entry is invalid or unexpected.

- Source MAC address—The switch checks ARP requests and responses for the source MAC address in the Ethernet header and the sender's host address in the ARP payload. If the source MAC address and senders's host address are the same, the entry is valid. If the source MAC source and the sender's host address are different, the entry is invalid.
- Destination MAC address—The switch checks the ARP payload for the destination MAC address in the Ethernet header and the receiver's host address. If the destination MAC address and the target's host address are the same, the entry is valid. If the destination MAC address and the target's host address are different, the entry is invalid.

Any violation that occurs causes the switch to generate an EMS log message. You can configure to suppress the log messages by configuring EMS log filters.

Displaying ARP Validation Information

To display information about ARP validation, use the following command:

```
show ip-security arp validation {vlan} vlan_name
```

Example

The following example enables ARP validation on port 1:1 of the VLAN valid:

```
enable ip-security arp validation vlan valid ports 1:1 drop-packet
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN and VLAN ID options added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security dhcp-bindings restoration

```
enable ip-security dhcp-bindings restoration
```

Description

Enables download and upload of *DHCP* bindings.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The command allows you to enable the download and upload of the DHCP bindings, essentially enabling the DHCP binding functionality. The default is disabled.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security dhcp-snooping

```
enable ip-security dhcp-snooping [dynamic | {vlan} vlan_name] ports
   [all | ports] violation-action [drop-packet {[block-mac | block-port]
   [duration duration_in_seconds | permanently] | none]}] {snmp-trap}
```

Description

Enables DHCP snooping for the specified VLAN and ports.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping VLAN. Create and configure the VLAN before enabling DHCP snooping.
dynamic	Configuration options for dynamically created VLANs.
all	Specifies all ports to receive DHCP packets.
ports	Specifies one or more ports to receive DHCP packets.
drop-packet	Indicates that the switch drop the rogue DHCP packet received on the specified port.
block-mac	Indicates that the switch blocks rogue DHCP packets from the specified MAC address on the specified port. The MAC address is added to the DHCP bindings database.
block-port	Indicates that the switch blocks rogue DHCP packets on the specified port. The port is added to the DHCP bindings database.
duration_in_seconds	Specifies that the switch temporarily disable the specified port upon receiving a rogue DHCP packet. The range is seconds.
permanently	Specifies that the switch to permanently disable the specified port upon receiving a rogue DHCP packet.
none	Specifies that the switch takes no action when receiving a rogue DHCP packet; the switch does not drop the packet.
snmp-trap	Specifies the switch to send an *SNMP* trap when an event occurs.

Default

By default, DHCP snooping is disabled.

Usage Guidelines

Use this command to enable DHCP snooping on the switch.

Note
Snooping IP fragmented DHCP packets is not supported.

The violation action setting determines what action(s) the switch takes when a rouge DHCP server packet is seen on an untrusted port or the IP address of the originating server is not among those of the configured trusted DHCP servers. The DHCP server packets are DHCP OFFER, ACK and NAK. The following list describes the violation actions:

- block-mac—The switch automatically generates an *ACL* to block the MAC address on that port. The switch does not blackhole that MAC address in the *FDB*. The switch can either temporarily or permanently block the MAC address.
- block-port—The switch blocks all incoming rogue DHCP packets on that port. The switch disables the port either temporarily or permanently to block the traffic on that port.
- none—The switch takes no action to drop the rogue DHCP packet or block the port, and so on. In this case, DHCP snooping continues to build and manage the DHCP bindings database and DHCP forwarding will continue in hardware as before.

Any violation that occurs causes the switch to generate an EMS log message. You can configure to suppress the log messages by configuring EMS log filters.

Displaying DHCP Snooping Information

To display the DHCP snooping configuration settings, use the following command:

```
show ip-security dhcp-snooping {vlan} vlan_name
```

To display the DHCP bindings database, use the following command:

```
show ip-security dhcp-snooping entries {vlan} vlan_name
```

To display any violations that occur, use the following command:

```
show ip-security dhcp-snooping violations {vlan} vlan_name
```

Example

The following example enables DHCP snooping on the switch and has the switch block DHCP packets from port 1:1:

```
enable ip-security dhcp-snooping vlan snoop ports 1:1 violation-action drop-packet block-port
```

History

This command was first available in ExtremeXOS 11.6.

Dynamic VLAN option added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ip-security source-ip-lockdown ports

```
enable ip-security source-ip-lockdown ports [all | ports]
```

Description

Enables the source IP lockdown feature on one or more ports.

Syntax Description

all	Specifies all ports for which source IP lockdown should be enabled.
ports	Specifies one or more ports for which source IP lockdown should be enabled.

Default

By default, source IP lockdown is disabled on the switch.

Usage Guidelines

Note
Source-IP lockdown cannot be enabled on load sharing ports.

Source IP lockdown prevents IP address spoofing by automatically placing source IP address filters on specified ports. If configured, source IP lockdown allows only traffic from a valid *DHCP*-assigned address obtained by a DHCP snooping-enabled port or an authenticated static IP address to enter the network.

To configure source IP lockdown, you must enable DHCP snooping on the ports connected to the DHCP server and DHCP client before you enable source IP lockdown. You must enable source IP lockdown on the ports connected to the DHCP client, not on the ports connected to the DHCP server. The same DHCP bindings database created when you enable DHCP snooping is also used by the source IP lockdown feature to create ACLs that permit traffic from DHCP clients. All other traffic is dropped. In addition, the DHCP snooping violation action setting determines what action(s) the switch takes when a rouge DHCP server packet is seen on an untrusted port.

To enable DHCP snooping, use the following command:

```
enable ip-security dhcp-snooping {vlan} vlan_name ports [all | ports]
violation-action [drop-packet {[block-mac | block-port] [duration
duration_in_seconds | permanently] | none]}] {snmp-trap}
```

Displaying Source IP Lockdown Information

To display the source IP lockdown configuration on the switch, use the following command:

`show ip-security source-ip-lockdown`

Example

The following command enables source IP lockdown on ports 1:1 and 1:4:

```
enable ip-security source-ip-lockdown ports 1:1, 1:4
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable iqagent

`enable iqagent`

Description

Enables the ExtremeCloud™ IQ Agent.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

To disable the IQ Agent, use the command `disable iqagent`.

To view the state if the IQ Agent, use the command `show` **`iqagent discovery`** without the **`discovery`** option.

Example

The following example enables the IQ Agent:

```
# enables iqagent
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on the ExtremeSwitching 5520 platform.

enable irdp

```
enable irdp {vlan name}
```

Description

Enables the generation of *ICMP* router advertisement messages on one or all *VLAN*s.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

ICMP Router Discovery Protocol (IRDP) allows client machines to determine what default gateway address to use. The switch sends out IP packets at the specified intervals identifying itself as a default router. IRDP enabled client machines use this information to determine which gateway address to use for routing data packets to other networks.

If no optional argument is specified, all the IP interfaces are affected.

Example

The following example enables IRDP on VLAN "accounting":

```
enable irdp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.link-22.1"/>

enable isis

```
enable isis {area area_name}
```

Description

This command enables the specified IS-IS router process on the current virtual router.

Syntax Description

area_name	Specifies the name of the IS-IS router process to be enabled.

Default

Disabled.

Usage Guidelines

If no area name is specified, all IS-IS router processes on the current virtual router are enabled. Once a router process is enabled, IS-IS PDUs are sent and processed provided that the following conditions are met:

- The router process has a system ID and area address configured.
- At least one associated *VLAN* interface has IPv4 or IPv6 forwarding enabled.

This command has no effect on router processes that are already enabled.

Example

The following command enables the IS-IS process named areax:

```
enable isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable isis area adjacency-check

```
enable isis area area_name adjacency-check {ipv4 | ipv6}
```

Description

This command enables the checking of the following TLVs when forming adjacencies: Protocols Supported and IP Interface Address.

Syntax Description

area_name	Specifies the name of the IS-IS router process that should perform the adjacency check.
ipv4	Specifies that the adjacency check is to be performed in IPv4 interfaces.
ipv6	Specifies that the adjacency check is to be performed in IPv6 interfaces.

Default

ipv4/ipv6: Enabled.

Usage Guidelines

When enabled for IPv4, IPv4 adjacencies may only be formed with neighbors whose connected interface supports IPv4 and is on the same subnet as the receiving interface. Similarly, when enabled for IPv6, IPv6 adjacencies may only be formed with neighbors whose connected interface supports IPv6 and is on the same link local subnet as the receiving interface. For each enabled protocol, if both criteria are not met, received Hello PDUs are discarded. By default, IPv4 routing is affected by this command. The optional ipv6 keyword enables adjacency checking for IPv6 interfaces on the specified router process. It may be necessary to disable adjacency checking in multi-topology environments where a neighbor may only form an IPv4 or an IPv6 adjacency, but not both.

Example

The following command directs the IS-IS process named areax to perform adjacency checks on IPv6 interfaces:

```
enable isis area areax adjacency-check ipv6
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable isis area dynamic-hostname

```
enable isis area area_name dynamic-hostname [area-name | snmp-name]
```

Description

This command enables the dynamic hostname feature, which displays either the area name or the *SNMP* name instead of a IS-IS router system ID in select show commands.

Syntax Description

area_name	Specifies the name of the IS-IS process for which the dynamic-hostname feature is to be enabled.
area-name	Specifies that affected show commands display the area name instead of the IS-IS system ID.
snmp-name	Specifies that affected show commands display the SNMP name instead of the IS-IS system ID.

Default

Disabled.

Usage Guidelines

This command enables support for the dynamic hostname exchange feature defined by RFC 2763.

Example

The following command enables the display of IS-IS area names:

```
enable isis area areax dynamic-hostname area-name
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable isis area export

```
enable isis area area_name export {ipv4} route-type [policy | metric
   mvalue {metric-type [internal | external]}] {level[1| 2 | both-1-
   and-2]}
```

Description

This command enables IPv4 route redistribution into IS-IS for direct, static, *BGP*, *RIP*, or *OSPF* routes.

Syntax Description

area_name	Specifies the IS-IS router process that receives the exported routes.
ipv4	Specifies that the redistributed routes are for use in IPv4 IS-IS routing.
route-type	Selects the type of route for export. The valid route types are: bgp, direct, e-bgp, i-bgp, ospf, ospf-extern1, ospf-extern2, ospf-inter, ospf-intra, rip, and static.
policy	Specifies a policy that controls how routes are redistributed into IS-IS.
mvalue	Specifies a metric to assign to the routes exported to IS-IS. The range is 0 to 4261412864.
metric-type [internal | external]	Specifies a metric type, which is internal or external, to assign to the routes exported to IS-IS.
level [1 | 2 | both-1-and-2]	Limits the use of redistributed routes to level 1, level 2, or both.

Default

All types are disabled.

Usage Guidelines

If wide metrics are enabled, redistributed routes are included in the Extended IP Reachability TLV in LSPs. If wide metrics are not enabled, redistributed routes are added to IP External Reachability TLV in LSPs. For policies, the nlri match attribute is supported, and the cost, cost-type internal, permit, and deny set attributes are supported.

Example

The following command exports RIP routes to IS-IS and assigns the internal metric type and metric value 5 to the redistributed routes:

```
enable isis area areax export rip metric 5 metric-type internal
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable isis area export ipv6

```
enable isis area area_name export ipv6 route-type [policy | metric
   mvalue] {level[1| 2 | both-1-and-2]}
```

Description

This command enables IPv6 route redistribution into IS-IS for direct, static, *RIPng*, or *OSPFv3* routes.

Syntax Description

area_name	Specifies the IS-IS router process that receives the exported routes.
route-type	Selects the type of route for export. The valid route types are: direct, ospfv3, ospfv3-extern1, ospfv3-extern2, ospfv3-inter, ospfv3-intra, ripng, bgp, and static.
policy	Specifies a policy that controls how routes are redistributed into IS-IS.
mvalue	Specifies a metric to assign to the routes exported to IS-IS. The range is 0 to 4261412864.
level [1 | 2 | both-1-and-2]	Limits the use of redistributed routes to level 1, level 2, or both.

Default

All types are disabled.

Usage Guidelines

If a policy is specified, the policy is used to determine what specific routes are redistributed into IS-IS. Otherwise, the specified metric and type are assigned to the redistributed routes. Redistributed routes are added to the IPv6 External Reachability TLV in LSPs. For policies, the nlri match attribute is supported, and the cost, cost-type internal, permit, and deny set attributes are supported.

Example

The following command exports RIPng routes to IS-IS and assigns the internal metric type and metric value 5 to the redistributed routes:

```
enable isis area areax export ipv6 ripng metric 5 metric-type internal
```

History

This command was first available in ExtremeXOS 12.1.

Support for *BGP* was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable isis area originate-default

```
enable isis area area_name originate-default {ipv4 | ipv6}
```

Description

This command causes the specified IS-IS router process to generate the default route in its LSPs.

Syntax Description

area_name	Specifies the name of the IS-IS router process that should generate the default route.
ipv4	Specifies that the router process should generate the default IPv4 route.
ipv6	Specifies that the router process should generate the default IPv6 route.

Default

IPv4: Disabled

IPv6: Disabled

Usage Guidelines

This applies to level 2 routing only. In contrast, level 1 routers compute the default route as the nearest attached L1/L2 router. When enabled, the router process generates an IPv4 default route unless the ipv6 option is specified. Only one level 2 router in the IS-IS domain should be configured to originate a default route. This command has no effect on router processes that are already enabled for default route origination or on router processes that are level 1-only.

Example

The following command directs the IS-IS process named areax to generate the default IPv4 route in it's LSPs:

```
enable isis area areax originate-default
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable isis area overload-bit

```
enable isis area area_name overload-bit {suppress [external | interlevel
    | all]}
```

Description

This command enables the overload-bit feature, which signals other routers that they are no longer permitted to use this router as a transit or forwarding node.

Syntax Description

area_name	Specifies the area name of the IS-IS process for which this feature is to be enabled.
suppress	Specifies that one or all types of reachability information is to be suppressed or excluded from LSPs.
external	When included with the suppress option, this specifies that external reachability information is to be excluded from LSPs.
interlevel	When included with the suppress option, this specifies that interlevel reachability information is to be excluded from LSPs.
all	When included with the suppress option, this specifies that external and interlevel reachability information is to be excluded from LSPs.

Default

Disabled.

Usage Guidelines

When the overload bit feature is enabled, the router process still receives and processes LSPs.

Example

The following command enables the overload bit feature for areax:

```
enable isis area areax overload-bit
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable isis hello-padding

```
enable isis [vlan all | {vlan} vlan_name] hello-padding
```

Description

This command enables the padding of hello PDUs on one or all *VLAN*s.

Syntax Description

vlan all	Enables hello padding on all IS-IS VLANs.
vlan_name	Specifies a single VLAN on which hello padding is enabled.

Default

Enabled.

Usage Guidelines

When hello padding is enabled, IS-IS pads hello packets to the interface MTU. This is used among neighbors to verify that adjacencies have the same MTU configured on either end. The disadvantage of hello padding is the price of bandwidth consumed by larger packets.

Example

The following command enables hello padding on the SJvlan VLAN:

```
enable isis SJvlan hello-padding
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable isis restart-helper

```
enable isis restart-helper
```

Description

This command enables the IS-IS router to act as a restart helper according to draft-ietf-isis-restart-02—Restart signaling for IS-IS.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

None.

Example

The following command enables the IS-IS restart helper:

```
enable isis restart-helper
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable jumbo-frame ports

```
enable jumbo-frame ports [all | port_list]
```

Description

Enables support on the physical ports that will carry jumbo frames.

Syntax Description

all	Specifies ports.
port_list	Specifies one or more slots and ports.

Default

Disabled.

Usage Guidelines

Increases performance to back-end servers or allows for VMAN 802.1Q encapsulations.

You can configure the maximum size of a jumbo frame if you want to use a different size than the default value of 9216. Use the `configure jumbo-frame-size` command to configure the size.

This setting is preserved across reboots.

Example

The following command enables jumbo frame support on a switch:

```
enable jumbo-frame ports all
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable l2vpn

```
enable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]]
```

Description

Enables the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

All newly created VPLS or VPWS instances are enabled.

Usage Guidelines

When enabled, VPLS or VPWS attempts to establish sessions between all configured peers. Services must be configured and enabled for sessions to be established successfully.

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4 and is required when enabling a VPWS. For backward compatibility, the **l2vpn** keyword is optional when enabling a VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command enables the VPLS instance myvpls:

```
enable vpls myvpls
```

The following command enables the VPWS instance myvpws:

```
enable l2vpn vpws myvpws
```

History

This command was first available in ExtremeXOS 11.6.

The **l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable l2vpn health-check vccv

enable l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **health-check vccv**

Description

Enables the VCCV health check feature on the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS for which health check is to be enabled.
vpws_name	Identifies the VPWS for which health check is to be enabled.

Default

Health check is disabled.

Usage Guidelines

Health check must be enabled on both ends of a PW to verify connectivity between two VPLS or VPWS peers. Both VCCV peers negotiate capabilities at PW setup. A single VCCV session monitors a single PW. Therefore, a VPLS with multiple PWs will have multiple VCCV sessions to multiple peers.

VCCV in ExtremeXOS uses LSP ping to verify connectivity.

The **l2vpn** keyword was introduced in ExtremeXOS Release 12.4 and is required when enabling health check for a VPWS instance. For backward compatibility, the **l2vpn** keyword is optional when enabling health check for a VPLS instance. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command enables the health check feature on the VPLS instance myvpls:

```
enable l2vpn vpls myvpls health-check vccv
```

History

This command was first available in ExtremeXOS 12.1.

The **l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable l2vpn service

enable l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]] **service**

Description

Enables the configured services for the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

Enabled.

Usage Guidelines

When services are disabled, the VPLS or VPWS is withdrawn from all peer sessions. The keyword all enables services for all VPLS or VPWS instances.

The **l2vpn** keyword was introduced in ExtremeXOS Release 12.4 and is required when enabling services for a VPWS instance. For backward compatibility, the **l2vpn** keyword is optional when enabling services for a VPLS instance. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command enables the configured VPLS services for the specified VPLS instance:

```
enable l2vpn vpls myvpls service
```

History

This command was first available in ExtremeXOS 11.6.

The **l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable l2vpn sharing

```
enable l2vpn sharing
```

Description

Enables LSP sharing for Layer 2 VPN pseudowires .

Syntax Description

This command has no keywords or arguments.

Default

Disabled.

Usage Guidelines

This command enables LSP sharing for L2VPN PWs. When LSP sharing is enabled, up to 16 named LSPs are used for a PW. When LSP sharing is disabled, only 1 named LSP is used for a PW.

If LSP Sharing is disabled, and more than 1 Transport LSP is programmed into HW, all but 1 Transport LSP is removed from HW, and the configuration is preserved. If LSP Sharing is enabled, and more than 1 Transport LSP was previously configured, the remaining LSPs is programmed into HW as they become available for use.

Example

The following command enables LSP sharing for L2VPN PWs:

```
enable l2vpn sharing
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable l2vpn vpls peer fdb send-mac-withdrawal

```
enable l2vpn vpls peer [ipaddress | all] fdb send-mac-withdrawal
```

Description

Enables the Layer 2 VPN MAC address withdrawal capability.

Syntax Description

l2vpn	Designates L2 VPN configuration.
vpls	Designates VPLS of MPLS configuration.
peer	Designates VPLS peer.
ipaddress	Selects the VPLS peer of the provided IP address.
all	Selects all VPLS peers.
fdb	Designates FDB.
send-mac-withdrawal	Enables sending the MAC address withdrawal message.

Default

Enabled.

Usage Guidelines

Use this command to enable *FDB* MAC withdrawal after it has been disabled.

Example

The following command enables MAC address withdrawal message for all VPLS peers:

```
# enable l2vpn vpls peer all fdb send-mac-withdrawal
```

History

This command was first available in ExtremeXOS 12.1.

The **l2vpn** keyword was added in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable learning iparp sender-mac

```
enable learning iparp {request | reply | both-request-and-reply} {vr
   vr_name} sender-mac
```

Description

Enables MAC address learning from the payload of IP ARP packets.

Syntax Description

request	Enables learning only for IP ARP request packets.
reply	Enables learning only for IP ARP reply packets.
both-request-and-reply	Enables learning for both request and reply packets.
vr_name	Specifies a virtual router.

Default

Disabled.

Usage Guidelines

To view the configuration for this feature, use the following command: `show iparp`

Example

The following command enables MAC address learning from the payload of reply IP ARP packets:

```
enable learning iparp reply sender-mac
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable learning port

```
enable learning {drop-packets} ports [all | port_list]
```

Description

Enables MAC address learning on one or more ports.

Syntax Description

drop-packets	Forwards *EDP* packets, and drops all unicast, multicast, and broadcast packets from a source address not in the *FDB*. No further processing occurs for dropped packets.
all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

Use this command to enable MAC address learning on one or more ports.

Example

The following example enables MAC address learning on ports 7 and 8 on a switch:

```
enable learning ports 7-8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable led locator

```
enable led locator {timeout [seconds | none]} {pattern [alternating |
   flash-all | high-to-low | scanner]} {slot [ slot | all ]}
```

Description

Configures the front panel LEDs to flash so a switch can be easily located in a crowded lab/data center.

Syntax Description

timeout	Limit the LED display time to *seconds* before returning to normal operation.
seconds	The length of time to display the flashing LEDs. The default is 300 seconds. The maximum value is 1 week (604800 seconds).
none	Display LED pattern until disabled.
pattern	Configures the LED display pattern.
alternating	Groups of LEDs are lit in alternating patterns (Default).
flash-all	All LEDs flash on and off.
high-to-low	LED's are lit in descending port order.
scanner	A group of 4 LED's is lit back and forth.
slot *slot*	Slot number.
all	All slots.

Default

The default **timeout** length is 300 seconds.

The default pattern is alternating.

Usage Guidelines

Use this command to enable the front panel LEDs to flash so that a switch can be easily located in a crowded lab, or data center.

Bridge Port Extenders (BPEs)

The LED locator service works for both directly attached and cascaded bridge port extenders (BPEs). Only the default LED pattern of alternating is supported by the BPEs. This causes alternating flashing of groups of 8 port LEDs.

Example

The following example enables the front panel LEDs to flash in an alternating pattern for one hour on all slots:

```
enable led locator timeout 3600 pattern alternating all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable license

```
enable license {software} [key ]
```

Description

Enables software license or feature pack that allows you to use advanced features.

Syntax Description

software	Applies base license.
key	Specifies your hexadecimal license key in format xxxx-xxxx-xxxx-xxxx-xxxx (10 hex digits) or xxxx-xxxx-xxxx-xxxx-xxxx-xxxx-xxxx (14 hex digits).

Default

N/A.

Usage Guidelines

The software license levels that apply to ExtremeXOS software are described in the *Switch Engine 32.2 Feature License Requirements* document.

To obtain a software license, specify the key in the format xxxx-xxxx-xxxx-xxxx-xxxx.

You obtain the software license key (or feature pack key) either by ordering it from the factory or by obtaining a license voucher from your Extreme Networks supplier. You can obtain a regular software license or a trial software license, which allows you use of the license for either 30, 60 or 90 days; you cannot downgrade software licenses.

The voucher contains all the necessary information on the software license, whether regular or trial, and number of days for trial software license.

After you enable the software license or feature pack by entering the software key, the system returns a message that you either successfully or unsuccessfully set the license.

Once you enable the software license (or if you do not use the correct key, attempt to downgrade the license, or already installed the software license) you see one of the following messages:

```
Enabled license successfully. Error: Unable to set license using supplied key. Error:
Unable to set license - downgrade of licenses is not supported. Error: Unable to set
license - license is already enabled. Error: Unable to set license - trial license already
enabled.
```

If you enable a trial license, the system generates a daily message showing the number of days until expiry.

If you attempt to execute a command and you do not either have the required software license or have reached the limits defined by the current software license level, the system returns one of the following messages:

```
Error: This command cannot be executed at the current license level. Error: You have
reached the maximum limit for this feature at this license level.
```

If you attempt to execute a command and you do not have the required feature pack, the system also returns a message.

To protect against attacks to install maliciously created license keys, the system has an exponential delay of each failed attempt to install a license.

To view the type of software license you are currently running on the switch, use the `show licenses` command. The license key number is not displayed, but the type of software license is displayed in the `show licenses` output. This command can be run on any node in a SummitStack, regardless of its node role (master, standby, or backup).

Messages for different scenarios:

- Key format is incorrect:
  `"Error: Incorrect key format."`
- Attempted to apply Switch Port Speed License to another switch model:
  `Error: Unable to set license - platform incompatible with license.`
- Attempted to apply Switch Port Speed License beyond number of ports available on switch:
  `Error: Unable to set license - platform only supports ports in range 1 to <max for platform>.`
- EEPROM Read/Write failure for Switch Port Speed License:
  `Error: Unable to set license. Read from EEPROM failed.`
- Attempted to apply Switch Port Speed License when it is already applied:
  `Error: Unable to set license - license is already enabled.`
- Attempted to apply Switch Port Speed License license for fewer ports groups than is currently enabled. You cannot downgrade the license this way. However, you can remove the license using the **`clear license`** command, and then apply a license enabling fewer port groups:
  `Error: Unable to set license - downgrade of port speed license not supported. <num_ports> ports already licensed. Current license can be cleared via 'clear license-info port-speed'.`
- EEPROM Read/Write failure for Switch Port Speed License:
  `Error: Unable to set license - write to EEPROM failed.`

Example

The following command enables a software license on the switch:

```
enable license 2d5e-0e84-e87d-c3fe-bfff
Warning: A reboot switch or disable and enable slot 3 is required before the new license
takes effect.
```

History

This command was first available in ExtremeXOS 11.1.

The software parameter was added in ExtremeXOS 11.6.

The *capacity-key* variable was added in ExtremeXOS 15.4.

The *capacity-key* variable was removed in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable license file

`enable license file` *filename*

Description

Enables the text file that applies software licenses and feature packs licenses to more than one switch at a time.

Syntax Description

filename	Specifies the file name that you download onto the switch using TFTP; the file extension is .xlic.

Default

N/A.

Usage Guidelines

You download the license file to the switch using TFTP or SCP. The file name extension for this file is *xlic*; for example, you may see a file named systemlic.xlic.

Using this file, you enable the software and feature pack licenses for more than one switch simultaneously. The file can contain licenses for some or all of the Extreme Networks switches that the customer owns. During upload, only those license keys destined for the specific switch are used to attempt enabling the licenses. The license file is a text file that has the switch serial number, software license type, and license key; it is removed from the switch after the licenses are enabled.

After you enable the license file, the system returns one or more of the following messages:

```
Enabled license successfully. Error: Unable to set license
<license_name> using supplied key. Error: Unable to set license
<license_name> - downgrade of licenses is not supported. Error: Unable
to set license <license_name> - license is already enabled. Error:
Unable to set license <license_name> - trial license already enabled.
```

To protect against attacks to install maliciously created license keys, the system has an exponential delay of each failed attempt to install a license.

Example

The following command enables a license file on the specified Extreme Networks switches:

```
enable license file santaclara.xlic
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable lldp ports

```
enable lldp ports [all | port_list] {receive-only | transmit-only}
```

Description

Enables *LLDP* transmit mode, receive mode, or transmit and receive mode. If the transmit-only or receive-only option is not specified, both transmit and receive modes are enabled.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
receive-only	Specifies that the port only receives LLDP messages.
transmit-only	Specifies that the port only transmits LLDP messages.

Default

Enabled.

Usage Guidelines

If you do not specify an option, the port is enabled to both transmit and receive LLDP messages.

Once the port is enabled for LLDP in one mode and you issue another `enable lldp ports` command for another mode, that second mode replaces the original mode. For example, you might originally enable several ports to only receive LLDP messages and then want those ports to both receive and transmit LLDP messages. In that case, you issue the `enable lldp ports` command with no variables (and the receive-and-transmit mode replaces the receive-only mode).

To verify the port setting for LLDP, use the `show lldp {port [all |port_list]} {detailed}` command.

Example

The following example enables LLDP transmit and receive mode on port 1:4.

```
enable lldp port 1:4
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable log debug-mode

```
enable log debug-mode
```

Description

Enables debug mode. The switch generates debug events.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables debug mode. Debug mode must be enabled prior to configuring advanced debugging capabilities. These include allowing debug messages, which can severely degrade performance. For typical network device monitoring, debug mode should remain disabled, the default

setting. Debug mode should only be enabled when advised by technical support, or when advanced diagnosis is required. The debug mode setting is saved to FLASH.

The following configuration options require that debug mode be enabled:

- Including a severity of debug-summary, debug-verbose, or debug-data when configuring filters.
- Target format options process-name, process-id, source-function, and source-line.

Example

The following command enables debug mode:

```
enable log debug-mode
```

When you enable debug mode, the following message appears:

```
WARNING: Debug mode should only be enabled when advised by technical
support, or when advanced diagnosis is required. Performance degradation
is possible. Debug mode now enabled.
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable log display

```
enable log display
```

Description

Enables a running real-time display of log messages on the console display. In a stack, this command is applicable only to Master and Backup nodes. You cannot run this command on standby nodes.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If you enable the log display on a terminal connected to the console port, your settings will remain in effect even after your console session is ended (unless you explicitly disable the log display).

You configure the messages displayed in the log using the `configure log display`, or configure log target console-display commands.

You can also use this command to control logging to different targets. This command is equivalent to `enable log target console-display` command.

To change the log filter association, severity threshold, or match expression for messages sent to the console display, use the configure log target console-display command

Example

The following command enables a real-time display of log messages:

```
enable log display
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable log target

```
enable log target [console | memory-buffer | nvram | primary-
   node|backup-node| session | syslog [all | ipaddress udp-port
   {udp_port} | ipPort | ipaddress tls_port {tls_port}] {vr vr_name}
   {local0...local7}]]
```

Description

Starts sending log messages to the specified target.

Syntax Description

console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
primary-node	Specifies the primary node of a stack.
backup-node	Specifies the backup node of a stack.
session	Specifies the current session (including console display).
syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.

tls_port	Specifies remote Syslog server Transport Layer Security (TLS) for connection type.
tls_port	TLS port number.
vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
local0 ... local7	Specifies the local syslog facility.

Default

Enabled, for memory buffer and NVRAM; all other targets are disabled by default.

Usage Guidelines

This command starts sending messages to the specified target. By default, the memory-buffer, NVRAM, primary node, and backup node targets are enabled. Other targets must be enabled before messages are sent to those targets.

Configuration changes to the session target are in effect only for the duration of the console display or Telnet session, and are not saved in FLASH. Others are saved in FLASH.

You can also use the following command to enable displaying the log on the console: `enable log display`

This command is equivalent to the enable log target console-display command.

Example

The following example enables log messages on the current session:

```
enable log target session
```

History

This command was first available in ExtremeXOS 10.1.

The **ipPort** parameter was first available in ExtremeXOS 11.0.

The **udp-port** parameter was added in ExtremeXOS 21.1.

Transport Layer Security (TLS) option added in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable log target upm

```
enable log target upm {upm_profile_name}
```

Description

Enables the specified UPM log target.

Syntax Description

upm_profile_name	Specifies the name of the UPM log target to be enabled.

Default

N/A.

Usage Guidelines

UPM log targets are disabled when they are created.

Example

The following command enables the UPM log target testprofile1:

```
enable log target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable log target xml-notification

```
enable log target xml-notification xml_target_name
```

Description

Enables a Web server target.

Syntax Description

xml_target_name	Specifies the name of the xml-notification target.

Default

N/A.

Usage Guidelines

Use this command to enable a web server target for EMS.

Example

The following command enables the web server target target2:

```
enable log target xml-notification target2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable loopback-mode vlan

```
enable loopback-mode vlan [vlan_name | vlan_list]
```

Description

Allows a *VLAN* to be placed in the UP state without an external active port. This allows (disallows) the VLANs routing interface to become active.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.

Default

N/A.

Usage Guidelines

Use this command to specify a stable interface as a source interface for routing protocols. This decreases the possibility of route flapping, which can disrupt connectivity.

Example

The following example allows the VLAN "accounting" to be placed in the UP state without an external active port:

```
enable loopback-mode vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mac-lockdown-timeout ports

```
enable mac-lockdown-timeout ports [all | port_list]
```

Description

Enables the MAC address lock down timeout feature for the specified port or group of ports or for all ports on the switch.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

By default, the MAC address lock down timeout feature is disabled.

Usage Guidelines

You cannot enable the MAC lock down timer on a port that also has the lock learning feature enabled.

Example

The following command enables the MAC address lock down timeout feature for ports 2:3, 2:4, and 2:6:

```
enable mac-lockdown-timeout ports 2:3, 2:4, 2:6
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mac-locking ports

```
enable mac-locking ports [port_list | all]
```

Description

Enables MAC locking on the specified port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports.

Default

MAC locking is disabled by default.

Usage Guidelines

To enable MAC locking on a specific port, you must enable MAC locking on the switch and on the port. Use the `enable mac-locking` command to enable MAC locking on the switch.

You cannot enable MAC locking on a port if limit-learning or lock-learning is configured on the port for any *VLAN*.

Example

The following example enables MAC locking on port 14.

```
enable mac-locking ports 14
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mac-locking

```
enable mac-locking
```

Description

Enables MAC locking globally on the switch.

Syntax Description

This command has no arguments or variables.

Default

MAC locking is disabled by default.

Usage Guidelines

To enable MAC locking on a specific port, you must enable MAC locking on the switch and on the port. Use the `enable mac-locking ports` command to enable MAC locking on a port.

Example

The following example enables MAC locking on the switch.

```
enable mac-locking
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mirror

`enable mirror` *`mirror_name`*

Description

Enables a mirror instance.

Syntax Description

`mirror_name`	Specifies the mirror name.

Default

Disabled.

Usage Guidelines

Use this command to enable a mirror instance. An instance may be enabled without source filters defined (per current function), but no traffic will be mirrored until source filters are added.

Example

The following example enables a mirror instance named "mirror1" :

```
enable mirror mirror1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mirror control_index

enable mirror *control_index* {**mirror** *mirror_name*}

Description

Enables a Mirror MIB instance or the assigned instance to an existing mirror.

Syntax Description

control_index	Selects the Mirror MIB instance to enable. Range is 1 through 4.
mirror	Designates specifying a mirror name associated within the specified control index.
mirror_name	Specifies the mirror name associated within the specified control index.

Default

Disabled.

Usage Guidelines

Specifying a mirror name only enables that mirror within the Mirror MIB group (control index).

Example

The following example enables Mirror MIB specified by control index "1":

```
# enable mirror 1
```

The following example enables the mirror named "m1" within the Mirror MIB specified by control index "1":

```
# enable 1 mirror m1
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mirror to port

```
enable mirror to [port port | port-list port_list loopback-port port]
   {remote-tag tag}
```

Description

Dedicates a port on the switch to be the mirror output port, or the monitor port.

Syntax Description

port	Specifies the mirror output port.
port_list	Specifies the list of ports where traffic is to be mirrored.
loopback-port	Specifies an otherwise unused port required when mirroring to a *port_list*. The loopback-port is not available for switching user data traffic.
port	Specifies a single loopback port that is used internally to provide this feature.
remote-tag	Specifies the value of the *VLAN* ID used by the mirrored packets when egressing the monitor port.

Default

Disabled.

Usage Guidelines

Port mirroring configures the switch to copy all traffic associated with one or more ports, VLANS or virtual ports. A virtual port is a combination of a VLAN and a port. The monitor port(s) can be connected to a network analyzer or RMON probe for packet analysis. The switch uses a traffic filter that copies a group of traffic to the monitor port.

Up to 16 mirroring filters and up to four monitor ports can be configured on the switch. After a port has been specified as a monitor port, it cannot be used for any other function. Frames that contain errors are not mirrored.

You cannot run ELSM and mirroring on the same port. If you attempt to enable mirroring on a port that is already enabled for ELSM, the switch returns a message similar to the following:

```
Error: Port mirroring cannot be enabled on an ELSM enabled port.
```

Standalone Switches and SummitStacks

The traffic filter can be defined based on one of the following criteria:

- Physical port—All data that traverses the port, regardless of VLAN configuration, is copied to the monitor port(s). You can specify which traffic the port mirrors:
  - Ingress—Mirrors traffic received at the port.
  - Egress—Mirrors traffic sent from the port.
  - Ingress and egress—Mirrors traffic either received at the port or sent from the port.

    (If you omit the optional parameters, all traffic is forwarded; the default for port-based mirroring is ingress and egress).
- VLAN—All data to a particular VLAN, regardless of the physical port configuration, is copied to the monitor port.
- Virtual port—All data specific to a VLAN on a specific port is copied to the monitor port.
- ExtremeSwitching series switches support a maximum of 128 mirroring filters with the restriction that a maximum of 16 VLAN and/or virtual port (port + VLAN) filters may be configured.
- ExtremeXOS supports up to 16 monitor ports for one-to-many mirroring.
- Only traffic ingressing a VLAN can be monitored; you cannot specify ingressing or egressing traffic when mirroring VLAN traffic.
- Ingress traffic is mirrored as it is received (on the wire).
- Packets which match both an ingress filter and an egress filter will result in two packets egressing the monitor port or ports.
- In normal mirroring, a monitor port cannot be added to a load share group. In one-to-many mirroring, a monitor port list can be added to a load share group, but a loopback port cannot be used in a load share group.
- You can run mirroring and sFlow on the same device when you are running ExtremeSwitching series switches.
- With a monitor port or ports on ExtremeSwitching series switches, all traffic ingressing the monitor port or ports is tagged only if the ingress packet is tagged. If the packet arrived at the ingress port as untagged, the packet egress the monitor port or ports as untagged.
- Two packets are mirrored when a packet encounters both an ingress and egress mirroring filter.
- The configuration of remote-tag does not require the creation of a VLAN with the same tag; on these platforms the existence of a VLAN with the same tag as a configured remote-tag is prevented. This combination is allowed so that an intermediate remote mirroring switch can configure remote mirroring using the same remote mirroring tag as other source switches in the network. Make sure that VLANs meant to carry normal user traffic are not configured with a tag used for remote mirroring.

  When a VLAN is created with remote-tag, that tag is locked and a normal VLAN cannot have that tag. The tag is unique across the switch. Similarly if you try to create a remote-tag VLAN where remote-tag already exists in a normal VLAN as a VLAN tag, you cannot use that tag and the VLAN creation fails.

SummitStack Only

The traffic filter can be defined based on one of the following criteria:

- Physical port—All data that traverses the port, regardless of VLAN configuration, is copied to the monitor port(s). You can specify which traffic the port mirrors:
  - Ingress—Mirrors traffic received at the port.
  - Egress—Mirrors traffic sent from the port.
  - Ingress and egress—Mirrors traffic either received at the port or sent from the port.

    (If you omit the optional parameters, all traffic is forwarded; the default for port-based mirroring is ingress and egress).
- VLAN—All data to a particular VLAN, regardless of the physical port configuration, is copied to the monitor port.
- Virtual port—All data specific to a VLAN on a specific port is copied to the monitor port.
- SummitStack supports a maximum of 128 mirroring filters with the restriction that a maximum of 16 VLAN and/or virtual port (port + VLAN) filters may be configured.
- ExtremeXOS supports up to 16 monitor ports for one-to-many mirroring.
- Only traffic ingressing a VLAN can be monitored; you cannot specify ingressing or egressing traffic when mirroring VLAN traffic.
- Ingress traffic is mirrored as it is received (on the wire).
- Two packets are mirrored when a packet encounters both an ingress and egress mirroring filter.
- When traffic is modified by hardware on egress, egress mirrored packets may not be transmitted out of the monitor port as they egressed the port containing the egress mirroring filter. For example, an egress mirrored packet that undergoes VLAN translation is mirrored with the untranslated VLAN ID. In addition, IP multicast packets which are egress mirrored contain the source MAC address and VLAN ID of the unmodified packet.
- You cannot include the monitor port for a SummitStack in a load-sharing group.
- You can run mirroring and sFlow on the same device when you are running a SummitStack.
- With a monitor port or ports, the mirrored packet is tagged only if the ingress packet is tagged (regardless of what module the ingressing port is on). If the packet arrived at the ingress port as untagged, the packet egress the monitor port(s) as untagged.
- You may see a packet mirrored twice. This occurs only if both the ingress mirrored port and the monitor port or ports are on the same one-half of the module and the egress mirrored port is either on the other one-half of that module or on another module.
- When traffic is modified by hardware on egress, egress mirrored packets may not be transmitted out of the monitor port as they egressed the port containing the egress mirroring filter. For example, an egress mirrored packet that undergoes VLAN translation is mirrored with the untranslated VLAN ID. In addition, IP multicast packets which are egress mirrored contain the source MAC address and VLAN ID of the unmodified packet.
- The configuration of remote-tag does not require the creation of a VLAN with the same tag; on these platforms the existence of a VLAN with the same tag as a configured remote-tag is prevented. This combination is allowed so that an intermediate remote mirroring switch can configure remote mirroring using the same remote mirroring tag as other source switches in the network. Make sure

that VLANs meant to carry normal user traffic are not configured with a tag used for remote mirroring.

- When a VLAN is created with remote-tag, that tag is locked and a normal VLAN cannot have that tag. The tag is unique across the switch. Similarly if you try to create a remote-tag VLAN where remote-tag already exists in a normal VLAN as a VLAN tag, you cannot use that tag and the VLAN creation fails.

Example

The following example selects port 4 as the mirror, or monitor, port:

```
# enable mirror to port 4
```

History

This command was added in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mirror to remote-ip

```
enable mirror {mirror_name} to remote-ip remote_ip_address {{vr}
   vr_name} {priority priority_value} {from [source_ip_address | auto-
   source-ip]} {ping-check [on | off]}]
```

Description

Enables traffic to be mirrored to the specified remote IPv4 destination address encapsulated in a GRE tunneled packet.

Syntax Description

mirror_name	Specifies the mirror instance name.
remote-ip	Specifies to send mirrored packets to specified destination remote IP address.
remote_ip_address	Specifies the remote destination IP address for mirrored packets.
vr	Specifies a virtual router of the remote IP address.
vr_name	Specifies the virtual router name. If not specified, VR of current command context is used.
from	Configures source IP address of encapsulated mirrored packets.
source_ip_address	Specifies the local source IPv4 address for encapsulated mirrored packets.
auto-source-ip	Automatically use source IP address of egress VLAN to be used to reach remote IP address.

ping-check	Configure ping health check for remote IP address.
on	Only send mirrored packets to remote IP address if periodic pings to remote IP address are successful (default).
off	Send mirrored packets to remote IP address without any ping health check, assuming MAC address and port of next hop IP address are static or learned.
priority	Configures a unique priority value for each redundant remote IP address of a mirror instance.
priority_value	Sets the unique priority value for the remote IP address. The priority value must be unique for each remote IP address in the mirror instance. The range is from 1 (least preferred) to 100 (most preferred). The default is 50.

Default

If a VR is not specified, the VR of the current command context is used.

Ping health check of the remote IP address is enabled unless otherwise specified.

The default priority value is 50.

Usage Guidelines

This command enables hardware mirroring of Ethernet frames to a specified remote IPv4 address, which can reside zero or more router hops away. This is useful for ExtremeAnalytics Application Telemetry or other forms of remote network analysis or monitoring.

Port mirroring configures the switch to copy all traffic associated with one or more ports, VLANS or virtual ports. A virtual port is a combination of a VLAN and a port. The monitor port(s) can be connected to a network analyzer or RMON probe for packet analysis. The switch uses a traffic filter that copies a group of traffic to the monitor port.

Up to 16 mirroring filters and up to four monitor ports can be configured on the switch. After a port has been specified as a monitor port, it cannot be used for any other function. Frames that contain errors are not mirrored.

You cannot run ELSM and mirroring on the same port. If you attempt to enable mirroring on a port that is already enabled for ELSM, the switch returns a message similar to the following:

```
Error: Port mirroring cannot be enabled on an ELSM enabled port.
```

For high availability, you can add up to four redundant remote IP addresses. When creating a mirror with this command, you can add one IP address. To add additional remote IP addresses, use the `configure mirror` *mirror_name* {**to** [**port** *port* | **port-list** *port_list* | **loopback port** *port*] **| remote-ip** {**add**} *remote_ip_address* {{**vr**} *vr_name* } {**from** [*source_ip_address* | **auto-source-ip**]} {**ping-check** [**on** | **off**]}] {**remote-tag** *rtag* | **port none**} {**priority** *priority_value*}command.

Standalone Switches and SummitStacks

The traffic filter can be defined based on one of the following criteria:

- Physical port—All data that traverses the port, regardless of VLAN configuration, is copied to the monitor port(s). You can specify which traffic the port mirrors:
  - Ingress—Mirrors traffic received at the port.
  - Egress—Mirrors traffic sent from the port.
  - Ingress and egress—Mirrors traffic either received at the port or sent from the port.

    (If you omit the optional parameters, all traffic is forwarded; the default for port-based mirroring is ingress and egress).
- VLAN—All data to a particular VLAN, regardless of the physical port configuration, is copied to the monitor port.
- Virtual port—All data specific to a VLAN on a specific port is copied to the monitor port.
- ExtremeSwitching series switches support a maximum of 128 mirroring filters with the restriction that a maximum of 16 VLAN and/or virtual port (port + VLAN) filters may be configured.
- ExtremeXOS supports up to 16 monitor ports for one-to-many mirroring.
- Only traffic ingressing a VLAN can be monitored; you cannot specify ingressing or egressing traffic when mirroring VLAN traffic.
- Ingress traffic is mirrored as it is received (on the wire).
- Packets which match both an ingress filter and an egress filter will result in two packets egressing the monitor port or ports.
- In normal mirroring, a monitor port cannot be added to a load share group. In one-to-many mirroring, a monitor port list can be added to a load share group, but a loopback port cannot be used in a load share group.
- You can run mirroring and sFlow on the same device when you are running ExtremeSwitching series switches.
- With a monitor port or ports on ExtremeSwitching series switches, all traffic ingressing the monitor port or ports is tagged only if the ingress packet is tagged. If the packet arrived at the ingress port as untagged, the packet egress the monitor port or ports as untagged.
- Two packets are mirrored when a packet encounters both an ingress and egress mirroring filter.

SummitStack Only

The traffic filter can be defined based on one of the following criteria:

- Physical port—All data that traverses the port, regardless of VLAN configuration, is copied to the monitor port(s). You can specify which traffic the port mirrors:
  - Ingress—Mirrors traffic received at the port.
  - Egress—Mirrors traffic sent from the port.
  - Ingress and egress—Mirrors traffic either received at the port or sent from the port.

    (If you omit the optional parameters, all traffic is forwarded; the default for port-based mirroring is ingress and egress).
- VLAN—All data to a particular VLAN, regardless of the physical port configuration, is copied to the monitor port.
- Virtual port—All data specific to a VLAN on a specific port is copied to the monitor port.

- SummitStack supports a maximum of 128 mirroring filters with the restriction that a maximum of 16 VLAN and/or virtual port (port + VLAN) filters may be configured.
- ExtremeXOS supports up to 16 monitor ports for one-to-many mirroring.
- Only traffic ingressing a VLAN can be monitored; you cannot specify ingressing or egressing traffic when mirroring VLAN traffic.
- Ingress traffic is mirrored as it is received (on the wire).
- Two packets are mirrored when a packet encounters both an ingress and egress mirroring filter.
- When traffic is modified by hardware on egress, egress mirrored packets may not be transmitted out of the monitor port as they egressed the port containing the egress mirroring filter. For example, an egress mirrored packet that undergoes VLAN translation is mirrored with the untranslated VLAN ID. In addition, IP multicast packets which are egress mirrored contain the source MAC address and VLAN ID of the unmodified packet.
- You cannot include the monitor port for a SummitStack in a load-sharing group.
- You can run mirroring and sFlow on the same device when you are running a SummitStack.
- With a monitor port or ports, the mirrored packet is tagged only if the ingress packet is tagged (regardless of what module the ingressing port is on). If the packet arrived at the ingress port as untagged, the packet egress the monitor port(s) as untagged.
- You may see a packet mirrored twice. This occurs only if both the ingress mirrored port and the monitor port or ports are on the same one-half of the module and the egress mirrored port is either on the other one-half of that module or on another module.
- When traffic is modified by hardware on egress, egress mirrored packets may not be transmitted out of the monitor port as they egressed the port containing the egress mirroring filter. For example, an egress mirrored packet that undergoes VLAN translation is mirrored with the untranslated VLAN ID. In addition, IP multicast packets which are egress mirrored contain the source MAC address and VLAN ID of the unmodified packet.
- The configuration of remote-tag does not require the creation of a VLAN with the same tag; on these platforms the existence of a VLAN with the same tag as a configured remote-tag is prevented. This combination is allowed so that an intermediate remote mirroring switch can configure remote mirroring using the same remote mirroring tag as other source switches in the network. Make sure that VLANs meant to carry normal user traffic are not configured with a tag used for remote mirroring.
- When a VLAN is created with remote-tag, that tag is locked and a normal VLAN cannot have that tag. The tag is unique across the switch. Similarly if you try to create a remote-tag VLAN where remote-tag already exists in a normal VLAN as a VLAN tag, you cannot use that tag and the VLAN creation fails.

Example

The following example enables a mirroring instance named "analytics_chicago_1" to mirror packets to the remote IP address 1.2.3.4 with ping health check (default behavior) being performed on the remote IP address:

```
enable mirror analytics_chicago_1 to remote-ip 1.2.3.4
```

The following example enables a mirroring instance named "analytics_seattle_2" to mirror packets to the remote IP address 5.6.7.8 from the source IP address 10.1.1.1 without ping health check being performed on the remote IP address:

```
enable mirror analytics_seattle_2 to remote-ip 5.6.7.8 from 10.1.1.1 ping-check off
```

History

This command was first available in ExtremeXOS 22.4.

Redundant remote IP addresses capability was added in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mlag port peer id

```
enable mlag port port peer peer_name id identifier
```

Description

Binds a local port or *LAG* to an .

Syntax Description

port	Specifies a local member port of the MLAG group.
peer_name	Specifies an alpha numeric string identifying the MLAG peer.
identifier	Specifies a unique MLAG identifier value. The range is 1 to 65000.

Default

N/A.

Usage Guidelines

Use this command to bind a local port or LAG to an MLAG that is uniquely identified by the MLAG ID value. The MLAG ID can be any number from 1 to 65000.

The specified port number may be a single port or the master port of a load sharing group but may not be a load sharing member port. If it is, a message similar to the following is displayed:

```
ERROR: Port 2 is a member of a load share group. Use the load share
master port (10) instead.
```

A port can be part of only one MLAG, If you try to add it to another MLAG, a message similar to the following is displayed:

```
ERROR: Port 2 is already part of an MLAG Id 101
```

Once the MLAG group binding is made, any change to load sharing on MLAG ports is disallowed.

The MLAG peer must exist or the command will fail.

Example

The following command binds the local member port 2 to the peer switch switch101with an identifier of 101:

```
# enable mlag port 2 peer switch101 id 101
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, 5720 series switches.

enable mlag port reload-delay

```
enable mlag port reload-delay
```

Description

This command enables reload-delay on Multi-switch Link Aggregation Group (MLAG) ports.

Syntax Description

This command has no arguments or variables.

Default

MLAG reload-delay is disabled by default.

Usage Guidelines

There are cases where MLAG ports comes up quicker than ISC ports after a switch reboot causing traffic loss during this time gap. After using the configure mlag ports reload-delay on page 862 command to configure a time delay for MLAG ports that provides enough time for ISC ports/neighborship of other Layer 3 protocols to come up, you have to issue this command to enable the timer.

Example

The following example enables the MLAG reload-delay timer:

```
# enable mlag port reload-delay
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, 5720 series switches.

enable mld

```
enable mld {vlan vlan_name {MLDv1 | MLDv2} }
```

Description

Enables MLD on a router interface. If no *VLAN* is specified, MLD is enabled on all router interfaces.

Syntax Description

vlan_name	Specifies a VLAN name.
MLDv1	Sets the compatibility mode to MLDv1.
MLDv2	Sets the compatibility mode to MLDv2.

Default

Disabled.

Usage Guidelines

MLD is a protocol used by an IPv6 host to register its IPv6 multicast group membership with a router. Periodically, the router queries the multicast group to see if the group is still in use. If the group is still active, IPv6 hosts respond to the query, and group registration is maintained.

MLD is disabled by default on the switch. However, the switch can be configured to enable the generation and processing of MLD packets. If compatibility mode is not specified in the command, MLDv1 compatibility mode is set.

A VLAN must have an IPv6 address to support MLD.

Example

The following example enables MLDv1 on the VLAN accounting:

```
enable mld vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

enable mld snooping

```
enable mld snooping {{vlan} vlan_name}
```

Description

Enables MLD snooping on the switch.

Syntax Description

vlan_name	Specifies a *VLAN*.

Default

Disabled.

Usage Guidelines

If a VLAN is specified, MLD snooping is enabled only on that VLAN, otherwise MLD snooping is enabled on all VLANs.

A VLAN must have an IPv6 address to support MLD.

Example

The following command enables MLD snooping on the switch:

```
enable mld snooping
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

enable mld snooping with-proxy

```
enable mld snooping with-proxy
```

Description

Enables the MLD snooping proxy.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Enabling the proxy allows the switch to suppress the duplicate join requests on a group to forward to the connected Layer 3 switch. The proxy also suppresses unnecessary MLD leave messages so that they are forwarded only when the last member leaves the group.

This command can be used for troubleshooting purpose. It should be enabled for normal network operation. The command does not alter the snooping setting.

Example

The following command enables the MLD snooping proxy:

```
enable mld snooping with-proxy
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

enable mld ssm-map

```
enable mld ssm-map {{vr} vr_name}
```

Description

Enables MLD SSM mapping on a virtual router (VR).

Syntax Description

vr *vr_name*	Specifies a virtual router name.

Default

Disabled.

Usage Guidelines

Use this command to enable MLD SSM mapping on a VR.

Configure the SSM address range using the `configure pim ipv6 ssm range [default | {policy} policy_name]` command before you enable SSM Mapping.

Example

The following example enables SSM mapping on VR1:

```
enable mld ssm-map vr vr1
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls

```
enable mpls
```

Description

Enables *MPLS* on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Enabling MPLS allows MPLS processing to begin for any enabled MPLS protocols (RSVP-TE and/or LDP).

While MPLS is transitioning to the enabled state, only the MPLS show commands are accepted.

Before you can enable MPLS on a SummitStack, the stack must meet the following requirements:

- Each stack switch must meet the software and hardware requirements listed in the *Switch Engine 32.2 Feature License Requirements* document.
- You must configure the enhanced stacking protocol on each ExtremeSwitching series switch.

Note
When MPLS is enabled on a stack, you can only add MPLS-compatible switches to the stack.

Example

The following command globally enables MPLS on the switch:

```
enable mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls bfd

```
enable mpls bfd [{vlan} vlan_name | vlan all]
```

Description

Enables the Bidirectional Forwarding Detection (BFD) client for *MPLS* on the specified *VLAN* or all VLANs.

Syntax Description

vlan_name	Specifies the VLAN on which to enable the MPLS BFD client.
vlan all	Enables the MPLS BFD client on all VLANs.

Default

Disabled.

Usage Guidelines

This command causes MPLS to request a BFD session to each next-hop peer reachable through the named interface. BFD sessions are triggered by the establishment of an LSP over the interface. If this command is issued after LSPs are established, then the list of active LSPs is searched for next-hop peers

associated with the named interface, and a BFD session is requested for each neighbor which does not already have a session. This command also instructs MPLS to begin to consider BFD neighbor session state updates as part of the effective interface link state reported to the MPLS upper layer protocols.

Note

BFD must be enabled on the interface before sessions can be established. To enable BFD, use the command: `[enable | disable] bfd vlan vlan_name` .

Example

The following command enables the MPLS BFD client on VLAN vlan1:

```
enable mpls bfd vlan1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls exp examination

```
enable mpls exp examination
```

Description

Enables assigning an *MPLS* packet to a *QoS* profile based on the MPLS packet's EXP value.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables assigning an MPLS packet to a QoS profile based on the MPLS packet's EXP value. The EXP values to QoS profile mappings are configured using the `configure mpls exp examination` command.

When disabled, all received MPLS packets are assigned to QoS profile qp1.

Example

The following command enables assignment of an MPLS packet to a QoS profile based on the MPLS packet's EXP value:

```
enable mpls exp examination
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls exp replacement

```
enable mpls exp replacement
```

Description

Enables setting an *MPLS* packet's EXP value based on the packet's *QoS* profile.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables setting an MPLS packet's EXP value based on the packet's QoS profile. The QoS profiles to EXP value mappings are configured using the `configure mpls exp replacement` command.

When disabled, all MPLS packets are transmitted with an EXP value of zero.

Example

The following command enables the setting of an MPLS packet's EXP value based on the packet's QoS profile:

```
enable mpls exp replacement
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls ldp bgp-routes

```
enable mpls ldp bgp-routes
```

Description

Enables LDP to use IP prefixes learned from *BGP* when establishing LDP LSPs.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command allows LDP to use routes learned via BGP when establishing LDP LSPs. Because each established LSP consumes internal resources, it is recommended that this setting be used only in BGP environments where the number of BGP routes is controlled.

When disabled, LDP does not establish LSPs to routes learned via BGP, thus reducing the internal resources used by LDP. Note that *MPLS* LSPs can still be used to transport packets to routes learned via BGP through the use of the `enable bgp mpls-next-hop` command.

Example

The following command enables the use of BGP routes by LDP:

```
enable mpls ldp bgp-routes
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls ldp loop-detection

```
enable mpls ldp loop-detection
```

Description

Enables LDP loop detection on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Loop detection provides a mechanism for finding looping LSPs and for preventing Label Request messages from looping in the presence of non-merge capable LSRs. The mechanism makes use of Path Vector and Hop Count TLVs carried by Label Request and Label Mapping messages.

Example

The following command globally enables LDP loop detection on the switch:

```
enable mpls ldp loop-detection
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls ldp

```
enable mpls ldp [{vlan} vlan_name | vlan all]
```

Description

Enables LDP for the specified *MPLS* configured *VLAN*s.

Syntax Description

vlan	Enables LDP for one or more specific VLANs.
vlan_name	Enables LDP on the specified VLAN.
vlan all	Enables LDP for all VLANs that have been added to MPLS.

Default

Disabled.

Usage Guidelines

When LDP is enabled, LDP attempts to establish peer sessions with neighboring routers on the enabled VLAN. Once a peer session is established, LDP advertises labels for local IP interfaces and for routes learned from other neighboring routers. By default, LDP is disabled for all VLANs that have been added to MPLS. Specifying the optional **all** keyword enables LDP for all MPLS configured VLANs.

Example

The following command enables LDP for all VLANs that have been added to MPLS:

```
enable mpls ldp vlan all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls php

When enabled, PHP is requested on all LSPs advertised over that *VLAN* for which the switch is the egress LSR.

```
enable mpls php [{vlan} vlan_name | vlan all]
```

Description

Enables penultimate hop popping (PHP) on the specified VLAN.

Syntax Description

vlan	Enables PHP for one or more specific VLANs.
vlan_name	Enables PHP on the specified VLAN.
vlan all	Enables PHP for all VLANs that have been added to *MPLS*.

Default

Disabled.

Usage Guidelines

Penultimate hop popping is requested by assigning the Implicit Null Label in an advertised mapping. Extreme's MPLS implementation always performs penultimate hop popping when requested to do so by a peer LSR. When the all VLANs option is selected, PHP is enabled on all configured VLANs that have been added to MPLS.

Example

The following command enables penultimate hop popping (PHP) on the specified VLAN:

```
enable mpls php vlan vlan1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls protocol ldp

```
enable mpls protocol ldp
```

Description

Enables LDP for the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When LDP is enabled, LDP attempts to establish peer sessions with neighboring routers on *VLAN* interfaces where LDP has been enabled . Once a peer session is established, LDP can advertise labels for local IP interfaces and for routes learned from other neighboring routers. While LDP is transitioning to the enabled state, only the *MPLS* show commands are accepted.

Note that the LDP protocol must be enabled to establish VPLS pseudo-wires even if the transport LSPs are being established using RSVP-TE.

Example

The following command globally enables LDP on the switch:

```
enable mpls protocol ldp
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls protocol rsvp-te

```
enable mpls protocol rsvp-te
```

Description

Enables RSVP-TE for the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When RSVP-TE is enabled, configured LSPs begin the process of TE LSP establishment and *VLAN* interfaces that have RSVP-TE enabled begin processing RSVP path/reserve messages. By default, RSVP-TE is disabled. While RSVP-TE is transitioning to the enabled state, only the *MPLS* show commands are accepted.

Example

The following command globally enables RSVP-TE on the switch:

```
enable mpls protocol rsvp-te
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls rsvp-te bundle-message

```
enable mpls rsvp-te bundle-message [{vlan} vlan_name | vlan all]
```

Description

Enables the bundling of RSVP-TE messages for the specified *VLAN* interface.

Syntax Description

vlan	Specifies that message-bundling is to be enabled on one or more VLAN interfaces.
vlan_name	Identifies a VLAN interface for which message bundling is to be enabled.
vlan all	Specifies that message bundling is to be enabled on all VLANs that have been added to *MPLS*.

Default

Disabled.

Usage Guidelines

Enabling message bundling can improve control plane scalability by allowing the switch to bundle multiple RSVP-TE messages into a single PDU. Not all devices support bundled messages. If the switch determines that a peer LSR, connected to a specific interface, does not support message bundling, the switch reverts to sending separate PDUs for each message on that interface. By default, message bundling is disabled. Specifying the **all** keyword enables message bundling on all MPLS-configured VLANs.

Example

The following command enables message bundling on the specified VLAN:

```
enable mpls rsvp-te bundle-message vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls rsvp-te fast-reroute

```
enable mpls rsvp-te fast-reroute
```

Description

Enables the *MPLS* RSVP-TE fast reroute (FRR) protection feature.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

You can configure FRR LSPs only when FRR is enabled on the LSR. Enabling FRR protection on the LSR automatically enables the point-of-local-repair and merge-point capabilities on the LSR. FRR should be enabled on all LSRs along each FRR LSP path.

Example

The following command enables FRR protection on the local switch:

```
enable mpls rsvp-te fast-reroute
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls rsvp-te lsp

```
enable mpls rsvp-te lsp [lsp_name | all]
```

Description

Enables one or more RSVP-TE LSPs.

Syntax Description

lsp_name	Specifies the ingress LSP within the switch to be enabled.
all	Enables all RSVP-TE configured ingress LSPs.

Default

Enabled.

Usage Guidelines

When an RSVP-TE LSP is enabled, the switch attempts to set up the LSP by signaling the destination by sending a path message using the assigned path and profile. By default, all newly created LSPs are enabled and can become active when the LSP has been configured. Note that an LSP must be configured with at least one path before it can be signaled.

Example

The following command enables all RSVP-TE-configured LSPs:

```
enable mpls rsvp-te lsp all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls rsvp-te summary-refresh

```
enable mpls rsvp-te summary-refresh [{vlan} vlan_name | vlan all]
```

Description

Enables the sending of summary refresh messages, instead of path messages, to refresh RSVP-TE path state for the specified *VLAN* interface.

Syntax Description

vlan	Specifies that summary refresh messages are to refresh the RSVP-TE path state on one or more VLAN interfaces.
vlan_name	Identifies a VLAN interface on which RSVP-TE summary refresh messages are to refresh the RSVP-TE path state.
vlan all	Specifies that summary refresh messages are to refresh the RSVP-TE path state on all VLANs that have been added to *MPLS*.

Default

Disabled.

Usage Guidelines

Enabling summary refresh can improve control plane scalability by refreshing multiple LSPs in a single message. Not all devices support summary refresh. If the switch determines that a peer LSR, connected to a specific interface, does not support summary refresh, the switch reverts to using path messages on that interface. By default, summary refresh is disabled. Specifying the **all** keyword enables summary refresh on all MPLS-configured VLANs.

Example

The following command enables summary refresh on the specified VLAN:

```
enable mpls rsvp-te summary-refresh vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls rsvp-te

```
enable mpls rsvp-te [{vlan} vlan_name | vlan all]
```

Description

Enables RSVP-TE for the specified *MPLS*-configured *VLAN*.

Syntax Description

vlan	Specifies that RSVP-TE is to be enabled on one or more VLANs.
vlan_name	Identifies a specific VLAN on which RSVP-TE is to be enabled.
vlan all	Enables RSVP-TE on all VLANS that have been added to MPLS.

Default

Disabled.

Usage Guidelines

When RSVP-TE is enabled, TE LSP establishment for configured LSPs begins and the processing of RSVP path/reserve messages from peer LSRs is permitted. By default, RSVP-TE is disabled for all MPLS-configured VLANs. Specifying the optional all keyword enables RSVP-TE for all VLANs that have been added to MPLS.

Example

The following command enables RSVP-TE on the specified VLAN:

```
enable mpls rsvp-te vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable mpls static lsp

```
enable mpls static lsp {lsp_name | all }
```

Description

Administratively enables one or all static LSPs.

Syntax Description

lsp_name	Identifies the LSP to be enabled.
all	Specifies that all static LSPs on this LSR are to be enabled.

Default

N/A.

Usage Guidelines

On executing this command, the software tries to activate the static LSP by programming the LSP in hardware. Static LSPs are not enabled by default. You need to explicitly enable LSPs after the ingress and egress segments have been configured.

Example

The following command enables a static LSP:

```
enable mpls static lsp lsp598
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.ture-link-in-22.1"/>

enable mpls vlan

`enable mpls [{vlan}vlan_name|vlan all]`

Description

Enables the *MPLS* interface for the specified *VLAN*.

Syntax Description

vlan	Enables an MPLS interface for one or more specific VLANs.
vlan_name	Enables an MPLS interface on the specified VLAN.
vlan all	Enables an MPLS interface for all VLANs that have been added to MPLS.

Default

Disabled.

Example

The following command enables an MPLS interface for the specified VLAN:

```
enable mpls vlan vlan-nyc
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable msdp data-encapsulation

```
enable msdp data-encapsulation {vr vrname}
```

Description

Enables the encapsulation of locally originated SA messages with multicast data (if available).

Syntax Description

vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, multicast data packet encapsulation is enabled for locally originated SA messages. Multicast data packets with a packet size of up to 8 KB are encapsulated in SA messages.

Usage Guidelines

Enable data encapsulation to handle bursty sources.

Example

The following command enables multicast data packet encapsulation:

```
enable msdp data-encapsulation
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *MSDP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.opic/ph "/>

enable msdp export local-sa

```
enable msdp export local-sa {export-filter filter-name} {vr vrname}
```

Description

Enables the advertisement of local sources to groups for which the router is an RP.

Syntax Description

filter-name	Specifies the policy to associate with the export of local sources. No policy is specified by default.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the export of local sources is enabled. All sources are advertised if the router is an RP for the groups.

Usage Guidelines

You can create a policy to filter out some of the local sources so that they are not advertised to *MSDP* peers and exposed to the external multicast domain. To configure an export filter, you must first disable the export of local sources (with the `disable msdp export local-sa` command), and then re-enable it with an export filter (with the `enable msdp export local-sa export-filter` command).

You can use the following policy attributes in an export policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit
  - deny

Please note that the syntax for “multicast-group”, “multicast-source,” and “pim-rp” are the same as for the “nlri” policy attribute.

```
[multicast-group | multicast-source | pim-rp]  [ipaddress | any]/mask-length> {exact}
[multicast-group | multicast-source | pim-rp]  [ipaddress | any]  mask  mask  {exact}
```

An example of an MSDP policy file follows:

```
entry allow_internal_rp {
if match any {
multicast-group  234.67.89.0/24;
multicast-source  23.123.45.0/24;
pim-rp  10.203.134.5/32;
} then {
permit;
}
}
entry deny_local_group239 {
if match any {
multicast-group 239.0.0.0/8;
multicast-source  23.123.45.0/24;
} then {
deny;
}
}
entry allow_external_rp_172 {
if {
multicast-group 234.172.0.0/16;
} then {
permit
}
}
# deny remaining entries
```

Example

The following command enables the advertisement of local sources:

```
nable msdp export local-sa
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable msdp peer

```
enable msdp [{peer} remoteaddr | peer all] {vr vr_name}
```

Description

Configures the administrative state of an *MSDP* peer.

Syntax Description

all	Enables all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer to configure.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, MSDP peers are disabled.

Usage Guidelines

You must use this command to administratively enable the MSDP peers before they can establish peering sessions and start exchanging SA messages.

Example

The following example enables an MSDP peer:

```
enable msdp peer 192.168.45.43
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable msdp process-sa-request

```
enable msdp [{peer} remoteaddr | peer all] process-sa-request {sa-
   request-filter filter-name } {vr vr_name}
```

Description

This command configures *MSDP* to receive and process SA request messages from a specified peer or all peers. If an SA request filter is specified, only SA request messages from those groups permitted are accepted. All others are ignored.

Syntax Description

peer all	Specifies all MSDP peers.
filter-name	Specifies the name of the policy filter associated with SA request processing.

remoteaddr	Specifies the IP address of the MSDP peer.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, all SA request messages are accepted from peers.

Usage Guidelines

Use this command to configure the router to accept all or just some SA request messages from peers. If no policy is specified, all SA request messages are accepted. If a policy is specified, only SA request messages from those groups permitted are accepted, and all others are ignored.

You cannot change an SA request filter while SA request processing is enabled for an MSDP peer. You must first disable SA request processing for a peer and then re-enable it with an SA request filter.

You can use the following policy attributes in an SA request policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit
  - deny

Example

The following example enables processing of SA request messages received from a peer with the IP address 192.168.45.43:

```
enable msdp peer 192.168.45.43 process-sa-request sa-request-filter intra_domain
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable msdp

```
enable msdp {vr vrname}
```

Description

Enables *MSDP* on a virtual router.

Syntax Description

vrname	Specifies the name of the virtual router on which MSDP is being enabled or disabled. If a name is not specified, it is extracted from the current CLI context.

Default

MSDP is disabled by default.

Usage Guidelines

None.

Example

The following command enables MSDP on a virtual router:

```
enable msdp
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable msrp ports

```
enable msrp ports [port_list | all]
```

Description

Enables MSRP in the ports listed in the command after the keyword **ports**.

Syntax Description

msrp	Multiple Stream Registration Protocol.
port_list	Port list separated by a comma or "-".
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to enable MSRP in the ports listed or all ports.

Note
MSRP is not supported for Link Aggregated Ports.

Example

```
# enable msrp ports 1-3
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the *Switch Engine 32.2 Feature License Requirements*.

enable msrp

```
enable msrp
```

Description

Enables MSRP globally on the switch.

Syntax Description

msrp	Multiple Stream Registration Protocol.

Default

Disabled.

Usage Guidelines

Use this command to enable MSRP globally on a switch.

Example

The following command enables MSRP:

```
enable msrp
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the *Switch Engine 32.2 Feature License Requirements*.

enable mvr

```
enable mvr
```

Description

Enables MVR on the system.

Syntax Descripton

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables MVR on the system:

```
enable mvr
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable mvrp

```
enable mvrp
```

Description

Enables MVRP globally on a switch.

Syntax Description

mvrp	Multiple *VLAN* Registration Protocol.

Default

Disabled.

Usage Guidelines

Use this command to enable MVRP globally on a switch. MVRP is run on the MVRP enabled ports only if the global setting is enabled. By default, MVRP is disabled globally and on individual ports. When MVRP is disabled globally, all MVRP packets are forwarded transparently.

Example

The following command enables MVRP globally on the switch:

```
enable mvrp
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable mvrp ports

```
enable mvrp ports [port_list | all]
```

Description

Enables MVRP on a given set of ports.

Syntax Description

mvrp	Multiple *VLAN* Registration Protocol
port_list	Port(s) on which MVRP is to be enabled.
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to enable MVRP on given set of ports. MVRP is run on the MVRP enabled ports only if the global setting is enabled. By default, MVRP is disabled globally and on individual ports. When MVRP is disabled globally, all MVRP packets will be forwarded transparently. An error message is displayed if the user tries to enable/disable MVRP on a lag member port which is not the master port. No configuration changes are made.

Example

The following command enables MVRP on ports 4 and 5:

```
enable mvrp ports 4-5
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable neighbor-discovery refresh

```
enable neighbor-discovery {vr vr_name} refresh
```

Description

Enables the IPv6 neighbor cache to refresh each entry before the timeout period expires.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

None.

Example

The following example enables the refresh of neighbor discovery cache entries:

```
enable neighbor-discovery refresh
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

enable netlogin

```
enable netlogin [{dot1x} {mac} {web-based}]
```

Description

Enables network login authentication modes.

Syntax Description

dot1x	Specifies 802.1X authentication.
mac	Specifies MAC-based authentication.
web-based	Specifies web-based authentication.

Default

All types of authentication are disabled.

Usage Guidelines

Any combination of types of authentication can be enabled on the same switch. At least one of the authentication types must be specified on the command line.

Entering **enable netlogin mac** adds **configure netlogin add mac-list default** configuration by default.

To disable an authentication mode, use the following command:

```
disable netlogin [{dot1x} {mac} {web-based}]
```

Example

The following command enables web-based network login:

```
enable netlogin web-based
```

History

This command was first available in ExtremeXOS 11.1.

Default **configure netlogin add mac-list default** configuration was added in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable netlogin authentication failure vlan ports

```
enable netlogin authentication failure vlan ports [ports | all]
```

Description

Enables the configured authentication failure *VLAN* on the specified ports.

Syntax Description

all	Specifies all ports included in the authentication failure VLAN.
ports	Specifies one or more ports or slots and ports on which the authentication failure VLAN is enabled.

Default

All ports.

Usage Guidelines

Use this command to enable the configured authentication failure VLAN on either the specified ports, or all ports.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable netlogin authentication service-unavailable vlan ports

```
enable netlogin authentication service-unavailable vlan ports [ports |
   all]
```

Description

Enables the configured authentication service-unavailable *VLAN* on the specified ports.

Syntax Description

ports	Specifies one or more ports or slots and ports on which the service-unavailable VLAN is enabled.
all	Specifies all ports included in the service-unavailable VLAN.

Default

All ports.

Usage Guidelines

Use this command to enable the configured authentication service-unavailable VLAN on the specified ports, or on all ports.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable netlogin dot1x guest-vlan ports

```
enable netlogin dot1x guest-vlan ports [all | ports]
```

Description

Enables the guest *VLAN* on the specified 802.1X network login ports.

Syntax Description

all	Specifies all ports included in the guest VLAN.
ports	Specifies one or more ports or slots and ports on which the guest VLAN is enabled.

Default

Disabled.

Usage Guidelines

A guest VLAN provides limited or restricted network access if a supplicant connected to a port does not respond to the 802.1X authentication requests from the switch. A port always moves untagged into the guest VLAN.

Modifying the Supplicant Timer

By default, the switch attempts to authenticate the supplicant every 30 seconds for a maximum of three tries. If the supplicant does not respond to the authentication requests, the client moves to the guest VLAN. The number of authentication attempts is a user-configured parameter with allowed values in the range of 1 to 10.

To modify the supplicant response timer, use the following command and specify the supp-resp-timeout parameter:

```
configure netlogin dot1x timers [{server-timeout server_timeout}
{quiet-periodquiet_period} {reauth-periodreauth_period {reauth-
maxmax_num_reauths}} {supp-resp-timeoutsupp_resp_timeout}]
```

Creating the Guest VLAN

Before you can enable the guest VLAN on the specified ports, you must create the guest VLAN. To create the guest VLAN, use the following command:

```
configure netlogin dot1x guest-vlan vlan_name {portsport_list}
```

Example

The following command enables the guest VLAN on all ports:

```
enable netlogin dot1x guest-vlan ports all
```

The following command enables the guest VLAN on ports 2 and 3:

```
enable netlogin dot1x guest-vlan ports 2,3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable netlogin logout-privilege

```
enable netlogin logout-privilege
```

Description

Enables network login logout pop-up window.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command controls the logout window pop-up on the web-based network client. This command applies only to the web-based authentication mode of network login.

Example

The following command enables network login logout-privilege:

```
enable netlogin logout-privilege
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable netlogin ports

```
enable netlogin ports ports [{dot1x} {mac} {web-based}]
```

Description

Enables NetLogin on a specified port for a particular authentication method.

Syntax Description

ports	Specifies the ports for which NetLogin should be enabled.
dot1x	Specifies 802.1X authentication.
mac	Specifies MAC-based authentication.
web-based	Specifies web-based authentication.

Default

All methods are disabled on all ports.

Usage Guidelines

For campus mode NetLogin with web-based clients, the following conditions must be met:

- A *DHCP* server must be available, and a DHCP range must be configured for the port or ports in the *VLAN* on which you want to enable NetLogin.
- The switch must be configured as a *RADIUS* client, and the RADIUS server must be configured to enable the NetLogin capability.

For ISP mode login, no special conditions are required. A RADIUS server must be used for authentication.

NetLogin is used on a per-port basis. A port that is tagged can belong to more than one VLAN. In this case, NetLogin can be enabled on one port for each VLAN.

Windows authentication is not supported via NetLogin.

To support NetLogin on all user virtual routers (VRs) in policy mode, remove any associated VRs from the port before enabling NetLogin (see configure vr delete ports on page 1559). This is applicable for uplink ports and ISC ports. This must be done prior to authentication so that once the client gets authenticated the ports can move across different VLANs of various VRs.

Example

The following command configures NetLogin on port 2:9 using web-based authentication:

```
enable netlogin ports 2:9 web-based
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable netlogin reauthentication-on-refresh

```
enable netlogin reauthentication-on-refresh
```

Description

Enables network login reauthentication on refresh.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The web-based Netlogin client's session is periodically refreshed by sending a HTTP request which acts as a keep-alive without actually re-authenticating the user's credentials with the back-end *RADIUS* server or local database. If reauthenticate-on-refresh is enabled, re-authentication occurs with the session refresh.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable netlogin redirect-page

```
enable netlogin redirect-page
```

Description

Enables the network login redirect page function.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command enables the network login redirect page so that the client is sent to the redirect page rather than the original page.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable netlogin session-refresh

```
enable netlogin session-refresh {refresh_minutes}
```

Description

Enables network login session refresh.

Syntax Description

refresh_minutes	Specifies the session refresh time for network login in minutes.

Default

Enabled, with a value of three minutes for session refresh.

Usage Guidelines

Network login sessions can refresh themselves after a configured timeout. After the user has been logged in successfully, a logout window opens which can be used to close the connection by clicking on the Logout link. Any abnormal closing of this window is detected on the switch and the user is logged out after a time interval as configured for session refresh. The session refresh is enabled and set to three minutes by default. The value can range from 1 to 255 minutes. When you configure the network login session refresh for the logout window, ensure that the *FDB* aging timer is greater than the network login session refresh timer.

This command applies only to the web-based authentication mode of network login.

To reset the session refresh value to the default behavior, use this command without the minutes parameter.

Example

The following command enables network login session refresh and sets the refresh time to ten minutes:

```
enable netlogin session-refresh 10
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable network-clock gptp

```
enable network-clock gptp
```

Description

Enables gPTP on the switch.

Syntax Description

network-clock	Network clock.
gptp	IEEE 802.1AS Generalized Precision Time Protocol (gPTP).

Default

Disabled.

Usage Guidelines

Use this command to enable gPTP.

Example

```
# enable network-clock gptp
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the *Switch Engine 32.2 Feature License Requirements*.

enable network-clock gptp ports

```
enable network-clock gptp ports [port_list {only} | all]
```

Description

Enables gPTP on one or more ports.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
only	Apply change only to specified port, even if port is master of a load sharing group.
all	Specifies all of the switch's physical ports.

Default

Disabled.

Usage Guidelines

Use this command to configure on which ports gPTP runs. gPTP does not run on any ports if it is not first enabled in the switch by the `enable network-clock gptp` command.

Example

```
# enable network-clock gptp ports 4
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on the ExtremeSwitching 5520 switch if the AVB feature pack license is installed on the switch..

enable nodealias ports

```
enable nodealias ports [port_list | all]
```

Description

This command enables the Node Alias feature on specified ports. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

nodealias	Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis.
ports	Designates that Node Alias should be enabled on specified ports.
port_list	Specifies on which ports to have Node Alias enabled. Designated as a port list separated by comma (,) or dash (-).
all	Specifies that all ports have Node Alias enabled.

Default

Node Alias is disabled by default on all ports.

Usage Guidelines

If the port is part of a *LAG*, Node Alias should be enabled separately on each LAG port.

Example

The following example enables Node Alias on all ports:

```
enable nodealias ports all
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

VLAN

enable nodealias protocol

enable **nodealias protocol** [*protocol_name* | **all**]

Description

This command designates the specific protocols detected for the Node Alias feature. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

nodealias	Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis.
protocol	Designates selection of protocols to detect.
protocol_name	Specifies enabling a protocol to detect (one at a time). The following protocols are enabled by default: IPv4, IPv6, *OSPF*, *BGP*, *VRRP*, DHCPS, DHCPC, BOOTPS, BOOTPC, UDP, BPDU, LLMNR, SSDP, and mDNS.
any	Specifies enabling all Node Alias-supported protocols.

Default

The following protocols are enabled by default: IPv4, IPv6, OSPF, BGP, VRRP, DHCPS, DHCPC, BOOTPS, BOOTPC, UDP, BPDU, LLMNR, SSDP, and mDNS.

Note

- ARP is categorized under IP.
- UDP entry is created when destination IP address is broadcast.
- BPDU means *STP* and GVRP frames.

Usage Guidelines

By default, the following protocols are enabled (IPv4, IPv6, OSPF, BGP, VRRP, DHCPS, DHCPC, BOOTPS, BOOTPC, UDP, BPDU, LLMNR, SSDP, mDNS). You can optionally disable any of these protocols (and then enable them back if desired).

Example

The following example specifically enables BGP to be detected:

```
enable nodealias protocol bgp
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

VLAN

enable ntp

```
enable ntp
```

Description

Enables NTP globally on the switch.

Syntax Description

N/A.

Default

NTP is disabled by default.

Usage Guidelines

N/A.

Example

The following command enables NTP globally on the switch:

```
enable ntp
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ntp authentication

```
enable ntp authentication
```

Description

Enables NTP authentication globally on the switch.

Syntax Description

N/A.

Default

NTP authentication is disabled by default.

Usage Guidelines

If authentication is disabled, NTP will not use any authentication mechanism to a server or from clients. To use authentication for a specific server, enable NTP authentication globally, and then configure an RSA Data Security, Inc. *MD5* Message-Digest Algorithm or SHA256 key index for the specific server.

Example

The following command enables NTP authentication globally on the switch:

```
enable ntp authentication
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ntp broadcast-client

```
enable ntp broadcast-client {{vr} vr_name}
```

Description

Enables an NTP broadcast client on the switch.

Syntax Description

broadcast-client	Specifies enabling NTP broadcast client.
vr	Specifies enabling NTP broadcast client for a VR.
vr_name	Specifies the VR name. If a VR name is not specified, the VR of current command context is used.

Default

An NTP broadcast client is enabled by default.

If a VR name is not specified, the VR of current command context is used.

Usage Guidelines

If the broadcast client function is enabled, the system can receive broadcast-based NTP messages and process them only if a *VLAN* is enabled for NTP and the VLAN is active.

Example

The following command enables an NTP broadcast client on the switch:

```
enable ntp broadcast-client
```

History

This command was first available in ExtremeXOS 12.7.

The **vr** was added in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ntp broadcast-server

```
enable ntp {vlan} vlan-name broadcast-server {key keyid}
```

Description

Enables NTP to send broadcast messages with or without a key to a *VLAN*.

Syntax Description

vlan-name	Specifies the name of a particular VLAN on which to enable or disable NTP.
keyid	Specifies the key ID as a value from 1 to 65534.

Default

An NTP broadcast server is enabled by default.

Usage Guidelines

For the broadcast server function to work correctly, configure a VLAN to forward broadcast packets by using the `enable ipforwarding broadcast vlan-name` command. All broadcast clients will receive clock information from the broadcasted clock messages.

Example

The following command enables an NTP broadcast server on the switch:

```
enable ntp vlan toSW3 broadcast-server key 100
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ntp vlan

```
enable ntp [{vlan} vlan-name | all] {{vr} vr_name}
```

Description

Enables NTP on a *VLAN*.

Syntax Description

enable	Enables NTP on a VLAN.
vlan-name	Specifies the name of a particular VLAN on which to enable or disable NTP.
all	Enables or disables NTP on all VLANs.
vr	Specifies setting up NTP on a VR.
vr_name	Specifies the VR name to enable NTP on. If a VR name is not specified, the VR of current command context is used.

Default

NTP is disabled on all VLANs by default.

Usage Guidelines

N/A.

Example

The following command enables NTP on a VLAN named “Southwest”:

```
enable ntp vlan Southwest
```

History

This command was first available in ExtremeXOS 12.7.

The **vr** option was added in ExtremeXOS 22.2

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ntp vr

```
enable ntp vr vr_name
```

Description

This command enables and configures NTP for the specified VR.

Syntax Description

vr	Specifies setting up NTP on a VR.
vr_name	Specifies the VR name to enable NTP on. If a VR name is not specified, the VR of current command context is used.

Default

If a VR name is not specified, the VR of current command context is used.

Example

The following example enables NTP on a VR named "vr1".

```
enable ntp vr vr1
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ospf

```
enable ospf
```

Description

Enables the *OSPF* process for the router.

Syntax Description

This command has no keywords or arguments.

Default

N/A.

Usage Guidelines

Not applicable.

Example

The following command enables the OSPF process for the router:

```
enable ospf
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ospf capability opaque-lsa

```
enable ospf capability opaque-lsa
```

Description

Enables opaque LSAs across the entire system.

Syntax Description

This command has no keywords or variables.

Default

Enabled.

Usage Guidelines

Opaque LSAs are a generic *OSPF* mechanism used to carry auxiliary information in the OSPF database. Opaque LSAs are most commonly used to support OSPF traffic engineering.

Normally, support for opaque LSAs is auto-negotiated between OSPF neighbors. In the event that you experience interoperability problems, you can disable opaque LSAs.

If your network uses opaque LSAs, all routers on your OSPF network should support opaque LSAs. Routers that do not support opaque LSAs do not store or flood them. At minimum a well-interconnected subsection of your OSPF network needs to support opaque LSAs to maintain reliability of their transmission.

On an OSPF broadcast network, the designated router (DR) must support opaque LSAs or none of the other routers on that broadcast network will reliably receive them. You can use the OSPF priority feature to give preference to an opaque-capable router, so that it becomes the elected DR.

For transmission to continue reliably across the network, the backup designated router (BDR) must also support opaque LSAs.

Example

The following command enables opaque LSAs across the entire system:

```
enable ospf capability opaque-lsa
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ospf export

```
enable ospf export [bgp | direct | e-bgp | i-bgp | rip | static | isis
   | isis-level-1 | isis-level-1-external | isis-level-2 | isis-level-2-
   external | host-mobility] [cost cost type [ase-type-1 | ase-type-2]
   {tag number} | policy-map]
```

Description

Enables redistribution of routes to *OSPF*.

Syntax Description

bgp	Specifies *BGP* routes.
direct	Specifies direct routes.
e-bgp	Specifies E-BGP routes.
i-bgp	Specifies I-BGP routes.
rip	Specifies *RIP* routes.
static	Specifies static routes.

isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routes.
isis-level-1-external	Specifies ISIS Level 1 External routes.
isis-level-2	Specifies ISIS Level 2 routes.
isis-level-2-external	Specifies ISIS Level 2 External routes.
host-mobility	Specifies host-mobility routes.
cost	Specifies a cost metric.
ase-type-1	Specifies AS-external type 1 routes.
ase-type-2	Specifies AS-external type 2 routes.
number	Specifies a tag value.
policy-map	Specifies a policy.

Default

The default tag number is 0. The default setting is disabled.

Usage Guidelines

After OSPF export is enabled, the OSPF router is considered to be an ASBR. Interface routes that correspond to the interface that has OSPF enabled are ignored.

The cost metric is inserted for all BGP, IS-IS, RIP-learned, static, and direct routes injected into OSPF. If the cost metric is set to 0, the cost is inserted from the route. The tag value is used only by special routing applications. Use 0 if you do not have specific requirements for using a tag. The tag value in this instance has no relationship with 802.1Q *VLAN* tagging.

The same cost, type, and tag values can be inserted for all the export routes, or a policy can be used for selective insertion. When a policy is associated with the export command, the policy is applied on every exported route. The exported routes can also be filtered using a policy.

Example

The following command enables OSPF to export BGP-related routes using LSAs to other OSPF routers:

```
enable ospf export bgp cost 1 ase-type-1 tag 0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ospf mpls-next-hop

```
enable ospf mpls-next-hop {vr vrf_name}
```

Description

Enables IP forwarding over calculated *MPLS* LSPs to subnets learned through *OSPF*.

Syntax Description

vrf-name	Specifies OSPF on a particular VRF.

Default

Disabled.

Usage Guidelines

This command enables IP forwarding over calculated MPLS LSPs to subnets learned through OSPF. (Calculated refers to an LSP that only reaches part of the way to the destination). By default, IP forwarding over MPLS LSPs to subnets learned via OSPF is disabled.

In order to configure OSPF on a particular VRF, you must supply the optional **vr** *vr-name* CLI parameter.

Example

The following command enables OSPF's use of MPLS LSPs to reach OSPF routes:

```
enable ospf mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

The **vr** keyword and *vrf_name* variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable ospf originate-default

```
enable ospf originate-default {always} cost cost type [ase-type-1 | ase-
   type-2] {tag number}
```

Description

Enables a default external LSA to be generated by *OSPF*, if no other default route is originated by OSPF by way of *RIP* and static route re-distribution.

Syntax Description

always	Specifies for OSPF to always advertise the default route.
cost	Specifies a cost metric.
ase-type-1	Specifies AS-external type 1 routes.
ase-type-2	Specifies AS-external type 2 routes.
number	Specifies a tag value.

Default

N/A.

Usage Guidelines

If always is specified, OSPF always advertises the default route. If always is not specified, OSPF adds the default LSA if a reachable default route is in the route table.

Example

The following command generates a default external type-1 LSA:

```
enable ospf originate-default cost 1 ase-type-1 tag 0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ospf restart-helper-lsa-check

```
enable ospf [vlan [all | vlan-name] | area area-identifier |virtual-link
   router-identifier area-identifier] restart-helper-lsa-check
```

Description

Enables the restart helper router to terminate graceful *OSPF* restart when received LSAs would affect the restarting router.

Syntax Description

all	Specifies all *VLAN*s
vlan-name	Specifies a VLAN name.
router-identifier	Specifies the router ID of the remote router of the virtual link.
area-identifier	Specifies an OSPF area.

Default

The default is enabled.

Usage Guidelines

This command configures the restart helper router to terminate graceful OSPF restart when received LSAs would affect the restarting router. This will occur when the restart-helper receives an LSA that will be flooded to the restarting router or when there is a changed LSA on the restarting router's retransmission list when graceful restart is initiated.

Example

The following command configures a router to terminate graceful OSPF restart for all routers in area 10.20.30.40 if it receives an LSA that would affect routing:

```
enable ospf area 10.20.30.40 restart-helper-lsa-check
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ospf use-ip-router-alert

```
enable ospf use-ip-router-alert
```

Description

Enables the generation of the *OSPF* router alert IP option.

Syntax Description

This command has no keywords or arguments.

Default

Disabled.

Usage Guidelines

Not applicable.

Example

The following command enables the OSPF router alert IP option:

```
enable ospf use-ip-router-alert
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ospfv3

```
enable ospfv3
```

Description

Enables *OSPFv3* for the router.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

When OSPFv3 is enabled, it will start exchanging Hellos on all of it's active interfaces. It will also start exporting routes into OSPFv3 routing domain from other protocols, if enabled.

When OSPFv3 is disabled, it will release all the run-time allocated resources like adjacencies, link state advertisements, run-time memory, etc.

OSPFv3 can be enabled successfully if and only if:

- At least one of the VLANs in the current virtual router has one IPv4 address configured

—OR—

- You explicitly configure the OSPFv3 router ID, a four-byte, dotted decimal number

Example

The following command enables OSPFv3 for the router:

```
enable ospfv3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ospfv3 export

```
enable ospfv3 export [direct | ripng | static | isis | isis-level-1
   | isis-level-1-external | isis-level-2 | isis-level-2-external| bgp
   | e-bgp | i-bgp |host-mobility] [cost cost type [ase-type-1 | ase-
   type-2] | policy_map]
```

Description

Enables redistribution of routes to *OSPFv3*.

Syntax Description

direct	Specifies direct routes.
ripng	Specifies *RIPng* routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routes.
isis-level-1-external	Specifies IS-IS Level 1 External routes.
isis-level-2	Specifies IS-IS Level 2 routes.
isis-level-2-external	Specifies IS-IS Level 2 External routes.
bgp	Specifies *BGP* IPv6 routes.
i-bgp	Specifies internal BGP IPv6 routes.

e-bgp	Specifies external BGP IPv6 routes.
host-mobility	Specifies host-mobility routes.
cost	Specifies a cost metric.
ase-type-1	Specifies AS-external type 1 routes.
ase-type-2	Specifies AS-external type 2 routes.
number	Specifies a tag value.
policy_map	Specifies a policy.

Default

The default setting is disabled.

Usage Guidelines

The cost metric is inserted for all RIPng-learned, static, and direct routes injected into OSPFv3. If the cost metric is set to 0, the cost is inserted from the route.

The same cost and type values can be inserted for all the export routes, or a policy can be used for selective insertion. When a policy is associated with the export command, the policy is applied on every exported route. The exported routes can also be filtered using a policy.

Policy files for this command will only recognize the following policy attributes:

- Match attributes
  - nlri *IPv6-address/mask-len*
- Action (set) attributes
  - cost <cost>
  - cost-type [ase-type-1 | ase-type-2]
  - permit
  - deny

Any other policy attribute will not be recognized and will be ignored.

The following is an example OSPFv3 export policy file:

```
entry first {
    if match any{
        nlri 2001:db8:200:300:/64;
        nlri 2001:db8:2146:23d1::/64;
        nlri 2001:db8:af31:3d0::/64;
        nlri 2001:db8:f6:2341::/64;
    } then {
        deny;
    }
}
entry second {
    if match any{
        nlri 2001:db8:304::/48;
        nlri 2001:db8:ca11::/48;
        nlri 2001:db8:da36::/48;
        nlri 2001:db8:f6a6::/48;
```

```
    } then {
        cost 220;
        cost-type ase-type-2;
        permit;
    }
}
```

Example

The following command enables OSPFv3 to export RIPng-related routes and associates a policy redist:

```
enable ospfv3 export ripng redist
```

History

This command was first available in ExtremeXOS 11.2.

The tag keyword was removed in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ospfv3 restart-helper-lsa-check

```
enable ospfv3 [[vlan | tunnel] all | {vlan} vlan-name | {tunnel} tunnel-
    name | area area-identifier] restart-helper-lsa-check
```

Description

This command configures the restart helper router to terminate *OSPF* graceful restart when received LSAs would affect the restarting router. This will occur when the restart helper receives an LSA that will be flooded to the restarting router or when there is a changed LSA on the restarting router's retransmission list when graceful restart is initiated.

Syntax Description

vlan	*VLAN*.
all	All VLANs.
vlan-name	VLAN name.
area	*OSPFv3* area.
area-identifier	Area identifier.
restart-helper-lsa-check	Terminate graeful restart helper mode when there is a change to an LSA.

Default

Enabled.

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ospfv3 virtual-link restart-helper-lsa-check

```
enable ospfv3 virtual-link {routerid} router-identifier {area} area-
   identifier restart-helper-lsa-check
```

Description

This command configures the restart helper router to terminate *OSPFv3* graceful restart when received LSAs would affect the restarting router. This occurs when the restart helper receives an LSA that will be flooded to the restarting router or when there is a changed LSA on the restarting router's retransmission list when graceful restart is initiated.

Syntax Description

virtual-link	OSPFv3 virtual link.
routerid	OSPFv3 router ID.
router-identifier	Router ID of neighbor OSPFv3 router.
area	OSPFv3 area.
area-identifier	Transit area ID of virtual link.
restart-helper-lsa-check	Terminates graceful restart helper mode when there is a change to an LSA (default is enabled).

Default

Enabled.

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable pim

```
enable pim {ipv4 | ipv6}
```

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables PIM on the system:

```
enable pim
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable pim iproute sharing

```
enable pim {ipv4 | ipv6} iproute sharing
```

Description

Enables the PIM *ECMP* feature.

Syntax Description

iproute	IP Route.
sharing	Equal Cost Multipath Routing.

Default

Disabled.

Usage Guidelines

Use this feature to allow downstream PIM router to choose multiple ECMP path to source via hash from one of the following selections without affecting the existing unicast routing algorithm:

- Source
- Group
- Source-Group
- Source-Group-Next-Hop

This feature does load splitting, not load balancing, and operates on a per (S, G) and (*;G) basis, splitting the load onto the available equal cost paths by hashing according to the selection criteria defined by the user.

Make sure that IP route sharing is also enabled using `enable iproute {ipv4| ipv6}` sharing.

Example

The following command enables the PIM ECMP feature:

```
enable pim ipv4 iproute sharing
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable pim snooping

`enable pim snooping {{`**`vlan`**`} `*`name`*`}`

Description

Enables PIM snooping globally or on one or all *VLAN*s.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

PIM snooping does not require PIM to be enabled. However, *IGMP* snooping must be disabled on VLANs that use PIM snooping. PIM snooping and MVR cannot be enabled simultaneously on a switch. PIM snooping should not be enabled on a VLAN that supports PIM-DM neighbors.

Example

The following example enables PIM snooping on the default VLAN:

```
enable pim snooping default
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable pim ssm vlan

```
enable pim {ipv4 | ipv6} ssm vlan [vlan_name | all]
```

Description

Enables PIM SSM on an IP interface.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
vlan_name	Specifies a *VLAN* name.
all	Specifies all VLANs.

Default

Disabled on all interfaces.

Usage Guidelines

This command enables PIM-SSM on the specified Layer 3 VLAN.

PIM-SM must also be configured on the interface for PIM to begin operating (which includes enabling IP multicast forwarding).

IGMPv3 include messages for multicast addresses in the SSM range are only processed by PIM if PIM-SSM is enabled on the interface. Any non-IGMPv3 include messages in the SSM range are not processed by PIM on any switch interface, whether SSM is enabled or not.

Example

The following example enables PIM-SSM multicast routing on VLAN accounting:

```
enable pim ssm vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable policy

```
enable policy
```

Description

This command enables the ONEPolicy functionality.

Syntax Description

This command has no arguments or variables.

Default

None.

Usage Guidelines

None.

Example

The following example shows how to enable ONEPolicy:

```
X450G2-48t-10G4.4 # enable policy
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable port

```
enable port [port_list | all]
```

Description

Enables a port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

All ports are enabled.

Usage Guidelines

Use this command to enable the port(s) if you disabled the port(s) for security, administration, or troubleshooting purposes.

Example

The following command enables ports 3, 5, and 12 through 15 on the stand-alone switch:

```
enable ports 3,5,12-15
```

The following command enables ports 3, 5, and 12 through 15 on the switch:

```
enable port 3,5,12-15
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ports mlag-id

```
enable ports [mlag-id mlag_id]
```

Description

Enables the current ports associated with the given ID.

Syntax Description

mlag-id	Port associated with MLAG.
mlag_id	MLAG identifier value of the MLAG port. Range is 1–65,000.

Default

N/A.

Usage Guidelines

If any ports are added or deleted from the LAG, the port state for those ports is not changed.

In MLAG orchestration mode, this command is executed on the other MLAG peer before it is executed on the MLAG peer on which the command is run. In orchestration mode, if the MLAG port numbers are not same on both the peers, it is possible that a different set of port numbers is enabled on the different MLAG peers. This command helps ensure that the correct set of ports associated with the MLAG ID is enabled.

If the port associated with the given MLAG ID is a load shared port, all the member ports associated with this load shared group are enabled.

If the port associated with the given MLAG ID is a virtual port, the command is ignored.

Example

The following example enables the ports associated with MLAG ID "123":

```
# enable ports mlag-id 123
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, 5720 series switches.

enable radius

```
enable radius {mgmt-access | netlogin}
```

Description

Enables the *RADIUS* client on the switch.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.

Default

RADIUS authentication is disabled for both switch management and network login by default.

Usage Guidelines

Before you enable RADIUS on the switch, you must configure the servers used for authentication and configure the authentication string (shared secret) used to communicate with the RADIUS authentication server.

To configure the RADIUS authentication servers, use the following command:

```
configure radius {mgmt-access | netlogin} [primary | secondary] server
[ipaddress | hostname] {udp_port} client-ip [ipaddress] {vrvr_name}
```

To configure the shared secret, use the following command:

```
configure radius {mgmt-access | netlogin} [primary | secondary] shared-
secret {encrypted} string
```

If you do not specify a keyword, RADIUS authentication is enabled on the switch for both management and network login. When enabled, all web, Telnet, and SSH logins are sent to the RADIUS servers for authentication. When used with a RADIUS server that supports ExtremeXOS CLI authorization, each CLI command is sent to the RADIUS server for authorization before it is executed.

Use the mgmt-access keyword to enable RADIUS authentication for switch management functions.

Use the netlogin keyword to enable RADIUS authentication for network login.

Example

The following command enables RADIUS authentication on the switch for both management and network login:

```
enable radius
```

The following command enables RADIUS authentication on the switch for network login:

```
enable radius netlogin
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable radius-accounting

```
enable radius-accounting {mgmt-access | netlogin}
```

Description

Enables *RADIUS* accounting.

Syntax Description

mgmt-access	Specifies the switch management RADIUS accounting server.
netlogin	Specifies the network login RADIUS accounting server.

Default

RADIUS accounting is disabled for both switch management and network login by default.

Usage Guidelines

The RADIUS client must also be enabled.

Before you enable RADIUS accounting on the switch, you must configure the servers used for accounting and configure the authentication string (shared secret) used to communicate with the RADIUS accounting server.

To configure the RADIUS accounting servers, use the following command:

`configure radius-accounting {mgmt-access | netlogin} [primary | secondary] server [ipaddress |hostname] {tcp_port} client-ip [ipaddress] {vr vr_name}`

To configure the shared secret, use the following command:

configure radius-accounting {mgmt-access | netlogin} [primary | secondary] shared-secret {encrypted} *string*

If you do not specify a keyword, RADIUS accounting is enabled on the switch for both management and network login.

Use the mgmt-access keyword to enable RADIUS accounting for switch management functions.

Use the netlogin keyword to enable RADIUS accounting for network login.

Example

The following command enables RADIUS accounting on the switch for both management and network login:

```
enable radius-accounting
```

The following command enables RADIUS accounting for network login:

```
enable radius-accounting netlogin
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable radius dynamic-authorization

`enable radius` **`dynamic-authorization`**

Description

Enables dynamic authorization *RADIUS* accounting.

Syntax Description

This command has no arguments or variables.

Default

Dynamic authorization RADIUS accounting is disabled by default.

Usage Guidelines

Before you enable RADIUS on the switch, you must configure the servers used for authentication and configure the authentication string (shared secret) used to communicate with the RADIUS authentication server.

To configure the RADIUS authentication servers and shared secret, use the following command:

```
configure radius dynamic-authorization index [nas-ip [ignore | require]
| server [host_ipaddr | host_ipV6addr | hostname] {tls {tls_port}}
client-ip [client_ipaddr | client_ipV6addr] {vr vr_name} {shared-secret
{encrypted} secret}
```

Example

The following command enables dynamic authorization RADIUS authentication on the switch:

```
enable radius dynamic-authorization
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable rip

```
enable rip
```

Description

Enables *RIP* for the whole router.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

RIP has a number of limitations that can cause problems in large networks, including:

- A limit of 15 hops between the source and destination networks.
- A large amount of bandwidth taken up by periodic broadcasts of the entire routing table.
- Slow convergence.
- Routing decisions based on hop count; no concept of link costs or delay.
- Flat networks; no concept of areas or boundaries.

Example

The following command enables RIP for the whole router:

```
# enable rip
```

History

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip aggregation

```
enable rip aggregation
```

Description

Enables the *RIP* aggregation of subnet information on a RIP version 2 (RIPv2) interface.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The enable (disable) rip aggregation command enables (disables) the RIP aggregation of subnet information on an interface configured to send RIPv1 or RIPv2-compatible traffic. The switch

summarizes subnet routes to the nearest class network route. The following rules apply when using RIP aggregation:

- Subnet routes are aggregated to the nearest class network route when crossing a class boundary.
- Within a class boundary, no routes are aggregated.
- If aggregation is enabled, the behavior is the same as in RIPv1.
- If aggregation is disabled, subnet routes are never aggregated, even when crossing a class boundary.

Example

The following command enables RIP aggregation on the interface:

```
# enable rip aggregation
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable rip export

```
enable rip export [bgp | direct | e-bgp | i-bgp | ospf | ospf-
   extern1 | ospf-extern2 | ospf-inter | ospf-intra | static | isis
   | isis-level-1| isis-level-1-external | isis-level-2 | isis-level-2-
   external ] [cost number {tag number} | policy policy-name]
```

Description

Enables *RIP* to redistribute routes from other routing functions.

Syntax Description

bgp	Specifies *BGP* routes.
direct	Specifies interface routes (only interfaces that have IP forwarding enabled are exported).
e-bgp	Specifies E-BGP routes.
i-bgp	Specifies I-BGP routes.
ospf	Specifies all *OSPF* routes.
ospf-extern1	Specifies OSPF external route type 1.
ospf-extern2	Specifies OSPF external route type 2.
ospf-inter	Specifies OSPF-inter area routes.
ospf-intra	Specifies OSPF-intra area routes.

static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routes.
isis-level-1-external	Specifies ISIS Level 1 External routes.
isis-level-2	Specifies ISIS Level 2 routes.
isis-level-2-external	Specifies ISIS Level 2 External routes.
cost *number*	Specifies the cost metric, from 0-15. If set to 0, RIP uses the route metric obtained from the route origin.
tag *number*	Specifies a tag number.
policy-name	Specifies a policy.

Default

Disabled.

Usage Guidelines

This command enables the exporting of BGP, static, direct, and OSPF-learned routes into the RIP domain. You can choose which types of OSPF routes are injected, or you can simply choose ospf, which will inject all learned OSPF routes regardless of type.

The cost metric is inserted for all RIP-learned, static, and direct routes injected into RIP. If the cost metric is set to 0, the cost is inserted from the route. For example, with BGP, the cost could be the MED or the length of the BGP path. The tag value is used only by special routing applications. Use 0 if you do not have specific requirements for using a tag.

Each protocol can have a policy associated with it to control or modify the exported routes.

Example

The following command enables RIP to redistribute routes from all OSPF routes:

```
# enable rip export ospf cost 0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable rip originate-default cost

```
enable rip originate-default {always} cost number {tag number}
```

Description

Configures a default route to be advertised by *RIP*.

Syntax Description

always	Specifies to always advertise the default route.
cost number	Specifies a cost metric. The range is 1 - 15.
tag *number*	Specifies a tag number.

Default

Disabled.

Usage Guidelines

If always is specified, RIP always advertises the default route to its neighbors. If always is not specified, RIP advertises a default route only if a reachable default route is in the system route table.

The default route advertisement is filtered using the out policy.

The cost metric is inserted for all RIP-learned, static, and direct routes injected into RIP. The tag value is used only by special routing applications.

Example

The following command configures a default route to be advertised by RIP if there is a default route in the system routing table:

```
# enable rip originate-default cost 7
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable rip poisonreverse

```
enable rip poisonreverse
```

Description

Enables poison reverse algorithm for *RIP*.

Syntax Description

Enables poison reverse algorithm for RIP.

Default

Enabled.

Usage Guidelines

Like split horizon, poison reverse is a scheme for eliminating the possibility of loops in the routed topology. In this case, a router advertises a route over the same interface that supplied the route, but the route uses a hop count of 16, defining it as unreachable.

Example

The following command enables the split horizon with poison reverse algorithm for RIP:

```
# enable rip poisonreverse
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable rip splithorizon

```
enable rip splithorizon
```

Description

Enables the split horizon algorithm for *RIP*.

Syntax Description

Enables the split horizon algorithm for RIP.

Default

Enabled.

Usage Guidelines

Split horizon is a scheme for avoiding problems caused by including routes in updates sent to the router from which the route was learned. Split horizon omits routes learned from a neighbor in updates sent to that neighbor.

Example

The following command enables the split horizon algorithm for RIP:

```
# enable rip splithorizon
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable rip triggerupdates

Triggered updates are a mechanism for immediately notifying a router's neighbors when the router adds or deletes routes or changes their metric.

```
enable rip triggerupdates
```

Description

Enables the trigger update mechanism.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Triggered updates occur whenever a router changes the metric for a route and it is required to send an update message immediately, even if it is not yet time for a regular update message to be sent. This will generally result in faster convergence, but may also result in more *RIP*-related traffic.

Example

The following command enables the trigger update mechanism:

```
3 enable rip triggerupdate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable rip use-ip-router-alert

```
enable rip use-ip-router-alert
```

Description

Enables the router alert IP option in the outgoing *RIP* control packets.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables the RIP router alert IP option:

```
# enable rip use-ip-router-alert
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable ripng

```
enable ripng
```

Description

Enables *RIPng* for the whole router.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Although RIPng is useful in small networks, it has a number of limitations that can cause problems in large networks, including:

- A limit of 15 hops between the source and destination networks.
- A large amount of bandwidth taken up by periodic broadcasts of the entire routing table.
- Slow convergence.
- Routing decisions based on hop count; no concept of link costs or delay.
- Flat networks; no concept of areas or boundaries.

For larger networks, consider *OSPFv3* as an alternative IGP.

Example

The following command enables RIPng for the whole router:

```
enable ripng
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ripng export

```
enable ripng export [direct | ospfv3 | ospfv3-extern1 | ospfv3-extern2
   | ospfv3-inter | ospfv3-intra | static | isis | isis-level-1| isis-
   level-1-external | isis-level-2| isis-level-2-external | bgp | e-bgp
   i-bgp] [cost number {tag number} | policy policy-name]
```

Description

Enables *RIPng* to redistribute routes from other routing functions.

Syntax Description

direct	Specifies interface routes (only interfaces that have IP forwarding enabled are exported).
ospfv3	Specifies all *OSPFv3* routes.
ospfv3-extern1	Specifies OSPFv3 external route type 1.
ospfv3-extern2	Specifies OSPFv3 external route type 2.
ospfv3-inter	Specifies OSPFv3-inter area routes.
ospfv3-intra	Specifies OSPFv3-intra area routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routes.
isis-level-1-external	Specifies IS-IS Level 1 External routes.
isis-level-2	Specifies IS-IS Level 2 routes.
isis-level-2-external	Specifies IS-IS Level 2 External routes.
bgp	Specifies *BGP* IPv6 routes
e-bgp	Specifies EBGP routes.
i-bgp	Specifies IBGP routes.
cost *number*	Specifies the cost metric, from 0-15. If set to 0, RIPng uses the route metric obtained from the route origin.
tag *number*	Specifies a tag number.
policy-name	Specifies a policy.

Default

Disabled. However, direct routes will always be advertised for all the interfaces where RIPng is enabled. For those interfaces where RIPng is not enabled, the corresponding direct route could be redistributed if direct route export is enabled through this command.

Default tag is 0.

Usage Guidelines

This command enables the exporting of static, direct, IS-IS, and OSPFv3-learned routes from the routing table into the RIPng domain. You can choose which types of IS-IS or OSPFv3 routes are injected, or you can simply choose isis or ospfv3, which will inject all learned routes (of all types) for the selected protocol.

The cost metric is inserted for all RIPng-learned, static, and direct routes injected into RIPng. If the cost metric is set to 0, the cost is inserted from the route table. The tag value is used only by special routing applications. Use 0 if you do not have specific requirements for using a tag.

Each protocol can have a policy associated with it to control or modify the exported routes. The following is sample policy file which modifies the cost of redistributed routes from OSPFv3 and statically configured routes:

```
entry filter_rt {
    If match any {
        Route-origin ospfv3;
        Route-origin static;
    }
    then {
        cost 10;
    }
}
```

Example

The following command enables RIPng to redistribute routes from all OSPFv3 routes:

```
enable ripng export ospfv3 cost 0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ripng originate-default

```
enable ripng originate-default {always} cost metric {tag number}
```

Description

Configures a default route to be advertised by *RIPng*.

Syntax Description

always	Specifies to advertise the default route in addition to learned default route.
cost *metric*	Specifies a cost metric. The range is 1 - 15.
tag *number*	Specifies a tag number.

Default

Disabled.

Usage Guidelines

If always is specified, RIPng always advertises the default route to its neighbors. If always is not specified, RIPng advertises a default route only if a reachable default route is in the system route table (the route is learned from other neighbors).

The default route advertisement is filtered using the out policy. Use the command, `configure ripng route-policy`, to specify the out policy.

The cost metric is inserted for all RIPng-learned, static, and direct routes injected into RIPng. The tag value is used only by special routing applications.

Example

The following command configures a default route to be advertised by RIPng if there is a default route in the system routing table:

```
enable ripng originate-default cost 7
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ripng poisonreverse

```
enable ripng poisonreverse {vlan vlan-name | tunnel tunnel_name | [vlan
   | tunnel] all}
```

Description

Enables the split horizon with poison reverse algorithm for *RIPng* on specified interfaces.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Used with split horizon, poison reverse is a scheme for eliminating the possibility of loops in the routed topology. In this case, a router advertises a route over the same interface that supplied the route, but the route uses a hop count of 16, defining it as unreachable.

If both split horizon and poison reverse are enabled, poison reverse takes precedence.

Example

The following command enables split horizon with poison reverse for RIPng on all IPv6 interfaces in the virtual router:

```
enable ripng poisonreverse
```

The following command enables split horizon with poison reverse for all the IPv6 configured VLANs in the virtual router:

```
enable ripng poisonreverse vlan all
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ripng splithorizon

```
enable ripng splithorizon {vlan vlan-name | tunnel tunnel_name | [vlan |
   tunnel] all}
```

Description

Enables the split horizon algorithm for *RIPng*.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Split horizon is a scheme for avoiding problems caused by including routes in updates sent to the router from which the route was learned. Split horizon omits routes learned from a neighbor in updates sent to that neighbor.

Example

The following command enables the split horizon algorithm for RIPng on all IPv6 configured interfaces:

```
enable ripng splithorizon
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

enable ripng triggerupdates

```
enable ripng triggerupdates {vlan vlan-name | tunnel tunnel_name | [vlan
    | tunnel] all}
```

Description

Enables the trigger update mechanism. Triggered updates are a mechanism for immediately notifying a router's neighbors when the router adds or deletes routes or changes their metric.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Triggered updates occur whenever a router changes the metric for a route and it is required to send an update message immediately, even if it is not yet time for a regular update message to be sent. This will generally result in faster convergence, but may also result in more *RIPng*-related traffic.

Example

The following command enables the trigger update mechanism on all IPv6 configured interfaces:

```
enable ripng triggerupdate
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

enable rmon

```
enable rmon
```

Description

Enables the collection of RMON statistics on the switch.

Syntax Description

This command has no arguments or variables.

Default

By default, RMON is disabled. However, even in the disabled state, the switch responds to RMON queries and sets for alarms and events. By enabling RMON, the switch begins the processes necessary for collecting switch statistics.

Usage Guidelines

The switch supports four out of nine groups of Ethernet RMON statistics. In an enabled state, the switch responds to the following four groups:

- Statistics—The RMON Ethernet Statistics group provides traffic and error statistics showing packets, bytes, broadcasts, multicasts, and errors on a LAN segment or *VLAN*.
- History—The History group provides historical views of network performance by taking periodic samples of the counters supplied by the Statistics group. The group features user-defined sample intervals and bucket counters for complete customization of trend analysis.
- Alarms—The Alarms group provides a versatile, general mechanism for setting threshold and sampling intervals to generate events on any RMON variable. Both rising and falling thresholds are supported, and thresholds can be on the absolute value of a variable or its delta value. In addition, alarm thresholds may be auto calibrated or set manually.
- Events—The Events group creates entries in an event log and/or sends *SNMP* traps to the management workstation. An event is triggered by an RMON alarm. The action taken can be configured to ignore it, to log the event, to send an SNMP trap to the receivers listed in the trap receiver table, or to both log and send a trap. The RMON traps are defined in RFC 1757 for rising and falling thresholds.

The switch also supports the following parameters for configuring the RMON agent, as defined in RFC2021:

- probeCapabilities—If you configure the probeCapabilities object, you can view the RMON MIB groups supported on at least one interface by the probe.
- probeSoftwareRev—If you configure the probeSoftwareRev object, you can view the current software version of the monitored device.
- probeHardwareRev—If you configure the probeHardwareRev object, you can view the current hardware version of the monitored device.
- probeDateTime—If you configure the probeDateTime object, you can view the current date and time of the probe.
- probeResetControl—If you configure the probeResetControl object, you can restart a managed device that is not running normally. Depending on your configuration, you can do one of the following:
  - Warm boot—A warm boot restarts the device using the current configuration saved in non-volatile memory.
  - Cold boot—A cold boot causes the device to reset the configuration parameters stored in non-volatile memory to the factory defaults and then restarts the device using the restored factory default configuration.

Note

You can only use the RMON features of the system if you have an RMON management application and have enabled RMON on the switch.

RMON requires one probe per LAN segment, and stand-alone RMON probes have traditionally been expensive. Therefore, the approach taken by Extreme Networks has been to build an inexpensive RMON probe into the agent of each system. This allows RMON to be widely deployed around the network without costing more than traditional network management. The switch accurately maintains RMON statistics at the maximum line rate of all of its ports.

For example, statistics can be related to individual ports. Also, because a probe must be able to see all traffic, a stand-alone probe must be attached to a nonsecure port. Implementing RMON in the switch means that all ports can have security features enabled.

To view the status of RMON polling on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for RMON polling.

To view the RMON memory usage statistics for a specific memory type (for example, statistics, events, logs, history, or alarms) or for all memory types, use the following command:

`show rmon memory {detail | memoryType}`

Example

The following command enables the collection of RMON statistics on the switch:

```
enable rmon
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable router-discovery

`enable router-discovery {ipv6} vlan vlan_name`

Description

Enables router discovery advertisements on the *VLAN* and the processing of router discovery messages.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command is only valid when the specified VLAN has an IPv6 address associated with it. After IPv6 Router Discovery is enabled on a VLAN, router advertisement messages are regularly sent on all ports associated with the VLAN.

Example

The following example enables router discovery for the VLAN "top_floor":

```
enable router-discovery vlan top_floor
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

enable sflow

```
enable sflow
```

Description

Globally enables sFlow statistical packet sampling.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables sFlow globally on the switch.

Note
sFlow and mirroring are not mutually exclusive. You can enable sFlow and mirroring at the same time.

Any traffic grouping using QP2 may encounter unexpected results when sFlow is enabled. For more information about *QoS*, see the *Quality of Service* section in the *Switch Engine 32.2 User Guide*.

Example

The following command enables sFlow sampling globally:

```
enable sflow
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable sflow ports

```
enable sflow ports [ all |port_list ] {ingress | egress | both }
```

Description

Enables sFlow statistical packet sampling on a particular list of ports.

Syntax Description

port_list	Specifies a list of ports.
all	All ports in the system.
ingress	Enables ingress sFlow on a per-port basis.
egress	Enables egress sFlow on a per-port basis.
both	Enables both ingress and egress sFlow on a per-port basis.

Default

Ingress.

Usage Guidelines

This command enables sFlow on a particular list of ports. Ingress, egress, or a combination of both types of sampling can be enabled on a port. You also need to enable sFlow globally in order to gather statistics and send the data to the collector. Once sFlow is enabled globally, and on the ports of interest, sampling and polling begins.

Use the following command to enable sFlow globally: `enable sflow`

Note

sFlow and mirroring are not mutually exclusive. You can enable sFlow and mirroring at the same time.

For more information about mirroring, see Configuring Slots and Ports on a Switch.

Example

The following command enables egress sFlow sampling on the port 3:1:

```
enable sflow ports 3:1 egress
```

History

This command was first available in ExtremeXOS 11.0.

The ingress, egress, and both keywords we added in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable sharing grouping

```
enable sharing port grouping port_list {algorithm [address-based {L2 |
   L3 | L3_L4 | custom} | port-based }]} {resilient-hashing [on | off]}
   {distribution-mode [all | local-slot | port-lists]} {lacp | health-
   check}
```

Description

Enables the switch to configure port link aggregation, or load sharing. By using link aggregation, you use multiple ports as a single logical port. Link aggregation also provides redundancy because traffic is redistributed to the remaining ports in the *LAG* if one port in the group goes down. LACP allows the system to dynamically configure the LAGs.

The **port-based** keyword was added to the command to support the creation of port-based load sharing groups.

Syntax Description

port	Specifies the master logical port for a load-sharing group or link aggregation group (LAG).
port_list	Specifies one or more ports or slots and ports to be grouped to the logical port.
address-based	Specifies link aggregation by address-based algorithm.
L2	Specifies address-based link aggregation by Layer 2. This is the default value.
L3	Specifies address-based link aggregation by Layer 3. Note: The L3 algorithm will be deprecated. Selection of L3 behaves the same as L3_L4. The inclusion of Layer 4 ports for distribution is not available on a per group basis. The inclusion of Layer4 ports for distribution is controlled globally for all LAGs in a switch via the `configure forwarding sharing [L3 | L3_L4]` command.
L3_L4	Specifies address-based link aggregation by Layer 3 IP plus Layer4 port. Note: The inclusion of Layer4 ports for distribution is not available on a per group basis. The inclusion of Layer4 ports for distribution is controlled globally for all LAGs in a switch via the `configure forwarding sharing [L3 | L3_L4]` command.

custom	Selects the custom link aggregation algorithm configured with the following command: `configure sharing address-based custom [ipv4 [L3-and-L4 | source-only | destination-only | source-and-destination] | hash-algorithm [xor | crc-16]]`. The configuration of the custom option applies to all LAGs on the switch.
port-based	Supports the creation of port-based load sharing groups.
all	All active members of the group are eligible for distribution on all slots in the switch.
local-slot	If there are one or more active members of the group on the slot where traffic is received, distribution wil be restricted to these local-slot members.
port-lists	If there are one or more active members of the group in the configured distribution port list for the slot on which traffic is received, distribution will be restricted to these configured ports.
resilient-hashing	Enables the resilient hashing hardware-based capability that minimizes the remapping of flows to aggregator member ports during aggregator member changes.
lacp	Specifies dynamic link aggregation, or load sharing, using the LACP.
health-check	Specifies a health check type of link aggregation group.

Default

Disabled.

Usage Guidelines

Link aggregation, or load sharing, allows you to increase bandwidth and availability between switches by using a group of ports to carry traffic in parallel between switches. The aggregation algorithm allows the switch to use multiple ports as a single logical port. For example, *VLAN*s see the link aggregation group (LAG) as a single logical port.

Note
All ports that are designated for the LAG must be removed from all VLANs prior to configuring the LAG.

You can enable and configure dynamic link aggregation, using LACP or health-check link aggregation. Static link aggregation is the default link aggregation method.

Note
Always verify the LACP configuration by issuing the `show ports sharing` command. Look for the ports listed as being in the aggregator.

If a port in a LAG fails, traffic is redistributed to the remaining ports in the LAG. If the failed port becomes active again, traffic is redistributed to include that port.

Link aggregation must be enabled on both ends of the link, or a network loop will result.

Any attempt to enable sharing on ports that have an configuration is denied with following error message:

```
ERROR: Sharing configuration on MLAG ports cannot be modified. Use "disable mlag port
<port>" to remove port from MLAG group first.
```

Note

See the appropraite volume of the *Switch Engine 32.2 User Guide* for information on the interaction of port-based ACLs and LAGs of ports.

LAGs are defined according to the following rules:

- Although you can reference only the logical port of a LAG to a *STPD*, all the ports of a load-sharing group actually belong to the specified STPD.
- When using link aggregation, you should always reference the logical port of the LAG when configuring or viewing VLANs. VLANs configured to use other ports in the LAG will have those ports deleted from the VLAN when link aggregation becomes enabled.

Link aggregation, or load-sharing, algorithms allow you to select the distribution technique used by the LAG to determine the output port selection. Algorithm selection is not intended for use in predictive traffic engineering.

ExtremeXOS switches use address based algorithms to determine which physical port in the LAG to use for forwarding traffic out of the switch. Refer to `configure sharing address-based custom` for more information on using addressing information.

For Port-based load sharing:

Note

If you attempt to create a port-based load sharing group with more than 16 possible aggregator ports, the following message will be displayed:

```
Error: The system can have a maximum of 16 ports in a load sharing group withthe
configured algorithm.
```

This message indicates enforcement of the limit of 16 aggregator ports in a port-based LAG. Existing error messages are also used to enforce the 16 aggregator port limit for port-based load sharing groups modified by the `configure sharing` *`port`* `add ports`*`port_list`* command.

You cannot enable sharing on ports that have MVRP enabled.

The following guidelines apply to link aggregation on all switches:

- For all switches a static LAG can contain up to 8 ports.
- An LACP LAG can include twice the number of ports as a static LAG; out of these half can be selected links and any remaining ports will be standby links.
- A Health Check LAG may contain the same number of ports as a static LAG.
- The maximum number of LAGs is 128.
- The default load-sharing algorithm is L2 address-based aggregation. Any broadcast, multicast, or unknown unicast packet is distributed across all members in the LAG.
- The available address-based parameters are L2 for Layer 2 and L3_L4 for Layer 3 plus Layer4. If the packet is not IP, the switch applies the Layer 2 algorithm, which is the default setting.
- The custom keyword is supported on all switches.

History

This command was first available in ExtremeXOS 10.1.

The address-based algorithm was added in ExtremeXOS 11.0.

The **L2** and **L3** optional parameters were added in ExtremeXOS 11.1.

IPv6-compatibility was added in ExtremeXOS 11.2.

Dynamic link aggregation, using LACP, was added in ExtremeXOS 11.3.

The **L3_L4** optional parameter was added in ExtremeXOS 11.5.

SummitStack functionality was added in ExtremeXOS 12.0.

Health-check link aggregation was added in ExtremeXOS 12.1.3.

The **custom** keyword was added in ExtremeXOS 12.3.

The **port-based** keyword was added in ExtremeXOS 15.4.

The **resilient-hashing** keyword was added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable slpp guard

enable **slpp guard ports** [*port_list* | **all**]

Description

Enables the Simple Loop Protection Protocol (SLPP) Guard feature.

Syntax Description

slpp	Specifies enabling SLPP.
guard	Specifies disabling a port as soon as an SLPP PDU is received.
ports	Specifies selecting ports on which to enable SLPP guard.
port_list	Selects which ports to enable SLPP guard on.
all	Specifies enabling SLPP guard on all ports.

Default

By default, SLPP Guard is disabled on all ports.

Usage Guidelines

SLPP is an application that detects loops in a Split Multi-link Trunking (SMLT) network. SLPP Guard is a complementary feature that helps prevent loops in networks by administratively disabling an edge port if a switch receives an SLPP PDU from an SMLT network.

Example

The following example enables SLPP Guard on port 5:

```
# enable slpp guard ports 5
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable smartredundancy

`enable smartredundancy` *`port_list`*

Description

Enables the Smart Redundancy feature on the primary port.

Syntax Description

`port_list`	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

You must configure the software-controlled redundant port using the `configure ports redundant` command prior to enabling Smart Redundancy.

The Smart Redundancy feature works in concert with the software-controlled redundant port feature. With Smart Redundancy enabled on the switch, when the primary port becomes active the switch redirects all traffic to the primary port and blocks the redundant port again. If you disable Smart Redundancy, the primary port is blocked because traffic is now flowing through the redundant port.

Example

The following command enables the Smart Redundancy feature on port 4 on a switch:

```
enable smartredundancy 4
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp access

```
enable snmp access {snmp-v1v2c | snmpv3}
```

Description

Selectively enables *SNMP* access on the switch.

Syntax Description

snmp-v1v2c	Specifies SNMPv1/v2c access only.
snmpv3	Specifies SNMPv3 access only.

Default

Disabled.

Usage Guidelines

To have access to the SNMP agent residing in the switch, at least one *VLAN* must have an IP address assigned to it.

Any network manager running SNMP can manage the switch for v1/v2c/v3, provided the MIB is installed correctly on the management station. Each network manager provides its own user interface to the management facilities.

For SNMPv3, additional security keys are used to control access, so an SNMPv3 manager is required for this type of access.

This command allows you to enable either all SNMP access, no SNMP access, v1/v2c access only, or v3 access only.

To prevent any SNMP access, use the following command : `disable snmp access {snmp-v1v2c | snmpv3}`

ExtremeXOS 11.2 introduced the concept of safe defaults mode. Safe defaults mode runs an interactive script that allows you to enable or disable SNMP, Telnet, and switch ports. When you set up your switch for the first time, you must connect to the console port to access the switch. After logging in to the switch, you enter safe defaults mode. Although SNMP, Telnet, and switch ports are enabled by default, the script prompts you to confirm those settings.

If you choose to keep the default setting for SNMP—the default setting is enabled—the switch returns the following interactive script:

```
 Since you have chosen less secure management methods, please remember to increase the
security of your network by taking the following actions: * change your admin password
* change your SNMP public and private strings * consider using SNMPv3 to secure network
management traffic
```

In addition, you can return to safe defaults mode by issuing the following command: `configure safe-default-script`

If you return to safe defaults mode, you must answer the questions presented during the interactive script.

For more detailed information about safe defaults mode, see the *Using Safe Defaults Mode* section in the *Switch Engine 32.2 User Guide*.

Example

The following command enables all SNMP access for the switch:

```
enable snmp access
```

History

This command was first available in ExtremeXOS 10.1.

SNMPv3 was added to ExtremeXOS 12.2. It was also included in ExtremeXOS 11.6.4 and 12.1.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp access vr

```
enable snmp access vr [vr_name | all]
```

Description

Selectively enables *SNMP* access on virtual routers.

Syntax Description

vr_name	Specifies the virtual router name.
all	Specifies all virtual routers.

Default

Enabled on all virtual routers.

Usage Guidelines

Use this command to enable SNMP access on any or all virtual routers.

To disable SNMP access on virtual routers, use the `disable snmp access vr` command.

To display the SNMP configuration and statistics on a specified virtual router, use the `show snmp vr_name` command.

Example

The following command enables SNMP access on the virtual router vr-finance:

```
enable snmp access vr vr-finance
```

History

This command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp community

```
enable snmp community [encrypted enc_community_name | community_name |
   alphanumeric-community-string | hex hex_community_name
```

Description

Enables *SNMP* community strings.

Syntax Description

encrypted	Community name is encrypted.
enc_community_name	Encrypted community name.
community_name	Community name in ASCII format.
hex	Provide value in hexadecimal.
hex_community_name	Community name in hexadecimal.
alphanumeric-community-string	Specifies the SNMP community string name.

Default

N/A.

Usage Guidelines

This command allows the administrator to enable an snmp community that has been disabled. It sets the row status of the community to Active.

Example

The following command enables the community string named extreme:

```
enable snmp community extreme
```

History

This command was first available in ExtremeXOS 12.1.

The **hex** keyword and *hex_community_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp notification-log

```
enable snmp notification-log [ default | name | hex hex_name |all]
```

Description

Controls the administrative state of a log.

Syntax Description

default	The default log.
name	Specifies the name of the log.
hex	Provide value in hexadecimal.
hex_name	Name of the log in hexadecimal.
all	Specifies all logs.

Default

Disabled.

Usage Guidelines

Use this command to control the administrative state of a log.

Example

The following example enables all logs:

```
enable snmp notification-log all
```

The following example enables *nmslog2*:

```
enable snmp notification-log nmslog2
```

History

This command was first available in ExtremeXOS 15.5.

The **default** and **hex** keywords and *hex_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp trap l3vpn

```
enable snmp trap l3vpn {vr_name}
```

Description

This command enables Layer 3 VPN MIB notification traps for the child VPN VRFs of the specified VR.

Syntax Description

vr_name	Specifies the name of the parent VR where this RFC 4382 scalar is applied. If *vr_name* is not provided, then this command is applied to the VR in the current context.

Default

Disabled.

Usage Guidelines

This command enables generation of the following Layer 3 VPN *SNMP* traps:

- mplsL3VpnVrfUp—Sent when the first IP *VLAN* becomes active and the administrative state is enabled.
- mplsL3VpnVrfDown—Sent when the last active IP VLAN becomes inactive, or the administrative state is disabled.

Example

The following example enables SNMP traps for Layer 3 VPNs on the default VR:

```
enable snmp traps l3vpn vr vr-default
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp traps

```
enable snmp traps
```

Description

Turns on *SNMP* trap support.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

An authorized trap receiver can be one or more network management stations on your network. The switch sends SNMP traps to all trap receivers.

To view if SNMP traps are being sent from the switch, use the `show management` command. The `show management` command displays information about the switch including the enabled/disabled state of SNMP traps being sent.

Example

The following command enables SNMP trap support on the switch:

```
enable snmp traps
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp traps configuration

```
enable snmp traps configuration [save | change]
```

Description

Enables sending *SNMP* trap when saving or changing the switch configuration.

Syntax Description

configuration	Sends SNMP trap for switch configuration.
save	Generates SNMP trap when switch configuration is saved (default is disabled).
change	Generates SNMP trap when switch configuration is changed (default is disabled).

Default

The default is that SNMP traps are disabled for switch configuration changes/saves.

Example

The following example enables SNMP traps for switch configuration changes:

```
enable snmp traps configuration change
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches..

enable snmp traps bfd

```
enable snmp traps bfd session down | session-up
```

Description

This command enables session up/down trap reception for BFD.

Syntax Description

snmp	Configure *SNMP* specific settings.
traps	Configure SNMP Trap generation settings.
bfd	BFD-specific traps.
session-down	Generate trap when BFD session goes down.
session-up	Generate trap when BFD session goes up.

Default

Both session-down and session-up.

Usage Guidelines

Use this command to enable trap reception for BFD session up/down.

Example

The following command will enable trap generation for BFD session down events.

```
# enable snmp traps bfd session-down
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp traps fdb mac-tracking

```
enable snmp traps fdb mac-tracking
```

Description

Enables *SNMP* trap generation when MAC-tracking events occur for a tracked MAC address.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following example enables SNMP traps for MAC-tracking events:

```
enable snmp traps fdb mac-tracking
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp traps identity-management

```
enable snmp traps identity-management
```

Description

Enables the identity management feature to send *SNMP* traps for low memory conditions.

Syntax Description

This command has no arguments or variables.

Default

No traps are sent.

Usage Guidelines

The low memory conditions are described in the description for the `configure identity-management stale-entry aging-time` *`seconds`* command.

Example

The following command enables the identity management SNMP trap feature:

```
enable snmp traps identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp traps l2vpn

```
enable snmp traps l2vpn
```

Description

Enables *SNMP* traps associated with Layer 2 VPNs for all *MPLS* configured VLANs.

Syntax Description

This command has no arguments or variables.

Default

All Layer 2 VPN traps are disabled.

Example

The following command enables SNMP traps associated with Layer 2 VPNs:

```
enable snmp traps l2vpn
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable snmp traps l3vpn

```
enable snmp traps l3vpn {vr vr_name}
```

Description

Use this command to turn on *SNMP* trap support for L3 VPN.

Syntax Description

vr_name	Specifies the name of the parent VR where this RFC 4382 scalar is applied. If VR name is not provided, then this command is applied to the VR in the current context.

Default

Enabled.

Usage Guidelines

Use this command to enable generation of L3VPN SNMP traps—mplsL3VpnVrfUp and mplsL3VpnVrfDown. These trap notifications are sent under the following conditions:

- mplsL3VpnVrfUp—first IP *VLAN* becomes active and administrative state is enabled.
- mplsL3VpnVrfDown—last active IP VLAN becomes inactive OR administrative state is disabled.

Example

The following example enables L3 VPN SNMP traps support on the switch:

```
enable snmp traps l3vpn vr vr-default
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp traps lldp

```
enable snmp traps lldp {ports [all | port_list]}
```

Description

Enables the transmission of *LLDP SNMP* trap notifications.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

Note

To enable SNMP traps for LLDP MED TLVs, you must issue a separate command; use the `enable snmp traps lldp-med {ports [all | port_list]}`.

If you do not specify any ports, the system sends LLDP traps for all ports.

Note

The Avaya-Extreme proprietary TLVs do not send traps.

Example

The following command enables LLDP SNMP traps for all ports:

```
enable snmp traps lldp ports all
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp traps lldp-med

`enable snmp traps lldp-med {ports [all | port_list]}`

Description

Enables the transmission of *LLDP SNMP* trap notifications related to LLDP MED extension TLVs.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

If you do not specify any ports, the system sends LLDP-MED traps for all ports.

Example

The following command enables LLDP-MED SNMP traps for all ports:

```
enable snmp traps lldp-med ports all
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmp traps mpls

```
enable snmp traps mpls
```

Description

Enables *SNMP* traps associated with *MPLS* for all MPLS configured VLANs.

Syntax Description

This command has no arguments or variables.

Default

All MPLS traps are disabled.

Example

The following command enables SNMP traps associated with MPLS:

```
enable snmp traps mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable snmp traps ospf

```
enable snmp traps ospf [all | trap-map bit-map]
```

Description

Enables the *OSPF* module to send traps on various OSPF events.

Syntax Description

all	Sets RFC1850 ospfSetTrap to 0x1ffff.
trap-map	Specifies the ospfSetTrap as defined in RFC1850.
bit-map	Specifies the ospfSetTrap value in HEX (for example, 0x1ffff for all traps).

Default

The default is disabled.

Usage Guidelines

This command enables the OSPF module to send traps on various OSPF events.

Example

The following command sets ospfSetTrap for all traps:

```
enable snmp traps ospf all
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable snmp traps ospfv3

```
enable snmp traps ospfv3
```

Description

Enables the transmission of *OSPFv3 SNMP* notifications.

Syntax Description

ospfv3	OSPFv3-related traps.

Default

The default is disabled.

Example

The following example enables the transmission of OSPFv3 SNMP notifications:

```
enable snmp traps ospfv3
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

enable snmp traps port-up-down ports

```
enable snmp traps port-up-down ports [port_list | all]
```

Description

Enables port up/down trap reception for specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled.

Usage Guidelines

Use this command to begin receiving *SNMP* trap messages when a port transitions between being up and down.

Example

The following command enables ports 3, 5, and 12 through 15 on a stand-alone switch to receive SNMP trap messages when the port goes up/down:

```
enable snmp traps port-up-down ports 3,5,12-15
```

History

This command was first available in ExtremeXOS 10.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmpv3

```
enable snmpv3 default-group
```

Description

Selectively enables SNMPv3 default-group access on the switch.

Syntax Description

default-group	Specifies SNMPv3 default-group.

Default

Enabled.

Usage Guidelines

This command is used to enable SNMPv3 default-group access.

Enabling SNMPv3 default-group access activates the access to an SNMPv3 default-group and the user-created SNMPv3-user part of default-group. This command produces an error if SNMPv3 access is disabled on the switch.

The default groups are: admin, initial, v1v2c_ro, v1v2c_rw.

Example

The following command enables the default group access on the switch:

```
enable snmp default-group
```

History

This command was available in ExtremeXOS 12.2.

It was also included in ExtremeXOS 11.6.4 and ExtremeXOS 12.1.2.

The default-user option was removed in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable snmpv3 community

```
enable snmpv3 community [ community_index | hex hex_community_index ]
```

Description

This command enables a community entry specified by the community index.

Syntax Description

community_index	Community index in ASCII.
hex	Provide value in hexadecimal.
hex_community_index	Community index in hexadecimal.

Default

Enabled.

Usage Guidelines

This command is used to enable a community entry specified by the community index.

Example

```
enable snmpv3 community abcd
```

History

This command was available in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable sntp-client

```
enable sntp-client
```

Description

Enables the *SNTP* client.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

SNTP can be used by the switch to update and synchronize its internal clock from a Network Time Protocol (NTP) server. After the SNTP client has been enabled, the switch sends out a periodic query to the indicated NTP server, or the switch listens to broadcast NTP updates. In addition, the switch supports the configured setting for Greenwich Mean Time (GMT) offset and the use of Daylight Savings Time (DST).

Example

The following command enables the SNTP client:

```
enable sntp-client
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable ssh2

```
enable ssh2 {access-profile [access_profile | none]} {port
   tcp_port_number} {vr [vr_name | all | default]}
```

Description

Enables SSH2 server to accept incoming sessions from SSH2 clients.

Syntax Description

access_profile	Specifies an *ACL* policy.
none	Cancels a previously configured ACL policy.
port	Specifies a TCP port number. The default is port 22.
vr_name	Specifies a virtual router name. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
all	Specifies that SSH is enabled on all virtual routers.
default	Specifies that SSH is enabled on the default virtual router.

Default

The SSH2 feature is disabled by default.

Usage Guidelines

SSH2 enables the encryption of session data. You must be logged in as an administrator to enable SSH2.

Use the port option to specify a TCP port number other than the default port of 22. You can only specify ports 22 and 1024 through 65535.

Using ACLs to Control SSH Access

You can specify a list of predefined clients that are allowed SSH2 access to the switch. To do this, you configure an ACL policy to permit or deny a specific list of IP addresses and subnet masks for the SSH port. You must create an ACL policy file before you can use the access-profile option. If the ACL policy file does not exist on the switch, the switch returns an error message indicating that the file does not exist.

Use the none option to cancel a previously configured ACL.

In the ACL policy file for SSH2, the source-address field is the only supported match condition. Any other match conditions are ignored.

Policy files can also be configured using the following command:

```
configure ssh2 access-profile [ access_profile | [[addrule ] [first |
[[before | after]previous_rule]]] | delete rule | none ]
```

Creating an ACL Policy File

To create an ACL policy file, use the `edit policy` command. For more information about creating and implementing ACL policy files, see Policy Manager and ACLs.

If you attempt to implement a policy that does not exist on the switch, an error message similar to the following appears:

```
Error: Policy /config/MyAccessProfile_2.pol does not exist on file system
```

If this occurs, make sure the policy you want to implement exists on the switch. To confirm the policies on the switch, use the `ls` command. If the policy does not exist, create the ACL policy file.

Viewing SSH Information

To view the status of SSH2 sessions on the switch, use the `show management` command. This command displays information about the switch including the enable/disable state for SSH2 sessions and whether a valid key is present.

Example

The following command enables the SSH2 feature:

```
enable ssh2
```

The next example assumes you have already created an ACL to apply to SSH.

The following command applies the ACL MyAccessProfile_2 to SSH:

```
enable ssh2 access-profile MyAccessProfile_2
```

History

This command was first available in the ExtremeXOS 11.0

The access-profile and none options were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable stacking

```
enable stacking {node-address node-address}
```

Description

This command enables stacking on one or all nodes.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the `show stacking` command.

Default

Default value is stacking disabled.

Usage Guidelines

This command enables stacking on one or all nodes. When a node is operating in stacking mode, *QoS* profile QP7 cannot be created.

For information about stacking methods, and which switches can stack with other switches, see the *Available Stacking Methods* topic in the *Switch Engine 32.2 User Guide*.

If a node-address is not specified, this command first performs an analysis of the current stacking configuration on the entire stack. If the stack has not yet been configured for stacking operation, or if the configuration is self-inconsistent, the user is offered the option of invoking the easy setup function. The following message appears:

```
You have not yet configured all required stacking parameters. Would you
like to perform an easy setup for stacking operation? (y/N)
```

If you enter Yes, the easy setup procedure is invoked and you first see the following message:

```
Executing "configure stacking easy-setup" command...
```

If you enter No, the following message appears:

```
Stacking has been enabled as requested.
```

The following describes the operation performed if easy setup is neither offered nor selected.

If you do not enter any node-address, stacking is enabled on all nodes in the stack topology.

If the node-address parameter is present, stacking is enabled on the node with the specified node-address. This is the MAC address assigned to the stackable by the factory.

The `show stacking configuration` command shows the current configuration of this parameter as well as the value currently in use.

A node that is enabled for stacking attempts to join the active topology. If successful, it then negotiates a node role with the other nodes in the stack and becomes an operational node in the stack according to its role. The master node's configuration is applied to the node.

When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified
node(s).
```

Example

To enable stacking on a stack:

```
# enable stacking
This command will take effect at the next reboot of the specified node(s).
```

To enable stacking on node 5, with a MAC address 00:04:96:26:6b:ed:

```
# enable stacking node-address 00:04:96:26:6b:ed
This command will take effect at the next reboot of the specified node(s).
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable stacking-support

```
enable stacking-support
```

Description

This command enables a switch with dual-purpose hardware to participate in a stack.

Syntax Description

This command does not have additional syntax.

Default

Stacking support is disabled by default for all platforms, except for the ExtremeSwitching X450-G2 and X465 series switches, which have dedicated stacking ports that are always enabled.

Usage Guidelines

The Stacking-Support Option Control column in Table 18 on page 1352 displays Yes in the rows for switch configurations for which you can enable the stacking-support option.

After you enable the stacking-support option, you must reboot the switch to activate the configuration change.

If you enable the stacking-support option on a switch and reboot, data communications on the data ports listed in Table 18 on page 1352 stops, and the ports use stacking protocols instead of Ethernet protocols.

Example

To enable the stack ports, enter the following command:

```
# enable stacking-support
This setting will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable stpd

```
enable stpd {stpd_name}
```

Description

Enables the *STP* protocol for one or all STPDs.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.

Default

Enabled.

Usage Guidelines

If you want to enable the STP protocol for all STPDs, do not specify an STPD name.

Example

The following command enables an STPD named Backbone_st:

```
enable stpd backbone_st
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable stpd auto-bind

```
enable stpd stpd_name auto-bind [ {vlan} vlan_name | vlan vlan_list]
```

Description

Automatically adds ports to an *STPD* when ports are added to a member *VLAN*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
vlan_name	Specifies the name of the VLAN to have autobind enabled.
vlan_list	Specifies the VLAN list of IDs to have autobind enabled.

Default

The autobind feature is disabled on user-created STPDs. The autobind feature is enabled on the default VLAN that participates in the default STPD S0.

If you enable autobind and add ports to a member VLAN, those ports are automatically added to the STPD.

Usage Guidelines

If you create an STPD and a VLAN with unique names, the keywords stpd and vlan are optional.

You cannot configure the autobind feature on a network login VLAN.

In an EMISTP or PVST+ environment, when you issue this command, any port or list of ports that you add to the carrier VLAN are automatically added to the STPD with autobind enabled. In addition, any port or list of ports that you remove from a carrier VLAN are automatically removed from the STPD. This allows the STPD to increase or decrease its span as you add ports to or remove ports from a carrier VLAN.

For *MSTP*, when you issue this command, any port or list of ports that gets automatically added to an *MSTI* are automatically inherited by the CIST. In addition, any port or list of ports that you remove from an MSTI protected VLAN are automatically removed from the CIST. For more information see the section. For more information, see Automatically Inheriting Ports--MSTP Only on page 2325.

Carrier VLAN

A carrier VLAN defines the scope of the STPD, which includes the physical and logical ports that belong to the STPD and the 802.1Q tag used to transport STP BPDUs in the encapsulation mode is EMISTP or PVST+. Only one carrier VLAN can exist in a given STPD, although some of its ports can be outside the control of any STPD at the same time.

Note
The STPD ID must be identical to the VLAN ID of the carrier VLAN in that STPD.

If you configure MSTP, you do not need a carrier VLAN. With MSTP, you configure a CIST that controls the connectivity of interconnecting MSTP regions and sends BPDUs across the regions to communicate the status of MSTP regions. All VLANs participating in the MSTP region have the same privileges.

Protected VLAN

Protected VLANs are all other VLANs that are members of the STPD. These VLANs “piggyback” on the carrier VLAN. Protected VLANs do not transmit or receive *STP* BPDUs, but they are affected by STP

state changes and inherit the state of the carrier VLAN. Protected VLANs can participate in multiple STPDs, but any particular port in the VLAN can belong to only one STPD.

Enabling autobind on a protected VLAN does not expand the boundary of the STPD. However, the VLAN and port combinations are added to or removed from the STPD subject to the boundaries of the carrier VLAN.

If you configure MSTP, all member VLANs in an MSTP region are protected VLANs. These VLANs do not transmit or receive STP BPDUs, but they are affected by STP state changes communicated by the CIST to the MSTP regions. MSTIs cannot share the same protected VLAN; however, any port in a protected VLAN can belong to multiple MSTIs.

Automatically Inheriting Ports--MSTP Only

In an MSTP environment, whether you manually or automatically bind a port to an MSTI in an MSTP region, the switch automatically binds that port to the CIST. The CIST handles BPDU processing for itself and all of the MSTIs; therefore, the CIST must inherit ports from the MSTIs in order to transmit and receive BPDUs.

Displaying STP Information

To view STP configuration status of the ports on a VLAN, use the following command:

```
show {vlan} [vlan_name | vlan_list] stpd
```

Example

The examples in this section assume that you have already removed the ports from the Default VLAN.

To automatically add ports to an STPD running 802.1D, EMISTP, or PVST+ and to expand the boundary of the STPD, you must complete the following tasks:

- Create the carrier VLAN.
- Assign a VLAN ID to the carrier VLAN.
- Add ports to the carrier VLAN.
- Create an STPD (or use the default, S0).
- Enable autobind on the STPDs carrier VLAN.
- Configure the STPD tag (the STPD ID must be identical to the VLAN ID of the carrier VLAN in the STP domain).
- Enable STP.

The following example enables autobind on an STPD named s8 after creating a carrier VLAN named v5:

```
create vlan v5
configure vlan v5 tag 100
configure vlan v5 add ports 1:1-1:20 tagged
create stpd s8
enable stpd s8 auto-bind v5
configure stpd s8 tag 100
enable stpd s8
```

To automatically add ports to the CIST STPD and to expand the boundary of the STPD, you must complete the following tasks:

- Create a VLAN or use the Default VLAN. (In this example, the Default VLAN is used.)
- Create the MSTP region.
- Create the STPD to be used as the CIST, and configure the mode of operation for the STPD.
- Specify the priority for the CIST.
- Enable the CIST.

The following example enables autobind on the VLAN Default for the CIST STPD named s1. (Starting with ExtremeXOS 22.2, before configuring a user-created STP domain for MSTP, you must first disable the STPD "s0" domain, which by default is in the MSTP CIST domain, and change its operational mode to dot1d or dot1w, as only one MSTP CIST domain can be there on a switch.):

```
disable stpd s0
configure stpd s0 mode dot1d
configure mstp region 1
create stpd s1
configure stpd s1 mode mstp cist
configure stpd s1 priority 32768
enable stpd s1
```

The following example enables autobind on the VLAN math for the MSTI STPD named s2:

```
create vlan math
configure vlan math tag 2
configure vlan math add ports 2-3
configure mstp region 1
create stpd s2
configure stpd s2 mode mstp msti 1
configure stpd s2 priority 32768
enable stpd s2 auto-bind vlan math
configure stpd s2 ports link-type point-to-point 5-6
enable stpd s2
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable stpd ports

```
enable stpd stpd_name ports [all | port_list]
```

Description

Enables the *STP* protocol on one or more ports.

Syntax Description

stpd_name	Specifies an *STPD* on the switch.
all	Specifies all ports for a given STPD.
port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

If you create an STPD with a unique name, the keyword stpd is optional.

If STP is enabled for a port, BPDUs are generated and processed on that port if STP is enabled for the associated STPD.

You must configure one or more STPDs before you can use the `enable stpd ports` command. To create an STPD, use the `create stpd stpd_name {description stpd-description}` command. If you have considerable knowledge and experience with STP, you can configure the STPD using the configure stpd commands. However, the default STP parameters are adequate for most networks.

Example

The following command enables slot 2, port 4 on an STPD named Backbone_st:

```
enable stpd backbone_st ports 2:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable stpd rapid-root-failover

`enable stpd stpd_name` **`rapid-root-failover`**

Description

Enables rapid root failover for faster *STP* recovery times.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.

Default

Disabled.

Usage Guidelines

This command is applicable for STPDs operating in 802.1D.

If you create an STPD with a unique name, the keyword stpd is optional.

To view the status of rapid root failover on the switch, use the `show stpd` command. The `show stpd` command displays information about the STPD configuration on the switch including the enable/disable state for rapid root failover.

Example

The following command enables rapid root fail over on STPD Backbone_st:

```
enable stpd backbone_st rapid-root-failover
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable subvlan-proxy-arp vlan

```
enable subvlan-proxy-arp vlan [vlan-name | all]
```

Description

Enables the automatic entry of subVLAN information in the proxy ARP table.

Syntax Description

vlan-name	Specifies a superVLAN name.
all	Specifies all VLANs.

Default

Enabled.

Usage Guidelines

To facilitate communication between subVLANs, by default, an entry is made in the IP ARP table of the superVLAN that performs a proxy ARP function. This allows clients on one subVLAN to communicate with clients on another subVLAN. In certain circumstances, intra-subVLAN communication may not be desired for isolation reasons.

Note
The isolation option works for normal, dynamic, ARP-based client communication.

Example

The following example enables the automatic entry of subVLAN information in the proxy ARP table of the superVLAN "vsuper":

```
enable subvlan-proxy-arp vlan vsuper
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable switch bluetooth

```
enable switch bluetooth {discovery | pairing }
```

Description

Enables Bluetooth capability on a switch.

Syntax Description

switch	Designates enabling switch capabilities.
bluetooth	Designates enabling Bluetooth capabilities on a switch.
discovery	Sets discoverable mode of the switch. Default is enabled.
pairing	Sets pairing ability with other Bluetooth-capable devices. Default is enabled.

Default

By default, discovery and pairing modes are enabled.

Usage Guidelines

Using the command with no options enables Bluetooth capability on the switch. The **discovery** and **pairing** options set discoverable mode and pairing ability, respectively.

To disable Bluetooth capabilites, use the `disable` **switch bluetooth** {**discovery** | **pairing** } command.

To view Bluetooth and discovery/pairing status, use the `show` **switch bluetooth** [**statistics** | **inventory**] command.

Example

The following example enables Bluetooth capability on a switch:

```
# enable switch bluetooth
```

The following example enables discovery mode on a switch:

```
# enable switch bluetooth discovery
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable switch locally-administered-address

`enable` **switch locally-administered-address**

Description

Directs the switch to generate locally administered per-port MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

This feature is disabled by default.

Usage Guidelines

ExtremeXOS switches do not use a unique per-port MAC address when transmitting bridge protocol data units (BPDUs). As a result, switch management can become inaccessible when switch MAC addresses are learned on the wrong L2 path (corresponding to a blocking port). This command allows you to direct the switch to generate locally administered MAC addresses used by STP/RSTP/MSTP BPDUs as source MAC address instead of the switch MAC address.

Example

The following example directs the switch to generate locally administered MAC addresses:

```
enable switch locally-administered-address
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable switch usb

```
enable switch usb
```

Description

Enables use of the switch's USB port.

Syntax Description

usb	Specifies USB port on switch.

Default

Enabled by default.

Usage Guidelines

This command requires a reboot to take effect. This setting persists after reboots. To remove it, use the command `disable switch` **usb** or use the command `unconfigure switch {`**all** | **erase** `[`**all** | **nvram**`]}` with the **all** option.

Stack support is not available. You need to run this command individually on each node in a stack.

Example

The following example enables use of the USB port:

```
enable switch usb
This setting will take effect at the next system reboot.
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable syslog

```
enable syslog
```

Description

Enables logging to all remote syslog host targets.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

To enable remote logging, you must do the following:

- Configure the syslog host to accept and log messages.
- Enable remote logging by using the `enable syslog` command.
- Configure remote logging by using the configure syslog command.

When you use the `enable syslog` command, the exporting process of the syslog begins. This command also determines the initial state of an added remote syslog target.

Example

The following command enables logging to all remote syslog hosts:

```
enable syslog
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable tacacs

```
enable tacacs
```

Description

Enables TACACS+ authentication.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

After they have been enabled, all web and Telnet logins are sent to one of the two TACACS+ servers for login name authentication.

Example

The following command enables TACACS+ user authentication:

```
enable tacacs
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable tacacs-accounting

```
enable tacacs-accounting
```

Description

Enables TACACS+ accounting.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If accounting is used, the TACACS+ client must also be enabled.

Example

The following command enables TACACS+ accounting for the switch:

```
enable tacacs-accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable tacacs-authorization

```
enable tacacs-authorization
```

Description

Enables CLI command authorization.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When enabled, each command is transmitted to the remote TACACS+ server for authorization before the command is executed. TACACS+ authentication must also be enabled to use TACACS+ authorization. Use the following command to enable authentication:

`enable tacacs`

Example

The following command enables TACACS+ command authorization for the switch:

```
enable tacacs-authorization
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable tech-support collector

```
enable tech-support collector
```

Description

Enables te tech support feature.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command turns on the tech-support feature. In the ExtremeXOS 15.4 release, the feature is disabled by default. When the feature is disabled, the previous scheduled reports are canceled, and the bootup event and critical severity events are ignored.

When the feature is enabled, if any configured collector has the report mode set to automatic, the switch automatically attempts to send switch status reports to those collectors based on the configuration setting for each individual collector.

You can always use the `run tech-support report` command to trigger a one-time report to a particular collector, or all collectors, regardless if the feature is enabled or disabled or if the collector's report mode is set to automatic or manual.

Example

The following command enables the tech-support feature:

```
enable tech-support collector
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable telnet

```
enable telnet
```

Description

Enables external Telnet services on the system.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

You must be logged in as an administrator to enable or disable Telnet.

ExtremeXOS 11.2 introduces the concept of safe defaults mode. Safe defaults mode runs an interactive script that allows you to enable or disable *SNMP*, Telnet, and switch ports. When you set up your switch for the first time, you must connect to the console port to access the switch. After logging in to the switch, you enter safe defaults mode. Although SNMP, Telnet, and switch ports are enabled by default, the script prompts you to confirm those settings.

If you choose to keep the default setting for Telnet—the default setting is enabled—the switch returns the following interactive script:

```
Since you have chosen less secure management methods, please remember to increase the
security of your network by taking the following actions: * change your admin password
```

```
* change your SNMP public and private strings * consider using SNMPv3 to secure network
management traffic
```

In addition, you can return to safe defaults mode by issuing the following command: `configure safe-default-script`

If you return to safe defaults mode, you must answer the questions presented during the interactive script.

For more detailed information about safe defaults mode, see the *Using Safe Defaults Mode* section in the *Switch Engine 32.2 User Guide*.

Example

With administrator privilege, the following command enables Telnet services on the switch:

```
enable telnet
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable tunnel

```
enable {tunnel} tunnel_name
```

Description

Allows GRE tunnels to be enabled.

Syntax Description

tunnel_name	GRE tunnel name

Default

Enabled.

Usage Guidelines

Use this command to enable GRE tunnels.

Example

```
enable myGREtunnel
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable twamp reflector

```
enable twamp reflector {restrict}
```

Description

This command enables the Session-Reflector.

Syntax Description

restrict	Restricts only TWAMP control sessions to create test sessions and reflector does not respond to TWAMP-test packets tgat do not match a test session created by a control session.

Default

N/A.

Usage Guidelines

If the you disable the Session-Reflector, the application terminates all current TWAMP test sessions. If you specify the **restrict** keyword, only TWAMP control sessions may create test sessions and the reflector will not respond to TWAMP-test packets that do not match a test session created by a control session.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable twamp server

```
enable twamp server
```

Description

This command enables the TWAMP server.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

The command is available on all platforms.

enable udp-echo-server

```
enable udp-echo-server {vr vrid}{udp-port port}
```

Description

Enables UDP echo server support.

Syntax Description

vrid	Specifies the VR or VRF.
port	Specifies the UDP port.

Default

Disabled.

Usage Guidelines

UDP echo packets are used to measure the transit time for data between the transmitting and receiving ends.

Example

The following example enables UDP echo server support:

```
enable udp-echo-server
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable upm profile

```
enable upm profile profile-name
```

Description

Enables the use of the specified Universal Port profile on the switch.

Syntax Description

profile-name	Specifies the UPM profile to be enabled.

Default

A UPM profile is enabled by default.

Example

The following command enables a UPM profile called example on the switch:

```
enable upm profile example
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable virtual-network remote-endpoint vxlan

```
enable virtual-network remote-endpoint vxlan [ ipaddress ipaddress {vr
   vr_name} | all ]
```

Description

Enables a *VXLAN* remote endpoint.

Syntax Description

virtual-network	Virtual overlay network.
remote-endpoint	Remote tunnel endpoint information.
vxlan	VXLAN virtual networks remote endpoint.
ipaddress	Specifies an IP address of a remote endpoint.
ipaddress	Specifies the IP address of the desired remote endpoint.
vr	Specifies a VR/VRF instance the remote endpoint is associated with.
vr_name	Specifies the desired existing VR/VRF instance the remote endpoint is associated with. Default is VR-Default.
all	Specifies all remote tunnel endpoints.

Default

If a VR is not specified, VR-Default is the VR.

Usage Guidelines

Extreme Loop Recognition Protocol (ELRP) detects loops across VXLAN tunnels. If a loop is detected across the tunnel, ELRP takes down the VXLAN remote endpoint. You can use this command to re-enable the remote endpoint.

Example

The following example enables the remote endpoint at 100.1.1.1 on VR-Default (not specified, command default):

```
# enable virtual-network remote-endpoint vxlan ipaddress 100.1.1.1
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

enable virtual-router

`enable` **`virtual-router`** *`vrf-name`*

Description

Enables a VRF.

Note
This command does not affect virtual routers.

Syntax Description

vrf-name	Specifies the name of the VR or VRF instance.

Default

Enabled.

Usage Guidelines

This command is used to administratively enable or disable a VRF. The VRF specific commands are still accepted and retained by the switch. This configuration has an operational impact on the VRF.

When you enable a VRF, the software does the following:

- Enables Layer 3 protocols for the VRF.
- Marks static routes as active and adds them to the hardware forwarding tables.

Example

The following example enables VRF "vrf1":

```
enable virtual-router vrf1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable vlan

```
enable [ {vlan} vlan_name | vlan vlan_list]
```

Description

Use this command to re-enable a *VLAN* that you previously disabled.

Syntax Description

vlan_name	Specifies the VLAN you want to enable.
vlan_list	Specifies the VLAN list of IDs you want to enable.

Default

Enabled.

Usage Guidelines

This command allows you to administratively enable specified VLANs that you previously disabled.

Example

The following example enables the VLAN named "accounting":

```
enable vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable vman cep egress filtering ports

```
enable vman cep egress filtering ports {port_list | all}
```

Description

Enables the egress filtering of frames based on their CVIDs on ports configured as CEPs.

Syntax Description

port_list	Specifies a list of ports.
all	Specifies all switch ports.

Default

Egress CVID filtering is disabled.

Usage Guidelines

For a given VMAN and a port configured as a CEP for that VMAN, only frames with CVIDs that have been mapped from the CEP to the VMAN are forwarded from the VMAN and out the CEP.

To view the configuration setting for the egress CVID filtering feature, use the `show ports information` command.

Note

CVID egress filtering is available only on switches that support this feature, and when this feature is enabled, it reduces the maximum number of CVIDs supported on a port. The control of CVID egress filtering applies to fast-path forwarding. When frames are forwarded through software, CVID egress filtering is always enabled.

Example

The following command enables egress CVID filtering on port 1:

```
enable vman cep egress filtering port 1
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable vm autostart

`enable` **`vm`** *`vm_name`* **`autostart`**

Description

Enables automatic start-up of guest virtual machines (VMs).

Syntax Description

`vm`	Designates a virtual machine.
`vm_name`	Specifies the VM name.
`autostart`	Specifies automatic start-up of the specified VM. Default is disabled.

Default

By default, automatic start-up is disabled.

Usage Guidelines

This command enables automatically starting up a specific VM when the system starts.

You must reboot the switch for this command to take effect.

To disable automatic start-up, use the command `disable` **`vm`** *`vm_name`* **`autostart`**.

Example

The following example enables automatic start-up of VM "vm1":

```
# enable vm vm1 autostart
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

enable vm-tracking

```
enable vm-tracking
```

Description

Enables the *XNV* feature on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables the XNV feature, which tracks VMs that connect to the switch.

This command does not enable XNV on any ports. To start tracking VMs, you must enable VM tracking on one or more ports using the `enable vm-tracking ports` command.

Example

The following command enables the XNV feature:

```
# enable vm-tracking
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

enable vm-tracking dynamic-vlan ports

```
enable vm-tracking dynamic-vlan ports port_list
```

Description

This command enables VM-tracking dynamic *VLAN* on specific ports. The ALL option is not supported because VM-tracking dynamic VLAN should never be enabled on a switch's uplink port.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to enable VM-tracking dynamic VLAN on specific ports. The ALL option is not supported because VM-tracking dynamic VLAN should not be enabled on a switch's uplink port.

Example

The following command enables VM tracking dynamic VLAN on port 2:1:

```
# enable vm-tracking dynamic-vlan ports 2:1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

enable vm-tracking ports

```
enable vm-tracking ports port_list
```

Description

Enables the *XNV* feature on the specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

You must enable VM tracking on the switch with the `enable vm-tracking` command before you can use this command. This command enables VM tracking on the specified ports. You should enable VM tracking only on ports that connect directly to a server that hosts VMs that you want to track. You should never enable VM tracking on a switch uplink port.

Example

The following command enables VM tracking on port 2:1:

```
# enable vm-tracking ports 2:1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

enable vpex

`enable` **`vpex`**

Description

Enables VPEX mode for using bridge port extenders (BPEs).

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).

Default

N/A.

Usage Guidelines

This command enables VPEX mode and allows you to refer to ports in the *slot*:*port* notation in applicable commands. A reboot of the switch is required for the command to take effect. After rebooting, the CLI prompt changes to show that the switch is now slot 1 (for example):

```
Slot-1 VPEX X670G2-48x-4q.14 #
```

After enabling VPEX mode, to use the BPE, you need to configure the slot assignment for the BPE, using the command: `enable` **`vpex`**

VPEX mode is not compatible with stacking mode. Only one of these modes can be enabled at a time.

Example

The following example enables VPEX mode:

```
# enable vpex
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

enable vpex auto-configuration

`enable` **`vpex auto-configuration`**

Description

Enables automatic configuration of the Extended Edge Switchingarchitecture (controlling bridge (CB) and bridge port extenders (BPEs)).

Syntax Description

vpex	Specifies Virtual Port Extender (VPEX).
auto-configuration	Specifies enabling automatic configuration of the Extended Edge Switching architecture.

Default

Disabled.

Usage Guidelines

When this command is run the controlling bridge switch detects new BPEs connected to ports not configured as cascade ports, and automatically configures cascade ports, extended slots, and LAGs/MLAGs on cascade ports.

If you want to use redundant CBs, you must create the peer relationship between redundant CBs and ensure that both CBs are up. The rest of the MLAG setup for redundant CBs is handled automatically.

To enable auto-configuration, you must first enter VPEX mode (see enable vpex on page 2347).

When auto-configuration mode is enabled, you cannot manually configure Extended Edge Switching ports using the command `configure` **`vpex ports`** *`port_list`* **`slot`** *`slot_num`*

Example

The following example enables auto-configuration mode:

```
# enable vpex auto-configuration
```

History

This command was first available in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

enable vpex auto-upgrade

`enable` **`vpex auto-upgrade`**

Description

Enables automatic upgrading on Extended Edge Switching topologies.

Syntax Description

`vpex`	Specifies Virtual Port Extender (VPEX).
`auto-upgrade`	Specifies that the controlling bridge (CB) automatically upgrades bridge port extender (BPE) slots in mode (default is enabled).

Default

Automatic upgrading is enabled by default.

Usage Guidelines

Automatic upgrading can occur only when both CBs in the MLAG have the same BPE xmod versions installed, and only after all slots are synchronized between the CBs.

To enable automatic upgrading, you must first enter VPEX mode (see enable vpex on page 2347). To view the status of automatic upgrading, use the command `show vpex`.

Example

The following example enables automatic upgrading:

```
# enable vpex auto-upgrade
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

enable vpls

`enable vpls [vpls_name | all]`

Note

This command has been replaced with the following command: `enable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]]`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Enables the VPLS instance specified by *vpls_name*.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
all	Specifies all VPLS.

Default

All newly created VPLS instances are enabled.

Usage Guidelines

This command enables the VPLS instance specified by *vpls_name*. By default, all newly created VPLS instances are enabled. When enabled, VPLS attempts to establish sessions between all configured peers. Services must be configured and enabled for sessions to be established successfully.

Example

The following command enables the VPLS instance myvpls:

```
enable vpls myvpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable vpls fdb mac-withdrawal

```
enable vpls fdb mac-withdrawal
```

Note

This command has been replaced with the following command: `enable l2vpn vpls fdb mac-withdrawal` .

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Enables the VPLS MAC address withdrawal capability.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Use this command to enable *FDB* MAC withdrawal after it has been disabled.

Example

The following command enables MAC address withdrawal:

```
enable vpls fdb mac-withdrawal
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable vpls health-check vccv

`enable vpls` *`vpls_name`* **`health-check vccv`**

Note

This command has been replaced with the following command: `enable l2vpn [vpls` *`vpls_name`* `| vpws` *`vpws_name`*`] health-check vccv`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Enables the VCCV health check feature on the specified VPLS.

Syntax Description

`vpls_name`	Identifies the VPLS for which health check is to be enabled.

Default

Health check is disabled.

Usage Guidelines

Health check must be enabled on both ends of a PW to verify connectivity between two VPLS peers. Both VCCV peers negotiate capabilities at PW setup. A single VCCV session monitors a single PW. Therefore, a VPLS with multiple PWs will have multiple VCCV sessions to multiple peers.

VCCV in ExtremeXOS uses LSP ping to verify connectivity.

Example

The following command enables the health check feature on the VPLS instance myvpls:

```
enable vpls myvpls health-check vccv
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable vpls service

```
enable vpls [vpls_name | all] service
```

Note

This command has been replaced with the following command: `enable l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]] service`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Enables the configured VPLS services for the specified *vpls_name*.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
all	Specifies all VPLS.

Default

Enabled.

Usage Guidelines

This command enables the configured VPLS services for the specified *vpls_name*. When services are disabled, the VPLS is withdrawn from all peer sessions. The keyword **all** enables services for all VPLS instances.

Example

The following command enables the configured VPLS services for the specified VPLS instance:

```
enable vpls myvpls service
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

enable vrrp group

```
enable vrrp group group_name {configuration | members}
```

Description

This command appliles group configuration on individual VRs and they then become member VRs.

Syntax Description

group	Form a group of *VRRP* VRs to operate in high-scale mode.
group_name	Specifies the VRRP group name.
configuration	Applies group configuration on individual VRs (default).
members	Enables all VRs that are members of the group.

Default

If you do not specify, group configuration is applied to individual VRs.

Usage Guidelines

When this command is issued the primary VR of the group sends VRRP advertisements at configured intervals. Secondary VRs send at a much slower rate.

Example

The following example brings group configuration into effect on the member VRs of the group:

```
enable vrrp group ExtremeNet configuration
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable vrrp vrid

```
enable vrrp {vlan [vlan_name | vlan_list] vrid [vridval | vrid_list}
```

Description

Enables a specific *VRRP* instance or all VRRP instances on the switch.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vlan_list	VLAN list (1–4,094).
vridval	Specifies the VRID for the VRRP instance to be enabled. To display the configured VRRP router instances, enter the `show vrrp` command.
vrid_list	List of virtual router IDs (1–255).

Default

N/A.

Usage Guidelines

This enables a specific VRRP instance on the device. If you do not specify a VRRP instance, all VRRP instances on this device are enabled.

Example

The following command enables all VRRP instances on the switch:

```
enable vrrp
```

History

This command was first available in ExtremeXOS 10.1.

VLAN and VR list options added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

enable watchdog

```
enable watchdog
```

Description

Enables the system watchdog timer.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

The watchdog timer monitors the health of the switch hardware and software events. For example, the watchdog timer reboots the switch if the system cannot reset the watchdog timer. This is caused by a long CPU processing loop, any unhandled exception, or a hardware problem with the communication channel to the watchdog. In most cases, if the watchdog timer expires, the switch captures the current CPU status and posts it to the console and the system log. In some cases, if the problem is so severe that the switch is unable to perform any action, the switch reboots without logging any system status information prior to reboot.

This command takes affect immediately.

The watchdog settings are saved in the configuration file.

To display the watchdog state of your system, use the `show switch` command.

Example

The following command enables the watchdog timer:

```
enable watchdog
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable web http

```
enable web http
```

Description

Enables hypertext transfer protocol (HTTP) access to the switch on the default HTTP port (80).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If HTTP access has been disabled, use this command to enable HTTP access to the switch.

Example

The following command enables HTTP on the default port:

```
enable web http
```

History

This command was first available in the ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable web https

```
enable web https
```

Description

Enables secure socket layer (SSL) access to the switch on the default port (443).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to allow users to connect using a more secure HTTPS connection.

To use secure HTTP access (HTTPS) for web-based login connections, you must specify HTTPS as the protocol when configuring the redirect URL. For more information about configuring the redirect URL, see the `configure netlogin redirect-page` command.

Example

The following command enables SSL on the default port:

```
enable web https
```

History

This command was first available in the ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable cli xml-mode

```
enable cli xml-mode
```

Description

Enables XML configuration mode on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables the XML configuration mode on the switch, however XML configuration mode is not supported for end users, and Extreme Networks strongly cautions you not to enable this mode. Use this command only under the direction of Extreme Networks.

If you inadvertently issue this command, the switch prompt will be changed by adding the text (xml) to the front of the prompt. If you see this mode indicator, please disable XML configuration mode by using the following command:

```
disable xml-mode
```

Example

The following command enables XML configuration mode on the switch:

```
enable cli xml-mode
```

History

This command was first available in an ExtremeXOS 11.2.

The **cli** keyword was added for syntax consistency in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable/disable bfd vlan

```
[enable | disable] bfd vlan vlan_name
```

Description

Enables or disables BFD on a *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN name.

Default

N/A.

Usage Guidelines

Use this command to enable or disable BFD on a VLAN.

Example

The following command enables the bfd on the VLAN named finance:

```
# enable bfd vlan finance
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

enable/disable xml-notification

[enable|disable] xml-notification [all | *target*]

Description

Enables or disables Web server target(s).

Syntax Description

target	wSpecifies the configured target.

Default

By default, the target Web server is not enabled for xml-notifications. You have to explicitly enable it, and the display value is “no.”

Usage Guidelines

Use the enable option to enable Web server target(s) in order to receive events from ExtremeXOS modules and to send out events to the targeted Web server(s).

Use the disable option to disable the Web server target(s).

Example

The following command enables all of the configured targets:

```
enable xml-notification all
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

ENDIF

```
ENDIF
```

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: `enable cli scripting {permanent}`.

Description

Causes the IF construct to be terminated.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The ENDIF command should be used after the `IF _expression THEN statement(s)` command.

You can insert comments by using a number sign (#). CLI scripting must be enabled to use this command.

Example

The following example executes the show switch command if the value of the variable is greater than 2 and execute the show vlan command otherwise:

```
IF ($x > 2) THEN

        show switch

ELSE

        show vlan

ENDIF
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

ENDWHILE

```
ENDWHILE
```

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: `enable cli scripting {permanent}`.

Description

Causes the WHILE construct to be terminated.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The `ENDWHILE` command must be used after a corresponding `WHILE` *`_expression`* `DO`*`statement(s)`* command.

You can insert comments by using a number sign (#). CLI scripting must be enabled to use this command.

Example

This example creates 10 VLANs, named x1 to x10:

```
set var x 1

WHILE ($x <= 10) DO

        create vlan v$x

        set var x ($x + 1)

ENDWHILE
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

exit

```
exit
```

Description

Logs out the session of a current user for CLI or Telnet.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to log out of a CLI or Telnet session.

When you issue this command, you are asked to save your configuration changes to the current, active configuration. Enter y if you want to save your changes. Enter n if you do not want to save your changes.

Example

The following command logs out the session of a current user for CLI or Telnet:

```
exit
```

A message similar to the following is displayed:

```
Do you wish to save your configuration changes to primary.cfg? (y or n)
```

Enter y if you want to save your changes. Enter n if you do not want to save your changes.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

history

```
history {last | -c | -d start {- {end}}
```

Description

Displays a list of all the commands entered on the switch, and enables the clearing or deleting of entries.

Syntax Description

last	Specifies the number of most recent entries of command history to display, or all of the entries if not specified. Range is 1-2147483647.
-c	Specifies to Clear all entries of command history.
-d	Specifies to Delete an entry or a range of entries of command history.
start	Specifies the start of the range of command history entries (or a single entry) to delete. Range is 1-2147483647.
-	Range separator.
end	Specifies the end of the range of command history entries to delete. Range is 1-2147483647.

Default

N/A.

Usage Guidelines

ExtremeXOS software “remembers” all the commands you entered on the switch.

Use the history command to display a list of these commands.

Example

The following command displays all the commands entered on the switch:

```
# history
         1  enable ssh
         2  show switch
         3  show ver images
         4  show switch
         5  configure timezone name EST -300 autodst name EDT
         6  show switch
         7  configure time 8 17 2021 14 58 0
         8  save
         9  show switch
        10  history
```

The following command deletes the history for the range of 4 and 5 from the previous list:

```
# history -d 4 - 5
```

The following command clears the history:

```
history -c
```

If you use a command more than once, consecutively, the history will only list the first instance.

History

This command was first available in ExtremeXOS.

The ability to clear and delete entries was added in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

IF ... THEN

`IF` **`(_expression) THEN`**

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Optionally executes a code block based on the condition supplied.

Syntax Description

expression	Specifies the condition for which the statements should be executed.
statements	Actions to be executed when the specified conditions are met.

Default

N/A.

Usage Guidelines

This command is usually followed by statements that are executed if the condition evaluates to true.

It can also be followed by an ELSE block, which is executed if the condition evaluates to false.

The IF construct should be terminated by an `ENDIF` command.

The _expression must be enclosed in parentheses.

The IF construct can be nested inside other IF and WHILE constructs. Nesting is supported up to five levels. If there is incorrect nesting of IF conditions, an error message is displayed. If a user tries to execute more than five nested IF conditions, an error message is displayed.

The operators mentioned in Using Operators can be used in an _expression in an IF condition.

You can insert comments by using a number sign (#).

Example

The following example executes the show switch command if the value of the variable is greater than 2 and executes the show vlan command otherwise:

```
IF ($x > 2) THEN

    show switch

ELSE

    show vlan

ENDIF
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

install bootrom

```
install bootrom [from-image | fname | local-file] {slot slot-number}
   {reboot}
```

Description

Installs a new version of the ExtremeXOS BootROM image.

Syntax Description

from-image	Specifes using BootROM image packaged in the booted software image.
fname	Specifies the BootROM image file name of previously downloaded image.
local-file	Specifies using a BootROM image file on a local file path (USB is `/usr/local/ext`, internal memory is `/usr/local/tmp`, and home directory is `/usr/local/cfg`).

slot	For SummitStacks, specifies installing the BootROM image on a particular node (slot).
slot-number	On a SummitStack, selects which node the BootROM image should be installed on.
reboot	Reboots the switch after the image is installed.

Default

N/A.

Usage Guidelines

When you download a BootROM image (`download bootrom [[`*ipaddress* | *hostname*`] `*filename* `{{`**vr**`} `*vrname*`} {`**block-size** *block_size*`}] {`**slot** *slotid*`} {`**install**`} {`**reboot**`}}`), you are prompted to install the image immediately after the download is finished. If you choose to install the image at a later time, you can use this command to install the software on the switch.

The BootROM image file is designated with a `.xtr` file extension.

For ExtremeSwitching 5420 and 5520 series switches only, the ExtremeXOS (`.xos`) image file includes the bootROM image. The **from-exos** specifies using the BootROM version packaged with the ExtremeXOS image. You do not need to specify a file name. After the `.xos` image installation is finished, and when a new `.xos` image is in use, the bootROM image is available in ExtremeXOS file system (`/exos/bin`). When this command is run with the **from-exos** option, this image will be used for bootROM upgrade. To see what version bootROM is installed on each partition, use the `show version {`**detail** | **process** *name* | **images** {**partition** *partition*} command.

Displaying the BootROM Versions

To display the BootROM version for the switch, use the `show version` command.

Local File Name Character Restrictions

When specifying a local or remote file name, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

SummitStack Only

You can run this command only from the master node.

Example

The following example installs the previously downloaded BootROM image file `summitX-1.0.1.5-bootrom.xtr`:

```
# install bootrom summitX-1.0.1.5-bootrom.xtr
```

The following messages appear:

```
Installing bootrom...
Writing bootrom...
................................................................
................................................................
.....................
Verifying Flash contents...
................................................................
................................................................
................................................................
................................................................
................................................
bootrom written.
Bootrom installed successfully
```

The following example installs the bootROM image file `uboot.xtr` located on the local file system at `/usr/local/tmp/`:

```
# install bootrom /usr/local/tmp/uboot.xtr

Downloading to Switch.
Installing bootrom...

Bootrom installed successfully.  It will be used on the next reboot.
```

History

This command was first available in ExtremeXOS 11.0.

Support for SummitStack was added in ExtremeXOS 12.0.

The *local-file* option was added in ExtremeXOS 30.7.

The **from-exos** option was removed in ExtremeXOS 31.5.

The **from-image** option was added in ExtremeXOS 31.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

and stacks.

install firmware

```
install firmware {force} {slot slot-number}
```

Description

This command upgrades the ExtremeSwitching Universal platforms using images from the installed Switch Engine package.

Syntax Description

force	Specifies that a new image is installed without a version check.
slot	Slot for firmware installation.
slot-number	Slot number.

Default

N/A.

Usage Guidelines

On the ExtremeSwitching 5520 switch, use the `install firmware` command to upgrade the system FPGA and PLD images.

Firmware images are bundled with ExtremeXOS software images.

On the ExtremeSwitching 5520 switch, the ExtremeXOS software automatically compares the existing firmware image flashed into the hardware with the firmware image bundled with the ExtremeXOS image. You can also use the install firmware command to compare the firmware images.

Before using the install firmware command in a stack, wait until the `show slot` command indicates the slots are operational. When the slots are operational, use the install firmware command.

The switch checks internal devices for a possible firmware upgrade. If the bundled firmware image is newer than the existing firmware image, the switch prompts you to confirm the upgrade.

- Enter `y` to upgrade the firmware.
- Enter `n` to cancel the firmware upgrade for the specified hardware and continue scanning for other hardware that needs to be upgraded.
- Enter $_{cr}$ to cancel the upgrade. After a firmware image upgrade, messages are sent to the log.

The new FPGA and PLD firmware overwrites the older versions flashed into the hardware. The switch always maintains a backup version in hardware in case the install is interrupted. Use the `reboot` command to reboot the switch and activate the new firmware.

During the firmware upgrade, do not cycle down or disrupt the power to the switch. If a power interruption occurs, the installed firmware may be corrupted. In this case, the switch uses a backup version, and you can run the upgrade again to install the latest version.

The switch displays status messages after you use the install firmware command. The output varies depending upon your platform and the software version running on your system.

During a firmware upgrade, the switch prompts you to save your configuration changes to the current, active configuration. Enter `y` to save your configuration changes to the current, active configuration. Enter `n` if you do not want to save your changes.

PoE firmware is always automatically upgraded or downgraded to match the operational code image. This configuration is not applicable to PoE firmware.

Sample Output--ExtremeSwitching 5520 Switch

The following is sample output from a ExtremeSwitching 5520 switch:

```
5520-24W # install firmware
Installing FPGA/PLD image(s) to slot 1.  Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes
Installing firmware...

Firmware image has been updated successfully.
Installing firmware...

Firmware image has been updated successfully.
Installing firmware...

Firmware image has been updated successfully.

The FPGA/PLD image(s) were installed
successfully and will be activated upon the next system reboot.
```

Displaying Firmware Versions

To display the firmware version for all devices in the switch, use the `show version` command.

Example

The following example installs the newer firmware image(s):

```
# install firmware
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

install image

```
install image [inactive |filename | local-file] {partition} {slot
   slotid}{reboot}
```

Description

Installs a new version of the ExtremeXOS software image.

Syntax Description

filename	Specifies the file name of a previously downloaded image.
local-file	Specifies using an image file on a local file path (USB is `/usr/local/ext`, internal memory is `/usr/local/tmp`, and home directory is `/usr/local/cfg`).
partition	Specifies primary or secondary partition, or specifies active or inactive for automatic determination: "active" "inactive" "primary" "secondary".
inactive	Copies an image from the active partition to the inactive partition. This includes the `.xos` image and all `.xmod` and `.lst` files.
slot	For SummitStacks, specifies installing the image on a particular node (slot).
slotid	On a SummitStack, selects which node the image should be installed on.
reboot	Reboots the switch after the image is installed.

Default

N/A.

Usage Guidelines

When you download a software image (`download [`**`url`** *`url`* `{`**`vr`** *`vrname`*`} | image [`**`active`** `|` **`inactive`**`] [[`*`hostname`* `|` *`ipaddress`*`] `*`filename`* `{{`**`vr`**`} `*`vrname`*`} {`**`block-size`** *`block_size`*`}] {`*`partition`*`} {`**`install`** `{`**`reboot`**`}}`, you are asked if you want to install the image immediately after the download is finished. If you choose to install the image at a later time, use this command to install the software on the switch.

The software image file can be an `.xos` file, which contains an ExtremeXOS core image, or an `.xmod` file, which contains additional functionality to supplement a core image.

Note

Beginning with ExtremeXOS 12.1, an ExtremeXOS core image must be installed on the alternate (non-active) partition. If you try to install on an active partition, the following error message appears: `Error: Image can only be installed to the non-active partition`.

When you install a new version of an ExtremeXOS image, the system automatically compares the currently installed bootROM image against the bootROM image contained in the new ExtremeXOS image. If the installed version is older, the system automatically upgrades to the bootROM version contained in the new ExtremeXOS image.

SummitStack Only

You can issue this command only from a master node.

Displaying the Software Image Version

To display the software image version running on the switch, use the `show version` or `show switch` commands.

Displaying the Downloaded Software Image Version.

To display a software image version that has been downloaded but not installed, use the `install image ?` command.

Local File Name Character Restrictions

When specifying a local file name, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

Installing an ExtremeXOS Core Image

Install the software image on the alternate partition. You can continue to run the currently booted image, but to run the newly installed image, you need to set the boot partition with the `use image {`**`partition`**`}` *`partition`* command and reboot the switch.

Installing an ExtremeXOS module image

An ExtremeXOS module (`.xmod`) image has functionality that supplements a core image. You need to install a module onto an already installed core image. The version number of the core image and the module must match.

For more detailed information about a hitless upgrade, see the `download [`**`url`** *`url`* `{`**`vr`** *`vrname`*`} | image [`**`active`**` | `**`inactive`**`] [[`*`hostname`*` | `*`ipaddress`*`] `*`filename`* `{{`**`vr`**`} `*`vrname`*`} {`**`block-size`** *`block_size`*`}] {`*`partition`*`} {`**`install`** `{`**`reboot`**`}}` command.

Example

The following example installs the software image file `summitX440-11.5.1.2.xos` on a switch:

```
# install image summitX440-11.5.1.2.xos
```

The following example shows software images that have been downloaded, but not installed:

```
install image ?

# install image ?
<fname>         Image file name
"summitX-12.1.0.52.xos"
```

History

This command was first available in ExtremeXOS 10.1.

The **slot** parameter was added to support SummitStack in ExtremeXOS 12.0.

The *local-file* option was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

install image inactive

```
install image inactive {slot slot}
```

Description

Copies the image installed on the active partition to the inactive partition.

Syntax Description

inactive	Copy image from active partition to inactive partition. This includes the .xos image and all .xmod and .lst files.
slot	Copy image only on the specified slot. Default is to copy to all slots.
slot	Specifies slot number to copy image to.

Default

By default, for stacks, if a slot is not specified, the image is copied to all slots.

Usage Guidelines

Copying from active partition to inactive partition includes the .xos image and all .xmod and .lst files.

This command can act on any or all slots only from the master. If not from the master, the command can only act on its own slot.

Example

The following example copies the image on the active partition to the inactive partion:

```
# install image inactive
This will overwrite the image installed on the secondary partition with the image
installed on the primary partition.
Do you want to proceed? (y/N) Yes
Copying image to secondary partition... 100% complete.
Image installed to the secondary partition successfully.
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

install license file

`install license` **`file`** *`filename`* {**`slot`** *`slot`*}

Description

Installs a license key file on ExtremeSwitching 5420 and 5520 series switches.

Syntax Description

`file`	Specifies providing the license key file.
`filename`	Specifies the name of the license key file. The file name must have a `.lic` extension.
`slot`	For stacks and Extended Edge Switching, specifies providing a slot for the license key file.
`slot`	For stacks and Extended Edge Switching, specifies the slot for the license key file.

Default

N/A.

Usage Guidelines

This command installs all of the license features contained in the selected license file to the specified slot (node).

To uninstall a license, use the command `uninstall license` **`file`** *`filename`* [{**`revoke`** *`revocation_file`*} | **`withhold`**]{**`slot`** *`slot`*}.

To uninstall a specific feature, use the command `uninstall license` **`product`** *`product_name`* [**`revoke`** *`revocation_file`* | **`withhold`**] {**`slot`** *`slot`*}

Example

The following example installs a license using the license file `mylicense.lic`:

```
# install license file mylicense.lic
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

load script

`load script` *`filename`* {**`arg1`**} {**`arg2`**} **`...`** {**`arg9`**}

Description

Loads (plays back) an ASCII-formatted configuration file or a user-written script file on the switch.

Syntax Description

`filename`	Specifies the user-defined name of the ASCII-formatted configuration file or a user-written script file. The script file is known as the XOS script file and uses the .xsf or .py file extension.
`arg`	Specifies up to nine variable values that can be specified by the user. The variables are created with the names CLI.ARGV1, CLI.ARGV2, ... CLIARGV9.

Default

N/A.

Usage Guidelines

Use this command to load an ASCII-formatted configuration file or a user-written script file.

Configuration File: After downloading the configuration file from the TFTP server, this command loads and restores the ASCII-formatted configuration file to the switch.

An ASCII-formatted configuration file uses the .xsf file extension, not the .cfg file extension. The .xsf file extension (known as the XOS script file) saves the XML-based configuration in an ASCII format readable by a text editor.

For more detailed information about the ASCII configuration file, including the steps involved to upload, download, and save the configuration, see the `upload configuration [hostname | ipaddress] filename {vr vr-name}` command.

User-Written Script File: After writing a script, this command executes the script and passes arguments to it. As with the configuration files, these files use the .xsf or .py file extension that is automatically added.

The command allows up to nine optional variable values to be passed to the script. These are created with the names CLI.ARGV1, CLI.ARGV2, CLI.ARGV3, ... CLI.ARGV9.

In addition, two other variables are always created. CLI.ARGC gives the count of the number of parameters passed, and CLI.ARGV0 contains the name of the script that is being executed.

To check the variable values use the command, show var.

Note
Only the .xsf and .py extensions are used. The load script command assumes a .py or .xsf extension and retries opening the file if the file cannot be found with the original specified name or no extension is provided.

Example

The following command loads the ASCII-formatted configuration named configbackup.xsf:

```
load script configbackup.xsf
```

After issuing this command, the ASCII configuration quickly scrolls across the screen. The following is an example of the type of information displayed when loading the ASCII configuration file:

```
script.meg_upload_config1.xsf.389 # enable snmp access
script.meg_upload_config1.xsf.390 # enable snmp traps
script.meg_upload_config1.xsf.391 # configure mstp region purple
script.meg_upload_config1.xsf.392 # configure mstp revision 3
script.meg_upload_config1.xsf.393 # configure mstp format 0
script.meg_upload_config1.xsf.394 # create stpd s0
```

ExtremeXOS 15.6 provided capability for Python scripting. Current Python scripting implementation allows a script to interact directly with the CLI inteface for managing ExtremeXOS functionality. Python script files end in .py. The .py suffix on the *script* file name tells the `load script` command to use the Python interpreter to process the script file. Additionally, ExtremeXOS 15.6 introduced a synonym command: `run script`. This command functions exactly as `load script`.

History

This command was first available in ExtremeXOS 11.4.

Multiple arguments for user-written scripts were added in ExtremeXOS 12.1.

Scripting support for Python was added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

load var key

```
load var key key [var1 var2 …]
```

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: `enable cli scripting {permanent}`.

Description

Imports the specified set of variables associated with a key into the current session.

Syntax Description

key	Specifies the key associated with the variables to be imported.
var1 var2	Specifies the variables to be imported. The first variable is mandatory, up to four more optional variables can be specified.

Default

N/A.

Usage Guidelines

The specified key should have created by the user. Also, the variables specified should have been saved using that key.

Attempting to use this command with a non-existent key results in an error message being displayed.

Example

The following example imports the variables “username,” “ipaddr,” and “vlan” from the key “blue:”

```
load var key blue username ipaddr vlan
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

logout

```
logout
```

Description

Logs out the session of a current user for CLI or Telnet.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to log out of a CLI or Telnet session.

When you issue this command, you are asked to save your configuration changes to the current, active configuration. Enter y if you want to save your changes. Enter n if you do not want to save your changes.

Example

The following command logs out the session of a current user for CLI or Telnet:

```
logout
```

A message similar to the following is displayed:

```
Do you wish to save your configuration changes to primary.cfg? (y or n)
```

Enter y if you want to save your changes. Enter n if you do not want to save your changes.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

ls

```
ls file_name
```

Description

Lists all configuration, policy, and if configured, core dump files in the system.

Syntax Description

file_name	Lists all the files that match the wildcard.

Default

N/A.

Usage Guidelines

When you use issue this command without any options, the output displays all of the configuration and policy files stored on the switch.

When you configure and enable the switch to send core dump (debug) information to the internal memory, specify the internal memory location `/usr/local/tmp` to display the core dump files stored internally. For more information about core dump files, see Core Dump Files on page 2379.

When you specify the *file-name* option, the output displays all of the files that fit the wildcard criteria.

Understanding the Output

Output from this command includes the following:

- The first column displays the file permission using the following ten place holders:
  - The first place holder displays - for a file.
  - The next three place holders display r for read access and w for write access permission for the file owner.
  - The following three place holders display r for read access permission for members of the file owner's group.
  - The last three place holders display r for read access for every user that is not a member of the file owner's group.
- The second column displays how many links the file has to other files or directories.
- The third column displays the file owner.
- The remaining columns display the file size, date and time the file was last modified, and the file name.

Core Dump Files

Core dump files have a `.gz` file extension. The file name format is: `core.process-name.pid.gz` where `process-name` indicates the name of the process that failed and *pid* is the numerical identifier of that process.

When the switch has not saved any debug files, no files appear. For information about configuring and sending core dump information to internal memory or a USB 2.0 storage device, see the `configure debug core-dumps` and `save debug tracefiles memorycard` commands.

For more detailed information about core dump files, see *Troubleshooting* section in the *Switch Engine 32.2 User Guide*.

Example

The following command displays a list of all current configuration and policy files in the system:

```
ls
```

The following is sample output from this command:

```
total 424
-rw-r--r--    1 root     root           50 Jul 30 14:19 hugh.pol
-rw-r--r--    1 root     root        94256 Jul 23 14:26 hughtest.cfg
-rw-r--r--    1 root     root       100980 Sep 23 09:16 megtest.cfg
-rw-r--r--    1 root     root           35 Jun 29 06:42 newpolicy.pol
-rw-r--r--    1 root     root       100980 Sep 23 09:17 primary.cfg
-rw-r--r--    1 root     root        94256 Jun 30 17:10 roytest.cfg
```

The following command displays a list of all current configuration and policy files on a removable storage device:

```
ls /usr/local/ext
```

The following is sample output from this command:

```
-rwxr-xr-x    1 root     0        15401865 Mar 30 00:03 onie-11.2.0.13.xos
-rwxr-xr-x    1 root     0              10 Mar 31 09:41 test-1.pol
-rwxr-xr-x    1 root     0              10 Apr  4 09:15 test.pol
-rwxr-xr-x    1 root     0              10 Mar 31 09:41 test_1.pol
-rwxr-xr-x    1 root     0          223599 Mar 31 10:02 v11_1_3.cfg
```

The following command displays a list of all configuration and policy files with a file name beginning with the letter “a:”

```
(debug) BD-12804.1 # ls a*
```

Following is sample output from this command:

```
-rw-r--r--    1 root     0            2062 Jan  6 09:11 abc
-rw-rw-rw-    1 root     0            1922 Jan  7 02:19 abc.xsf
1k-blocks      Used Available Use%
16384       496     15888   3%
```

The following command displays a list of all .tgz files:

```
ls /usr/local/tmp/*.tgz
```

Following is sample output from this command:

```
-rwxr-xr-x    1 root     0           79076 Jan  6 09:47 old_traces.tgz
1k-blocks      Used Available Use%
49038       110     48928   0%
```

History

This command was first available in ExtremeXOS 10.1.

The memorycard option was added in ExtremeXOS 11.0.

The internal-memory option was added in ExtremeXOS 11.4.

The file-name option was added in ExtremeXOS 12.2.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Pathname support was added in ExtremeXOS 15.5.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

mkdir

```
mkdir directory_name
```

Description

Creates a new directory on the specified file system to relative to the current working directory.

Syntax Description

mkdir	Create a directory.
directory_name	Pathname of a directory.

Default

N/A.

Usage Guidelines

Use this command to create a new directory on the specified file system to relative to the current working directory.

History

This command was first available in ExtremeXOS 15.5

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

mrinfo

```
mrinfo {router_address} {from from_address} {timeout seconds} {multiple-
   response-timeout multi_resp_timeout} {vr vrname}
```

Description

Requests information from a multicast router.

Syntax Description

router_address	Specifies the unicast IP address of the router for which you want information.
from_address	Specifies the unicast IP address of the interface where the mrinfo request is generated.
seconds	Specifies a maximum time to wait for a response. The range is 1–30 seconds.
multi_resp_timeout	Specifies a maximum time to wait for additional responses after the first response is received. The range is 0 to 3 seconds.
vrname	Specifies a VR name.

Default

router_address: One of the local interface addresses.

from_address: IP address of interface from which the mrinfo query is generated.

timeout: 3 seconds

multiple-response-timeout: 1 second

vr: DefaultVR

Usage Guidelines

The last column of the `mrinfo` command output displays information in the following format:

```
[Metric/threshold/type/flags]
```

This information is described in detail in the Syntax Description on page 2382..

Table 23: mrinfo Command Display Data

Data	Description
Metric	This should always be 1 because mrinfo queries the directly connected interfaces of a device.
Threshold	This should always be 0 because the threshold feature is not supported in ExtremeXOS software.

Table 23: mrinfo Command Display Data (continued)

Data	Description
Type	The type specifies the multicast protocol type. Because the ExtremeXOS software only supports PIM, this value is always pim.
querier	The querier flag indicates that the queried router is the *IGMP* querier.
leaf	The leaf flag indicates that the IP interface has no neighbor router.
down	The down flag indicates that the interface link status is down.

Example

The following command requests information from multicast router 1.1.1.1:

```
Switch.1 # mrinfo 1.1.1.1
1.1.1.1 [Flags:PGM]
2.2.2.1 -> 2.2.2.2 [1/0/pim/querier]
1.1.1.1 -> 0.0.0.0 [1/0/pim/querier/leaf]
8.8.8.1 -> 8.8.8.4 [1/0/pim/querier]
3.3.3.1 -> 0.0.0.0 [1/0/pim/down]
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

mtrace

```
mtrace source src_address {destination dest_address} {group grp_address}
   {from from_address} {gateway gw_address} {timeout seconds} {maximum-
   hops number} {router-alert [include | exclude]} {vr vrname}
```

Description

Traces multicast traffic from the receiver back to the source.

Syntax Description

src_address	Specifies the unicast IP address of the multicast source.
dest_address	Specifies the unicast IP address of the multicast group receiver.
grp_address	Specifies the multicast IP address of the group.

from_address	Specifies the unicast IP address of the interface where the mtrace request originates. This is used as the IP destination address of the mtrace response packet.
gw_address	Specifies the gateway router IP address of the multicast router to which the unicast mtrace query is sent.
seconds	Specifies a maximum time to wait for the mtrace response before making the next attempt. The range is 1–30 seconds.
number	Specifies the maximum number of hops for the trace. The range is 1 to 255.
router-alert	Specifies whether the router-alert option is included or excluded in mtrace packets.
vrname	Specifies a VR name.

Default

destination: IP address of interface from which mtrace query is generated.

group: 0.0.0.0

from: IP address of interface from which mtrace query is generated.

gateway: 224.0.0.2 when the destination is in the same subnet as one of the IP interfaces. For a non-local destination address, it is mandatory to provide a valid multicast router address.

timeout: 3 seconds

maximum-hops: 32

router-alert: include

vr: DefaultVR

Usage Guidelines

The multicast traceroute initiator node generates a multicast query and waits for timeout period to expire. If there is no response for the timeout period, the initiator node makes two more attempts. If no response is received after three attempts, the initiator node moves to a hop-by-hop trace by manipulating the maximum hop fields to perform a linear search.

The multicast trace response data contains the following fields:

- Incoming interface address—Interface on which traffic is expected from the specific source and group
- Outgoing interface address—Interface on which traffic is forwarded from the specified source and group towards the destination
- Previous hop router address
- Input packet count on incoming interface
- Output packet count on outgoing interface
- Total number of packets for this source-group pair

- Multicast routing protocol
- Forwarding code

Extreme Networks switches set the packet count statistics field to 0xffffffff to indicate that this field is not supported.

The last column of the mtrace command output displays forwarding codes, which are described in the following table.

Table 24: mtrace Command Forwarding Codes

Forwarding Code	Description
Wrong interface	mtrace request arrived on an interface to which this router would not forward for this source and group.
Prune sent upstream	This router has sent a prune request upstream for the source and group in the mtrace request.
Output pruned	This router has stopped forwarding for this source and group in response to a prune request from the next hop router.
Hit scope boundary	The group is subject to administrative scoping at this hop.
No route	This router has no route for the source or group and no way to determine a potential route.
Wrong Last Hop	This router is not the proper last-hop router.
Not forwarding[2]	This router is not forwarding for this source and group on the outgoing interface for an unspecified reason.
Reached RP/Core	Reached rendezvous point or core.
RPF Interface	mtrace request arrived on the expected RPF interface (upstream interface) for this source and group.
Multicast disabled	mtrace request arrived on an interface which is not enabled for multicast.
Info. Hidden[2]	One or more hops have been hidden from this trace.
No space in packet	There was not enough room to insert another response data block in the packet.
Next router no mtrace[2]	The previous hop router does not understand mtrace requests.
Admin. Prohibiteda	mtrace is administratively prohibited.

Example

The following command initiates an mtrace for group 225.1.1.1 at IP address 1.1.1.100:

```
Switch.6 # mtrace source 1.1.1.100 group 225.1.1.1
Mtrace from 1.1.1.100 to Self via 225.1.1.1
0          34.2.2.4
-1          34.2.2.4  PIM thresh^ 0         1.1.1.100/32   RPF Interface
-2          34.2.2.3  PIM thresh^ 0         1.1.1.100/32
-3          23.1.1.2  PIM thresh^ 0         1.1.1.100/32
-4          2.2.2.1   PIM thresh^ 0         1.1.1.100/32
Round trip time 9 ms; total ttl of 4 required.
```

[2] ExtremeXOS switches along the mtrace path do not provide this forwarding code.

History

This command was first available in ExtremeXOS 12.4.

The **router-alert** option was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

mv

```
mv old_name new_name
```

Description

Moves a file from the specified file system or relative to the current working directory to another file on the specified file system or relative to the current working directory.

Syntax Description

old_name	Specifies the current name of the configuration or policy file on the system.
new_name	Specifies the new name of the configuration or policy file on the system.

Default

N/A.

Usage Guidelines

Use this command to move a file from the specified file system or relative to the current working directory to another file on the specified file system or relative to the current working directory. This command provides the functionality to relocate an existing file by creating a new entry in the file system, linking the content of the existing file to the new one and removing the old entry. If given a different name, the new file can be created in the same directory as the existing file

- XML-formatted configuration files have the `.cfg` file extension. The switch only runs `.cfg` files.
- ASCII-formatted configuration files have the `.xsf` file extensions. For more information, see the *Software Upgrade and Boot Options* section in the *Switch Engine 32.2 User Guide*.
- Policy files have the `.pol` file extension.
- Core dump files have the `.gz` file extension. For more information, see the *Internal Memory and Core Dump Files* section in the *Switch Engine 32.2 User Guide*.

Make sure the renamed file uses the same file extension as the original file. If you change the file extensions, the file may be unrecognized by the system. For example, if you have an existing configuration file named `test.cfg`, the new file name must include the `.cfg` file extension.

You cannot rename an active configuration file (the configuration currently selected to boot the switch). To verify the configuration that you are currently using, run the show switch {detail} command. If you attempt to rename the active configuration file, the switch displays a message similar to the following:

```
Error: Cannot rename current selected active configuration file.
```

When you rename a file, the switch displays a message similar to the following:

```
Rename config test.cfg to config megtest.cfg on switch? (y/n)
```

Type `y` to rename the file on your system. Type `n` to cancel this process and keep the existing file name.

Case-Sensitive File Names

File names are case-sensitive. For example, if you have a configuration file named `Test.cfg`, and you attempt to rename the file with the incorrect case, for example `test.cfg`, the switch displays a message similar to the following:

```
Error: mv: unable to rename `/config/test.cfg': No such file or directory
```

Since the switch is unable to locate `test.cfg`, the file is not renamed.

Local File Name Character Restrictions

When specifying a local file name, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Dash (-).
- Underscore (_).

Internal Memory and Core Dump Files

Core dump files have a `.gz` file extension. The file name format is: `core.process-name.pid.gz`, where `process-name` indicates the name of the process that failed and `pid` is the numerical identifier of that process.

When you configure the switch to send core dump (debug) information to internal memory, specify the file path `/usr/local/tmp` to rename an existing core dump file. If you have a switch with a USB storage device installed, you can move and rename the core dump file to that location.

For information about configuring and saving core dump information, see the `configure debug core-dumps [` **`off`** `|` *`directory_path`*`]` and `save debug tracefiles` *`directory_path`* commands.

Example

The following command renames the configuration file named `Testb91.cfg` to `Activeb91.cfg`:

```
# mv Testb91.cfg Activeb91.cfg
```

The following example moves the configuration file named `test1.cfg` from the switch to the USB storage device:

```
# mv test1.cfg /usr/local/ext/test1.cfg
```

The following example moves the policy file named `bgp.pol` from the USB storage device to the switch:

```
# mv /usr/local/ext/bgp.pol bgp.pol
```

History

This command was first available in ExtremeXOS 10.1.

The **memorycard** option was added in ExtremeXOS 11.1.

The **internal-memory** option was added in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Path name support was added in ExtremeXOS 15.5.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

nslookup

`nslookup {`**IPv4** | **IPv6**`}` *hostname*

Description

Displays the IP address of the requested host.

Syntax Description

IPv4	Lookup only IPv4 address(es).
IPV6	Lookup only IPv6 address(es).
hostname	Specifies the hostname.

Default

Lookup both IPv4 and IPv6 addresses.

Usage Guidelines

For nslookup to work, you must configure the DNS client, and the switch must be able to reach the DNS server.

By default, the command looks for both IPv4 and IPv6 addresses and reports an error only when neither an IPv4 address nor an IPv6 address is found for the host.

If the IPv4 or IPv6 option is specified, DNS lookup happens only for that address type, and an error is reported when no address of that type is found.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Dash (-) Permitted only for host names.
- Underscore (_) Permitted only for host names.
- Colon (:).

When naming or configuring an IP address for your network server, remember the requirements listed above.

Example

The following command looks up the IP addresses of a computer with the name myhost.mydomain that has 2 IPv4 addresses and 1 IPv6 address:

```
nslookup myhost.mydomain
```

The following is sample output from the command on a switch:

```
Host "myhost.mydomain" has the IPv4 address 192.168.1.1
Host "myhost.mydomain" has the IPv4 address 192.168.1.2
Host "myhost.mydomain" has the IPv6 address 2000::1
```

History

This command was first available in ExtremeXOS 10.1.

Support for using an IP address to obtain the name of the host was added in ExtremeXOS 11.0. Support for looking up IPv6 addresses was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

open vm console

```
open vm vm_name {console}
```

Description

Opens a session to the serial console of a virtual machine (VM).

Syntax Description

vm	Designates a virtual machine.
vm_name	Specifies the VM name to use with a serial console.
console	Open VM serial console (default).

Default

By default, a serial console is opened.

The VM must be internally configured to enable the serial console.

Usage Guidelines

You can disconnect the console session by typing CTRL + Y, or, if using Telnet recursively with an appropriate client, by typing CTRL +] followed by “send escape”. A maximum of one session can be active for a VM.

You cannot access the serial console before starting a VM. You must start the VM, and then reboot it to gain serial console access.

The Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

Example

The following example opens a serial console session with VM "vm1":

```
# open vm vm1 console
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

ping

```
ping {count count {start-size start-size} | continuous {start-size
   start-size} | {start-size start-size {end-size end-size}}} {udp}
   {dont-fragment} {ttl ttl} {tos tos} {interval interval} {vr vrid}
   {ipv4 host | ipv6 host} {from} {with record-route}
```

Description

Enables you to send User Datagram Protocol (UDP) or *ICMP* echo messages or to a remote IP device.

Syntax Description

count	Specifies the number of ping requests to send.
start-size	Specifies the size, in bytes, of the packet to be sent, or the starting size if incremental packets are to be sent.
continuous	Specifies that UDP or ICMP echo messages to be sent continuously. This option can be interrupted by pressing **[Ctrl]** + **C**.
end-size	Specifies an end size for packets to be sent.
udp	Specifies that the ping request should use UDP instead of ICMP.
dont-fragment	Sets the IP to not fragment the bit.
ttl	Sets the TTL value.
tos	Sets the TOS value.
interval	Sets the time interval between sending out ping requests.
vr	Specifies the virtual route to use for sending out the echo message. If not specified, *VR-Default* is used. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
ipv4	Specifies IPv4 transport.
ipv6	Specifies IPv6 transport. Note: If you are contacting an IPv6 link local address, you must specify the *VLAN* you are sending the message from: `ping` **`ipv6`** *`link-local address %vlan_name host`*.
host	Specifies a host name or IP address (either v4 or v6).

from	Uses the specified source address. If not specified, the address of the transmitting interface is used.
with record-route	Sets the traceroute information.

Default

N/A.

Usage Guidelines

The `ping` command is used to test for connectivity to a specific host.

You use the ipv6 variable to ping an IPv6 host by generating an ICMPv6 echo request message and sending the message to the specified address. If you are contacting an IPv6 link local address, you must specify the VLAN you are sending the message from, as shown in the following example (you must include the % sign):

`ping` **`ipv6`** *`link-local address %vlan_name host`*.

The `ping` command is available for both the user and administrator privilege level.

When the IPv6 host ping fails, the following error message appears:

`Error: cannot determine outgoing interface. Link local address must be of form LLA%` *`vlan_name`*.

Due to upgrading ExtremeXOS 30.1 to 4.14 Linux kernel, ping success to local IP addresses does not depend on link-layer status. Earlier releases of ExtremeXOS had customized Linux behavior that meant that pinging a local VLAN interface would fail when the local interface was down. However, in ExtremeXOS 30.1, pinging a local VLAN interface that is down will result in a successful ping.

If you have an asymmetric routing to a specific destination (where the traffic from the source to the destination uses one path, and the return traffic uses another), use this command with option 7, **`with record-route`**.

For example:

```
ping <destination address> with record-route
ping <destination address> from <source-address> with record-route
```

For more information about this option, see `enable ip-option record-route`.

Example

The following example enables continuous ICMP echo messages to be sent to a remote host:

```
ping continuous 123.45.67.8
```

The following example uses the **`with record-route`** option:

```
ping 10.2.1.1 from 10.2.1.2 with record-route
Ping(ICMP) 10.2.1.1: 4 packets, 8 data bytes, interval 1 second(s).
```

```
16 bytes from 10.2.1.1: icmp_seq=0 ttl=63 time=10 ms
RR: 10.2.1.2    10.2.0.21    10.2.1.1    10.2.1.1    10.2.0.1    10.2.1.2
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv6** option was added in ExtremeXOS 11.2.

The IPv6 error message was modified in ExtremeXOS 15.2.

Ping success to local IP addresses not depend on link-layer status added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

ping mac port

The ping, or loopback message (LBM), goes from the MEP configured on the port toward the given MAC address.

`ping mac` *mac* **port** *port* {**domain**} *domain_name* {**association**} *association_name*

Description

Allows you to ping on the Layer 2 level throughout the specified domain and MA.

Syntax Description

mac	Enter the unique system MAC address on the device you want to reach. Enter this value in the format XX:XX:XX:XX:XX:XX.
port	Enter the port number of the MEP from which you are issuing the ping.
domain	Enter this keyword.
domain_name	Enter the name of the domain from which you are issuing the ping.
association	Enter this keyword.
association_name	Enter the name of the association from which you are issuing the ping.

Default

N/A.

Usage Guidelines

You must have CFM parameters configured prior to issuing a Layer 2 ping.

In order to send a Layer 2 ping, you must specify the port (MEP), the domain, and the MA from which you are issuing the ping. An UP MEP sends the ping to all ports (except the sending port) on the *VLAN* that is assigned to the specified MA, and a DOWN MEP sends the ping out from that port from that MA toward the specified MAC address.

All MIPs along the way forward the LBM to the destination. The destination MP responds back to the originator with a loopback reply (LBR).

This command sends out a ping from the MEP configured on the specified port toward the specified MAC address. If you attempt to send a ping message from a port that is not configured as a MEP, the system returns an error message. If the specified MAC address is not present in the Layer 2 forwarding table (*FDB*), the system cannot send the ping (applies to UpMEP, not DownMEP).

Example

The following command sends a Layer 2 ping to the unique system MAC address 00:04:96:1F:A4:31 from the previously configured UP MEP (port 2:4) in the speed association in the atlanta domain:

```
ping mac 00:04:96:1F:A4:31 port 2:4 atlanta speed
```

The following is sample output from the Layer 2 ping command:

```
BD-12802.48 # ping mac 00:04:96:1e:14:70 port 2:12 "extreme" 100
Send L2 Ping from Down MEP on 2:12, waiting for responses [press Ctrl-C to abort].
42 bytes from 00:04:96:1e:14:70, seq=4 time=17 ms
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

ping mpls lsp

```
ping mpls lsp [lsp_name | any host | prefix ipNetmask] {reply-mode [ip
   | ip-router-alert]} {continuous | count count} {interval interval}
   {start-size start-size {end-size end-size}} {ttl ttl} {{from from}
   {next-hop hopaddress}}
```

Description

Sends an *MPLS* ping packet to a FEC over an LSP.

Syntax Description

lsp_name	Specifies the LSP on which to send the MPLS echo request.
any	Allows the echo request to be sent over any available LSP.
host	Specifies the FEC using an ipaddress or hostname.
prefix	Specifies a prefix.
ipNetmask	Specifies the prefix address.
reply-mode	Specifies the return path for the MPLS echo response.
ip	Requests an IP UDP reply packet. This is the default mode.
ip-router-alert	Requests an IP UDP reply packet with the IP Router Alert option. If the reply is sent in an LSP, the router-alert label is inserted at the top of the label stack.
continuous	Sends pings continuously until the user intervenes.
count	Determines whether the size of the packet increments by one byte for each new MPLS echo request sent.
interval	Specifies the time interval (in seconds) between pings.
start-size	The number of payload data bytes in the MPLS ping packet. The range is from 1 - 1518 (if jumbo frames are disabled) and from 1 - the configured jumbo packet size (if jumbo frames are enabled). The default is 8 bytes.
end-size	Specifies that the size of the packet increments by one byte for each new MPLS echo request sent, up to the specified maximum size for the MPLS ping packet.
ttl	Sets the time-to-live value in the ping packet
from	Specifies the source IP address of the packet.
hopaddress	Specifies the next-hop address.

Default

Destination IP address for MPLS echo request - random, from the 127 and 128 IP address space IP TTL - 1 TTL value in MPLS echo request - 255 Destination UDP port - 3503 Payload data packet size - 8 bytes Number of pings sent - 4

Usage Guidelines

This command sends an MPLS ping packet to a FEC over an LSP. The ping command, with mpls keyword option, can be used to verify data plane connectivity across an LSP. This is useful because not all failures can be detected using the MPLS control plane. The **lsp** keyword and *lsp_name* parameter may be used to specify the LSP on which to send the MPLS echo request. The lsp keyword along with the any keyword allows the echo request to be sent over any available LSP that terminates at host, specified as an ipaddress or hostname. If no LSP exists to the specified host, the ping command fails even though an IP routed path may exist. If the optional **next-hop** is specified, the MPLS echo request is sent along the LSP that traverses the specified node. This option is useful for specifying an LSP when multiple LSPs exist to the specified FEC. For RSVP-TE LSPs, the FEC is implied from the LSP configuration. The TTL value in the MPLS Echo Request is set to 255.

By default, the destination IP address of the MPLS echo request is randomly chosen from the 127/8 IP address space and the IP TTL is set to 1. The destination UDP port is 3503 and the sender chooses the source UDP port.

The optional **start-size** keyword specifies the number of bytes to include as payload data in the MPLS ping packet. If no *start-size* parameter is specified, the size of the payload data is eight bytes. The minimum valid *start-size* value is one. The maximum *start-size* value is variable, depending on the type of MPLS ping packet sent, but the total size of the MPLS ping packet cannot exceed the configured jumbo packet size, if jumbo frames are enabled, or 1518 if jumbo frames are disabled. If the **end-size** keyword is specified, the size of the packet increments by one byte for each new MPLS echo request sent. The next MPLS echo request is not sent until the MPLS echo response for the previous packet is received. This is useful for detecting interface MTU mismatch configurations between LSRs. The switch ceases sending MPLS echo requests when the specified *end-size* value is reached, the MPLS ping is user interrupted, or an MPLS echo response is not received after four successive retries.

The optional **reply-mode** keyword is used to specify the reply mode for the MPLS echo response. When the **ip** option is specified, the MPLS echo reply is routed back to the sender in a normal IPv4 packet. When the **ip-router-alert** option is specified, the MPLS echo reply is routed back to the sender in an IPv4 packet with the Router Alert IP option set. Additionally, if the **ip-router-alert** option is specified and the reply route is through an LSP, the Router Alert Label is pushed onto the top of the label stack. If the reply-mode is not specified, the **reply-mode ip** option applies.

Example

The following example shows a ping command and the resulting display:

```
ping mpls lsp prefix 11.100.100.212/32
Ping(MPLS) : 4 packets, 8 data bytes, interval 1 second(s).
98 bytes from 11.100.100.212: mpls_seq=0 ttl=64 time=6.688 ms
98 bytes from 11.100.100.212: mpls_seq=1 ttl=64 time=6.036 ms
98 bytes from 11.100.100.212: mpls_seq=2 ttl=64 time=6.218 ms
98 bytes from 11.100.100.212: mpls_seq=3 ttl=64 time=6.467 ms
--- ping statistics ---
4 packets transmitted, 4 received, 0% loss
round-trip min/avg/max = 6/6/6/ms
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

pwd

```
pwd
```

Description

Prints the full pathname of the current working directory.

Syntax Description

pwd	Print current working directory.

Default

N/A.

Usage Guidelines

Use this command to print the full pathname of the current working directory.

History

This command was first available in ExtremeXOS 15.5

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

quit

```
quit
```

Description

Logs out the session of a current user for CLI or Telnet.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to log out of a CLI or Telnet session.

When you issue this command, you are asked to save your configuration changes to the current, active configuration. Enter y if you want to save your changes. Enter n if you do not want to save your changes.

Example

The following command logs out the session of a current user for CLI or Telnet:

```
quit
```

A message similar to the following is displayed:

```
Do you wish to save your configuration changes to primary.cfg? (y or n)
```

Enter y if you want to save your changes. Enter n if you do not want to save your changes.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

reboot

```
reboot {[time mon day year hour min sec] | cancel} {slot slot-number}
   | node-address node-address | stack-topology {as-standby} | all} |
   rolling}
```

Description

Reboots the switch, bridge port extenders (BPEs), or SummitStack in the specified slot at a specified date and time.

Syntax Description

time	Specifies a reboot date in mm dd yyyy format and reboot time in hh mm ss format.
cancel	Cancels a previously scheduled reboot.
slot *slot-number*	Specifies the slot number currently being used by the active stack node or BPE that is to be rebooted.
all	Specifies rebooting all attached BPEs and the controlling bridge switch. Using this option requires a Core License or above.
rolling	Specifies to reboot or upgrade a stack by rebooting one node at a time.

Default

N/A.

Usage Guidelines

If you do not specify a reboot time, the switch reboots immediately following the command, and any previously scheduled reboots are cancelled.

Prior to rebooting, the switch returns the following message:

```
Do you want to save configuration changes to primary and reboot? (y - save and reboot, n -
reboot without save, <cr> - cancel command)
```

To cancel a previously scheduled reboot, use the cancel option.

After selecting the **rolling** option, if a new image was not installed, a rolling reboot of all the nodes will be performed.

SummitStack Only

The `reboot` command used without any parameters on the master node reboots all members of the same active topology to which the master node belongs.

This version can only be used on the master node.

The `reboot slot` *`slot-number`* command can be used on any active node. The command will reboot the active node that is currently using the specified slot number in the same active topology as the issuing node. This variation cannot be used on a node that is not in stacking mode.

The `reboot node-address` *`node-address`* command can be used on any node whether or not the node is in stacking mode. It will reboot the node whose MAC address is supplied.

The `reboot stack-topology {as-standby}` command reboots every node in the stack topology. The command can be issued from any node whether or not the node is in stacking mode. If the as-standby option is used, every node in the stack topology restarts with master-capability disabled. This option is useful when manually resolving a dual master situation.

The `reboot rolling` command initiates a Stack Rolling Software Upgrade (Rolling Upgrade), which reboots each node in a stack one-by-one, allowing the stack to continue functioning during the reboot. The rolling upgrade process reboots all the Standby nodes, reboots the Backup node, and then initiates a failover to make the old Backup node the new Primary. The failover results in the old Primary node rebooting. Since the selected software version on each node is the newer, upgraded software version, after each node reboots, they will run the new software version. Performing a Rolling Upgrade does not change the current method of installing software, only how the stack is rebooted.

Bridge Port Extenders (BPEs)

Under normal circumstances, it is not necessary to reboot the BPEs slots. After rebooting a controlling switch, BPE upstream port down events cause the BPE's software to bring down all extended ports. This makes the BPE slot appear as down to any adjacently attached devices, and traffic properly re-converges on any redundant paths. When the controlling bridge switch comes back up, the BPE comes back up without any intervention. Therefore, using the commands `reboot` or `unconfigure switch {`**`all`** | **`erase`** `[`**`all`** | **`nvram`**`]}` does not reboot the attached BPEs. To reboot attached BPEs, you must use the **`all`** option.

Example

The following example reboots the switch at 8:00 AM on April 15, 2005:

```
reboot time 04 15 2005 08 00 00
```

History

This command was first available in ExtremeXOS 10.1.

The alternate BootROM image was added in ExtremeXOS 11.1.

The **slot**, **node-address**, **stack-topology**, and **as-standby** options were added in ExtremeXOS 12.0.

The **all** option for rebooting attached BPEs was added in ExtremeXOS 22.5.

The **rolling** option was added in ExtremeXOS 31.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

refresh access-list network-zone

```
refresh access-list network-zone [zone_name | all]
```

Description

This command is used to refresh a specific network zone, or all the network zones.

Syntax Description

network-zone	Specifies the logical group of remote devices.
zone_name	Specifies the network_zone name.
all	Refresh all the network-zones.

Default

N/A.

Usage Guidelines

Use this command to refresh a specific network zone, or all the network zones.

When you issue the command to refresh a network-zone, or all network-zones, it can take a long time to clear the CLI because each individual policy must be converted before it is refreshed. The command succeeds, or fails, only after it receives a response for all policy refresh results from the hardware.

If the refresh fails for a specific zone, the following error message will be printed on the console.

```
Switch # refresh access-list network-zone zone1
ERROR: Refresh failed for network-zone "zone1".
```

Example

The following example refreshes all policies in “zone1”:

```
refresh access-list network-zone zone1
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

refresh identity-management role

```
refresh identity-management role user [user_name {domain domain_name} |
   all {role role_name}]
```

Description

Refreshes the role evaluation for the specified user, for all users, or for all users currently under the specified role.

Syntax Description

user_name	Specifies a user name for which role evaluation will be refreshed.
domain_name	Specifies a domain name for the specified user.
all	Specifies a refresh for all users associated with the specified role.
role_name	Specifies a a role name for which all users will be refreshed.

Default

N/A.

Usage Guidelines

It may be necessary to refresh the role of a user due to a new role which might be better suited for the user or due to a change in LDAP attributes of the user which in turn might result in the user being classified under a different role. This command can be used in all such cases.

Example

The following example refreshes the role for user Tony:

```
* Switch.22 # refresh identity-management role user "Tony"
```

The following example refreshes the role for all users who are currently classified under the Marketing role:

```
* Switch.22 # refresh identity-management role all "Marketing"
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

refresh igmp ssm-map

```
refresh igmp ssm-map {dns group} [grpipaddress netmask | ipNetmask]
   {{vr} vrname}
```

Description

Refreshes an *IGMP* SSM mapping entry.

Syntax Description

dns group	Refreshes DNS sources for a multicast group.
grpipaddress	Specifies the multicast group IP address.
netmask	Specifies th multicast group netmask.
ipNetmask	Specifes the multicast gorup IP address and netmask.
vrname	Specifies the name of the virtual router.

Default

N/A

Usage Guidelines

None.

Example

The following example refreshes an IGMP SSM mapping entry.

```
refresh igmp ssm-map 224.0.0.5/24 VR-Default
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

refresh mld ssm-map

```
refresh mld ssm-map { v6groupnetmask } {{vr} vr_name}
```

Description

Sends a DNS request for a particular group. On receiving the DNS response, the “DNS Age” in the SSM mapping entry is refreshed.

Syntax Description

v6groupnetmask	Refreshes the specific group information.
vr *vr_name*	Specifies the virtual router name.

Default

Disabled.

Usage Guidelines

Use this command to send out DNS requests for a particular group. On receiving the DNS response, the “DNS Age” in the SSM mapping entry is refreshed.

Example

The following command send out DNS requests:

```
refresh mld ssm-map
```

When *v6groupnetmask* is specified, the SSM Mapping status and the SSM Mapping entries specific to the group range on the VR are displayed.

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

refresh policy

```
refresh policy policy-name
```

Description

Refreshes the specified policy.

Syntax Description

policy-name	Specifies the policy to refresh.

Default

N/A.

Usage Guidelines

Use this command when a new policy file for a currently active policy has been downloaded to the switch, or when the policy file for an active policy has been edited. This command reprocesses the text file and updates the policy database.

Before 12.6.1 there was no support to refresh the policies that are associated to the local VPP. For network VPP, you can achieve policy refresh by changing the policy timestamp file. Beginning in release 11.4, the policy manager uses Smart Refresh to update the *ACL*s. When a change is detected, only the ACL changes needed to modify the ACLs are sent to the hardware, and the unchanged entries remain. This behavior avoids having to blackhole packets because the ACLs have been momentarily cleared. Smart Refresh works well for minor changes, however, if the changes are too great, the refresh reverts to the earlier behavior. To take advantage of Smart Refresh, disable access-list refresh blackholing by using the command:

```
disable access-list refresh blackhole
```

If you attempt to refresh a policy that cannot take advantage of Smart Refresh while blackholing is enabled, you will receive a message similar to the following:

```
Incremental refresh is not possible given the configuration of policy
<name>. Note, the current setting for Access-list Refresh Blackhole is
Enabled. Would you like to perform a full refresh? (Yes/No) [No]:
```

If blackholing is not enabled, you will receive a message similiar to the following:

```
Incremental refresh is not possible given the configuration of policy
<name>. Note, the current setting for Access-list Refresh Blackhole
is Disabled. WARNING: If a full refresh is performed, it is possible
packets that should be denied may be forwarded through the switch during
```

```
the time the access list is being installed. Would you like to perform a
full refresh? (Yes/No) [No]:
```

If you attempt to refresh a policy that is not currently active, you will receive an error message.

For an ACL policy, the command is rejected if there is a configuration error or hardware resources are not available.

Example

The following example refreshes the policy zone5:

```
refresh policy zone5
```

History

This command was first available in ExtremeXOS 11.0.

Smart Refresh was added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

reset inline-power ports

```
reset inline-power ports port_list
```

Description

Power cycles the specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports for which power is to be reset.

Default

N/A.

Usage Guidelines

This command power cycles the specified ports. Ports are immediately disabled and then re-enabled, allowing remote PDs to be power-cycled.

This command affects only inline power; it does not affect network connectivity for the port(s).

Example

The following command resets power for port 4 on a switch:

```
reset inline-power ports 4
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the *PoE* devices listed in Extreme Networks PoE Devices.

restart ports

```
restart ports [all | port_list]
```

Description

Resets autonegotiation for one or more ports by resetting the physical link.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command resets autonegotiation on slot 1, port 4 on a modular switch:

```
restart ports 1:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

restart process

```
restart process [class cname | name {msm slot}]
```

Description

Terminates and restarts the specified process during a software upgrade on the switch.

Syntax Description

cname	Specifies the name of the process to restart. With this parameter, you can terminate and restart all instances of the process associated with a specific routing protocol on all VRs.You can restart the *OSPF* routing protocol and associated processes.
name	Specifies the name of the process to terminate and restart. You can use this command with the following processes: bgp, eaps, exsshd, isis, lldp, netLogin, netTools, ntp, ospf, ospfv3, snmp Subagent, snmpMaster, telnetd, thttpd, tftpd, vrrp, and xmld.
slot	On a SummitStack, specifies the node's slot number. The number is a value from 1 to 8.

Default

N/A.

Usage Guidelines

Use this command to terminate and restart a process during a software upgrade on the switch. You have the following options:

- cname—Specifies that the software terminates and restarts all instances of the process associated with a specific routing protocol on all VRs.
- name—Specifies the name of the process.

Depending on the software version running on your switch and the type of switch you have, you can terminate and restart different or additional processes. To see which processes you can restart during a software upgrade, enter restart process followed by [Tab]. The switch displays a list of available processes.

SummitStack Only

You can issue this command only from the master node. If you issue this command from any other node, the following message appears:

```
Error: Processes created by user can only be restarted on the primary node slot.
```

To display the status of ExtremeXOS processes on the switch, including how many times a process has been restarted, use the `show process {name} {detail} {description} {slotslotid}` command. The following is a truncated sample of the show process command on a switch:

```
Process Name     Version  Restart    State             Start Time
-------------------------------------------------------------------------
aaa              3.0.0.2     0    Ready        Thu Sep  1 17:00:52 2005
acl              3.0.0.2     0    Ready        Thu Sep  1 17:00:54 2005
bgp              Not Started 0    No license   Not Started
cfgmgr           3.0.0.21    0    Ready        Thu Sep  1 17:00:52 2005
cli              3.0.0.22    0    Ready        Thu Sep  1 17:00:52 2005
devmgr           3.0.0.2     0    Ready        Thu Sep  1 17:00:52 2005
dirser           3.0.0.2     0    Ready        Thu Sep  1 17:00:51 2005
dosprotect       3.0.0.1     0    Ready        Thu Sep  1 17:00:56 2005
eaps             3.0.0.8     0    Ready        Thu Sep  1 17:00:53 2005
...
```

You can also use the `restart process` command when upgrading a software modular package. For more information, see the section *Upgrading a Modular Software Package* in the *Switch Engine 32.2 User Guide*.

Example

The following example stops and restarts the process tftpd during a software upgrade:

```
restart process tftpd
```

The following example stops and restarts all instances of the OSPF routing protocol for all VRs during a software upgrade:

```
restart process class ospf
```

History

This command was first available in ExtremeXOS 11.3.

Support for restarting the Link Layer Discovery Protocol (lldp), Open Shortest Path First (ospf), and network login (netLogin) processes was added in ExtremeXOS 11.3.

Support for Border Gateway Protocol (bgp) and Ethernet Automatic Protection Switching (eaps) was added in ExtremeXOS 11.4.

Support for MultiProtocol Label Switching (mpls) and Virtual Router Redundancy Protocol (vrrp) was added in ExtremeXOS 11.6.

Support for netTools was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

restart process mpls

```
restart process mpls
```

Description

Restarts the *MPLS* process when it does not respond to the CLI commands.

Default

N/A.

Usage Guidelines

None.

Example

The following command restarts the MPLS process:

```
restart process mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

restart vm

```
restart vm vm_name {forceful | graceful}
```

Description

Restarts (reboots) a virtual machine (VM).

Syntax Description

vm	Virtual machine.
vm_name	Specifies the VM to restart.
forceful	Forcefully terminates the VM.
graceful	Gracefully shuts down the VM if possible (default).

Default

By default, the VM is gracefully shut down before restarting, if possible.

Usage Guidelines

N/A.

Example

The following example restarts the VM "testvm" gracefully:

```
restart vm testvm gracefully
```

History

This command was first available in ExtremeXOS 30.4.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

resume vm

`resume` **`vm`** *`vm_name`*

Description

Resumes a virtual machine (VM) that has been suspended.

Syntax Description

`vm`	Specifies a VM.
`vm_name`	Specifies the VM name to resume.

Default

N/A.

Usage Guidelines

When you resume a VM, the CPU state of the VM continues from the point at which it was suspended.

To suspend the VM again, use the `suspend` **`vm`** *`vm_name`* command.

Example

The following example resumes the VM "vm1":

```
# resume vm vm1
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

return

```
return statusCode
```

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: `enable cli scripting {permanent}`.

Description

Exits the current script and sets the $STATUS variable.

Syntax Description

statusCode	Specifies a integer value to which the $STATUS variable is set.

Default

N/A.

Usage Guidelines

When used in nested scripts, this command allows you to terminate the current script, set the $STATUS variable, return to the parent script, and evaluate the $STATUS variable in the parent script. For more information on the $STATUS variable, see “Using CLI Scripting” in the *Switch Engine 32.2 User Guide*.

Example

The following example exits the current script and sets the $STATUS variable to -200:

```
return -200
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

rm

```
rm file_name
```

Description

Deletes an existing configuration, policy, or if configured, core dump file from the system.

Syntax Description

file_name	Specifies the name of the configuration, policy file, or if configured, the core dump file to delete.

Default

N/A.

Usage Guidelines

After you delete a configuration or policy file from the system, that file is unavailable to the system.

You cannot delete an active configuration file (the configuration currently selected to boot the switch). To see which configuration that you are currently using, run the `show switch {detail}` command. If you attempt to delete the active configuration file, the switch displays a message similar to the following:

```
Error: Cannot remove current selected active configuration file.
```

When you delete a file from the switch, a message similar to the following appears:

```
Remove testpolicy.pol from /usr/local/cfg? (y/N)
```

Type `y` to delete the file from your system. Type `n` to cancel the process and keep the file on your system.

Case-Sensitive File Names

File names are case-sensitive. For example, if you have a configuration file named `Test.cfg`, and you attempt to delete a file with the incorrect case, for example `test.cfg`, the system is unable to delete the file. The switch does not display an error message; however, the `ls` command continues to display the file `Test.cfg`. To delete the file, make sure you use the appropriate case.

Local File Name Character Restrictions

When specifying a local file name, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Dash (-).
- Underscore (_).

Core Dump Files

When you configure the switch to send core dump (debug) information to internal memory, specify the file path `/usr/local/tmp`.

For information about configuring and saving core dump information, see the `configure debug core-dumps [ off | directory_path]` and `save debug tracefiles directory_path` commands.

You can use the * wildcard to mass delete core dump files. Currently running and in-use files are not deleted.

If you configure the switch to save core dump files to internal memory and attempt to download a new software image, you might have insufficient space to complete the image download. When this occurs, you must decide whether to continue the software download or move or delete the core dump files from internal memory. To resolve this problem, if you have a switch with a USB storage device installed with space available, transfer the files to the USB device. Another option is to transfer the files from internal memory to a TFTP server. This frees up space on the internal memory while keeping the core dump files.

Example

The following example deletes the configuration file named `Activeb91.cfg` from the system:

```
# rm Activeb91.cfg
```

The following example deletes all of the core dump files stored in internal memory:

```
# rm /usr/local/tmp/*
```

The following example deletes the policy file named `test.pol` from the USB storage device:

```
# rm /usr/local/ext/test.pol
```

The following example deletes all of the configuration files from the USB storage device:

```
# rm /usr/local/ext/*.cfg
```

History

This command was first available in ExtremeXOS 10.1.

The **`memorycard`** option was added in ExtremeXOS 11.1.

The **internal-memory** option was added in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Path name support was added in ExtremeXOS 15.5.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

rmdir

```
rmdir directory_name
```

Description

Removes an existing directory from the specified file system or relative to the current working directory.

Syntax Description

rmdur	Change current working directory.
directory_name	Pathname of a directory.

Default

N/A.

Usage Guidelines

Use this command to remove an existing directory from the specified file system or relative to the current working directory.

History

This command was first available in ExtremeXOS 15.5

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

rtlookup rpf

```
rtlookup [ipaddress | ipv6address] rpf {vr vr_name}
```

Description

Displays the RPF for a specified multicast source.

Syntax Description

ipaddress	Specifies an IPv4 address.
ipv6address	Specifies an IPv6 address.
rpf	Selects the RPF for the specified multicast source.
vr_name	Specifies the VR or VRF for which to display the route.

Default

vr_name is the VR of the current CLI context.

Usage Guidelines

None.

Example

The following example displays the RPF lookup for a multicast source through *VR-Default*:

```
rtlookup 2001db8::ef80:2525:1023:5213 rpf vr vr-default
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

rtlookup

`rtlookup [`*ipaddress* `|` *ipv6address*`] {` **unicast** `|` **multicast** `|` **vr** *vr_name*`}`

Description

Displays the available routes to the specified IPv6 address.

Syntax Description

ipaddress	Specifies an IPv4 address.
ipv6address	Specifies an IPv6 address.
unicast	Displays the routes from the unicast routing table in the current router context.

multicast	Displays the routes from the multicast routing table in the current router context.
vr_name	Specifies the VR or VRF for which to display the route.

Default

N/A.

Usage Guidelines

None.

Example

The following command performs a look up in the route table to determine the best way to reach the specified IPv6 address:

```
rtlookup 2001:db8::ef80:2525:1023:5213 unicast
```

History

This command was first available in ExtremeXOS 10.1.

The xhostname option was removed in ExtremeXOS 11.0.

Support for IPv6 was added in ExtremeXOS 11.2.

The unicast and multicast options were added in ExtremeXOS 12.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

run diagnostics

```
run diagnostics [extended | normal] }
```

Description

Runs normal or extended diagnostics on the switch or node, and stacking ports.

This command is not supported in stacking mode, but if you issue the show diagnostics command from the master node, it will show the diagnostic results for all the nodes.

Syntax Description

extended	Runs an extended diagnostic routine. Takes the ports offline, and performs extensive ASIC and packet loopback tests on all of the ports.
normal	Runs a normal diagnostic routine. Takes the ports offline, and performs a simple ASIC and packet loopback test on all of the ports.

Default

N/A.

Usage Guidelines

Depending on your platform, use this command to run diagnostics on the switch or stack port.

If you run the diagnostic routine on the switch, it reboots and then performs the diagnostic test. During the test, traffic to and from the ports on the switch is temporarily unavailable. When the diagnostic test is complete, the switch reboots and becomes operational again.

To run the diagnostic routine on the stack ports, you need a dedicated stacking cable that connects stack port 1 to stack port 2, which are located at the rear of the switch. The stacking cable is available from Extreme Networks. The switch performs a hardware test to confirm that the stack ports are operational; traffic to and from the ports on the switch is temporarily unavailable. This Bit Error Rate Test (BERT) provides an analysis of the number of bits transmitted in error.

After the switch runs the diagnostic routine, test results are saved to the switch's EEPROM and messages are logged to the syslog.

To run diagnostics on a switch that is in a SummitStack, first disable stacking on that switch, then restart the switch. Once restarted, log into the switch via its console port, and run diagnostics. The switch will perform the diagnostic tests, and then restart. Once restarted, log into the switch via its console port and enable stacking, then reboot the switch. Once restarted, the switch will rejoin the stack.

Viewing Diagnostics

To view results of the last diagnostics test run, use the following command:

`show diagnostics {slot [slot_number]}`

If the results indicate that the diagnostic failed on a node, replace the node with another switch of the same type.

If the results indicate that the diagnostic failed on the switch, contact Extreme Networks Technical Support.

The following example runs normal diagnostics on a ExtremeSwitching series switch:

```
run diagnostics normal
```

The switch displays a warning similar to the following about the impact of this test. You also have the opportunity to continue or cancel the test:

```
Running Diagnostics will disrupt network traffic.
Are you sure you want to continue? (y/n)
```

Enter `y` to continue and run the diagnostics. Enter `n` to cancel the operation.

The following command runs diagnostics on the stack ports on a ExtremeSwitching series switch:

```
run diagnostics stack-port
```

If you issue this command with a console connection, the switch displays the following information. You also have the opportunity to continue or cancel the test:

```
Summit Diagnostics Mode Enabled, Starting Diagnostics....
Found X440a-24T in Motherboard
Motherboard CPLD Revision: 2
Starting stacking port diagnostics
****************************************************************
*                                                              *
* Please connect a cable between Stack Port 1 and Stack Port 2. *
*                                                              *
*        Press S to skip test, ENTER key to continue.          *
*                                                              *
****************************************************************
```

Press **[Enter]** to continue and run the diagnostics. Enter `s` to cancel the operation.

If you continue with diagnostics, the switch displays messages similar to the following:

```
Stack Port 1 and Stack Port 2
BERT ..........................................................................
.
.........................................................................
Stacking ports
Port 1 (Device 0 - Device port 26)
Lane 0 PASSED.
Lane 1 PASSED.
Lane 2 PASSED.
Lane 3 PASSED.
Port 2 (Device 0 - Device port 27)
Lane 0 PASSED.
Lane 1 PASSED.
Lane 2 PASSED.
Lane 3 PASSED.
DIAGNOSTIC PASS: run test bert stacking
Summit Diagnostics completed, rebooting system...
```

If you issue this command with a Telnet connection, the switch displays a warning similar to the following about the impact of this test. You also have the opportunity to continue or cancel the test:

```
Running Diagnostics will disrupt network traffic.
Are you sure you want to continue? (y/n)
```

Enter `y` to continue and run the diagnostics. Enter `n` to cancel the operation.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

run elrp

```
run elrp {vlan}vlan_name {ports [ports |all | none]} {remote-endpoints
   vxlan all} {interval interval {seconds | milliseconds} } {retry
   count}
```

Description

Starts one-time, non-periodic ELRP packet transmission on the specified ports of the *VLAN* using the specified count and interval.

Syntax Description

vlan *vlan_name*	Specifies a VLAN name.
ports	Specifies the set of VLAN ports for packet transmission.
remote-endpoints	Specifies remote endpoints that are part of this VLAN.
vxlan	Specifies VXLAN remote endpoints that are part of this VLAN.
interval	Time interval between two successive ELRP PDUs.
interval	Interval value between 1–64 seconds or 100–64,000 milliseconds. Default is 1 second.
seconds	Specifies that time interval is in the unit of seconds.
milliseconds	Specifies that time interval is in the unit of milliseconds.
count	Specifies the number of times ELRP packets must be transmitted. The range is 3 to 255 times. The default is 10 times.

Default

Second—The interval between consecutive packet transmissions is 1 second.

Count—The number of time ELRP packets must be transmitted is 10.

If ports are not specified, the command is applied to all ports.

Usage Guidelines

This command starts one-time, non-periodic ELRP packet transmission on the specified ports of the VLAN using the specified count and interval. If any of these transmitted packets is returned, indicating

loopback detection, the ELRP client prints a log message to the console. There is no need to send a trap to the *SNMP* manager for non-periodic requests.

If you do not specify the optional interval or retry parameters, the default values are used.

Use the `configure elrp-client periodic` command to configure periodic transmission of ELRP packets.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the `enable elrp-client` command to globally enable the ELRP client.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the `disable elrp-client` command to globally disable the ELRP client.

Example

The following command starts one-time, non-periodic ELRP packet transmission on the VLAN green using the default interval and packet transmission:

```
run elrp green
```

History

This command was first available in ExtremeXOS 11.1.

The ability to specify the time interval in milliseconds was introduced in ExtremeXOS 22.4.

VXLAN remote endpoint option added in ExtremeXOS 22.4.

Designating ports made optional in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

run failover

```
run failover {force}
```

Description

Causes a user-specified node failover.

Syntax Description

force	Force failover to occur.

Default

N/A.

Usage Guidelines

Use this command to cause the master node to failover to the backup node in SummitStack.

Before you initiate failover, use the `show switch {detail}` command to confirm that the nodes are in sync and have identical software and switch configurations. If the output shows MASTER and BACKUP (InSync), the two nodes are in sync.

If the master and backup SummitStack nodes' software and configuration are not in sync and are running ExtremeXOS 12.0 or later, use the `synchronize` command to get the two nodes in sync. This command ensures that the backup has the same software in flash as the master.

Note

Both the backup and the master nodes must be running ExtremeXOS 11.0 or later to use the `synchronize` command.

Example

The following command causes a failover on a SummitStack:

```
run failover
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available only on a SummitStack.

run script

`run script` *filename* {**arg1**} {**arg2**} **...** {**arg9**}

Description

Run (plays back) an ASCII-formatted configuration file or a user-written script file on the switch. This command is synonomous with the `load script` command.

Syntax Description

filename	Specifies the user-defined name of the ASCII-formatted configuration file or a user-written script file. The script file is known as the XOS script file and uses the .xsf file extension.
arg	Specifies up to nine variable values that can be specified by the user. The variables are created with the names CLI.ARGV1, CLI.ARGV2, ... CLIARGV9.

Default

N/A.

Usage Guidelines

Use this command to load an ASCII-formatted configuration file or a user-written script file.

Configuration File: After downloading the configuration file from the TFTP server, this command loads and restores the ASCII-formatted configuration file to the switch.

An ASCII-formatted configuration file uses the .xsf file extension, not the .cfg file extension. The .xsf file extension (known as the XOS script file) saves the XML-based configuration in an ASCII format readable by a text editor.

For more detailed information about the ASCII configuration file, including the steps involved to upload, download, and save the configuration, see the `upload configuration [hostname | ipaddress] filename {vr vr-name}` command.

User-Written Script File: After writing a script, this command executes the script and passes arguments to it. As with the configuration files, these files use the .xsf file extension that is automatically added.

The command allows up to nine optional variable values to be passed to the script. These are created with the names CLI.ARGV1, CLI.ARGV2, CLI.ARGV3, ... CLI.ARGV9.

In addition, two other variables are always created. CLI.ARGC gives the count of the number of parameters passed, and CLI.ARGV0 contains the name of the script that is being executed.

To check the variable values use the command, show var.

Note
Only the .xsf extension is used. The load script command assumes an .xsf extension and retries opening the file if the file cannot be found with the original specified name or no extension is provided.

Example

The following command loads the ASCII-formatted configuration named configbackup.xsf:

```
load script configbackup.xsf
```

After issuing this command, the ASCII configuration quickly scrolls across the screen. The following is an example of the type of information displayed when loading the ASCII configuration file:

```
script.meg_upload_config1.xsf.389 # enable snmp access
script.meg_upload_config1.xsf.390 # enable snmp traps
script.meg_upload_config1.xsf.391 # configure mstp region purple
script.meg_upload_config1.xsf.392 # configure mstp revision 3
script.meg_upload_config1.xsf.393 # configure mstp format 0
script.meg_upload_config1.xsf.394 # create stpd s0
```

ExtremeXOS 15.6 provided capability for Python scripting. Current Python scripting implementation allows a script to interact directly with the CLI inteface for managing ExtremeXOS functionality. Python script files end in .py. The .py suffix on the *script* file name tells the `run script` command to use the Python interpreter to process the script file. This command is functions exactly as `load script`.

History

This command was first available in ExtremeXOS 15.6.

Scripting support for Python was added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

run tech-support report

```
run tech-support report {now | in hours | cancel} {collector [all |
   hostname | ip_address]}
```

Description

This command instructs the switch to generate a report and upload it to a collector.

Syntax Description

now	Specifies that you run a report immediately. This is the default setting.
in	Specifies that you run report in a specified number of hours.
hours	Specifies the hours from now to run report. The range is 1-168 hours (one week).
cancel	Cancels the scheduled report.
collector	Specifies the report collector. The default value is all collectors.
all	Specifies all report collectors.
hostname	Specifies the host name of the collector.
ip_address	Specifies the IPv4 address of the collector.

Default

The default time for running reports is **now**.

The default for number of collectors is **all**.

Usage Guidelines

This command instructs the switch to generate a report and upload it to a collector. The default operation is to perform this operation immediately for all existing collectors. Optionally, you can

configure a one-time trigger to perform the operation in "hours from now." The valid range is one to 168 hours (one week). If ou specify the hostname or IP address, the switch runs a report for that particular collector.

Only a single one-time report per collector can be scheduled at any time. When run `tech-support report in` *`hours`* is issued before the previous scheduled one-time report completes, the previous report is cancelled, and a new one-time report is scheduled.

This command also provides a way to cancel a scheduled report for a particular collector.

Example

The following command example configures a specific collector to display a detailed output set:

```
# run tech-support report
Connecting to 10.5.2.107:800 with SSL disabled...
Collector connected successfully.
Generating summary report for 10.5.2.107:9998.....................................
Report generated successfully.
Sending report to 10.5.2.107:800...
Report sent successfully

Connecting to 10.5.2.107:800 with SSL enabled...
Error: Failed to connect to the collector - Socket time out *

# run tech-support report in 1
Run tech-support report is scheduled on Thu Feb 21 05:06:32 2013 for the
collector 10.5.2.108:800.

Run tech-support report is scheduled on Thu Feb 21 05:06:32 2013 for the
collector 10.5.2.107:9998.

To cancel a scheduled report, use 'run tech-support report cancel' command.
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

run update

```
run update
```

Description

Activates a newly installed modular software package.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

After you install a modular software package to the active partition, use this command to make the update active. This command causes the ExtremeXOS system to start the newly installed processes contained in the package, without rebooting the switch.

If you installed the package to the inactive partition, you need to reboot the switch to activate the package.

Example

The following command activates any newly installed modular software packages installed on the active partition:

```
run update
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

run upm profile

```
run upm profile profile-name {event event-name} {variables variable-
   string}
```

Description

Executes the specified Universal Port profile on the switch.

Syntax Description

profile-name	Specifies the UPM profile to be run.
event-name	Specifies an event type for the specified profile. Valid event types are device-detect, device-undetect, user-authenticate, and user-unauthenticated.
variable-string	Specifies a string of variable names and the assigned variable values to be used in the profile. The format is: *var_name1=value_1*; *var_name2=value_2*; *var_name3=value_3*. Each variable name is followed by the equal sign (=), the variable value, and a semicolon (;).

Default

N/A.

Example

The following command runs a UPM profile called example on the switch:

```
run upm profile example
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

run vm-tracking repository

```
run vm-tracking repository sync-now
```

Description

Manually starts FTP file synchronization for NVPP and VMMAP files.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Before you can manually start FTP file synchronization, you must configure FTP servers using the `configure vm-tracking repository` command.

Example

The following command starts file synchronization with the configured FTP server:

```
# run vm-tracking repository sync-now
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

VLAN

save configuration

```
save configuration {primary | secondary | existing-config | new-config}
```

Description

Saves the current configuration from the switch's runtime memory to non-volatile memory.

Syntax Description

primary	Specifies the primary saved configuration.
secondary	Specifies the secondary saved configuration.
existing-config	Specifies an existing user-defined configuration.
new-config	Specifies a new user-defined configuration.

Default

Saves the current configuration to the location used on the last reboot.

Usage Guidelines

The configuration takes effect on the next reboot.

Each file name must be unique and can be up to 32 characters long but cannot include any spaces, commas, or special characters.

Configuration files have a .cfg file extension. When you enter the name of the file in the CLI, the system automatically adds the .cfg file extension. Do not use this command with ASCII-formatted configuration files. Those configuration files have an .xsf file extension. For more information about using ASCII-formatted configuration files see the `upload configuration [hostname | ipaddress] filename {vr vr-name}` and the `load script filename {arg1} {arg2} ... {arg9}` commands.

This command also displays in alphabetical order a list of available configurations. The following is sample output that displays the primary, secondary, and user-created and defined configurations ("test" and "XOS1" are the names of the user-created and defined configurations):

```
exsh.9 # save configuration
<cr>               Execute the command
primary            Primary configuration file
secondary          Secondary configuration file
<existing-config>  Existing configuration file name
```

```
"test"  "XOS1"
<new-config>       New configuration file name
```

The switch prompts you to save your configuration changes. Enter y to save the changes or n to cancel the process.

If you enter n, the switch displays a message similar to the following:

```
Save configuration cancelled.
```

If you enter y, the switch saves the configuration and displays a series of messages. The following sections provide information about the messages displayed when you save a configuration on your switch.

Note

Configuration files are forward-compatible only and not backward-compatible. That is, configuration files created in a newer release, such as ExtremeXOS 12.4, might contain commands that do not work properly in an older release, such as ExtremeXOS 12.1.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local file, remember the requirements listed above.

Saving a New Configuration

If you create and save a configuration with a new file name, the switch saves the new configuration and then prompts you to select the newly created configuration as the switch's default configuration.

The following sample output is similar to the message displayed:

```
Do you want to save configuration to test1.cfg? (y/n) Yes
Saving configuration.............................. done!
Configuration saved to test1.cfg successfully.
```

The switch then prompts you to select which configuration to use to bootup the system. The following sample output is similar to the message displayed:

```
The current selected default configuration database to boot up the system
(primary.cfg) is different than the one just saved (test.cfg).
Do you want to make test.cfg the default database? (y/n)
```

Enter y to use the new configuration as the default configuration. Enter n to cancel the operation and keep using the current default, active configuration.

Saving an Existing Configuration

If you make and save changes to an existing configuration, the switch prompts you to save and override the existing configuration.

The following sample output is similar to the message displayed:

```
The configuration file test.cfg already exists.
Do you want to save configuration to test.cfg and overwrite it? (y/n) Yes
Saving configuration ............................. done!
Configuration saved to test.cfg successfully.
```

The following sample output on a SummitStack is similar to the output displayed:

```
The configuration file primary.cfg already exists.
Do you want to save configuration to primary.cfg and overwrite it? (y/N) Yes
Saving configuration on primary ........... done!
Synchronizing configuration to backup .... done!
Saving config on Standbys (Slots: 1).
...
Configuration saved on Standby (Slot 1): done!
```

If you override an existing configuration that is not the current default, active configuration, the switch prompts you to select which configuration to use to bootup the system. The following sample output is similar to the message displayed:

```
The current selected default configuration database to boot up the system
(primary.cfg) is different than the one just saved (test.cfg).
Do you want to make test.cfg the default database? (y/n) No
Default configuration database selection cancelled.
```

Enter y to use the updated configuration as the default configuration. Enter n to cancel the operation and keep using the current default, active configuration.

Example

The following command saves the current switch configuration to the configuration file named XOS1:

```
save configuration XOS1
```

The following command save the current switch configuration to the secondary configuration file:

```
save configuration secondary
```

History

This command was first available in ExtremeXOS 10.1.

The status messages displayed by the switch were updated in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

save configuration as-script

```
save configuration as-script script-name
```

Description

Saves the running configuration as a script.

Syntax Description

script-name	Specifies the name of the file to save the configuration to. The script file is known as the XOS script file and uses the .xsf file extension.

Default

N/A.

Usage Guidelines

This command allows you to save the current configuration as a script and export it out of the box for later use.

For SummitStack only

The script is saved on all the nodes in a SummitStack when the save configuration as-script command is executed.

Example

The following example saves a running ASCII-formatted configuration named primary.xsf.

```
save configuration as-script primary.xsf
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

save configuration automatic

```
save configuration automatic {every minutes {primary | secondary |
   existing-config | new-config} | never}
```

Description

This command configures the periodic auto-save of the currently running switch configuration.

Syntax Description

automatic	Configures auto-save of system configuration.
every	Sets the switch configuration to be saved at the designated recurrent intervals.
minutes	Designates the auto-save interval in minutes with a range of 2–1,440 minutes (default is two minutes).
primary	Designates the primary configuration file for saving.
secondary	Designates the secondary configuration file for saving.
existing-config	Name of the existing configuration file name.
new-config	New configuration file name.
never	Turns off auto-save feature (default is turned off).

Default

By default, auto-save is turned off.

If you do not select a time interval for saving, the default is two minutes.

By default, the configuration is saved to the file specified in the `Config Automatic` field of the show switch on page 3233 command output. If no value appears in this field, the configuration is saved to the file specified in the `Config Selected` field of the show switch on page 3233 command. If no value appears in this field either, the configuration is saved to `autosave.cfg`.

Usage Guidelines

The auto-save features is turned off by default. To turn on the auto-save feature, use the command `save configuration` **`automatic`** (to accept the default two-minute save interval) or `save configuration` **`automatic every`** *`minutes`* `(to specify the auto-save interval)`. The message `Do you want to auto-save configuration to primary.cfg and overwrite it? (y/N)` appears. Select "yes" to enable the auto-save to the `primary.cfg` file. Selecting "no" cancels the command.

To turn off auto-save, use the command `save configuration` **`automatic never.`**

If you want to specify a different file to save the configuration to (than the default `primary.cfg`), use the command `save configuration` **`automatic`** `{`**`every`** *`minutes`* `{`**`primary`** `|`

secondary | *existing-config* | *new-config*}}, specifying an auto-save interval and configuration file name.

To see the current status of the auto-save feature, use the command show switch on page 3233.

Example

The following example turns on auto-save, accepting the default auto-save interval (two minutes) and the default configuration file (`primary.cfg`):

```
save configuration automatic
```

The switch status appear as:

```
show switch
...
Config Selected:  primary.cfg
Config Booted:    primary.cfg
Config Automatic: primary.cfg

primary.cfg       Created by ExtremeXOS version 22.2.0.16
                  344404 bytes saved on Tue Jan 17 11:17:56 2017
                  Auto-saved every 2 minutes.
                  Next periodic save on Tue Jan 17 14:45:33 2017
```

The following example turns off auto-save:

```
save configuration automatic never
```

The switch status appear as:

```
show switch
...
Config Selected:  primary.cfg
Config Booted:    primary.cfg
Config Automatic: NONE

primary.cfg       Created by ExtremeXOS version 22.2.0.16
                  344404 bytes saved on Tue Jan 17 14:45:33 2017
```

The following example changes the auto-save interval to five minutes and makes `autosave.cfg` the file that is saved to:

```
save configuration automatic every 5 autosave
```

The switch status appears as:

```
show switch
...
Config Selected: primary.cfg
Config Booted: primary.cfg
Config Automatic: primary.cfg (Disabled)
primary.cfg Created by ExtremeXOS version 22.2.0.16
344404 bytes saved on Tue Jan 17 14:45:33 2017
Auto-save not enabled
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

save debug tracefiles

```
save debug tracefiles directory_path
```

Description

Copies debug information to USB 2.0 storage device.

Syntax Description

directory_path	Directory path (memory card is `/usr/local/ext`; internal memory is `/usr/local/tmp`; and home directory is `/usr/local/cfg`.

Default

N/A.

Usage Guidelines

Note

Use this command only under the guidance of Extreme Networks Technical Support to troubleshoot the switch.

Use this command to copy debug information to an installed removable storage device. The debug information includes log files and trace files.

Progress messages are displayed that indicate the file being copied and when the copying is finished.

Beginning with ExtremeXOS 11.6, you can use the `upload debug [hostname |ipaddress] {{vr}vrname}` command to copy debug information to a network TFTP server.

Example

The following command copies debug information to a removable storage device:

```
# save debug tracefiles /usr/local/ext
```

History

This command was first available in ExtremeXOS 11.0.

The syntax for this command was modified in ExtremeXOS 11.1 from upload debug-info memorycard to save debug tracefiles memorycard.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

The option **memorycard** was removed and the variable *directory_path* was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

save var key

```
save var key key [var1 var2 …]
```

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Saves the specified variables to the specified key.

Syntax Description

key	Specifies the key to which the specified variables are saved.
var1 var2	Specifies the variables to save, The first variable is mandatory, up to four more optional variables can be specified.

Default

N/A.

Usage Guidelines

The variables saved by the SAVE VAR command are represented by the specified key and can be retrieved and restored in the context in which this profile was applied. They are available to rollback events like user-unauthenticate and device-undetect. The key option allows the user to save data for a unique key and retrieve the saved data based on this key. The user is responsible for generating unique keys for each variable. The system has a limited amount of memory to store these variables.

Example

The following example saves the variables “username,” “ipaddr,” and “vlan” to the key “blue:”

```
save var key blue username ipaddr vlan
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

save vm image

```
save vm vm_name image image_file
```

Description

Exports a disk image of an existing virtual machine (VM).

Syntax Description

vm	Virtual machine.
vm_name	Specifies the VM to export a disk from.
image	Saves (exports) the disk image of a VM in current format (QCOW2 or VMDK).
image_file	Specifies the file name for the exported VM disk image. File extension are appended if not specified.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example exports the disk image from VM "testvm" to a file named "testvmimage":

```
# save vm testvm image testvmimage
```

History

This command was first available in ExtremeXOS 30.4.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

save vm state

```
save vm vm_name state
```

Description

Pauses the CPU state of a guest virtual machine (VM), saves the state to a file, and then moves the VM to "shut-off" state to free resources.

Syntax Description

vm	Specifies a virtual machine.
vm_name	Specifies the virtual machine name.
state	Specifies saving the running CPU state to persist across switch reboots.

Default

N/A.

Usage Guidelines

The saved state persists across switch reboots and virtMgr process restarts. The next time the VM is started, either by explicit `start` **vm** *vm_name* command or by autostart (`enable` **vm** *vm_name* **autostart**), the saved CPU state is restored.

A suspended VM (`suspend` **vm** *vm_name*) can be saved. In this case, it is returned to a suspended state after the next time it is started, and requires an explicit resume (`resume` **vm** *vm_name*) to continue processing.

You cannot apply this command to a VM with Integrated Application Hosting (IAH) dedicated ports attached.

Example

The following example saves the vm "vm1" preserving the state:

```
# save vm vm1 state
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

scp2

```
scp2 {cipher cipher} {mac mac} {compression [on | off]} {port portnum}
   {vr vr_name} user [hostname | ipaddress]:remote_file local_file
```

or

```
scp2 {cipher cipher} {macmac} {compression [on | off]} {port portnum}
   {vr vr_name} local_file user [hostname | ipaddress]:remote_file
```

Description

The first command initiates an SCP2 client session to a remote SCP2 server and copies a configuration or policy file from the remote system to the switch.

The second command initiates an SCP2 client session to a remote SCP2 server and copies a configuration or policy file from the switch to a remote system.

Syntax Description

vr_name	Specifies the virtual router. The default virtual router is *VR-Mgmt*. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
cipher	Specifies the name of the cipher. Possible values are: • 3des-cbc • aes128-cbc • aes128-ctr • aes192-cbc • aes192-ctr • aes256-cbc • aes256-ctr • chacha20-poly1305@openssh.com • rijndael-cbc@lysator.liu.se
mac	Specifies the name of the Message Authentication Code. Possible values are: • hmac-md5 • hmac-md5-96 • hmac-md5-96-etm@openssh.com • hmac-md5-etm@openssh.com • hmac-sha1 • hmac-sha1-96 • hmac-sha1-96-etm@openssh.com • hmac-sha1-etm@openssh.com • hmac-sha2-256 • hmac-sha2-256-etm@openssh.com • hmac-sha2-512 • hmac-sha2-512-etm@openssh.com

on	Specifies that the data is to be compressed.
off	Specifies that compression is not to be used. This is the default.
portnum	Specifies the TCP port number to be used for communicating with the SSH2 client. The default is port 22.
user	Specifies a login name for the remote host.
hostname	Specifies the name of the remote host.
ipaddress	Specifies the IP address of the remote host. Note: For IPv6 addresses, use square brackets.
remote_file	Specifies the name of the remote file (configuration file, policy file, image file, public key file) to be transferred.
local_file	Specifies the name of the local file (configuration file, policy file, image file, public key file) to be transferred.

Default

The default settings for SSH2 parameters are as follows:

- cipher—the full cipher list
- mac—the full Message Authentication Code list
- port—22
- compression—off
- vr_name—VR-Mgmt

Usage Guidelines

SSH2 does not need to be enabled on the switch in order to use this command.

This command logs into the remote host as *user* and accesses the file *remote_file*. You will be prompted for a password from the remote host, if required.

Host Name, User Name, and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name, user name, or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted for host and user names
- Underscore (_) Permitted for host and user names
- Colon (:)

- At symbol (@). Permitted only for user names
- Slash (/). Permitted only for user names

When naming the host, creating a user name, or configuring the IP address, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/)

When naming a remote file, remember the requirements listed above.

Example

The following command copies the configuration file test.cfg on host system1 to the switch:

```
# scp2 admin@system1:test.cfg localtest.cfg
```

The following command copies the configuration file engineering.cfg from the switch to host system1:

```
# scp2 engineering.cfg admin@system1:engineering.cfg
```

The following command copies the file Anna5.xsf from the default virtual router to 150.132.82.140:

```
# scp2 vr vr-default Anna5.xsf root@150.132.82.140:Anna5.xsf
Upload /config/Anna5.xsf to
Connecting to 150.132.82.140...
```

History

This command was first available in ExtremeXOS 11.2.

Changes to **cipher**, as well as the addition of **mac** and **compression**, were first available in ExtremeXOS 15.7.1.

Ciphers and MACs that are unsupported in OpenSSH 8.1p1 were removed in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

set var

```
set var varname _expression
```

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Creates and sets the CLI scripting variable to the desired value.

Syntax Description

varname	Specifies the name of the CLI scripting variable. Valid format is $VARNAME (case insensitive, character string up to 32 characters).
_expression	Specifies the _expression whose value should be evaluated and used to set the variable.

Default

N/A.

Usage Guidelines

The format of a local variable (case insensitive) is: $VARNAME.

An error message is displayed if the user attempts to use a variable name with a length greater than 32 characters.

If a variable already exists, it is overwritten. No error message is displayed.

Example

The following examples show some ways you can manipulate variables:

```
Set var x 100
Set var x ($x + 2)
Set var y ($x - 100)
Set var y ($(x) - 100)
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list

```
show access-list {any | ports port_list | vlan vlan_name} {ingress |
   egress}
```

Description

Displays the *ACL*s configured on an interface.

Syntax Description

aclname	Specifies the ACL name. The name can be from 1-32 characters long.
any	Specifies the wildcard ACL.
port_list	Specifies which ports' ACLs to display.
vlan_name	Specifies which *VLAN*'s ACL to display.
ingress	Display ingress ACLs.
egress	Display egress ACLs.

Default

The default is to display all interfaces, ingress.

Usage Guidelines

The ACL with the port and VLAN displayed as an asterisk (*) is the wildcard ACL.

If you do not specify an interface, the policy names for all the interfaces are displayed, except that dynamic ACL rule names are not displayed. To display dynamic ACLs use the following commands:

```
show access-list dynamic
```

```
show access-list dynamic rule rule {detail}
```

If you specify an interface, all the policy entries, and dynamic policy entries are displayed.

Example

The following command displays all the interfaces configured with an ACL:

```
show access-list
```

The output from this command is similar to:

```
Vlan Name    Port   Policy Name          Dir      Rules  Dyn Rules
=============================================================
*            3:6    TCP_flag             ingress  3      2
*            3:8    qos_hongkong         ingress  3      0
*            2:1    tc_2.4               ingress  4      0
```

```
*            2:7    tcp                  ingress  1      0
v1           *      tcp                  ingress  1      0
*            *      firewall1            ingress  2      1
```

The following command displays the ingress access list entries configured on the VLAN v1006:

```
show access-list v1006 ingress
```

The output from this command is similar to the following:

```
# RuleNo 1
entry dacl13 {       #Dynamic Entry
if match all {
ethernet-destination-address 00:01:05:00:00:00 ;
} then {
count c13 ;
redirect 1.1.5.100 ;
} }
# RuleNo 2
entry dacl14 {       #Dynamic Entry
if match all {
ethernet-source-address 00:01:05:00:00:00 ;
} then {
count c14 ;
qosprofile qp7 ;
} }
# RuleNo 3
entry dacl13 {
if match all {
ethernet-destination-address 00:01:05:00:00:00 ;
} then {
count c13 ;
redirect 1.1.5.100 ;
} }
```

History

This command was first available in ExtremeXOS 10.1.

The *aclname* option was removed in ExtremeXOS 11.1.

The ingress, egress, any, ports, and vlan options were added in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list configuration

```
show access-list configuration
```

Description

Displays the *ACL* configuration.

Syntax Description

There are no arguments or variables for this command.

Default

N/A.

Usage Guidelines

This command displays the state of the ACL configuration, set by the following commands:

```
enable access-list refresh blackhole
enable access-list permit to-cpu
configure access-list rule-compression port-counters
configure access-list vlan-acl-precedence
```

Example

The following command displays the state of the ACL configuration:

```
show access-list configuration
```

On a series switches, the output from this command is similar to the following:

```
Access-list Refresh Blackhole: Enabled
Access-list Permit To-CPU: Enabled
Access-list configured vlan-acl precedence mode: Dedicated or Shared
Access-list operational vlan-acl-precedence mode: Dedicated or Shared
Access-list Rule-compression Port-counters: Dedicated or Shared
```

The following displays how the output looks when "multiple matches" action resolution mode is chosen:

```
Access-list Refresh Blackhole: Enabled
Access-list configured vlan-acl-precedence mode: Dedicated
Access-list operational vlan-acl-precedence mode: Dedicated
Access-list Rule-compression Port-counters: Dedicated
Access-list Action Resolution: Multiple
```

The following displays how the output looks when "highest priority only" action resolution mode is chosen:

```
Access-list Refresh Blackhole: Enabled
Access-list configured vlan-acl-precedence mode: Dedicated
Access-list operational vlan-acl-precedence mode: Dedicated
Access-list Rule-compression Port-counters: Dedicated
Access-list Action Resolution: Highest Priority Only
```

The command `show configuration acl` also shows the `configure access-list action-resolution highest-priority` command if "highest priority only" action resolution mode is chosen:

```
show config acl
#
# Module acl configuration.
#
configure access-list action-resolution highest-priority
```

History

This command was first available in ExtremeXOS 11.0.

The Access-list Permit to CPU configuration was added in ExtremeXOS 11.3.2.

The Access-list Rule-compression Port Counters configuration was added in ExtremeXOS 12.3.

The Access-list Configured *VLAN*-ACL Precedence Mode configuration was added in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list counter

```
show access-list counter {countername} {any | ports port_list | vlan
   vlan_name} {ingress | egress}
```

Description

Displays the specified access list counters.

Syntax Description

countername	Specifies the *ACL* counter to display.
port_list	Specifies to display the counters on these ports.
vlan_name	Specifies to display the counters on the *VLAN*.
ingress	Specifies to display ingress counters.
egress	Specifies to display egress counters.

Default

The default direction is ingress.

Usage Guidelines

Use this command to display the ACL counters.

Example

The following example displays all the counters for all ACLs:

```
# sh access-list counter
Policy Name       Vlan Name        Port   Direction
    Counter Name                   Packet Count         Byte Count
=========================================================================
temp              *                15     ingress
    mac1                           0
    mac2                           2720
egressdeny        *                15     egress
    mac01count                     0
temp              *                20     egress
    mac1                           0
    mac2                           0
```

History

This command was first available in ExtremeXOS 10.1.

The egress option was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list counters process

```
show access-list counters process [snmp | telnet | ssh2 | http]
```

Description

Displays the access-list permit and deny statistics.

Syntax Description

snmp	Specifies statistics for *SNMP*.
telnet	Specifies statistics for Telnet.
ssh2	Specifies statistics for SSH2.
http	Specifies statistics for HTTP.

Default

N/A.

Usage Guidelines

Use this command to display the access-list permit and deny statistics. The permit and deny counters are updated automatically regardless of whether the *ACL* is configured to add counters.

Example

The following command displays permit and deny statistics for the SNMP application:

```
# sh access-list counter process snmp
```

Following is sample output for this command:

```
show access-list counter process snmp
=============================================================
Access-list     Permit Packets     Deny Packets
=============================================================
a1                          10                     0
a3                           0                              25
a2                           0                             6
=============================================================
Total Rules : 3
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list dynamic rule

```
show access-list dynamic rule [rule | rule_li ] detail
```

Description

Displays the syntax of a dynamic *ACL*.

Syntax Description

rule	Specifies the rule to display.
rule_li	Specifies the dynamic rule name for Lawful Intercept account only. You must have lawful intercept user privileges to specify this variable.
detail	Specifies to display where the ACL has been applied.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the syntax of the dynamic ACL udpacl:

```
show access-list dynamic rule udpacl
```

The output of the command is similar to the following:

```
entry udpacl {
if match all {
source-address 10.203.134.0/24 ;
destination-address 140.158.18.16/32 ;
protocol udp ;
source-port 190 ;
destination-port 1200 - 1250 ;
} then {
permit  ;
} }
```

The following command displays where the dynamic ACL udpacl has been applied:

```
show access-list dynamic rule udpacl
```

The output of the command is similar to the following:

```
Rule updacl has been applied to the following interfaces.
Vlan Name    Port   Direction
================================
*            1      ingress
```

The lawful intercept user can display the names of the existing dynamic ACLs and a count of how many times each is used when the following command is issued:

```
* show access-list dynamic
Dynamic Rules: ((*)- Rule is non-permanent )
(*)hclag_arp_0_4_96_51_fe_b2  Bound to 0 interfaces for application HealthCheckLAG
(*)idmgmt_def_blacklist       Bound to 0 interfaces for application IdentityManager
(*)idmgmt_def_whitelist       Bound to 0 interfaces for application IdentityManager
(*)mirror-data                Bound to 2 interfaces for application CLI
```

Use the following command to see the conditions and actions for a dynamic ACL:

```
* show access-list dynamic rule "mirror-data"
entry mirror-data {
if match all {
    source-address 10.66.9.8/24 ;
    protocol udp ;
} then {
    permit ;
    mirror law_mirror ;
} }
```

History

This command was first available in ExtremeXOS 11.3.

The **detail** keyword was added in ExtremeXOS 11.4.

The *rule_li* variable was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list dynamic counter

```
show access-list dynamic counter {{countername} any | {countername}
   ports port_list | {countername} vlan vlan_name} {ingress | egress}
```

Description

Displays the dynamic *ACL* counters.

Syntax Description

countername	Display the counter.
any	Specifies the wildcard ACL.
port_list	Specifies which ports' ACLs to display.
vlan_name	Specifies which *VLAN*'s ACL to display.
ingress	Display ingress ACLs.
egress	Display egress ACLs.

Default

The default is to display all interfaces, ingress.

Usage Guidelines

None.

Example

The following command displays all the dynamic ACL counters:

```
# sh access-list dynamic counter
 Vlan Name         Port   Direction
    Counter Name                    Packet Count         Byte Count
=========================================================================
*                15     ingress
    mac1Count                       594
 *                15     egress
    egressCount                     0
```

The following command displays output with port number specified:

```
# sh access-list dynamic counter ports 15
Vlan Name         Port   Direction
    Counter Name                    Packet Count         Byte Count
=========================================================================
*                15     ingress
```

```
    mac1Count                       757
 *                15     egress
    egressCount                     0
```

The following command displays output with counter name specified:

```
# sh access-list counter mac1 ports 15,20
Policy Name       Vlan Name        Port   Direction
    Counter Name                   Packet Count         Byte Count
=======================================================================
temp              *                15     ingress
    mac1                           0
temp              *                20     egress
    mac1                           0
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list dynamic

```
show access-list dynamic
```

Description

Displays the names of existing dynamic *ACL*s and a count of how many times each is used.

Syntax Description

There are no arguments or variables for this command.

Default

N/A.

Usage Guidelines

This command displays the names of existing dynamic ACLs, and how many times the ACL is used (bound to an interface).

To see the conditions and actions for a dynamic ACL, use the following command:

`show access-list dynamic rule` *`rule`* {**`detail`**}

Example

The following command displays names of all the dynamic ACLs:

```
show access-list dynamic
```

The following is sample output for this command:

```
Dynamic Rules:
Udpacl                          Bound to 1 interfaces
icmp-echo                       Bound to 1 interfaces
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list interface

```
show access-list {rule rule {start} } [ any | port port | vlan
   vlan_name ] {zone zone_name { appl-name appl_name {priority
   number }}} {ingress | egress} {detail}
```

Description

Displays the specified *ACL* zones, including their priority, applications, and the application priorities.

Syntax Description

any	Displays all zones on the specified interface.
port *port*	Displays all ACLs associated with the specified ports.
vlan *vlan_name*	Displays all ACLs associated with the specified *VLAN*.
zone_name	Specifies a zone to be displayed.
appl-name *appl_name*	Displays information by application within a zone.
priority *number*	Displays ACLs of the specified priority only, within an application area.
ingress	Displays ACLs applied to traffic in the ingress direction.
egress	Displays ACLs applied to traffic in the egress direction.
detail	Displays all ACLs applied to the specified interface.

Default

N/A.

Usage Guidelines

Use this command to display the ACL zones, applications, and priorities.

Specifying a zone will show all the ACLs installed in the particular zone. Specifying a priority within a zone will show all the ACLs installed at a particular priority within a zone.

Use the detail keyword to display all ACLs installed on a given interface.

Example

The following example displays the detailed view of the ACLs on port 1:1:

```
show access-list port 1:1 detail
```

The output of this command is similar to the following:

```
# show access-list port 1:1  detail
RuleNo      Application    Zone        Sub Zone
==================================
    1    CLI        myZone    1
entry mac1 {
if match all {
ethernet-source-address 00:0c:29:e5:94:c1 ;
destination-address 192.168.11.144/32 ;
} then {
count mac1 ;
} }
    2    CLI        myZone    5
entry mac51 {
if match all {
ethernet-source-address 00:0c:29:e5:94:51 ;
} then {
count mack51;
} }
    3    CLI        myZone    5
entry mac52 {
if match all {
ethernet-source-address 00:0c:29:e5:94:52 ;
} then {
count mac52 ;
} }
```

The following example displays the detailed view of the priority 5 ACLs in the zone myzone on port 1:1:

```
# show access-list port 1:1  zone myZone priority 5  detail
RuleNo      Application    Zone        Sub Zone
==================================
    2    CLI        myZone    5
 entry mac51 {
if match all {
ethernet-source-address 00:0c:29:e5:94:51 ;
} then {
count mack51;
} }
    3    CLI        myZone    5
entry mac52 {
if match all {
```

```
ethernet-source-address 00:0c:29:e5:94:52 ;
} then {
count mac52 ;
} }
```

The following example displays the priority 5 ACLs in the zone myzone on port 1:1:

```
# show access-list port 1:1  zone myZone priority 5
#Dynamic Entries  ((*)- Rule is non-perminent )
RuleNo      Name                              Application     Zone             Sub-Zone
1          mac51                 CLI            myZone         5
2          mac52                 CLI            myZone         5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list meter

```
show access-list meter {metername} [any | ports [port_list ] | vlan
   vlanname ] {ingress | egress}
```

Description

Displays the specified access list meter statistics and configurations.

Syntax Description

meter-name	Specifies the *ACL* meter to display.
out-of-profile	Show the meter out-of-profile status.
disabled-ports	Show the meter out-of-profile status that resulted in disable-port action.
port_list	Specifies the port list name to display the meters on.
port_group	Specifies a port group name to display the meters on.
vlan_name	Specifies to display the meters on the *VLAN*.
global-count	Counter of all the rules using a per-port meter.
ingress	ACLs applied to ingress.
egress	ACLs applied to egress.

Default

N/A.

Usage Guidelines

Use this command to display the ACL meters.

Example

The following example displays access list meter information for port 7:1:

```
# show access-list meter ports 1-4
================================================================================
Policy Name      Vlan Name        Port
                   Committed        Max Burst    Out-of-Profile  Out-of-Profile
     Meter         Rate (Kbps)      Size         Action    DSCP    Packet Count
================================================================================
(none)           *                2

Action   :  (D) Disable Port, (Dr) Drop, (DrP) Set Drop Precedence,
            (L) Log, (T) Trap
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list network-zone

```
show access-list network-zone {zone_name}
```

Description

Displays the network-zones configured, the number of attributes configured, and the number of policy files that have the specified zones in it.

Syntax Description

network-zone	Specifies the logical group of remote devices.
zone_name	Specifies the network-zone name.

Default

N/A.

Usage Guidelines

Use this command to display detailed information about a particular network-zone, the attibutes configured in the zone, and the policies bound to the zone.

Example

The following example displays network-zone statistics for all configured zones:

```
Switch # sh access-list network-zone
=============================================================
Network Zone                        No. of    No. of Policies
Entities       Bound
=============================================================
zone1                                 5              2
zone2                                 3              1
zone3                                 0              0
=============================================================
Total Network Zones : 3
```

This example displays statistics for the specified zones, “zone1”, and “zone2”:

```
Switch #show access-list network-zone zone1
Network-zone     : zone1
Total Attributes : 3
Attributes       : 10.1.1.1 / 32
10.1.1.1 / 30
10.1.1.0 / 24
No. of Policies  : 1
Policies         : test
Switch # sh access-list network-zone zone2
Network-zone    : zone2
No. of Entities : 3
Entities        : 00:00:00:00:00:22 / ff:ff:ff:ff:ff:ff
00:00:00:00:00:23 / ff:ff:ff:ff:00:00
00:00:00:00:00:24 / ff:ff:ff:ff:ff:00
No. of Policies : 0
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list usage acl-mask port

```
show access-list usage acl-mask port port
```

Description

Displays the number of *ACL* masks consumed by the ACLs on a particular port.

Syntax Description

port	Displays the usage on the specified port.

Default

N/A.

Usage Guidelines

Use this command to display how many masks are currently consumed on a port.

Example

The following example displays the ACL mask usage on port 1:1:

```
Switch.8 # show access-list usage acl-mask port 1:1
Used: 3  Available: 12
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list usage acl-range port

`show access-list usage acl-range port` *port*

Description

Displays the number of Layer 4 port ranges consumed by the ACLs on the slices that support a particular port.

Syntax Description

port	Specifies to display the usage for the slices that support this port.

Default

N/A.

Usage Guidelines

ExtremeSwitching series switches can support a total of 16 Layer4 port ranges among the slices that support each group of 24 ports.

Use this command to display how many of these Layer4 ranges are currently consumed by the ACLs on the slices that support a particular port. The output of this command also displays which ports share the same slices as the specified port.

Example

The following example displays the Layer4 range usage on port 9:1:

```
Switch.3 # show access-list usage acl-range port 9:1
Ports 9:1-9:12, 9:25-9:36
L4 Port Ranges:  Used: 4  Available: 12
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list usage acl-rule port

```
show access-list usage acl-rule port port
```

Description

Displays the number of *ACL* rules consumed by the ACLs on a particular port or on the slices that support a particular port.

Syntax Description

port	Specifies to display the usage on this port.

Default

N/A.

Usage Guidelines

Use this command to display the rules used per slice, and also display the rule usage of the specified port.

Example

The following example displays the ACL rule usage on port 5:

```
Switch.3 # show access-list usage acl-rule port 5
Ports 1-12, 25-36
Total Rules:     Used: 34  Available: 990
```

In ExtremeXOS 15.5.1 and onwards, unless there is at least 1 rule in a given slice, the slice is not allocated. Since the slice is not yet allocated, a physical slice is not assigned to a virtual slice. So in this previous example, "used" displays what is used in that particular slice, and "available" shows the remaining rules in that particular used slice.

The following example displays the ACL ingress and egress rule usage on port 5:1:

```
Switch.4 # show access-list usage acl-rule port 5:1
Ports 5:1-5:48
Total Ingress/Egress Rules:
Used: 11  Available: 8181
Used: 1  Available: 1023
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list usage acl-slice port

```
show access-list usage acl-slice port port
```

Description

Displays the number of *ACL* slices and rules consumed by the ACLs on the slices that support a particular port.

Syntax Description

port	Specifies to display the usage for the slices that support this port.

Default

N/A.

Usage Guidelines

Use this command to display how many slices and how many rules per each slice are currently consumed by the ACLs on the slices that support a particular port. This command also displays which ports share the same slices as the specified port.

Beginning with ExtremeXOS 12.5, you can reserve or allocate a slice for a specific feature such that rules for the feature does not share a slice with other components. A text string has been added at the end of the output for each slice that indicates which feature, if any, is reserving the slice. See the example below.

In ExtremeXOS 15.5.1 and onwards, unless there is at least one rule in a given slice, the slice is not allocated. Since the slice is not yet allocated, a physical slice is not assigned to a virtual slice. So "used" displays what is used in that particular slice, and "available" shows the remaining rules in that particular used slice.

Slices are allocated or reserved as follows:

- **user/other**—The slice is used by user ACLs and/or other switch features.
- **Reserved for:** *feature name*—the slice is reserved for the named feature, for instance *VLAN* statistics. Rules for this feature may not share a slice with other features or user ACLs.
- **system**—The slice contains only rules used for certain specific switch features. User ACLs may not share a slice with a system slice.

Example

The following example displays the ACL slice usage on port 1 or an ExtremeSwitching X870 series switch:

```
# show access-list usage acl-slice port 1
Ports 1-93, 95, 97, 101, 105, 109, 113, 117, 121, 125
Stage: INGRESS Pipe 0
Group 3 Priority 31 Rules:   Used:     10 Available   1014 system Double Reserved=FALSE
Reservations:
type                num       mode
Stage: INGRESS Pipe 1
Group 6 Priority 31 Rules:   Used:      0 Available   2048 user/other IntraSliceDouble
Reserved=FALSE
Group 7 Priority 30 Rules:   Used:      1 Available   2047 user/other IntraSliceDouble
Reserved=FALSE
Group 4 Priority 29 Rules:   Used:      1 Available   2047 user/other IntraSliceDouble
Reserved=FALSE
Group 5 Priority 28 Rules:   Used:     10 Available    758 system Double Reserved=FALSE
Reservations:
type                num       mode
Stage: INGRESS Pipe 2
Group 1 Priority 31 Rules:   Used:     10 Available   1014 system Double Reserved=FALSE
Reservations:
type                num       mode
Stage: INGRESS Pipe 3
Group 2 Priority 31 Rules:   Used:     10 Available   1014 system Double Reserved=FALSE
Reservations:
type                num       mode
Stage: EGRESS
Slices:          Used: 0  Available: 4
Virtual Slice  * (physical slice  0) Rules:   Used:      0  Available:    256
Virtual Slice  * (physical slice  1) Rules:   Used:      0  Available:    256
Virtual Slice  * (physical slice  2) Rules:   Used:      0  Available:    256
Virtual Slice  * (physical slice  3) Rules:   Used:      0  Available:    256
Stage: LOOKUP
Slices:          Used: 0  Available: 4
Virtual Slice  * (physical slice  0) Rules:   Used:      0  Available:    256
Virtual Slice  * (physical slice  1) Rules:   Used:      0  Available:    256
Virtual Slice  * (physical slice  2) Rules:   Used:      0  Available:    256
Virtual Slice  * (physical slice  3) Rules:   Used:      0  Available:    256
```

```
Stage: EXTERNAL

Virtual Slice :  (*) Physical slice not allocated to any virtual slice.
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show access-list width

```
show access-list width [slot slotNo | all]
```

Description

Displays the wide *ACL* mode configured on the supported switch or slot.

Syntax Description

slotNo	Specifies the slot to display.
all	Specifies all slots.

Default

N/A.

Usage Guidelines

Use this feature to display the width of the ACL TCAM key configured on a switch as being double wide or single wide.

Example

The following command displays the wide key mode on all slots:

```
show access-list width slot all
```

Following is sample output for this command:

```
Slot  Type              Width (Configured)
----  ----------------  ---------------------
1     X460G2-48t-10G4   Single
2     X460G2-48t-10G4   Single
3     X670G2-48x-4q     Double
4                       Single
5                       Single
6                       Single
```

```
7                       Single
8                       Single                                          double
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show accounts

```
show accounts
```

Description

Displays user account information for all users on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You need to create a user account using the create account command before you can display user account information.

To view the accounts that have been created, you must have administrator privileges.

This command displays the following information in a tabular format:

- User Name—The name of the user. This list displays all of the users who have access to the switch.
- Access—This may be listed as R/W for read/write or RO for read only.
- Login OK—The number of logins that are okay.
- Failed—The number of failed logins.
- Accounts locked out—Account configured to be locked out after three consecutive failed login attempts (using the `configure account password-policy lockout-on-login-failures` command).

Note

This command does not show the failsafe account.

Example

The following command displays user account information on the switch:

```
show accounts pppuser
```

Output from this command looks similar to the following:

```
User Name      Access  LoginOK  Failed
-------------- ------- -------  ------
admin             R/W        3       1
user              RO         0       0
dbackman          R/W        0       0
ron*              RO         0       0
nocteam           RO         0       0
---------------------------------------
(*) - Account locked
```

The following command displays the lawful intercept account distinguished by the "R/L" displayed in the Access column:

```
* (Private) X440e-24t.9 # show accounts
                    User Name      Access LoginOK   Failed
--------------------------------  ------  -------  ------
                         admin     R/W           6       0
                          user      RO           0       0
                       myLIuser     R/L         N/A     N/A
```

History

This command was first available in ExtremeXOS 11.0.

Lawful intercept output was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show accounts password-policy

```
show accounts password-policy
```

Description

Displays password policy information for all users on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

To view the password management information, you must have administrator privileges.

The `show accounts password-policy` command displays the following information in a tabular format:

- Global password management parameters applied to new accounts upon creation:
  - Maximum age—The maximum number of days for the passwords to remain valid.
  - History limit—The number of previous password that the switch scans prior to validating a new password.
  - Minimum length—The minimum number of characters in passwords.
  - Character validation—The passwords must be in the specific format required by the `configure account password-policy char-validation` command.
  - Lockout on login failures—If enabled, the system locks out users after 3 failed login attempts.
  - Accounts locked out—Number of accounts locked out.
- User Name—The name of the user. This list displays all of the users who have access to the switch.
- Password Expiry Date—Date the password for this account expires; may be blank.
- Password Max. age—The number of days originally allowed to passwords on this account; may show None.
- Password Min. length—The minimum number of characters required for passwords on this account; may show None.
- Password History Limit—The number of previous passwords the system scans to disallow duplication on this account; may show None.

Example

The following command displays the password management parameters configured for each account on the switch:

```
# show accounts password-policy

-------------------------------------------------------------------------
Accounts global configuration(applied to new accounts on creation)
-------------------------------------------------------------------------
Password Max. age               : None
Password Min. age               : None
Password Min. Different Chars   : 8
Password History limit          : None
Password Min. length            : None
Password Character Validation   : Disabled
Accts. lockout on login failures: Disabled
Lockout time period             : Until Cleared
-------------------------------------------------------------------------------------------------
----------------
                  User Name     Expiry       Max. Expiry       Min. Min. Min. Hist
Lockout Lockout Flags
                                Date         Age  Date         age  len  diff Limit
Time    Time
                                (Max)             (Min)                  char
Config  Remain
------------------------------- ------------ ---- ------------ ---- ---- ---- -----
------- ------- -----
                          admin              None              None None    0
None       U       - ---
```

```
                              user              None              None None    0
None       U       - ---
-------------------------------------------------------------------------------------------
---------------
Lockout Time Config: (U) Account is locked until cleared via 'clear account <name>
lockout'.
Flags: (C) Password character validation enabled, (L) Account locked out,
       (l) Account lockout on login failures enabled
```

History

This command was first available in ExtremeXOS 11.2.

Minimum different characters for changed password and minimum lifespan for passwords information was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show auto-peering

```
show auto-peering {bgp | ospf}
```

Description

This command displays the status of BGP or OSPF auto-peering and the learned auto-peering interfaces and corresponding remote peer information.

Syntax Description

ospf	Shows OSPF auto-peering status and interface information.
bgp	Shows BGP auto-peering status and interface information.

Default

N/A

Usage Guidelines

All existing BGP show commands can be used to display the status of BGP peers and routes.

Example

The following example shows the status of BGP auto-peering:

```
# show auto-peering bgp
Type     : BGP
Password :
Id       : 0
Router ID: 2.2.2.102
```

```
AS       : 102

Peer Id     Password
----------- ---------------------------------
2222        None
2223        #$75Zvb3YfCBE/4+eSQE5dA5T2lmhF5A==

VLAN          Neighbor IP Address      Router ID       Remote AS  Port    Fabric ID
Peer
------------- ------------------------ --------------- ---------- ------- ---------- -----
SYS_BGP_0002  fe80::204:96ff:fe9d:66e8 3.3.3.103       103        69      0          Yes
```

The following example shows OSPF auto-peering information:

```
# show auto-peering ospf

Type     : OSPF
Id       : 0
Router ID: 1.1.1.54

VLAN          Router ID       Port    Fabric ID  Peer
------------- --------------- ------- ---------- -----
SYS_OSPF_0002 1.1.1.55        19      0          No
```

History

This command was first available in ExtremeXOS 22.5.

Peer ID and password information was added in ExtremeXOS 30.5.

The **ospf** option was added in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

This feature requires the Advanced Edge license. For more information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

show auto-peering one-config

```
show auto-peering one-config {remote | service | route | database |
   bootprelay}
```

Description

Shows auto-peered OneConfig information configured on the device.

Syntax Description

auto-peering	Specifies Auto-peering.
one-config	Specifies changing the BGP Auto-peering OneConfig configuration.
remote	Displays only remote ID information.

service	Displays only service information.
route	Displays only host-driven static route information.
database	Displays only overlay database information.
bootprelay	Displays only BOOTP relay information.

Default

N/A.

Usage Guidelines

To configure remote IDs, use the `configure` **auto-peering one-config remote id** [**add** | **delete**] *id* {**password** [**none** | {**encrypted**} *tcpPassword*]} command.

To configure services, use the `configure` **auto-peering one-config nsi-id** *id* **type** [**nsi** | **vrf**] [**add** | **delete**] [[*ipaddress* {*netmask*} | *ipNetmask*] | *ipNetmaskv6*] {**vr** *vrname* } command.

To configure routes, use the `configure` **auto-peering one-config iproute** [**add** | **delete**] [*host* | *hostv6*] [[*ipaddress* {*netmask*} | *ipNetmask*] *gateway* | *ipNetmaskv6 gatewayv6*] {**vr** *vrname* } command.

To configure overlay databases, use the `configure` **auto-peering one-config overlay** [**add** | **delete**] **server** [*address* | *addressv6*] {**type bgp-rr** } {**id** *id*} {**password** [**none** | {**encrypted**} *password*]} command.

To configure BOOTP relay, use the `configure` **auto-peering one-config bootprelay** [**add** | **delete**] [*ip_address* | *ipv6_address*] **vr** *vrname* comamnd.

Example

The following example shows all auto-peered OneConfig information:

```
# show auto-peering one-config
ID              : 0
Password        : None
Route Target    : None
Anycast MAC     : 00:00:00:1b:1b:1b

OneConfig Allowed Remote IDs

Remote ID   Password
----------- ----------------------------------
23456       None
34567       #$HktHhKOFo/Tk1YtJC1pBz24ZMBHCGg==

OneConfig Dynamic Service

```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show auto-provision

```
show auto-provision {{vr} vr_name}
```

Description

Displays the current state of auto provision on the switch.

Syntax Description

vr_name	Specifies the virtual router. This may be *VR-Default* or *VR-Mgmt* only

Default

N/A.

Usage Guidelines

Use this command to display the current state and the statistics of the auto provision feature on the switch.

Example

The following command displays all information on the current state of auto provision:

```
show auto-provision
```

Following is sample output for the command when the auto provision is enabled. When “Enabled” the feature can be “In progress”, “Done”, or “Failed.”

```
(Auto-Provision) switch # show auto-provision
--------------------------------------------------------------------------------
VR-Name     Auto-Provision Status  Number of attempts
--------------------------------------------------------------------------------
VR-Default  Enabled (In progress)  2
VR-Mgmt     Enabled (In progress)  1
switch # show auto-provision
--------------------------------------------------------------------------------
VR-Name     Auto-Provision Status  Number of attempts
--------------------------------------------------------------------------------
VR-Default  Enabled (Done)         0
VR-Mgmt     Enabled (Done)         0
```

The following command displays information on the current state of auto provision on VR-Mgmt.

```
show auto-provision vr "VR-Mgmt"
```

Following is sample output for the command when auto provision is disabled:

```
switch # show auto-provision vr "VR-Mgmt"
DHCP Auto-Provision       : Disabled
Number of attempts        : 0
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show automation edge database

```
show automation edge database
```

Description

Displays Automation Edge remote *VXLAN* network identifier (VNI)-device database information.

Syntax Description

automation	Displays Automation Edge VXLAN VNI-device database information.
edge	Specifies Automation Edge.
database	Specifies Automation Edge database information.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example shows database information:

```
# show automation edge database
Database Name  Status
-------------  ------
SampleDB       Up

Database Name  Status
-------------  ------
SampleDB       Down
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on the ExtremeSwitching 5520 platform.

show automation edge devices

```
show automation edge devices {vni vni}
```

Description

Displays network devices information for an Automation Edge remote *VXLAN* network identifier (VNI)-device database.

Syntax Description

automation	Displays Automation Edge VXLAN VNI-device database information.
edge	Specifies Automation Edge.
devices	Specifies network devices information, such as switches or APs.
vni	A unique 24-bit Virtual Network Identifier";%
vni	Virtual Network Identifier value between 1 and 16777215";

Default

N/A.

Usage Guidelines

This command shows the details about the network devices, including device identifier, IP address of the device, MAC address of the device, and the device type (access point or switch).

Example

The following example shows network devices information:

```
# show automation edge devices
VNI   Device Name              Serial Number            IP Address      Type
----- ---------------------- ------------------------ --------------- ------
30    APName1                1111222233334444_110     200.200.200.10  AP
31    APName2                1111222233334444_11      200.200.200.1   AP
```

The following example shows network devices information for VNI "100":

```
# show automation edge devices vni 100
Device Name              Serial Number            IP Address      Type
------------------------ ------------------------ --------------- ------
APName1                  1111222233334444_15      200.200.200.5   AP
APName2                  1111222233334444_17      200.200.200.7
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on the ExtremeSwitching 5520 platform.

show avb

```
show avb
```

Description

Displays a summary of MSRP, MVRP, and gPTP configuration on the switch.

Syntax Description

avb	Audio Video Bridging.

Default

N/A.

Usage Guidelines

Use this command to display a summary of MSRP, MVRP, and gPTP configuration and status on the switch.

Example

```
#show avb
gPTP status                          : Enabled
gPTP enabled ports                   : *17d *19d

MSRP status                          : Enabled
MSRP enabled ports                   : !3 *17ab *19a

MVRP status                          : Enabled
MVRP enabled ports                   : *17 *19

Flags:        (*) Active, (!) Administratively disabled,
              (a) SR Class A allowed, (b) SR Class B allowed,
              (d) Disabled gPTP port role, (m) Master gPTP port role,
              (p) Passive gPTP port role, (s) Slave gPTP port role.
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bandwidth pool

```
show bandwidth pool [ingress | egress | duplex] vlan vlan_name
```

Description

Displays the configured bandwidth pool settings for the specified *VLAN*.

Syntax Description

ingress	Displays configured bandwidth pool settings for incoming traffic only.
egress	Displays configured bandwidth pool settings for outgoing traffic only.
duplex	Displays configured bandwidth pool settings for traffic in both directions.
vlan_name	Displays configured bandwidth pool settings only for the specified VLAN.

Default

N/A.

Usage Guidelines

This command displays the configured bandwidth pool settings for a VLAN. Values displayed include the VLAN, maximum reserveable bandwidth (both ingress and egress), and bandwidth reserved by application and by priority level.

Example

The following command displays bandwidth pool settings and accepted bandwidth reservations for all ports:

```
show bandwidth pool duplex vlan vlan_1
# show bandwidth pool duplex vlan vlan_1
(mbps)  Rsvd CIRBW  Cmmt  Cmmt CIRBW
Vlan         Dir   Phy    BE Limit Pools Total Avail
-------------------------------------------------
vlan_1        Rx  1000     0  1000   300   300   700
Tx  1000     0  1000   500   500   500
-----------------------------------------------------------------
(mbps)   CIRBW Available in Pool (per priority level)
Appl  Dir  Pool     0     1     2     3     4     5     6     7
-----------------------------------------------------------------
mpls   Rx   300   300   300   290   290   290   290   290   290
Tx   500   500   500   491   491   491   491   491   491
(Rx)-Receive, (Tx)-Transmit  (BE)-Best Effort
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

show banner

```
show banner { after-login | before-login }
```

Description

Displays the user-configured banners.

Syntax Description

after-login	Specifies the banner that is displayed after login.
before-login	Specifies the banner that is displayed before login.

Default

N/A.

Usage Guidelines

Use this command to display specific configured CLI banners.

If no keywords are specified, all configured banners are displayed. To display a specific banner, use the before-login or after-login keyword.

Example

The following command displays the configured CLI switch banners:

```
show banner
```

Output from this command varies depending on your configuration; the following is one example:

```
Before-login banner:
Extreme Networks Summit Switch
########################################################
Unauthorized Access is strictly prohibited.
Violators will be prosecuted
########################################################
Acknowledge: Enabled
After-login banner:
Press any key to continue
```

History

This command was first available in ExtremeXOS 10.1.

The after-login option was added in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show banner netlogin

```
show banner netlogin
```

Description

Displays the user-configured banner string for network login.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view the banner that is displayed on the network login page.

Example

The following command displays the network login banner:

```
show banner netlogin
```

If a custom banner web page exists, show banner netlogin generates the following output:

```
********** Testing NETLOGIN BANNER at <system name>**********
NOTE: Banner is not in use. Overridden since custom login page
"netlogin_login_page.html" is present.
```

If a custom banner web page does not exist, show banner netlogin generates the following output:

```
********** Testing NETLOGIN BANNER at <system name>**********
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd

```
show bfd
```

Description

Displays information on existing BFD sessions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to show the status of the current BFD sessions.

The following session states are displayed:

- Init—The state when BFD is establishing the session.
- Down—The state when BFD detects that the session is down.
- Admin Down—The state when the user disables BFD on that interface.
- Up—The state when the BFD session is established.

Example

The following command displays information on current BFD sessions:

```
# show bfd
```

Following is sample output from this command:

```
Number of  sessions                    : 2
Sessions in Init State                 : 0
Sessions in Down State                 : 0
Sessions in Admin Down State           : 1
Sessions in Up State                   : 1

SNMP Traps for Session Down            : Enabled
SNMP Traps for Session Up              : Enabled
SNMP Traps Batch Delay                 : 1000 ms
Hardware Assist Operational State      : Enabled
                                    (or)
                                       :
Disabled
                                           (Incapable heterogeneous stack)
                                           (Incapable standalone platform)
                                           (Loopback port not configured)
Hardware Assist Primary Loopback Port  : 1:1
Hardware Assist Secondary Loopback Port : None
Maximum # of Hardware Assist Sessions  : 2047
```

History

This command was first available in ExtremeXOS 12.4.

The hardware assist output was added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd counters

```
show bfd counters
```

Description

Displays the readings of the global BFD counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display global BFD counters.

To clear the counters, use the `clear counters bfd` command.

Example

The following command displays BFD global counters:

```
# show bfd counters

Valid Tx Pkt                    : 177     Valid Rx Pkt                    : 177
Rx Invalid TTL                  : 0       Rx Invalid UDP SrcPort          : 0
Interface Not found             : 0       Rx Invalid Version              : 0
Rx Invalid Length Pkt           : 0       Rx Invalid Multiplier           : 0
Rx Invalid Demand Mode          : 0       Rx Poll & Final set             : 0
Rx Invalid My Discriminator     : 0       Rx Invalid Your Discriminator   : 0
Rx Invalid Auth Length          : 0       Rx session Not Found            : 6
Auth Type Fails                 : 0       Authentication Fails            : 0
```

```
Tx Fails                        : 0       Rx Discarded Pkt              : 0
Rx Invalid Multipoint           : 0
```

Note

The Rx session Not Found counter is incremented when the BFD session corresponding to the received BFD packet is not found. The Rx Discarded Pkt counter is incremented when the neighbor state indicated in the BFD packet is not one of the expected/allowed states.

History

This command was first available in ExtremeXOS 12.4.

Rx Invalid Multipoint information was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd session client

```
show bfd session client [ bgp {ipv4 | ipv6} | mpls | ospf {ipv4 | ipv6}
   | static {ipv4 | ipv6}] {vr [vrname | all]}
```

Description

Displays the BFD session information for a specified client.

Syntax Description

bgp	*BGP*
mpls	Specifies an *MPLS* client.
ospf	*OSPF* protocol.
ipv4	Displays sessions requested by IPv4 version client, e.g. OSPFv2 (Default).
ipv6	Displays sessions requested by IPv6 version client, e.g. *OSPFv3*.
static	Specifies a static route.
vrname	Specifies the name of the virtual router.

Default

IPv4.

Usage Guidelines

Use this command to display session information for a specified client.

Example

The following command displays the BFD sessions for an MPLS client on all VRs:

```
# show bfd session client mpls vr all
```

Following is sample output from this command:

```
Neighbor     Interface      Detection   Status
---------     --------       ---------   -----
10.10.10.2    vlan10      3000        Up
================================================
NOTE: All timers in milliseconds.
```

History

This command was first available in ExtremeXOS 12.4.

Support for BFD protected static route was added in ExtremeXOS 12.5.3.

The **ospf** keyword was added in ExtremeXOS 15.3.2.

Support for border gateway protocol (BGP) was added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd session counters missed-hellos

```
show bfd session counters missed-hellos {session-id first {- last} |
   neighbor ipaddress {vr [vrname | all]} | vr [vrname| all]} {detail |
   no-refresh | refresh}
```

Description

This command displays statistics of missed hello packets.

Syntax Description

session-id	Display statistics for sessions having session ID within the given range.
first	Only or first of range of session
last	Last of range of session ID.
ipaddress	Specify IPv4 or IPv6 Destination address.
vr	Virtual router.
vrname	Virtual router name.
all	All virtual routers.
detail	Detailed view of statistics.

no-refresh	Page by page display without continuous refresh.
refresh	Continuous refresh of output.

Default

Refresh.

Usage Guidelines

You can select the sessions by either neighbor IP address, by range of session IDs, by VR or display all the available sessions. Display selection by session ID is useful if the neighbor IP is link-local and *VLAN* name is long (i.e. close to 32 characters).

Example

The following example displays summary view with the refresh option.

```
# show bfd session counters missed-hellos
================================================================================
Neighbor                                          Session ID   Number Of
Misses
                                                                 1     2     2+
================================================================================
fe80::204:96ff:fe7e:c2f%test                        251    15     8      7
fe80::204:96ff:fe7e:c2f%verify                      252    10     6      4
50.0.0.1                                            300 >9999 >9999  >9999
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd session counters vr all

```
show bfd session {ipv4 | ipv6} {ipaddress} counters {vr [vrname | all]}
```

Syntax Description

ipv4	Displays all IPv4 sessions.
ipv6	Displays all IPv6 sessions.
ipaddress	Displays sessions in specified VR.

Default

Displays all IPv4 sessions counters by default if IPv4 or IPv6 is not specified.

Usage Guidelines

Use this command to display BFD session counters.

To clear the counters, use the `clear counters bfd` command.

Example

The following command displays the session counters:

```
# show bfd session counters vr all
```

Following is sample output from this command:

```
Neighbor : 10.10.10.1     Interface : vlan10Vr-Name :   bfd_vr10
Valid Rx Pkt          : 87
Total Tx Pkt          : 87
Auth Type Fails       : 0
Authentication Fails : 0
Discarded Pkt         : 0
```

History

This command was first available in ExtremeXOS 12.4.

IPv6 version of this command was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd session detail vr all

```
show bfd session {ipv4 | ipv6} {ipaddress } detail {vr [vrname | all]}
```

Description

Displays detailed information about a BFD session.

Syntax Description

ipv4	Displays all IPv4 sessions.
ipv6	Displays all IPv6 sessions.
ipaddress	Displays sessions in specified VR.
vrname	Displays sessions in specified VR.

Default

Displays all IPv4 sessions by default if ipv4 or ipv6 is not specified.

Usage Guidelines

Use this command to display BFD session information in detail.

Example

The following command displays the BFD session information in detail:

```
show bfd session detail vr all
```

Following is sample output from this command:

```
# show bfd session  detail vr all
Neighbor       : 10.10.10.1          Local       : 10.10.10.2

```

History

This command was first available in ExtremeXOS 12.4.

IPv6 version was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd session vr all

```
show bfd session {ipv4 | ipv6} {ipaddress } { vr [vrname |all ] }
```

Description

Displays general information about a BFD session.

Syntax Description

ipv4	Displays all IPv4 sessions.
ipv6	Displays all IPv6 sessions.
ipaddress	Displays session that has specified address as destination address.
vrname	Displays sessions in specified VR.

Default

Displays all IPv4 sessions by default if ipv4 or ipv6 keyword is not specified.

Usage Guidelines

Use this command to display general information about a BFD session.

Example

The following command displays general information about the BFD session:

```
# show bfd session vr all
```

Following is sample output from this command:

```
Neighbor       Interface      Clients  Detection  Status       VR
================================================
30.30.30.2     bfdVlan        ----s      0        Down         VR-Default
================================================
Clients Flag: b - BGP, m - MPLS, o - OSPF, s - Static
NOTE: All timers in milliseconds.
```

Following is sample output with hardware assist information displayed:

```
)
# show bfd session detail vr all
Neighbour      : 10.10.10.1          Local       : 10.10.10.2
Vr-Name        : bfd_vr10            Interface   : bfd_vlan10
Session Type   : Single Hop          State       : Up
```

```
…
Up Count                          : 1
Last Valid Packet Rx              : 00:51:49.300000
Last Packet Tx                    : 00:51:48.8200000
Hardware Assist                   : Yes

Neighbour      : 10.10.11.1          Local       : 10.10.11.2
Vr-Name        : bfd_vr10            Interface   : bfd_vlan11
Session Type   : Single Hop          State       : Up
…
Up Count                          : 1
Last Valid Packet Rx              : 00:51:49.300000
Last Packet Tx                    : 00:51:48.8200000
Hardware Assist                   : Yes
```

History

This command was first available in ExtremeXOS 12.4.

The hardware assist example output was added in ExtremeXOS 21.1.

Support for *BGP* was added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd vlan counters

```
show bfd vlan {vlan_name} counters
```

Description

Displays BFD counters on a specified *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN name.

Default

N/A.

Usage Guidelines

Use this command to display counter readings for a specified VLAN.

This command is not supported by hardware-assisted BFD.

Example

The following command displays the counter readings for the VLAN vlan10:

```
# show bfd vlan vlan10 counters
```

Following is sample output from this command:

```
VLAN                                                    : vlan10
Valid Rx Pkt             : 144
Total Tx Pkt             : 144
Auth Type Fails          : 0
Authentication Fails     : 0
Discarded Pkt            : 0
Rx session Not Found     : 6
```

Note

The Discarded Pkt counter is incremented when the neighbor state indicated in the BFD packet is not one of the expected/allowed states. The Rx session Not Found counter is incremented when the BFD session corresponding to the received BFD packet is not found.

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bfd vlan

```
show bfd vlan {vlan_name}
```

Description

Displays the BFD settings for the specified *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN name.

Default

N/A.

Usage Guidelines

Use this command to display the BFD settings on a specified VLAN.

Example

The following command displays the BFD settings for the VLAN vlan10:

```
# show bfd vlan vlan10
```

Following is sample output from this command:

```
VLAN                 : vlan10
BFD                  : Enabled
Tx Interval          : 1000
Rx Interval          : 1000
Detection Multiplier : 3
Authentication       : None
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bgp

```
show bgp
```

Description

Displays *BGP* configuration information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command examples display various BGP configurations:

Output for `show bgp` for a VRF (PE-CE Protocol, RD and RT configured):

```
(virtual-router vrf-foo) # show bgp
Enabled             : No                OperStatus          :        Down
```

```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

This command was modified in Extreme ExtremeXOS 15.3 to reflect its operation in VRs and VRFs.

Support for IPv4 VXLAN was added in ExtremeXOS 22.3.

Support for BGP multipath-relax was added in ExtremeXOS 22.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp evpn

```
show bgp evpn
```

Description

Displays EVPN global configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example shows the EVPN global configuration for the switch:

```
# show bgp evpn

Enabled                              : Yes
OperStatus                           : Up
Local Identifier                             : 1.0.0.25     Restart Duration (sec)      :
180
MAC Move Duration (sec)                      : 60                MAC Move
Limit                     : 10
MAC Withdraw Delay (sec)                     : 1
Ignore AS for Route Target Matching   : On
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

show bpg evpn evi

show **bgp evpn evi** {**evi-index** *evi_index*} {**vni** *vni*}

Description

Show information about the EVPN instance table.

Syntax Description

bgp	Specifies BGP.
evpn	Specifies Ethernet VPN (RFC 7432).
evi	Shows the EVPN instance table.
evi-index	Specifies the EVI index.
vni	Specifies a particular virtual network identifier.
vni	Selects the VNI. Range is 1 to 16,777,215.

Default

N/A.

Usage Guidelines

Each EVPN instance represents a VLAN in a virtual network. In this implementation, there must be a 1-to-1 relationship between VLAN and VNI.

Example

The following example displays the currently active EVPN EVI instances:

```
# show bgp evpn evi

Flgs EVI-Idx Name       VNI      Local VTEP               RD       Import RTs      Export

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp evpn ipv4

show **bgp evpn ipv4** {**evi-index** *evi_index*} {**ip-address** *ip_address*}

Description

Shows the IPv4 entries from the EVPN MAC/IP table.

Syntax Description

bgp	Specifies BGP.
evpn	Specifies Ethernet VPN (RFC 7432).
ipv4	Shows only the IPv4 entries from the EVPN MAC/IP table.
evi-index	Specifies the EVI index.
evi_index	Restricts the display to EVI index (should be equal to VLAN ID). Range is 1 to 4,094.
ip-address	Restricts the display to an IP address.
ip_address	Selects the IP address.

Default

N/A.

Usage Guidelines

This command allows you to view the current set of IPv4 addresses configured in EVPN. If the ESI and ESI-Port fields are non-zero, then the entry was learned over a shared interface. The remote LACP partner's 6-byte MAC address is part of the ESI. For a full decoding of the ESI, see *RFC 7432*. The source (Src) column indicates whether the entry was learned (L)ocally or (R)emotely. The local entries are from the IP ARP cache or a locally configured routable VLAN. The remote entries appear only if the "In Use" flag is set to yes.

Example

The following example shows the current set of IPv4 addresses configured in EVPN.

```
# show bgp evpn ipv4

Src EVI-Idx Destination     MAC               BGP Next Hop           VNI

Total MAC/IP entries: 10
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp evpn ipv6

show **bgp evpn ipv6** {**evi-index** *evi_index*} {**ip-address** *ip_address*}

Description

Shows the IPv6 entries from the EVPN MAC/IP table.

Syntax Description

bgp	Specifies BGP.
evpn	Specifies Ethernet VPN (RFC 7432).
ipv6	Shows only the IPv6 entries from the EVPN MAC/IP table.
evi-index	Specifies the EVI index.
evi_index	Restricts the display to EVI index (should be equal to VLAN ID). Range is 1 to 4,094.
ip-address	Restricts the display to an IP address.
ip_address	Selects the IP address.

Default

N/A.

Usage Guidelines

This command allows you to view the current set of IPv6 addresses configured in EVPN. If the ESI and ESI-Port fields are non-zero, then the entry was learned over a shared interface. The remote LACP partner's 6-byte MAC address is part of the ESI. For a full decoding of the ESI, see *RFC 7432*. The source (Src) column indicates whether the entry was learned (L)ocally or (R)emotely. The local entries are from the neighbor-discovery cache or a locally configured routable VLAN. The remote entries are seen only if the "In Use" flag is set to yes.

Example

The following example shows the current set of IPv6 addresses configured in EVPN.

```
# show bgp evpn ipv6

Src EVI-Idx Destination
     MAC               BGP Next Hop  VNI ESI                              ESI-Port In Use
R    1020 2022::2%tenant
    01:01:01:01:01:01 3.3.3.103       101020  00:01:02:03:04:05:06:07:08:09  22    Yes

Src: (L) Local, (R) Remote
In Use: Yes/No - Indicates if entry is installed in neighbor discovery cache.

Total MAC/IP entries: 1
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp evpn l3vni

show **bgp evpn l3vni** {**vr** *vr_name*}}

Description

Shows the L3 VNI entries from the EVPN MAC/IP table.

Syntax Description

bgp	Specifies showing the BGP configuration.
evpn	Specifies showing the EVPN configuration.
l3vni	Specifies showing the integrated routing and bridging IP VRF VNI configuration.

vr	Specifies showing the VRF.
vr_name	Provides the VRF name.

Default

N/A.

Usage Guidelines

If you do not specify a VR, all VRs appear.

Example

The following example shows all L3 VNI entries:

```
1 # show bgp evpn l3vni
VRF Name                         Layer 3 VNI  RD
-------------------------------- ----------- ------------
vr-a                             10300        2.2.2.2:10300
vr-b                             10100        2.2.2.2:10100
vr-c                             10200        2.2.2.2:10200
```

The following example shows L3 VNI entries for VR "vr-b":

```
# show bgp evpn l3vni vr vr-b
VRF Name                         Layer 3 VNI  RD
-------------------------------- ----------- ------------
vr-b                             10100        2.2.2.2:10100
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp evpn mac

show **bgp evpn mac** {**mac-address** *mac_address*}

Description

Shows the current set of MAC addresses configured in EVPN.

Syntax Description

bgp	Specifies BGP.
evpn	Specifies Ethernet VPN (RFC 7432).
mac	Shows only the MAC entries from the EVPN MAC/IP table.
mac-address	Specifies restricting the display to a particular MAC address.
mac_address	Selects the MAC address to show.

Default

N/A.

Usage Guidelines

If the ESI and ESI-Port fields are non-zero, then the entry was learned over a shared interface. The remote LACP partner's 6-byte MAC address is part of the ESI. For a full decoding of the ESI, see RFC 7432. The (S)source column indicates whether the entry was learned (L)ocally or (R)emotely. The local entries are from the MAC forwarding database. The remote entries are in the MAC forwarding database only if the "In Use" flag is set to yes.

Example

The following example shows the current set of MAC addresses configured in EVPN.

```
# show bgp evpn mac

Src EVI-Idx MAC               BGP Next Hop           VNI ESI

Src: (L) Local, (R) Remote
In Use: Yes/No - Indicates if entry is installed in MAC forwarding database.
```

```
Total MAC/IP entries: 11
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp memory

```
show bgp memory {detail | memoryType}
```

Description

Displays *BGP* specific memory usage.

Syntax Description

detail	Displays detail information.
memoryType	Specifies the memory type usage to display.

Default

N/A.

Usage Guidelines

To see the memory types that you can display, enter the show bgp memory command without any attributes.

Example

The following command displays detailed BGP output for a specific memory types:

```
Switch.16.3 # sh bgp memory
BGP Memory Information

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

This command is updated to reflect L3 VPN changes in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp neighbor [flap-statistics | suppressed-routes]

For IPv4 and IPv6 address families:

```
show bgp {neighbor} remoteaddr {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast]} [flap-statistics
   | suppressed-routes] {detail} [all | as-path path-expression |
   community [no-advertise | no-export | no-export-subconfed | number
   community-number | autonomous-system-id : bgp-community] | network
   [any/netMaskLen | networkPrefixFilter] {exact}]
```

For the VPNv4 address family:

```
show bgp {neighbor} remoteaddr address-family vpnv4 [flap-statistics
| suppressed-routes] {detail} [all | as-path path-expression |
community [no-advertise | no-export | no-export-subconfed | number
community-number | autonomous-system-id : bgp-community] | rd
rd_value network [any/ netMaskLen | networkPrefixFilter] {exact}]
```

Description

Displays flap statistics or suppressed-route information about a specified neighbor.

Syntax Description

remoteaddr	Specifies an IPv4 or IPv6 address that identifies a *BGP* neighbor.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
flap-statistics	Specifies that only flap-statistics should be displayed (for route flap dampening enabled routes).
suppressed-routes	Specifies that only suppressed routes should be displayed (for route flap dampening enabled routes).

detail	Specifies to display the information in detailed format.
all	Specifies all routes.
path-expression	Display routes that match the specified AA path expression.
no-advertise	Specifies the no-advertise community attribute.
no-export	Specifies the no-export community attribute.
no-export-subconfed	Specifies the no-export-subconfed community attribute.
community_number	Specifies a community number.
autonomous-system-id	Specifies an autonomous system ID (0-65535).
bgp-community	Specifies the BGP community number.
rd	Specifies the Route Distinquisher (RD) value for the Layer 3 VPN routes for which you want to clear flap statistics.
any	Specifies all routes with a given or larger mask length.
netMaskLen	Specifies a IPv4 or IPv6 subnet mask length (number of bits).
networkPrefixFilter	Specifies an IPv4 or IPv6 address and netmask.
exact	Specifies an exact match with the IP address and subnet mask.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

Note

If this command displays Bad Source Address, the BGP neighbor IP address is unavailable. Possible causes for this condition include a deleted or unconfigured *VLAN* or IP address.

The option network any / *netMaskLen* displays all BGP routes whose mask length is equal to or greater than *maskLength*, irrespective of their network address.

The option network any / *netMaskLen* exact displays all BGP routes whose mask length is exactly equal to *maskLength*, irrespective of their network address.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and no address-family information appears. Similarly an IPv4 peer only supports IPv4 address families and no address-family information appears if an IPv6 address family is specified.

To display Layer 3 VPN information, you must enter this command in the context of on the *MPLS*-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command displays flap statistics for the specified IPv4 neighbor:

```
* Switch.18 # show bgp neighbor 10.0.0.0 flap-statistics
  BGP Routes Flap Statistics
  Destination            NextHop          Penalty Flaps Duration Reuse             AS-
Path

--------------------------------------------------------------------------------------

  * ?100:1:100.0.0.0/8    11.0.0.2                100
100
Flags: (*) Preferred BGP route, (>) Active, (d) Suppressed, (h) History
       (s) Stale, (m) Multipath, (u) Unfeasible
Origin: (?) Incomplete, (e) EGP, (i) IGP
Total Number of Flapped Routes: 1
```

The following command displays flap statistics for the specified IPv6 neighbor:

```
* Switch.21 # show bgp neighbor 2001::64:: address-family ipv6-unicast flap-statistics
  BGP Routes Flap Statistics
Destination            NextHop          Penalty Flaps Duration Reuse             AS-
Path
--------------------------------------------------------------------------------------

* ?2001::/64           3001::1                100                                100

Flags: (*)  Preferred BGP route, (>) Active, (d) Suppressed, (h) History
       (s) Stale, (m) Multipath, (u) Unfeasible
Origin: (?) Incomplete, (e) EGP, (i) IGP
Total Number of Flapped Routes: 1
```

History

This command was first available in ExtremeXOS 10.1.

The **any**/*netMaskLen* options were added in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp neighbor received orf

```
show bgp {neighbor} remoteaddr {address-family [ipv4-unicast |ipv4-
   multicast | vpnv4] } received-orf
```

Description

Displays on the remote speaker the ORF lists received and installed from the local speaker for installation and outbound route filtering for IPv4 and IPv6 address families.

Syntax Description

remoteaddr	Specifies an IPv4 address that identifies a *BGP* neighbor.
ipv4-unicast	Specifies IPv4 unicast routes.
ipv4-multicast	Specifies IPv4 multicast routes.
vpnv4	Specifies VPNv4 routes.
received-orf	Displays on the remote speaker the ORF lists it received, and subsequently installed from the local speaker for installation and outbound route filtering.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

ORF is only supported for IPv4 peers. If this command is executed for an IPv6 peer, the command is rejected with the following error message:

```
Outbound-route-filtering not supported for IPv6 peer remoteaddr
```

Example

The following example shows the ORF filters received by the remote speaker:

```
show bgp neighbor 11.0.0.2 received-orf
  Address family: IPv4 unicast
  Prefix list:
    nlri 21.0.0.0/8    exact             permit
    nlri 22.1.0.0/16   min 24 max 28     permit
    nlri 23.0.0.0/8    min 16            deny
```

```
Community list:

Extended-community list:
    rt:100:2                          permit
    rt:100:3                          permit
    rt:101:1                          deny
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the L3 VPN feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp neighbor

For IPv4 and IPv6 address families:

```
show bgp {neighbor} remoteaddr {address-family [ipv4-unicast | ipv4-
   multicast |ipv6-unicast | ipv6-multicast | ipv4-vxlan | {l2vpn-evpn
   [inclusive-multicast | mac-ip | auto-discovery | esi | ip-prefix]}]}
   [accepted-routes | received-routes | rejected-routes | transmitted-
   routes] {detail} [all | as-path path-expression | community [no-
   advertise | no-export | no-export-subconfed | number community_number
   | autonomous-system-id : bgp-community] | network [any/netMaskLen |
   networkPrefixFilter] {exact}]
```

For the VPNv4 address family:

```
show bgp {neighbor} remoteaddr address-family vpnv4 [accepted-routes
   | received-routes | rejected-routes | transmitted-routes] {detail}
   [all | as-path path-expression | community [no-advertise | no-
   export | no-export-subconfed | number community_number | autonomous-
   system-id :bgp-community] | rd rd_value network [any/netMaskLen |
   networkPrefixFilter] {exact}]
```

Description

Displays information about routes to a specified neighbor.

Syntax Description

remoteaddr	Specifies an IPv4 or IPv6 address that identifies a *BGP* neighbor.
ipv4-unicast	Specifies IPv4 unicast routes.
ipv4-multicast	Specifies IPv4 multicast routes.
ipv6-unicast	Specifies IPv6 unicast routes.

ipv6-multicast	Specifies IPv6 multicast routes.
ipv4-vxlan	Specifies IPv4 VXLAN routes.
l2vpn-evpn	Specifies an L2VPN EVPN address family.
inclusive-multicast	Displays EVPN inclusive-multicast (type 3) routes
mac-ip	Displays EVPN MAC/IP (type 2) routes.
auto-discovery	Displays EVPN auto-discovery (type 1) routes.
esi	Displays EVPN Ethernet segment (type 4) routes.
ip-prefix	Displays EVPN ip-prefix (type 5) routes.
vpnv4	Specifies VPNv4 routes.
accepted-routes	Specifies that only accepted routes are displayed.
received-routes	Specifies that only received routes are displayed.
rejected-routes	Specifies that only rejected routes are displayed.
transmitted-routes	Specifies that only transmitted routes are displayed.
detail	Specifies to display the information in detailed format.
all	Specifies all routes.
path-expression	Display routes that match the specified AA path expression.
no-advertise	Specifies the no-advertise community attribute.
no-export	Specifies the no-export community attribute.
no-export-subconfed	Specifies the no-export-subconfed community attribute.
community_number	Specifies a community number.
autonomous-system-id	Specifies an autonomous system ID (0-65535).
bgp-community	Specifies the BGP community number.
rd	Specifies the Route Distinquisher (RD) value for the Layer 3 VPN routes for which you want to clear flap statistics.
any	Specifies all routes with a given or larger mask length.
netMaskLen	Specifies a IPv4 or IPv6 subnet mask length (number of bits).
networkPrefixFilter	Specifies an IPv4 or IPv6 address and netmask.
exact	Specifies an exact match with the IP address and subnet mask.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

show bgp neighbor now supports v6 unicast and multicast and vpnv4 address families. This command applies to the current VR or VRF context.

Note

If this command displays Bad Source Address, the BGP neighbor IP address is unavailable. Possible causes for this condition include a deleted or unconfigured *VLAN* or IP address.

The option network any / *netMaskLen* displays all BGP routes whose mask length is equal to or greater than *maskLength*, irrespective of their network address.

The option network any / *netMaskLen* exact displays all BGP routes whose mask length is exactly equal to *maskLength*, irrespective of their network address.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default address-family, i.e. IPv4 unicast is assumed and hence no address-family information appears. Similarly an IPv4 peer only supports IPv4 address families and no address-family information appears if an IPv6 address family is specified.

To display Layer 3 VPN information, you must enter this command in the context of on the *MPLS*-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command displays sample output when an error message is generated when the user attempts to create more than the limit of 2 peering sessions with a Base license on VR-Default (including any child VRFs of VR-Default:

```
# show bgp neighbor

     Peer                                    AS         Weight State        InMsgs
OutMsgs(InQ)  Up/Down
------------------------------------------------------------------------------------------
------------------
Id-- 10.1.1.1                                10         1      IDLE         0      0
(0    ) 0:0:13:53
Id-- 20.1.1.1                                10         1      IDLE         0      0
(0    ) 0:0:00:07
Flags: (d) disabled, (e) enabled, (E) external peer, (I) internal peer

switch-model-EXOS.24 # create bgp neighbor 30.1.1.1 remote-AS-number 10
Error: Core license is required to configure more than 2 peers

Base License (User VR):

* (vr user1) switch-model-EXOS.29 # create bgp neighbor 30.1.1.1 remote-AS-number 50
Error: vr user1: Core license is required to configure peer on VR other than VR-Default
```

The following command displays sample output for **show bgp neighbor summary**:

```
# show bgp neighbor

Peer                AS    Weight      State        InMsgs OutMsgs(InQ)  Up/Down
------------------------------------------------------------------------------
Ie-- 11.0.0.2       100   0           OPENSENT     0      9      (0    ) 0:8:27:21
Ie-- 3001::1        100   0           ESTABLISEHD  4      3      (0    ) 0:8:27:21

Flags:  (d) disabled, (e) enabled, (E) external peer, (I) internal peer
        (m) EBGP multihop, (r) route reflector client

```

History

This command was first available in ExtremeXOS 10.1.

The any / *netMaskLen* options were added in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Support for BFD on neighbors was added in ExtremeXOS 21.1

Support for IPv4 VXLAN was added in ExtremeXOS 22.3.

Support for L2VPN EVPN was added in ExtremeXOS 30.2.

Support for EVPN auto-discovery and EVPN Ethernet Segment routes was added in ExtremeXOS 30.4.

Support for Type 5 routes (**ip-prefix**) was added in ExtremeXOS 30.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp peer-group

```
show bgp peer-group {detail | peer-group-name {detail}}
```

Description

Displays the peer groups configured in the system.

Syntax Description

detail	Specifies to display the information in detailed format.
peer-group-name	Specifies a peer group.

Default

N/A.

Usage Guidelines

If the detail keyword is specified then the parameters of the neighbors in the peer group, which are different from the ones that are configured in the peer group, are displayed.

If no peer group name is specified, all the peer group information is displayed.

This command applies to the current VR or VRF context.

Example

The following command displays information for the outer peer group:

```
* (debug) Summit-PC.19 # show bgp peer-group "outer"
Peer Group          : outer

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp routes summary

```
show bgp routes {address-family [ipv4-unicast | ipv4-multicast |ipv6-
   unicast | ipv6-multicast | vpnv4 | ipv4-vxlan]} summary {vr vr_name}
```

Description

Displays a summary of the *BGP* route information base (RIB).

Syntax Description

ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
ipv4-vxlan	Specifies an IPv4 VXLAN address family.

vr	Specifies viewing routes associated with a specified virtual router.
vr_name	Specifes the VR name. If not specified, the VR of current command context is used.

Default

If no address family is specified, IPv4 unicast is the default.

If not specified, the VR of current command context is used.

Usage Guidelines

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

To display Layer 3 VPN information, you must enter this command in the context of on the *MPLS*-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

When the `show bgp routes summary` command is issued with **`address-family vpnv4`**, the command will impact the behavior of PE to PE neighbor sessions and display/clear the VPN-IPv4 RIB of BGP.

Example

The following command displays a summary of the BGP route information base (RIB) for IPv4 multicast:

```
show bgp routes address-family ipv4-multicast summary
```

The following example displays VPN routes with RD 100:1:

```
  virtual-router corp1_vrf
    show bgp routes address-family vpnv4 rd 100:1
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Support for IPv4 VXLAN was added in ExtremeXOS 22.3.

Support for user-specified VRs was added in ExtremeXOS 30.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bgp routes

For IPv4 and IPv6 address families:

```
show bgp routes {address-family [ipv4-unicast | ipv4-multicast |ipv6-
   unicast | ipv6-multicast | ipv4-vxlan | {l2vpn-evpn [inclusive-
   multicast | mac-ip | auto-discovery | esi | ip-prefix]}]} {detail}
   [ipv4-vxlan | all | as-path path-expression | community [no-
   advertise | no-export | no-export-subconfed | number community_number
   | autonomous-system-idbgp-community] | network [any/netMaskLen |
   networkPrefixFilter] {exact}] {vr vr_name}
```

For the VPNv4 address family:

```
show bgp routes address-family vpnv4 {detail} [all | as-path
   path-expression | community [no-advertise | no-export | no-
   export-subconfed | number community-number |autonomous-system-idbgp-
   community] |rd rd network [any/netMaskLen |networkPrefixFilter]
   {exact}] {vr vr_name}
```

Description

Displays the *BGP* route information base (RIB).

Syntax Description

ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
ipv4-vxlan	Specifies an IPv4 VXLAN address family.
l2vpn-evpn	Specifies an L2VPN EVPN address family.
inclusive-multicast	Displays EVPN inclusive-multicast (type 3) routes
mac-ip	Displays EVPN MAC/IP (type 2) routes.
auto-discovery	Displays EVPN auto-discovery (type 1) routes.
esi	Displays EVPN Ethernet segment (type 4) routes.
ip-prefix	Displays EVPN ip-prefix (type 5) routes.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
all	Specifies all routes.
path-expression	Displays routes that match the specified AA path expression.

no-advertise	Specifies the no-advertise community attribute.
no-export	Specifies the no-export community attribute.
no-export-subconfed	Specifies the no-export-subconfed community attribute.
community_number	Specifies a community number.
autonomous-system-id	Specifies an autonomous system ID (0-65535).
bgp-community	Specifies the BGP community number.
rd	Specifies the Route Distinquisher (RD) value for the Layer 3 VPN routes for which you want to clear flap statistics.
any	Specifies all routes with a given or larger mask length.
netMaskLen	Specifies a IPv4 or IPv6 subnet mask length (number of bits).
networkPrefixFilter	Specifies an IPv4 or IPv6 address and netmask.
exact	Specifies an exact match with the IP address and subnet mask.
vr	Specifies viewing routes associated with a specified virtual router.
vr_name	Specifes the VR name. If not specified, the VR of current command context is used.

Default

If no address family is specified, IPv4 unicast is the default.

If not specified, the VR of current command context is used.

Usage Guidelines

The option network any / *netMaskLen* displays all BGP routes whose mask length is equal to or greater than *maskLength*, irrespective of their network address.

The option network any / *netMaskLen* exact displays all BGP routes whose mask length is exactly equal to *maskLength*, irrespective of their network address.

To display Layer 3 VPN information, you must enter this command in the context of on the *MPLS*-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

You can only execute the show for **vpnv4** address family in a VR context. If you execute this command in a VRF context, the “Cannot execute command in VRF context” error is displayed.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command displays detailed information about all BGP routes:

```
* Switch.5 #  show bgp routes all
Received Routes:
Destination         LPref Weight MED     Peer            Next-Hop        AS-Path
-------------------------------------------------------------------------------
*>? 1.1.1.1/32      100   0              11.0.0.1        11.0.0.1        100
* ? 11.0.0.0/24     100   0              11.0.0.1        11.0.0.1        100
*>? 101.0.0.0/24    100   0              11.0.0.1        11.0.0.1        100
u ? 103.0.0.0/24    100   0              11.0.0.1        11.0.0.1        100
Flags: (*) Preferred BGP route, (>) Active, (d) Suppressed, (h) History
       (s) Stale, (m) Multipath, (u) Unfeasible

Origin: (?) Incomplete, (e) EGP, (i) IGP

BGP Route Statistics
  Total Rxed Routes : 4

History

This command was first available in ExtremeXOS 10.1.

The any / *netMaskLen* options were added in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Support for IPv4 VXLAN was added in ExtremeXOS 22.3.

Support for L2VPN EVPN was added in ExtremeXOS 30.2.

Support for user-specified VRs was added in ExtremeXOS 30.3.

Support for EVPN auto-discovery and EVPN Ethernet Segment routes was added in ExtremeXOS 30.4.

Support for Type 5 routes (**ip-prefix**) was added in ExtremeXOS 30.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show bootprelay

```
show bootprelay
```

Description

Displays the *DHCP*/BOOTP Relay statistics and the configuration for the VRs.

Syntax Description

ipv4	Specifies unconfiguring the DHCPv4 BOOTP Relay service (default).
ipv6	Specifies unconfiguring the DHCPv6 BOOTP Relay service.
vlan	Unconfigures BOOTP relay for a specified *VLAN*.
vlan_name	Specifies the VLAN name.
include-secondary	Removes the include-secondary configuration for the specified VLAN.

Default

None.

Usage Guidelines

The fields displayed in the DHCP Information Option 82 section depend on the configuration defined by the `configure bootprelay dhcp-agent information policy [drop | keep | replace]` command. If the policy configured is keep, the Requests unmodified counter appears. If the policy configured is replace, the Requests replaced counter appears. And if the drop policy is configured, the Requests dropped counter appears.

The Opt82 added to Requests counter indicates the number of DHCP requests to which the BOOTP Relay agent (the switch) has added its own option 82 information.

Example

The following example displays the DHCP/BOOTP relay statistics for existing VRs:

```
Switch.1 # show bootprelay
Bootprelay : Enabled  on virtual router "VR-Default"
DHCP Relay Agent Information Option : Enabled  on virtual router "VR-Default"
DHCP Relay Agent Information Check  : Enabled  on virtual router "VR-Default"
DHCP Relay Agent Information Policy : Replace
DHCP Relay Agent Information Remote-ID : "default"
Bootprelay servers for virtual router "VR-Default":
Destination: 10.127.8.1
DHCP/BOOTP relay statistics for virtual router "VR-Default"
Received from client =          2  Received from server =          2
Requests relayed     =          2  Responses relayed    =          2
DHCP Discover        =          1  DHCP Offer           =          1
DHCP Request         =          1  DHCP Ack             =          1
DHCP Decline         =          0  DHCP NAck            =          0
DHCP Release         =          0
DHCP Inform          =          0
DHCP Information Option 82 packets statistics for virtual router "VR-Default"
Received from client    =          0  Received from server =          2
Requests replaced       =          0  Responses dropped    =          0
Opt82 added to Requests =          2
Note: Default Remote-ID : System MAC Address
```

The following example shows DHCP/BOOTP relay that is disabled for the VR, but enabled on some VLANs:

```
# show bootprelay
Bootprelay : Disabled on virtual router "VR-Default", but enabled on some VLANs.
Include Secondary : Disabled
DHCP Relay Agent Information Option : Disabled on virtual router "VR-Default"

DHCP/BOOTP relay statistics for virtual router "VR-Default"
    Received from client =          0  Received from server =          0
    Requests relayed     =          0  Responses relayed    =          0
    DHCP Discover        =          0  DHCP Offer           =          0
    DHCP Request         =          0  DHCP Ack             =          0
    DHCP Decline         =          0  DHCP NAck            =          0
    DHCP Release         =          0
    DHCP Inform          =          0
```

History

This command was first available in ExtremeXOS 10.1.

Information about DHCP/BOOTP relay being disabled for the VR, but enabled on some VLANs was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bootprelay configuration

```
show bootprelay configuration {ipv4 | ipv6} {{vlan vlan_name } | {vr
   vr_name}}
```

Description

Displays the enabled/disabled configuration of BOOTP relay on one or all *VLAN*s for the specified VR.

Syntax Description

bootprelay	BOOTP Relay Configuration
ipv4	DHCPv4 BOOTP Relay service.
ipv6	DHCPv6 BOOTP Relay service.
vlan	VLAN
vlan_name	Specifies a single VLAN for which to display BOOTP relay configuration information.
vr	Use a specific virtual router name.
vr_name	Specifies a single VR for which to display BOOTP relay configuration information.

Default

IPv4.

If a VR is not specified, this command displays the specified VLANs for the current VR context.

Usage Guidelines

Note
ExtremeXOS DHCPv6 supports three options: OPTION_RELAY_MSG (9), OPTION_INTERFACE_ID (18), and OPTION_REMOTE_ID (37).

Note
It is mandatory to configure BOOTP Relay v6 Agents. The packets are not forwarded if the v6 agents are not configured.

Example

The following example displays the BOOTP relay configuration for all VLANs on the *VR-Default* virtual router:

```
# show bootprelay configuration vr "VR-Default"
BOOTP Relay : Enabled on virtual router "VR-Default"
VLAN                                    BOOTP Relay
--------------------------------        -----------
Default                                 Disabled
client1                                 Enabled
serv                                    Enabled
```

The following example displays the BOOTP relay configuration for all VLANs in the current VR context:

```
# show bootprelay configuration
BOOTP Relay : Enabled on virtual router "VR-Default"
VLAN                                    BOOTP Relay
```

```
--------------------------------        -----------
Default                                 Disabled
client1                                 Disabled
serv                                    Disabled
```

The following example displays the BOOTP relay configuration for VLAN client1:

```
# show bootprelay configuration vlan "client1"
BOOTP Relay : Enabled on virtual router "VR-Default"
VLAN                                    BOOTP Relay
--------------------------------        -----------
client1                                 Disabled
```

The following example displays the BOOTP relay configuration for IPv6:

```
# show bootprelay configuration ipv6
DHCPv6 BOOTP Relay : Enabled on virtual router "VR-Default"
VLAN                                     DHCPv6 BOOTP Relay
--------------------------------          ------------------
Default                                        Enabled
```

The following example displays the BOOTP relay configuration for IPv6 when vr is disabled:

```
# show bootprelay configuration ipv6
DHCPv6 BOOTP Relay : Disabled on virtual router "VR-Default"
```

The following example shows DHCP/BOOTP relay configuration that is disabled for the VR, but enabled on some VLANs:

```
# show bootprelay configuration
DHCPv4 BOOTP Relay : Disabled on virtual router "VR-Default", but enabled on some VLANs.
    Include Secondary    : Disabled
    BOOTP Relay Servers  :
    DHCP Relay Agent Information Option: Disabled
    DHCP Relay Agent Information Check : Disabled
    DHCP Relay Agent Information Policy: Replace
    DHCP Relay Agent Source VLAN       : ltep
```

History

This command was first available in ExtremeXOS 12.4.2.

Information about DHCP/BOOTP relay being disabled for the VR, but enabled on some VLANs was added in ExtremeXOS 22.5.

VLAN to use as the source IP address in the BOOTRrelay packet information was added in 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bootprelay configuration ipv4

```
show bootprelay
```

Description

Displays various BOOTP Relay configuration details.

Syntax Description

ipv4	Specifies unconfiguring the DHCPv4 BOOTP Relay service (default).
ipv6	Specifies unconfiguring the DHCPv6 BOOTP Relay service.
vlan	Unconfigures BOOTP relay for a specified *VLAN*.
vlan_name	Specifies the VLAN name.
include-secondary	Removes the include-secondary configuration for the specified VLAN.

Default

Usage Guidelines

Use this command to display various bootprelay configuration details.

Example

The following command displays IPv4 bootprelay statistics:

```
# show bootprelay configuration ipv4
DHCPv4 BOOTP Relay   : Enabled on virtual router "VR-Default"
    Include Secondary : Enabled (parallel)
    BOOTP Relay Servers  :
    DHCP Relay Agent Information Option: Enabled
    DHCP Relay Agent Information Check : Disabled
    DHCP Relay Agent Information Policy: Replace
VLAN                                  DHCPv4 BOOTP Relay
------------------------              ------------------
VLAN "Default":
    BOOTP Relay                       : Enabled
    Include Secondary                 : Enabled (sequential)
    BOOTP Relay Servers               : 192.168.1.1
    DHCP Relay Agent Information Option: Enabled
    DHCP Relay Agent Information Check : Disabled
    DHCP Relay Agent Information Policy: Replace
VLAN "v1":
    BOOTP Relay                       : Enabled
    Include Secondary                 : Enabled (sequential)
    BOOTP Relay Servers               : 10.1.1.1
    DHCP Relay Agent Information Option: Enabled
    DHCP Relay Agent Information Check : Disabled
    DHCP Relay Agent Information Policy: Replace
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bootprelay configuration ipv6

```
show bootprelay
```

Description

Displays various BOOTP Relay configuration details.

Syntax Description

ipv4	Specifies unconfiguring the DHCPv4 BOOTP Relay service (default).
ipv6	Specifies unconfiguring the DHCPv6 BOOTP Relay service.
vlan	Unconfigures BOOTP relay for a specified *VLAN*.
vlan_name	Specifies the VLAN name.
include-secondary	Removes the include-secondary configuration for the specified VLAN.

Default

N/A.

Usage Guidelines

Use this command to display BOOTP Relay details for IPv6.

Example

The following command :

```
# show bootprelay configuration ipv6
DHCPv6 BOOTP Relay : Enabled on virtual router "VR-Default"
Include Secondary : Enabled (parallel)

VLAN                      DHCPv6 BOOTP Relay
------------------------  ------------------
VLAN "Default":
    BOOTP Relay           : Disabled
VLAN "v1":
    BOOTP Relay           : Enabled
    Include Secondary     : Enabled (sequential)
VLAN "v2":
    BOOTP Relay           : Enabled
    Include Secondary     : Enabled (parallel)
```

The following example shows DHCPv6/BOOT Relay configuration that is disabled on the VR, but enabled on some VLANs:

```
# show bootprelay configuration ipv6
DHCPv6 BOOTP Relay : Disabled on virtual router "VR-Default", but enabled on some VLANs.
Include Secondary  : Disabled

VLAN                      DHCPv6 BOOTP Relay
------------------------  ------------------
```

```
VLAN "Default":
    BOOTP Relay          : Enabled
```

History

This command was first available in ExtremeXOS 15.4.

Information about DHCP/BOOTP relay being disabled for the VR, but enabled on some VLANs was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bootprelay dhcp-agent information circuit-id port-information

```
show bootprelay dhcp-agent information circuit-id port-information ports
   all
```

Description

Displays the circuit ID sub-option that identifies the port for an incoming *DHCP* request.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the circuit ID port_info value for all ports:

```
Switch.12 # show bootprelay dhcp-agent information circuit-id port-information ports all
Port            Circuit-ID Port information string
----            ----------------------------------
1               1001
2               1002
3               extreme1
4               1004
5               1005
6               1006
7               1007
8               1008
9               1009
10              1010
```

```
:
:
11              1011
12              1012
:
:
48              1048
49              1049
50              1050
Note: The full Circuit ID string has the form '<Vlan Info>-<Port Info>'
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bootprelay dhcp-agent information circuit-id vlan-information

```
show bootprelay dhcp-agent information circuit-id vlan-information
```

Description

Displays the circuit ID sub-options that identify the VLANs on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the circuit ID vlan_info for all VLANs:

```
Summit # show bootprelay dhcp-agent information circuit-id vlan-information
Vlan            Circuit-ID vlan information string
----            ----------------------------------
Default         1
Mgmt            4095
v1              4094
v2              extreme123
Note: The full Circuit ID string has the form '<Vlan Info>-<Port Info>'
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bootprelay ipv6

```
show bootprelay ipv6
```

Description

Displays various BOOTP Relay configuration details.

Syntax Description

bootprelay	Shows the BOOTP relay information.
ipv6	DHCPv6 BOOTP Relay Service.

Default

Not applicable.

Usage Guidelines

Use this command to display IPv6 bootp relay information.

Example

The following command displays IPv6 bootprelay information:

```
* switch # show bootprelay ipv6
BOOTP Relay: DHCPv6 BOOTP Relay enabled on virtual router "VR-Default"
Include Secondary : Disabled
    BOOTP Relay Servers :2001::1
                         3001::1
                         4001::1
VLAN "Default"          :
    BOOTP Relay         : Enabled
    Interface ID        : 3999 (Default)
    Remote ID           : 00:04:96:52:08:76 (Default)
    Prefix Snooping     : Disabled
VLAN "v1"               :
    BOOTP Relay         : Enabled
    Interface ID        : Interface-Sring1
    Remote ID           :
* switch #
```

When vr is disabled:

```
* SWITCH # show bootprelay ipv6 configuration
BOOTP Relay: DHCPv6 BOOTP Relay disabled on virtual router "VR-Default"
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show bootprelay ipv6 prefix-delegation snooping

```
show bootprelay ipv6 prefix-delegation snooping {vlan} vlan_name
```

Description

Displays the information about snooped IPv6 prefixes delegated via *DHCP*.

Syntax Description

vlan_name	Specifies the *VLAN* name.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays snooped IPv6 prefixes delegated via DHCP for all VLANs.

```
show bootprelay ipv6 prefix-delegation snooping
```

The following is sample output:

```
Delegated Prefix                                Interface
    Gateway                                         Valid For
-----------------------------------------------------------------
2000::/48                                       v1
    2000::1                                             7154 secs

3000::/48                                       v2
    3000::1                                              992 secs
```

```
2800::/56                                       v3
    2800::1                                              10 secs
```

The following command displays snooped IPv6 prefixes delegated via DHCP for VLAN v1:

```
show bootprelay ipv6 prefix-delegation snooping vlan v1
```

The following is sample output:

```
Delegated Prefix                                Interface
    Gateway                                         Valid For
-----------------------------------------------------------------
2000::/48                                       v1
    2000::/1                                            7074 secs
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cdp

```
show cdp
```

Description

Displays the interval between advertisements, the hold time and the version of the advertisement.

Syntax Description

There are no arguments ot keywords for this command.

Default

N/A.

Usage Guidelines

Use this command to display the interval between advertisements, the hold time and the version of the advertisement.

Example

The following command displays specific information on the CDP feature:

```
# show cdp
12345678901234567890123456789012345678901234567890123456789012345678901234567890
```

```
CDP Transmit time                  : 60 seconds
CDP Hold time                      : 180 seconds
CDP Device ID                      : 00:04:96:8B:C2:CA
CDP Enabled ports                  : 1-2, 7
Power Available TLV Enabled ports  : 1-2,23
CDP Local management address      : VLAN Chicago (2001:db8:85a3::7334)
```

History

This command was first available in ExtremeXOS 15.4.

The output of this command was updated in ExtremeXOS 21.1.

Management IP address information was added in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cdp counters

```
show cdp counters {ports port_list}
```

Description

Displays CDP port counter statistics.

Syntax Description

ports	Displays CDP port statistics.
port_list	Port list of CDP ports.

Default

N/A.

Usage Guidelines

Use this command to display CDP port counter statistics.

Example

The following command displays counter statistic for CPD ports:

```
# show cdp counters ports 10
Port   Tx PDU       Rx PDU     Rx Drop       Rx Drop
        Count       Count      Checksum Err  Invalid
----   ---------  ---------  ------------    ---------
10         3729       3729         0            0
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cdp neighbor

```
show cdp neighbor {detail}
```

Description

Displays information about neighbors.

Syntax Description

detail	Displays detailed information.

Default

N/A.

Usage Guidelines

Use this command to display CDP neighbor information.

History

This command was first available in ExtremeXOS 15.4.

The output of this command was updated in ExtremeXOS 21.1

Management IP address information was added in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cdp ports

```
show cdp ports {port_list} {configuration | detail}
```

Description

Displays information about neighbors in ports.

Syntax Description

port_list	Specifies the port list, separated by a comma.
configuration	CDP local port configuration.
detail	Detailed information.

Default

N/A.

Usage Guidelines

Use this command to display CDP port information.

Example

The following command displays neighbor port information on the CDP feature:

```
# show cdp ports

Neighbor Information--------------------
Port  Device-Id            Hold time  Remote CDP  Port
ID                                    Version
----  ---------            ---------  ----------  --------------------
1     Eni-Extreme-x440-sw> 149        Version-1   Slot:  1, Port:  1
2     00:04:96:8B:9D:B0    160        Version-2   Slot:  1, Port:  2
7     00:04:96:8B:C1:ED    138        Version-2   Slot:  1, Port:  7
```

Note

">" indicates that the value was truncated to the column size in the output.

The following example displays the COS extended neighbor port information on the CDP feature:

```
Local Port Information
----------------------
Port     Trust       Cos   VoIP VLAN                       VoIP VLAN
                                                           Advertise
----     ----------  ----  --------------------------------  ------------
1        Trusted     0     Default                           Solicited
2        Trusted     0     Default                           Unsolicited
```

The following example shows detailed information for port 10:

```
# show cdp port 10 detail

Neighbor Information
--------------------
Device ID               : X670G2-48x-4q
Port ID (outgoing port) : Slot:  1, Port: 10
Advertisement Version   : 2
Platform                : X670G2-48x-4q
Interface               : 10
Holdtime                : 162

Version                 :
ExtremeXOS version 22.4.0.5 xos_22.4 by kosharma
```

```
     on Fri Jul 14 12:28:36 IST 2017

Native VLAN             : 1
Duplex                  : Full
Trust                   : Trusted
SysName                 : X670G2-48x-4q
```

History

This command was first available in ExtremeXOS 15.4.

The output of this command was updated in ExtremeXOS 21.1.

The **detail**option was added and the output of this command was updated in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm detail

```
show cfm {domain_name {association_name {ports port_list} {[end-point
   [up | down]]}}} detail
```

Description

Displays the MEP CCM database.

Syntax Description

domain_name	Enter the name of the domain for which you want to display the MEP CCM databases.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Enter the ports in the domain/association for which you want to display the CCM databases.
up	Enter this to display the CCM database on the UP MEP for the specified MA.
down	Enter this to display the CCM database on the DOWN MEP for the specified MA.

Default

N/A.

Usage Guidelines

If you do not specify any parameters or variables, the system displays information on all CCM databases on the switch.

This command displays the following items of the CCM database:

- The name of the domain and association
- Port number
- MP and type
- MAC address of remote end points
- MEP IDs
- Lifetime for CCM messages from each remote end point
- Actual age of CCM messages

Note

The TTL for the CCM messages from the MP you are working on is 3.5 times the transmission interval.

Example

The following command displays the CCM databases on the switch:

```
show cfm detail
```

The following is sample output from this command:

```
# show cfm detail
Domain/       Port     MP   Remote End-Point   Remote End-Point MEP    Life        Flags
 Association                    MAC Address        IP Address      ID     time  Age

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm groups

```
show cfm groups {group_name}
```

Description

This command displays the details of specified or all groups. The information contains group name, grop status, LMEP id, the physical port of the LMEP, RMEP ids, registered clients, domain and association names.

Syntax Description

group_name	Group name, maximum of 31 characters.

Default

N/A.

Usage Guidelines

Use this command to display the details of specified or all groups. The information contains group name, grop status, LMEP id, the physical port of the LMEP, RMEP ids, registered clients, domain and association names.

Example

The following output shows the typical output of this command:

```
# sh cfm groups
Group : eapsCfmGrp1     Status : UP
Local MEP      : 11     port   : 41
Remote MEPs    : 10
Client(s)      : eaps
Domain         : MD1
Association    : MD1v2
Group : eapsCfmGrp2     Status : UP
Local MEP      : 12     port   : 31
Remote MEPs    : 13
Client(s)      : eaps
```

```
Domain         : MD1
Association    : MD1v2
```

The following example shows the output for *ERPS* with Y.1731 CCMs:

```
# show configuration cfm
#
# Module dot1ag configuration.
#
create cfm domain string "dom" md-level 5
configure cfm domain "dom" add association meg "VSNLMEG1" vlan "v1"
configure cfm domain "dom" association "VSNLMEG1" ports 1 add end-point down 100
configure cfm domain "dom" association "VSNLMEG1" ports 15 add end-point down 200
configure cfm domain "dom" association "VSNLMEG1" ports 1 end-point down add group" erps-
g1"
configure cfm domain "dom" association "VSNLMEG1" ports 15 end-point down add group "erps-

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm segment frame-delay statistics

```
show cfm segment frame-delay statistics {segment-name} {mep mep_id}
```

Description

This command displays frame-delay information for the given CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
mep	Maintenance association End Point.
mep_id	MEP-ID. The range is 1-8191.

Default

N/A.

Usage Guidelines

Use this command to display the delay for the last received frame, the minimum, maximum and average delay, and the delay variance during the current transmission. When the segment name is not specified, only the segments which have valid statistics alone are displayed. When the segment name is specified, that particular segment's information, although not present, is displayed.

Example

The following command displays the frame delay statistics for the CFM segment:

```
show cfm segment frame-delay statistics
```

Following is sample output for this command:

```
-------------------------------------------------------------------------
Segment Name    Mep     Recent  Min     Max     Mean    Jitter   Errored
                 ID     Delay   Delay   Delay   Delay   Delay    Frames*
                        (ms)    (ms)    (ms)    (ms)    (ms)
-------------------------------------------------------------------------
segment1        ----   0.000   0.000   0.000    0.000    0.000      0
segment2        100    0.000   0.000   0.000    0.000    0.000      0
                200    0.000   0.000   0.000    0.000    0.000      0
segment3        100    0.000   0.000   0.000    0.000    0.000      0
                300    0.000   0.000   0.000    0.000    0.000      0
-------------------------------------------------------------------------
Flags: (*) % of frames beyond alarm threshold in the current measurement window
Total Configured Segments       : 3
Total Active Segments           : 3
```

History

This command was first available in ExtremeXOS 12.3.

The **mep id** show output was added in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm segment frame-delay

```
show cfm segment frame-delay {segment_name]}
```

Description

This command displays frame-delay information for the given CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to display frame-delay information for the given CFM segment.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm segment frame-delay/frame-loss mep id

```
show cfm segment {{segment_name} | {frame-delay {segment_name}} |
   {frame-loss {segment_name {mep mep_id}}}}
```

Description

This command is used to display the current status and configured values of a CFM segment.

Syntax Description

segment_name	An alphanumeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to display the current status and configured values of a CFM segment.

Note

In this command, the row “pending frames” will be displayed only for on-demand mode of transmission.

A segment is considered as active if any of the MEPs in the segment is enabled for Frame Loss measurement. Active Segment count will be incremented by one only even if there are multiple MEPs enabled for Frame Loss. For example, assume that there are 3 segments created - seg1, seg2 and seg3.

Segment "seg1" is enabled for Frame Delay measurement. Segment "seg3" has 10 MEPs added with 4 enabled for Frame Loss measurement, the following are the valid counts. Switch wide "Total Configured Segments" will be 3 and "Total Active Segments" will be 2. For Segments "seg1" and "seg2", "Total Configured MEPs" and "Total Active MEPs" will be 0. For segment "seg3", "Total Configured MEPs" will be 10 and "Total Active MEPs" will be 4.

By default, both the Frame Delay and Frame Loss sections are displayed for all the CFM segments. The user has option to filter out based on Segment Name or Frame Delay / Frame Loss.

The behavior for each of the optional parameters is explained below:

- `show cfm segment`: Displays frame-delay and frame-loss information for all the CFM segments.
- `show cfm segment` *`segment_name`*: Displays frame-delay and frame-loss information for the given CFM segment.
- `show cfm segment frame-delay`: Displays frame-delay information for all the CFM segments.
- `show cfm segment frame-delay` *`segment_name`*: Displays frame-delay information for the given CFM segment.
- `show cfm segment frame-loss`: Displays frame-loss information for all the CFM segments (and all the MEPs under each of the segment).
- `show cfm segment frame-loss` *`segment_name`*: Displays frame-loss information for the given CFM segment (and all the MEPs under the given segment).
- `show cfm segment frame-loss` *`segment_name`* **`mep`** *`mep_id`*: Displays frame-loss information for the given CFM segment - MEP ID combination.

Example

```
Switch#show cfm segment sc-rtp

```

History

This command was first available in ExtremeXOS 12.3.

The **mep id** show output was added in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm segment frame-loss statistics

```
show cfm segment frame-loss statistics {segment-name}
```

Description

Displays shows frame-loss statistics.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

The below output is an example for displaying the frame-loss stats for the cfm segments. This command shows the recent, minimum, maximum and average near-end and far-end frame loss ratios during the current transmission. The stats for a particular segment will be preserved till the user triggers the next LMM transmission or until it does a clear counter.

Example

The following command displays the frame loss statistics for the CFM segment:

```
LEFT.93 # show cfm segment frame-loss statistics
-----------------------------------------------------------------
Segment Name       MEP     Last   Last    Min   Max   Min   Max   Mean

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm segment frame-loss

```
show cfm segment frame-loss {segment_name}
```

Description

This command displays frame-loss information for the given CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to display frame-delay information for the given CFM segment.

Example

```
sho cfm seg frame-loss
CFM Segment Name                : cs2
Domain Name                     : dom2
Association                     : a2
MD Level                        : 2

#
#
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm segment mep

```
show cfm segment {segment_name} {mep mep_id }
```

Description

This command displays frame-delay information for the given CFM segment – MEP ID combination.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to display frame-delay information for the given CFM segment – MEP ID combination.

Example

```
Switch#showcfm segment sc-rtp
CFM Segment Name              : sc-rtp
Domain Name                   : pbt-d2

-------------------------------------------------------
Total Configured Segments       : 1
Total Active Segments           : 1
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm segment

```
show cfm segment {segment_name}
```

Description

Displays information for CFM segments.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to display information for the selected CFM segment.

If a segment name is not specified, the information for all of the segments that are currently configured are displayed.

Example

The following command displays information for an active CFM segment that is configured to transmit with a specific count:

```
show cfm segment s2
CFM Segment Name                : s2
Domain Name                     : pbt-d2
Association                     : pbt-d2-protecting
MD Level                        : 2
Destination MAC                 : 00:04:96:1e:14:70
DMM Transmission                : In Progress
Transmission mode               : Continuous
Frames Transmitted              : 2
Frames Received                 : 2
DMM TX Interval                 : 2secs
DMR RX Timeout                  : 10 msec
Alarm Threshold                 : 10 %
Clear Threshold                 : 95 %
Measurement Window Size         : 60
Class of Service                : 0
Tx Start Time                   : Sun Apr 19 21:18:58 2009
Min Delay                       : Sun Apr 19 21:18:58 2009
Max Delay                       : Sun Apr 19 21:19:00 2009
Last Alarm Time                 : None
Alarm State                     : Not Set
Lost Frames in Current window   : 0
-------------------------------------------------------
Total Configured Segments       : 2
Total Active Segments           : 1
```

The following command displays information for a disabled segment:

```
BD-12804.1 # sh cfm seg s2
CFM Segment Name                : s2
Domain Name                     : pbt-d2
Association                     : pbt-d2-protecting
MD Level                        : 2
Destination MAC                 : 00:04:96:1e:14:70
DMM Transmission                : Disabled
Frames Transmitted              : 10
Frames Received                 : 10
DMM TX Interval                 : 2secs
DMR RX Timeout                  : 10 msec
Alarm Threshold                 : 10 %
Clear Threshold                 : 95 %
Measurement Window Size         : 60
Class of Service                : 0
Tx Start Time                   : Sat Apr 18 05:39:54 2000
Min Delay                       : Sat Apr 18 05:40:12 2000
Max Delay                       : Sat Apr 18 05:39:56 2000
Last Alarm Time                 : None
Alarm State                     : Not Set
Lost Frames in Current window   : 1
-------------------------------------------------------
Total Configured Segments       : 2
Total Active Segments           : 0
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm session counters missed-hellos

```
show cfm session counters missed-hellos { domain_name { association_name
   { {ports port_list} { end-point [up|down] } } } } {history | no-
   refresh | refresh}
```

Description

This command displays current and historical CFM session missed-hellos statistics.

Syntax Description

domain_name	IEEE 802.1ag domain name.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
ports	Specifiy ports to show.
port_list	List of ports to show.
end-point	Show MEPs (Maintenance association End Point).
up	End point is up.
down	End point is down.
history	Historical set of bins.
no-refresh	Page by page display without continuous refresh.
refresh	Continuous refresh of output.

Default

Refresh.

Usage Guidelines

None.

Example

The following example show the current statistics with no-refresh:

```
# show cfm session counters missed-hellos no-refresh
         1         2         3         4         5         6         7         8

       0->Clear Counters  U->page up  D->page down ESC->exit
#
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cfm

```
show cfm { domain_name { association_name {{ports port_list
   {[intermediate-point | [end-point [up|down]]]}}}
```

Description

Displays the current CFM configuration on the switch.

Syntax Description

domain_name	Enter the name of the domain you want to display.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Enter the ports in the domain and association you want to display.
up	Enter this to display the UP MEP for the specified MA.
down	Enter this to display the DOWN MEP for the specified MA.
intermediate-point	Enter this to display the MIPs for the specified MA.

Default

N/A.

Usage Guidelines

This command displays the following information:

- Domain names
- MA levels
- Association names
- *VLAN* names
- Transmit Interval
- UP MEPs
- MEPIDs
- MEP transmit intervals
- MEP State
- DOWN MEPs
- Intermediate points (MIPs)
- Total number of CFM ports on the switch
- Destination MAC Type
- VPLS-based MPs
- Sender ID information
- ISID Intermediate Point

For the number of domains, ports, MEPs, MIPs, and associations supported on the switch, see the *Supported Instances for CFM* section in the *Switch Engine 32.2 User Guide*.

Example

The `show cfm` command displays the current CFM configuration on the switch:

```
* switch # show cfm
Domain: "dnsname", MD Level: 2
    Association: "10", Destination MAC Type: Multicast, VLAN "v1" with 2 cfm ports
    Transmit Interval: 1000 ms,  Type : IEEE 802.1ag Maintenance Association
        port 1; Up End Point,   mepid: 100, transmit-interval: 1000 ms (from association)
```

```
                MEP State: Enabled, CCM Message: Enabled, Send SenderId TLV:

          Remote : Not receiving CCMs from Remote MEP
          Error  : Erroneous CCM received
          XCON   : Cross-connect CCM received
          RDI    : Remote Defect Indication sent by some MEP
```

History

This command was first available in ExtremeXOS 11.4.

Transmit Interval and MEP State were added in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show checkpoint-data

```
show checkpoint-data {process}
```

Description

Displays the status of one or more processes being copied from the master node to the backup node.

Syntax Description

process	Specifies the name of the processes being copied.

Default

N/A.

Usage Guidelines

This command displays, in percentages, the amount of internal state copying completed by each process and the traffic statistics between the process on both the master and the backup nodes.

This command is also helpful in debugging synchronization problems that occur at run-time. To check the status of synchronizing the nodes, use the `show switch` command.

Depending on the software version running on your switch and the type of switch you have, additional or different checkpoint status information may be displayed.

Example

The following command displays the checkpointing status and the traffic statics of all of the processes between the master and the backup nodes:

```
# show checkpoint-data
Process          Tx     Rx  Errors    Sent  Total     % Chkpt    Debug-info
-------------------------------------------------------------------------------
devmgr         3812   1731       0       3      3  100% ON  OK   1 (00008853)
dirser            0      0       0       0      0    0% ON  OK   1 (000008D3)
ems               5      0       0       0      0  100% ON  OK   1 (000008D3)

Flags : S - Server started, c - Client started, D - Checkpoint dependency satisfied
        C - Checkpointing is ON, f - No config dependency, N - DMLIB not in sync
        R - CM Backend not ready, l - Process is loading config, L - Process config is
loaded
        I - IPML connection alive, n - Backup process not in sync with Primary process
```

To view the output for a specific process, use the process option. The following command displays detailed information for the *STP* process:

```
# show checkpoint-data stp
Process          Tx     Rx  Errors   Sent  Total     % Chkpt    Debug-info
-------------------------------------------------------------------------------
stp               1      0       0      0      0    0% ON  OK   1 (000008D3)
```

History

This command was first available in ExtremeXOS 10.1.

An error count was added to the output in ExtremeXOS 11.1.

IPML connection alive flag added in ExtremeXOS 22.5.

The "n" flag for the backup process being out of sync was added in ExtremeXOS 31.1.

Platform Availability

This command is available only on SummitStack.

show clear-flow

```
show clear-flow
```

Description

Displays the status of the CLEAR-Flow agent, any CLEAR-Flow policies on each interface, and the number of CLEAR-Flow rules.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following display shows output for the command show clear-flow:

```
clear-flow: Enabled
VLAN         Port   Policy Name          No. of CF Rules
=============================================================
*            2:1    CFexample            6
*            2:26   CFexample            6
*            2:40   CFexample            6
Default      *      CFexample            6
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

VLAN

show clear-flow acl-modified

```
show clear-flow acl-modified
```

Description

Displays the ACLs modified by CLEAR-Flow actions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the ACLs that have been modified by CLEAR-Flow rules that have been triggered.

Example

The following display shows output for the command show clear-flow acl-modified:

```
Policy Name     Vlan Name       Port Rule Name         Default ACL     CF Added
Actions         Actions
================================================================================
clearFlow       *               2:26 acl-rule-4        D               QP1
clearFlow       *               2:26 acl-rule-3        D               D
clearFlow       *               2:26 acl-rule-2        D               M
clearFlow       *               2:26 acl-rule-1                        P
clearFlow       Default         *    acl-rule-4        D               QP1
clearFlow       Default         *    acl-rule-3        D               D
clearFlow       Default         *    acl-rule-2        D               M
clearFlow       Default         *    acl-rule-1                        P
================================================================================
Total Entries: 8
Notation:
P - Permit, D- Deny, M - mirror enabled, m - mirror disabled
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

VLAN

show clear-flow rule

```
show clear-flow [port port | vlan vlanname | any] {rule rulename}
   {detail}
```

Description

Displays the CLEAR-Flow rules, values, and configuration.

Syntax Description

port	Specifies the port.
vlanname	Specifies the *VLAN*.
any	Specifies the wildcard interface.
rulename	Specifies the entry name of a CLEAR-Flow rule.
detail	Display detailed information.

Default

N/A.

Usage Guidelines

If you issue the command without the rule keyword, all of the CLEAR-Flow rules for the policy on the port, VLAN, and the wildcard are displayed. If you specify a rule name, only that rule will be displayed. The detail keyword displays detailed information about the rule.

Example

The following display shows output for the command show clear-flow port 2:6:

```
Rule Name      Type Period   Last           Rel  Threshold      TCNT  NumAction
Value          Oper                      If   Else
================================================================================
rule-count       CN 30       16892762       >    100            7     3    3
rule-delta       DT 30       7762385        >    1000           1     4    3
rule-delta-2     DT 5        0              >    1000           0     4    3
rule-delta-ratio DR 30       0              >    20             0     2    0
rule-ratio       RT 30       0              >    10             0     3    3
rule-ratio-2     RT 5        0              >    10             0     3    3
================================================================================
Total Entries: 6
Notation:
Threshold Type: CN - Count, DT - Delta, RT - Ratio, DR - DeltaRatio
TCNT - Number of times expression is continously evaluated to be true
```

The following display shows output for the command show clear-flow port 2:6 rule rule-delta detail:

```
Rule Name: rule-delta       Sample Period: 30       Hysteresis: 20
================================================================================
DELTA(counter1) = 0 sampled at 24 seconds ago
Expression evaluation is currently FALSE
if (DELTA(counter1) > 1000) then {

} else {
DENY:     Block ACL rule acl-rule-3
QOS:      Set rule acl-rule-4 qos value to QP1
CLI:      [enable port $port]
}
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

VLAN

show clear-flow rule-all

```
show clear-flow rule-all
```

Description

Displays all the CLEAR-Flow rules on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following display shows output for the command show clear-flow rule-all:

```
Policy Name    Vlan Name      Port Rule Name  Last Value OP Threshold  TCNT Sec
================================================================================
clearFlow      *              2:1  rule-count 1          >  100        0    11

```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

VLAN

show clear-flow rule-triggered

```
show clear-flow rule-triggered
```

Description

Displays the triggered CLEAR-Flow rules.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the rules that have been triggered; in other words, the rule threshold has been reached.

Example

The following display shows output for the command show clear-flow rule-triggered:

```
Policy Name    Vlan Name      Port Rule Name  Last Value OP Threshold  TCNT Sec
================================================================================
clearFlow      *              2:26 rule-count 9130377    >  100        2    25
clearFlow      *              2:26 rule-delta 99742      >  1000       2    25
clearFlow      Default        *    rule-count 37069465   >  100        2    25
clearFlow      Default        *    rule-delta 403026     >  1000       2    25
================================================================================
Total Entries: 4
Notation:
TCNT - Number of times expression is continously evaluated to be true
Sec - Number of seconds elapsed from last sampled data
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

VLAN

show cli journal

```
show cli journal
```

Description

This command shows the historical list (journal) of the most recently executed CLI commands.

Syntax Description

This command has no arguments or variables.

Default

By default, one hundred commands are preserved in the journal.

Usage Guidelines

The journal retains as many as 200 of the most recently executed commands along with the timestamp and user name. Commands are saved even after logging off, rebooting, or switch crashes.

To set the size (number of commands) of the journal, use the `configure cli` **`journal size`** *`size`* command.

Example

The following is sample output from the command:

```
Timestamp              Session    User Name                        Command
---------------------- ---------- -------------------------------

```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show configuration

```
show configuration {module-name} {detail}
```

Description

Displays the current configuration for the system or the specified module.

Syntax Description

module-name	Specifies the name of configuration module. The term configuration module refers to feature in ExtremeXOS. By displaying a module, you can view the commands used to configure that feature. For example, to display all of the configurations that you made for only *STP*, specify the stp as the module-name.
detail	Displays configuration data including default. If the detail option is not specified, only the configuration changes you made to the factory defaults are shown.

Default

N/A.

Usage Guidelines

If the output scrolls off the top of the screen, you can use the `enable clipaging` command to pause the display when the output fills the screen. The default for clipaging is enabled.

These files have the .cfg file extension. Do not use a text editor to view or modify your XML-based switch configuration files.

To save the configuration file as an ASCII-formatted file, and to view it with a text editor, see the `upload configuration [hostname | ipaddress] filename {vr vr-name}` and the `load script filename {arg1} {arg2} ... {arg9}` commands.

Beginning with ExtremeXOS 12.1, when you specify `show configuration` only, the switch displays configuration information for each of the switch modules excluding the default data.

You can display only the configuration of a module of interest by using the module-name keyword. For example, some of the modules are AAA, *ACL*, *BGP*, *EDP*, *FDB*, *SNMP*, and *VLAN*. Use [TAB]-completion to see a list.

You must have administrator access to view the output of the `show configuration` command.

Depending on the software version running on your switch, the configurations on your switch, and the type of switch you have, additional or different configuration information may appear.

Loading ARP and neighbor discovery (ND) configurations from versions earlier than ExtremeXOS 30.1 after upgrading to ExtremeXOS 30.1, abide by the following rules:

- The number of static ARP/ND entries configured in all VRs (default + Mgmt + user VRs) do not exceed the new global max. entries.
- The number of static proxy entries configured in all VRs do not exceed the new global max. proxy entries.
- The sum of (per VR configured limits of VR-default + default limit of VR-Mgmt) do not exceed the respective new max. global limit.
- ExtremeXOS ignores pre-30.1 user VR configured limits in 30.1.
- ExtremeXOS logs any static entry restoration failures after they exceed new global limits.

The output of `show configuration fdb` after upgrading to ExtremeXOS 30.1 differs from 22.x output because of the changes in per VR-based IPARP and ND configurations (see examples below).

Example

The following example shows the current configuration of the *OSPF* module on the switch:

```
# show configuration ospf
# Module ospf configuration.
#
configure ospf routerid automatic
configure ospf spf-hold-time 3
configure ospf metric-table 10M 10 100M 5 1G 4 10G 2
configure ospf lsa-batch-interval 30
configure ospf import-policy none
configure ospf ase-limit 0
disable ospf originate-default
disable ospf use-ip-router-alert
disable ospf
configure ospf restart none
configure ospf restart grace-period 120
disable ospf export direct
disable ospf export static
disable ospf export rip
disable ospf export e-bgp
disable ospf export i-bgp
configure ospf area 0.0.0.0 external-filter none
configure ospf area 0.0.0.0 interarea-filter none
```

The following example illustrates the difference between ExtremeXOS 30.1 versus 22.x output for *FDB*.

Example 1

22.x

```
# show configuration fdb detail
configure iparp vr VR-Default max_entries 8192
configure iparp vr VR-Mgmt max_entries 4096
configure neighbor-discovery vr VR-Default max_entries 4096
configure neighbor-discovery vr VR-Mgmt max_entries 4096
```

30.1 and Later

```
# show configuration fdb detail
configure iparp max_entries 12288  ---- > Default values of (VR-Default + VR-Mgmt) = 8192
```

```
+ 4096
configure neighbor-discovery max_entries 8192
```

Example 1

22.x

```
# show configuration fdb
configure iparp vr VR-Default max_entries 10000
configure iparp vr VR-Default max_pending_entries 10
configure iparp vr VR-Default max_proxy_entries 10
configure iparp vr VR-Mgmt max_entries 2000
configure iparp vr VR-Mgmt max_pending_entries 20
configure iparp vr VR-Mgmt max_proxy_entries 20
configure iparp vr vr1 max_entries 3000
configure iparp vr vr1 max_pending_entries 30
configure iparp vr vr1 max_proxy_entries 30
configure neighbor-discovery vr VR-Default max_entries 10000
configure neighbor-discovery vr VR-Default max_pending_entries 100
configure neighbor-discovery vr VR-Mgmt max_entries 1000
configure neighbor-discovery vr VR-Mgmt max_pending_entries 10
configure neighbor-discovery vr vr1 max_entries 60
configure neighbor-discovery vr vr1 max_pending_entries 70
```

30.1 and Later

```
# show configuration fdb
configure iparp max_entries 14096  ---------  max_entries = (Configured VR-Default
max_entries) + (Default VR-Mgmt max_entries) = 10000 + 4096
configure iparp max_pending_entries 266 --------  max_pending_entries = (Configured VR-
Default max_pending_entries) + (Default VR-Mgmt max_ pending_entries) = 10 + 256
configure iparp max_proxy_entries 266 --------  max_proxy_entries = (Configured VR-
Default max_proxy_entries) + (Default VR-Mgmt max_ proxy_entries) = 10 + 256
configure neighbor-discovery max_entries 14096 -------- max_entries = (Configured VR-
Default max_entries) + (Default VR-Mgmt max_entries) = 10000 + 4096
configure neighbor-discovery max_pending_entries 1124 -------- max_pending_entries =
(Configured VR-Default max_pending_entries) + (Default VR-Mgmt max_ pending_entries) =
100 + 1024
```

Example 1

22.x

```
# show configuration fdb
#
# Module fdb configuration.
#
configure iparp vr VR-Default max_entries 10000
configure iparp vr VR-Mgmt max_entries 1000
configure iparp vr vr-user1 max_entries 2000
configure iparp add 20.0.0.100 vr VR-Default 00:0a:0b:0c:0d:0e
configure iparp add 10.68.13.100 vr VR-Mgmt 00:66:77:88:99:aa
configure iparp add 100.0.0.150 vr vr-user 00:11:22:33:44:55
```

30.1 and Later

```
# show configuration fdb
#
# Module fdb configuration.
#
configure iparp max_entries 14096 --- max. limit of one current global table of kernel
configure iparp add 20.0.0.100 vr VR-Default 00:0a:0b:0c:0d:0e ---
configure iparp add 10.68.13.100 vr VR-Mgmt 00:66:77:88:99:aa | --- All static entries of
```

```
all VRs are restored back as long as they do not exceed current max limit.
configure iparp add 100.0.0.150 vr vr-user 00:11:22:33:44:55 --- Once they exceed the
limit, rest of the entries will be discarded and logged as failures.
```

History

This command was first available in ExtremeXOS 11.0.

The detail variable was added in ExtremeXOS 12.1.

The display of blackhole output was first available in ExtremeXOS 12.1.

Impacts to ARP, ND, and FDB output introduced in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show configuration difference

```
show configuration difference { from-config-file {to-config-file} }
   {module-name} {detail} {context lines}
```

Description

Displays the difference between switch configurations.

Syntax Description

difference	Compare one configuration file to another.
from-config-file	Configuration file from which to base the difference (the booted configuration if not specified).
to-config-file	Configuration file to which the base configuration is compared (the running configuration if not specified).
module-name	Configuration module name: aaa, acl, bfd, bgp, brm, cfgmgr, cfm, devmgr, dirser, dosprotect, eaps, edp, elrp, elsm, ems, epm, erps, esrp, ethoam, etmon, exsshd, fdb, hal, hclag, idMgr, ipfix, ipSecurity, lacp, lldp, mcmgr, mrp, msdp, netlogin, nettools, nodealias, nodemgr, ntp, ospf, ospfv3, otm, pim, policy, polMgr, pwmib, rip, ripng, rtmgr, snmp, stp, techSupport, telnetd, tftpd, throw, thttpd, twamp, upm, vlan, vmt, vrrp, vsm, xmlc, xmldbe
detail	Specifies showing configuration difference including default configuration choices; If not selected, default configuration information does not appear.
context	Adjusts the number of context lines around the difference output. Default is three lines.
lines	Specifies the number of context lines around the difference output. Default is three lines.

Default

If not specified, *from-config-file* is the booted configuration; if not specified, *to-config-file* is the running configuration.

If not specified, the default is three context lines.

Usage Guidelines

Use this command to compare the difference between two configuration files, or configuration files with the running configuration. When using the `save configuration` **automatic** {**every** *minutes* {**primary** | **secondary** | *existing-config* | *new-config*} | **never**} command this can be especially helpful for comparing what changed between the running (or "startup") configuration and the most recently autosaved configuration.

Example

The following example compares the factory default configuration (new switch or after `unconfigure switch` {**all** | **erase** [**all** | **nvram**]} using the **all** keyword:

```
# show configuration difference
--- Factory Default             Tue Feb 27 19:54:10 2018
+++ Running Configuration       Wed Feb 28 12:37:36 2018
@@ -0,0 +1,212 @@
+#
+# Module devmgr configuration.
+#
+configure snmp sysContact "support@extremenetworks.com, +1 888 257 3000"
+#
+# Module vlan configuration.
+#
+create vlan "VLAN_0008"
+configure vlan VLAN_0008 tag 8
.
.
.
+#
+# Module vsm configuration.
+#
```

The following example compares the `primary.cfg` file with the currently running configuration (default) showing default configuration information (**detail** option) and changing the number of context lines to six (as opposed to the default of three):

```
# show configuration difference primary detail context 6
--- primary.cfg                 Mon Dec  4 18:08:59 2017
+++ Running Configuration       Mon Dec  4 18:11:45 2017

#
# Module dosprotect configuration.
```

```
#
disable dos-protect
configure dos-protect interval 1
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show configuration “xmlc”

```
show configuration "xmlc" {detail | non-persistent {detail}}
```

Description

Displays the configuration of an XMLC module.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Displays the configuration of an XMLC module.

When the detail option is chosen, all configuration data including the default is displayed. Otherwise the default would not be displayed.

When the non-persistent option is chosen, UPM non-persistent configuration data is displayed.

Example

The following command displays the xmlc configuration:

```
show configuration “xmlc” detail
```

Following is sample output from this command:

```
Module xmlc configuration.
#
create xml-notification target test url http://10.255.42.73:9080/axis/services/eventPort
configure xml-notification test queue-size 100
disable xml-notification test
```

```
create xml-notification target test2 url http://10.255.42.48:9080/axis/services/eventPort
configure xml-notification test2 queue-size 100
enable xml-notification test2
create xml-notification target epicenter-target url http://10.255.42.48:8080/xos/
webservice
configure xml-notification target epicenter-target user admin encrypted-auth
YWRtaW46ZXBpY2VudGVy
configure xml-notification epicenter-target queue-size 100
enable xml-notification epicenter-target
configure xml-notification target test add idMgr
configure xml-notification target test2 add idMgr
configure xml-notification target epicenter-target add idMgr
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cos-index

```
show cos-index {cos_index}
```

Description

This command displays a one-to-one mapping of *CoS* reference to resource.

Syntax Description

cos-index	Class of Service (CoS) index value.

Default

N/A.

Usage Guidelines

None

Example

```
# show cos-index
            QOS        TOS   TOS    Ingress
COS Index  Profile   Value  Mask    Meter
---------  -------  ------  ----  ----------
        0  qp0          --    --   --
        1  qp1          64 0xfc  ingmeter2
        2  qp2          --    --  ingmeter15
        3  qp3          --    --  ingmeter2
        4  qp4          32 0xfc  ingmeter12
```

```
        5  qp5          --   --  --
        6  qp6          --   --  --
        7  qp7          --   --  --
       32  qp4          --   --  --
      255  qp6          --   --  ingmeter3
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show counters vr

```
show counters vr {vpn-vrf-name}
```

Description

Displays statistics information about VPN VRF operation.

Syntax Description

vpn-vrf-name	Specifies the name of a VPN VRF.

Default

N/A.

Usage Guidelines

This command displays counters that show:

- The total number of IP unicast and multicast routes.
- Route add operation count.
- Route delete operation count.
- Routes dropped count.

Note
The total route count displayed for this command can exceed the total route count displayed by the `show iproute` command because the `show iproute` command displays either unicast or multicast routes, but not both.

This command is supported only on VPN VRFs.

Example

The following example displays the counters for VPN VRF "red":

```
Switch.19 # show counters vr red
Num of Current Routes: 4            Num of Routes Dropped: 0
Num of Route Add:      12           Num of Route Del:      6
Num of Current Routes: 10           Num of Routes Dropped: 0
Num of Route Add:      5             Num of Route Del:      2
```

History

This command was introduced in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show cpu-monitoring

```
show cpu-monitoring {process name}
```

Description

Displays the CPU utilization history of one or more processes.

Syntax Description

name	Specifies the name of the process.

Default

N/A.

Usage Guidelines

Viewing statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. This way, statistics can help you get the best out of your network.

By default, CPU monitoring is enabled and occurs every 5 seconds. The default CPU threshold value is 90%.

This information may be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch or your switch model, additional or different CPU and process information might be displayed.

SummitStack Only

When you issue the command with out any parameters:

- From the stack manager or backup node, the stack displays CPU utilization history for all the processes running on the master node and the backup node in the Active Topology.
- From the stack manager or a standby node, the stack displays CPU utilization history for all the processes running on the master node and the standby node in the Active Topology.

Modular Switches Only

Reading the Output

The show cpu-monitoring command is helpful for understanding the behavior of a process over an extended period of time. The following information appears in a tabular format:

- Process—The name of the process.
- Range of time (5 seconds, 10 seconds, and so forth)—The CPU utilization history of the process or the system. The CPU utilization history goes back only 1 hour.
- Total User/System CPU Usage—The amount of time recorded in seconds that the process spends occupying CPU resources. The values are cumulative meaning that the values are displayed as long as the system is running. You can use this information for debugging purposes to see where the process spends the most amount of time: user context or system context.

Example

The following example displays CPU utilization on the switch:

```
show cpu-monitoring
```

The following is sample output from a switch:

```
CPU Utilization Statistics - Monitored every 25 seconds
-------------------------------------------------------------------------

```

History

This command was first available in an ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show database

```
show database database_name
```

Description

Shows information about all servers configured for Automation Edge remote *VXLAN* network identifier (VNI)-device databases.

Syntax Description

database	Shows database information.
database_name	Shows database information for the specific named database.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example shows server information for all databases:

```
# show database
Retries : 3
-----------------------------------------------------------------
Database Name
    Server                                    Port Flags
-----------------------------------------------------------------
NewsroomNetwork1
    2001:0db8:85a3:0000:0000:8a2e:0370:7334  5456 C----
    CastleBlack                              34344 D----
    10.10.10.10                              12345 C----
NewsroomNetwork2
    3001:0db8:85a3:0000:0000:8a2e:0370:7334  5456 C----
    EastWatch                                34344 D----
    10.10.10.12                              12345 T----
-----------------------------------------------------------------
Flags : (C) Connected, (D) Disconnected, (T) Timed out.
```

The following example shows server information for the database "NewsroomNetwork1":

```
# show database NewsroomNetwork1
Database : NewsroomNetwork1                          Retry : 3
    Server: 2001:0db8:85a3:0000:0000:8a2e:0370:7334 Port  : 5456
    Status: DOWN
        Last connect   : Tue Sep 10 20:22:48 UTC 2019
```

```
        Last disconnect: Tue Sep 10 20:22:48 UTC 2019
        # Disconnects  : 2
    Server: EastWatch                              Port  : 34245
    Status: UP
        Last connect   : Tue Sep 10 20:22:48 UTC 2019
        Last disconnect: Tue Sep 10 20:22:48 UTC 2019
        # Disconnects  : 5
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on the ExtremeSwitching 5520 platform.

show debug

```
show debug
```

Description

This command displays whether the writing of core dump files is enabled or disabled and whether the files are written to internal memory, a compact flash card, or a USB 2.0 storage device.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

By default, the switch writes core dump files to the internal memory card. To change the default configuration, use the `configure debug core-dumps [ off | directory_path]` command.

Example

The following example shows that the switch is configured to send core dump files to the internal memory card:

```
Switch.2 # show debug
Debug Settings:
    Core dumps: Enabled (/usr/local/tmp)
```

The following example shows that the sending core dump files is disabled:

```
Switch.99 # show debug
Debug Settings:
    Core dumps: Disabled
```

The following example shows that the switch is configured to send core dump files to a compact flash card or USB 2.0 storage device:

```
Switch.76 # show debug
Debug Settings:
    Core dumps: Enabled (/usr/local/ext)
```

History

This command was first available in ExtremeXOS 11.1.

Support for the internal memory card was added in ExtremeXOS 11.2.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

The output was changed to show a directory path ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dhcp-client state

```
show dhcp-client {ipv4 | ipv6} state {vlan}
```

Description

Displays the current *DHCP*/BOOTP client state for each vlan.

Syntax Description

This command has no arguments or variables.

Default

If the IPv4 or IPv6 keyword is not specified, IPv4 is the default.

Usage Guidelines

None.

Example

The following command displays the DHCP/BOOTP status for all VLANs:

```
show dhcp-client state
```

Depending on your configurations, output from this command is similar to the following:

```
# sh dhcp-client ipv6 state v3
Client VLAN                     : v3
Client Type                     : Stateful
Identity Association Type       : IA-NA
                    IA-NA       : Identity Association for Non-Temporary
Addresses
Identity Association Identifier : 96:7e:1f:5a
Client IP Address               : 2001::550b:ebf8:d0b8:9a8
Client Identifier Type          : Link-Layer Address Plus Time
Client Identifier               : 00:01:00:01:1a:85:0a:bd:00:04:96:7e:1a:5a:00:00
Server Identifier               : 00:01:00:01:13:e0:f4:93:00:11:43:c0:06:50
State                           : Bound

Identity Association Types:
    IA-NA - Identity Association for Non-Temporary Addresses,
    IA-TA- Identity Association for Temporary Addresses.
```

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 15.6 to include the **ipv4** and **ipv6** keywords.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dhcp-server

```
show dhcp-server {vlan vlan_name}
```

Description

Displays the *DHCP* server's configuration and address allocation on a specified *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN of the DHCP server of interest.

Default

N/A.

Usage Guidelines

If no VLAN is specified, the configuration and address allocation for the servers on all the VLANs is displayed.

Example

The following command displays the configuration and address allocation for the DHCP server for the VLAN test:

```
show dhcp-server vlan test
```

The following is sample output from this command:

```
# show dhcp-server
VLAN "Default":
DHCP Address Range   : Not configured
Netlogin Lease Timer : Not configured (Default = 10 seconds)
DHCP Lease Timer     : Not configured (Default = 7200 seconds)
DHCP Option Code  12 : hex "11:22:33:44:45"
DHCP Option Code  69 : ipaddress 10.0.0.1 10.0.0.2
Ports DHCP Enabled   : No ports enabled
```

History

This command was first available in ExtremeXOS 11.0.

The output is modified to show primary and secondary DNS servers in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show diagnostics

```
show diagnostics {slot [slot_number]}
```

Description

Displays the status of the last diagnostic test run on the switch.

Syntax Description

slot	Specifies which node to display diagnostic status information on.
slot_number	Specifies the slot number of the node on which you need to run the diagnostics. Values can be from 1 to 8.

Default

N/A.

Usage Guidelines

Use this command to display information from the last diagnostic test run on the switch.

To run diagnostics on a switch in a stack, you need to remove the node from the stacking mode, restart the node, and then run the diagnostics locally on the node. You can see the latest diagnostics results from the Master node of a stack after the node has rejoined the stack.

Output

The switch displays the following diagnostic information:

If you have run diagnostics, information includes the:

- Date the test was run—The month, date, and year.
- Last Test Version—The ExtremeXOS version associated with the results.
- Test data—If the diagnostic test failed, the switch displays the name of the failed test. The switch displays a message similar to the following:MAC memory test failed
- Summary—A brief summary of the overall diagnostic test. Options are:
  - Diagnostics Pass—The diagnostic test has passed.
  - Diagnostics Fail—One or more diagnostic tests have failed.

If you have never run diagnostics on the switch or stack ports, the switch displays a message similar to the following:

```
Result: FAIL
Test date run is invalid. Please run Diagnostics.
Error reading diagnostics information.
```

This message is normal and expected if you have never run diagnostics on the switch. After you run diagnostics, you should see information about the executed test.

Running Diagnostics

To run diagnostics, use the following command:

`run diagnostics [extended | normal | stack-port]`

Depending on the software version running on your switch or your switch model, additional or different diagnostic information might be displayed. For more information, see the command `run diagnostics`.

Example

The following command displays the results of the switch diagnostics:

```
show diagnostics
```

The following is sample output from this command:

```
Last Test Date: May-04-2006
Last Test Version: 12.3.0.1
Summary: Diagnostics Pass
```

When the version is unknown, Last Test Version reads “Unknown.”

History

This command was available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show diffserv examination

```
show diffserv examination
```

Description

Displays the DiffServ-to-QoS profile mapping.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Once you alter the default mappings, the “->” in the display (shown below) becomes “* >”.

Example

Because the SummitStack and ExtremeSwitching series switches have two default *QoS* profiles, you see different displays depending on the platform.

The following is sample output:

```
show diffserv examination
CodePoint->QOSProfile mapping:
00->QP1 01->QP1 02->QP1 03->QP1 04->QP1 05->QP1 06->QP1 07->QP1
08->QP1 09->QP1 10->QP1 11->QP1 12->QP1 13->QP1 14->QP1 15->QP1
16->QP1 17->QP1 18->QP1 19->QP1 20->QP1 21->QP1 22->QP1 23->QP1
24->QP1 25->QP1 26->QP1 27->QP1 28->QP1 29->QP1 30->QP1 31->QP1
32->QP1 33->QP1 34->QP1 35->QP1 36->QP1 37->QP1 38->QP1 39->QP1
40->QP1 41->QP1 42->QP1 43->QP1 44->QP1 45->QP1 46->QP1 47->QP1
48->QP1 49->QP1 50->QP1 51->QP1 52->QP1 53->QP1 54->QP1 55->QP1
56->QP8 57->QP8 58->QP8 59->QP8 60->QP8 61->QP8 62->QP8 63->QP8
```

History

This command was first available in ExtremeXOS 10.1.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show diffserv replacement

```
show diffserv replacement
```

Description

Displays the DiffServ replacement code-point values assigned to each *QoS* profile.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Once you alter the default mappings, the "->" in the display (shown below) becomes "* >".

Example

The following is sample output:

```
show diffserv replacement
QOSProfile->CodePoint mapping:
QP1->00
QP8->56
```

History

This command was first available in ExtremeXOS 10.1.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dns-client

```
show dns-client
```

Description

Displays the DNS configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the DNS configuration:

```
show dns-client
```

Output from this command looks similar to the following:

```
Number of domain suffixes: 2
Domain Suffix 1:        njudah.local
Domain Suffix 2:        dbackman.com
Number of name servers: 2
Name Server 1:  172.17.1.104
Name Server 2:  172.17.1.123
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dns cache analytics configuration

```
show dns cache analytics configuration {{vr} vr_name}
```

Description

Displays Domain Name System (DNS) analytics configuration.

Syntax Description

dns	Domain Network System.
cache	Specifies DNS cache.
analytics	Specifies showing DNS analytics information.
configuration	Specifies showing the DNS analytics configuration.
vr	Specifies the DNS analytics for a specific VR.
vr_name	Specifies the VR name. If not specified, the VR of the current command context is used.

Default

If not specified, the VR of the current command context is used.

Usage Guidelines

This command shows if DNS analytics is enabled and shows the configured maximum entries and timeout period.

Example

The following example shows the DNS analytics configuration for the current VR:

```
# show dns cache analytics configuration
DNS Cache Analytics : Enabled
Maximum Entries     : 10000
Timeout             : 1440
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dns cache analytics protected-client

show **dns cache analytics protected-client** {{**vr**} *vr_name*}

Description

Shows the Domain Name System (DNS) cache analytics protected client list for a virtual router (VR).

Syntax Description

dns	Domain Name System.
cache	Specifies showing DNS cache information.
analytics	Specifies showing DNS cache analytics information.
protected-client	Specifies showing the DNS cache analytics protected client list.
vr	Specifies the VR for the protected client list.
vr_name	Specifies the VR. If not specified, the VR of the current command context is used.

Default

If not specified, by default the VR of the current command context is used.

Usage Guidelines

None.

Example

The following example shows DNS analytics protected client list for VR "VR-Default":

```
# show dns cache analytics protected-client VR-Default
VR Name                          Client IP/Mask length
-------------------------------  ---------------------
VR-Default                       192.168.1.2/32
VR-Default                       192.168.3.0/32
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dns cache configuration

```
show dns cache configuration {{vlan} vlan_name | {vr} vr_name}
```

Description

Shows the Domain Name System (DNS) cache configuration (enabled or disabled) on a virtual router (VR) or *VLAN*.

Syntax Description

dns	Domain name system.
cache	Specifies showing the DNS cache information.
configuration	Specifies showing the DNS cache configuration (enabled or disabled).
vlan	Specifies showing the DNS cache configuration on a VLAN.
vlan_name	Specifies the VLAN name.
vr	Specifies showing the DNS configuration cache on a VR.
vr_name	Specifies the VR name. If not specified, the VR of the current command context is used.

Default

If no VR name is specified, the VR of the current command context is used.

Usage Guidelines

None.

Example

The following example shows the DNS cache configuration on VR "vrA":

```
# show dns cache configuration vrA
DNS Cache : Enabled on some VLANs of virtual router "vrA"
DNSSEC    : Enabled

VLAN                             DNS Cache Operational
-------------------------------- --------- -----------
vlanA1                           Enabled   Up
```

History

This command was first available in ExtremeXOS 30.3.

Domain Name System Security Extension (DNSSEC) status was added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dns cache analytics statistics

show **dns cache analytics statistics** {**client** *client_ip* **domain** *domain_name* } {**detail**} {{**vr**} *vr_name*}}

Description

Shows Domain Name System (DNS) cache analytics statistics for clients on a virtual router (VR).

Syntax Description

dns	Domain Name System.
cache	DNS cache.
analytics	Specifies showing information about the DNS cache analytics.
statistics	Specifies showing information about the DNS cache analytics statistics.
client	Specifies client statistics.
client_ip	Specifies which client by IP address.
domain	Specifies detailed domain.
domain_name	Specifies the domain.
detail	Displayed detailed statistics information.
vr	Specifies showing DNS cache analytics statistics on a VR.
vr_name	Specifies the VR name. If not specified, the VR of the current command context is used.

Default

If no VR name is specified, the VR of the current command context is used.

Usage Guidelines

This command displays DNS analytics statistics for a given VR. This command displays the total DNS queries received from clients, displaying IPv4 and IPv6 queries separately. For a specific client IP address, this command displays domain names queried by the client, number of DNS queries received for the domains, and the time stamp of the last received DNS query. Also, for a particular domain, it displays a detailed view of the specific domain with all the DNS query time stamps separately for IPv4 and IPv6.

Example

The following example shows DNS cache analytics statistics for all clients on the current VR:

```
# show dns cache analytics statistics
DNS Cache             : Enabled
DNS Cache Analytics   : Enabled

                                                 # IPv4      # IPv6
Client IP                                      Queries     Queries
---------------------------------------  ----------  ----------
10.127.2.251                                    21928        2682
```

The following example shows DNS cache analytics statistics for the client at IP address "1.1.1.1" at domain "wwww.aaaaa.com" on the current VR:

```
# show dns cache analytics statistics  client 1.1.1.1 domain www.aaaaa.com
DNS Cache           : Enabled
DNS Cache Analytics : Enabled

Domain Name                     Query Type       Query Time
```

```
------------------------------  --------------  ------------------------------
www.aaaaa.com                   IPv4 [A]        Thu Jan 15 06:56:07 1970
                                IPv4 [A]        Thu Jan 15 06:56:07 1970

Number of DNS IPv4 [A] Queries: 2
Number of DNS IPv6 [AAAA] Queries: 0

Flags: > - Indicates Domain Name is truncated past 44 characters.
```

The following example shows detailed DNS cache analytics statistics for the client at IP address "10.127.2.200" on the current VR:

```
# show dns cache analytics statistics client 10.127.2.200 detail
Domain Name          : geo.yahoo.com
# IPv4 Queries       : 1
# IPv6 Queries       : 0
Last IPv4 Query Time : Fri Jan  4 06:48:56 2019
Last IPv6 Query Time :

Domain Name          : acdn.adnxs.com
# IPv4 Queries       : 1
# IPv6 Queries       : 0
Last IPv4 Query Time : Fri Jan  4 06:48:59 2019
Last IPv6 Query Time :

Domain Name          : cdn.adnxs.com
# IPv4 Queries       : 1
# IPv6 Queries       : 0
Last IPv4 Query Time : Fri Jan  4 06:48:59 2019
Last IPv6 Query Time :

Domain Name          : sync.adaptv.advertising.com
# IPv4 Queries       : 1
# IPv6 Queries       : 0
Last IPv4 Query Time : Fri Jan  4 06:49:02 2019
Last IPv6 Query Time :

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dns cache

```
show dns cache {current} {detail}
```

Description

Shows Domain Name System (DNS) cache entries.

Syntax Description

dns	Domain Name System.
cache	Specifies showing DNS cache entries.
current	Retrieves the current entries rather than most recent cache. Using this option might take some time to display the output.
detail	Displays output without truncation.

Default

N/A.

Usage Guidelines

To clear the DNS cache, use the command `clear dns cache`.

Example

The following example shows DNS cache entries (truncated):

```
# show dns cache
Domain Name                  Address                              Flag  Expiry Time

```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dns cache name-server

```
show dns cache name-server
```

Description

Displays the Domain Name System (DNS) name server.

Syntax Description

dns	Domain Name System.
cache	Specifies viewing DNS name servers.
name-server	Specifies viewing DNS name servers.

Default

N/A.

Usage Guidelines

None.

Example

The following example shows DNS name servers:

```
# show dns cache name-server
Name Server 1: 1.1.1.2             VR: VR-Default
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dos-protect

```
show dos-protect {detail}
```

Description

Displays DoS protection configuration and state.

Syntax Description

detail	Specifies to display statistics in addition to configuration and state.

Default

N/A.

Usage Guidelines

Use this command to display the DoS protection settings. Using the detail option will also display the following cumulative statistics:

- trusted.
- notify.
- alerts.

Example

The following command displays the DoS protection settings for the switch:

```
show dos-protect
```

The following is sample output from this command:

```
dos-protect is disabled
dos-protect settings:
interval:         1   (measurement interval secs)
acl expire time:  5   (secs)
trusted ports:
no trusted ports configured
type L3-Protect:
notify threshold:   3500  (level to log a message)
alert threshold:    4000  (level to generate an ACL)
```

The following command displays detailed DoS protection settings for the switch:

```
show dos-protect detail
```

The following is sample output from this command:

```
dos-protect is enabled
dos-protect settings:
interval:         1   (measurement interval secs)
acl expire time:  5   (secs)
trusted ports:
1:2
type L3-Protect:
notify threshold:   3500  (level to log a message)
alert threshold:    4000  (level to generate an ACL)
dos-protect statistics:
trusted:   1301
notify:    0
alerts:    0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dot1p

```
show dot1p
```

Description

Displays the 802.1p-to-QoS profile mappings.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The SummitStack and ExtremeSwitching series switches have two default *QoS* profiles.

Following is sample output from the show dot1p command:

```
show dot1p
802.1p Priority Value     QOS Profile    Ingress Meter
         0                QP1            ingmeter0
         1                QP1            none
         2                QP1            ingmeter0
         3                QP1            ingmeter4
         4                QP1            ingmeter4
         5                QP1            ingmeter15
         6                QP1            none
         7                QP8            ingmeter8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show dwdm channel-map

```
show dwdm channel-map { channel_first { - channel_last } } {port
   port_num}
```

Description

Displays the channel scheme adopted for mapping the DWDM wavelengths.

Syntax Description

channel_first	Specifies the starting channel number.
channel_last	Specifies the ending channel number.
port_num	Specifies the port for which the status is to be displayed.

Default

N/A.

Usage Guidelines

Use this command to display the wavelength and the supportability of the channel by the optical module in the port.

Example

The following command displays information for channels 50 through 60 on port 3:1:

```
show dwdm channel-map 50 - 60 port 3:1
```

The following is sample output for this command:

```
================================================
Channel #     Wavelength (nm)    Port 3:1
================================================
50            1537.40          Supported
51            1536.61          Supported
52            1535.82          Supported
…             ……                   ……
58            1531.12          Supported
59            1530.33          Supported
60            1529.55          Supported
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show eaps

```
show eaps {eapsDomain} {detail}
```

Description

Displays *EAPS* status information.

Syntax Description

eapsDomain	Specifies the name of an EAPS domain.
detail	Specifies all available detail for each domain.

Default

N/A.

Usage Guidelines

If you enter the show eaps command without a keyword, the command displays less than with the detail keyword.

Use the optional eapsDomain parameter to display status information for a specific EAPS domain.

Some state values are different on a transit node than on a master node.

When you enter the show eaps command without a domain name, the switch displays the following fields:

EAPS Enabled:	Current state of EAPS on this switch: Yes—EAPS is enabled on the switch.No—EAPS is not enabled.
EAPS Fast Convergence:	Displays only when Fast Convergence is on.
EAPS Display Config Warnings:	Displays the setting for loop protection messages: On—Loop protection messages are displayed (this is the default behavior).Off—Loop protection messages are not displayed.
EAPS Multicast Add Ring Ports:	Displays the configuration of the multicast add-ring-ports feature as configured with the `configure eaps multicast add-ring-ports` command.
EAPS Multicast Send *IGMP* Query:	Displays the configuration of the multicast send-igmp-query feature as configured with the `configure eaps multicast send-igmp-query` command.
EAPS Multicast Temporary Flooding:	Displays the configuration of the multicast temporary-flooding feature as configured with the `configure eaps multicast temporary-flooding` command.

EAPS Multicast Temporary Flooding Duration:	Displays the duration configuration for the multicast temporary-flooding feature as configured with the `configure eaps multicast temporary-flooding duration` command.
Number of EAPS instances:	Number of EAPS domains created. The maximum number of EAPS domains per switch is 128.
Domain:	Entries in this column identify the name of an EAPS domain.
State:	On a transit node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete.Links-Up—This EAPS domain is running, and both its ports are up and in the FORWARDING state.Links-Down—This EAPS domain is running, but one or both of its ports are down.Preforwarding—This EAPS domain is running, and both of its ports are up, but one of them is in a temporary BLOCKED state. On a master node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete.Init—The EAPS domain has started but has not yet determined the status of the ring. The secondary port is in a BLOCKED state.Complete—The ring is in the COMPLETE state for this EAPS domain.Failed—There is a break in the ring for this EAPS domain.Pre-Init—The EAPS domain has started operation for Init state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from hardware layer indicating the operation is completed.Pre-Complete—The EAPS domain has started operation for Complete state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from the hardware layer indicating the operation is completed.[Failtimer Expired]—When the failtimer expires and it's action is set to send-alert, this flag is set. This flag indicates there is a misconfiguration or hardware problem in the EAPS ring. The EAPS master node continues to remain in COMPLETE or INIT state with it's secondary port blocking.
Mo:	The configured EAPS mode for this switch: transit (T) or master (M).
Primary/Secondary port:	The port numbers assigned as the EAPS primary and secondary ports. On the master node, the port distinction indicates which port is blocked to avoid a loop.
Prio	The EAPS domain priority, which is H for high priority or N for normal priority.

When you enter the show eaps command with a domain name or the detail keyword, the switch displays the following fields:

Name:	Identifies the EAPS domain displayed.
Priority	The EAPS domain priority, which is either High or Normal.

State:	On a transit node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete.Links-Up—This EAPS domain is running, and both its ports are up and in the FORWARDING state.Links-Down—This EAPS domain is running, but one or both of its ports are down.Preforwarding—This EAPS domain is running, and both of its ports are up, but one of them is in a temporary BLOCKED state. On a master node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete.Init—The EAPS domain has started but has not yet determined the status of the ring. The secondary port is in a BLOCKED state. Complete—The ring is in the COMPLETE state for this EAPS domain.Failed—There is a break in the ring for this EAPS domain. Pre-Init—The EAPS domain has started operation for Init state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from hardware layer indicating the operation is completed. Pre-Complete—The EAPS domain has started operation for Complete state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from the hardware layer indicating the operation is completed. [Failtimer Expired]—When the failtimer expires and it's action is set to send-alert, this flag is set. This flag indicates there is a misconfiguration or hardware problem in the EAPS ring. The EAPS master node continues to remain in COMPLETE or INIT state with it's secondary port blocking.
[Running: ...]	Yes—This EAPS domain is running. No—This EAPS domain is not running.
Enabled:	Indicates whether EAPS is enabled on this domain. Y—EAPS is enabled on this domain. N—EAPS is not enabled.
Mode:	The configured EAPS mode for this switch: transit (T) or master (M).
Primary/Secondary port:	The port numbers assigned as the EAPS primary and secondary ports. On the master node, the port distinction indicates which port is blocked to avoid a loop.
Port status:	Unknown—This EAPS domain is not running, so the port status has not yet been determined. Up—The port is up and is forwarding data.Down—The port is down.Blocked—The port is up, but data is blocked from being forwarded.
Tagstatus:	Tagged status of the control *VLAN*: Tagged—The control VLAN has this port assigned to it, and the port is tagged in the VLAN.Untagged—The control VLAN has this port assigned to it, but the port is untagged in the control VLAN.Undetermined—Either a VLAN has not been added as the control VLAN to this EAPS domain or this port has not been added to the control VLAN.
Hello timer interval:	The configured value of the timer in seconds and milliseconds, specifying the time that the master node waits between transmissions of health check packets.
Fail timer interval:	The configured value of the timer in seconds, specifying the time that the master node waits before the failtimer expires.

Failtimer expiry action:	Displays the action taken when the failtimer expires: Send-alert—Sends a critical message to the syslog when the failtimer expires.Open-secondary-port—Opens the secondary port when the failtimer expires. Displays only for master nodes.
Preforwarding Timer interval:	The configured value of the timer. This value is set internally by the EAPS software. The set value is 15 seconds. Note: If two links in an EAPS domain go down at the same time and one link comes back up, it takes 15 seconds for the reconnected link to start receiving traffic again. Displays only for transit nodes.
Last valid EAPS update:	Indicates the last time a hello packet was received.
EAPS Domain Controller Vlan:	Lists the assigned name and ID of the control VLAN.
EAPS Domain Protected Vlan(s):	Lists the assigned names and VLAN IDs of all the protected VLANs configured on this EAPS domain.
Number of Protected Vlans:	The count of protected VLANs configured on this EAPS domain.

Example

The following command displays information for all EAPS domains:

```
Switch.5 # show eaps
EAPS Enabled: Yes
EAPS Fast-Convergence: Off
EAPS Display Config Warnings: On
EAPS Multicast Add Ring Ports: Off
EAPS Multicast Send IGMP Query: On
EAPS Multicast Temporary Flooding: Off
EAPS Multicast Temporary Flooding Duration: 15 sec
Number of EAPS instances: 2
# EAPS domain configuration :
--------------------------------------------------------------------------------
Domain         State           Mo  En  Pri   Sec   Control-Vlan VID   Count Prio
--------------------------------------------------------------------------------
d1             Idle            T   N   1     2     cv1          (101 ) 0     H
d2             Links-Up        T   Y   3:8   3:16  c2           (1001) 100   H
--------------------------------------------------------------------------------
```

The following command displays information for EAPS domain d1:

```
Switch.7 # show eaps d1
Name: d1           Priority: High
State: Idle        Running: No
Enabled: No        Mode: Transit
Primary port:   1            Port status: Unknown    Tag status: Undetermined
Secondary port: 2            Port status: Unknown    Tag status: Undetermined
Hello timer interval: 1  sec  0  millisec
Fail timer interval:  3  sec  0  millisec
Fail Timer expiry action: Send alert
Last valid EAPS update: From Master Id 00:01:30:f9:9c:b0, at Wed Jun  9 09:09:35 2004
EAPS Domain has following Controller Vlan:
Vlan Name                   VID
c1                          1000
```

[3] These fields apply only to transit nodes; they are not displayed for a master node.

```
EAPS Domain has following Protected Vlan(s):
Vlan Name                    VID
p_1                          1

p_29                         29
p_30                         30
```

The following command displays information on EAPS domain domain12, which is configured to send hello packets on the secondary port:

```
Switch.9 # show eaps "domain12"
Name: domain12     Priority: High
State: Complete    Running: Yes
Enabled: Yes       Mode: Master
Primary port:   17            Port status: Up Tag status: Tagged
Secondary port: 27            Port status: Blocked    Tag status: Tagged
Hello Egress Port: Secondary
Hello timer interval: 0  sec  100  millisec
Fail timer interval:  0  sec  300  millisec
Fail Timer expiry action: Send alert
Last update: From Master Id 00:04:96:34:e3:43, at Tue May 11 15:39:29 2010
EAPS Domain has following Controller Vlan:
Vlan Name                    VID
vlanc12                      1002
EAPS Domain has following Protected Vlan(s):
Vlan Name                    VID
pvlan11                      204
pvlan12                      205
pvlan13                      206
Number of Protected Vlans: 3
```

Note

You might see a slightly different display, depending on whether you display the master node or the transit node.

The display from the show eaps detail command shows all the information shown in the `show eaps` *`eapsDomain`* command, but displays information for all configured EAPS domains.

For the CFM support in EAPS, t he existing show eaps output places a "!" next to a CFM monitored ring port if the CFM indicates the MEP group for that port is down.

```
# sh eaps
EAPS Enabled: Yes

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show eaps cfm groups

`show eaps cfm` **`groups`**

Description

Displays summary *EAPS* CFM groups information.

Syntax Description

There are no keywords or variables for this command.

Default

N/A.

Usage Guidelines

The following command displays EAPS CFM group information:

```
# sh eaps cfm groups
-------------------------------------------------------------------------------
MEP Group Name                  Status Port   MEP ID
-------------------------------------------------------------------------------
eapsCfmGrp1                     Up     41     11
eapsCfmGrp2                     Up     31     12
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show eaps counters shared-port

```
show eaps counters shared-port [global | port {segment-port segport
   {eapsDomain}}]
```

Description

Displays summary *EAPS* shared port counter information.

Syntax Description

global	Displays general counter information for all configured EAPS shared port instances. The output displayed is calculated for all configured EAPS shared ports; not just one specific shared port instance.
port	Identifies the port number of the specified common link port.
segport	Identifies the segment port. The segment port is the other ring port of an EAPS domain that is not the shared-port.
eapsDomain	Specifies the name of the EAPS domain. If no EAPS domain is specified, all counters for all EAPS domains on the specified segment port are displayed.

Default

N/A.

Usage Guidelines

If the switch is configured for EAPS shared ports, use this command to display an array of counters associated with the EAPS shared port functionality.

If you specify the global keyword, the switch displays general counter information for all configured EAPS shared port instances. The output displayed is calculated for all configured EAPS shared ports; not just one specific shared port instance.

If you specify a particular EAPS shared port, the switch displays counter information related to only that shared port.

If you specify a particular EAPS segment port, the switch displays counter information related to only that segment port for the specified EAPS domain.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults.

Clearing the Counters

The counters continue to increment until you clear the information. By clearing the counters, you can see fresh statistics for the time period you are monitoring. To clear, reset the EAPS counters, including the shared port counters, use one of the following commands:

- `clear counters`
- `clear eaps counters`

Understanding the Output

The following table describes the significant fields and values in the display output of the `show eaps counters shared-port` global command:

Field	Description
Rx-Invalid-Instance	Displays the number of dropped EAPS shared-port PDUs because there is not a valid EAPS shared port instance for the incoming port.
Rx-Unknown	Displays the number of unknown EAPS PDUs dropped by the shared port instances.
Fw-Invalid-Instance	Displays the number of EAPS shared-port PDUs that could not be forwarded in slow path because the shared port instances could not find a valid EAPS shared port instance for the outgoing port.

The following table describes the significant fields and values in the display output of the `show eaps counters shared-port` *port*`segment-port` *segport eapsDomain* command:

Field	Description
Rx-Seg-Health	Indicates the shared port instance received EAPS shared ports Segment-Health-Check PDUs.
Rx-Path-Detect	Indicates the shared port instance received EAPS shared ports Path-Detect PDUs.

Field	Description
Rx-Flush-Notify	Indicates the shared port instance received EAPS shared ports Flush-Notify PDUs and flushed the *FDB*. If this PDU reaches a port of the shared ports pair that initiated the PDU, the shared port instance might terminate the PDU. Otherwise, the shared port instance forwards the PDU.
Rx-Unknown	Displays the number of unknown EAPS PDUs dropped by the shared port instance.
Rx-Seg-Health-Dropped	Displays the number of EAPS shared ports Segment-Health-Check PDUs dropped by the shared port instance. This counter increments if the Segment-Health-Check PDU returns to the sending switch. If that occurs, the switch drops the Segment-Health-Check PDU.
Rx-Path-Detect-Dropped	Displays the number of EAPS shared ports Path-Detect PDUs dropped by the shared port instance. This counter increments in the following situations: If the packet's Fwd-id matches the EAPS shared port's Link-Id, the port is not in the blocking state, and the incoming port is a segment port.If the packet's Link-Id matches the EAPS shared port's Link-Id, the port is not in the blocking state, and the incoming port is a segment port.
Rx-Flush-Notify-Dropped	Displays the number of EAPS shared ports Flush-Notify-Dropped PDUs dropped by the shared port instance. This counter increments in the following situations: If the Flush-Notify-Dropped PDU returns to the sending switch.If the packet's Fwd-Id matches the EAPS shared port's Link-Id and the port is not in the blocking state.
Rx-Dropped-Invalid-Port	Displays the number of EAPS shared ports PDUs dropped by the shared port instance because it does not exist.
Tx-Seg-Health	Indicates the shared port instance sent EAPS shared ports Segment-Health-Check PDUs.
Tx-Path-Detect	Indicates the shared port instance sent EAPS shared ports Path-Detect PDUs. NOTE: This counter appears under Common Link Port Stats and should always be 0.
Tx-Flush-Notify	Indicates the shared port instance sent EAPS shared ports Flush-Notify PDUs to flush the FDB. NOTE: This counter appears under Common Link Port Stats and should always be 0.
Tx-Flush-Fdb	Indicates the shared port instance sent EAPS Flush-Fdb PDUs because the FDB needs to be flushed. NOTE: This counter appears under Common Link Port Stats and should always be 0.
Tx-Unknown	Indicates the number of unknown EAPS PDUs sent by the shared port instance. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the sending routine.
Tx-Transmit-Err	Indicates the number of EAPS PDUs the shared port instance was unable to send because of an error.
Fw-Seg-Health	Indicates the number of EAPS shared ports Segment-Health-Check PDUs received by the shared port instance and forwarded in slow path.

Field	Description
Fw-Path-Detect	Indicates the number of EAPS shared ports Path-Detect PDUs received by the shared port instance and forwarded in slow path.
Fw-Flush-Notify	Indicates the number of EAPS Flush-Notify PDUs received by the shared port instance and forwarded in slow path to flush the FDB.
Fw-Flush-Fdb	Indicates the number of EAPS Flush-Fdb PDUs received by the shared port instance and forwarded in slow path.
Fw-Unknown	Indicates the number of unknown EAPS PDUs forwarded in slow path. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the forwarding routine.
Fw-Transmit-Err	Indicates the number of EAPS PDUs the shared port instance was unable to forward in slow path because of an error.

Example

The following command displays global, high-level counter information for EAPS shared port:

```
show eaps counters shared-port global
```

The following is sample output from this command:

```
Global counters for EAPS Shared-Ports:
Rx Dropped
Rx-Invalid-Instance : 0
Rx-Unknown          : 0
Fw Dropped
Fw-Invalid-Instance : 0
```

The following example assumes that port 17 is configured as an EAPS shared port. The following command displays counter information the specified EAPS shared port:

```
show eaps counters shared-port 17
```

The following is sample output from this command:

```
Counters for EAPS Shared-Port 17:
Common Link Port Stats
Rx Stats
Rx-Seg-Health            :  0
Rx-Path-Detect           :  0
Rx-Flush-Notify          :  0
Rx Dropped
Rx-Seg-Health-Dropped    :  0
Rx-Path-Detect-Dropped   :  0
Rx-Flush-Notify-Dropped  :  0
Rx-Dropped-Invalid-Port  :  0
Tx Stats
Tx-Seg-Health            :  0
Tx-Path-Detect           :  0
Tx-Flush-Notify          :  0
Tx-Flush-Fdb             :  0
Tx Dropped
Tx-Unknown               :  0
```

```
Tx-Transmit-Err          :  0
Fw Stats
Fw-Seg-Health            :  0
Fw-Path-Detect           :  0
Fw-Flush-Notify          :  0
Fw Dropped
Fw-Unknown               :  0
Fw-Transmit-Err          :  0
```

The following example assumes that port 1:2 is configured as an EAPS shared port and port 1:1 is a segment port. The following command displays counter information the specified EAPS shared port, segment port, and EAPS domain:

```
show eaps counters shared-port 1:2 segment-port 1:1 eaps1
```

The following is sample output from this command:

```
Counters for EAPS Shared-Port 1:2, Segment Port: 1:1, EAPS Domain: eaps1
Rx Stats
Rx-Seg-Health            :  0
Rx-Path-Detect           :  0
Rx-Flush-Notify          :  0
Rx-Seg-Health-Dropped    :  0
Rx-Path-Detect-Dropped   :  0
Rx-Flush-Notify-Dropped  :  0
Rx-Dropped-Invalid-Port  :  0
Tx Stats
Tx-Seg-Health            :  2275
Tx-Path-Detect           :  0
Tx-Flush-Notify          :  0
Tx-Flush-Fdb             :  0
Tx-Transmit-Err          :  0
Tx-Unknown               :  0
Fw Stats
Fw-Seg-Health            :  0
Fw-Path-Detect           :  0
Fw-Flush-Notify          :  0
Fw-Transmit-Err          :  0
Fw-Unknown               :  0
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show eaps counters

```
show eaps counters [eapsDomain | global]
```

Description

Displays summary *EAPS* counter information.

Syntax Description

eapsDomain	Specifies the name of an EAPS domain. The switch displays counter information for only that domain.
global	Displays EAPS counter information when the events counted are not applicable to any specific EAPS domain.

Default

N/A.

Usage Guidelines

If you specify the name of an EAPS domain, the switch displays counter information related to only that domain. If you specify the global keyword, the switch displays EAPS counter information when the events counted are not applicable to any specific EAPS domain. The output displayed is for all configured EAPS domains, not just one specific EAPS domain.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults.

Clearing the Counters

The counters continue to increment until you clear the information. By clearing the counters, you can see fresh statistics for the time period you are monitoring. To clear, reset the EAPS counters, use one of the following commands:

- `clear counters`
- `clear eaps counters`

Understanding the Output

The following table describes the significant fields and values in the display output of the `show eaps counters` *eapsDomain* command:

Field	Description
Rx-Health	Indicates the EAPS domain received EAPS Health PDUs.
Rx-RingUp-FlushFdb	Indicates the EAPS ring is up, and the EAPS domain received EAPS RingUp-FlushFdb PDUs to flush the *FDB*.
Rx-RingDown-FlushFdb	Indicates the EAPS ring is down, and the EAPS domain received EAPS RingDown-FlushFdb PDUs to flush the FDB.
Rx-Link-Down	Indicates the EAPS domain received EAPS Link-Down PDUs and took down the link.

Field	Description
Rx-Flush-Fdb	Indicates the EAPS domain received EAPS Flush-Fdb PDUs and flushed the FDB.
Rx-Suspend-Prefwd-Timer	Indicates the EAPS domain received EAPS Suspend-Preforward-Timer PDUs.
Rx-Query-Link-Status	Indicates the EAPS domain received EAPS Query-Link-Status PDUs.
Rx-Link-Up	Indicates the EAPS domain received EAPS Link-Up PDUs and brought the link back up.
Rx-Unknown	Indicates the EAPS domain dropped unknown EAPS PDUs.
Rx-Another-Master	Indicates the EAPS domain dropped EAPS PDUs because there is another Master switch in the same EAPS domain.
Rx-Unconfigured-Port	Indicates the EAPS domain dropped EAPS PDUs because the ingress port is not configured to be a ring port for the EAPS domain and the corresponding control *VLAN*.
Rx-Health-Pdu-Pri-Port	Indicates the EAPS domain dropped EAPS Health PDUs because the primary port received them instead of the secondary port. NOTE: The secondary port of the Master switch must receive EAPS Health PDUs, not the primary port.
Tx-Health	Indicates the EAPS domain sent EAPS Health PDUs.
Tx-RingUp-FlushFdb	Indicates the EAPS ring is up, and the EAPS domain sent EAPS RingUp-FlushFdb PDUs to flush the FDB.
Tx-RingDown-FlushFdb	Indicates the EAPS ring is down, and the EAPS domain sent EAPS RingDown-FlushFdb PDUs to flush the FDB.
Tx-Link-Down	Indicates the EAPS domain sent EAPS Link-Down PDUs because the link went down.
Tx-Flush-Fdb	Indicates the EAPS domain sent EAPS Flush-Fdb PDUs because the FDB needs to be flushed.
Tx-Suspend-Prefwd-Timer	Indicates the EAPS domain sent EAPS Suspend-Preforward-Timer PDUs.
Tx-Query-Link-Status	Indicates the EAPS domain sent EAPS Query-Link-Status PDUs.
Tx-Link-Up	Indicates the EAPS domain sent EAPS Link-Up PDUs and the link is up.
Tx-Unknown	Indicates the number of unknown EAPS PDUs sent by the EAPS domain. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the sending routine.
Tx-Transmit-Err	Indicates the number of EAPS PDUs the EAPS domain was unable to send because of an error.
Fw-Link-Down	Indicates the number of EAPS Link-Down PDUs received by the EAPS domain and forwarded in slow path.
Fw-Flush-Fdb	Indicates the number of EAPS Flush-Fdb PDUs received by the EAPS domain and forwarded in slow path.
FW-Query-Link-Status	Indicates the number of EAPS Query-Link-Status PDUs received by the EAPS domain and forwarded in slow path.

Field	Description
Fw-Unknown	Indicates the number of unknown EAPS PDUs forwarded in slow path. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the forwarding routine.
Fw-Transmit-Er	Indicates the number of EAPS PDUs the EAPS domain was unable to forward in slow path because of an error.

Note

Rx and Fw counters—If a PDU is received, processed, and consumed, only the Rx counter increments. If a PDU is forwarded in slow path, both the Rx counter and Fw counter increment.

The following table describes the significant fields and values in the display output of the `show eaps counters` global command:

Field	Description
Rx-Failed	Indicates an error occurred when receiving packets from the Layer 2 forwarding engine.
Rx-Invalid-Vlan-Intf	Indicates that the VLAN interface for the incoming VLAN cannot be found.
Rx-Undersize-Pkt	Indicates the length of the packet is less than the length of the header.
Rx-Invalid-8021Q-Tag	Indicates the VlanTypeLength field in the Ethernet header does not match the default Ethernet value for the 802.1Q tag.
Rx-Invalid-SNAP-Type	Indicates an invalid Subnetwork Access Protocol (SNAP) value in the Ethernet header.
Rx-Invalid-OUI	Indicates the Organizational Unique Identifier (OUI) value in the Ethernet header does not match 00:E0:2B.
Rx-EEP-Unsupported-Version	Indicates an unsupported Extreme Encapsulation Protocol (EEP) version. The EEP version should be 1.
Rx-EEP-Invalid-Length	Indicates the length of the EEP header is greater than the length of the packet.
Rx-EEP-Checksum-Invalid	Indicates the EEP checksum is invalid.
Rx-Domain-Invalid	Indicates the control VLAN's incoming PDU is not associated with an EAPS domain.
Rx-Lif-Invalid	Indicates that EAPS is unable to determine the logical interface (LIF) for the ingress port.
Rx-Lif-Down	Indicates the LIF for the ingress port is in the Down state.
Tx-Failed	Indicates an error occurred when sending packets to the Layer 2 forwarding engine.

Example

The following command displays the counters for a specific EAPS domain named eaps1:

```
show eaps counters eaps1
```

The following is sample output from this command:

```
Counters for EAPS domain: eaps1
Rx Stats
Rx-Health                 :  0
Rx-Ringup-Flushfdb        :  0
Rx-Ringdown-Flushfdb      :  0
Rx-Link-Down              :  0
Rx-Flush-Fdb              :  0
Rx-Suspend-Prefwd-Timer   :  0
Rx-Query-Link-Status      :  0
Rx-Link-Up                :  0
Rx Dropped
Rx-Unknown                :  0
Rx-Another-Master         :  0
Rx-Unconfigured-Port      :  0
Rx-Health-Pdu-Pri-Port    :  0
Tx Stats
Tx-Health                 :  5011
Tx-Ringup-Flushfdb        :  0
Tx-Ringdown-Flushfdb      :  0
Tx-Link-Down              :  0
Tx-Flush-Fdb              :  0
Tx-Suspend-Prefwd-Timer   :  0
Tx-Query-Link-Status      :  3342
Tx-Link-Up                :  0
Tx Dropped
Tx-Unknown                :  0
Tx-Transmit-Err           :  0
Fw Stats
Fw-Link-Down              :  0
Fw-Flush-Fdb              :  0
Fw-Query-Link-Status      :  0
Fw Dropped
Fw-Unknown                :  0
Fw-Transmit-Err           :  0
```

The following command displays the global EAPS counters:

```
show eaps counters global
```

The following is sample output from this command:

```
Global counters for EAPS:
Rx-Failed : 0
Rx-Invalid-Vlan-Intf : 0
Rx-Undersize-Pkt : 0
Rx-Invalid-SNAP-Type : 0
Rx-Invalid-OUI : 0
Rx-EEP-Unsupported-Version : 0
Rx-EEP-Invalid-Length : 0
Rx-EEP-Checksum-Invalid : 0
Rx-Domain-Invalid : 0
Rx-Failed : 0
```

```
Rx-Lif-Invalid : 0
Rx-Lif-Down : 0
Tx-Failed : 0
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show eaps shared-port

```
show eaps shared-port {port} {detail}
```

Description

Displays shared-port information for one or more *EAPS* domains.

Syntax Description

port	Specifies a shared-port.
detail	Specifies to display the status of all segments and VLANs.

Default

N/A.

Usage Guidelines

If you enter the `show eaps shared-port` command without the detail keyword, the command displays a summary of status information for all configured EAPS shared ports.

If you specify an EAPS shared-port, the command displays information about that specific port and the related segment ports. The segment ports are sorted in ascending order based on their port number. You can use this order and your knowledge of the EAPS topology to determine which segment port becomes the active-open port if the common link fails. For more information, see “Common Link Fault Detection and Response” in the *Switch Engine 32.2 User Guide*.

You can use the detail keyword to display more detailed status information about the segments and VLANs associated with each shared port.

The following table describes the significant fields and values in the display output of the `show eaps shared-port {port {detail}` commands:

Field	Description
Shared Port	Displays the port number of the shared port.
Mode	Indicates whether the switch on either end of the common link is a controller or partner. The mode is configured by the user.
Link ID	The link ID is the unique common link identifier configured by the user.
Up	Displays one of the following: Yes—Indicates that the link ID and the mode are configured. No—Indicates that the link ID or the mode is not configured.
State	Displays one of the following states: Idle—Shared-port instance is not running. Ready—The EAPS shared-port instance is running, the neighbor can be reached, and the common link is up. Blocking—The EAPS shared-port instance is running, the neighbor cannot be reached, or the common link is down. Preforwarding—The EAPS shared-port instance is in a blocking state, and the common link came up. To prevent a superloop, a temporary blocking state is created before going into Ready state.
Domain Count	Indicates the number of EAPS domains sharing the common link.
VLAN Count	Indicates the total number of VLANs that are protected under the EAPS domains sharing this common link.
Nbr	Yes—Indicates that the EAPS instance on the other end of the common link is configured with matching link ID and opposite modes. For example, if one end of the common link is configured as a controller, the other end must be configured as a partner. Err—Indicates that the EAPS instance on the other end of the common link is configured with a matching link ID, but the modes are configured the same. For example, both modes are configured as controller, or both modes are configured as partner. No—The neighbor on the other end of the common link cannot be reached. Indicates one or more of the following: • The switch on the other end of the common link is not running. • The shared port has not been created. • The link IDs on each side of the common link do not match. • The common link, and any other segment, between the controller and partner are not fully connected.
RB ID	The ID of the root blocker. If the value is none, there are not two or more common-link failures.
RB State	None—This EAPS shared-port is not the root blocker.Active—This EAPS shared-port is the root blocker and is currently active.Inactive—This EAPS shared-port is the root blocker but is currently inactive.
Active Open (available with the detail keyword)	None—Indicates that there is no Active-Open port on the VLAN.Port #—Indicates the port that is Active-Open and is in a forwarding state.

Field	Description
Segment Timer expiry action	Segment down—Specifies that if the controller or partner switch detects a down segment, that segment stays down and a query is not sent through the ring. The switch marks the segment status as Down. Send alert—Specifies that if the controller or partner switch detects a down segment, that switch keeps the segment up and sends a warning message to the log (default). The switch sends a trap alert and sets the failed flag [F].
Segment Port (available with the detail keyword or by specifying a shared port)	Identifies the segment port of an EAPS ring that shares the common link.
Status (available with the detail keyword or by specifying a shared port)	Up—Connectivity is established between the segment and the EAPS shared-port on the common link neighbor. Down—There is a break in the path between the segment and the EAPS shared-port on the common link neighbor. Blocking-Up—The path is Up, but due to the root blocker being in the Active state, this port is blocked to prevent a loop. Blocking-Down—The root blocker is in the Active state; however, the path is Down. Because the path is Down, there is no need to block the root blocker port to prevent a loop. [F]—The segment timer has expired but has not received an explicit link-down notification. The segment port remains in the Up state, with the timer expired flag set to True.
EAPS Domain (available with the detail keyword or by specifying a shared port)	The EAPS domain assigned to the segment port.
Vlan-port count (available with the detail keyword or by specifying a shared port)	The total number of VLANs being protected on this segment port.
Adjacent Blocking Id (available with the detail keyword or by specifying a shared port)	None—The neighbor on this port is not reporting a Controller in the Blocking state. *Link-Id*—The neighbor on this port is a controller in the Blocking state with a link ID of *Link-Id*.
Segment RB Id (available with the detail keyword or by specifying a shared port)	None—The neighbor on this port is not aware of a root blocker in the network. *RB-Id*—The neighbor on this port has determined that there is a root blocker in the network with a link ID of *RB-Id* .
Vlan (available with the detail keyword or by specifying a shared port)	Displays a list of VLANs protected by the segment port.

Field	Description
Virtual-port Status (available with the detail keyword or by specifying a shared port)	This information appears for the Controller, when it is in either the Blocking or Preforwarding state. Active-Open—This VLAN or port is in the Forwarding state and has connectivity to the neighboring EAPS shared port via this port. Open—This VLAN or port is in the Forwarding state but does not have connectivity to the neighboring EAPS shared port via this port. Blocked—This VLAN or port is in the Blocking state to prevent a loop in the network. Down—This port's link is down. Active—At this moment, this VLAN or port is not being handled by EAPS shared port. Rather, this VLAN or port is being handled by the regular EAPS protocol.
Bvlan	When a common link connects an access VLAN (CVLAN or SVLAN) to a core VLAN (BVLAN), this field displays the BVLAN name. For more information, see the *Common Link Fault Detection and Response* section in the *Switch Engine 32.2 User Guide*.

Example

The following command displays shared-port information for all EAPS shared ports on a switch:

```
#show eaps shared-port
EAPS shared-port count: 1
--------------------------------------------------------------------------------
Link               Domain Vlan      RB       RB
Shared-port  Mode        Id   Up State      count  count Nbr State    Id
--------------------------------------------------------------------------------
10:1         Controller  1    Y  Ready      2      1     Yes None     None
Segment Timer expiry action: Send alert
--------------------------------------------------------------------------------
```

The following command displays detailed information for all EAPS shared ports:

```
#show eaps shared-port detail
EAPS shared-port count: 1
--------------------------------------------------------------------------------
Link               Domain Vlan      RB       RB
Shared-port  Mode        Id   Up State      count  count Nbr State    Id
--------------------------------------------------------------------------------
4:1          Controller  10   Y  Blocking   2      1     Yes Active   10
Segment Timer expiry action: Send alert
Segment Port: 5:7,  Status: Blocking-Up
EAPS Domain:             d1
Vlan-port count:         1
Adjacent Blocking Id:    None
Segment RB Id:           None
Vlan                     Virtual-port Status
p_1                   Blocked
Segment Port: 2:11,         Status: Down
EAPS Domain:             d2
Vlan-port count:         1
Adjacent Blocking Id:    20
Segment RB Id:           None
Vlan                     Virtual-port Status
p_1                   Open
Vlan: p_1,   Vlan-port count: 2,    Active Open: None
Segment Port             Virtual-port Status
```

```
5:7                 Blocked
2:11                Open
```

The following command displays detailed information for an EAPS shared port that is in the Blocking state:

```
#  show eaps shared-port 1:24
-------------------------------------------------------------------------------
Link                   Domain Vlan      RB       RB
Shared-port  Mode        Id   Up State          count  count Nbr State    Id

Vlan: data3,          Vlan-port count: 3,    Active Open: 3:38 Bvlan: metro2
Vlan: metro1,         Vlan-port count: 1,    Active Open: 3:38
Vlan: metro2,         Vlan-port count: 1,    Active Open: 3:38
-------------------------------------------------------------------------------
```

Note
The BVLAN information in the previous example appears only when a BVLAN configuration is present.

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show eaps shared-port neighbor-info

```
show eaps shared-port {port} neighbor-info {detail}
```

Description

Displays shared-port information from neighboring shared links for one or more *EAPS* domains.

Syntax Description

port	Specifies a shared-port.
detail	Specifies to display the status of all segments and VLANs.

Default

N/A.

Usage Guidelines

If you enter the command without the detail keyword, the command displays a summary of status information for all configured EAPS shared ports from neighboring shared links. If you specify an EAPS shared-port, the command displays information about that specific port. Otherwise, the command displays information about all of the shared-ports configured on the switch.

You can use the detail keyword to display more detailed status information about the segments and VLANs associated with each shared port. For full details of the significant fields and values in the display output of the command, see the relevant tables in the `show eaps shared port {port} {detail}` command description.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show edp

```
show edp {ports [all | ports] {detail | vlan-id {mismatch {untagged}}
   {neighbor nbr}}}
```

Description

Displays connectivity and configuration information for neighboring Extreme Networks switches.

Syntax Description

all	Specifies all ports.
ports	Specifies one or more ports or slots and ports.
vlan-id	Shows local and neighbor VLAN IDs.

mismatch	Shows only VLAN IDs that are mismatched to neighbor VLAN IDs.
untagged	Shows only mismatches for untagged ports.
neighbor	Shows only VLAN IDs for a specific neighbor.
nbr	Specifies the neighbor by Neighbor-ID (for example: 00:00:08:00:27:f3:f8:d9).
detail	Shows detailed information.

Default

N/A.

Usage Guidelines

port_list can be one or more port numbers. For a detailed explanation of port specification, see Port Numbering in Command Reference Overview To clear the counters, use the clear lacp counters command.

The neighbor-ID value is eight bytes. The first two bytes are always set to 00:00; the last six bytes are set to the neighbor's system MAC address.

Use the `show edp` command to display neighboring switches and configurations. This is most effective with Extreme Networks switches.

Example

The following example displays the configuration of the switch:

```
# show edp
EDP advert-interval     :60 seconds
EDP holddown-interval   :180 seconds
EDP enabled on ports    :1:1  1:2  1:3  1:4  1:5  1:6  3:1  3:2  3:3  3:4
```

The following example shows Extreme switch connectivity and configuration information for port 1:1:

```
# show edp ports 1:1
Port   Neighbor                        Neighbor-ID Remote  Age    Num
Port         Vlans
================================================================================
1:1    Oban                         00:00:00:30:48:41:ed:97   1:1    54     1
================================================================================
```

The following example displays detailed connectivity and configuration information of neighboring Extreme switches on port 1:1:

```
# show edp ports 1:1 detail

================================================================================
Port 1:1: EDP is Enabled
Tx stats: sw-pdu-tx=2555       vlan-pdu-tx=1465       pdu-tx-err=0
Rx stats: sw-pdu-rx=2511       vlan-pdu-rx=2511       pdu-rx-err=0
Time of last transmit error: None
Time of last receive error:  None
Remote-System:          Oban                        Age = 41
Remote-ID:              00:00:00:30:48:41:ed:97
```

```
Software version:       11.1.0.19
Remote-Port:            1:1
Port Type:              Ethernet
Auto Negotiation:       OFF
Flow Control:           SYMMETRIC/ASYMMETRIC
Duplex Speed:           Configured = HALF       Actual = HALF
Port Speed (MB):        Configured = ERROR      Actual = 100 Mbps
Remote-Vlans:
test (4094)  Age = 41
================================================================================
```

The following example shows local and neighbor VLAN IDs on port 3:

```
# show edp port 3 vlan-id
Local    Remote                      |------- Local VLAN -------| |---------- Remote VLAN
---------|
Port  Port  Neighbor ID                ID  Name                      ID

articnorth             7
----- ----- ------------------------ ----- ---------------------- -----
---------------------- ----

Flags: (*) Port is untagged in VLAN, (+) Neighbor does not send port tagged/untagged
information
```

The following example show mismatched neighbor VLAN IDs for untagged ports on port 3 :

```
# show edp port 3 vlan-id mismatch untagged
Local    Remote                      |------- Local VLAN -------| |---------- Remote VLAN
---------|
Port  Port  Neighbor ID                ID  Name                      ID
Name                      Age
----- ----- ------------------------ ----- ---------------------- -----
---------------------- ----
3     1:3   00:00:08:00:27:f3:e8:c9   200* v2-
deepsouth
                                      300  v3-articnorth           300* v3-
articnorth             11
----- ----- ------------------------ ----- ---------------------- -----
---------------------- ----
```

History

This command was first available in ExtremeXOS 10.1.

Mismatched VLAN IDs check ability was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show elrp

```
show elrp
```

Description

Displays ELRP information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the following:

- State of ELRP (enabled/disabled).
- Total number of ELRP sessions.
- ELRP packets transmitted.
- ELRP packets received.

In addition to the summary information at the top of the display, the `show elrp` command also displays the following information:

Client	Displays the name of the ELRP client.
VLAN	Displays the name of the VLAN with ELRP enabled.
Ports	Displays the set of VLAN ports used for packet transmission.
Interval	Displays the configured interval. An interval of 3 indicates that ELRP PDUs are transmitted every 3 seconds.
Count	Lists the configured number of ELRP PDUs that are transmitted. The PDUs are transmitted at the configured interval. This method of ELRP PDU transmission is used by *ESRP* in the pre-master state. A count of 0 indicates continuous PDU transmission. If the Cyclic value is Yes, the count is always 0.

Cyclic	Indicates whether ELRP PDUs are being continuously sent. The column shows Yes for the master VLAN because that VLAN is continuously sending ELRP PDUs for loop detection. When a VLAN is in the pre-master state, it only sends three ELRP PDUs before changing to master or slave. During this time the column shows No for that VLAN.
Pkts-Xmit	Displays the number of ELRP PDUs transmitted.
Pkts-Rcvd	Displays the number of ELRP PDUs received.
Action	Displays the configured action the switch takes when ELRP messages are received back indicating a detection of a network loop or no packets are received within the specified duration. The following list describes the actions: Print (P)—Specifies that the switch prints a message to the console.Log (L)—Specifies that the switch sends a message to the system log file.Trap (T)—Specifies that the switch sends a message to the *SNMP* manager.Callback (C)—Specifies a callback action. If you use ELRP with another protocol (for example ESRP), ELRP uses a callback action to notify the protocol of a loop detection.
Disable Port	Displays the configured hold time (number of seconds or permanent) for a port that was disabled with the `configure elrp-client periodic` command. When the time in seconds expires, the port is automatically enabled.

With hardware-assisted ELRP, one ACL egress counter is used to record ELRP PDUs transmitted per VLAN port, and the displayed Pkts-Xmit is calculated after all egress counters are queried from hardware. If show commands are executed very frequently, the statistics might not change every time.

Example

The following example displays summary ELRP status information on the switch:

```
# show elrp

ELRP Standalone Client:       Enabled
ELRP Inter-VLAN loop detection:   On
ELRP client hardware assist:      Enabled
Loopback port:                    1

Number of ELRP sessions:          1
Number of ELRP pkts transmitted:  0
Number of ELRP pkts received:     0

                                      Interval                    Pkts    Pkts
Disable
Client VLAN          Ports              (sec) Count Cyclic      Xmit    Rcvd Action Port
(sec)
-------------------------------------------------------------------------------------------
----
CLI    Default       All,                 1.0     0 Yes            0       0 LT
-
                     All VXLAN RTEPs
-------------------------------------------------------------------------------------------
----
```

History

This command was first available in ExtremeXOS 11.1.

VXLAN remote endpoint information was added in ExtremeXOS 22.4.

Hardware-assisted ELRP information was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show elrp disabled-ports

```
show elrp disabled-ports
```

Description

Displays information about ELRP disabled ports.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the results of disabling ports using the `configure elrp-client periodic` command.

This command displays the following:

- Exclude *EAPS* ring ports—Whether EAPS ring ports can be excluded.
- Exclude VXLAN RTEPs—Whether VXLAN remote endpoints can be excluded.
- Exclude inter-VLAN loop ports—Whether inter-VLAN loop ports can be excluded.
- Excluded Ports—User defined ports that will not be disabled.
- Disabled Port—The port that ELRP disabled.
- Detected *VLAN*—The VLAN with looping ELRP PDU(s).
- Duration—The configured time to keep the port disabled.
- Time Disabled—The time when ELRP disabled the port.

Example

The following example shows ELRP information for disabled ports:

```
# show elrp disabled-ports

  Exclude EAPS ring ports : No
  Exclude VXLAN RTEPs     : Yes
  Exclude inter-VLAN loop ports :No
```

```
  Excluded Ports
  -------------------------------------------------------------------------

  -------------------------------------------------------------------------

  Disabled                  Detected            Duration  Time
Disable
  Port/Virtual Port         Vlan                (sec)     Disabled
Direction

-------------------------------------------------------------------------------------------
--

-------------------------------------------------------------------------------------------
--
```

History

This command was first available in ExtremeXOS 12.4.

The excluded port list was added in ExtremeXOS 12.5.3.

VXLAN remote endpoint exclusion information was added in ExtremeXOS 22.4.

Inter-VLAN loop ports exclusion information was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show elrp dynamic-vlans

```
show elrp dynamic-vlans {vm-tracking | netlogin | mvrp | policy |
   fabric-attach | all}
```

Description

This command shows ELRP configuration information for all, or specific types of, dynamic *VLAN*s.

Syntax Description

dynamic-vlans	ELRP configuration options for dynamically created VLANs.
mvrp	Shows ELRP information for dynamic VLANs created by Multiple VLAN Registration Protocol (MVRP) only.
netlogin	Shows ELRP information for dynamic VLANs created by Network Login only.
vm-tracking	Shows ELRP information for dynamic VLANs created by virtual machine MAC tracking only.
policy	Specifies that the command applies to dynamic VLANs created by One Policy.

fabric-attach	Specifies that the command applies to dynamic VLANs created by Fabric Attach.
all	(Default) Shows ELRP information for all dynamic VLANs.

Default

If you do not specify the type of dynamic VLAN, information about all types appear.

Example

The following example shows ELRP information for all types of dynamic VLANs:

```
# show elrp dynamic-vlans

VM-Tracking :
ELRP on client ports : Disabled
ELRP on uplink ports : Disabled
ELRP on VXLAN RTEPs  : Disabled
Transmit interval    : 1 second(s)
Loop detect action   : log and trap
Port disable on loop : Yes
Disabled port        : Ingress
Disabled duration    : 30 seconds

Netlogin :
ELRP on client ports : Disabled
ELRP on uplink ports : Disabled
ELRP on VXLAN RTEPs  : Disabled
Transmit interval    : 1 second(s)
Loop detect action   : log and trap
Port disable on loop : Yes
Disabled port        : Ingress
Disabled duration    : 30 seconds

MVRP                 : Disabled
Transmit interval    : 1 second(s)
Loop detect action   : log and trap
Port disable on loop : Yes
Disabled port        : Ingress
Disabled duration    : 30 seconds

Policy               : Enabled
Transmit interval    : 1 second(s)
Loop detect action   : log and trap
Port disable on loop : Yes
Disabled port        : Ingress
Disabled duration    : 30 seconds

Fabric-Attach        : Disabled
Transmit interval    : 1 second(s)
Loop detect action   : log and trap
Port disable on loop : Yes
Disabled port        : Ingress
Disabled duration    : 30 seconds
```

The following example shows ELRP information for dynamic VLANs created by virtual machine MAC tracking only:

```
# show elrp dynamic-vlans vm-tracking
VM-Tracking:
```

```
ELRP for dynamic VLANs        : Enabled
ELRP on client ports          : Enabled
ELRP on uplink ports          : Enabled
```

The following example shows ELRP information for dynamic VLANs created by One Policy:

```
# show elrp dynamic-vlans policy

Policy               : Enabled
Transmit interval    : 1 second(s)
Loop detect action   : log and trap
Port disable on loop : Yes
Disabled port        : Ingress
Disabled duration    : 30 seconds
```

The following example shows ELRP information for dynamic VLANs created by Fabric Attach:

```
show elrp dynamic-vlans fabric-attach

Fabric-Attach        : Disabled
Transmit interval    : 1 second(s)
Loop detect action   : log and trap
Port disable on loop : Yes
Disabled port        : Ingress
Disabled duration    : 30 seconds
```

History

This command was first available in ExtremeXOS 22.2.

Loop detection action information was added in ExtremeXOS 22.3.

The **policy** and **fabric-attach keywords** were added in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show elsm ports

```
show elsm ports all | port_list
```

Description

Displays detailed information for one or more ELSM-enabled ports.

Syntax Description

all	Displays detailed ELSM information for all ports.
port_list	Displays detailed ELSM information for one or more ports.

Default

N/A.

Usage Guidelines

Use this command to display detailed information about the operational state of ELSM on the configured ports.

This command displays in a tabular format the following ELSM data for one or more ELSM-enabled ports on the switch:

- Port—The port number of the ELSM-enabled port.
- Link State—The state of the link between ELSM-enabled (peer) ports. The link state can be one of the following:
  - Ready—Indicates that the port is enabled but there is no link.
  - Active—Indicates that the port is enabled and the physical link is up.
- ELSM Link State—The current state of the ELSM logical link on the switch. The ELSM link state can be one of the following:
  - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM State—The current state of ELSM on the port. The ELSM state can be one of the following:
  - Up—Indicates a healthy remote system and this port is receiving Hello+ messages from its peer.

    If an ELSM-enabled port enters the Up state, the up timer begins. Each time the port receives a Hello+ message from its peer, the up timer restarts and the port remains in the Up state. The up timer is 6* hello timer, which by default is 6 seconds.
  - Down—Indicates that the port is down, blocked, or has not received Hello+ messages from its peer.

    If an ELSM-enabled port does not receive a hello message from its peer before the up timer expires, the port transitions to the Down state. When ELSM is down, data packets are neither forwarded nor transmitted out of that port.
  - Down-Wait—Indicates a transitional state.

    If the port enters the Down state and later receives a Hello+ message from its peer, the port enters the Down-Wait state. If the number of Hello+ messages received is greater than or equal to the hold threshold, the port transitions to the Up state. If the number of Hello+ messages received is less than the hold threshold, the port enters the Down state.
  - Down-Stuck—Indicates that the port is down and requires user intervention.

    If the port repeatedly flaps between the Up and Down states, the port enters the Down-Stuck state. Depending on your configuration, there are two ways for a port to transition out of this state:

By default, automatic restart is enabled, and the port automatically transitions out of this state. See the command `enable elsm ports auto-restart` for more information.

If you disabled automatic restart, and the port enters the Down-Stuck state, you can clear the stuck state and enter the Down state by using one of the following commands:

`clear elsm ports port_list auto-restart`

`enable elsm ports port_list auto-restart`

- Hello Transmit State—The current state of ELSM hello messages being transmitted. The transmit state can be one of the following:
  - HelloRx(+)—Specifies that the ELSM-enabled port is up and receiving Hello+ messages from its peer. The port remains in the HelloRx+ state and restarts the HelloRx timer each time it receives a Hello+ message. If the HelloRx timer expires, the hello transmit state enters HelloRX(-). The HellotRx timer is 6 * hello timer, which by default is 6 seconds.
  - HelloRx(-)—Specifies that the ELSM-enabled port either transitions from the initial ELSM state or is up and not receiving hello messages because there is a problem with the link or the peer is missing.
- Hello time—The current value of the hello timer, which by default is 1 second. The hello timer indicates the number of seconds between consecutive hello messages.
- Hold Threshold—The number of Hello+ messages required by the ELSM-enabled port to transition from the Down-Wait state to the Up state within the hold threshold.
- UpTimer Threshold—The number of hello times that span without receiving Hello+ packets before a port changes its ELSM state from Up to Down.
- Auto Restart—The current state of ELSM automatic restart on the port. The state of Auto Restart can be one of the following:
  - Enabled—If an ELSM-enabled port goes down, ELSM automatically brings up the down port. This is the default behavior.
  - Disabled If an ELSM-enabled port goes down, the port enters and remains in the Down-Stuck state until you clear the stuck state.

  For more information about automatic restart, see the command `enable elsm ports auto-restart`.
- Sticky Threshold—Specifies the number of times a port can transition between the Up and Down states. The sticky threshold is not user-configurable and has a default value of 1. That means a port can transition only one time from the Up state to the Down state. If the port attempts a subsequent transition from the Up state to the Down state, the port enters the Down-Stuck state.
- Sticky Threshold Counter—The number of times the port transitions from the Up state to the Down state.
- Down Timeout—The actual waiting time (msecs or secs) before a port changes its ELSM state from Down to Up. When ELSM is enabled on a port and it is in a Down state, before it changes its ELSM state from Down to Up, it expects to receive at least a “Hold Threshold” number of Hello+ packets during the Down Timeout period after it receives the first Hello+ packet from its peer. It is equal to [Hello Time * (Hold Threshold+2)].
- Up Timeout—The actual waiting time (msecs or secs) before a port changes its ELSM state from Up to Down after receiving the last Hello+ packets. When a port is in an Up state, it expects to receive a Hello+ packet from its peer every “Hello Time” period to maintain its Up state. When it does not

receive a Hello+ packet after an “Up Timeout” period, it changes its ELSM state from Up to Down. It is equal to [Hello Time * UpTimer Threshold].

The remaining output displays counter information. Use the counter information to determine the health of the ELSM peers and how often ELSM has gone up or down. The counters are cumulative.

- RX Hello+—The number of Hello+ messages received by the port.
- Rx Hello- —The number of Hello- messages received by the port.
- Tx Hello+—The number of Hello+ messages sent by the port.
- Tx Hello- —The number of Hello- messages sent by the port.
- ELSM Up/Down Count—The number of times ELSM has been up or down.

To clear, reset the counters, use either the `clear elsm {ports port_list} counters` or the clear counters command.

Additional show Command

You can also use the `show ports {port_list} information {detail}` command to display ELSM information.

If you do not specify the detail parameter, the following columns display the current state of ELSM on the switch:

- Flags:
  - L—Indicates that ELSM is enabled on the switch.
  - - —Indicates that ELSM is disabled on the switch.
- ELSM:
  - up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - dn—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
  - - —Indicates that ELSM is disabled on the switch.

If you specify the optional detail parameter, the following ELSM output is called out in written explanations versus displayed in a tabular format:

- ELSM Link State (displayed only if ELSM is enabled on the switch).
  - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM:
  - Enabled—Indicates that ELSM is enabled on the switch.
  - Disabled—Indicates that ELSM is disabled on the switch.

Example

The following command displays detailed ELSM information for all configured ports on the switch:

```
show elsm ports all
```

The following is sample output from this command:

```
ELSM Info Port 4:4
Link State                : Active
ELSM Link State           : Up
ELSM State                : Up
Hello Transmit State      : HelloRx(+)
Hello Time                : 100 msec
Hold Threshold            : 2
UpTimer Threshold         : 6
Auto Restart              : Enabled
Down Timeout              : 400 msec
Up Timeout                : 600 msec

Tx Hello-                 : 0
ELSM Up/Down Count        : UP: 0    DOWN: 0
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show elsm

```
show elsm
```

Description

Displays summary information for all of the ELSM-enabled ports on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the operational state of ELSM on the configured ports.

If no ports are configured for ELSM, the switch does not display any information.

For ELSM-enabled ports, this command displays the following information in a tabular format:

- Port—The port number of the ELSM-enabled port.
- ELSM State—The current state of ELSM on the port. The ELSM state can be one of the following:
  - Up—Indicates a healthy remote system and this port is receiving Hello+ messages from its peer.

    If an ELSM-enabled port enters the Up state, the up timer begins. Each time the port receives a Hello+ message from its peer, the up timer restarts and the port remains in the Up state.
  - Down—Indicates that the port is down, blocked, or has not received Hello+ messages from its peer.

    If an ELSM-enabled port does not receive a hello message from its peer before the up timer expires, the port transitions to the Down state. When ELSM is down, data packets are neither forwarded nor transmitted out of that port.
  - Down-Wait—Indicates a transitional state.

    If the port enters the Down state and later receives a Hello+ message from its peer, the port enters the Down-Wait state. If the number of Hello+ messages received is greater than or equal to the hello threshold (by default 2 messages), the port transitions to the Up state. If the number of Hello+ messages received is less than the hold threshold, the port enters the Down state.
  - Down-Stuck—Indicates that the port is down and requires user intervention.

    If the port repeatedly flaps between the Up and Down states, the port enters the Down-Stuck state. Depending on your configuration, there are two ways for a port to transition out of this state:

    By default, automatic restart is enabled, and the port automatically transitions out of this state. See the command `enable elsm ports auto-restart` for more information.

    If you disabled automatic restart, and the port enters the Down-Stuck state, you can clear the stuck state and enter the Down state by using one of the following commands:

    `clear elsm ports` *`port_list`* `auto-restart`

`enable elsm ports port_list auto-restart`

- Hello time —The current value of the hello timer, which by default is 1 second. The hello timer indicates the number of seconds between consecutive hello messages.

Additional show Command

You can also use the `show ports {port_list} information {detail}` command to display ELSM information.

If you do not specify the detail parameter, the following columns display the current state of ELSM on the switch:

- Flags:
  - L—Indicates that ELSM is enabled on the switch.
  - - —Indicates that ELSM is disabled on the switch.
- ELSM:
  - up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - dn—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
  - - —Indicates that ELSM is disabled on the switch.

If you specify the optional detail parameter, the following ELSM output is called out in written explanations versus displayed in a tabular format:

- ELSM Link State (displayed only if ELSM is enabled on the switch):
  - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM:
  - Enabled—Indicates that ELSM is enabled on the switch.
  - Disabled—Indicates that ELSM is disabled on the switch.

Example

The following command displays summary configuration information for all of the ELSM-enabled ports on the switch:

```
show elsm
```

The following is sample output from this command:

```
Port   ELSM State   Hello Time
```

```
====   ==========   ==========
5:14   Up 1 (second)
5:18   Down         1 (second)
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show erps

```
show erps
```

Description

Display global information for *ERPS*.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to display global information for ERPS.

Example

```
# show erps

ERPS Enabled: Yes
ERPS Display Config Warnings: On
ERPS Multicast Add Ring Ports: Off
ERPS Multicast Send IGMP Query: On
ERPS Multicast Temporary Flooding: Off
ERPS Multicast Temporary Flooding Duration: 15 sec
Number of ERPS instances: 1
# ERPS ring configuration :

--------------------------------------------------------------------------------
Ring           State           Type    East    West    Control-Vlan   VID
--------------------------------------------------------------------------------
R1             Protection      R r     21      +20       cvl           (1000)
--------------------------------------------------------------------------------
where State: Init/Idle/Protection/Manual-Switch/Force-Switch/Pending
    Type: (I) Interconnected node, (N) RPL Neighbor,
```

```
        R) RPL Owner, (X) Ring node
    Flags: (n) Non-revertive, (r) Revertive,
           (+) RPL Protection Port, (^) RPL Neighbor Port
           (f) Force Switch Port, (m) Manual Switch Port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show erps ring-name

```
show erps ring-name
```

Description

Display specific details for an *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to display specific details for an ERPS ring.

Example

The following example displays details for an ERPS ring named "R1":

```
# show erps "R1"

Name: R1
Operational State: Protection enabled        Node Type: RPL Owner,  Revertive
Configured State : Enabled

East Ring Port :  21  MepId: 1  Remote MepId: 3       Status: Blocked
West Ring Port : +20  MepId: 2  Remote MepId: 4       Status: Blocked

Periodic timer interval:  5000 millisec (Enabled)
Hold-off timer interval:  0    millisec (Enabled)
Guard timer interval   :  500  millisec (Enabled)
WTB timer interval     :  5500 millisec (Enabled)
WTR timer interval     :  1000 millisec (Enabled)
```

```
Ring MD Level          :  1
CCM Interval East      :  1000 millisec
CCM Interval West      :  1000 millisec
Notify Topology Change :  -------
Subring Mode           :  Virtual Channel

ERPS Control Vlan: cvl           VID:1000
Topology Change Propogation List: None
Topology Change Propogation  : Disabled
ERPS Ring's Sub-Ring(s): None
ERPS Ring has following Protected Vlan(s):
    Vlan Name                    VID
    pvl                          1001
Number of Protected Vlans: 1
(+) RPL Protection Port, (^) RPL Neighbor Port
(f) Force Switch Port, (m) Manual Switch Port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show erps statistics

show erps *ring-name* **statistics**

Description

Display control packet and event statistics for an *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to display control packet and event statistics for an ERPS ring.

Example

The following example displays statistics for an ERPS ring named "R1":

```
# show erps "R1" statistics
port    Sent   Received  Dropped   Blocked  Un-blocked  SF   SF-clear
        R-APS  R-APS     R-APS     events   events
-------------------------------------------------------------------
2:1     2309   3400       4         5         0         0         0
1:20     100     45       0         0        10      2000       100
-------------------------------------------------------------------
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show esrp

```
show esrp { {name} | {type [vpls-redundancy | standard]} }
```

Description

Displays *ESRP* configuration information for one or all ESRP domains on the switch.

Syntax Description

name	Specifies an ESRP domain name.
type	Specifies whether ESRP is standard or redundant VPLS.
vpls-redundancy	Specifies redundant VPLS.
standard	Specifies standard ESRP.

Default

Shows summary ESRP information.

Usage Guidelines

This command shows information about the state of an ESRP domain and its neighbors. This includes information about tracked devices.

In addition to ESRP information, ELRP status information is also displayed. This includes information about the master and pre-master states, number of transitions to the pre-master state, and the ports where ELRP is disabled.

The output varies depending upon the configuration and the state of the switch.

Example

The following command displays summary ESRP status information for the ESRP domains on the switch:

```
show esrp
```

The following is sample output from this command:

```
ESRP:                     Enabled
Configured Version:       Extended
# ESRP domain configuration :
-------------------------------------------------------------------------------- Domain
Grp Ver VLAN    VID  DId   IP/IPX         State  Master MAC Address Nbr
-------------------------------------------------------------------------------
ed2     0  E v2      2    2    2.2.2.3         Master   00:01:30:f9:9e:90  0
ed2     5  E v2      2    2    2.2.2.3         Aware    00:01:00:0D:9e:8a  0
ed3     0  E v3      3    3    0.0.0.0         Aware    00:01:00:0C:F0:D1  0
ed4     0  E v4      4    4    0.0.0.0         Slave    00:00:00:00:00:00  0
-------------------------------------------------------------------------------
# ESRP Port configuration:
-------------------------------------------------------------------------------
Port      Weight        Host    Restart
-------------------------------------------------------------------------------
6:1        0            H
6:2       10
6:3        0                    R
```

The following command displays detailed ESRP status information for the specified ESRP domain on the switch (the election policy displayed is the default policy in extended mode):

```
show esrp ed2
```

The following is sample output from this command:

```
show esrp ed2
Domain:                   ed2
Group:                    0
Operational Version:      extended
Vlan Interface:           v2
Vlan Tag:                 2
Domain Id:                2
Rtif. Admin Status:       DOWN
Rtif. Virtual Mac :       00:e0:2b:00:00:80

```

History

This command was first available in ExtremeXOS 11.0.

ELRP status information was added in ExtremeXOS 11.1.

Ping success information added in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show esrp aware

```
show esrp domain aware {selective-forward-ports | statistics}
```

Description

Displays all selective forwarding information for a given *ESRP*-aware domain.

Syntax Description

domain	Specifies the name of an ESRP domain.
selective-forward-ports	Specifies that the selective-forward-port table is the only table displayed.
statistics	Specifies that the selective-forward-port statistics table is the only table displayed.

Default

Disabled.

Usage Guidelines

An ESRP-aware switch floods ESRP PDUs from all ports in an ESRP-aware *VLAN*. This flooding creates unnecessary network traffic because some ports forward ESRP PDUs to switches that are not running the same ESRP groups. You can select the ports that are appropriate for forwarding ESRP PDUs by configuring selective forwarding on an ESRP-aware VLAN and thus reduce this excess traffic. Configuring selective forwarding creates a port list of only those ports that forward to the ESRP groups that are associated with an ESRP-aware VLAN. This aware port list is then used for forwarding ESRP PDUs.

The first of the two tables that this command displays shows Selective Forward Ports information:

- Group—The number of an ESRP group within the given domain.
- Port Count—The number of ports in the group that are selected to forward PDUs on the master VLAN.
- Selective Forward Ports—The list of ports in the group that are selected to forward PDUs on the master VLAN.

The second of the two tables displays statistical information about the activity of the ports:

- Group—The number of an ESRP group within the given domain.
- Master MAC—The MAC address for the master of the group.
- Rx—The number of PDUs received matching the domain/group pair.
- Fwd—The number of PDUs received and forwarded matching the domain/group pair.
- *FDB* Flush—The number of FDB Flush requests received from the ESRP Master for this domain/group pair.
- Fwd Ports—Selective or Default.

  Selective describes the group as having a configured aware port list for selective forwarding of PDUs on the Master VLAN. The list of ports is displayed in the first table above.

  Default describes the group as one where all the ports on the master VLAN forward the ESRP PDUs that are received for the domain/group pair. Because there is no selective forwarding configuration for this group, there is no entry in the first table.

Example

The following command displays the ESRP aware information for the domain d1.

```
show esrp d1 aware
Domain:             d1
Vlan:            vesrp1
-------------------------------------------------
Group                Port Count                    Selective Forward Ports
-------------------------------------------------
0                5                    5:1, 5:2, 7:31, 7:32: 8:1
3                2                    5:1, 8:1
-------------------------------------------------------------------------
Group            Master MAC                                 Rx            Fwd
FDB Flush                    Fwd Ports
-------------------------------------------------------------------------
0            00:12:00:33:44:55                                 10
10                        1        selective

```

```
77                          3
default
3             00:02:00:13:11:11                                99
99                          3        selective
```

History

This command was first available in Extreme XOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show esrp counters

```
show esrp {name} counters
```

Description

Displays *ESRP* counter information for ESRP or for a specified ESRP domain.

Syntax Description

name	Specifies an ESRP domain name.

Default

Displays summary ESRP counter information.

Usage Guidelines

The `show esrp counters` command displays information about the number of:

- Failed received protocol packets
- Failed sent protocol packets
- Dropped protocol packets belonging to unknown ESRP domains
- Dropped protocol packets due to invalid Extreme Encapsulation Protocol (EEP) data
- Dropped packets due to old sequence numbers
- Dropped packets due to an invalid 802.1Q tag
- Dropped packets because the packet length was truncated (packet length is less than expected)
- Dropped packets due to failed checksum verification

The `show esrp {name} counters` command displays information about the number of times ESRP, ESRP-aware, and ESRP error packets were transmitted and received.

Example

The following command displays ESRP counter information:

```
show esrp counters
```

The following is sample output from this command:

```
Current-time:                    Sun Nov 16 00:25:08 2003
esrpStatsRxHelloFailed           = 0
esrpStatsTxHelloFailed           = 0
esrpStatsUnknownDomain           = 0
esrpStatsUnsupportedEEPVersion   = 0
esrpStatsInvalidEEPLength        = 0
esrpStatsNotInTimeWindow         = 0
esrpStatsInvalid8021Qtag         = 0
esrpStatsInvalidSNAPType         = 0
esrpStatsUndersizePkt            = 0
esrpStatsInvalidChecksum         = 0
esrpStatsWrongDigest             = 0
```

The following command displays counter information for ESRP domain ed5:

```
show esrp ed5 counters
```

The following is sample output from this command:

```
Domain:  ed5              Current-time:  Sun Nov 16 00:25:27 2003
Rx-Esrp-Pkts         = 628        Tx-Esrp-Pkts         = 630
Rx-Aware-Esrp-Pkts   = 112        Tx-Aware-Esrp-Pkts   = 34
Rx-Err-Pkts          = 0 Tx-Err-Pkts          = 0
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ethernet oam

```
show ethernet oam {ports [port_list] {detail}
```

Description

Displays Ethernet OAM information.

Syntax Description

port_list	Specifies the particular ports.
detail	Specifies that detailed information be displayed.

Default

N/A.

Usage Guidelines

Use this command to display basic Ethernet OAM information for specified ports on the switch. If you do not specify the port(s), information for all ports is displayed.

Use the detail option for additional information.

When operating as a stack master, the switch can process this command for ports on supported platforms.

Example

The following command displays basic Ethernet OAM information for all ports:

```
show ethernet oam
```

Following is sample output from the command:

```
switch # show ethernet oam
================================================
Port  Flags   Tx Cnt Rx Cnt Tx Err Rx Err
================================================

```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fabric attach agent

```
show fabric attach agent
```

Description

Displays known fabric attach agent information.

Syntax Description

agent	Displays Fabric Attach agent information.

Default

N/A.

Example

The following example shows Fabric Attach agent information:

```
# show fabric attach agent
Fabric Attach Agent Status
------------------------------------------------------
Service Status:          Enabled
Element Type:            Disabled
Zero Touch Status:       Not Supported
Auto Provision Setting:  Not Supported
Provision Mode:          Not Supported
Client Proxy Status:     Enabled
Standalone Proxy Uplink: 10
Agent Timeout:           240 seconds
```

```
Extended Logging Status: Not Supported
Primary Server ID:       00-04-96-a0-a4-93-00-01-00-05
Server Descr: ExtremeXOS (X670G2-48x-4q) version 22.5.0.43 xos_22.5
  by cmbuild on Wed Mar 28 08:57:47 EDT 2018
Forward Management VLAN: Enabled
```

History

This command was first available in ExtremeXOS 22.5.

The information about whether or not Fabric Attach proxy switches send Management VLAN data to clients was added in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fabric attach assignments

```
show fabric attach {{vlan} | {vlan} vlan_name | vlan vlan_id}
   assignments
```

Description

Displays known fabric attach assignment information.

Syntax Description

assignments	Display Fabric Attach assignments.
vlan	Designates specifying the VLAN.
vlan_name	Specifies VLAN name.
vlan_id	Specifies VLAN ID.

Default

N/A.

Example

The following example shows Fabric Attach assignments information:

```
# show fabric attach assignments
Fabric Attach Mode: Proxy
Port     VLAN  VLAN Name                        Type     ISID/NSI  Status
-------  ----  -------------------------------  -------  --------  --------
          100  VLAN_0100                        Static        100  Active
          400  v4                               Static        400  Active
         1000  VLAN_1000                        Static       1000  Active
5         400  v4                               Dynamic    404040  Rejected
9          20  SYS_VLAN_0020                    Dynamic        20  Active
```

```
9        2500  SYS_VLAN_2500                    Dynamic        25  Active
9        3500  SYS_VLAN_3500                    Dynamic        35  Active
```

History

This command was first available in ExtremeXOS 30.2.

VLAN syntax was clarified in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fabric attach elements

```
show fabric attach elements
```

Description

Displays known fabric attach elements information.

Syntax Description

elements	Display Fabric Attach elements (neighbors).

Default

N/A.

Example

The following example shows Fabric Attach element information:

```
# show fabric attach elements
Fabric Attach Mode: Standalone Proxy

                                                        Mgmt     Auto
System Id                       Port    Type            VLAN Tag Provision
------------------------------- ------- --------------- ---- --- --------------
00-21-70-f2-37-05-00-00-00-00 2       Virtual Switch   1212 Mix Disabled
6c-a8-49-5a-44-00-00-00-00-d3 20      Server (No Auth) 1212 Mix Disabled
```

History

This command was first available in ExtremeXOS 22.4.

The the term **neighbors** was changed to **elements** in ExtremeXOS 22.5.

Standalone proxy mode information was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fabric attach port

```
show fabric attach ports [port_list | all]
```

Description

Displays the Fabric Attach port configuration.

Syntax Description

ports	Specifies the port to configure.
port_list	Specifies a list of ports to configure.
all	Specifies configuring all ports in the system.

Default

If no mapping is present, no information will be displayed for the client type.

Usage Guidelines

Use this command to display configured Fabric Attach ports.

Example

The following example displayes configured Fabric Attach ports:

```
# show fabric attach ports 25
Port       Disabled Managment Forward Authentication
---------  -------- ----------------- --------------
25         Yes      Off               Disabled
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fabric attach ports authentication

```
show fabric attach ports [port_list | all] authentication {detail}
```

Description

Shows Fabric Attach authentication information.

Syntax Description

ports	Specifes ports to show.
port_list	Specifies the list of ports to show.
all	Shows information for all ports in the system.
authentication	Specifies showing Fabric Attach authentication information.
detail	Specifies showing detailed Fabric Attach authentication information.

Default

N/A.

Usage Guidelines

This command shows the configuration settings from the `configure fabric attach` **ports** [*port_list* | **all**] **authentication** [**disable** | **enable** | **key** {*key* | **default** | **encrypted** *encrypted_key*}] command.

Example

The following example shows Fabric Attach authentication information on port 1:

```
# show fabric attach ports 1 authentication
Port       Authentication
---------  --------------
1          Enabled
```

The following example shows detailed Fabric Attach authentication information on all ports:

```
show fabric attach ports all authentication detail
Port       Authentication  Encrypted Key
---------  --------------  ------------------------------------------------------------
1          Enabled         "#$GuZJvU40xnRwKd+PUlsBxSwfpQYr5w=="
2          Disabled
"#$4MoonVveq8vrk9BrKO9I673CCDfnWUEcAcKeTZcvQup3XFApn36GWvMGXAl3TpufrUXPZPV2geztybwV/
0xfLoFt+zg/4g=="
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fabric attach statistics

```
show fabric attach statistics
```

Description

Displays known fabric attach statistics information.

Syntax Description

statistics	Displays Fabric Attach statistics.

Default

N/A.

Usage Guidelines

To clear these statistics, use the `clear counters` command.

Example

The following example shows Fabric Attach statistics information:

```
# show fabric attach statistics
          Element     Element     Element     Auth
Port      Received    Timed Out   Deleted     Failed
-------  ----------  ----------  ----------  ----------
1:20     4000000000  4000000000  4000000000  N/A
1:2              25           0           3  N/A
2:32           1234           0          12  N/A
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fabric attach zero-touch-client

```
show fabric attach zero-touch-client
```

Description

Displays the configured ZTC mappings for Fabric Attach Zero Touch Clients.

Syntax Description

zero-touch-client	Displays Zero Touch Clients.

Default

If no mapping is present, no information will be displayed for the client type.

Usage Guidelines

This command is only used when mappings are present.

Example

The following example displays configured Fabric Attach Zero Touch Clients:

```
# show fabric attach zero-touch-client
Client Name         VLAN Name                       NSI/I-SID Priority Status
------------------- ------------------------------- --------- -------- --------
wap-type1           VLAN_123                            11111    dot1p Enabled
camera              VLAN_200                             2000        5 Disabled
ona-spb-over-ip     VLAN_4001                           40001        7 Enabled
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show failsafe-account

```
show failsafe-account
```

Description

Displays whether the user configured a username and password for the failsafe account or shows the configured connection type access restrictions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view the failsafe account configuration.

The command shows the access permissions and whether or not the user configured a username and password. It does not show the configured username or password.

Example

The following command displays the failsafe account configuration:

```
show failsafe-account
```

Output from this command looks similar to the following when a failsafe account username and password have been configured with all connections types permitted for failsafe account access:

```
The Failsafe Account is enabled for these connection types:
        - Serial Console
        - Control Fabric (inter-node)
```

Output from this command looks similar to the following when the factory default (i.e. no user-specified username and password are configured) is in effect:

```
The Failsafe Account is disabled.
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fans

```
show fans {detail}
```

Description

Displays the status of the fans in the system.

Syntax Description

detail	The detail option is reserved for future use.

Default

N/A.

Usage Guidelines

Use this command to view detailed information about the health of the fans.

This status information may be useful for your technical support representative if you have a network problem.

The switch collects and displays the following fan information:

- State—The current state of the fan. Options are:
  - Empty: There is no fan installed.
  - Failed: The fan failed.
  - Operational: The fan is installed and working normally.
- NumFan—The number of fans in the fan tray.
- Fan Name, displayed as Fan-1, Fan-2, and so on—Specifies the individual state for each fan in a fan tray and its current speed in revolutions per minute (rpm).

Note
For the ExtremeSwitching X435-24P-4S switches, you cannot view the fan speed.

Bridge Port Extenders (BPEs)

Fan information for bridge port extenders (BPEs) does not appear in this command. Use the `show` **`vpex bpe`** {**`slot`** *`slot_num`*} {**`environment`**} command instead.

Example

The following command displays the status of the installed fans. If a fan is not installed, the state of the fan is Empty.

```
show fans
```

The following is sample output from an ExtremeSwitching switch:

```
FanTray information:
State:                  Operational
NumFan:                 6
PartInfo:               0931G-00064 450237-00-05
Revision:               5.0
Fan-1:                  Operational at 14894 RPM
Fan-2:                  Operational at 15360 RPM
Fan-3:                  Operational at 15360 RPM
Fan-4:                  Operational at 9637 RPM
Fan-5:                  Operational at 9637 RPM
Fan-6:                  Operational at 9637 RPM
```

The following is a sample output from a SummitStack:

```
FanTray-1 information:
State:                  Operational
NumFan:                 1
Fan-1:                  Operational at 1000 RPM
FanTray-2 information:
```

```
State:                  Operational
NumFan:                 1
Fan-1:                  Operational at 1000 RPM
FanTray-3 information:
State:                  Operational
NumFan:                 1
Fan-1:                  Operational at 1000 RPM
FanTray-4 information:
State:                  Operational
NumFan:                 1
Fan-1:                  Operational at 1000 RPM
FanTray-5 information:
State:                  Empty
FanTray-6 information:
State:                  Empty
FanTray-7 information:
State:                  Empty
FanTray-8 information:
State:                  Empty
```

History

This command was first available in an ExtremeXOS 10.1.

Information about the current speed in RPM was added to the `show fans` output in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fdb

```
show fdb {blackhole {netlogin [all | mac-based-vlans]} | netlogin [all
   | mac-based-vlans] | permanent {netlogin [all | mac-based-vlans]}
   | mac_addr {netlogin [all | mac-based-vlans]} | ports port_list
   {netlogin [all | mac-based-vlans]} | [ {vlan} vlan_name | vlan
   vlan_list] {netlogin [all | mac-based-vlans]} | {{vpls} {vpls_name} |
   vxlan { vni } | virtual-network vn_name}}
```

Description

Displays *FDB* entries.

Syntax Description

blackhole	Displays the blackhole entries. (All packets addressed to these entries are dropped.)
slot	Specifies a slot in the switch.
num_entries	Specifies the maximum number of hardware entries to display. The range is 1 to 25.
netlogin all	Displays all FDBs created as a result of the netlogin process.

netlogin mac-based-vlans	Displays all netlogin MAC-based *VLAN* FDB entries.
permanent	Displays all permanent entries, including the ingress and egress *QoS* profiles.
mac_addr	Specifies a MAC address, using colon-separated bytes, for which FDB entries should be displayed.
port_list	Displays the entries for one or more ports or ports and slots.
vlan_name	Displays the entries for a specific VLAN.
vlan_list	Displays a VLAN list of IDs.
vpls_name	Specifies a specific VPLS for which to display entries.
vxlan	MAC addresses reachable through VXLAN-encapsulated Tunnels.
vni	MAC Addresses reachable through VXLAN tunnels encapsulated with the specified Virtual Network Identifier value.
virtual-network	MAC addresses associated with a Virtual Overlay Network learning domain.
vn_name	Alphanumeric string identifying the Virtual Network whose associated MAC addresses need to be displayed.

Default

All.

Usage Guidelines

The pulling of MAC addresses for display purposes is given a lower priority to the actual data path learning. Eventually all the MAC addresses are learned in a quiescent system.

The show fdb command output displays the following information:

Mac	The MAC address that defines the entry.
Vlan	The PVLAN or VLAN for the entry.
Age	The age of the entry, in seconds (does not appear if the keyword permanent is specified).

Flags	Flags that define the type of entry: • b - Ingress Blackhole • B - Egress Blackhole • D - Drop entry for an isolated subscriber VLAN • d - Dynamic • h - hardware aging • i - an entry also exists in the IP FDB • l - lockdown MAC • L - lockdown-timeout MAC • m - MAC • M - Mirror • n - *NetLogin* • o - IEEE 802.1ah backbone MAC • P - PVLAN created entry • p - Permanent • s - Static • v - NetLogin MAC-Based VLAN • x - an entry also exists in the IPX FDBs. • X - VXLAN
Port List	The ports on which the MAC address has been learned.

Example

The following example shows how the FDB entries appear for all options except the hardware option:

```
# show fdb
Mac                     Vlan       Age  Flags       Port / Virtual Port List
-------------------------------------------------------------------------------
00:0c:29:4b:34:cf       v101(0101) 0041 d m       D  1:2
00:0c:29:4b:34:cf       v100(0100) 0041 d m       P  1:2
00:0c:29:d2:2d:48       v102(0102) 0045 d m          1:3
00:0c:29:d2:2d:48       v100(0100) 0045 d m       P  1:3
00:0c:29:f1:f2:f5       v100(0100) 0045 d m          1:1
00:0c:29:f1:f2:f5       v102(0102) 0045 d m       P  1:1
00:0c:29:f1:f2:f5       v101(0101) 0045 d m       P  1:1
Flags : d - Dynamic, s - Static, p - Permanent, n - NetLogin, m - MAC, i - IP,
x - IPX, l - lockdown MAC, L - lockdown-timeout MAC, M- Mirror, B - Egress
        Blackhole,
b - Ingress Blackhole, v - MAC-Based VLAN, P - Private VLAN, T - VLAN
        translation,
D - drop packet, h - Hardware Aging, o - IEEE 802.1ah Backbone MAC.
S - Software Controlled Deletion, r - MSRP
X - VXLAN, E - EVPN
Total: 3 Static: 0  Perm: 0  Dyn: 3  Dropped: 0  Locked: 0  Locked with Timeout: 0
FDB Aging time: 300
FDB VPLS Aging time: 300
```

The following example output shows where the port tag is displayed in parentheses:

```
# show fdb
Mac                     Vlan       Age  Flags       Port / Virtual Port List
-------------------------------------------------------------------------------
00:00:00:00:04:0a       test(0200) 0057 d m            3(0010)
00:00:00:00:04:0b       test(0200) 0300 d m            3(0011)
00:01:02:03:04:05       test(0200) 0000 spm            3(0010)
Flags : d - Dynamic, s - Static, p - Permanent, n - NetLogin, m - MAC, i - IP,
```

```
        x - IPX, l - lockdown MAC, L - lockdown-timeout MAC, M- Mirror, B - Egress
Blackhole,
        b - Ingress Blackhole, v - MAC-Based VLAN, P - Private VLAN, T - VLAN translation,
        D - drop packet, h - Hardware Aging, o - IEEE 802.1ah Backbone MAC,
        S - Software Controlled Deletion, r - MSRP,
        X - VXLAN, E - EVPN
        Total: 3 Static: 0  Perm: 0  Dyn: 3  Dropped: 0  Locked: 0  Locked with Timeout: 0
        FDB Aging time: 300
        FDB VPLS Aging time: 300
```

The following show fdb example includes VXLAN output:

```
# show fdb vxlan
Mac                 Vlan Age Flags Port / Virtual Port List
------------------------------------------------------------------------------
00:00:00:00:00:21 vlan101 0000 s mX VR-Default:20.20.20.1

FDB Aging time: 300
```

History

This command was first available in ExtremeXOS 10.1.

The **stats** and **netlogin** parameters were first available in ExtremeXOS 11.3.

The blackhole output under the **b** and **B** flags was first available for all platforms in ExtremeXOS 12.1.

The **o** flag was first available in ExtremeXOS 12.4.

The *vlan_list* variable was added in ExtremeXOS 16.1.

The command was enhanced to show the MAC to IP binding entries in ExtremeXOS 21.1. In addition to retrieving all FDB entries known to the switch, you can query the filtering database for all fdb entries learned within a virtual network (key: <vn_name>), all entries learnt on VXLAN tunnels (token: vxlan) and entries learned on VXLAN tunnels on a specific VNI (key:VNI).

Flag for EVPN-learned entries was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fdb mac-tracking configuration

```
show fdb mac-tracking configuration
```

Description

Displays configuration information for the MAC address tracking feature.

Syntax Description

This command has no arguments or variables.

Default

The MAC address tracking table is empty.

Usage Guidelines

None.

Example

The following exmaple displays the contents of the MAC address tracking table:

```
# show fdb mac-tracking configuration
MAC-Tracking enabled ports: 1-3,10,20
SNMP trap notification    : Enabled
MAC address tracking table (4 entries):
00:30:48:72:ee:88
00:21:9b:0e:ca:32
00:12:48:82:9c:56
00:30:48:84:d4:16
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fdb mac-tracking statistics

```
show fdb mac-tracking statistics {mac_addr} {no-refresh | refresh}
```

Description

Displays statistics for the MAC addresses that are being tracked.

Syntax Description

mac_addr	Specifies a MAC address, using colon-separated bytes, for which *FDB* entries should be displayed.
no-refresh	Specifies a static snapshot of data instead of the default dynamic display.
refresh	Specifies a continuous refresh of output.

Default

N/A.

Usage Guidelines

Use the keys listed below the display to clear the statistics counters or page up or down through the table entries.

Example

The following example displays statistics for the entries in the MAC address tracking table:

```
# show fdb mac-tracking statistics
MAC Tracking Statistics      Fri Mar 20 15:25:01 2009
Add         Move        Delete
MAC Address         events      events      events
=======================================================

00:00:00:00:00:18           0           0           0
=======================================================
0->Clear Counters  U->page up  D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 12.3.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fdb static-mac-move configuration

```
show fdb static-mac-move configuration
```

Description

Displays the configuration for the feature that reports the discovery of MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example shows the command display:

```
# show fdb static-mac-movement configuration
Static MAC Movement Notification: Enabled
MAC learning Packets Count      : 5
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show fdb stats

```
show fdb stats {{ports {all | port_list} | vlan {all} | [ {vlan}
   vlan_name | vlan vlan_list] {no-refresh |refresh}}
```

Description

Displays *FDB* entry statistics for the specified ports or VLANs in either a dynamic or a static report.

Syntax Description

all	Requests statistics for all ports or all VLANs.
port_list	Specifies which ports are to be included in the statistics display.
vlan_name	Specifies a single *VLAN* to be included in the statistics display.
vlan_list	Specifies a VLAN list of IDs to be included in the statistics display.
refresh	Specifies a continuous refresh of output.

Default

Summary FDB statistics for the switch.

Usage Guidelines

The dynamic display remains visible and continues to update until you press **[Esc]**.

The `show fdb stats` command output displays the following information:

Port	When you chose to display statistics for ports, this column displays port numbers.
Link State	When you chose to display statistics for ports, this column displays the link states, which are described at the bottom of the display.
VLAN	When you chose to display statistics for VLANs, this column displays VLAN names.
MAC Addresses	This column displays the total number of MAC addresses for each port or VLAN.
Dynamic	This column displays the total number of MAC addresses that were learned dynamically for each port or VLAN.
Static	This column displays the total number of MAC addresses that are configured on this switch for each port or VLAN.
Dropped	This column displays the total number of dynamic MAC addresses that were discovered, but not stored in the FDB. Discovered MAC addresses might be dropped because a configured learning limit is reached, the FDB is in lockdown, or a port forwarding state is in transition. Some conditions that lead to dropped MAC addresses can produce log messages or *SNMP* traps.

Example

The following command example displays summary FDB statistics for the switch:

```
torino1.1 # show fdb stats
Total: 4 Static: 3 Perm: 3 Dyn: 1 Dropped: 0
FDB Aging time: 300
FDB VPLS Aging time: 300
torino1.2 #
```

The following command example displays FDB statistics for ports 1 to 16 on slot 1:

```
# show fdb stats ports 1:1-1:16
FDB Stats                                          Mon Mar 15 15:30:49 2010
Port        Link   MAC
State   Addresses      Dynamic       Static      Dropped
================================================================================
1:1           A         2394         2389            5            2
1:2           A           37           37            0            0
1:3           A          122          121            1          452
1:4           R            0            0            0            0
1:5           R            0            0            0            0
1:6           A           43           43            0            0
1:7           A          118          118            0            0
1:8           R            0            0            0            0
1:9           R            0            0            0            0
1:10          A            8            8            0            0
1:11          A         2998         2990            8            1
1:12          A          486          486            0            0
1:13          R            0            0            0            0
1:14          A           42           42            0            0
1:15          A          795          795            0            0
1:16          A           23           23            0            2
================================================================================
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
U->page up  D->page down ESC->exit
```

The following command example displays FDB statistics for all VLANs:

```
# show fdb stats vlan all
FDB Stats                                             Mon Mar 15 15:30:49 2010
VLAN                       MAC Addresses     Dynamic     Static     Dropped
================================================================================
SV_PPPOE                              2394        2389          5           2
NV_PPPOE                               122         121          1         452
================================================================================
U->page up  D->page down  ESC->exit
```

History

The dynamic display for this command was first available in ExtremeXOS 12.4.2.

The **no-refresh** keyword was removed in ExtremeXOS 16.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show flow-redirect

```
show flow-redirect {flow_redirect_name}
```

Description

Displays nexthop ipaddresses, up/down status, health-checking (ping/ARP/ND) and *ACL* bindings.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.

Default

N/A.

Usage Guidelines

None.

Example

The following example displays information for all redirection policies:

```
Switch.1 # show flow-redirect
Name          Nexthop  Active          VR Name     Inactive  Health
Count    IP Address                  Nexthops  Check
=================================================================
pkh           2        2001:400::100   VR-Default  Forward   PING
ND: Neighbor Discovery
```

The next example displays an IPv6 redirection policy for a longer IPv6 address, which causes a two-line display for the related redirection policy:

```
Switch.13 # sh flow-redirect
Name          Nexthop  Active             VR Name     Inactive  Health
Count    IP address                     Nexthops  Check
=================================================================
pbr1          2        2004:1000:1000:1000::10
VR-Default  Forward   PING
ND: Neighbor Discovery
```

This example displays information for a specified IPv6 redirection policy:

```
* Switch.14 # show flow-redirect "pbr1"
Name             : pbr1                  VR Name          : VR-Default
Inactive Nexthops: Forward               Health Check     : PING
Nexthop Count    : 2
Active IP Address : 2004:1000:1000:1000::10
Index    State      Priority  IP Address          Status Interval Miss Success
=============================================================================
0        Disabled   200       2003::10            DOWN   2        2    5
1        Enabled    100       2004:1000:1000:1000::10
UP     2        2
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Ping success count information added in ExtremeXOS 22.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in the *Switch Engine 32.2 Feature License Requirements* document..

NEW! show flowmon

```
show flowmon
```

Description

Displays the state of Flow Monitor.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to show whether Flow Monitor is in enabled or disabled state, the number of groups, number of keys, and number of collectors. It also shows the current total number of flows learned in each hardware domain.

Example

The following command shows Flow Monitor information:

```
# show flowmon
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! show flowmon collector

```
show flowmon collector [collector_name | all] detail
```

Description

Displays Flow Monitor collector information.

Syntax Description

collector	Specifies to send flow information to a collector.
collector_name	Specifies the name of the created collector. Range is 32 characters.
all	Specifies to show Flow Monitor information for all collectors.
detail	Specifies to show all information associated with the specified collector.

Default

N/A.

Usage Guidelines

If **detail** is entered, the source and destination IPv4 addresses, source and destination UDP ports, VR name, and export MTU size are displayed.

If *collector_name* is not entered, then a list of collectors is displayed.

Example

The following command displays detail information for a collector with the name 'c1':

```
# show flowmon collector c1 detail
Name                                  : c1
Destination IP address                : 11.1.1.100
Virtual Router                        : VR-Default (default)
Source IP address                     : 11.1.1.1
Source UDP port                       : 46562 (default)
Destination UDP port                  : 4739 (default)
Export MTU                            : 512 (default)
Refresh time                          : 600 (default)
* (pacman debug) 5420F-24T-4XE-SwitchEngine.13 #

* (pacman debug) 5420F-24T-4XE-SwitchEngine.13 # show flowmon key k1 detail
Name                                  : k1
Type                                  : IPv4
Group                                 : g1
Destination IP address                : 11.1.1.101
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! show flowmon group

```
show flowmon group group_name | all] detail
```

Description

Displays Flow Monitor group information.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.
all	Specifies to show Flow Monitor information for all groups.
detail	Specifies to show all information associated with the specified group.

Default

N/A.

Usage Guidelines

For each Flow Monitor group, the group name and parameters are shown.

When **detail** is entered, the assigned collector name, complete template name, template key portion name, and a list of key names, dependent keys and containing groups are shown. In addition, the group state and whether the group is enabled or disabled are shown. The group state is defined as follows:

- Configuring – The user is configuring the group, and the group is not enabled.
- GroupInstall – The group is being installed.
- KMirrorInstall – The K-mirror rule is being installed for the group.
- KeysInstall – The rules related to the keys that are added to the group are being installed.
- Ready – The group is fully installed and awaiting hardware activation.
- CollectorActivate – The collector is being informed of the complete templates associated to the group.
- GroupActivate – The group is being activated.
- Active – The group is fully active, and flows are being collected and advertised to the collector.

When **all** is entered, then all groups are shown with full detail.

Example

The following command displays detail information for the group 'g1':

```
# show flowmon group g1 detail
Name                                    : g1
Group is configured to be               : Enabled
Group is operationally                  : Enabled
Max Flow Age                            : 60000      (default)
Flow Limit                              : 256
Collector                               : c1
Group State                             : Active
Group Last Failed State                 : <none>
Group enable backoff in progress        : No
Complete template name                  : g1
Key template name                       : k1
Keys added to this group:
  k1
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! show flowmon group statistics

```
show flowmon group group_name statistics no-refresh wide
```

Description

Displays Flow Monitor group statistics information.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.
statistics	Specifies to show Flow Monitor information for all groups.
no-refresh	Specifies to show only one sample of the statistics and then exit the statistics display.
wide	Specifies to show a wider version of the display.

Default

N/A.

Usage Guidelines

When *group_name* is entered, only the statistics for that group are shown. When not entered, all groups are shown using the **Page Up** and **Page Down** options.

Each group name is displayed along with the number of active flows, the number of flows that have aged out, the number of flows that were not learned because the group flow limit was exceeded, the number of flows learned on the group, and the number of flows that were not learned because the flow table was full.

When **no-refresh** is provided, the specified group or groups are displayed one time with their current values.

If **no-refresh** is not entered, the display is updated with refreshed values every five seconds. This display operates as a standard updatable Switch Engine statistics display, providing **Page Up**, **Page Down**, **Exit**, and **Clear** options.

When **no-refresh** is entered, the specified group or groups are displayed one time with their current values.

When **wide** is entered, a wider version of the display is shown. When **wide** is not entered, the counters are limited to a display width that fits into 80 display columns. When **wide** is provided, the full 64-bit counter value can be displayed (about 21 columns per integer value).

Example

The following command shows statistics for a group with the name 'g1' with **no-refresh** specified:

```
# show flowmon gr g1 statistics  no-refresh
Group Name               Active   Aged Out Flow Limit    Learned Full Table State

```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! show flowmon group template

```
show flowmon group group_name template detail
```

Description

Displays Flow Monitor group template information.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.
template	Specifies to show template information for the specified group.
detail	Specifies to show all information associated with the specified group.

Default

N/A.

Usage Guidelines

The complete template name is shown with the template key portion name.

When **detail** is entered, the Element IDs are shown in text form.

Example

The following command shows template information for the group 'max-flow-age':

```
# show flowmon group max-flow-age template
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! show flowmon key

```
show flowmon key key_name
```

Description

Displays Flow Monitor key information.

Syntax Description

key	Specifies the Flow Monitor key.
key_name	Specifies the assigned name of the Flow Monitor key. Range is 32 characters.
all	Specifies to show Flow Monitor information for all keys.
detail	Specifies to show all information associated with the specified key.

Default

N/A.

Usage Guidelines

For each key, the name, type, associated group name (if applicable), and the 'before' or after key name (if applicable) are displayed.

When **all** is entered and **detail** is not specified, all keys are shown in tabular format.

When **detail** is entered, the IPv4 or IPv6 address and mask, source or destination UDP or TCP port, protocol or next header, and specified list of ports to which the key is applied are shown. If none are specified, all values are shown.

Example

The following command displays information for a key with the name 'src-ipv4-addr':

```
# show flowmon key src-ipv4-addr
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

show forwarding configuration

```
show forwarding configuration
```

Description

Displays the configured selection criteria for *ECMP* routes and load-sharing group ports and the hardware table settings, including the configured and current hash algorithm and dual-hash settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output of this command displays the following information:

- Configured hash algorithm—The hash algorithm configured on the switch. After the configuration is saved and the switch is rebooted, the switch uses this hash algorithm.
- Current hash algorithm—The hash algorithm currently used by the switch.
- Configured dual-hash setting—Whether the dual-hash feature is configured ‘on’ or ‘off’ on the switch. After the configuration is saved and the switch is rebooted, the switch uses this setting.
- Current dual-hash setting—Whether the dual-hash feature is currently ‘on’ or ‘off’ on the switch.
- Dual-Hash recursion level—The current dual-hash recursion level; default is ‘1.’
- Sharing criteria—Current selection criterion used for ECMP route sharing as well as for load-sharing groups. Specifies which Layer 3 and Layer4 information is used in the sharing hash algorithm. For more information, see the description for the `configure forwarding sharing [L3 | L3_L4]` command.
- Group Table Compression—Whether the group table compression is currently ‘on’ or ‘off’ on the switch.
- Switching mode—Whether the switching mode is currently set to ‘cut-through’ or ‘store-and-forward.’
- Fabric flow control—Whether flow control fabric configuration is set to ‘auto’ or ‘off.’
- ARP and ND Settings:—Suppression filter status.
- Extended Edge Switching—VLAN port membership and IP multicast replication status.
- Forward to VLAN filters for mDNS, LLMNR, and UPnP.

It is possible for the values of the configured and the current hash, or the configured and current dual-hash settings to be different. For example, if you modified the hash algorithm and have not saved the configuration and rebooted the switch, the values might be different. In this situation, the switch also displays the following message:

```
NOTE: A save and reboot are required before the configured hash will take effect
```

Example

The following command displays the hardware forwarding algorithm configured on the switch:

```
show forwarding configuration
```

```
L2 and L3 Forwarding table hash algorithm:
    Configured hash algorithm:              crc32
    Current hash algorithm:                 crc32

L3 Dual-Hash configuration:
    Configured setting:                     on
    Current setting:                        on
    Dual-Hash Recursion Level:              1

Hash criteria for IP unicast traffic for L2 load sharing and ECMP route sharing
    Sharing criteria:                       L3_L4

IP multicast:
    Group Table Compression:                on
    Local Network Forwarding:               slow-path
    Lookup-Key:                             (SourceIP, GroupIP, VlanId)

Internal lookup tables:
    Configured Setting:                     l2-and-l3
    Current Setting:                        l2-and-l3

Switch Settings:
    Switching mode:                         store-and-forward

L2 Protocol:
    Fast convergence:                       on

Rate Limit:
    Overhead Bytes:                         20

Fabric Flow Control:
    Fabric Flow Control:                    auto

ARP and ND Settings:
    ARP Suppression Filters:                per-port
    ND Suppression Filters:                 per-port

VPEX Settings:
    VLAN Port Membership:                   hash-table
    IPMC Replication:                       bpe

IP multicast:

mDNS: flood

LLMNR: learn

UPnP: flood
```

History

This command was first available in ExtremeXOS 11.3.2.

The flow control feature was added in ExtremeXOS 12.5.

The Forwarding Lookup-Key feaure show output is added in ExtremeXOS 15.3.

Extended Edge Switching setting for VLAN port membership was added in ExtremeXOS 22.6.

Extended Edge Switching IP multicast replication feature information was added in ExtremeXOS 30.6.

Forward to VLAN filters for mDNS, LLMNR, and UPnP was added in Release 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show forwarding hardware-utilization

```
show forwarding hardware-utilization {slot [slot_num | all]}
```

Description

Shows forwarding hardware table utilization statistics.

Syntax Description

hardware-utilization	Specifies showing hardware table utilization statistics.
slot	Specifies selecting slots.
slot_num	Specifies which slots to show statistics for.
all	Specifies showing statistics for all slots.

Usage Guidelines

Shows forwarding hardware table utilization statistics with L2, L3 and ACLs configured.

Example

The following example shows table utilization statistics:

```
# show forwarding hardware-utilization

Hardware Table Utilization Statistics

Slot: 1
Type: X870-32c
Resource Type           Current    Maximum    % Util.
--------------------    -------    -------    -------
MAC Entries                   0      73727          0
Host Entries                  0      73728          0
IPv4 Entries                  0      73728          0
IPv6 Entries                  0      36864          0
Long IPv6 Entries             0       2048          0
Total Routes                  0      16384          0
IPv4 Neighbors                0        N/A        N/A
IPv6 Neighbors                0        N/A        N/A
IPv4 Routes                   0        N/A        N/A
IPv6 Routes                   0        N/A        N/A
ECMP Next Hops                0       1023          0
ACL Ingress Entries          40       6144          0
ACL Ingress Counters          0      38912          0
ACL Ingress Meters            0       2048          0
ACL Ingress Slices            0         12          0
ACL Egress Entries            0       1024          0
```

```
ACL Egress Counters            0       1024          0
ACL Egress Meters              0       1024          0
ACL Egress Slices              0          4          0
ACL VLAN Entries *                     1       2048          0
ACL VLAN Slices *                      1          4         25

Legend: N/A - Maximum not defined in published sFlow structure.
        *   - Resource type not defined in published sFlow structure.
              Also see IP usage in 'show iproute reserved-entries statistics'.
```

History

This command was first available in ExtremeXOS 22.6.

Legend explaining N/A entries was added in ExtremeXOS 30.1.

ACL VLAN entries and slices was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show heartbeat process

```
show heartbeat process {name}
```

Description

Displays the health of the ExtremeXOS processes.

Syntax Description

name	Specifies the name of the process.

Default

N/A.

Usage Guidelines

The software monitors all of the ExtremeXOS processes running on the switch. This process monitor creates and terminates XOS processes on demand (for example, when you log in or log out of the switch) and restarts processes if an abnormal termination occurs (for example, if your system crashes). The process monitor also ensures that only version-compatible processes and processes with proper licenses are started.

The `show heartbeat process` command is a resource for providing background system health information because you can view the health of ExtremeXOS processes on the switch.

Use this command to monitor the health of the ExtremeXOS processes. The switch uses two algorithms to collect process health information: polling and reporting. Both polling and reporting measure the heartbeat of the process. Polling occurs when a HELLO message is sent and a HELLO_ACK message is received. The two counts are the same. Reporting occurs when a HELLO_ACK message is sent only. Therefore, no HELLO messages are sent and the HELLO count remains at zero.

The `show heartbeat process` command displays the following information in a tabular format:

- Process Name—The name of the process.
- Hello—The number of hello messages sent to the process.
- HelloAck—The number of hello acknowledgement messages received by the process manager.
- Last Heartbeat Time—The timestamp of the last health check received by the process manager. (Unknown specifies kernel modules and they do not participate in heartbeat monitoring.)

This status information may be useful for your technical support representative if you have a network problem.

You may find it useful to capture the process information under normal operating conditions to establish a baseline. By having a baseline, if you experience a problem, you and your technical support representative can more easily identify the problem.

Example

To display the health of all processes on your system, use the following command:

```
show heartbeat process
```

The following is sample output from a switch:

```
Process Name     Hello HelloAck     Last Heartbeat Time
-------------------------------------------------------------------------
aaa              0        254328   Tue Feb 10 05:21:46 2004

...
```

To display the health of the *STP* process on your system, use the following command:

```
show heartbeat process stp
```

The following is sample output from a switch:

```
Process Name     Hello HelloAck     Last Heartbeat Time
-------------------------------------------------------------------
stp              50870    50870    Tue Feb 10 05:22:13 2004
```

History

This command was first available in an ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show identity-management blacklist

```
show identity-management blacklist
```

Description

Displays the identities in the identity manager blacklist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identities in the blacklist:

```
* Switch.93 # show identity-management blacklist
-----------------------------------------------
Type      BlackList Entry
-----------------------------------------------
MAC       01:02:03:04:05:06/ff:ff:ff:00:00:00
IP        1.2.3.4/255.255.255.0
User      john@mydomain.com
-----------------------------------------------
> indicates entry value truncated past 35 characters
Number of BlackList Entries     : 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show identity-management entries

```
show identity-management entries {user id_name} {domain domain} {ports
   port_list} {mac mac_address} {vlan vlan_name} {ipaddress ip_address}
   {detail}
```

Description

Displays the entries in the identity management database.

Syntax Description

id_name	Limits the display to entries that contain the specified user ID.
domain	Limits the display to entries for the specified domain.
port_list	Limits the display to entries for the specified ports.
mac_address	Limits the display to entries that contain the specified MAC address.
vlan_name	Limits the display to entries that contain the specified *VLAN* name.
ip_address	Limits the display to entries that contain the specified IP address.
detail	Expands the display to include more information about identity management entries.

Default

N/A.

Usage Guidelines

Only admin-level users can execute this command.

The displayed ID Name is the actual user name when Network Login or Kerberos Snooping is enabled. For unknown users, the software creates a user name using the format: User_xxxxxxxxxxxxxxxx. The number in the user name is a 16-bit hash number that is generated using the user's port, MAC address, and IP address numbers.

The displayed Domain Name is displayed only if the client is discovered through Kerberos snooping or Dot1x and the domain name is supplied in the form of *domain**user*). The NetBIOS hostname is only displayed if this information was present in the Kerberos packets.

When the role is shown as multiple, the identity is connected through multiple ports/locations and different roles apply to each device.

Example

The following command displays all entries in the identity management database:

```
* Switch.4 # show identity-management entries
ID Name/          Flags  Port        MAC/          VLAN            Role
Domain Name                          IP
-------------------------------------------------------------------------------

```

The following command example shows that you can specify multiple options, such as the user name and ports:

```
show identity-management entries user eelco ports 2:2
```

History

This command was first available in ExtremeXOS 12.4.

Kerberos Force Aging TTL and Inactive Aging TTL information was added in ExtremeXOS 12.6.

Support for multiple roles for a single identity was added in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show identity-management greylist

```
show identity-management greylist
```

Description

Displays the identities in the identity manager greylist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the identities in the identity manager greylist.

Example

```
* Switch.94 # show identity-management greylist
-------------------------------------------
Type      GreyList Entry
-------------------------------------------
User      june@mydomain.com
User               Richard@corp.acme.com
-------------------------------------------
> indicates entry value truncated past 35 characters
Number of GreyList Entries     : 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show identity-management list-precedence

```
show identity-management list-precedence
```

Description

This command displays the order of list-precedence. The default list-precedence is: greylist blacklist whitelist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the order of list-precedence.

Example

```
* Switch.97 # show identity-management list-precedence
List Precedence:
1.    Greylist
2.    Blacklist
3.    Whitelist
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show identity-management role

```
show identity-management role {role_name} {detail}
```

Description

Displays summary or detailed configuration information for one or all roles.

Syntax Description

role_name	Specifies a name of an existing role to display.
all	Specifies that all roles are to be displayed.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays all roles that are configured on the switch:

```
* Switch.95 # show identity-management role
-------------------------------------------------------------------
Role Name               Priority    Child Roles       # Identities
*authenticated          255                                 0
*unauthenticated        255                                 0
extr-empl               255         extr-engr               2
extr-engr               255                                 0
*whitelist              0                                   0
*blacklist              0                                   3
-------------------------------------------------------------------
Flags : * - Default Roles
-------------------------------------------------------------------
Total number of role(s) configured : 6
```

The following command displays detailed information for all roles that are configured on the switch:

```
* Switch.96 # show identity-management role detail
Role name : extr-empl
Child  Roles : engr
Match Criteria : "company==Extreme;"
Policies : extrPol
Identities : john_smith@d.com; MAC: 00:16:23:51:77:99; Port:8
bob_craig@e.com; MAC: 00:18:23:51:77:99; Port:9
Role name : engr
Child  Roles : india-engr
Match Criteria : "department==Engineering;"
Policies : engrPol, extrPol
Identities : joe_hardy@b.com; MAC: 00:12:23:51:77:99; Port:10
Role name : india-engr
Child  Roles : -
Match Criteria : "country=India; AND department=Engineering;"
Policies : indEngrPol, engrPol, extrPol
Identities : bill_jacob@b.com; MAC: 00:12:33:51:77:99; Port:11
Role name : marketing
Child  Roles : -
Match Criteria : "department=Marketing;"
Policies : markrPol, extrPol
Identities : will_smith@a.com; MAC: 00:11:33:51:77:99; Port:14
Role Name: whitelist (Default Role)
Child Roles : ---
```

```
Priority : 0
Match Criteria : "Not Applicable"
Policies : --
Identities # : 0
Identities : --
Role Name: blacklist(Default Role)
Child Roles : ---
Priority : 0
Match Criteria : "Not Applicable"
Policies : --
Identities # : 3
Identities : Unknown_00:11:22:33:44:55; MAC: 00:11:22:33:44:55; Port:1
johndoe@extremenetworks.com; MAC: 00:01:02:03:04:05; Port:2
janedoe@extremenetworks.com; MAC: 00:02:04:06:08:10; Port:3
```

The next two examples display detailed information for a single role:

```
* Switch.97 # show identity-management role extr-empl detail
Role name : extr-empl
Child  Roles : engr
Match Criteria : "company=Extreme;"
Policies : extrPol
Identities : johnsmith@extreme.com; MAC: 00:11:33:55:77:99; Port:4
bobcraig@extreme.com; MAC: 00:01:03:05:07:09; Port:5
* Switch.98 # show identity-management role NotAccessibleUser detail
Role name : NotAccessibleUser
Child  Roles : engr
Match Criteria : "UserName = adam; AND IP-Address == 1.2.3.0/24; AND port == 1;"
Policies : extrPol
Identities : adam; MAC: 00:00:11:22:33:44; Port: 1
```

History

This command was first available in ExtremeXOS 12.5.

MAC addresses were added to the displays for the detail option in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show identity-management statistics

```
show identity-management statistics
```

Description

Displays operation statistics for the identity management feature.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

A user can login from multiple machines or ports, so the total number of login instances can be more than the number of unique users logged in.

Example

The following command displays the identity management feature statistics:

```
Switch.4 # show identity-management statistics
Total number of users logged in          :    2
Total number of login instances          :    2
Total memory used                        :    1 Kbytes
Total memory used by events              :    0 Kbytes
Total memory available                   :  511 Kbytes
High memory usage level reached count    :    0
Critical memory usage level reached count:    0
Max memory usage level reached count     :    0
Current memory usage level               : Normal
Normal memory usage level trap sent      :    0
High memory usage level trap sent        :    0
Critical memory usage level trap sent    :    0
Max memory usage level trap sent         :    0
Event notification sent                  :    0
Total number of roles configured         :    3
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show identity-management whitelist

```
show identity-management whitelist
```

Description

Displays the identities in the identity manager whitelist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identities in the whitelist:

```
* Switch.94 # show identity-management whitelist
-------------------------------------------
Type      WhiteList Entry
-------------------------------------------
MAC       04:32:13:44:25:06/ff:ff:ff:00:00:00
IP        11.12.13.14/255.255.255.0
User      jane@mydomain.com
-------------------------------------------
> indicates entry value truncated past 35 characters
Number of WhiteList Entries     : 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show identity-management

```
show identity-management
```

Description

Displays the identity management feature configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identity management feature configuration:

```
# show identity-management
Identity Management                    : Enabled
Stale entry age out (effective)        : 180 Seconds (180 Seconds)
Max memory size                        : 512 Kbytes
Enabled ports                          : 1-26
FDB Detection Disabled ports           : None
IPARP Detection Disabled ports         : None
IPSecurity Detection Disabled ports    : None
Kerberos Detection Disabled ports      : None
LLDP Detection Disabled ports          : None
Netlogin Detection Disabled ports      : None
SNMP trap notification                 : Enabled
Match Criteria Inheritance             : On
Access list source address type        : MAC
Kerberos aging time (DD:HH:MM)         : None
Kerberos force aging time (DD:HH:MM)   : None
Valid Kerberos servers                 : none configured(all valid)
```

History

This command was first available in ExtremeXOS 12.4.

Kerberos Force Aging Time information was added in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show igmp

```
show igmp {vlan} {vlanname}
```

Description

This command can be used to display an *IGMP*-related configuration and group information, per *VLAN*.

Syntax Description

vlanname	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

The output of this command shows:

- The VLAN name.
- The router interface IP address and subnet mask.
- If the interface is active (up), by the letter U.
- If IP forwarding is enabled for the interface, by the letter f.
- If multicast forwarding is enabled, by the letter M.
- If IGMP is enabled, by the letter i.
- If IGMP snooping is enabled, by the letter z.

Example

The following command displays the IGMP configuration:

```
# show igmp
VLAN                 IP Address           Flags     nLRMA  nLeMA IGMPver
Default              0.0.0.0        / 0   ---izpt-      0      0       3
isc                  50.50.50.1     /24   ---izpt-      0      0       3
v1                   0.0.0.0        / 0   U--izpt-      0      2       3
v3000                1.1.1.1        /24   ---izpt-      0      0       3
v666                 6.0.0.1        /16   ---izpt-      0      0       3
Flags: (f) Forwarding Enabled, i) IGMP Enabled
(m) Multicast Forwarding Enabled, (p) IGMP Proxy Query Enabled
(r) Receive Router Alert Required (t) Transmit Router Alert
(U) Interface Up, (z) IGMP Snooping Enabled
(nLeMA) Number of Learned Multicast Addresses
(nLRMA) Number of Locally Registered Multicast Addresses
```

The following command displays the IGMP configuration for VLAN vlan1:

```
# show igmp vlan1
Query Interval    :    125 sec
Max Response Time :     10 sec
Last Member Query :      1 sec
Robustness        :      2
Interface on VLAN vlan1 is enabled and up.
inet 0.0.0.0/0
Locally registered multicast addresses:
Learned multicast addresses(Last Querier=118.1.1.100):
224.0.0.2          224.0.0.22
s = static igmp member
Flags:
IP Fwding  NO       IPmc Fwding  NO            IGMP YES
IGMP Ver  V3          Snooping YES     Proxy Query YES
XmitRtrAlrt YES     RcvRtrAlrtReq  NO
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show igmp counters

```
show igmp counters
```

Description

Shows Internet Group Management Protocol (IGMP) counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example shows IGMP counters:

```
# show igmp counters
Global IGMP Statistics:
Out Query   =          13 Out Report =           0 Out Leave  =           0
In Query    =           0 In Report  =          13 In Leave   =           0
In Error    =           0
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show igmp group

```
show igmp group {{vlan} name | {grpipaddress}} {IGMPv3}
```

Description

Lists the *IGMP* group membership for the specified *VLAN*.

Syntax Description

name	Specifies a VLAN name.
grpipaddress	Specifies a group IP address.
IGMPv3	Displays the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise displays in earlier format).

Default

IGMPv2.

Usage Guidelines

If no VLAN is specified, all VLANs are displayed. You can also filter the display by group address or by multicast stream sender address.

The output of this command shows:

- The multicast group address received.
- The version of the IGMP group.
- The name of the VLAN where the group address is being received.
- The physical port where the group address is being received. If multiple ports within the VLAN have subscribers for the group, all the ports are listed.
- The age since the last IGMP report for this group was received.

Note

The `show igmp group` command output is populated on the router that is the PIM Rendezvous Point.

Example

The following is sample output from the `show igmp group` command, listing the IGMP group membership:

```
Group Address      Ver Vlan                 Port      Age
239.2.4.70         2   banana               7         101
224.0.1.24         2   banana               7         107
239.255.255.254    2   banana               7         103
Total: 3
```

History

This command was first available in ExtremeXOS 10.1.

The **IGMPv3** option was added in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show igmp snooping cache

This command is provided for backward compatibility. The recommended command is:

```
show mcast cache {{vlan} name} {{[group grpaddressMask | grpaddressMask]
   {source sourceIP | sourceIP}} {type [snooping | pim | mvr]}|
   {summary}}
```

The syntax for the original form of this command is:

```
show igmp snooping cache {{vlan} name} {{group} grpaddressMask}
```

Description

Displays multicast cache entries added by *IGMP* snooping for all VLANs and groups. The display can be limited to specific VLANs or groups.

Syntax Description

name	Specifies a *VLAN* name.
grpaddressMask	Specifies a multicast group address and mask.

Default

Displays information for all VLANs and groups.

Usage Guidelines

None.

Example

The following command displays IGMP snooping cache information for all VLANs and groups:

```
show igmp snooping cache
```

This command display is the same as for the following preferred command:

```
show mcast cache {{vlan} name} {{[group grpaddressMask |grpaddressMask]
{source sourceIP |sourceIP}} {type [snooping | pim | mvr]}| {summary}}
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show igmp snooping vlan filter

```
show igmp snooping {vlan} name filter
```

Description

Displays *IGMP* snooping filters.

Syntax Description

name	Specifies a *VLAN* name.

Default

None.

Usage Guidelines

Use this command to display IGMP snooping filters configured on the specified VLAN. When no VLAN is specified, all the filters are displayed.

Example

The following command displays the IGMP snooping filter configured on VLAN vlan101:

```
# show igmp snooping vlan101 filter
Filter           Port Flags
igmppermit0      5:10 a
Flags: (a) Active
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show igmp snooping vlan static

```
show igmp snooping {vlan} name static [group | router]
```

Description

Displays static *IGMP* snooping entries.

Syntax Description

name	Specifies a *VLAN* name.
group	Displays static multicast groups.
router	Displays static router entries.

Default

None.

Usage Guidelines

Use this command to display the IGMP snooping static groups or router ports configured on the specified VLAN. When no VLAN is specified, all the static groups or router ports are displayed.

Example

The following command displays the IGMP snooping static groups configured on VLAN vlan101:

```
# show igmp snooping vlan101 static group
VLAN vlan101 (4094)
Group            Port   Flags
239.1.1.2        29      s-
239.1.1.2        30      s-
239.1.1.2        31      sa
239.1.1.2        32      s-
239.1.1.2        34      s-
Total number of configured static IGMP groups = 5
Flags: (s) Static, (a) Active
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show igmp snooping vlan

```
show igmp snooping {vlan} name {port port} {IGMPv3}
```

Description

Displays *IGMP* snooping registration information for a specific *VLAN*. The display can be further limited to a specific port or to only IGMPv3 entries.

Syntax Description

name	Specifies a VLAN name.
port	Specifies a single port for which information is displayed.
IGMPv3	Displays the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise displays in earlier format).

Default

IGMPv2.

Usage Guidelines

The two types of IGMP snooping entry are sender entry and subscribed entry.

The following information is displayed in a per-interface format:

- Group membership information
- Router entry
- Timeout information
- Sender entry

Example

The following output displays IGMP snooping registration information on VLAN v1:

```
# show igmp snooping vlan v1
Router Timeout                :    260 sec
Host Timeout                  :    260 sec
Igmp Snooping Fast Leave Time :   1000 ms
VLAN v1 d              (4084) Snooping=Enabled
Port   Host            Subscribed        Age    Group-Limit
25     118.1.1.100     All Groups        3      0
```

The following command displays IGMP snooping registration information for port 2:1 on VLAN test:

```
show igmp snooping test port 2:1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show igmp snooping

```
show igmp snooping {detail {IGMPv3}}
```

Description

Displays *IGMP* snooping registration information for all VLANs.

Syntax Description

detail	Displays the information in detailed format.
IGMPv3	Displays the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise displays in earlier format).

Default

IGMPv2.

Usage Guidelines

None.

Example

The following command displays IGMP snooping registration information for all VLANs:

```
# show igmp snooping
Igmp Snooping Flag            : forward-all-router
Igmp Snooping Flood-list      : none
Igmp Snooping Proxy           : Disable
Igmp Snooping Filters         : per-port
Vlan             Vid  Port   #Senders #Receivers Router Enable
-------------------------------------------------------------
Default          1           0                        Yes
v1               4090        0                        Yes
```

History

This command was first available in ExtremeXOS 10.1.

The IGMP Forwding Lookup mode output was removed from this command in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show igmp ssm-map

```
show igmp ssm-map {group_ip} {vr vr-name}
```

Description

Displays the *IGMP* SSM feature status (enabled or disabled), the mappings for the specified multicast group IP address, and the total count of maps.

Syntax Description

group_ip	Specifies an IP multicast group, for which all mappings in the PIM SSM range are to be displayed. If no group address is specified, the switch displays all IGMP-SSM mappings.
vr-name	Specifies a virtual router name. If the VR name is omitted, the switch displays the mappings on the VR specified by the current CLI VR context.

Default

N/A.

Usage Guidelines

When a target group is specified, this command displays all mapping entries for the configured range in which the group IP address resides.

Example

The following example displays the mappings for the multicast group starting at IP address 232.1.1.1:

```
X620-16x-DUT1.1 # show igmp ssm-map
IGMP SSM mapping : Enabled

Group                   Source            Type
232.1.1.1/32            2.1.1.3           Static
232.1.1.2/32            2.1.1.3           Static
232.1.1.3/32            2.1.1.3           Static
232.1.1.4/32            2.1.1.3           Static
232.1.1.5/32            2.1.1.3           Static
232.1.1.6/32            2.1.1.3           Static
232.1.1.7/32            2.1.1.3           Static
232.1.1.8/32            2.1.1.3           Static
232.1.1.9/32            2.1.1.3           Static
232.1.1.10/32           2.1.1.3           Static
232.1.1.11/32           2.1.1.3           Static
232.1.1.12/32           2.1.1.3           Static
```

```
232.1.1.13/32          2.1.1.3           Static
232.1.1.14/32          2.1.1.3           Static
232.1.1.15/32          2.1.1.3           Static
232.1.1.16/32          2.1.1.3           Static
232.1.1.17/32          2.1.1.3           Static
232.1.1.18/32          2.1.1.3           Static
232.1.1.19/32          2.1.1.3           Static
232.1.1.20/32          2.1.1.3           Static
232.1.1.21/32          2.1.1.3           Static
Total Number of Mappings : 510
X620-16x-DUT1.2 # show igm ssm-map 232.1.1.1
IGMP SSM mapping : Enabled
Group   : 232.1.1.1
Type    : STATIC
DNS Name: -
Aging TTL (Expiry Time): -
Sources :
          2.1.1.3
Total Number of Mappings : 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show inline-power configuration ports

```
show inline-power configuration ports {port_list}
```

Description

Displays inline power configuration information for the specified ports.

Syntax Description

port_list	Specifies one or more ports. If you do not specify ports, information for all ports appears.

Default

N/A.

Usage Guidelines

The output displays the following inline power configuration information for the specified ports:

- Config—Indicates whether the port is enabled to provide inline power:
  - Enabled: The port can provide inline power.

  - Disabled: The port cannot provide inline power.
- Operator Limit—Displays the configured limit, in milliwatts, for inline power on the port.
- Label—Displays a text string, if any, associated with the port.

Example

The following command displays inline power configuration information for ports 1 to 7:

```
# show inline-power configuration ports 1-7

Port   Config    Operator   Priority   Detection                 Classification
Fast   Label
                 Limit
1      Enabled   15400 mW   Low        802.3af-only              802.3af-high
N
2      Enabled   90000 mW   Low        802.3af-only              802.3af
N
3      Enabled   90000 mW   Low        802.3af-only              802.3af
N
4      Enabled   90000 mW   Low        802.3af-only              802.3af
N
5      Enabled   90000 mW   Low        802.3af-only              802.3pre-at
N
6      Enabled   90000 mW   Low        802.3af-only              802.3pre-bt
N
7      Enabled   90000 mW   Low        802.3af-only              802.3bt-type4
N
```

History

This command was first available in ExtremeXOS 11.1.

Per-port Fast PoE information was added in ExtremeXOS 31.1.

The **802.3af**, **802.3af-high**, and **802.3pre-at** options were added in ExtremeXOS 31.7.

Platform Availability

This command is available on the *PoE* devices listed in Extreme Networks PoE Devices.

show inline-power fast ports

```
show inline-power fast ports {port_list}
```

Description

Displays fast *PoE* information by port.

Syntax Description

fast	Specifies showing fast PoE power status, which is the ability to provide power to devices at the time of switch power on without waiting for boot up based on last saved PoE state.
ports	Designates showing fast PoE information for specified ports.
port_list	Specifies on which ports to show fast PoE information.

Default

All ports are fast PoE disabled by default.

Usage Guidelines

This command shows the port level fast PoE configurations saved in hardware, along with the ones currently configured to allow you to see any mismatches. If the default configuration file has never been saved in this boot session, the hardware configurations shown are the initial running configurations from hardware at boot time. If the default configuration file has been saved in this boot session (by `save configuration`), the hardware configurations shown are the last configurations saved to hardware.

Example

The following example shows fast PoE information on ports 1:1-2, 2:1-5, 3:1-3:

```
# show inline-power fast ports 1:1-2,2:1-5,3:1-3
Port   State   Enable     Operator Limit   Priority   Detection
----   -----   --------   --------------   --------   -------------------------
1:1    HW      Enabled          28000 mW   Low        802.3af-only
       Cfg     Enabled          28000 mW   Low        802.3af-only
1:2    HW      Enabled          30000 mW   High       4-point legacy-and-802.3af
       Cfg     Enabled          30000 mW   High       4-point legacy-and-802.3af
3:1    HW      Enabled          30000 mW   Critical   802.3af-only
       Cfg     Enabled          30000 mW   Critical   802.3af-only
3:2    HW      Disabled         15000 mW   Low        802.3af-only
       Cfg     Disabled         15000 mW   Low        802.3af-only
3:3    HW      Enabled          30000 mW   High       802.3af-only
       Cfg     Enabled          30000 mW   Low        802.3af-only
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on the *PoE* devices listed in Extreme Networks PoE Devices.

show inline-power info ports

`show inline-power info {detail} ports {port_list}`

Description

Displays inline power information for the specified ports.

Syntax Description

port_list	Specifies one or more ports. If you do not specify ports, information for all ports appear.

Default

N/A.

Usage Guidelines

Note

Ports in the denied or faulted state periodically display the searching state as the hardware retests the PD state.

You can use this command to generate a summary report or a detailed report.

Summary output displays the following inline power information for the specified ports:

- State—Displays the port power state:
  - Disabled.
  - Searching.
  - Delivering.
  - Faulted.
  - Disconnected.
  - Other.
  - Denied.
- PD's power class—Displays the class type of the connected PD:
  - "-----": disabled or searching.
  - "class0": class 0 device.
  - "class1": class 1 device.
  - "class2": class 2 device.
  - "class3": class 3 device.
  - "class4": class 4 device.
  - "class5": class 5 device.
  - "class6": class 6 device.
  - "class7": class 7 device.
  - "class8": class 8 device.
- Volts—Displays the measured voltage. A value from 0 to 2 is valid for ports that are in a searching state.
- Curr—Displays the measured current, in milliamperes, drawn by the PD.

- Power—Displays the measured power, in watts, supplied to the PD.
- Fault—Displays the fault value:
  - None.
  - UV/OV fault.
  - UV/OV spike.
  - Over current.
  - Overload.
  - Undefined.
  - Underload.
  - HW fault.
  - Discovery resistance fail.
  - Operator limit violation.
  - Disconnect.
  - Discovery resistance, A2D failure.
  - Classify, A2D failure.
  - Sample, A2D failure.
  - Device fault, A2D failure.
  - Force on error.

The detail command lists all inline power information for the selected ports.

Detail output displays the following information:

- Configured Admin State—Displays the port's configured state; Enabled or Disabled.
- Inline Power State—Displays the port power state.
- MIB Detect Status—Displays the port state as reported by *SNMP*; valid values are as follows:
  - disabled
  - searching
  - delivering
  - fault
  - test
  - otherFault
  - denyLowPriority
- Label—Displays the port's configured label.
- Operator Limit—Displays the port's configured operator limit value.
- PD Class—Displays the class type of connected PD:
- Max Allowed Power—Displays the amount of maximum allowed power for a device of this class.
- Measured Power—Displays the measured power, in watts, supplied to the PD.
- Line Voltage—Displays the measured voltage. A value from 0 to 2 is valid for ports in a searching state.
- Current—Displays the measured current, in milliamperes, drawn by the PD.
- Fault Status—Displays the fault value.
- Detailed Status
- Priority

- Power Up Status—2-pair or 4-pair, 15W–90W
- Powered Channels—primary channel, alternative channel, or both
- Detection

Example

The following command displays summary inline power information for ports 1 to 3 on a switch:

```
show inline-power info ports 1-3
```

Following is sample output from this command:

```
Port  State         Class      Volts   Curr    Power     Fault
(mA)   (Watts)
1   delivering    class3     48.3    192      9.300    None
2   delivering    class3     48.3    192      9.300    None
3   searching     ------      0.0      0      0.0      None
```

The following command displays detail inline power information for port 1 on slot 3:

```
show inline-power info detail port 3:1
```

Following is sample output from this command:

```
Port 3:1
Configured Admin State: enabled
Inline Power State    : delivering
MIB Detect Status     : delivering
Label                 :
Operator Limit        : 16800 milliwatts
PD Class              : class3
Max Allowed Power     : 15.400 W
Measured Power        : 9.400 W
Line Voltage          : 48.3 Volts
Current               : 193 mA
Fault Status          : None
Detailed Status       :
```

The following command displays detail inline power information for port 27:

```
# show inline-power info detail ports 27
```

Following is sample output from this command:

```
Port 27

Configured Admin State: enabled
Inline Power State    : delivering
MIB Detect Status     : delivering
Label                 :
Operator Limit        : 90000 milliwatts
PD Class              : class8
Max Allowed Power     : 90.0 W
Measured Power        : 33.300 W
Line Voltage          : 53.7 Volts
Current               : 621 mA
Fault Status          : None
Detailed Status       : Delivering power to IEEE PD
Priority              : low
Power Up Status       : 4-pair 60W
```

```
Powered Channels      : Primary and Alternative
Detection             : 802.3af-only
```

History

This command was first available in ExtremeXOS 11.1.

PD classes 7 and 8, and power up status and powered channels information for ExtremeSwitching X465 PoE switches with 60W ('u') and 90W ('w') ports was added in ExtremeXOS 30.2.

Platform Availability

This command is available on the *PoE* devices listed in Extreme Networks PoE Devices.

show inline-power slot

```
show inline-power [fast | perpetual] slot slot
```

Description

Displays inline power information for the specified node (slot) on SummitStacks.

Syntax Description

slot	Specifies the node (slot).
fast	Specifies showing fast PoE power status, which is the ability to provide power to devices at the time of switch power on without waiting for boot up based on last saved PoE state.
perpetual	Specifies showing perpetual PoE power status, which is the ability to preserve PoE power delivery to devices during reboot. Perpetual PoE is a switch-wide setting.

Default

N/A.

Usage Guidelines

On SummitStacks, the output indicates the following inline power status for each system:

- Configured power:
  - Enabled.
  - Disabled.
- System power surplus.
- Redundant power surplus.
- Power usage threshold.

- Disconnect precedence.
- Legacy—The status of the legacy mode, which allows detection of many non-standard PDs.

The output indicates the following inline power status information for each slot:

- Inline power status—The status of inline power. The status conditions are:
  - Enabled.
  - Disabled.
- Firmware status—The operational status of the slot. The status conditions are:
  - Operational.
  - Not operational.
  - Disabled.
  - Subsystem failure.
  - Card not present.
  - Slot disabled.
- Budgeted power—The amount of power, in watts, that is available to the slot.
- Measured power—The amount of power, in watts, that currently being used by the slot.

On a stack, if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Using the **fast** option of this command shows the slot-level fast PoE information. It shows the last fast PoE boot result. It also shows the slot-level PoE configurations saved in hardware along with the ones currently configured so that you can see any mismatches. If the default configuration file has never been saved in this boot session, the hardware configurations shown in this command are the initial running configurations from hardware at boot time. If the default configuration file has been saved in this boot session (by `save configuration`), the hardware configurations shown in this command are the last configurations saved to hardware.

Example

The following command displays inline power information for node (slot) 3 on a SummitStack:

```
# show inline-power slot 3

Inline Power System Information
Configured                 : Enabled
System Power Surplus       : 1500 Watts available for budgeting
Redundant Power Surplus    :  465 Watts available for budgeting to maintain N+1
Power Usage Threshold      : 70 percent (per slot)
Disconnect Precedence      : lowest-priority
Legacy Mode                : Disabled
Budgeted       Measured
Slot  Inline-Power  Firmware Status    Power (Watts)  Power (Watts)
3     Enabled       Operational          50 W           9 W
4     Enabled       Card Not Present   ( 50 W)          n/a
7     Enabled       Operational          50 W           0 W
Note: A budget value in parentheses is not allocated from the system power
```

The following example shows fast PoE status on a stack:

```
# show inline-power fast
Slot   State   Enable     Disconnect        Last Fast Boot Status
----   -----   --------   ---------------   ------------------------
```

```
1       HW      Enabled    Deny-port          Succeeded
        Cfg     Enabled    Deny-port
3       HW      Disabled   Deny-port          Disabled
        Cfg     Disabled   Deny-port
4       HW      Enabled    Lowest-priority    Mismatch
        Cfg     Enabled    Deny-port
5       HW      Enabled    Deny-port          Failed (Query failed)
        Cfg     Enabled    Deny-port
6       HW      Enabled    Deny-port          Failed (Firmware upgrade)
        Cfg     Enabled    Deny-port
7       HW      Enabled    Deny-port          Failed (In reset)
        Cfg     Enabled    Deny-port
8       HW      Enabled    Deny-port          Failed (Invalid config)
        Cfg     Enabled    Deny-port

State: (HW) Hardware state per-slot, (Cfg) Configured state per-slot.
Fast Boot Status:
  Succeeded - Fast PoE boot succeeded and configuration matches.
  Disabled  - Fast PoE was disabled in hardware at boot time.
  Mismatch  - Fast PoE booted but the configuration in hardware
              did not match the configuration file.
  Failed    - Fast PoE boot failed and PoE was reset.
```

The following example shows perpetual PoE status on slot 3:

```
# show inline-power perpetual on slot 3
Perpetual POE is Enabled
```

History

This command was first available in ExtremeXOS 11.1.

The **fast** and **perpetual** PoE options were added in ExtremeXOS 30.3.

Platform Availability

It is available on SummitStack when the stack contains switches listed in Extreme Networks PoE Devices.

show inline-power stats ports

```
show inline-power stats ports {port_list}
```

Description

Displays inline power statistics for the specified ports.

Syntax Description

port_list	Specifies one or more slots and ports. If you do not specify ports, information for all ports appear.

Default

N/A.

Usage Guidelines

The output displays the following inline power statistics for the specified ports:

- State—Displays the port power state:
  - Disabled.
  - Searching.
  - Delivering.
  - Faulted.
  - Disconnected.
  - Other.
  - Denied.
- PD's power class—Displays the class type of the connected PD:
  - "-----": disabled or searching.
  - "class0": class 0 device.
  - "class1": class 1 device.
  - "class2": class 2 device.
  - "class3": class 3 device.
  - "class4": class 4 device.
- Absent—Displays the number of times the port was disconnected.
- InvSig—Displays the number of times the port had an invalid signature.
- Denied—Displays the number of times the port was denied.
- Over-current—Displays the number of times the port entered an overcurrent state.
- Short—Displays the number of times the port entered undercurrent state.

Example

The following command displays inline power configuration information for ports 1 to 10 in node (slot) 3 on a SummitStack:

```
show inline-power stats ports 3:1-10
```

Following is sample output from this command:

```
STATISTICS COUNTERS
Port  State       Class     Absent  InvSig   Denied    OverCurrent   Short
3:1   delivering  class3         0       0        0          18             0
3:2   delivering  class3         0       0        0           0             0
3:3   searching   class0         0       0        0           0             0
3:4   searching   class0         0       0        0           0             0
3:5   searching   class0         0       0        0           0             0
3:6   searching   class0         0       0        0           0             0
3:7   searching   class0         0       0        0           0             0
3:8   searching   class0         0       0        0           0             0
```

```
3:9   searching   class0        0       0       0          0             0
3:10  searching   class0        0       0       0          0             0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the *PoE* devices listed in Extreme Networks PoE Devices.

show inline-power stats slot

```
show inline-power stats slot slot
```

Description

Displays inline power statistics for the specified slot on SummitStacks.

Syntax Description

slot	Specifies the slot.

Default

N/A.

Usage Guidelines

Use this command to produce a report that shows the firmware status and version plus how many ports are currently faulted, powered, and waiting for power for the selected slots. Unlike the values displayed with the `show inline-power stats ports` command, these values (displayed with the `show inline-power stats slot` command) are current readings, not cumulative counters.

On a stack, if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Example

The following command displays inline power statistics information for node (slot) 3 on a SummitStack:

```
show inline-power stats slot 3
```

Following is sample output from this command:

```
Inline-Power Slot Statistics
Slot:  3
Firmware status               : Operational
Firmware revision             : 292b1
```

```
Total ports powered           : 7
Total ports awaiting power    : 41
Total ports faulted           : 0
Total ports disabled          : 0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on SummitStacks when the stack contains switches listed in Extreme Networks PoE Devices.

show inline-power stats

```
show inline-power stats
```

Description

Displays inline power statistics for the specified switch.

Syntax Description

There are no variables or parameters for this command.

Default

N/A.

Usage Guidelines

Use this command to produce a report that shows the firmware status and version plus how many ports are currently faulted, powered, and waiting for power for the switch. Unlike the values displayed with the `show inline-power stats ports` command, these values are current readings, not cumulative counters.

Example

The following command displays inline power statistics information:

```
show inline-power stats
```

Following is sample output from this command:

```
Inline-Power Slot Statistics
Firmware status               : Operational
Firmware revision             : 292b1
Total ports powered           : 7
Total ports awaiting power    : 17
```

```
Total ports faulted           : 0
Total ports disabled          : 0
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on the switches listed in Extreme Networks PoE Devices.

show inline-power

```
show inline-power [fast | perpetual]
```

Description

Displays inline power status information for the specified *PoE* switch.

Syntax Description

fast	Specifies showing fast PoE power status, which is the ability to provide power to devices at the time of switch power on without waiting for boot up based on last saved PoE state.
perpetual	Specifies showing perpetual PoE power status, which is the ability to preserve PoE power delivery to devices during reboot. Perpetual PoE is a switch-wide setting.

Default

N/A.

Usage Guidelines

The output varies depending on the PoE device you are using.

Note

For additional information on inline power parameters, see the `show power budget` command.

Example

The following command displays inline power status for the switch:

```
# show inline-power
Inline Power System Information
Configured                 : Enabled
Power Usage Threshold      : 70 percent
```

```
Firmware Status    Power (Watts)  Power (Watts)   Legacy
Operational         405 W           0 W           Disabled
```

The following example displays fast PoE status:

```
# show inline-power fast
State   Enable     Disconnect        Last Fast Boot Status
-----   --------   ---------------   -------------------------
HW      Disabled   Deny-port         Disabled
Cfg     Disabled   Deny-port

State: (HW) Hardware state per-slot, (Cfg) Configured state per-slot.
Fast Boot Status:
  Succeeded - Fast PoE boot succeeded and configuration matches.
  Disabled  - Fast PoE was disabled in hardware at boot time.
  Mismatch  - Fast PoE booted but the configuration in hardware
              did not match the configuration file.
  Failed    - Fast PoE boot failed and PoE was reset.
```

The following example displays perpetual PoE status:

```
# show inline-power perpetual
Perpetual POE is Enabled
```

The following example displays power budget information (line 7):

```
# show inline-power

Inline Power System Information
Configured                 : Enabled
Power Usage Threshold      : 70 percent
Disconnect Precedence      : deny-port
Power Budget               : Maximum
                   Budgeted       Measured
Firmware Status    Power (Watts)  Power (Watts)
Operational         490 W           5 W
```

History

This command was first available in ExtremeXOS 11.1.

The **fast** and **perpetual** PoE options were added in ExtremeXOS 30.3.

Platform Availability

This command is available on the switches listed in Extreme Networks PoE Devices.

show ip nat

```
show ip nat
```

Description

Shows Network Address Translation (NAT) information.

Syntax Description

ip	Shows Internet Protocol (IP) information.
nat	Shows NAT information.

Default

N/A.

Usage Guidelines

NAT maps IP addresses from one address domain (typically a private IP address space) to an another address domain (typically a public Internet IP address space) to provide transparent routing to end hosts. This translation is accomplished transparently by having a NAT device translate the IP address and/or Layer 4 port of the packets.

To enable or disable IP NAT, use the commands `enable` **`ip nat`** and `disable` **`ip nat`**.

Example

The following example shows IP NAT information:

```
# show ip nat
NAT                                    : Disabled
Number of NAT VLANs                    : 0
Maximum number of NAT VLANs            : 4
Number of NAT rules                    : 0
Number of source NAT rules             : 0
Number of destination NAPT rules       : 0
Number of configured NAPT rules        : 0
Number of dynamic NAPT rules           : 0
Maximum number of NAT rules            : 1024
Aging Time                             : 20 minutes
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

show ip nat rule

`show` **`ip nat rule`** {**`detail`**}

Description

Displays information about IP Network Address Translation (NAT) rules.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies viewing NAT rule information.
detail	Specifiifes showing detailed NAT rule information.

Default

N/A.

Usage Guidelines

Example

The following example shows basic information about all IP NAT rules configured on the switch:

```
# show ip nat rule
Rule Name                          State     VR                  IPAddr
NewIPAddr
                                     Type      EgressVLAN            Protocol  L4Port
NewL4Port
================================================================================================
==============
baseNapt                           Enabled   VR-Default          10.1.1.100/24
112.123.234.200
                                     NAPT      out                   ---       -----
-----
srcTxlate                          Enabled   VR-Default          10.20.30.40/32
50.1.1.100
                                     Src-NAT   out                   ---       -----
-----
natIncomplete                      Disabled  -----               -----
-----
                                     Src-NAT   -----                 ---       -----
-----
dnat-http-server                   Enabled   VR-Default          40.1.1.2/32
10.1.1.100
                                     Dst-NAPT  out                   UDP       8080
80
================================================================================================
==============
NAT                                      : Enabled
Total number of NAT rules                : 4
Total number of source NAT rules         : 2
Total number of destination NAPT rules   : 1
Total number of configured NAPT rules    : 1
Total number of dynamic NAPT rules       : 0
Maximum number of NAT rules              : 1024
Aging Time                               : 10 minutes
```

The following example shows detailed information about all IP NAT rules configured on the switch:

```
show ip nat rule detail
Rule Name                : baseNapt
Type                     : NAPT

Aging Time                              : 20 minutes
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

show ip nat rule statistics

show **ip nat rule** {*rule_name*} **statistics** {**no-refresh**}

Description

Shows statistics IP Network Address Translation (NAT) statistics (byte/packet counters) in the outward direction.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies NAT rules.
rule_name	Specifies displaying statistics only for the specified NAT rule.
statistics	Specifies showing IP NAT rule statistics.
no-refresh	Specifies displaying page-by-page without auto-refresh.

Default

N/A.

Usage Guidelines

Example

The following example shows NAT statistics in the outward direction:

```
# show ip nat rule statistics
NAT Rule Statistics                                    Sat Sep 11 16:27:23 2019
NAT Rule Name                              Tx Packet                Tx Byte
================================  ====================  ====================
nat59                                            2168                138752
nat60                                            2168                138752
nat61                                            2168                138752
nat62                                            2168                138752
nat63                                            2168                138752
nat64                                            2168                138752
nat65                                            2168                138752
nat66                                            2168                138752
nat67                                            2168                138752
nat68                                            2168                138752
nat69                                            2168                138752
nat70                                            2168                138752
```

```
nat71                                                 2168                 138752
nat72                                                 2168                 138752
nat73                                                 2168                 138752
nat74                                                 2168                 138752
nat75                                                 2168                 138752
nat76                                                 2168                 138752
nat77                                                 2168                 138752
================================================================================
          0->Clear Counters  U->page up  D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

show ip nat vlan

```
show ip nat vlan {vlan_name}
```

Description

Shows Network Address Translation (NAT) VLAN information.

Syntax Description

ip	Shows Internet Protocol (IP) information.
nat	Shows NAT information.
vlan	Specifies VLAN NAT information.
vlan_name	Specifies which VLAN to show NAT information for.

Default

N/A.

Usage Guidelines

To view information for a specific VLAN, specify the VLAN name when running this command.

Example

The following example shows VLAN NAT information:

```
# show ip nat vlan
VLAN Name                        Direction
================================  =========
```

```
engineering                          Both
in                                   Ingress
out                                  Egress
=============================================
Total Number of NAT VLANs    : 3
Maximum number of NAT VLANs : 4
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

show ip nat vlan counters

`show` **`ip nat vlan counters`** {*vlan_name*}

Description

Shows the number of packets translated and discarded in the Network Address Translation (NAT) VLAN egress and ingress directions.

Syntax Description

ip	Shows Internet Protocol (IP) information.
nat	Shows NAT information.
vlan	Shows VLAN NAT information.
counters	Shows NAT VLAN counter information
vlan_name	Specifies which VLAN to show NAT information for.

Default

N/A.

Usage Guidelines

Source translations and discards constitute the packet counts in the egress direction. Destination translations and discards constitute the packet counts in the ingress direction.

To clear counters, run the command `clear` **`ip nat counters vlan`** {*vlan_name*}.

Example

The following example shows NAT VLAN counter information:

```
# show ip nat vlan counters
                                          Source        Source   Destination   Destination
VLAN Name                           Translations      Discards  Translations      Discards
=================================  ============  ============  ============  ============
out                                      203284             0             0             0
in                                            0             0             0             0
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

show iparp

```
show iparp {ip_addr |mac | [{vlan} vlan_name | vlan vlan_list] |
   permanent} {port port {vr vr_name}
```

Description

Displays the IP Address Resolution Protocol (ARP) table. You can filter the display by IP address, MAC address, *VLAN*, or permanent entries.

Syntax Description

ip_addr	Specifies an IP address.
mac	Specifies a MAC address.
vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.
permanent	Specifies permanent entries.
port	Show entries for a specific port.
port	Show only entries for this port number.
vr_name	Specifies a VR or VRF.

Default

Show all entries, except for proxy entries.

Usage Guidelines

Displays the IP ARP table, including:

- IP address
- MAC address
- Aging timer value
- VLAN name, VLAN ID and port number
- Flags

If you do not specify a VR or VRF, the command applies to the current VR context.

The show output displays the following information:

ARP address check	Whether IP ARP checking is enabled or disabled. IP ARP checking verifies if the ARP request's source address is in the receiving interface's subnet.
ARP refresh	Whether ARP refresh is enabled or disabled. ARP refresh is performed when an ARP entry's age is three-fourths of the timeout value.
Dynamic entries	The number of dynamic (learned ARP) entries in the table.
Pending entries	The number of sent ARP requests that have not yet received a response.
Static entries	The number of configured (static ARP) entries in the table.
Timeout	Timeout value for a dynamic (learned) ARP entry.
ARP Global Settings	
Max Entries	Maximum number of ARP entries.
Max Pending Entries	Maximum number of pending ARP entries.
Max Proxy Entries	Maximum number of proxy ARP entries.

Example

The following example displays the IP ARP table for the current VR or VRF context:

```
# show iparp
VR            Destination      Mac                Age  Static  VLAN          VID  Port
VR-Default    10.10.10.6       00:04:96:1f:a5:71    8      NO  bluered       4092  1
VR-Default    10.128.32.1      00:01:30:ba:6a:a0    0      NO  Default       4095
VR-Default    10.128.32.2      00:01:03:1c:ae:b0    5      NO  Default       4095
VR-Default    10.128.32.4      00:d0:59:17:74:83    3      NO  Default       4095
VR-Default    10.128.32.5      00:02:a5:c2:5c:dd    0      NO  Default       4095
VR-Default    10.128.32.6      00:12:3f:1c:f8:fb    5      NO  Default       4095

ARP Global Settings
Max Entries         :     4096
Max Pending Entries :      256
Max Proxy Entries   :      256
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

The *vlan_list* variable was added in ExtremeXOS 16.1.

For ARP, virtual network remote endpoints appear in the port column in ExtremeXOS 22.3

In Request, Out Request, Failed Requests, Proxy Answered, Rx Error, Rejected Count, Rejected Port, Max ARP entries, In Response, Out Response, Dup IP Addr, Rejected IP, Rejected I/F, and Max ARP pending entries output removed; ARP Global Settings Max Entries, Max Pending Entries, Max Proxy Entries output added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iparp proxy

```
show iparp proxy {[ipNetmask | ip_addr mask]} {vr vr_name}
```

Description

Displays the proxy ARP table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
vr_name	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

If no argument is specified, then all proxy ARP entries are displayed.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command displays the proxy ARP table:

```
# show iparp proxy
VR            Destination      Mask             Mac                Refcnt  Always  Dynamic
VR-Default    1.1.0.4          255.255.255.255  00:04:96:97:f5:32       0      NO      YES
VR-Default    10.1.1.200       255.255.255.255  vrrp                    0     YES      YES
VR-Default    10.1.1.201       255.255.255.255  vrrp                    0      NO       NO
VR-Default    10.1.1.202       255.255.255.255  00:11:22:33:44:55       0      NO       NO
VR-Default    10.1.1.204       255.255.255.255  vrrp                    0     YES      YES
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iparp security

```
show iparp security [ {vlan} vlan_name | vlan vlan_list]
```

Description

Displays the IP ARP security violation information for one or all *VLAN*s.

Syntax Description

vlan_name	Specifies a single VLAN for which to display security violation information.
vlan_list	Specifies a VLAN list of IDs to display security violation information.

Default

Shows security violation information for all VLANs except Mgmt.

Usage Guidelines

None.

Example

The following example displays IP ARP security violation information for all VLANs:

```
Switch.4 # show iparp security
Most Recent Violation
=======================================
Vlan               Security   Violations  Type   IP address        MAC          Port
================================================================================================
Default            ----
test               ----
Security Setting: (G) Gratuitous ARP Protection
Violation Type  : (g) Gratuitous ARP Violation
```

The following example displays IP ARP security violation information for VLAN Default:

```
Switch.5 # show iparp security "Default"
Most Recent Violation
=======================================
Vlan               Security   Violations  Type   IP address        MAC          Port
================================================================================================
Default            ----
Security Setting: (G) Gratuitous ARP Protection
Violation Type  : (g) Gratuitous ARP Violation
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iparp stats

```
show iparp stats [[vr_name | vr {all | vr_name} ] { no-refresh |refresh}
   {vr} summary]

show iparp stats [vlan {all {vr vr_name}} | [ {vlan} vlan_name | vlan
   vlan_list] {no-refresh |refresh}

show iparp stats ports {all | port_list} { no-refresh |refresh}
```

Description

Displays the IP ARP statistics for one or more VRs, VLANs, or ports.

Syntax Description

vr_name	Specifies a VR or VRF for which to display statistics.
vlan_name	Specifies a *VLAN* for which to display statistics.
vlan_list	Specifies a VLAN list of IDs to display statistics.
refresh	Continuous refresh of output.
port_list	Specifies a list of ports for which to display statistics.

Default

Shows all VLAN ARP statistics in a dynamic display.

Usage Guidelines

VLAN statistics and totals are displayed for a single VR. When you display IPARP statistics for one or all VLANS, the display includes the specified VLANS for the specified VR. If you do not specify a VR for a VLAN report, the display includes the specified VLANS for the current VR context.

Periodically as part of cleanup, failed entries go down and hence the total entries goes down. In certain scenarios, they may help detect a problem (memory leak or an attack). The `show iparp stats` command shows totals across all VRs, including VR-Mgmt.

Example

The following example displays ARP table statistics for all VRs and VRFs:

```
# show iparp stats vr all
IP ARP VR Statistics         Wed Apr 07 15:30:49 2010
ARP Total    Dynamic     Static    Pending
=========================================
VR-Default
96           89          5          0
VR-Mgmt
4            2           2          0
VR-SV_PPPOE
287          286         1          0
VR-NV_PPPOE
```

```
19          19          0          0
chicago2
50          44          5          0
Total for all VRs
456         440         13         0
=========================================
U->page up  D->page down  ESC->exit
```

The following example displays ARP table statistics for all VLANs in the current VR context:

```
# show iparp stats vlan all
IP ARP VLAN Statistics                                  Wed Apr 07 15:30:49 2010
VLAN                            ARP Total            Dynamic             Static
================================================================================
VLAN_06-AAR                            94                 89                  5
VLAN_07-AAR                           122                121                  1
VLAN_02-BOT                            43                 42                  1
================================================================================
Totals for VR U3c-South.
Dynamic :         440     Static   :          13    Pending  :             0
================================================================================
U->page up  D->page down  ESC->exit
```

The following example displays ARP table statistics for ports 1:1 to 1:17:

```
# show iparp stats ports 1:1-1:17
IP ARP Port Statistics                                  Wed Apr 07 15:30:49 2010
Port             Link State         ARP Total          Dynamic            Static
================================================================================
1:1                   A                   94               89                 5
1:2                   A                   37               37                 0
1:3                   A                  122              121                 1
1:4                   R                    0                0                 0
1:5                   R                    0                0                 0
1:6                   A                   43               43                 0
1:7                   A                  118              118                 0
1:8                   R                    0                0                 0
1:9                   R                    0                0                 0
1:10                  A                    8                8                 0
1:11                  A                    8                6                 2
1:12                  A                   41               41                 0
1:13                  A                   17               17                 0
1:14                  R                    0                0                 0
1:15                  R                    0                0                 0
1:16                  A                    8                8                 0
1:17                  A                    8                6                 2
================================================================================
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
U->page up  D->page down  ESC->exit
```

History

This command was first available in ExtremeXOS 12.4.2.

The **no-refresh** keyword was removed in ExtremeXOS 16.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

The **refresh** keyword was added in ExtremeXOS 16.1.

The ARP unneeded, failed, rejected, total entries, and last rejected information was removed in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ipconfig

```
show ipconfig {ipv4} {vlan vlan_name | tunnel tunnel_name}
```

Description

Displays configuration information for one or more *VLAN*s in the current VR context.

Syntax Description

vlan_name	Specifies a VLAN name.
tunnel_name	Specifies an IPv6 tunnel.

Default

N/A.

Usage Guidelines

If no VLAN information is specified, then global IP configuration is displayed. Otherwise, specific VLAN information is displayed.

Example

```
# show ipconfig
        Use Redirects : Disabled
        IpOption LSRR : Enabled
        IpOption SSRR : Enabled
          IpOption RR : Enabled
          IpOption TS : Enabled
          IpOption RA : Enabled
        Route Sharing : Disabled
    Originated Packets : Don't require ipforwarding
    IP Fwding into LSP : Disabled
   Max Shared Gateways : Current: 4  Configured: 4
   Route Sharing Hash : XOR, Custom Method
   Ping Protection : Enabled for static routes Interval: 2 Misses: 3
   IP Anycast MAC : 00:00:AB:BA:BA:BA
        IRDP:
            Advertisement Address: 255.255.255.255
            Maximum Interval: 600
            Minimum Interval: 450     Lifetime: 1800    Preference: 0
    Interface    IP Address          Flags                nSIA
    data2        200.0.0.1       /24 EUf---R--------    0
```

```
    inet         1.1.1.2         /24 EUf---R--------    0
    mytun        2.0.0.2         /24 EU----R--------    0
```

The following example displays configuration information about tunnel "mytunnel" with TCP MSS adjustment configuration (lines 3 and 8) and MTU value of 1400 (line 3):

```
# show ipconfig mytunnel
Router Interface on mytunnel is enabled and up.
    inet 2.0.0.1/24  broadcast 2.0.0.255  Mtu 1500  TCP-MSS  1360

    Flags:
        BOOTP Host  NO   DirBcstHwFwd  NO          Fwd Bcast  NO    IgnoreBcast YES
         IP Fwding YES       IPmc Fwd  NO   Multinetted VLAN  NO    IRDP Advert  NO
        Send Redir YES           VRRP  NO        Unicast RPF  NO TCP Adjust MSS  ON
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

This command changed to display information for the current VR context in ExtremeXOS 12.5.

Ping protection information added in ExtremeXOS 22.1.

Route sharing hashing algorithm (default or custom) added in ExtremeXOS 22.1.

The D (duplicate address detected on VLAN), t (tentative address), A (address mask reply enabled), M (send parameter problem enabled), P (send port unreachables enabled), T (time stamp reply enabled), u (send unreachables enabled), and X (send time exceeded enabled) flags were removed in ExtremeXOS 30.1.

IP anycast information was added in ExtremeXOS 30.6.

TCP MSS adjustment and IP MTU information were added in ExtremeXOS 31.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ipconfig ipv6

```
show ipconfig ipv6 {vlan vlan_name | tunnel tunnel_name}
```

Description

Displays configuration information for one or more interfaces in the current VR context.

Syntax Description

vlan_name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.

Default

N/A.

Usage Guidelines

If no interface is specified, then global IPv6 configuration is displayed. Otherwise, specific interface(s) will be displayed. Global IPv6 configuration information includes:

- IPv6 address/netmask/etc.
- IPv6 forwarding information/IPv6 multicast forwarding information

Example

The following example displays configuration information on a VLAN "accounting":

```
show ipconfig ipv6 vlan accounting
```

The current and configured values for **max-gateways** now apply to IPv6 gateway sets as well as IPv4, so these values are added to the output:.

```
# show ipconfig ipv6
Route Sharing : Disabled
ICMP Redirect for Fast Path : Disabled
Max Shared Gateways : Current: 32 Configured: 32
```

The configuration settings for static route ping protection enable/disable, interval, and misses also appear:

```
# show ipconfig ipv6
Route Sharing : Enabled
Route Compression : Enabled
ICMP Redirect for Fast Path : Disabled
Max Shared Gateways : Current: 16 Configured: 16
Route Sharing Hash : CRC Lower
Ping Protection : Enabled for static routes Interval: 2 Misses: 3
IPV6 Anycast MAC            : 00:00:AB:BA:BA:BA
```

The following example displays configuration information for ICMP multicast and anycast echo requests (lines 4-5):

```
# show ipconfig ipv6
    Route Sharing               : Disabled
    Route Compression           : Enabled
    Ignore ICMP Multicasts      : Enabled
    Ignore ICMP Anycasts        : Enabled
    ICMP Redirect for Fast Path : Disabled
    Max Shared Gateways         : Current: 16  Configured: 16
    Route Sharing Hash          : CRC Lower, Default Method
    Ping Protection             : Enabled for static routes   Interval: 2   Misses: 3
    IPv6 Anycast MAC : None
```

The following example displays configuration information with TCP MSS adjustment support (lines 2 and 9):

```
# show ipconfig ipv6 v61
Router Interface on v61 is enabled.  MTU: 1500  TCP-MSS: 0
    IPv6 Hop Limit: 64
    Locally registered unicast addresses:
```

```
        fe80::a01:101%v61/64 (Tentative)
    Flags:
        IPv6 Forwarding: YES   Accept recvd RA:  NO
         Send redirects: YES  Accept redirects:  NO
         TCP Adjust MSS: OFF
```

History

This command was first available in ExtremeXOS 11.2.

This command changed to display information for the current VR context in ExtremeXOS 12.5.

The show output for **max-gateways** was added in ExtremeXOS 15.3.

Ping protection information added in ExtremeXOS 22.1.

Route sharing hashing algorithm (default or custom) added in ExtremeXOS 22.1.

IP anycast information was added in ExtremeXOS 30.6.

Enabling or disabling replies to multicast and anycast echo requests was added in ExtremeXOS 31.3.

TCP MSS adjustment information was added in ExtremeXOS 31.6.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

show ipmroute

```
show ipmroute {source-net mask-len | source-net mask | summary} {vr vr-
    name}
```

Description

Displays the contents of the IP multicast routing table or the route origin priority.

Syntax Description

source-net	Specifies an IP address/mask length.
mask-len	Mask length for the IP multicast source's subnet. Range is 1–32.
mask	Specifies a subnet mask.
summary	Displays the statistics of multicast static routes.
vr-name	Specifies the virtual router to which the route is added.

Default

vr-name is the VR of the current CLI context.

Usage Guidelines

This command allows you to view the configured multicast static routes. You can specify the filtering criteria on this command to view only the desired route. The multicast static routes are displayed in ascending order of their prefix (same order as `show iproute displays`).

Example

The following example shows a multicast static route from a default virtual router:

```
# show ipmroute
Destination       Gateway         Mtr     Flags     Protocol     VLAN
Default Route     20.20.20.1      255     UG        None         pc4-1
*1.1.0.0/16       20.20.20.1      10      UG        bgp          pc4-1
*11.0.0.0/8       30.30.30.1      12      U-        None         pc5-3
11.22.0.0/16      20.20.20.1      10      UG        None         pc4-1
*11.22.33.0/24    30.30.30.1      8       U-        None         pc5-3
11.22.33.44/32    20.20.20.1      4       UG        None         pc4-1
*12.0.0.0/8       20.20.20.1      0       UG        None         pc4-1
12.24.0.0/16      30.30.30.1      0       U-        None         pc5-3
*12.24.48.96/32   30.30.30.1      2       U-        ospf-extern1 pc5-3
44.66.0.0/16      30.30.30.1      0       U-        None         pc5-3
Flags: (*) Active, (G) Gateway, (U) Up
Mask distribution:
1 default routes 2 routes at length 8
4 routes at length 16 1 routes at length 24
2 routes at length 32
Total number of multicast static routes = 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show iproute

```
show iproute {ipv4} {priority | vlan vlan_name | permanent | ip_address
   netmask | summary} {multicast | unicast} {vr vrname}}
```

Description

Displays the contents of the IP routing table or the route origin priority.

Syntax Description

priority	Displays the priority values for each route origin type.
vlan_name	Specifies a *VLAN* name.

permanent	Specifies permanent routing.
ip_address	Specifies an IP address.
netmask	Specifies a subnet mask.
summary	Displays summary information.
multicast	Displays information for IPv4 multicast routes only.
unicast	Displays information for IPv4 unicast routes only.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

A c flag in the **Flags** column indicates a compressed route resulting from enabling compression using the enable iproute compression command. The total number of compressed routes is also shown.

All routes that are provided to the FIB display the f flag.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example displays detailed information about all IP routing:

```
# show iproute vr vr-b
Ori  Destination        Gateway         Mtr  Flags         VLAN       Duration
#d   1.1.1.100/32       1.1.1.100       1    U------um--f- l3vni_vr_b 0d:0h:1m:17s
*evn 2.2.2.2/32         2.2.2.2         1    UGHD---u---f- l3vni_vr_b 0d:0h:0m:8s
*evn 2.2.2.200/32       2.2.2.2         1    UGHD---u---f- l3vni_vr_b 0d:0h:0m:7s

     4 routes at length 32

Route Origin distribution:
     2 routes from Direct               5 routes from EVPN

Total number of routes = 7
Total number of compressed routes = 0
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

The c flag was added in ExtremeXOS 12.0.

The f flag was added in ExtremeXOS 12.2.2.

The l flag showing *ICMP* ping protection was added in ExtremeXOS 22.1.

The ap flag showing auto-peering information was added in ExtremeXOS 22.5.

The evn origin prefix showing EVPN information was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iproute bfd

```
show iproute bfd
```

Description

Shows BFD protection gateway status for static routes added with BFD protection.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example shows BFD protection gateway status for static routes added with BFD protection:

```
# show iproute bfd
Strict BFD for static routes : Enabled
Gateway         BFD Session State              # Routes      VR
-------------------------------------------------------------------------------
1.1.1.2         Active (Down)                         1      VR-Default
1.1.1.3         Pending
```

History

This command was first available in ExtremeXOS 12.4.

Strict BFD session protection for static routes status was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iproute ipv6 origin

```
show iproute ipv6 origin [auto-peering | direct | static | blackhole
   | ripng | ospfv3 | ospfv3-intra | ospfv3-inter | ospfv3-extern1 |
   ospfv3-extern2 | isis | isis-level1-1 | isis-level-2 | isis-level-1-
   external | isis-level-2-external | bgp | ibgp | ebgp | bootp | host-
   mobility] {vr vr_name}
```

Description

Displays the contents of the IPv6 routing table for routes with the specified origin.

Syntax Description

direct	Specifies direct routes.
auto-peering	Specifies BGP auto-peering routes.
static	Specifies static routes.
blackhole	Specifies blackhole routes.
ripng	Specifies *RIPng* routes.
ospfv3	Specifies *OSPFv3* routes.
ospfv3-intra	Specifies OSPFv3 Intra routing.
ospfv3-inter	Specifies OSPFv3 Inter routing.
ospfv3-extern1	Specifies OSPFv3 External 1 routing.
ospfv3-extern2	Specifies OSPFv3 External 2 routing.
isis	Specifies IS-IS routes.

isis-level-1	Specifies IS-IS Level 1 routing.
isis-level-2	Specifies IS-IS Level 2 routing.
isis-level-1-external	Specifies IS-IS Level 1 External routing.
isis-level-2-external	Specifies IS-IS Level 2 External routing.
bgp	Specifies Border Gateway Protocol.
ibgp	Specifies Interior *BGP* route.
ebgp	Specifies Exterior BGP route.
bootp	Specifies BOOTP route.
host-mobility	Specifies host-mobility routes.
vr_name	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following example displays the RIPng routes:

```
show iproute ipv6 origin ripng
```

History

This command was first available in ExtremeXOS 11.2.

The **bootp** attribute was added in 15.7.1

The **auto-peering** option was added in ExtremeXOS 22.5.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

show iproute ipv6

```
show iproute ipv6 {priority | vlan vlan_name | tunnel tunnel_name |
   ipv6Netmask | summary {multicast | unicast}} {vr vr_name}}
```

Description

Displays the contents of the IPv6 routing table.

Syntax Description

priority	Displays the priority values for each route origin type.
vlan_name	Specifies a *VLAN* name.
tunnel_name	Specifies a tunnel name.
ipv6Netmask	Specifies an IPv6 address/prefix length.
summary	Specifies summary information.
vr_name	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example displays detailed information about all IPv6 routing:

```
Switch.18 # show iproute ipv6
Ori Destination                                 Mtr  Flags        Duration
Gateway                                      Interface

IsisL1Ext                 3400
IsisL2Ext                 3500
```

History

This command was first available in ExtremeXOS 11.2.

The I flag showing ICMP ping protection was added in ExtremeXOS 22.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

show iproute mpls origin

```
show iproute mpls origin [bgp | blackhole | bootp | direct | ebgp | ibgp
   | icmp | isis | isis-level-1 | isis-level-1-external | isis-level-2 |
   isis-level-2-external | mpls evpn {signaling-protocol [ldp | rsvp-te
   | static]} | ospf | ospf-extern1 | ospf-extern2 | ospf-inter | ospf-
   intra | rip | static ] {unicast} {vr vrname}
```

Description

Displays the *MPLS* contents of the IP routing table for routes with the specified origin.

Syntax Description

bgp	Specifies *BGP* routes.
blackhole	Specifies blackhole routes.
bootp	Specifies BOOTP routes.
direct	Specifies direct routes.
ebgp	Specifies E-BGP routes.
ibgp	Specifies I-BGP routes.
icmp	Specifies *ICMP* routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routing.
isis-level-1-external	Specifies ISIS Level 1 External routing.
isis-level-2	Specifies ISIS Level 2 routing.
isis-level-2-external	Specifies ISIS Level 2 External routing.
mpls	Specifies MPLS routes. This option is available only on platforms that support the MPLS feature pack, which is described in the *Switch Engine 32.2 Feature License Requirements* document.
evpn	Specifies EVPN routes.
signaling-protocol [ldp | rsvp-te | static]	Specifies an MPLS signaling protocol. This option is available only on platforms that support the MPLS feature pack, which is described in the *Switch Engine 32.2 Feature License Requirements* document.
ospf	Specifies *OSPF* routes.
ospf-extern1	Specifies OSPF External 1 routing.
ospf-extern2	Specifies OSPF External 2 routing.
ospf-inter	Specifies OSPFInter routing.
ospf-intra	Specifies OSPFIntra routing.
rip	Specifies *RIP* routes.
static	Specifies static routes.

unicast	Displays unicast routes with the specified origin.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following example displays all the MPLS routes that originate from BGP:

```
# show iproute mpls origin bgp
```

History

This command was first available in ExtremeXOS 12.2.2.

The **evpn** option was added in ExtremeXOS 30.7.

Platform Availability

This command is available on all platforms that support MPLS.

show iproute mpls

```
show iproute mpls {lsp lsp_name | vlan vlan_name | permanent |
   ip_address netmask | summary} {unicast} {vr vrname}
```

Description

Displays the *MPLS* contents of the IP routing table.

Syntax Description

lsp_name	Specifies an LSP name.
vlan_name	Specifies a *VLAN* name.
permanent	Specifies permanent routing.
ip_address	Specifies an IP address.
netmask	Specifies a subnet mask.
unicast	Displays unicast routes.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

A c flag in the Flags column indicates a compressed route resulting from enabling compression using the enable iproute compression command. The total number of compressed routes is also shown.

All routes that are provided to the FIB display the f flag.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example example displays detailed information about all IP routing:

```
Switch.3 # show iproute mpls
```

History

This command was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iproute multicast

```
show iproute {ipv4} {{vlan} name | [ipaddress netmask | ipNetmask] |
   origin [direct | static | mbgp | imbgp | embgp]} multicast {vr
   vr_name}
```

Description

Displays all or a filtered set of multicast routes in the IP multicast routing table.

Syntax Description

ipv4	Selects only IPv4 multicast routes.
name	Specifies a *VLAN* for which to display multicast routes.
ipaddress netmask	Specifies an IP address and network mask (in dotted decimal notation) for which to display multicast routes.
ipNetmask	Specifies the IP address and network mask in classless inter domain routing (CIDR) notation.

origin	Limits the displayed multicast routes to those generated by the specified origin. Origin options select direct routes, static routes, and routes created by the MBGP, IMBGP, and EMBGP protocols.
vr_name	Specifies the virtual router for which to display multicast routes.

Default

vr_name is the VR of the current CLI context.

Usage Guidelines

This command does not display unicast routes, which can be used for multicast traffic.

Example

The following example displays all the routes in multicast routing table:

```
# show iproute multicast

```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

show iproute origin

```
show iproute origin [auto-peering | bgp | blackhole | bootp | direct
   | ebgp | embgp | ibgp | icmp | imbgp | isis | isis-level-1 | isis-
   level-1-external | isis-level-2 | isis-level-2-external | mbgp | mpls
   | evpn {signaling-protocol [ldp | rsvp-te | static]} | ospf | ospf-
   extern1 | ospf-extern2 | ospf-inter | ospf-intra | rip | static ]
   {unicast} {vr vrname}
```

Description

Displays the contents of the IP routing table for routes with the specified origin.

Syntax Description

auto-peering	Specifies *BGP* auto-peering routes.
bgp	Specifies *BGP* routes.
blackhole	Specifies blackhole routes.
bootp	Specifies BOOTP routes.
direct	Specifies direct routes.
ebgp	Specifies E-BGP routes.
embgp	Specifies EMBGP routes.
ibgp	Specifies I-BGP routes.
icmp	Specifies *ICMP* routes.
imbgp	Specifies IMBGP routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routing.
isis-level-1-external	Specifies IS-IS Level 1 External routing.
isis-level-2	Specifies IS-IS Level 2 routing.
isis-level-2-external	Specifies IS-IS Level 2 External routing.
mbgp	Specifies MBGP routes.
mpls	Specifies *MPLS* routes. This option is available only on platforms that support the MPLS feature pack, which is described in the *Switch Engine 32.2 Feature License Requirements* document.

evpn	Specifies EVPN routes.
signaling-protocol [ldp | rsvp-te | static]	Specifies an MPLS signaling protocol. This option is available only on platforms that support the MPLS feature pack, which is described in the *Switch Engine 32.2 Feature License Requirements* document.
ospf	Specifies *OSPF* routes.
ospf-extern1	Specifies OSPF External 1 routing.
ospf-extern2	Specifies OSPF External 2 routing.
ospf-inter	Specifies OSPFInter routing.
ospf-intra	Specifies OSPFIntra routing.
rip	Specifies *RIP* routes.
static	Specifies static routes.
unicast	Displays unicast routes with the specified origin.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following example displays all the BGP routes:

```
# show iproute origin bgp
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

The **embgp**, **mbgp**, and **mpls** options were added and the **ipv4** and **multicast** options removed in ExtremeXOS 12.2.2.

The **evpn** option was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iproute protection ping

```
show iproute {ipv4 | ipv6} protection ping {v4_or_v6_gateway} {vr
   vr_name} {detail}
```

Description

Displays the current ping protection state for IPv4 or IPv6 routes, along with the number of protected routes. The information can be displayed per gateway, or for all gateways in a given VR.

Syntax Description

ipv4	Specifies IPv4 routes (default).
ipv6	Specifies IPv6 routes.
protection ping	Specifies protection ping information.
v4_or_v6_gateway	Name of the specific IPv4 or IPv6 gateway to show protected routes for.
vr *vr_name*	Shows all protected routes for the specified VR.
detail	Displays timestamps of the last time each gateway transitioned to the "up" state and to the "down" state.

Default

If not specified, IPv4 is the default.

Example

The following example shows all ping protected IPv4 routes only:

```
# show iproute protection ping
Ping protection for static IPv4 routes : Enabled
                              Interval : 2
                              Misses   : 3

Gateway          State  # Routes  VR
---------------  -----  --------  --------------------------------
1.2.3.4          Down          1  VR-Default
1.2.3.5          Up            1  VR-Default
```

The following example shows ping protected IPv6 routes only:

```
# show iproute ipv6 protection ping
Ping protection for static IPv6 routes : Enabled
                              Interval : 2
                              Misses   : 3
Gateway                                 State  # Routes  VR
--------------------------------------  -----  --------  ----------
2000:2000:2000:2000:2000:2000:2000:2001  Up            2  VR-Default
3000::2                                 Down          2  VR-Default
```

The following example shows ping protected IPv6 routes with gateway up/down transition timestamp information:

```
# show iproute ipv6 protection ping detail
Ping protection for static IPv6 routes : Enabled
                              Interval : 2
                              Misses   : 3

Gateway:   2000:2000:2000:2000:2000:2000:2000:2001
State:     Up
# Routes:  2
VR:        VR-Default
Last Up:   Thu Mar 31 22:44:12 2016
Last Down: Thu Mar 31 22:42:22 2016

Gateway:   3000::2
State:     Down
# Routes:  2
VR:        VR-Default
Last Up:   --
Last Down: Thu Mar 31 22:42:22 2016
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on all platforms with any license level as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

show iproute reserved-entries statistics

```
show iproute reserved-entries statistics {slot slot_num}
```

Description

Displays the current usage statistics of the Longest Prefix Match (LPM) hardware table and the Layer 3 hardware hash table by resource type.

Syntax Description

slot_num	For SummitStack only, this option displays the statistics for the specified slot.

Default

N/A.

Usage Guidelines

This command shows the current number of IP routes and local and remote IPv4 hosts in the LPM hardware table. It also shows the number of IPv4 unicast, multicast, and IPv6 unicast entries in the Layer 3 hardware hash table. The theoretical maximums for each individual resource type are shown at the bottom of the output. These maximum values cannot all be achieved simultaneously, and individual values might not be reached depending on the addresses or routes in use.

The ExtremeXOS software supports the coexistence of higher- and lower-capacity hardware. To allow for coexistence and increased hardware forwarding, when the number of IPv4 routes exceeds 25,000, the lower-capacity hardware automatically transitions from using LPM routing to forwarding of individual remote hosts, also known as IP Forwarding Database (IP *FDB*) mode. Higher-capacity hardware continues using LPM routing. Lower-capacity hardware operating in IP FDB mode will be indicated with a d flag in the output of `show iproute reserved-entries statistics` command, indicating that only direct routes are installed. For more information, see "Coexistence of Higher- and Lower-Capacity Hardware" in the *Switch Engine 32.2 User Guide*.

Example

The following example displays usage statistics for the LPM and Layer 3 hardware tables:

```
# show iproute reserved-entries statistics
                                      |-----In HW Route Table-----|  |--------In HW L3
Hash Table-------|
                                       # Used Routes   # IPv4 Hosts   IPv4   IPv4
IPv6    IPv4    IPv6
Slot  Type                              IPv4   IPv6    Local Remote   Local  Rem.
Local   MCast   MCast
----  ------------------------------ ------- ------  ------ ------  ------ ------
-----  ------  ------
1     5720-24MXW                           0      0       0      0       0      0
0       0       0

Theoretical maximum for each resource type:
5320 16-port, 5320 24-port              8160   4080    8192   8192   14334  16384   8192
*  8192 *  4096
5320 48-port, 5420F                    12256   6128   12285  12288   14334  16384   8192
*  8192 *  4096
5420M                                  12256   6128   12288  12288   28670  32768  16384
*
16384 *  8192
5520                                   16352   8176   16384  16384   41982  65536  18429
*
32768 * 16384
5720MW                                 16352   8176   16384  16384   61438  98304  24573
*
49152 * 24576
5720MXW                                24544  12272   24576  24576  143358 163840  81920
*
81920 * 40960

Flags: (!) Indicates all reserved route entries in use.
       (d) Indicates only direct IPv4 routes are installed.
       (>) Some IPv6 routes with mask > 64 bits are installed and do not use
           entries in the internal HW Route Table.
       (*) Assumes IP Multicast compression is on.
       (M) IPMC entries stored in L2 MAC Table when lookup-key is 'mac-vlan'.
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iproute reserved-entries

```
show iproute reserved-entries {slot slot_num}
```

Description

Displays the configured number of IPv4 and IPv6 routes reserved in the Longest Prefix Match (LPM) hardware table.

Syntax Description

slot_num	For SummitStack only, this option displays the reservations for the specified slot.

Default

N/A.

Usage Guidelines

The IPv4 Routes column in the command output shows whether IPv4 routes are stored in internal or external LPM tables.

To modify the configuration that this command displays, use the following command:

```
configure iproute reserved-entries [ num_routes_needed | maximum |
default ] slot [all |slot_num]
```

Example

The following example displays the reserved space for IP routes:

```
# show iproute reserved-entries
                                        IPv4       # Reserved Routes            Minimum #
Slot  Type                              Routes      IPv4   (or IPv6)            IPv4 Hosts
----  --------------------------------  --------  -------  ------------------   ----------
1     5720-24MXW                        Internal    20432  ( 10216) [default]         4112

Maximum supported # IPv4 (or IPv6) Reserved Routes:
5320 16-port, 5320 24-port              Internal     8160  (  4080)
5320 48-port, 5420F, 5420M              Internal    12256  (  6128)
5520                                    Internal    16352  (  8176)
5720MW                                  Internal    16352  (  8176)
5720MXW                                 Internal    24544  ( 12272)
```

```
Note:  IPv4 Hosts can occupy unused HW Route table space,
       unless # Reserved Routes is "maximum".
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security anomaly-protection notify cache ports

```
show ip-security anomaly-protection notify cache ports port_list
```

Description

Displays most anomaly notification caches.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

This command displays most anomaly notification caches.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security arp gratuitous-protection

```
show ip-security arp gratuitous-protection
```

Description

If configured for gratuitous ARP, displays the gratuitous ARP protection configuration on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The switch displays the name of each *VLAN* configured for gratuitous ARP.

If you do not have gratuitous ARP configured, the switch does not display any VLAN information.

Example

The following command displays the gratuitous ARP configuration on the switch:

```
show ip-security arp gratuitous-protectection
```

The following is sample output from this command:

```
Gratuitous ARP Protection enabled on following VLANs:
Default, test
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security arp learning

```
show ip-security arp learning [ {vlan} vlan_name | vlan vlan_list]
```

Description

Displays how the switch builds an ARP table and learns MAC addresses for devices on a specific *VLAN* and associated member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN.
vlan_list	Specifies the name of the VLAN list of IDs.

Default

N/A.

Usage Guidelines

The switch displays the following ARP learning information:

- Port—The member port of the VLAN.
- Learn-from—The method the port uses to build the ARP table. The methods are:
  - ARP—ARP learning is enabled. The switch uses a series or requests and replies to build the ARP table.
  - *DHCP*—DHCP secured ARP is enabled. The switch uses DHCP snooping to build the ARP table.
  - None—Both DHCP secured ARP and ARP learning are disabled.

Example

The following sample output displays how the switch builds its ARP table for the VLAN learn:

```
# show ip-security arp learning vlan learn
Port                Learn-from
-----------------------------------
2:1                 ARP
2:2                 DHCP,  poll 300 sec, retries 3
2:3                 ARP
2:4                 None
2:5                 ARP
2:6                 ARP
2:7                 ARP
2:8                 ARP
```

History

This command was first available in ExtremeXOS 11.6.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security arp validation

```
show ip-security arp validation [ {vlan} vlan_name | vlan vlan_list]
```

Description

Displays ARP validation information for the specified *VLAN*.

Syntax Description

vlan_name	Specifies the name of the VLAN.
vlan_list	Specifies a VLAN list of IDs.

Default

N/A.

Usage Guidelines

The switch displays the following ARP validation information:

- Port—Indicates the port that received the ARP entry.
- Validation—Indicates how the entry is validated.
- Violation-action—Determines what action(s) the switch takes when an invalid ARP is received.

Example

The following sample output displays ARP validation on for the VLAN valid:

```
# show ip-security arp validation vlan valid
-------------------------------------------------------------------
Port    Validation              Violation-action
-------------------------------------------------------------------
7       DHCP                    drop-packet, block-port for 120 seconds, snmp-trap
23      DHCP                    drop-packet, block-port for 120 seconds, snmp-trap
```

The following example shows ARP validation if configured through RADIUS:

```
# show ip-security arp validation "Default"
ARP Validation enabled via RADIUS
-------------------------------------------------------------------
Port               Validation             Violation-action
-------------------------------------------------------------------
1                  DHCP                   drop-packet
2                  DHCP                   drop-packet
30                 DHCP                   drop-packet
```

History

This command was first available in ExtremeXOS 11.6.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security arp validation violations

```
show ip-security arp validation violations [ {vlan} vlan_name | vlan
   vlan_list]ports [ports | all]
```

Description

Displays the violation count on an ARP validation.

Syntax Description

vlan_name	Specifies the name of the *VLAN*.
vlan_list	Specifies a VLAN list of IDs.
ports	Specifies the name of the port.
all	Specifies all ports.

Default

N/A.

Usage Guidelines

The switch displays the following ARP validation information:

- Port—Indicates the port that received the ARP entry.
- Validation—Indicates how the entry is validated.
- Violation count—Indicates the number of violations for each port.

Example

The following sample output displays ARP validation violation counts on all ports:

```
# show ip-security arp validation violations ragu ports all
-------------------------------------------------------------------
Port    Validation Violation Count
-------------------------------------------------------------------
1:1 ip,DHCP 1233
1:3 ip,DHCP 3425
1:4 ip,DHCP 5654
1:5 ip,DHCP 0
1:6 ip,DHCP 3645
```

History

This command was first available in ExtremeXOS 12.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security dhcp-snooping entries

```
show ip-security dhcp-snooping entries [ {vlan} vlan_name | vlan
   vlan_list]
```

Description

Displays the *DHCP* bindings database on the switch.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping *VLAN*.
vlan_list	Specifies the DHCP-snooping VLAN list of IDs.

Default

N/A.

Usage Guidelines

The switch displays the following DHCP bindings database information:

- VLAN—The name of the DHCP-snooping VLAN.
- IP Addr—The IP address of the untrusted interface or client.
- MAC Addr—The MAC address of the untrusted interface or client.
- Port—The port number where the untrusted interface or client attempted to access the network.

Example

The following sample output displays the DHCP bindings database on the switch:

```
# show ip-security dhcp-snooping entries vlan dhcpVlan
-------------------------------------------
Vlan: dhcpVlan
-------------------------------------------
Server    Client
IP Addr         MAC Addr            Port      Port
-------         --------            ------    ------
172.16.100.9    00:90:27:c6:b7:65   1:1       1:2
```

History

This command was first available in ExtremeXOS 11.6.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security dhcp-snooping information circuit-id port-information

```
show ip-security dhcp-snooping information circuit-id port-information
   ports [port_list | all ]
```

Description

Displays the port information portion of the circuit ID for the indicated port(s).

Syntax Description

port_list	Specifies one or more ports.
all	Specifies all ports.

Default

N/A.

Usage Guidelines

This command displays the port information portion of the circuit ID for the indicated ports.

Example

The following command:

```
# show ip-security dhcp-snooping information circuit-id port-information ports 1-7
```

Displays the following output:

```
Port            Circuit-ID Port information string
----            ----------------------------------
1               portinfostring1
2               portinfostring2
3               portinfostring3
4               portinfostring4
5               portinfostring5
Port            Circuit-ID Port information string
----            ----------------------------------
6               1006
7               1007
Note: The full Circuit ID string has the form '<Vlan Info>-<Port Info>'
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security dhcp-snooping information-option

```
show ip-security dhcp-snooping information-option
```

Description

Displays the *DHCP* relay agent option (option 82) settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays DHCP relay agent option (option 82) settings. For example, the following command:

```
show ip-security dhcp-snooping information-option
```

Generates the following output:

```
 Information option insertion: Enabled Information option checking : Disabled Information
option policy : Drop
```

The following command:

```
show ip-security dhcp-snooping information-option
```

Generates the following output:

```
 Information option insertion: Enabled Information option checking : Enabled Information
option policy : Keep
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security dhcp-snooping information-option circuit-id vlan-information

```
show ip-security dhcp-snooping information-option circuit-id vlan-
   information {{vlan} [vlan_name | vlan_list]
```

Description

Displays the *VLAN* information portion of the circuit ID for the indicated VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.

Default

N/A.

Usage Guidelines

This command displays the VLAN information portion of the circuit ID for the indicated VLAN. When a VLAN is not specified, the circuit ID information for all the VLANs is displayed.

Example

The following sample output displays circuit ID information for vlan "Mktg":

```
# show ip-security dhcp-snooping information-option circuit-id vlan-information vlan Mktg
Vlan                            Circuit-ID vlan information string
----                            ----------------------------------
Mktg                             DSLAM1
Note: The full Circuit ID string has the form <Vlan Info>-<Port ifIndex>.
```

History

This command was first available in ExtremeXOS 12.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security dhcp-snooping information remote-id

```
show ip-security dhcp-snooping information remote-id
```

Description

Shows the *DHCP* relay agent remote ID.

Syntax Description

This command has no arguments or variables.

Default

If a remote ID has not been configured, or it has been unconfigured, the default remote ID is the switch's MAC address. However, this default remote ID does not appear in this command.

Usage Guidelines

This command shows the remote ID set by the `configure ip-security dhcp-snooping information` **`remote-id`** `[`**`system-name`** `|`*`remote-id_info`*`]` command. If the remote ID has never been configured, or it has been unconfigured (`unconfigure ip-security dhcp-snooping information` **`remote-id`**), the default remote ID is the switch's MAC address, which does not appear in the output of this command.

Example

The following command shows the DHCP remote ID:

```
# show ip-security dhcp-snooping information-option remote-id

Switch                  Remote-ID information string
------                  ----------------------------
X465-48P                mydhcp
```

The following command shows that the DHCP remote ID has never been configured, or that it was unconfigured, and that the default (switch MAC address) is being used, but this default remote ID does not appear in the output of the command:

```
Switch                  Remote-ID information string
------                  ----------------------------

Note: If neither System Name nor the Customized remote id is configured
      the default will be the Switch MAC address, that will not be shown
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security dhcp-snooping

`show ip-security dhcp-snooping [ {`**`vlan`**`}` *`vlan_name`* `|` **`vlan`** *`vlan_list`*`]`

Description

Displays the *DHCP* snooping configurations on the switch.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping *VLAN*.
vlan_name	Specifies the name of the DHCP-snooping VLAN list.

Default

N/A.

Usage Guidelines

The switch displays the following DHCP snooping information:

- DHCP snooping enabled on ports—The ports that have DHCP snooping enabled.
- Trusted ports—The ports configured as trusted ports.
- Trusted DHCP servers—The servers configured as trusted DHCP servers.
- Port—The specific port that has DHCP snooping enabled.
- Violation-action—The action the switch takes upon detecting a rogue DHCP packet on the port.

Example

The following sample output displays the DHCP snooping settings for the switch:

```
# show ip-security dhcp-snooping vlan "Default"
DHCP Snooping enabled on ports: 7, 9, 11
Trusted Ports: None
Trusted DHCP Servers: None
Bindings Restoration     : Enabled
Bindings Filename        : dhcpsonia.xsf
Bindings File Location   :
Primary Server  : 10.1.1.14, VR-Default, TFTP
Secondary Server: None
Bindings Write Interval  : 5 minutes
Bindings last uploaded at:
-----------------------------------
Port            Violation-action
-----------------------------------
7               none
9               none
11              none
```

The following sample output displays the DHCP snooping settings for the switch if configured through RADIUS:

```
# show ip-security dhcp-snooping "Default"
DHCP Snooping enabled via RADIUS
DHCP Snooping enabled on ports: 1, 2,  30
Trusted Ports: None
Trusted DHCP Servers: 1.1.1.1, 1.1.2.1
Bindings Restoration     : Disabled
Bindings Filename        :
Bindings File Location   :
         Primary Server  : None
         Secondary Server: None
Bindings Write Interval  : 30 minutes
-----------------------------------
Port            Violation-action
```

```
-----------------------------------
1               drop-packet
2               drop-packet
30              drop-packet
```

History

This command was first available in ExtremeXOS 11.6.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security dhcp-snooping violations

```
show ip-security dhcp-snooping violations [ {vlan} vlan_name | vlan
   vlan_list]
```

Description

Displays the MAC addressed from which the rouge *DHCP* packet was received by the switch.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping *VLAN*.
vlan_list	Specifies the DHCP-snooping VLAN list of IDs.

Default

N/A.

Usage Guidelines

The switch displays the following DHCP snooping information:

- Port—The specific port that received the rouge DHCP packet.
- Violating MAC—The MAC address from which the rouge DHCP was received by the switch.

Example

The following sample output displays the DHCP snooping violations for the VLAN green:

```
# show ip-security dhcp-snooping violations green
Violations seen on following ports
-------------------------------------------
Port            Violating MAC
-------------------------------------------
2:3             00-0c-11-a0-3e-12
```

History

This command was first available in ExtremeXOS 11.6.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ip-security source-ip-lockdown

```
show ip-security source-ip-lockdown
```

Description

Displays the source IP lockdown configuration on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The switch displays the following source IP lockdown information:

- Port—Indicates the port that has *DHCP* snooping enabled and is configured for source IP lockdown.
- Locked IP Address—Indicates a valid DHCP-assigned address obtained by a DHCP snooping-enabled port or an authenticated static IP address.

Example

The following command displays the source IP configuration on the switch:

```
show ip-security source-ip-lockdown
```

The following is sample output from this command:

```
Ports           Locked IP Address
23 10.0.0.101
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ipstats ipv6

```
show ipstats ipv6 [{vlan name | tunnel tunnel_name}]
```

Description

Displays IPv6 statistics handled by the CPU for the switch for a particular *VLAN*.

Syntax Description

name	Specifies a VLAN name.
tunnel_name	Specifies a tunnel name.

Default

N/A.

Usage Guidelines

This command only shows statistics of the CPU-handled packets. Not all packets are handled by the CPU. For example, packets forwarded in hardware do not increment the statistics counters.

Example

The following example displays IPv6 statistics for the VLAN accounting:

```
show ipstats ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

The VR option was removed in ExtremeXOS 30.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

show ipstats

```
show ipstats {ipv4} [{vlan name } | {tunnel} tunnel_name]
```

Description

Displays IP statistics for the switch CPU for a particular *VLAN*.

Syntax Description

name	Specifies a VLAN name.
tunnel_name	Specifies a tunnel name.

Default

N/A.

Usage Guidelines

This command only shows statistics of the CPU-handled packets. Not all packets are handled by the CPU.

The fields displayed in the `show ipstats` command are defined in the following tables.

Table 25: Router Interface Statistics Field Definitions

Field	Definition
Packets IN/OUT	Total number of IP packets received or transmitted on a VLAN router interface.
Octets IN/OUT	Total number of octets received or transmitted on a VLAN router interface.
Mcast packets IN/OUT	Total number of multicast packets received or transmitted on a VLAN router interface.
Bcast packets IN/OUT	Total number of broadcast packets received or transmitted on a VLAN router interface.
Errors IN/OUT	Total number of IP packets with errors received or transmitted on a VLAN router interface.
Discards IN/OUT	Total number of IP packets that cannot travel up to the CPU due to lack of buffer space.
Unknown Protocols IN/OUT	Total number of IP packets with unknown upper layer protocols received by the router interface.

Example

The following example displays IP statistics for the VLAN "accounting":

```
show ipstats vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

The VR option was removed in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show ipv6 dad

```
show ipv6 dad {[{{vr} vr_name {ip_address} | vr all | [ { vlan }
   vlan_name | vlan vlan_list ] {tentative | valid | duplicate} | {{vr}
   vr_name} ipaddress] | {tunnel} tunnel_name}
```

Description

Displays the configuration and run time status for the DAD feature on the specified IPv6 interface.

Syntax Description

vr_name	Specifies a VR for which to display the DAD information.
ip_address	Specifies an IPv6 address for which to display the DAD information.
vlan_name	Specifies a *VLAN* name for which to display the DAD information.
vlan_list	Specifies a VLAN list of IDs to display the DAD information.
tentative	Displays information for IPv6 interfaces for which the status is up and the DAD check is incomplete.
valid	Displays information for IPv6 interfaces for which the status is up, the DAD check is complete, and no duplicate IPv6 addresses were detected.
duplicate	Displays information for IPv6 interfaces for which the status is down because a duplicate IPv6 address was detected.

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

The **vr all** option displays DAD information for all IPv6 interfaces on the switch.

Example

The following example displays the DAD feature status for all interfaces in the current VR context:

```
IPv6 Duplicate Address Detection

DAD Status                 : On
Max Solicitation Attempts  : 1
```

```
Virtual Router                  Interface                       Flags Failures IP
Address
------------------------------- ------------------------------- ----- --------
--------------------------------
VR-Default                      vwest                           DlE-U        1
fe80::204:96ff:fe99:1424%vwest
VR-Default                      vwest                           -lE-U        0
fe80::1%vwest
VR-Default                      vwest                           --E-U        0 2010::1

Flags: (D) Duplicate address detected, (E) L2 Interface enabled,
       (l) Link-local address, (L) Loopback enabled,
       (t) Tentative due to the lack of a valid link-local address,
       (T) Tentative address, (U) L2 Interface up
```

History

This command was first available in ExtremeXOS 12.6.

The *vlan_list* variable was added in ExtremeXOS 16.1.

The Conflict MAC heading was removed and Interface Failures heading added; the P (prefix address) flag was removed and the l (Link-local address) was added; the t flag was renamed (tentative due to the lack of a valid link-local address); and the **detail** option was removed in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

show iqagent

```
show iqagent discovery
```

Description

Displays information about the ExtremeCloud™ IQ Agent.

Syntax Description

iqagent	Specifies showing information about IQ Agent.
discovery	Specifies showing information about IQ Agent discovery.

Default

N/A.

Usage Guidelines

If IQ Agent is not running, only the first section appears. A device is registered on an IQ server using the serial number.

Example

The following example shows information about IQ Agent:

```
# show iqagent
---------------------------------  -----------------------------------------
State                              Enabled
Active VR                          VR-Mgmt
Detected VR                        VR-Mgmt
XIQ Address                        10.16.231.95
Serial Number                      1405G-00056
---------------------------------  -----------------------------------------
```

The following example shows discovery information for IQ Agent:

```
# show iqagent discovery
--------------------------------------------------------------------------------
Virtual-Router  : VR-Default
  XIQ FQDN CLI  :
  XIQ DHCP IP   :
  XIQ DHCP FQDN : test.com
  Redirector    :
--------------------------------------------------------------------------------
Virtual-Router  : VR-Mgmt
  XIQ FQDN CLI  : 10.16.231.95
  XIQ DHCP IP   : 1.2.3.4
  XIQ DHCP FQDN : test2.com
  Redirector    :
--------------------------------------------------------------------------------
```

The following example shows information about IQ Agent with a configured HTTP proxy (line 14):

```
# show iqagent
---------------------------------  -----------------------------------------
State                              Enabled
Active VR                          VR-Mgmt
Detected VR                        VR-Mgmt
XIQ Address                        10.51.3.175
Serial Number                      1546N-40030
---------------------------------  -----------------------------------------
Status                             CONNECTED TO XIQ

```

History

This command was first available in ExtremeXOS 30.7.

IQ Agent status was added in ExtremeXOS 31.1.

HTTP proxy support was added in ExtremeXOS 31.3.

IQ Agent Management VLAN was added in Release 32.1.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

show iqagent discovery detail

show **iqagent discovery detail** {**vr** *vr_name*}

Description

Displays detailed information about a Virtual Router connected to the ExtremeCloud™ IQ Agent.

Syntax Description

iqagent	Specifies showing information about IQ Agent.
discovery	Specifies showing information about IQ Agent discovery.
detail	Specifies showing a detailed view of connection to ExtremeCloud IQ.
vr	Specifies showing a detailed view for a specific Virtual Router.
vr_name	Specifies the Virtual Router name.

Default

N/A.

Usage Guidelines

If IQ Agent is not running, only the first section displays. A device is registered on an IQ server using the serial number.

Example

The following example shows information about a configured static IQ Agent (10.51.3.171) and DHCP providing both sub-options 225 and 226:

```
# show iqagent discovery detail
IQ Agent configured on VR VR-Default
    HTTP proxy                          : Not configured
    User configured FQDN/IP             : 10.51.3.171
        XIQ Server Status               : Connected
    DHCP opt 43, sub-opt 225 (FQDN)     : fqdn.xiq-ut.com
        Resolved IP                     : 10.51.3.175
        XIQ Server Status               : Connected
    DHCP opt 43, sub-opt 226 (IP)       : 10.16.231.94
        XIQ Server Status               : Connected
    Redirector                          : hac.extremecloudiq.com
        Resolved IP                     : Unresolved
```

The following example shows information about a configured static IQ Agent (10.51.3.171) onboarded device with hac.extremecloudiq.com that is reachable:

```
# show iq discovery detail
IQ Agent configured on VR VR-Default
    HTTP proxy                          : Not configured
    User configured FQDN/IP             : 10.51.3.171
        XIQ Server Status               : Connected
    DHCP opt 43, sub-opt 225 (FQDN)     : Not provided
    DHCP opt 43, sub-opt 226 (IP)       : Not provided
    Redirector                          : hac.extremecloudiq.com
        Resolved IP                     : 34.253.190.222
        Cloud IQ Status                 : Connected
        Data Center [1848F-10070]       : va2.extremecloudiq.com
            Resolved IP                 : 34.202.197.10
            XIQ Server Status           : Connected
```

The following example shows a user configured FQDN that is not resolvable:

```
show iq discovery detail
IQ Agent configured on VR VR-Default
```

```
    HTTP proxy                          : Not configured
    User configured FQDN/IP             : xiq.xiq-ut.com
        Resolved IP                     : Unresolved
    DHCP opt 43, sub-opt 225 (FQDN)     : Not provided
    DHCP opt 43, sub-opt 226 (IP)       : 10.16.231.94
        XIQ Server Status               : Connected

            XIQ Server Status           : Connected
```

History

This command was first available in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

show isis

```
show isis
```

Description

This command displays the global IS-IS configuration information as well as a summarized router process listing.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The displayed global configuration information includes the restart enablement, restart grace period, and import-policy setting. The router process listing includes the area name, system ID, whether it's enabled, the IS type, and a count of associated interfaces and area addresses. This command applies only to the IS-IS router processes running in the current virtual router.

Example

The following command displays IS-IS information:

```
show isis
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

show isis area summary-addresses

```
show isis area area_name summary-addresses
```

Description

This command displays the configured IPv4 and IPv6 summary addresses for the specified area.

Syntax Description

area_name	Specifies the router process for which you want to display summary addresses.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the summary addresses for areax:

```
show isis area areax summary-addresses
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

show isis area

```
show isis area [area_name | all]
```

Description

This command displays configuration information for a specific router process or for all IS-IS router processes.

Syntax Description

area_name	Specifies the router process for which to display IS-IS area information.
all	Displays information for all IS-IS router processes.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays IS-IS configuration for areax:

```
show isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

show isis counters

```
show isis counters {area [area_name | all] | vlan [vlan_name | all]}
```

Description

This command displays counters for an area or a *VLAN*.

Syntax Description

area_name	Specifies a router process for which to display the IS-IS counters. If you do not specify an IS-IS area, the software displays counters for all areas.
vlan_name	Specifies a VLAN for which to display IS-IS counters.
all	Displays IS-IS counters for all areas or VLANs.

Default

None.

Usage Guidelines

If you enter the show isis counters command without any additional keywords or parameters, the software displays the counters for all areas.

Example

The following command displays the IS-IS counters for the configured area:

```
show isis counters
```

The following command displays the IS-IS counters for the SJvlan VLAN:

```
show isis counters vlan SJvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

show isis lsdb

```
show isis lsdb {area area_name {lsp-id lsp_id}} {level [1|2]} {detail |
   stats}
```

Description

Displays a summary of the IS-IS link state database for one or all IS-IS router processes running in the current virtual router.

Syntax Description

area_name	Specifies the name of a router process for which to display the IS-IS link state database. If the area name is omitted, this command displays information for all areas.
lsp_id	Limits the display to the specified LSP ID, which is specified in the form *system id*.*pseudonode ID*-*LSP number*. For example: 0102.0ff2.0023.00-01.The pseudonode ID and LSP numbers are optional. If they are not included, multiple listings might appear.
level [1|2]	Limits the display to LSPs for either level 1 or level 2.
detail	Expands the display to include the LSP TLVs and IPv4 and IPv6 reachability information. The displayed information varies depending on what is included in the LSPs.
stats	Displays counts of the number of LSPs and prefixes in the LSP database.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays information for a specific LSP:

```
show isis lsdb area areax lsp-id 0102.0ff2.0023.00-01
```

The following example shows the display for the stats option:

```
(debug) Switch.6 # show isis lsdb stats
Area "a1" :
IS-IS Level-1 Link State Database:
LSPs (including fragments)   : 4
Internal Prefixes (Type 128) : 7
External Prefixes (Type 130) : 0
IPv4 Prefixes     (Type 135) : 0
IPv6 Prefixes     (Type 236) : 0
MT IPv4 Prefixes  (Type 235) : 0
MT IPv6 Prefixes  (Type 237) : 0
IS-IS Level-2 Link State Database:
LSPs (including fragments)   : 1
Internal Prefixes (Type 128) : 5
External Prefixes (Type 130) : 0
IPv4 Prefixes     (Type 135) : 0
IPv6 Prefixes     (Type 236) : 0
MT IPv4 Prefixes  (Type 235) : 0
MT IPv6 Prefixes  (Type 237) : 0
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

show isis neighbors

```
show isis neighbors {area area_name} {vlan vlan_name} {ipv4 | ipv6}
   {detail}
```

Description

This command displays information about neighbors and their adjacencies.

Syntax Description

area_name	Specifies a router process for which to specify neighbor information. If you do not specify an IS-IS area, the software displays the neighbors in all areas.
vlan_name	Specifies a *VLAN* for which to specify neighbor information.
ipv4	Displays only the neighbors that advertise the IPv4 protocol as supported.
ipv6	Displays only the neighbors that advertise the IPv6 protocol as supported.
detail	Displays detailed information for IS-IS neighbors.

Default

N/A.

Usage Guidelines

If you do not specify either the ipv4 or the ipv6 keyword, this command displays all neighbors regardless of the supported protocol.

Example

The following command displays IS-IS neighbor information for areax:

```
show isis neighbors area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

show isis topology

```
show isis topology {area area_name {level [1 | 2]}} {ipv4 | ipv6}
```

Description

This command displays the topology for IPv4, IPv6, or both IPv4 and IPv6 for the specified area and level.

Syntax Description

area_name	Specifies the router process for which the topology applies.
level [1 | 2]	Specifies the IS-IS level of the topology you want to view.
ipv4	Selects the IPv4 topology for display. If you omit the ipv4 and ipv6 options, the IPv4 topology appears.
ipv6	Selects the IPv6 topology for display. If you omit this option, the IPv4 topology appears.

Default

None.

Usage Guidelines

Each known IS in the area or domain is displayed along with the next-hop and metric information.

Example

The following command display IPv4 topology information for areax:

```
show isis topology area areax ipv4
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

show isis vlan

```
show isis vlan {enabled | { vlan_name | all} }
```

Description

This command displays configuration and status information about the specified IS-IS interface.

Syntax Description

enabled	Displays information only for IS-IS-enabled *VLAN*s.
vlan_name	Specifies a VLAN for which to display IS-IS interface information.
all	Displays information on all IS-IS interfaces.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays IS-IS interface information for the SJvlan VLAN:

```
show isis vlan SJvlan
ISIS Interfaces Summary :
--------------------------------------------------------------------------------
VLAN       Area          State    Cfg       Address
--------------------------------------------------------------------------------
v2         a1            u46--   p1246      2.1.1.2/24
2001:db8:2010::1/64
v3         a1            u46-g   p1246      2001:db8:2011::2/64
State Flags :
u - Links up, d - Links down,
4 - IPv4 forwarding enabled, 6 - IPv6 forwarding enabled,
n - Multinetted (v4), g - Multiple global addresses (v6)
